If $P_{REV\_IN\_USE}$ is less than or equal to six, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.

If the ORIG_REASON is set to ‘1’, the mobile station shall set this field to the number of consecutive silent-retry, i.e. an autonomous access re-attempt that were made to re-originate the call, without user interaction, that were due to the mobile receiving an access attempt failure from the ARQ Sublayer. If the number of consecutive silent-retry is greater than three, the mobile station shall set this field to ‘11’.

If the ORIG_REASON is set to ‘0’, the mobile station shall set this field according to Table 2.7.1.3.2.4-8 depending on the number of autonomous re-connection attempts for the desired service (specified by SERVICE_OPTION) that have failed since the last successful connection of that desired service\(^2\). The count shall only include attempts since the last power-up.

<table>

<td>‘11’</td>
</tr>
</tbody>
</table>

**STS_SUPPORTED** - STS supported indicator.

\(^2\) For example, if the mobile station requests SO\(_x\) in the *Origination Message* and SO\(_y\) is granted by the base station, the counter associated with SO\(_x\) is reset.
If P_REV_IN_USE is less than seven, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.

The mobile station shall set this field to ‘1’ if the mobile station supports Space Time Spreading Transmit Diversity; otherwise, the mobile station shall set this field to ‘0’.

**3X_CCH_SUPPORTED** – 3X Common Channels supported.

If P_REV_IN_USE is less than seven, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.

The mobile station shall set this field to ‘1’ if the mobile station supports the Spreading Rate 3 common channels (3X BCCH, 3X F-CCCH, and 3X R-EACH); otherwise, the mobile station shall set this field to ‘0’.

**WLL_INCL** – WLL information included indicator.

If P_REV_IN_USE is less than seven, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.

If the mobile station is a Wireless Local Loop device, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

**WLL_DEVICE_TYPE** – WLL device type indicator.

If WLL_INCL is not included, or if WLL_INCL is included and is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall set this field as follows.

The mobile station shall set this field to the WLLDEVICE_TYPE value shown in Table 2.7.1.3.2.1-3 corresponding to the mobile station device type.

**GLOBAL_EMERGENCY_CALL** – Global Emergency Call indicator.

If P_REV_IN_USE is less than seven, the mobile station shall omit this field; otherwise, the mobile station shall include this field and shall set it as follows:

The mobile station shall set this field to ‘1’ if the mobile station recognizes that this is an emergency call; otherwise, the mobile station shall set this field to ‘0’.

**MS_INIT_POS_LOC_IND** – Mobile Initiated Position Location Session indicator.

If the GLOBAL_EMERGENCY_CALL field is not included in this message or is included but is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and shall set it as follows:

The mobile station shall set this field to ‘1’ if MS_INIT_POS_LOC_SUP_IND is equal to ‘1’ and if the mobile station is to initiate a position location session associated with this emergency call; otherwise, the mobile station shall set this field to ‘0’.
QOS_PARMS_INCL - Presence indicator for the QoS parameters.

If P_REV_IN_USEs is less than seven, the mobile station shall omit this field; otherwise the mobile station shall include this field and set it as follows.

The mobile station shall set this field to ‘1’, if QoS parameters are included in the message for the service instance corresponding to SR_ID; otherwise the mobile station shall set this field to ‘0’. The mobile station shall not set this field to ‘1’, if MOB_QOSs is set to ‘0’ or if the inclusion of the QoS parameters would prevent the inclusion of all the dialed digits in the message.

QOS_PARMS_LEN - Length of the block of QoS parameters.

If QOS_PARMS_INCL is included and is set to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to the combined length in octets, of the QOS_PARMS field and the immediately following QOS_RESERVED field.

QOS_PARMS - QoS parameters block.

If QOS_PARMS_INCL is included and is set to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set it to the set of QoS parameter values as defined in accordance with the requirements for the requested service option and/or for the user, per subscription.

QOS_RESERVED - QoS reserved bits.

If QOS_PARMS_INCL is included and is set to ‘1’, the mobile station shall include the minimum number of bits of ‘0’, such that the combined length of the QOS_PARMS field and of this field is an integer number of octets; otherwise, the mobile station shall omit this field.

ENC_INFO_INCL – Encryption fields included.

If P_REV_IN_USEs is less than seven, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.

The mobile station shall set this field to ‘1’ if the encryption related fields are included; otherwise the mobile station shall set this field to ‘0’. The mobile station shall set this field to ‘0’ if the base station does not support encryption or the mobile station does not support any of the encryption modes supported by the base station.

SIG_ENCRYPT_SUP – Signaling encryption supported indicator.

If ENC_INFO_INCL is included and is set to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, this field indicates which signaling encryption algorithms are supported by the mobile station.
This field consists of the subfields shown in Table 2.7.1.3.2.1-5.

If this field is included, the mobile station shall set the subfields as follows:

The mobile station shall set the CMEA subfield to ‘1’.

The mobile station shall set each other subfield to ‘1’ if the corresponding signaling encryption algorithm is supported by the mobile station; otherwise, the mobile station shall set the subfield to ‘0’.

The mobile station shall set the RESERVED subfield to ‘00000’.

D_SIG_ENCRYPT_REQ – Dedicated channel signaling encryption request indicator.

If ENC_INFO_INCL is included and is set to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to ‘1’ to request signaling encryption to be turned on for signaling messages sent on f-dsch and r-dsch, and to ‘0’ to request signaling encryption to be turned off for signaling messages sent on f-dsch and r-dsch.

C_SIG_ENCRYPT_REQ – Common channel signaling encryption request indicator.

If ENC_INFO_INCL is included and is set to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to ‘1’ to request signaling encryption to be turned on for signaling messages sent on f-csch and r-csch, and to ‘0’ to request signaling encryption to be turned off for signaling messages sent on f-csch and r-csch.

NEW_SSEQ_H – The 24-bit value used to initialize the 24 MSB of the crypto-sync.

If SIG_ENCRYPT_SUP is included and the ECMEA or REA subfield in SIG_ENCRYPT_SUP is set to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to a 24-bit value that will be used as the initial value of the 24 MSB of the crypto-sync for both forward and reverse link message encryption and integrity (if message integrity is performed).

NEW_SSEQ_H_SIG - The signature of NEW_SSEQ_H

If NEW_SSEQ_H is included, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to the digital signature of the NEW_SSEQ_H as described in 2.3.12.4.5.

UI_ENCRYPT_REQ – Request for user information encryption on the traffic channel indicator.
If ENC_INFO_INCL is included and is set to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to ‘1’ to request user information encryption, and to ‘0’ to request no user information encryption.

**UI_ENCRYPT_SUP** – User information encryption supported indicator.

If ENC_INFO_INCL is included and is set to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to indicate the supported user information encryption algorithms.
This field consists of the subfields shown in Table 2.7.1.3.2.4-9.

Table 2.7.1.3.2.4-9. Encoding of the UI_ENCRYPT_SUP Field

<table>
<thead>
<tr>
<th>Subfield</th>
<th>Length (bits)</th>
<th>Subfield Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORYX</td>
<td>1</td>
<td>Support for ORYX encryption algorithm</td>
</tr>
<tr>
<td>REA</td>
<td>1</td>
<td>Support for the Rijndael encryption algorithm used in extended encryption</td>
</tr>
<tr>
<td>RESERVED</td>
<td>6</td>
<td>Reserved bits</td>
</tr>
</tbody>
</table>

The mobile station shall set each subfield to ‘1’ if the corresponding user information encryption algorithm is supported by the mobile station; otherwise, the mobile station shall set the subfield to ‘0’.

The mobile station shall set the RESERVED subfield to ‘000000’.

SYNC_ID_INCL - Service Configuration synchronization identifier included indicator.

If P_REV_IN_USE is less than seven, the mobile station shall omit this field; otherwise, the mobile station shall include this field and shall set it as follows:

The mobile station shall set this field to ‘1’ if the SYNC_ID field is included in this message; otherwise, the mobile station shall set this field to ‘0’.

If SYNC_ID_SUPPORTED is equal to ‘0’, the mobile station shall set this field to ‘0’.

SYNC_ID_LEN - Service Configuration synchronization identifier length indicator.

If the SYNC_ID_INCL field is not included or is included and is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to the length of the SYNC_ID field included in this message.

SYNC_ID - Service Configuration synchronization identifier.

If the SYNC_ID_INCL field is not included, or is included but is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to the Service
Configuration synchronization identifier corresponding to a stored service configuration.

PREV_SID_INCL - Previous System Identification (SID) included indicator.

If $P_{\text{REV IN USE}}$ is less than seven, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to ‘1’ if:

- The mobile station determines that the SID has been changed after a packet data dormant handoff, and
- This message includes the main service instance (see [42]).

Otherwise, the mobile station shall set this field to ‘0’.

PREV_SID - Previous System Identification.

If PREV_SID_INCL is not included, or is included but is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to the previous SID.

PREV_NID_INCL - Previous Network Identification (NID) included indicator.

If $P_{\text{REV IN USE}}$ is less than seven, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to ‘1’ if:

- The mobile station determines that NID has been changed after a packet data dormant handoff, and
- This message includes the main service instance (see [42]).

Otherwise, the mobile station shall set this field to ‘0’.

PREV_NID - Previous Network Identification.

If PREV_NID_INCL is not included, or is included but is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to the previous NID.

PREV_PZID_INCL - Previous Packet Zone ID (PZID) included indicator.

If $P_{\text{REV IN USE}}$ is less than seven, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:
The mobile station shall set this field to ‘1’ if:
- The mobile station determines that the Packet Zone ID has been changed after a packet data dormant handoff, and
- This message includes the main service instance (see [42]).

Otherwise, the mobile station shall set this field to ‘0’.

**PREV_PZID** - Previous Packet Zone ID.

If PREV_PZID_INCL is not included, or is included but is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to the previous PZID.

**SO_BITMAP_IND** - Service option bitmap indicator.

If P_REV_IN_USEs is less than 7, the mobile station shall omit this field; otherwise, the mobile station shall set this field as defined in Table 2.7.1.3.2.4-10.

Table 2.7.1.3.2.4-10. Encoding of the SO_BITMAP_IND Field

<table>
<thead>
<tr>
<th><strong>SO_BITMAP_IND</strong></th>
<th>Size of bitmap (in bits) included</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>0 bit (i.e., No bitmap included)</td>
</tr>
<tr>
<td>01</td>
<td>4 bits</td>
</tr>
<tr>
<td>10</td>
<td>8 bits</td>
</tr>
<tr>
<td>11</td>
<td>Reserved 16 bits</td>
</tr>
</tbody>
</table>

**SO_GROUP_NUM** - Service option group number.

If SO_BITMAP_IND is included and not set to ‘00’, the mobile station shall include this field and set this field to service option group number defined in [30], of the bitmap to be included in this message; otherwise, the mobile station shall omit this field.

**SO_BITMAP** - Service option bitmap.

If the field SO_BITMAP_IND is included and is not set to ‘00’, the mobile station shall include the bitmap of the service option group (SO_GROUP_NUM); otherwise, the mobile station shall omit this field.

When the service option bitmap is included, if there are more than \(2^{(1+4 \times SO_BITMAP_IND)}\) service options defined in [30] for the service option group [SO_GROUP_NUM], the mobile station shall include the bitmap containing the least significant bits \(2^{(1+4 \times SO_BITMAP_IND)}\) for the service option group.
The mobile station shall set a bit in this bitmap to ‘1’, if the mobile station is capable of supporting the service option for which the bit represents; otherwise, the mobile station shall set a bit in this bitmap to ‘0’.

**SDB_DESIRED_ONLY** – Short Data Burst Desired Only.

If P_REV_IN_USE is less than eight, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

If the mobile station desires to exchange user data using only Short Data Bursts on common channels, it shall set this field to ‘1’; otherwise, it shall set this field to ‘0’.

**ALT_BAND_CLASS_SUP** – Alternate band class support indicator.

If P_REV_IN_USE is less than eight, then the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

If BAND_CLASS_INFO_REQ is equal to ‘1’ and the mobile station supports the CDMA band class specified by ALT_BAND_CLASS, then the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

**MSG_INT_INFO_INCL** – Signaling message integrity information included indicator.

If P_REV_IN_USE is less than nine, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

If MSG_INTEGRITY_SUP is set to ‘0’, the mobile station shall set this field to ‘0’; otherwise, the mobile station shall set this field to ‘1’.

**SIG_INTEGRITY_SUP_INCL** – Signaling message integrity information included indicator.

If MSG_INT_INFO_INCL is included and is set to ‘1’, the mobile station shall include this field and set it as follows; otherwise, the mobile station shall omit this field.

If the mobile station supports other integrity algorithm(s) in addition to the default integrity algorithm, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

**SIG_INTEGRITY_SUP** – Signaling integrity algorithm supported by the mobile station.

If SIG_INTEGRITY_SUP_INCL is included and is set to ‘1’, the mobile station shall set this field as follows; otherwise, the mobile station shall omit this field.

The mobile station shall set this field to indicate the supported message integrity algorithms in addition to the default integrity algorithm.
This field consists of the subfields shown in Table 2.7.1.3.2.1-6.

The mobile station shall set each subfield to ‘1’ if the corresponding message integrity algorithm is supported by the mobile station; otherwise, the mobile station shall set the subfield to ‘0’.

The mobile station shall set the RESERVED subfield to ‘00000000’.

SIG_INTEGRITY_REQ - Signaling message integrity algorithm requested by the mobile station.

If SIG_INTEGRITY_SUP_INCL is included and is set to ‘1’, the mobile station shall set this field as follows; otherwise, the mobile station shall omit this field.

The mobile station shall include this field and set it to the value corresponding to the message integrity algorithm requested as shown in Table 2.7.1.3.2.1-7.

NEW_KEY_ID - New key identifier.

If MSG_INT_INFO_INCL is included and is set to ‘1’, the mobile station shall include this field and set it as follows; otherwise, the mobile station shall omit this field.

The mobile station shall set this field as follows:
- If LAST_2G_KEY_ID equals ‘00’, the mobile station shall set this field to ‘01’.
- If LAST_2G_KEY_ID equals ‘01’, the mobile station shall set this field to ‘00’.

NEW_SSEQ_H_INCL - The include indicator of the 24 MSB of the security sequence number.

If MSG_INT_INFO_INCL is included and is set to ‘1’, the mobile station shall include this field and set it as follows; otherwise, the mobile station shall omit this field.

The mobile station shall set this field to ‘0’ if any of the following is true:
- If SIG_ENCRYPT_SUP is included and the ECMEA or REA subfield in SIG_ENCRYPT_SUP is set to ‘1’
- RESTORE_KEYS is equal to ‘1’.

In all other cases, the mobile station shall set this field to ‘1’.

NEW_SSEQ_H - The 24-bit value used to initialize the 24 MSB of the crypto-sync.

If NEW_SSEQ_H_INCL is included and is set to ‘1’, the mobile station shall include this field and set this field as follows; otherwise, the mobile station shall omit this field.

The mobile station shall set this field to a 24-bit value that will be used as the initial value of the 24 MSB of the crypto-sync for both forward and reverse link message integrity.
NEW_SSEQ_H_SIG - The signature of NEW_SSEQ_H
If NEW_SSEQ_H_INCL is included and is set to ‘1’, the mobile station shall include this field and set this field as follows; otherwise, the mobile station shall omit this field.
The mobile station shall set this field to the digital signature of the NEW_SSEQ_H computed as described in 2.3.12.4.5.

FOR_PDCH_SUPPORTED - Forward Packet Data Channel supported indicator.
If P_REV_IN_USEs is less than nine, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.
If the mobile station supports the Forward Packet Data Channel, then the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

FOR_PDCH Capability
Type-specific fields - Forward Packet Data Channel capability information.
If the FOR_PDCH_SUPPORTED field is included and is set to ‘1’, the mobile station shall include this field and set it as defined in 2.7.4.27.5; otherwise, the mobile station shall omit this field.

EXT_CH_IND - Extended Channel Indicator.
If the CH_IND field is not included or is included but is not set to ‘00’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.
The mobile station shall set this field as shown in Table 2.7.1.3.2.4-11 to request a physical resource.
### Table 2.7.1.3.2.4-11. Extended Channel Indicator

<table>

</tbody>
</table>

1 SIGN_SLOT_CYCLE_INDEX – Sign of the slot cycle index.

If P_REV_IN_USEs is less than 11, or if the SLOT_CYCLE_INDEX field is set to ‘000’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field as specified in Table 2.7.1.3.2.1-8 to the sign of the preferred slot cycle index, SLOT_CYCLE_INDEXp (see 2.6.2.1.1). The absolute value of the preferred slot cycle index, SLOT_CYCLE_INDEXp, is specified in the SLOT_CYCLE_INDEX field of this message.
ADD_SERV_INSTANCE_INCL - Additional service instances included indicator.

If P_REV_IN_USEs is less than 11 or if SR_ID is included and set to ‘111’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

If at least one occurrence of the ADD_SR_ID field is included in this message, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

If SYNC_ID_INCL is equal to ‘0’ and MAX_ADD_SERV_INSTANCEs is equal to ‘0’, the mobile station shall set this field to ‘0’.

NUM_ADD_SERV_INSTANCE - Number of additional service instances included.

If ADD_SERV_INSTANCE_INCL is not included or is included and set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it to the number of additional service instances included in this message.

If SYNC_ID_INCL is equal to ‘0’, the mobile station shall set this field to a value less than or equal to MAX_ADD_SERV_INSTANCEs.

If ADD_SERV_INSTANCE_INCL is included and set to ‘1’, the mobile station shall include NUM_ADD_SERV_INSTANCE occurrences of the following variable-field record:

ADD_SR_ID - Additional service reference identifier.

If SYNC_ID_INCL is set to ‘0’, the mobile station shall set this field as follows:

- If the service instance provides a service reference identifier, the mobile station shall set this field to the service reference identifier specified by the service instance. If the service instance does not provide a service reference identifier, the mobile station shall set this field to the smallest unused service reference identifier value between 1 and 6 (inclusive).

Otherwise, the mobile station shall set this field to the service reference identifier corresponding to the service option connection that the mobile station requests to be restored from the stored service configuration.

ADD_DRS - Additional Data Ready to Send indicator.

If the service instance corresponding to the ADD_SR_ID field of this record has data to send, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

ADD_SERVICE_OPTION_INCL - Additional service option included indicator.
If SYNC_ID_INCL is set to ‘1’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to ‘0’ if the requested service option number of the service instance corresponding to the ADD_SR_ID field of this record is the same as SERVICE_OPTION; otherwise, the mobile station shall set this field to ‘1’.

ADD_SERVICE_OPTION – Additional service option number.

If the ADD_SERVICE_OPTION_INCL field of this record is not included or is included and set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it to the value specified in [30], corresponding to the requested service option number of the service instance corresponding to the ADD_SR_ID field of this record.

ADD_QOS_PARMS_INCL – Additional QoS parameters included indicator.

If SYNC_ID_INCL is set to ‘1’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

If QoS parameters for the service instance corresponding to the ADD_SR_ID field of this record are included in this message, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

The mobile station shall not set this field to ‘1’ if MOB_QOSs is set to ‘0’.

ADD_QOS_PARMS_LEN – Additional Length of the block of QoS parameters.

If the ADD_QOS_PARMS_INCL field of this record is not included or is included and is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it to the combined length of the ADD_QOS_PARMS field and the ADD_QOS_RESERVED field of this record, in octets.

ADD_QOS_PARMS – Additional QoS parameters block.

If the ADD_QOS_PARMS_INCL field of this record is not included or is included and is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it to the set of QoS parameter values as defined in accordance with the requirements for the requested service option and/or for the user, per subscription.

ADD_QOS_RESERVED – Additional QoS reserved bits.
If the ADD_QOS_PARMS_INCL field of this record is not included or is included and is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall include the minimum number of bits of '0', such that the combined length of the QOS_PARMS field and of this field is an integer number of octets.

BCMC_INCL - BCMC information included indicator

If the P_REV_IN_USE is less than eleven, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to '1' if one or more BCMC_PROGRAM_IDS are included in the message; otherwise, the mobile station shall set this field to '0'.

BCMC_ORIG ONLY_IND - BCMC origination only indicator

If the BCMC_INCL field is not included or is included and is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to '1' to indicate that this origination is only for BCMC and no point to point call is requested in this message; otherwise the mobile station shall set this field to '0'.

FUNDICATED_BCMC_SUPPORTED - Fundicated BCMC capability type-specific supported indicator.

If the BCMC_INCL field is not included or is included and is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

If the mobile station supports Fundicated BCMC channel configurations, the mobile station shall set this field to '1'; otherwise, the mobile station shall set this field to '0'.

FUNDICATED_BCMC Capability

Type-specific fields - FUNDICATED_BCMC capability information.

If the FUNDICATED_BCMC_SUPPORTED field is included and is set to '1', the mobile station shall include this field and set it as defined in 2.7.4.27.7; otherwise, the mobile station shall omit this field.

AUTH_SIGNATURE_INCL - Authorization signature included indication.

If the BCMC_INCL field is not included or is included and is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to '1' to indicate that the authorization signature is included in this message for some of the BCMC flows included in this message; otherwise, the mobile station shall set this field to '0'.

TIME_STAMP_SHORT_LENGTH - Length of time stamp included in this message.
If the AUTH_SIGNATURE_INCL field is not included or is included and is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to the length of the time stamp, in units of bits, included in this message.

**TIME_STAMP_SHORT** - Time stamp short.

If the AUTH_SIGNATURE_INCL field is not included or is included and is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to the **TIME_STAMP_SHORT**_LENGTH_ least significant bits of the time stamp parameter used to generate the Authorization signature included in this message.

**NUM_BCMC_PROGRAMS** - Number of BCMC Programs

If the BCMC_INCL field is not included or is included and is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to the number of BCMC programs included in this message minus 1.

The mobile station shall include **NUM_BCMC_PROGRAMS+1** occurrences of the following variable length record:

**BCMC_PROGRAM_ID_LEN** - Length of BCMC_PROGRAM_ID field

The mobile station shall set this field to one less than the length, in bits, of the BCMC_PROGRAM_ID of this program.

**BCMC_PROGRAM_ID** - BCMC program Identifier

The length of this field shall be one more than the value of BCMC_PROGRAM_ID_LEN bits.

The mobile station shall set this field to the identifier of the BCMC program corresponding to one or more flows that the mobile station will continue to monitor or start to monitor upon receiving confirmation of delivery of this message or is requesting transmission.

**BCMC_FLOW_DISCRIMINATOR_LEN** - Length of BCMC_FLOW_DISCRIMINATOR field

The mobile station shall set this field to the length, in bits, of the BCMC_FLOW_DISCRIMINATOR of this program. To request all flows associated with this BCMC_PROGRAM_ID, the mobile station may set this field to ‘000’.
NUM_FLOW_DISCRIMINATOR - Number of BCMC flow discriminators included for this program.

The length of this field shall be determined by the value of the BCMC_FLOW_DISCRIMINATOR_LEN as follows: if BCMC_FLOW_DISCRIMINATOR_LEN is set to '000', this field is omitted; otherwise, the length of this field shall be BCMC_FLOW_DISCRIMINATOR_LEN bits.

The mobile station shall set this field to the number of flow discriminators included for this program minus one.

If NUM_FLOW_DISCRIMINATOR field is included, the mobile station shall include NUM_FLOW_DISCRIMINATOR+1 occurrences of the following variable length record; otherwise, the mobile station shall include 1 occurrence of the following variable length record:

BCMC_FLOW_DISCRIMINATOR – BCMC Flow discriminator.

The length of this field shall be determined by the value of the BCMC_FLOW_DISCRIMINATOR_LEN as follows: if BCMC_FLOW_DISCRIMINATOR_LEN is set to '000', this field is omitted; otherwise, the length of this field shall be BCMC_FLOW_DISCRIMINATOR_LEN bits.

The mobile station shall set this field to the BCMC flow discriminator requested.

AUTH_SIGNATURE_IND - Authorization signature indicator.

If the AUTH_SIGNATURE_INCL field is not included or is included and is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to ‘1’ to indicate that the authorization signature is included in this message for this BCMC flow; otherwise, the mobile station shall set this field to ‘0’.

AUTH_SIGNATURESAME_IND - Authorization signature same as previous BCMC flow indicator.

If the AUTH_SIGNATURE_IND field is not included or is included and is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to ‘1’ to indicate that the authorization signature generated for this BCMC flow is the same as the one generated for the BCMC flow listed prior to this BCMC flow in this message; otherwise, the mobile station shall set this field to '0'.
For the first BCMC flow listed in this message, the mobile station shall set this field to ‘0’.

BAK_ID - BAK identifier.

If the AUTH_SIGNATURESAME_IND field is not included or is included and is set to ‘1’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to BAK identifier used to generate the Authorization signature included in this message.

AUTH_SIGNATURE - Authorization signature.

If the AUTH_SIGNATURESAME_IND field is not included or is included and is set to ‘1’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to the Authorization signature computed for this BCMC flow as specified in 2.6.13.9.

REV_PDCH_SUPPORTED - Reverse Packet Data Channel supported indicator.

If P_REV_IN_USES is less than 11 or FOR_PDCH_SUPPORTED is not included or is included and is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.

If the mobile station supports the Reverse Packet Data Channel (R-PDCH), the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

REV_PDCH Capability Type-specific fields - Reverse Packet Data Channel capability information.

If the REV_PDCH_SUPPORTED field is included and is set to ‘1’, the mobile station shall include this field and set it as defined in 2.7.4.27.6; otherwise, the mobile station shall omit this field.

BAND_SUB_REP_INCL – Band class – band subclass report included

If P_REV_IN_USES is less than eleven, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:
If CAND_BAND_INFO_REQ is equal to ‘1’ and the mobile station supports at least 1 band class and band subclass (if applicable) combination queried by the base station, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

**NUM_BAND_SUBCLASS** – Number of band class - band subclass capabilities reported

If BAND_SUB_REP_INCL is set to ‘0’ or is not included, this field shall be omitted; otherwise, the mobile station shall include this field and set it as follows:

If the mobile station supports all candidate band class and band subclass (if applicable) combinations queried by the base station, the mobile station shall set this field to ‘0000’; otherwise, the mobile station shall set this field to the number of band class-band subclass capabilities reported.

If the NUM_BAND_SUBCLASS field is included in this message, the mobile station shall include NUM_BAND_SUBCLASS occurrences of the **BAND_SUBCLASS_SUP** field:

**BAND_SUBCLASS_SUP** – Band class-band subclass supported indicator

The mobile station shall set this field as specified in section 2.6.14.1.

1

MOB\_TERM   – Mobile terminated calls accepted indicator.

If the mobile station is configured to accept mobile terminated calls while operating with the current roaming status (see 2.6.5.3), the mobile station shall set this bit to ‘1’. Otherwise, the mobile station shall set this bit to ‘0’.

SLOT\_CYCLE\_INDEX   – Slot cycle index.

If P\_REV\_IN\_USE of is less than 11, or if MIN\_SLOT\_CYCLE\_INDEX is equal to ‘0’, the mobile station shall perform the following:

• If the mobile station is configured for slotted mode operation, the mobile station shall set this field to max (0, SLOT\_CYCLE\_INDEXp) (see 2.6.2.1.1). Otherwise, the mobile station shall set this field to ‘000’.

Otherwise, the mobile station shall perform the following:

• If the mobile station is configured for slotted mode operation, the mobile station shall set this field to the absolute value of the preferred slot cycle index, SLOT\_CYCLE\_INDEXp (see 2.6.2.1.1); otherwise, the mobile station shall set this field to ‘000’. The sign of SLOT\_CYCLE\_INDEXp is specified in the SIGN\_SLOT\_CYCLE\_INDEX field of this message (see Table 2.7.1.3.2.1-8).

MOB\_P\_REV   – Protocol revision of the mobile station.

The mobile station shall set this field to ‘00001011’.
SCM – Station class mark.

The mobile station shall set this field to the station class mark of the mobile station. See 2.3.3.

REQUEST_MODE – Requested mode code. The mobile station shall set this field to the value shown in Table 2.7.1.3.2.4-1 corresponding to its current configuration.

SERVICE_OPTION – Service option.

If the mobile station accepts the service option specified by the mobile-station-addressed page, it shall set this field as follows:

- If the page record to which the mobile station is responding contained a SERVICE OPTION field, the mobile station shall set this field to the service option number specified in the SERVICE OPTION field of the page record to which the mobile station is responding.

- If the page record to which the mobile station is responding did not contain a SERVICE OPTION field, the mobile station shall set this field to the default option number ‘0000000000000001’.

If the mobile station does not accept the service option specified by the mobile-station-addressed page to which the mobile station is responding and the mobile station does have an alternative service option to request, the mobile station shall set this field to the service option code specified in [30] corresponding to the alternative service option.

If the mobile station does not accept the service option specified by the mobile-station-addressed page to which the mobile station is responding and the mobile station does not have an alternative service option to request, the mobile station shall set this field to ‘0000000000000000’ to reject the service option specified by the page record of the General Page Message or Universal Page Message to which the mobile station is responding.

PM – Privacy mode indicator.

To request voice privacy, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

NAR_AN_CAP – Narrow analog capability.

---

3 This scenario could occur only in a Direct Channel Assignment call setup.
If the mobile station is capable of narrow analog operation, the mobile station shall set this bit to ‘1’; otherwise, the mobile station shall set this bit to ‘0’.

**ENCRYPTION_SUPPORTED** – Encryption algorithms supported by the mobile station.

If P_REV_IN_USEs is greater than or equal to seven or AUTH_MODE is equal to ‘00’, the mobile station shall omit this field. If P_REV_IN_USEs is less than seven and AUTH_MODE is not equal to ‘00’, then the mobile station shall set this field as specified in table 2.7.1.3.2.4-5.

**NUM_ALT_SO** – Number of alternative service options.

If P_REV_IN_USEs is less than seven, the mobile station shall set this field to the number of alternative service options it supports other than the one specified in the SERVICEOPTION field. The mobile station shall set this field to a value less than or equal to MAX_NUM_ALT_SOs.

If P_REV_IN_USEs is equal to or greater than seven, the mobile station shall set this field to the number of alternate service options, which either have no service option group number assigned or do not belong to the same service option group whose bitmap is being included. The alternate service option numbers are other than the one specified in the SERVICEOPTION field. The mobile station shall set this field to a value less than or equal to MAX_NUM_ALT_SOs.

**ALT_SO** – Alternative service option.

The mobile station shall include NUM_ALT_SO occurrences of this field. The mobile station shall set this field to the value specified in [30], corresponding to the alternative service option supported by the mobile station.

If P_REV_IN_USEs is equal to or greater than seven, the mobile station shall include NUM_ALT_SO occurrences of this field. The mobile station shall set this field to the service option number defined in [30] corresponding to the alternate service options which either have no service option group number assigned or do not belong to the same service option group whose bitmap is included in this message.

**UZID_INCL** – User Zone Identifier included indicator.

If P_REV_IN_USEs is less than six, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.

If the message is to contain the User Zone Identifier, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

**UZID** – User Zone Identifier.

If the UZID_INCL field is included in the message and is set to ‘1’, the mobile station shall include this field and set it to UZIDs; otherwise, the mobile station shall omit this field.
CH_IND – Channel Indicator.

If $P_{REV\_IN\_USE_S}$ is less than six, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it, as shown in Table 2.7.1.3.2.5-1, to request physical resources.

<table>
<thead>

</tbody>
</table>

OTD_SUPPORTED – Orthogonal transmit diversity supported indicator

If $P_{REV\_IN\_USE_S}$ is less than six, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.

If the mobile station supports orthogonal transmit diversity, it shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

QPCH_SUPPORTED – Quick Paging Channel supported indicator.

If $P_{REV\_IN\_USE_S}$ is less than six, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.

If the mobile station supports the Quick Paging Channel, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

ENHANCED_RC – Enhanced radio configuration supported indicator.

If $P_{REV\_IN\_USE_S}$ is less than six, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.

If the mobile station supports any radio configuration in the Radio Configuration Class 2 (see 1.1.1), the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

FOR_RC_PREF – Forward Radio Configuration preference.

If $P_{REV\_IN\_USE_S}$ is less than six, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.
The mobile station shall set this field to its preferred Radio Configuration for the Forward Fundamental Channel and/or Forward Dedicated Control Channel.

**REV_RC_PREF** – Reverse Radio Configuration preference.

If P_REV_IN_USE is less than six, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.

The mobile station shall set this field to its preferred Radio Configuration for the Reverse Fundamental Channel and/or Reverse Dedicated Control Channel.

**FCH_SUPPORTED** – Fundamental Channel supported indicator.

If P_REV_IN_USE is less than six, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.

The mobile station shall set this field to ‘1’ if the mobile station supports Fundamental Channel; otherwise, the mobile station shall set this field to ‘0’.

**FCH Capability Type specific fields** – Fundamental Channel capability information.

If the FCH_SUPPORTED field is included and is set to ‘1’, the mobile station shall include this field and set it as described in 2.7.4.27.1; otherwise, the mobile station shall omit this field.

**DCCH_SUPPORTED** – Dedicated Control Channel supported indicator.

If P_REV_IN_USE is less than six, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.

The mobile station shall set this field to ‘1’ if the mobile station supports Dedicated Control Channel; otherwise, the mobile station shall set this field to ‘0’.

**DCCH Capability Type specific fields** – Dedicated Control Channel capability information.

If DCCH_SUPPORTED is included and is set to ‘1’, the mobile station shall include this field and set it as defined in 2.7.4.27.2; otherwise, the mobile station shall omit this field.

**REV_FCH_GATING_REQ** – Reverse Fundamental Channel eighth gating mode request indicator.

If P_REV_IN_USE is less than six, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

If the mobile station requests to turn on the reverse Fundamental Traffic Channel gating mode in Radio Configurations 3, 4, 5, and 6, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

**STS_SUPPORTED** – STS supported indicator.
If P_REV_IN_USE is less than seven, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.

The mobile station shall set this field to ‘1’ if the mobile station supports Space Time Spreading Transmit Diversity; otherwise, the mobile station shall set this field to ‘0’.

3X_CCH_SUPPORTED – 3X Common Channels supported.

If P_REV_IN_USE is less than seven, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.

The mobile station shall set this field to ‘1’ if the mobile station supports the Spreading Rate 3 common channels (3X BCCH, 3X F-CCCH, and 3X R-EACH); otherwise, the mobile station shall set this field to ‘0’.

WLL_INCL - WLL information included indicator.

If P_REV_IN_USE is less than seven, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.

If the mobile station is a Wireless Local Loop device, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

WLL_DEVICE_TYPE – WLL device type indicator.

If WLL_INCL is not included, or if WLL_INCL is included and is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall set this field as follows.

The mobile station shall set this field to the WLL_DEVICE_TYPE value shown in Table 2.7.1.3.2.1-3 corresponding to the mobile station device type.

HOOK_STATUS – WLL terminal hook status.

If WLL_INCL is not included, or if WLL_INCL is included and is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall set this field to the value shown in Table 2.7.1.3.2.1-4 corresponding to the hook state.
ENC_INFO_INCL – Encryption fields included.
If P_REV_IN_USE is less than seven, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to ‘1’ if the encryption related fields are included; otherwise the mobile station shall set this field to ‘0’. The mobile station shall set this field to ‘0’ if the base station does not support encryption or the mobile station does not support any of the encryption modes supported by the base station.

SIG_ENCRYPT_SUP – Signaling encryption supported indicator.
If ENC_INFO_INCL is included and is set to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to indicate which signaling encryption algorithms are supported by the mobile station.

This field consists of the subfields shown in Table 2.7.1.3.2.1-5.
If this field is included, the mobile station shall set the subfields as follows:

The mobile station shall set the CMEA subfield to ‘1’.
The mobile station shall set each other subfield to ‘1’ if the corresponding signaling encryption algorithm is supported by the mobile station; otherwise, the mobile station shall set the subfield to ‘0’.
The mobile station shall set the RESERVED subfield to ‘00000’.

D_SIG_ENCRYPT_REQ – Dedicated channel signaling encryption request indicator.
If ENC_INFO_INCL is included and is set to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to ‘1’ to request signaling encryption to be turned on for signaling messages sent on f-dsch and r-dsch, and to ‘0’ to request signaling encryption to be turned off for signaling messages sent on f-dsch and r-dsch.

C_SIG_ENCRYPT_REQ – Common channel signaling encryption request indicator.
If ENC_INFO_INCL is included and is set to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to ‘1’ to request signaling encryption to be turned on for signaling messages sent on f-csch and r-csch, and to ‘0’ to request signaling encryption to be turned off for signaling messages sent on f-csch and r-csch.

NEW_SSEQ_H – The 24-bit value used to initialize the 24 MSB of the crypto-sync.

2-787
If SIG_ENCRYPT_SUP is included and the ECMEA or REA subfield in SIG_ENCRYPT_SUP is set to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to a 24-bit value that will be used as the initial value of the 24 MSB of the crypto-sync for both forward and reverse link message encryption and integrity (if message integrity is performed).

NEW_SSEQ_H_SIG - The signature of NEW_SSEQ_H

If the NEW_SSEQ_H field is included in the message, the mobile station shall set this field to the digital signature of the NEW_SSEQ_H as described in 2.3.12.4.5; otherwise, the mobile station shall omit this field.

UI_ENCRYPT_REQ – Request for user information encryption on the traffic channel indicator.

If ENC_INFO_INCL is included and is set to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to ‘1’ to request user information encryption, and to ‘0’ to request no user information encryption.

UI_ENCRYPT_SUP – User information encryption supported indicator.

If ENC_INFO_INCL is included and is set to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to indicate the supported user information encryption algorithms.

This field consists of the subfields shown in Table 2.7.1.3.2.4-9.

The mobile station shall set each subfield to ‘1’ if the corresponding user information encryption algorithm is supported by the mobile station; otherwise, the mobile station shall set the subfield to ‘0’.

The mobile station shall set the RESERVED subfield to ‘000000’.

SYNC_ID_INCL - Service Configuration synchronization identifier included indicator.

If P_REV_IN_USES is less than seven, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.

The mobile station shall set this field to ‘1’ if the SYNC_ID field is included in this message; otherwise, the mobile station shall set this field to ‘0’.

If SYNC_ID_SUPPORTEDS is equal to ‘0’, the mobile station shall set this field to ‘0’.
SYNC_ID_LEN - Service Configuration synchronization identifier length
indicator.

If the SYNC_ID_INCL field is not included or is included and
is set to '0', the mobile station shall omit this field; otherwise
the mobile station shall include this field and set it as follows:

The mobile station shall set this field to the length of the
SYNC_ID field included in this message.

SYNC_ID - Service Configuration synchronization identifier.

If the SYNC_ID_INCL field is not included, or is included and
is set to '0', the mobile station shall omit this field; otherwise,
the mobile station shall include this field and set it as follows:

The mobile station shall set this field to the Service
Configuration synchronization identifier corresponding to the
stored service configuration.

SO_BITMAP_IND - SO bitmap indicator.

If P_REV_IN_USEs is less than 7, the mobile station shall omit
this field; otherwise, the mobile station shall include this field
and set this field as defined in Table 2.7.1.3.2.4-10.

SO_GROUP_NUM - The service option group number.

If SO_BITMAP_IND is included and not set to '00', the mobile
station shall include this field and set this field to service
option group number of the bitmap to be included in this
message; otherwise, the mobile station shall omit this field.

SO_BITMAP - Service option bitmap.

If the field SO_BITMAP_IND field is included and is not set to
'00', the mobile station shall include the bitmap of the service
option group (SO_GROUP_NUM); otherwise, the mobile
station shall omit this field.

When the service option bitmap is included, if there are more
than \(2^{\left(1+4\times SO\_BITMAP\_IND\right)}\) service options defined for
the service option group, the mobile station shall include the
bitmap containing the least significant bits \(2^{\left(1+4\times SO\_BITMAP\_IND\right)}\) of the service option group.

The mobile station shall set a bit in this bitmap to '1', if the
mobile station is capable of supporting the service option for
which the bit represents; otherwise, the mobile station shall
set a bit in this bitmap to '0'.

ALT_BAND_CLASS_SUP – Alternate band class support indicator.

If P_REV_IN_USEs is less than eight, then the mobile station
shall omit this field; otherwise, the mobile station shall
include this field and set it as follows:
If BAND_CLASS_INFO_REQ\textsubscript{s} is equal to ‘1’ and the mobile station supports the CDMA band class specified by ALT_BAND_CLASS\textsubscript{s}, then the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

MSG\\_INT\\_INFO\\_INCL - Signaling message integrity information included indicator.  
If P\\_REV\\_IN\\_USE\textsubscript{s} is less than nine, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.  
If MSG\\_INTEGRITY\\_SUP\textsubscript{s} is set to ‘0’, the mobile station shall set this field to ‘0’; otherwise, the mobile station shall set this field to ‘1’.

SIG\\_INTEGRITY\\_SUP\\_INCL - Signaling message integrity information included indicator.  
If MSG\\_INT\\_INFO\\_INCL is included and is set to ‘1’, the mobile station shall include this field and set it as follows; otherwise, the mobile station shall omit this field.  
If the mobile station supports other integrity algorithm(s) in addition to the default integrity algorithm, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

SIG\\_INTEGRITY\\_SUP - Signaling integrity algorithm supported by the mobile station.  
If SIG\\_INTEGRITY\\_SUP\\_INCL is included and is set to ‘1’, the mobile station shall set this field as follows; otherwise, the mobile station shall omit this field.  
The mobile station shall set this field to indicate the supported message integrity algorithms in addition to the default integrity algorithm.
This field consists of the subfields shown in Table 2.7.1.3.2.1-6.

The mobile station shall set each subfield to ‘1’ if the corresponding message integrity algorithm is supported by the mobile station; otherwise, the mobile station shall set the subfield to ‘0’.

The mobile station shall set the RESERVED subfield to ‘00000000’.

SIG_INTEGRITY_REQ - Signaling message integrity algorithm requested by the mobile station.

If SIG_INTEGRITY_SUP_INCL is included and is set to ‘1’, the mobile station shall set this field as follows; otherwise, the mobile station shall omit this field.

The mobile station shall include this field and set it to the value corresponding to the message integrity algorithm requested as shown in Table 2.7.1.3.2.1-7.

NEW_KEY_ID - New key identifier.

If MSG_INT_INFO_INCL is included and is set to ‘1’, the mobile station shall include this field and set it as follows; otherwise, the mobile station shall omit this field.

The mobile station shall set this field as follows:

- If LAST_2G_KEY_ID equals ‘00’, the mobile station shall set this field to ‘01’.
- If LAST_2G_KEY_ID equals ‘01’, the mobile station shall set this field to ‘00’.

NEW_SSEQ_H_INCL - The include indicator of the 24 MSB of the security sequence number.

If MSG_INT_INFO_INCL is included and is set to ‘1’, the mobile station shall include this field and set it as follows; otherwise, the mobile station shall omit this field.

The mobile station shall set this field to ‘0’ if any of the following is true:

- If SIG_ENCRYPT_SUP is included and the ECMEA or REA subfield in SIG_ENCRYPT_SUP is set to ‘1’
- RESTORE KEYS is equal to ‘1’.

In all other cases, the mobile station shall set this field to ‘1’.

NEW_SSEQ_H - The 24-bit value used to initialize the 24 MSB of the crypto-sync.

If NEW_SSEQ_H_INCL is included and is set to ‘1’, the mobile station shall include this field and set this field as follows; otherwise, the mobile station shall omit this field.

The mobile station shall set this field to a 24-bit value that will be used as the initial value of the 24 MSB of the crypto-sync for both forward and reverse link message integrity.
NEW_SSEQ_H_SIG - The signature of NEW_SSEQ_H

If NEW_SSEQ_H_INCL is included and is set to ‘1’, the mobile station shall include this field and set this field as follows; otherwise, the mobile station shall omit this field.

The mobile station shall set this field to the digital signature of the NEW_SSEQ_H computed as described in 2.3.12.4.5.

FOR_PDCH_SUPPORTED - Forward Packet Data Channel supported indicator.

If P_REV_IN_USEs is less than nine, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.

If the mobile station supports the Forward Packet Data Channel, then the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

FOR_PDCH Capability

Type-specific fields - Forward Packet Data Channel capability information.

If the FOR_PDCH_SUPPORTED field is included and is set to ‘1’, the mobile station shall include this field and set it as defined in 2.7.4.27.5; otherwise, the mobile station shall omit this field.

EXT_CH_IND - Extended Channel Indicator.

If the CH_IND field is not included or is included but is not set to ‘00’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.

The mobile station shall set this field as shown in Table 2.7.1.3.2.4-11 to request a physical resource.

SIGN_SLOT_CYCLE_INDEX - Sign of the slot cycle index.

If P_REV_IN_USEs is less than 11, or if the SLOT_CYCLE_INDEX field is set to ‘000’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field as specified in Table 2.7.1.3.2.1-8 to the sign of the preferred slot cycle index, SLOT_CYCLE_INDEXp (see 2.6.2.1.1). The absolute value of the preferred slot cycle index, SLOT_CYCLE_INDEXp, is specified in the SLOT_CYCLE_INDEX field of this message.

BCMC_INCL - BCMC information included indicator

If the P_REV_IN_USEs is less than 11, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to ‘1’ if one or more BCMC_PROGRAM_IDs are included in the message; otherwise, the mobile station shall set this field to ‘0’.

2-792
BCMC_PREF_INCL - BCMC preference included indicator

If the BCMC_INCL field is not included or is included and is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to ‘1’ if BCMC preference information is included in this message; otherwise, the mobile station shall set this field to ‘0’.

FUNDICATED_BCMC_SUPPORTED - Fundicated BCMC capability type-specific supported indicator.

If the BCMC_INCL field is not included or is included and is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.

If the mobile station supports Fundicated BCMC channel configurations, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

FUNDICATED_BCMC Capability

Type-specific fields - FUNDICATED_BCMC capability information.

If the FUNDICATED_BCMC_SUPPORTED field is included and is set to ‘1’, the mobile station shall include this field and set it as defined in 2.7.4.27.7; otherwise, the mobile station shall omit this field.

AUTH_SIGNATURE_INCL - Authorization signature included indication.

If the BCMC_INCL field is not included or is included and is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.

The mobile station shall set this field to ‘1’ to indicate that the authorization signature is included in this message for each of the BCMC flows included in this message; otherwise, the mobile station shall set this field to ‘0’.

TIME_STAMP_SHORT_LENGTH - Length of time stamp included in this message.

If the AUTH_SIGNATURE_INCL field is not included or is included and is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to the length of the time stamp, in units of bits, included in this message.

TIME_STAMP_SHORT - Time stamp short.

If the AUTH_SIGNATURE_INCL field is not included or is included and is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:
The mobile station shall set this field to the TIME_STAMP_SHORT_LENGTH least significant bits of the time stamp parameter used to generate the Authorization signature included in this message.

**NUM_BCMC_PROGRAMS** - Number of BCMC Programs

If the BCMC_INCL field is not included or is included and is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to the number of BCMC programs included in this message minus 1.

The mobile station shall include NUM_BCMC_PROGRAMS+1 occurrences of the following variable length record:

**BCMC_PROGRAM_ID_LEN** - Length of BCMC_PROGRAM_ID field

The mobile station shall set this field to one less than the length, in bits, of the BCMC_PROGRAM_ID of this program.

**BCMC_PROGRAM_ID** - BCMC program Identifier

The length of this field shall be one more than the value of BCMC_PROGRAM_ID_LEN bits.

The mobile station shall set this field to the identifier of the BCMC program corresponding to one or more flows that the mobile station is requesting.

**BCMC_FLOW_DISCRIMINATOR_LEN** - Length of BCMC_FLOW_DISCRIMINATOR field

The mobile station shall set this field to the length, in bits, of the BCMC_FLOW_DISCRIMINATOR of this program. To request all flows associated with this BCMC_PROGRAM_ID, the mobile station may set this field to ‘000’.

**NUM_FLOW_DISCRIMINATOR** - Number of BCMC flow discriminators

The length of this field shall be determined by the value of the BCMC_FLOW_DISCRIMINATOR_LEN as follows: if BCMC_FLOW_DISCRIMINATOR_LEN is set to ‘000’, this field is omitted; otherwise, the length of this field shall be BCMC_FLOW_DISCRIMINATOR_LEN bits.

The mobile station shall set this field to the number of flow discriminators included for this program minus one.

If NUM_FLOW_DISCRIMINATOR field is included, the mobile station shall include NUM_FLOW_DISCRIMINATOR+1 occurrences of the following variable length record; otherwise, the mobile station shall include 1 occurrence of the following variable length record:
BCMC_FLOW_DISCRIMINATOR - BCMC Flow discriminator

The length of this field shall be determined by the value of the BCMC_FLOW_DISCRIMINATOR_LEN as follows:

1. If the BCMC_FLOW_DISCRIMINATOR_LEN field is not included or is included and is set to '000', this field is omitted;
2. otherwise, the length of this field shall be BCMC_FLOW_DISCRIMINATOR_LEN bits.

BCMC_FLOW_DISCRIMINATOR_LEN is set to '000' if this field is omitted.

The mobile station shall set this field to the BCMC flow discriminator requested.

The length of this field shall be determined by the value of the BCMC_FLOW_DISCRIMINATOR_LEN.

BCMC_FLOW_DISCRIMINATOR_LEN.

The mobile station shall set this field to the BCMC flow discriminator requested.

BCMC_PREF - BCMC preference indicator

The length of this field shall be BCMC_PREF as follows:

1. If the BCMC_PREF field is not included or is included and is set to '0', the mobile station shall omit this field;
2. otherwise, the mobile station shall include this field and set it as follows:
3. The mobile station shall set this field to '1' to indicate that the mobile station has higher preference for this BCMC flow than the incoming call for which this message is sent; otherwise, the mobile station shall set this field to '0'.

AUTH_SIGNATURE_IND - Authorization signature indicator

If the AUTH_SIGNATURE_IND field is not included or is included and is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall set this field to '1' to indicate that the authorization signature is included in this message for this BCMC flow; otherwise, the mobile station shall set this field to '0'.

AUTH_SIGNATURE_SAME_IND - Authorization signature same as previous BCMC flow indicator

If the AUTH_SIGNATURE_IND field is not included or is included and is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

1. The mobile station shall set this field to '1' to indicate that the authorization signature generated for this BCMC flow is the same as the one generated for the BCMC flow listed prior to this BCMC flow in this message; otherwise, the mobile station shall set this field to '0'.

BAK_ID - BAK identifier

For the first BCMC flow listed in this message, the mobile station shall set this field to '0'.

AUTH_SIGNATURE_SAME_IND - Authorization signature same as previous BCMC flow indicator

If the AUTH_SIGNATURE_IND field is not included or is included and is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

1. The mobile station shall set this field to '1' to indicate that the authorization signature generated for this BCMC flow is the same as the one generated for the BCMC flow listed prior to this BCMC flow in this message; otherwise, the mobile station shall set this field to '0'.

AUTH_SIGNATURE_IND - Authorization signature indicator

If the AUTH_SIGNATURE_IND field is not included or is included and is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

1. The mobile station shall set this field to '1' to indicate that the authorization signature is included in this message for this BCMC flow; otherwise, the mobile station shall set this field to '0'.

The mobile station shall set this field to the BCMC flow discriminator requested.
If the AUTH_SIGNATURESAME_IND field is not included or is included and is set to '1', the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to BAK identifier used to generate the Authorization signature included in this message.

**AUTH_SIGNATURE** - Authorization signature.

If the AUTH_SIGNATURESAME_IND field is not included or is included and is set to '1', the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to the Authorization signature computed for this BCMC flow as specified in 2.6.13.9.

**REV_PDCH_SUPPORTED** - Reverse Packet Data Channel supported indicator.

If P_REV_IN_USEs is less than 11 or FOR_PDCH_SUPPORTED is not included or is included and is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.

If the mobile station supports the Reverse Packet Data Channel (R-PDCH), the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

**REV_PDCH Capability Type-specific fields** - Reverse Packet Data Channel capability information.

If the REV_PDCH_SUPPORTED field is included and is set to ‘1’, the mobile station shall include this field and set it as defined in 2.7.4.27.6; otherwise, the mobile station shall omit this field.

**BAND_SUB_REP_INCL** - Band class – band subclass report included

If P_REV_IN_USEs is less than eleven, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

If CAND_BAND_INFO_REQs is equal to ‘1’ and the mobile station supports at least 1 band class and band subclass (if applicable) combination queried by the base station, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’. 
**NUM_BAND_SUBCLASS** – Number of band class - band subclass capabilities reported

If BAND_SUB_REP_INCL is set to ‘0’ or is not included, this field shall be omitted; otherwise, the mobile station shall include this field and set it as follows:

If the mobile station supports all candidate band class and band subclass (if applicable) combinations queried by the base station, the mobile station shall set this field to ‘0000’; otherwise, the mobile station shall set this field to the number of band class-band subclass capabilities reported.

If the NUM_BAND_SUBCLASS field is included in this message, the mobile station shall include NUM_BAND_SUBCLASS occurrences of the BAND_SUBCLASS_SUP field:

**BAND_SUBCLASS_SUP** – Band class-band subclass supported indicator

The mobile station shall set this field as specified in section 2.6.14.1.
2.7.1.3.2.6 Authentication Challenge Response Message

RECORD_TYPE     8
RECORD_LEN      8
Type-specific fields $8 \times \text{RECORD_LEN}$
```

QUAL_INFO_TYPE – Qualification information type.

The mobile station shall set this field to the QUAL_INFO_TYPE field in the corresponding Status Request Message.

QUAL_INFO_LEN – Qualification information length.

The mobile station shall set this field to the QUAL_INFO_LEN field in the corresponding Status Request Message.

Type-specific fields – Type-specific fields.

The mobile station shall set these fields to the qualification information in the corresponding Status Request Message.

The mobile station shall include all the records requested in the corresponding Status Request Message. The mobile station shall include one occurrence of the following fields for each information record to be included:

RECORD_TYPE – Information record type.

The mobile station shall set this field to the record type value shown in Table 2.7.4-1 corresponding to the type of this information record.

RECORD_LEN – Information record length.

The mobile station shall set this field to the number of octets included in the type-specific fields of this information record.

Type-specific fields – Type-specific fields.

The mobile station shall set these fields to the information as specified in 2.7.4 for the specific type of records. The mobile station shall only specify the information corresponding to the included qualification information.

- **UI_ENC_INCL**: User information encryption fields included.
  
The mobile station shall set this field to ‘1’ if the user information encryption related fields are included in this message; otherwise, the mobile station shall set this field to ‘0’.

- **UI_ENCRYPT_SUP**: User information encryption supported indicator.
  
  If **UI_ENC_INCL** is equal to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to indicate the supported user information encryption algorithms.

  This field consists of the subfields shown in Table 2.7.1.3.2.4-9.

  The mobile station shall set each subfield to ‘1’ if the corresponding user information encryption algorithm is supported by the mobile station; otherwise, the mobile station shall set the subfield to ‘0’.

- **SIG_ENC_INCL**: Signaling encryption fields included.
  
  The mobile station shall set the RESERVED subfield to ‘000000’.

- **NEW_SSEQ_H**

  The mobile station shall set the **NEW_SSEQ_H** field to a value between 0 and 24 inclusive.

- **NEW_SSEQ_H_SIG**

  The mobile station shall set the **NEW_SSEQ_H_SIG** field to a value between 0 and 8 inclusive.

- **MSG_INT_INFO_INCL**

  The mobile station shall set the **MSG_INT_INFO_INCL** field to ‘1’ if the message integrity information fields are included in this message; otherwise, the mobile station shall set this field to ‘0’.

- **SIG_INTEGRITY_SUP_INCL**

  If **MSG_INT_INFO_INCL** is equal to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to indicate the supported message integrity algorithms.

  This field consists of the subfields shown in Table 2.7.1.3.2.4-9.

  The mobile station shall set each subfield to ‘1’ if the corresponding message integrity algorithm is supported by the mobile station; otherwise, the mobile station shall set the subfield to ‘0’.

  The mobile station shall set the RESERVED subfield to ‘000000’. 
The mobile station shall set this field to ‘1’ if the following two fields related to signaling encryption fields are included in this message; otherwise, the mobile station shall set this field to ‘0’.

SIG_ENCRYPT_SUP – Signaling encryption supported indicator.

If SIG_ENC_INCL is equal to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to indicate the supported signaling encryption algorithms supported by the mobile station.

This field consists of the subfields shown in Table 2.7.1.3.2.1.

If this field is included, the mobile station shall set the subfields as follows:

The mobile station shall set the CMEA subfield to ‘1’.

The mobile station shall set each other subfield to ‘1’ if the corresponding signaling encryption algorithm is supported by the mobile station; otherwise, the mobile station shall set the subfield to ‘0’.

The mobile station shall set the RESERVED subfield to ‘00000’.

C_SIG_ENCRYPT_REQ – Common channel signaling encryption request indicator.

If SIG_ENC_INCL is equal to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to ‘1’ to request signaling encryption to be turned on for signaling messages sent on f-csch and r-csch, and to ‘0’ to request signaling encryption to be turned off for signaling messages sent on f-csch and r-csch.

NEW_SSEQ_H_INCL – The NEW_SSEQ included indicator.

The mobile station shall set this field to ‘1’ if NEW_SSEQ_H is included in this message; otherwise, the mobile station shall set this field to ‘0’.

If MSG_INTEGRITY_SUP is equal to ‘0’, the mobile station shall set this field to ‘1’ if the mobile station is to include the NEW_SSEQ_H and NEW_SSEQ_H_SIG fields.

If MSG_INTEGRITY_SUP is equal to ‘1’, the mobile station shall set this field to ‘0’.

NEW_SSEQ_H – The 24-bit value used to initialize the 24 MSB of crypto-sync.

If NEW_SSEQ_H_INCL is set to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to a 24-bit value that will be used as the initial value of the 24 MSB of the crypto-sync for both forward and reverse link message encryption and integrity.
NEW_SSEQ_H_SIG – The signature of NEW_SSEQ_H

If NEW_SSEQ_H is included, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to the digital signature of the NEW_SSEQ_H computed as described in 2.3.12.4.5.

MSG_INT_INFO_INCL – Signaling message integrity information included indicator.

If MSG_INTEGRITY_SUP is equal to ‘0’, the mobile station shall set this field to ‘0’; otherwise, the mobile station shall set this field to ‘1’.

SIG_INTEGRITY_SUP_INCL – Signaling message integrity information included indicator.

If MSG_INT_INFO_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

If the mobile station supports other integrity algorithm(s) in addition to the default integrity algorithm, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

SIG_INTEGRITY_SUP – Signaling integrity algorithm supported by the mobile station.

If SIG_INTEGRITY_SUP_INCL is included and is set to ‘1’, the mobile station shall set this field as follows; otherwise, the mobile station shall omit this field.

The mobile station shall set this field to indicate the supported message integrity algorithm in addition to the default integrity algorithm.

This field consists of the subfields shown in Table 2.7.1.3.2.1-6.

The mobile station shall set each subfield to ‘1’ if the corresponding message integrity algorithm is supported by the mobile station; otherwise, the mobile station shall set the subfield to ‘0’.

The mobile station shall set the RESERVED subfield to ‘00000000’.

SIG_INTEGRITY_REQ – Signaling message integrity algorithm requested by the mobile station.

If SIG_INTEGRITY_SUP_INCL is included and is set to ‘1’, the mobile station shall set this field as follows; otherwise, the mobile station shall omit this field.

The mobile station shall include this field and set it to the value corresponding to the message integrity algorithm requested as shown in Table 2.7.1.3.2.1-7.
### 2.7.1.3.2.13 Authentication Response Message

**MSG_TAG:** AURSPM

<table>
<thead>
<tr>

<tr>
<td>NEW_KEY_ID</td>
<td>2</td>
</tr>
<tr>
<td>NEW_SSEQ_H</td>
<td>24</td>
</tr>
</tbody>
</table>

**RES** – The output, RES, of the User Authentication Function.

The mobile station shall set this field to the output, RES, of the function as specified in Figure 2.3.12.5.2-2. If the UIM returns a RES value with length smaller than 128, the mobile station shall store the RES value in the most significant bits of the RES field and pad the least significant bits with ‘0’s.

**SIG_INTEGRITY_SUP_INCL** – Signaling message integrity information included indicator.

If the mobile station supports other integrity algorithm(s) in addition to the default integrity algorithm, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.
SIG_INTEGRITY_SUP – Signaling integrity algorithm supported indicator. If SIG_INTEGRITY_SUP_INCL is set to ‘1’, the mobile station shall set this field as follows; otherwise, the mobile station shall omit this field.

The mobile station shall set this field to indicate the supported message integrity algorithms in addition to the default integrity algorithm. This field consists of the subfields shown in Table 2.7.1.3.2.1-6.

The mobile station shall set each subfield to ‘1’ if the corresponding message integrity algorithm is supported by the mobile station; otherwise, the mobile station shall set the subfield to ‘0’.

The mobile station shall set the RESERVED subfield to ‘00000000’.

SIG_INTEGRITY_REQ – Signaling message integrity algorithm requested by the mobile station. If SIG_INTEGRITY_SUP_INCL is set to ‘1’, the mobile station shall set this field as follows; otherwise, the mobile station shall omit this field.

The mobile station shall include this field and set it to the value corresponding to the message integrity algorithm requested as shown in Table 2.7.1.3.2.1-7.

NEW_KEY_ID – New key identifier.

The mobile station shall set this field as follows:
- If LAST_3G_KEY_ID equals ‘10’, the mobile station shall set this field to ‘11’.
- If LAST_3G_KEY_ID equals ‘11’, the mobile station shall set this field to ‘10’.

NEW_SSEQ_H – The 24-bit value used to initialize the 24 MSB of the crypto-sync.

The mobile station shall set this field to a 24-bit value that will be used as the initial value of the 24 MSB of the crypto-sync for both forward and reverse link message integrity.
2.7.1.3.2.14 Authentication Resynchronization Message

<tr>
<td>MAC_S</td>
<td>64</td>
</tr>
</tbody>
</table>

- **CON_MS_SQN** – The concealed sequence number of the authentication vector. The mobile station shall set this field to the output, \( \text{CON_MS_SQN} \), of the function as specified in Figure 2.3.12.5.2-3.

- **MAC_S** – Message authentication code for resynchronization. The mobile station shall set this field to the output, \( \text{MAC_S} \), of the function as specified in Figure 2.3.12.5.2-3.
2.7.1.3.2.15 Reconnect Message

<tr>
<td>NUM_FIELDS</td>
<td>0 or 8</td>
</tr>
</tbody>
</table>

NUM_FIELDS occurrences of the following field:

\{ (NUM_FIELDS) \\
CHAR_8 \}

} (NUM_FIELDS)

ORIG_IND – Origination indicator

If this message is being sent in place of an Origination Message, the mobile station shall set this field to ‘1’; if this message is being sent in place of a Page Response Message, the mobile station shall set this field to ‘0’.

SYNC_ID_INCL – Service Configuration synchronization identifier included indicator.

The mobile station shall set this field to ‘1’ if the SYNC_ID field is included in this message; otherwise, the mobile station shall set this field to ‘0’.

If SYNC_ID_SUPPORTEDs is equal to ‘0’, the mobile station shall set this field to ‘0’.
SYNC_ID_LEN – Service Configuration synchronization identifier length indicator.

If the SYNC_ID_INCL field is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to the length of the SYNC_ID field included in this message.

SYNC_ID – Service Configuration synchronization identifier.

If the SYNC_ID_INCL field is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to the Service Configuration synchronization identifier corresponding to the stored service configuration.

SERVICE_OPTION – Service option number.

If the SYNC_ID_INCL field is set to ‘1’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

If the ORIG_IND field is set to ‘1’, the mobile station shall set this field to the service option number corresponding to the service being reconnected.

If the ORIG_IND field is set to ‘0’, the mobile station shall set this field as follows:

- If the mobile station accepts the service option specified by the mobile-station-addressed page, it shall set this field as follows:

  • If the mobile station accepts the service option specified by the mobile-station-addressed page, if the page record to which the mobile station is responding contained a SERVICE OPTION field, the mobile station shall set this field to the service option number specified in the SERVICE OPTION field of the page record to which the mobile station is responding.

  • If the page record to which the mobile station is responding did not contain a SERVICE OPTION field, the mobile station shall set this field to the default option number ‘0000000000000001’.

- If the mobile station does not accept the service option specified by the mobile-station-addressed page to which the mobile station is responding and the mobile station has an alternative service option to request, the mobile station shall set this field to the service option code
If the mobile station does not accept the service option specified by the mobile-station-addressed page to which the mobile station is responding and the mobile station does not have an alternative service option to request, the mobile station shall set this field to ‘0000000000000000’ to reject the service option specified by the page record of the General Page Message or Universal Page Message to which the mobile station is responding.
SR_ID – Service reference identifier.

If the ORIG_IND field is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.

If the SYNC_ID_INCL field is set to ‘0’, the mobile station shall set this field as follows:

- If the service instance provides a service reference identifier, the mobile station shall set this field to the service reference identifier specified by the service instance. If the service instance does not provide a service reference identifier, the mobile station shall set this field to the smallest unused service reference identifier value between 1 and 6 (inclusive).

Otherwise, the mobile station shall set this field as follows:

- If the mobile station requests the restoration of a single service option connection from the stored service configuration, the mobile station shall set this field to the corresponding service reference identifier.
- If the mobile station requests the restoration of more than one but not all service option connections from the stored service configuration, the mobile station shall set this field to the service reference identifier corresponding to one of the service option connections to be restored.
- Otherwise (that is, the mobile station requests the restoration of all the service option connections from the stored service configuration), the mobile station shall set this field to ‘111’.

ADD_SERV_INSTANCE_INCL – Additional service instances included indicator.

If the ORIG_IND field is set to ‘0’ or P_REV_IN_USE $s$ is less than 11 or if SYNC_ID_INCL is set to ‘0’ or if SR_ID is included and set to ‘111’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:
If at least one occurrence of the ADD_SR_ID field is included in this message, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

NUM_ADD_SERV_INSTANCE - Number of additional service instances included.

If ADD_SERV_INSTANCE_INCL is not included or is included and set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it to the number of additional service instances included in this message.

If ADD_SERV_INSTANCE_INCL is included and set to ‘1’, the mobile station shall include NUM_ADD_SERV_INSTANCE occurrences of the following record:

  ADD_SR_ID – Additional service reference identifier.
  The mobile station shall set this field to the service reference identifier corresponding to the service option connection that the mobile station requests to be restored from the stored service configuration.

  SDB_INCL – Short Data Burst included indicator.
  If P_REV_IN_USEs is less than eleven, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:
  If a Short Data Burst (i.e., data burst message with burst type equal to ‘000110’, see [30]) is being included in this message, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.
  The mobile station shall set this field to ‘0’ if SDB_IN_RCNM_INDs or SDB_SUPPORTEDs is equal to ‘0’.

  NUM_FIELDS – Number of characters in this message.
  If SDB_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:
  The mobile station shall set this field to the number of CHARi fields included in this message.

  If SDB_INCL is included and set to ‘1’, the mobile station shall include NUM_FIELDS occurrences of the following record:

    CHARi – Character.
    The mobile station shall set these fields to the corresponding octet of the data burst stream.
2.7.1.3.2.16 Radio Environment Message

MSG_TAG: REM

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>MODE_DISABLED</td>
<td>1</td>
</tr>
<tr>
<td>TKZ_MODE_IND</td>
<td>1</td>
</tr>
</tbody>
</table>

**MODE_DISABLED** - Mode disabled indicator.

The mobile station shall set this field to ‘1’ if any of the following conditions is true:

- RER_COUNT is equal to (RER_MAX_NUM_MSG_S – 1) and the TKZ_MODE_IND field in this message is set to ‘0’, or
- TKZ_COUNT is equal to (TKZ_MAX_NUM_MSG_S – 1) and the TKZ_MODE_IND field in this message is set to ‘1’.

Otherwise, the mobile station shall set this field to ‘0’.

**TKZ_MODE_IND** - Tracking zone mode indicator.

The mobile station shall set this field to ‘1’ if the *Radio Environment Message* is sent for tracking zone mode; otherwise, the mobile station shall set this field to ‘0’.
During Traffic Channel operation, the mobile station sends signaling messages to the base station using the r-dsch.

ORDER – Order code.

The mobile station shall set this field to the ORDER code.

See 2.7.3.

ADD_RECORD_LEN – Additional record length.

The mobile station shall set this field to the number of octets in the order-specific fields included in this message.

Order-specific fields – Order-specific fields.

The mobile station shall include order-specific fields as specified in 2.7.3.

CON_REF_INCL – Connection reference included indicator.

If the order carried by this message is not a Call Control order (2.6.10), the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to ‘1’ if the connection reference field is included in this message; otherwise, it shall set this field to ‘0’.

CON_REF – Connection reference.

If the CON_REF_INCL field is not included, or is included but is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and shall set it to the value of the connection reference assigned to the service option connection of the call, to which this message corresponds.
2.7.2.3.2.2 Authentication Challenge Response Message

MSG_TAG: AUCRM

<table>
<thead>
<tr>
<th>Field</th>

</tbody>
</table>

The mobile station shall include one occurrence of the following record for each information record to be included:

RECORD_TYPE – Information record type.

The mobile station shall set this field to the record type code shown in Table 2.7.4-1 corresponding to the type of this information record.

RECORD_LEN – Information record length.

The mobile station shall set this field to the number of octets in the type-specific fields of this record.

Type-specific fields – Type-specific fields.

The mobile station shall set these fields as specified in 2.7.4 for this type of information record.
2.7.2.3.2.4 Data Burst Message

MSG_TAG: DBM

<table>
<thead>
<tr>

<table>
<thead>
<tr>
<th>{ (NUM_FIELDS)</th>
<th>CHARi</th>
<th>8</th>
</tr>
</thead>
</table>

| } (NUM_FIELDS) |

MSG_NUMBER – Message number within the data burst stream.

The mobile station shall set this field to the number of this message within the data burst stream.

BURST_TYPE – Data burst type.

The mobile station shall set the value of this field for the type of this data burst as defined in [30]. If the mobile station sets this field equal to ‘111110’, it shall set the first two CHARi fields of this message equal to EXTENDED_BURST_TYPE_INTERNATIONAL as described in the definition of CHARi below. If the mobile station sets this field equal to ‘111111’, it shall set the first two CHARi fields of this message equal to the EXTENDED BURST_TYPE as described in the definition of CHARi below.

NUM_MSGS – Number of messages in the data burst stream.

The mobile station shall set this field to the number of messages within this data burst stream.

NUM_FIELDS – Number of characters in this message.

The mobile station shall set this field to the number of CHARi fields included in this message.

CHARi – Character.

The mobile station shall include NUM_FIELDS occurrences of this field. The mobile station shall set these fields to the corresponding octet of the data burst stream.
If the BURST_TYPE field of this message is equal to ‘111110’, the first two CHARi octets shall represent a 16 bit EXTENDED_BURST_TYPE_INTERNATIONAL field, which is encoded as shown below. The first ten bits of this field contain a binary mapping of the Mobile Country Code (MCC) associated with the national standards organization administering the use of the remaining octets of the message. Encoding of the MCC shall be as specified in 2.3.1.3. The remaining six bits of the EXTENDED_BURST_TYPE_INTERNATIONAL field shall specify the COUNTRY_BURST_TYPE. The mobile station shall set the value of the COUNTRY_BURST_TYPE according to the type of this data burst as defined in standards governed by the country where this data burst type is to be used.

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mobile Country Code</td>
<td>10</td>

<tr>
<td>COUNTRY_BURST_TYPE</td>
<td>6</td>
</tr>
<tr>
<td>Remaining CHARi fields</td>
<td>$8 \times (\text{NUM}_\text{FIELDS} - 2)$</td>
</tr>
</tbody>
</table>

If the BURST_TYPE field of this message is equal to ‘111111’, the first two CHARi octets shall represent a single, 16 bit, EXTENDED BURST TYPE field, as shown below. The mobile station shall set the value of the EXTENDED BURST TYPE according to the type of this data burst as defined in [30].

<table>
<thead>
<tr>
<th>Field</th>

</thead>
<tbody>
<tr>
<td>EXTENDED_BURST_TYPE (first two CHARi fields)</td>
<td>16</td>
</tr>
<tr>
<td>Remaining CHARi fields</td>
<td>$8 \times (\text{NUM}_\text{FIELDS} - 2)$</td>
</tr>
</tbody>
</table>
2.7.2.3.2.5 Pilot Strength Measurement Message

MSG_TAG: PSMM

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>REF_PN</td>
<td>9</td>
</tr>
<tr>
<td>PILOT_STRENGTH</td>
<td>6</td>
</tr>
<tr>
<td>KEEP</td>
<td>1</td>
</tr>
</tbody>
</table>

Zero or more occurrences of the following record:

```
{
  PILOT_PN_PHASE  15
  PILOT_STRENGTH  6
  KEEP            1
}
```

1. **REF_PN** – Time reference PN sequence offset.
   - The mobile station shall set this field to the PN sequence offset of the pilot used by the mobile station to derive its time reference, relative to the zero offset pilot PN sequence in units of 64 PN chips.

2. **PILOT_STRENGTH** – Pilot strength in dB.
   - The mobile station shall set this field to  
     \[ \left\lfloor -2 \times 10 \log_{10} \text{PS} \right\rfloor, \]
   - where PS is the strength of the pilot used by the mobile station to derive its time reference (see [2]), measured as specified in 2.6.6.2.2. If this value  \( \left\lfloor -2 \times 10 \log_{10} \text{PS} \right\rfloor \) is less than 0, the mobile station shall set this field to ‘000000’. If this value is greater than ‘111111’, the mobile station shall set this field to ‘111111’.

3. **KEEP** – Keep pilot indicator.
   - If the handoff drop timer (see 2.6.6.2.3) corresponding to the pilot used by the mobile station to derive its time reference (see [2]) has expired, the mobile station shall set this field to ‘0’; otherwise, the mobile station shall set this field to ‘1’.

If P_REV_IN_USE is less than or equal to three, the mobile station shall include one occurrence of the three-field record given below for each pilot in the Active Set and for each Candidate Set pilot reported (the number of Candidate Set pilots reported shall not exceed 5), other than the pilot identified by the REF_PN field. If P_REV_IN_USE is greater than
three and \( \text{SOFT}\_\text{SLOPE}_s \) is equal to ‘000000’, the mobile station shall include one occurrence of the three-field record given below for each pilot in the Active Set and for each pilot in the Candidate Set, other than the pilot identified by the REF\_PN field. If \( P\_\text{REV}\_\text{IN}\_\text{USE}_s \) is greater than three and \( \text{SOFT}\_\text{SLOPE}_s \) is not equal to ‘000000’, the mobile station shall include one occurrence of the three-field record given below for each pilot in the Active Set, for each pilot in the Candidate Set whose strength exceeds \( T\_\text{ADD} \), and shall also include one occurrence of the three-field record given below for each pilot in the Candidate Set whose strength satisfies the following inequality:

\[
10 \times \log_{10} PS > \frac{\text{SOFT}\_\text{SLOPE}_s}{8} \times 10 \times \log_{10} \sum_{i \in A} PS_i + \frac{\text{ADD}\_\text{INTERCEPT}_s}{2}
\]

where the summation is performed over all pilots currently in the Active Set. The mobile station shall not include these fields for the pilot identified by the REF\_PN field.

The mobile station shall order any occurrences of the three-field record given below which correspond to pilots in the Active Set such that they occur before any occurrences of the three-field record given below which correspond to pilots in the Candidate Set.

\[\text{PILOT}\_\text{PN}\_\text{PHASE} \quad \text{Pilot measured phase.}\]

The mobile station shall set this field to the phase of the pilot PN sequence relative to the zero offset pilot PN sequence of this pilot, in units of one PN chip, as specified in 2.6.6.2.4.

\[\text{PILOT}\_\text{STRENGTH} \quad \text{Pilot strength in dB.}\]

The mobile station shall set this field to \([-2 \times 10 \log_{10} PS]\),

where \( PS \) is the strength of this pilot, measured as specified in 2.6.6.2.2. If this value \([-2 \times 10 \log_{10} PS]\) is less than 0, the mobile station shall set this field to ‘000000’. If this value is greater than ‘111111’, the mobile station shall set this field to ‘111111’.

\[\text{KEEP} \quad \text{Keep pilot indicator.}\]

If the handoff drop timer (see 2.6.6.2.3) corresponding to this pilot has expired, the mobile station shall set this field to ‘0’; otherwise, the mobile station shall set this field to ‘1’.

<tr>
<td>SCH_PWR_MEAS_FRAMES</td>
<td>0 or 16</td>
</tr>
<tr>
<td>SCH_ERRORS_DETECTED</td>
<td>0 or 10</td>
</tr>
</tbody>
</table>

ERRORS_DETECTED – Number of detected bad frames.

When the Forward Fundamental Channel is assigned, the mobile station shall set this field to the number of bad frames detected [BAD_FRAMES, see 2.6.4.1.1] on the Forward Fundamental Channel.

If P_REV_IN_USE is greater than or equal to six and only the Forward Dedicated Control Channel is assigned, the mobile station shall set this field to the number of bad frames detected on the Forward Dedicated Control Channel [DCCH_BAD_FRAMES, see 2.6.4.1.1].

If the number of bad frames received on this channel within the measurement period is less than or equal to 31, the mobile station shall set this field to that number. If that number exceeds 31, the mobile station shall set this field to ‘11111’.
PWR_MEAS_FRAMES – Number of power measurement frames.
When the Forward Fundamental Channel is assigned, the mobile station shall set this field to the number of frames received on the Forward Fundamental Channel within the measurement period (TOT_FRAMESs, see 2.6.4.1.1).

If P_REV_IN_USEs is greater than or equal to six and only the Dedicated Control Channel is assigned, the mobile station shall set this field to the number of frames received on the Dedicated Control Channel (DCCH_TOT_FRAMESs, see 2.6.4.1.1).

LAST_HDM_SEQ – Extended Handoff Direction Message or a General Handoff Direction Message, or Universal Handoff Direction Message sequence number.
If an Extended Handoff Direction Message, a General Handoff Direction Message, or Universal Handoff Direction Message has been received during this call, the mobile station shall set this field to the value of the HDM_SEQ field from the Extended Handoff Direction Message, the General Handoff Direction Message or the Universal Handoff Direction Message that determined the current Active Set. If no Extended Handoff Direction Message, General Handoff Direction Message, or Universal Handoff Direction Message has been received during this call, the mobile station shall set this field to ‘11’.

NUM_PILOTS – Number of pilots reported.
The mobile station shall set this field to the number of pilots in the current Active Set.

PILOT_STRENGTH – Pilot strength in dB.
The mobile station shall include one occurrence of this field for each pilot in the Active Set. If the Active Set contains more than one pilot, the mobile station shall include the pilot strengths in the same order as in the Extended Channel Assignment Message, Extended Handoff Direction Message, General Handoff Direction Message or the Universal Handoff Direction Message that determined the current Active Set.
The mobile station shall set each occurrence of this field to \[-2 \times 10 \log_{10} PS\], where PS is the strength of the pilot, measured as specified in 2.6.6.2.2. If this value \(-2 \times 10 \log_{10} PS\) is less than 0, the mobile station shall set this field to ‘000000’. If this value is greater than ‘111111’, the mobile station shall set this field to ‘111111’.

DCCH_PWR_MEAS_INCL - Forward Dedicated Control Channel power measurement included.
If both Forward Fundamental Channel and Forward Dedicated Control Channel are assigned, the mobile station shall set this field equal to ‘1’; otherwise, the mobile shall set this field to ‘0’.

DCCH_PWR_MEAS_FRAMES - Number of received Dedicated Control Channel frames.

If DCCH_PWR_MEAS_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall set this field to the number of frames received on the Dedicated Control Channel within the measurement period (DCCH_TOT_FRAMES, see 2.6.4.1.1).

DCCH_ERRORS_DETECTED - Number of detected bad Dedicated Control Channel frames.

If DCCH_PWR_MEAS_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall set this field to the number of bad frames (DCCH_BAD_FRAMES) detected on the Forward Dedicated Control Channel.

If DCCH_BAD_FRAMES exceeds 31, the mobile station shall set this field to ‘11111’; otherwise, the mobile station shall set this field to DCCH_BAD_FRAMES (see 2.6.4.1.1).

SCH_PWR_MEAS_INCL - Supplemental Channel power measurement included indicator.

If FOR_SCH_FER_REP is set to ‘1’ and this message is to report the frame counts at the end of the burst on an assigned Supplemental Channel, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to

SCH_ID - Forward Supplemental Channel identifier.

If the SCH_PWR_MEAS_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile shall set this field to the Identifier of the Forward Supplemental Channel of which the frame counts are being reported in this message.

SCH_PWR_MEAS_FRAMES - Number of received Supplemental Channel frames.

If SCH_PWR_MEAS_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall set this field to the total number of frames (SCH_TOT_FRAMES) received during the burst duration on the Supplemental Channel specified by SCH_ID. If this measurement is greater than or equal to $2^{16} - 1$, the mobile station shall set this field to ‘1111111111111111’.

SCH_ERRORS_DETECTED - Number of detected bad Supplemental Channel frames.
If SCH_PWR_MEAS_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall set this field to the number of bad frame detected on the Forward Supplemental Channel of the SCH_ID for the duration of the forward burst on this channel.

If the number of bad frames (SCH_BAD_FRAMES) detected on the SCH_ID Supplemental Channel during the burst is greater than 1023, the mobile station shall set this field to ‘1111111111’.
### 2.7.2.3.2.7 Send Burst DTMF Message

</tbody>
</table>

**NUM_DIGITS** occurrences of the following field:

```
{ (NUM_DIGITS)
  DIGITi
} (NUM_DIGITS)
```

**CON_REF_INCL**

- **CON_REF**
  - 0 or 8

### NUM_DIGITS
- **Number of DTMF digits.**
  - The mobile station shall set this field to the number of DTMF digits included in this message.

### DTMF_ON_LENGTH
- **DTMF pulse width code.**
  - The mobile station shall set this field to the DTMF_ON_LENGTH value shown in Table 2.7.2.3.2.7-1 corresponding to the requested width of DTMF pulses to be generated by the base station.

#### Table 2.7.2.3.2.7-1. Recommended DTMF Pulse Width

<table>
<thead>
<tr>
<th>DTMF_ON_LENGTH Field (binary)</th>
<th>Recommended Pulse Width</th>

<tr>
<td>010</td>
<td>150 ms</td>
</tr>
<tr>
<td>011</td>
<td>200 ms</td>
</tr>
</tbody>
</table>

All other DTMF_OFF_LENGTH codes are reserved.

DIGITi – DTMF digit.

The mobile station shall include one occurrence of this field for each DTMF digit to be generated by the base station. The mobile station shall set each occurrence of this field to the code value shown in Table 2.7.1.3.2.4-4 corresponding to the dialed digit.

CON_REF_INCL – Connection reference included indicator.

The mobile station shall set this field to ‘1’ if the connection reference field is included in this message; otherwise, it shall set this field to ‘0’.

CON_REF – Connection reference.

If the CON_REF_INCL field is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and shall set it to the value of the connection reference assigned to the service option connection of the call, to which this message corresponds.
2.7.2.3.2.8 Status Message

MSG_TAG: STM

<table>
<thead>

\]

Zero or more occurrences of the following record:

\[
\text{RECORD TYPE} \quad 8 \\
\text{RECORD_LEN} \quad 8 \\
\text{Type-specific fields} \quad 8 \times \text{RECORD_LEN}
\]

**DIGIT_MODE** – Digit mode indicator. The mobile station shall set this field to the DIGIT_MODE value from the *Origination Message* for which this message is a continuation.

**NUM_FIELDS** – Number of dialed digits in this message. The mobile station shall set this field to the number of dialed digits included in this message.

**CHAR** – A dialed digit or character. The mobile station shall include NUM_FIELDS occurrences of this field. The mobile station shall include occurrences of this field for all dialed digits after those sent in the *Origination Message* of which this message is a continuation. If the DIGIT_MODE field is set to ‘0’, the mobile station shall set each occurrence of this field to the code value shown in Table 2.7.1.3.2.4-4 corresponding to the dialed digit. If the DIGIT_MODE field is set to ‘1’, the mobile station shall set each occurrence of this field to the ASCII representation corresponding to the dialed digit, as specified in [9], with the most significant bit set to ‘0’.

If the MORE_RECORDS field in the last *Origination Message*, of which this message is a continuation, is set to ‘1’, the mobile station shall include one or more occurrences of the following three-field record; otherwise, the mobile station shall not include the following record.
<table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>LAST_HDM_SEQ</td>
<td>2</td>
</tr>
</tbody>
</table>

One or more occurrences of the following field:

\{

PILOT_PN 9

\}

LAST_HDM_SEQ – *Extended Handoff Direction Message, General Handoff Direction Message, or Universal Handoff Direction Message* sequence number.

The mobile station shall set this field to the value of the HDM_SEQ field from the *Extended Handoff Direction Message, General Handoff Direction Message, or the Universal Handoff Direction Message* that determined the current Active Set.

PILOT_PN – Pilot PN sequence offset.

The mobile station shall include one occurrence of this field for each pilot in the current Active Set. The mobile station shall set this field to the pilot PN sequence offset, relative to the zero offset pilot PN sequence in units of 64 PN chips, for this pilot. If the Active Set contains more than one pilot, the mobile station shall include the pilot offsets in the same order as in the *Extended Handoff Direction Message, the General Handoff Direction Message, or the Universal Handoff Direction Message* that determined the current Active Set.
2.7.2.3.2.11 Parameters Response Message

MSG_TAG: PRSM

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>

</tr>
</tbody>
</table>

The mobile station shall include one occurrence of the following three-field record for each occurrence of the PARAMETER_ID field in the Forward Traffic Channel Retrieve Parameters Message to which this message is a response. See Annex E.

PARAMETER_ID – Parameter identification.

The mobile station shall set this field to the value of the PARAMETER_ID field for this parameter from the Retrieve Parameters Message to which this message is a response.

PARAMETER_LEN – Parameter length.

The mobile station shall set this field to the length shown in Table E-1 corresponding to this PARAMETER_ID.

If the mobile station is unable to return the value of this parameter, or if the parameter identification is unknown, the mobile station shall set this field to ‘1111111111’.

PARAMETER – Parameter value.

The mobile station shall set this field equal to the value of the parameter shown in Table E-1 corresponding to the PARAMETER_ID field of the record.

If the mobile station is unable to return the value of this parameter, or if the parameter identification is unknown, the mobile station shall omit this field.
2.7.2.3.2.12 Service Request Message

MSG_TAG: SRQM

<table>
<thead>

- **CON_REF** — Service option connection reference. The mobile station shall set this field to the reference for the target service option (see 2.6.4.1.2).
- **SERVICE_OPTION** — Service option. The mobile station shall set this field to the service option in use with the service option connection.
- **RESERVED** — Reserved bits. The mobile station shall set this field to ‘0000000’.
- **CTL_REC_LEN** — Control record length. The mobile station shall set this field to the number of octets included in the type-specific fields of this service option control record.
- **Type-specific fields** — Type-specific fields. The mobile station shall set these fields as specified by the requirements for the service option.

One or more occurrences of the following record:

```
RECORD_TYPE 8
RECORD_LEN 8
Type-specific fields $8 \times \text{RECORD_LEN}
```

QUAL_INFO_TYPE – Qualification information type.

The mobile station shall set this field to the QUAL_INFO_TYPE field in the corresponding Status Request Message.

QUAL_INFO_LEN – Qualification information length.

The mobile station shall set this field to the QUAL_INFO_LEN field in the corresponding Status Request Message.

Type-specific fields – Type-specific fields.

The mobile station shall set these fields to the qualification information in the corresponding Status Request Message.

The mobile station shall include all the records requested in the corresponding Status Request Message. The mobile station shall include one occurrence of the following fields for each information record that is included:

RECORD_TYPE – Information record type.

The mobile station shall set this field to the record type value shown in Table 2.7.4-1 corresponding to the type of this information record.

RECORD_LEN – Information record length.

The mobile station shall set this field to the number of octets included in the type-specific fields of this information record.

Type-specific fields 0 or $8 \times$ RECORD_LEN
```

SIZE_OF_REQ_BLOB  – Size of the request information block of bytes (REQ_BLOB).

The mobile station shall set this field to the number of bytes in the Reverse Supplemental Code Channel or the Reverse Supplemental Channel request block of bytes (REQ_BLOB).

REQ_BLOB  – Reverse Supplemental Code Channel or Reverse Supplemental Channel request block of bytes.

The mobile station shall include information in this field containing the parameters that specify the characteristics of the Reverse Supplemental Code Channels or the Reverse Supplemental Channel request. The mobile station shall set this field in accordance with the connected Service Option.

USE_SCRM_SEQ_NUM  – Use Supplemental Channel Request Message sequence number indicator.

The mobile station shall set this field to ‘1’ if the Supplemental Channel Request Message sequence number is included in this message; otherwise, the mobile station shall set this field to ‘0’.

SCRM_SEQ_NUM  – Supplemental Channel Request Message sequence number.
If USE_SCRM_SEQ_NUM is set to '1', the mobile station shall set this field to the Supplemental Channel Request Message sequence number that the base station is to include in a Supplemental Channel Assignment Message or Extended Supplemental Channel Assignment Message which is in response to this message; otherwise, the mobile station shall omit this field.

**REF_PN** – Time reference PN sequence offset.

If SIZE_OF_REQ_BLOB is set to '0000' and USE_SCRM_SEQ_NUM is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall set this field to the PN sequence offset of the pilot used by the mobile station to derive its time reference, relative to the zero offset pilot PN sequence in units of 64 PN chips.

**PILOT_STRENGTH** – Reference pilot strength in dB.

If SIZE_OF_REQ_BLOB is set to '0000' and USE_SCRM_SEQ_NUM is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall set this field to

\[ \lceil -2 \times 10 \times \log_{10} \text{PS} \rceil, \]

where PS is the strength of the pilot used by the mobile station to derive its time reference (see [2]), measured as specified in 2.6.6.2.2. If this value \( \lceil -2 \times 10 \log_{10} \text{PS} \rceil \) is less than 0, the mobile station shall set this field to '000000'. If this value is greater than '111111', the mobile station shall set this field to '111111'.

**NUM_ACT_PN** – Number of reported pilots in the Active Set.

If SIZE_OF_REQ_BLOB is set to '0000' and USE_SCRM_SEQ_NUM is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall set this field to the number of reported pilots in the Active Set other than the pilot identified by the REF_PN field.

If SIZE_OF_REQ_BLOB is set to '0000' and USE_SCRM_SEQ_NUM is set to '0', the mobile station shall not include any occurrence of the following record; otherwise, the mobile station shall include one occurrence of the following two-field record for each pilot in the Active Set other than the pilot identified by the REF_PN field:

**ACT_PN_PHASE** – Active pilot measured phase.

The mobile station shall set this field to the phase of this pilot PN sequence relative to the zero offset pilot PN sequence, in units of one PN chip, as specified in 2.6.6.2.4.

**ACT_PILOT_STRENGTH** – Active pilot strength in dB.

The mobile station shall set this field to

\[ \lceil -2 \times 10 \times \log_{10} \text{PS} \rceil, \]
where $PS$ is the strength of this pilot, measured as specified in 2.6.6.2.2. If this value $\lfloor -2 \times 10 \log_{10} PS \rfloor$ is less than 0, the mobile station shall set this field to ‘000000’. If this value is greater than 63, the mobile station shall set this field to ‘111111’.

**NUM_NGHBR_PN** – Number of reported neighbor pilots in the Candidate Set and the Neighbor Set.

If $\text{SIZE_OF_REQ_BLOB}$ is set to ‘0000’, the mobile station shall omit this field; otherwise, the mobile station shall set this field as follows:

The mobile station shall set this field to the number of reported pilots which are not in the Active Set and have measurable strength that exceeds $(T_{ADD}s - T_{MULCHAN}s)$. $(\text{NUM_ACT_PN} + \text{NUM_NGHBR_PN})$ shall not exceed 8. If there are more than $(8 - \text{NUM_ACT_PN})$ pilots not in the Active Set with strength exceeding $(T_{ADD}s - T_{MULCHAN}s)$, the mobile station shall set $\text{NUM_NGHBR_PN}$ to $(8 - \text{NUM_ACT_PN})$ and report the $\text{NUM_NGHBR_PN}$ strongest pilots not in the Active Set.

If $\text{SIZE_OF_REQ_BLOB}$ is set to ‘0000’ and USE_SCRM_SEQ_NUM is set to ‘0’, the mobile station shall not include any occurrence of the following record; otherwise, the mobile station shall include one occurrence of the following two-field record for each of the $\text{NUM_NGHBR_PN}$ reported pilots.

**NGHBR_PN_PHASE** – Neighbor pilot measured phase.

The mobile station shall set this field to the phase of this pilot PN sequence relative to the zero offset pilot PN sequence, in units of one PN chip, as specified in 2.6.6.2.4.

**NGHBR_PILOT_STRENGTH** – Neighbor pilot strength.

The mobile station shall set this field to

$$\lfloor -2 \times 10 \times \log_{10} PS \rfloor,$$

where $PS$ is the strength of this pilot, measured as specified in 2.6.6.2.2. If this value $\lfloor -2 \times 10 \log_{10} PS \rfloor$ is less than 0, the mobile station shall set this field to ‘000000’. If this value is greater than 63, the mobile station shall set this field to ‘111111’.

**REF_PILOT_REC_INCL** – Additional pilot information included indicator.

If $\text{SIZE_OF_REQ_BLOB}$ is set to ‘0000’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to ‘1’ if additional reference pilot information listed in the $\text{REF_PILOT_REC_TYPE}$ and $\text{REF_RECORD_LEN}$ fields are included. The mobile station shall set this field to ‘0’ if the corresponding pilot is the common pilot and there is no additional pilot information included.

**REF_PILOT_REC_TYPE** – Reference pilot record type.
If REF_PILOT_REC_INCL is included and set to ‘0’, the mobile station shall omit this field. If REF_PILOT_REC_INCL is included and set to ‘1’, the mobile station shall set this field to the REF_PILOT_REC_TYPE value shown in Table 2.7.2.3.2.34-1 corresponding to the type of Pilot Record specified by this record.

REF_RECORD_LEN  – Pilot record length for the reference pilot.

If REF_PILOT_REC_INCL is included and set to ‘0’, the mobile station shall omit this field. If REF_PILOT_REC_INCL is included and set to ‘1’, the mobile station shall set this field to the number of octets in the type-specific fields of this pilot record.

Type-specific fields  – Pilot record type-specific fields for the reference pilot.

If REF_PILOT_REC_INCL is included and set to ‘0’, the mobile station shall omit this field. If REF_PILOT_REC_INCL is included and set to ‘1’, the mobile station shall include type-specific fields based on the REF_PILOT_REC_TYPE of this pilot record.

If REF_PILOT_REC_TYPE is equal to ‘000’, the mobile station shall include the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>QOF</td>
<td>2</td>
</tr>
<tr>
<td>WALSH_LENGTH</td>
<td>3</td>
</tr>
<tr>
<td>PILOT_WALSH</td>
<td>(WALSH_LENGTH + 6)</td>
</tr>
<tr>
<td>RESERVED</td>
<td>0 to 7 (as needed)</td>
</tr>
</tbody>
</table>

QOF  – Quasi-orthogonal function index.

The mobile station shall set this field to the index of the Quasi-orthogonal function of the corresponding Auxiliary Pilot.

WALSH_LENGTH  – Length of the Walsh code for the reference pilot.

The mobile station shall set this field to the WALSH_LENGTH value shown in Table 2.7.2.3.2.34-2 corresponding to the length of the Walsh code for the pilot that is used as the Auxiliary Pilot.

PILOT_WALSH  – Walsh code for the Auxiliary Pilot used by the mobile station to derive its time reference.

The mobile station shall set this field to the Walsh code corresponding to the Auxiliary Pilot.
RESERVED – Reserved bits.
The mobile station shall set all the bits of this field to ‘0’ to make the entire record octet-aligned.

If SIZE_OF_REQ_BLOB is set to ‘0000’ and USE_SCRM_SEQ_NUM is set to ‘0’, the mobile station shall not include any occurrence of the following record; otherwise, the mobile station shall include one occurrence of the following record for each pilot in the Active Set other than the pilot identified by the REF_PN field:

PILOT_REC_INCL – Additional pilot information included indicator.
The mobile station shall set this field to ‘1’ if additional pilot information listed in the PILOT_REC_TYPE and RECORD_LEN fields are included. The mobile station shall set this field to ‘0’ if the corresponding pilot is the common pilot and there is no additional pilot information included.

PILOT_REC_TYPE – Reference pilot record type.
If PILOT_REC_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall set this field to the PILOT_REC_TYPE value shown in Table 2.7.2.3.2.34-1 corresponding to the type of Pilot Record specified by this record.

RECORD_LEN – Pilot record length.
If PILOT_REC_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall set this field to the number of octets in the type-specific fields of this pilot record.

Type-specific fields – Pilot record type-specific fields.
If PILOT_REC_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include type-specific fields based on the PILOT_REC_TYPE of this pilot record as described in 3.7.6.1.

If SIZE_OF_REQ_BLOB is set to ‘0000’ and USE_SCRM_SEQ_NUM is set to ‘0’, the mobile station shall not include any occurrence of the following record; otherwise, the mobile station shall include one occurrence of the following record for each of the NUM_NGHBR_PN reported pilots.

PILOT_REC_INCL – Additional pilot information included indicator.
The mobile station shall set this field to ‘1’ if additional pilot information listed in the PILOT_REC_TYPE and RECORD_LEN fields are included. The mobile station shall set this field to ‘0’ if the corresponding pilot is the common pilot and there is no additional pilot information included.

PILOT_REC_TYPE – Reference pilot record type.
If PILOT_REC_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall set this field to the PILOT_REC_TYPE value shown in Table 2.7.2.3.2.34-1 corresponding to the type of Pilot Record specified by this record.

**RECORD_LEN** – Pilot record length.

If PILOT_REC_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall set this field to the number of octets in the type-specific fields of this pilot record.

**Type-specific fields** – Pilot record type-specific fields.

If PILOT_REC_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include type-specific fields based on the PILOT_REC_TYPE of this pilot record as described in 3.7.6.1.
2.7.2.3.2.19 Candidate Frequency Search Response Message

MSG_TAG: CFSRSM

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>

<tr>
<td>MAX_NUM_VISITS</td>
<td>0 or 5</td>
</tr>
<tr>
<td>INTER_VISIT_TIME</td>
<td>0 or 6</td>
</tr>
</tbody>
</table>

LAST_CFSRM_SEQ – Candidate Frequency Search Request Message sequence number.

The mobile station shall set this field to the value of the CFSRM_SEQ field from the Candidate Frequency Search Request Message to which this message is a response.

TOTAL_OFF_TIME_FWD – Total time that the mobile station is off the Forward Traffic Channel.

The mobile station shall set this field to the mobile station’s estimate of the total number of frames or power control groups for which the mobile station will need to suspend its current Forward Traffic Channel processing in order to tune to the Candidate Frequency, to perform the requested search, and to re-tune to the Serving Frequency. If the mobile station requires multiple visits to the Candidate Frequency to complete the requested search, the mobile station shall set this field to the total number of frames (if PCG_OFF_TIME is set to ‘0’) or power control groups (if PCG_OFF_TIME is set to ‘1’) for all visits to the Candidate Frequency in a search period.

MAX_OFF_TIME_FWD – Maximum time the mobile station is away from the Forward Traffic Channel.
The mobile station shall set this field to the mobile station’s estimate of the maximum number of frames (if PCG_OFF_TIME is set to ‘0’) or power control groups (if PCG_OFF_TIME is set to ‘1’) for which the mobile station will need to suspend its current Forward Traffic Channel processing during a visit to the Candidate Frequency, to perform a part of the requested search, and to re-tune to the Serving Frequency.

TOTAL_OFF_TIME_REV – Total time that the mobile station is away from the Reverse Traffic Channel.

The mobile station shall set this field to the mobile station’s estimate of the total number of frames or power control groups for which the mobile station will need to suspend its current Reverse Traffic Channel processing in order to tune to the Candidate Frequency, to perform the requested search, and to re-tune to the Serving Frequency. If the mobile station requires multiple visits to the Candidate Frequency to complete the requested search, the mobile station shall set this field to the total number of frames or power control groups for all visits to the Candidate Frequency in a search period.

MAX_OFF_TIME_REV – Maximum time the mobile station is away from the Reverse Traffic Channel.

The mobile station shall set this field to the mobile station’s estimate of the maximum number of frames or power control groups for which the mobile station will need to suspend its current Forward Traffic Channel processing during a visit to the Candidate Frequency, to perform a part of the requested search, and to re-tune to the Serving Frequency.

PCG_OFF_TIMES – Indicator if off times are expressed in units of power control groups.

If P_REV_IN_USE is less than six, the mobile station shall set this field to ‘0’; otherwise, the mobile station shall set this field as follows:

The mobile station shall set this field to ‘1’ if it expresses TOTAL_OFF_TIME_FWD, MAX_OFF_TIME_FWD, TOTAL_OFF_TIME_REV, and MAX_OFF_TIME_REV in units of power control groups; otherwise, the mobile station shall set this field to ‘0’ so that TOTAL_OFF_TIME_FWD, MAX_OFF_TIME_FWD, TOTAL_OFF_TIME_REV, and MAX_OFF_TIME_REV are expressed in units of frames.

ALIGN_TIMING_USED – Alignment timing used indicator.

The mobile station shall set this field to ‘1’ if it will align the times of its visits away from the Serving Frequency, as requested by the base station; otherwise, the mobile station shall set this field to ‘0’.

MAX_NUM_VISITS – Maximum number of visits per search period.
If the ALIGN_TIMING_USED field is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it to the maximum number of visits per search period minus one.

**INTER_VISIT_TIME** – Inter-visit time.

If the mobile station includes the MAX_NUM_VISITS field and sets it to a value other than 0, the mobile station shall include this field and set it as described below; otherwise, the mobile station shall omit this field.

The mobile station shall set INTER_VISIT_TIME to

\[
\min \left( 63, \left\lfloor \frac{\text{inter\_visit\_time}}{\text{search\_time\_resolution}} \right\rfloor \right)
\]

where

\[
\text{search\_time\_resolution} \text{ is equal to } 0.02 \text{ if the mobile station sets PCG\_OFF\_TIMES to ‘0’; otherwise, } \text{search\_time\_resolution} \text{ is equal to } 0.00125,
\]

and

\[
\text{inter\_visit\_time} \text{ is the mobile station’s estimate of the time, in seconds, between the beginning of consecutive visits away from the Serving Frequency.}
\]
2.7.2.3.2.20 Candidate Frequency Search Report Message

MSG_TAG: CFSRPM

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>LAST_SRCH_MSG</td>
<td>1</td>
</tr>
<tr>

</tr>
<tr>
<td>MODE_SPECIFIC_LEN</td>
<td>8</td>
</tr>
<tr>
<td>Mode-specific fields</td>
<td>8 × MODE_SPECIFIC_LEN</td>
</tr>
</tbody>
</table>

- LAST_SRCH_MSG – Indicator for the type of message that started the search being reported. If this message is being sent to report the results of a single search or a periodic search started by a Candidate Frequency Search Control Message or by a Candidate Frequency Search Request Message, the mobile station shall set this field to ‘0’; otherwise, the mobile station shall set this field to ‘1’.

- LAST_SRCH_MSG_SEQ – Sequence number received in the message that started the search being reported. If this message is being sent in response to a Candidate Frequency Search Control Message, the mobile station shall set this field to the value of the CFSCM_SEQ field from the Candidate Frequency Search Control Message. If this message is being sent in response to a Candidate Frequency Search Request Message, the mobile station shall set this field to the value of the CFSRM_SEQ field from the Candidate Frequency Search Request Message. If this message is being sent in response to a General Handoff Direction Message or a Universal Handoff Direction Message, the mobile station shall set this field to the value of the HDM_SEQ field from the General Handoff Direction Message or the Universal Handoff Direction Message.

- SEARCH_MODE – Search mode. The mobile station shall set this field to the SEARCH_MODE value shown in Table 3.7.3.3.2.27-2 corresponding to the type of search specified by the Candidate Frequency Search Request Message that specified the search parameters.

- MODE_SPECIFIC_LEN – Length of mode-specific fields included in this message.

- Mode-specific fields – Search mode-specific fields.
The mobile station shall include mode-specific fields based on the SEARCH_MODE of this message.

If SEARCH_MODE is equal to ‘0000’, the mobile station shall include the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAND_CLASS</td>
<td>5</td>
</tr>
<tr>
<td>CDMA_FREQ</td>
<td>11</td>
</tr>
<tr>
<td>SF_TOTAL_RX_PWR</td>
<td>5</td>
</tr>
<tr>
<td>CF_TOTAL_RX_PWR</td>
<td>5</td>
</tr>
<tr>
<td>NUM_PILOTS</td>
<td>6</td>
</tr>
</tbody>
</table>

NUM_PILOTS occurrences of the following record:

/* (NUM_PILOTS)
 * PILOT_PN_PHASE          15
 * PILOT_STRENGTH          6
 * RESERVED_1              3
 */

/* (NUM_PILOTS)
 * PILOT_REC_INCL          1
 * PILOT_REC_TYPE          0 or 3
 * RECORD_LEN              0 or 3
 * Type-specific fields    0 or 8 × RECORD_LEN
 */

BAND_CLASS - Band class.

If this message is being sent to report an unsuccessful hard handoff attempt, the mobile station shall set this field to the CDMA band class corresponding to the CDMA Frequency Assignment for the Target Frequency, as specified in [30]. If this message is being sent to report measurements on a Candidate Frequency, the mobile station shall set this field to the CDMA band class corresponding to the CDMA Frequency Assignment for the Candidate Frequency, as specified in [30].

CDMA_FREQ - Frequency assignment.
If this message is being sent to report an unsuccessful hard handoff attempt, the mobile station shall set this field to the CDMA Channel number, in the specified CDMA band class, corresponding to the CDMA Frequency Assignment for the Target Frequency, as specified in [2]. If this message is being sent to report measurements on a Candidate Frequency, the mobile station shall set this field to the CDMA Channel number, in the specified CDMA band class, corresponding to the CDMA Frequency Assignment for the Candidate Frequency, as specified in [2].

**SF_TOTAL_RX_PWR** – Total received power on the Serving Frequency.

The mobile station shall set this field to

\[
\min (31, \lceil (10 \times \log_{10}(total_{received\_power}) + 110) / 2 \rceil)
\]

where \(total_{received\_power}\) is the mean input power received by the mobile station on the Serving Frequency, in mW/1.23 MHz.

**CF_TOTAL_RX_PWR** – Indicates the total received power on the Target Frequency or the Candidate Frequency.

If this message is being sent to report an unsuccessful hard handoff attempt, the mobile station shall include the total received power on the Target Frequency; if this message is being sent to report measurements on a Candidate Frequency, the mobile station shall include the total received power on the Candidate Frequency.

The mobile station shall set this field to

\[
\min (31, \lceil (10 \times \log_{10}(total_{received\_power}) + 110) / 2 \rceil)
\]

where \(total_{received\_power}\) is the mean input power received by the mobile station on the Target Frequency or the Candidate Frequency, in mW/1.23 MHz.

**NUM_PILOTS** – Number of pilots.

The mobile station shall set this field to the number of pilots included in this message. The mobile station shall set this field to a value from 0 to \(N_{8m}\), inclusive.

The mobile station shall include NUM_PILOTS occurrences of the following three-field record:

**PILOT_PN_PHASE** – Pilot measured phase.

The mobile station shall set this field to the phase of the pilot PN sequence relative to the zero offset pilot PN sequence of this pilot, in units of one PN chip, as specified in 2.6.6.2.4.

**PILOT_STRENGTH** – Pilot strength in dB.

The mobile station shall set this field to

\[
\lfloor - 2 \times 10 \times \log_{10} PS \rfloor
\]
where PS is the strength of this pilot, measured as specified in 2.6.6.2.2. If this value \((-2 \times 10 \log_{10} PS)\) is less than 0, the mobile station shall set this field to ‘000000’. If this value is greater than 63, the mobile station shall set this field to ‘111111’.

RESERVED_1 – Reserved bits.

The mobile station shall set this field to ‘000’.

The mobile station shall include NUM_PILOTS occurrences of the following record in the same order as the pilots listed above.

PILOT_REC_INCL – Additional pilot information included indicator.

The mobile station shall set this field to ‘1’ if additional pilot information listed in the PILOT_REC_TYPE and RECORD_LEN fields are included. The mobile station shall set this field to ‘0’ if the corresponding pilot is the common pilot and there is no additional pilot information included.

PILOT_REC_TYPE – Reference Pilot record type

If PILOT_REC_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall set this field to the PILOT_REC_TYPE value shown in Table 2.7.2.3.2.34-1 corresponding to the type of Pilot Record specified by this record.

RECORD_LEN – Pilot record length.

If PILOT_REC_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall set this field to the number of octets in the type-specific fields of this pilot record.

Type-specific fields – Pilot record type-specific fields.

If PILOT_REC_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include type-specific fields based on the PILOT_REC_TYPE of this pilot record as described in 3.7.6.1.

If SEARCH_MODE is equal to ‘0001’, the mobile station shall include the following fields:
<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAND_CLASS</td>
<td>5</td>
</tr>
<tr>
<td>SF_TOTAL_RX_PWR</td>
<td>5</td>
</tr>
<tr>
<td>NUM_ANALOG_FREQS</td>
<td>3</td>
</tr>
<tr>
<td>RESERVED_2</td>
<td>5</td>
</tr>
</tbody>
</table>

NUM_ANALOG_FREQS occurrences of the following record:

\[
\{ \text{NUM_ANALOG_FREQS} \\
\begin{align*}
\text{ANALOG_FREQ} & & 11 \\
\text{SIGNAL_STRENGTH} & & 6
\end{align*}
\} \text{NUM_ANALOG_FREQS}
\]

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RESERVED_3</td>
<td>0 - 7 (as needed)</td>
</tr>
</tbody>
</table>

1. BAND_CLASS – Band class. The mobile station shall set this field to the CDMA band class corresponding to the analog frequencies that are being reported in this message, as specified in [30].

2. SF_TOTAL_RX_PWR – Indicates the total received power on the Serving Frequency. The mobile station shall set this field to

\[
\min(31, \lceil (10 \times \log_{10}(\text{total\_received\_power}) + 110) / 2 \rceil)
\]

where \(\text{total\_received\_power}\) is the mean input power received by the mobile station on the Serving Frequency, in mW/1.23 MHz.

3. NUM_ANALOG_FREQS – Number of analog frequencies. The mobile station shall set this field to the number of analog frequencies included in this message.

4. RESERVED_2 – Reserved bits. The mobile station shall set this field to ‘00000’.

The message will include NUM_ANALOG_FREQS occurrences of the following two-field record, one for each neighbor on the candidate frequency.

5. ANALOG_FREQ – Analog frequency channel number. The mobile station shall set this field analog frequency channel number to search.

6. SIGNAL_STRENGTH – Signal strength. The mobile station shall set this field to

\[
\lfloor -0.5 \times SS \rfloor
\]
where SS is the strength of this signal, measured in dBm as specified in 2.6.6.2.10.3. If this value \((-0.5 \times SS)\) is less than 0, the mobile station shall set this field to ‘000000’. If this value is greater than 63, the mobile station shall set this field to ‘111111’.

**RESERVED_3** – The mobile station shall add reserved bits as needed in order to make the length of the entire record equal to an integer number of octets. The mobile station shall set each of these bits to ‘0’.
### 2.7.2.3.2.21 Periodic Pilot Strength Measurement Message

NUM_PILOT occurrences of the following record:

```
{ (NUM_PILOT)
  PILOT_PN_PHASE       15
  PILOT_STRENGTH       6
  KEEP                 1
}
```

NUM_PILOT occurrences of the following record:

```
{ (NUM_PILOT)
  PILOT_REC_INCL       1
  PILOT_REC_TYPE       0 or 3
  RECORD_LEN           0 or 3
  Type-specific fields 0 or 8 × RECORD_LEN
}
```

NUM_SUP occurrences of the following fields:

```
{ (NUM_SUP)
  SCH_ID               1
  FPC_SCH_CURR_SETPT   8
}
```

**REF_PN** - Time reference PN sequence offset.
The mobile station shall set this field to the PN sequence offset of the pilot used by the mobile station to derive its time reference, relative to the zero offset pilot PN sequence in units of 64 PN chips.

**PILOT_STRENGTH** - Pilot strength in dB.

The mobile station shall set this field to

\[ -2 \times 10 \times \log_{10}PS \, \text{dB}, \]

where \( PS \) is the strength of the pilot used by the mobile station to derive its time reference (see [2]), measured as specified in 2.6.6.2.2. If this value is less than 0, the mobile station shall set this field to ‘000000’. If this value is greater than ‘111111’, the mobile station shall set this field to ‘111111’.

**KEEP** - Keep pilot indicator.

If the handoff drop timer (see 2.6.6.2.3) corresponding to the pilot used by the mobile station to derive its time reference (see [2]) has expired, the mobile station shall set this field to ‘0’; otherwise, the mobile station shall set this field to ‘1’.

**SF_RX_PWR** - The received power spectral density of the Serving Frequency.

The mobile station shall set this field to

\[ \min (31, \lceil (10 \times \log_{10}(spec\_density) + 120) / 2 \rceil) \]

where \( spec\_density \) is the mobile station received power spectral density of the Serving Frequency, in mW/1.23MHz. If this value is less than 0, the mobile station shall set this field to ‘000000’.

**NUM_PILOT** - Number of Pilots.

The mobile station shall set this field to the number of other reported pilots of the Active Set and the Candidate Set.

The mobile station shall include **NUM_PILOT** occurrences of the following three-field record, one for each pilot in the Active Set and one for each pilot in the Candidate Set, other than the pilot identified by the **REF_PN** field.

**PILOT_PN_PHASE** - Pilot measured phase.

The mobile station shall set this field to the phase of the pilot PN sequence relative to the zero offset pilot PN sequence of this pilot, in units of one PN chip, as specified in 2.6.6.2.4.

**PILOT_STRENGTH** - Pilot strength in dB.

The mobile station shall set this field to

\[ -2 \times 10 \times \log_{10}PS \, \text{dB}, \]

where \( PS \) is the strength of this pilot, measured as specified in 2.6.6.2.2. If this value is less than 0, the mobile station shall set this field to ‘000000’. If this value is greater than ‘111111’, the mobile station shall set this field to ‘111111’.
KEEP - Keep pilot indicator.

If the handoff drop timer (see 2.6.6.2.3) corresponding to this pilot has expired, the mobile station shall set this field to ‘0’; otherwise, the mobile station shall set this field to ‘1’.

The mobile station shall include NUM_PILOTS occurrences of the following record in the same order as the pilots listed above.

PILOT_REC_INCL - Additional pilot information included indicator.

The mobile station shall set this field to ‘1’ if additional pilot information listed in the PILOT_REC_TYPE and RECORD_LEN fields are included. The mobile station shall set this field to ‘0’ if the corresponding pilot is the common pilot and there is no additional pilot information included.

PILOT_REC_TYPE - Reference Pilot record type

If PILOT_REC_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall set this field to the PILOT_REC_TYPE value shown in Table 2.7.2.3.2.34-1 corresponding to the type of Pilot Record specified by this record.

RECORD_LEN - Pilot record length.

If PILOT_REC_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall set this field to the number of octets in the type-specific fields of this pilot record.

Type-specific fields - Pilot record type-specific fields.

If PILOT_REC_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include type-specific fields based on the PILOT_REC_TYPE of this pilot record as described in 2.7.2.3.2.34.

SETPT_INCL - Setpoint information included indicator.

The mobile station shall set this field to ‘1’ if setpoint information is included in this message; otherwise, the mobile station shall set this field to ‘0’.

FCH_INCL - Fundamental Channel included indicator.

If SETPT_INCL is equal to ‘1’, the mobile station shall include this field and set it as follows; otherwise, the mobile station shall omit this field.

If P_REV_IN_USE is less than nine, the mobile station shall do the following:

- The mobile station shall set this field to ‘1’ if FPC_PRI_CHAN is equal to ‘0’; otherwise, the mobile station shall set this field to ‘0’.

If P_REV_IN_USE is greater than or equal to nine, the mobile station shall do the following:

2-865
The mobile station shall set this field to ‘1’ if a Fundamental Channel is assigned; otherwise, the mobile station shall set this field to ‘0’.

FPC_FCH_CURR_SETPT - The outer loop $E_b/N_t$ setpoint of the Fundamental Channel.

If SETPT_INCL is equal to ‘1’ and if FCH_INCL is set to ‘1’, the mobile station shall set this field to the value of the $E_b/N_t$ setpoint, in units of 0.125 dB, currently in use in the Fundamental Channel power control outer loop estimation; otherwise, the mobile station shall omit this field.

DCCH_INCL - Dedicated Control Channel included indicator.

If SETPT_INCL is equal to ‘1’, the mobile station shall include this field and set it as follows; otherwise, the mobile station shall omit this field.

If P_REV_IN_USE is less than nine, the mobile station shall do the following:

The mobile station shall set this field to ‘1’ if FPC_PRI_CHAN is equal to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

If P_REV_IN_USE is greater than or equal to nine, the mobile station shall do the following:

The mobile station shall set this field to ‘1’ if a Dedicated Control Channel is assigned; otherwise, the mobile station shall set this field to ‘0’.

FPC_DCCH_CURR_SETPT - The outer loop $E_b/N_t$ setpoint of the Forward Dedicated Channel.

If SETPT_INCL is equal to ‘1’, and if DCCH_INCL is set to ‘1’, the mobile station shall set this field to the value of the $E_b/N_t$ setpoint, in units of 0.125 dB, currently in use in the Dedicated Channel power control outer loop estimation; otherwise, the mobile station shall omit this field.

NUM_SUP - The number of Supplemental Channels.

If SETPT_INCL is equal to ‘1’, the mobile station shall include this field and set it as follows; otherwise, the mobile station shall omit this field.

The mobile station shall set this field to the total number of the Supplemental Channels reported by this message.

The mobile station shall include NUM_SUP occurrences of the following two fields:

SCH_ID - The Supplemental Channel index.

The mobile station shall set this field to the Supplemental Channel index to indicate the Forward Supplemental Channel that is to be reported.
FPC_SCH_CURR_SETPT - The supplemental channel outer loop $E_b/N_t$ setpoint.

The mobile station shall set this field to the value of the power control outer loop $E_b/N_t$ setpoint, in units of 0.125 dB, currently in use in the Channel specified by SCH_ID.

FCH_INCL – Fundamental Channel included indicator.

The mobile station shall set this field to ‘1’ if FPC_FCH_CURR_SETPT is included; otherwise the mobile station shall set this field to ‘0’.

FPC_FCH_CURR_SETPT – The outer loop $E_b/N_t$ setpoint of the Fundamental Channel.

If FCH_INCL is set to ‘1’, the mobile station shall set this field to the value of the $E_b/N_t$ setpoint, in units of 0.125 dB, currently in use in the Fundamental Channel power control outer loop estimation; otherwise, the mobile station shall omit this field.

DCCH_INCL – Dedicated Control Channel included indicator.

The mobile station shall set this field to ‘1’ if the FPC_DCCH_CURR_SETPT field is included; otherwise the mobile station shall set this field to ‘0’.

FPC_DCCH_CURR_SETPT – The outer loop $E_b/N_t$ setpoint of the Forward Dedicated Channel.

If DCCH_INCL is set to ‘1’, the mobile station shall set this field to the value of the $E_b/N_t$ setpoint, in units of 0.125 dB, currently in use in the Dedicated Channel power control outer loop estimation; otherwise, the mobile station shall omit this field.
NUM_SUP – The number of Supplemental Channels.
The mobile station shall set this field to the total number of
the Supplemental Channels reported by this message.

The mobile station shall in NUM_SUP occurrences of the following two fields:

SCH_ID – The Supplemental Channel index.
The mobile station shall set this field to the Supplemental
Channel index to indicate the Forward Supplemental Channel
that to be reported

FPC_SCH_CURR_SETPT – The supplemental outer loop E_b/N_t setpoint.
The mobile station shall set this field to the value of the power
control outer loop E_b/N_t setpoint, in units of 0.125 dB,
currently in use in the Channel specified by SCH_ID.

CH_IND_INCL – Channel indicator inclusion bit.

The mobile station shall set this field to ‘1’ if the mobile station is requesting a channel configuration; otherwise, the mobile station shall set this field to ‘0’.

CH_IND – Channel indicator.

If CH_IND_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as shown in Table 2.7.1.3.2.4-6 to request a new physical channel configuration.

EXT_CH_IND – Extended Channel Indicator.

If the CH_IND field is not included, or is included and not set to ‘00’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as shown in Table 2.7.1.3.2.4-11 to request a new physical channel configuration.

</table>

RSC_MODE_IND – Reduced slot cycle mode indicator.

The mobile station shall set this field to ‘1’ to indicate that it will operate in the reduced slot cycle mode following release of the traffic channel; otherwise, the mobile station shall set this field to ‘0’.

RSCI – Reduced slot cycle index.

If RSC_MODE_IND is equal to ‘1’, the mobile station shall include this field and set it to the value of the reduced slot cycle index, as specified in Table 2.7.1.3.2.1-8; otherwise, the mobile station shall omit this field.

The mobile station shall set this field to a value less than the registered slot cycle index, SLOT_CYCLE_INDEX_REG.

RSC_END_TIME_UNIT – Reduced slot cycle mode end time unit.

If RSC_MODE_IND is equal to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall set this field according to Table 2.7.3.5-1 to indicate the units of the RSC_END_TIME_VALUE field.

RSC_END_TIME_VALUE – Reduced slot cycle mode end time value.

If RSC_MODE_IND is equal to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to the system time \( \text{mod } 16 \), in units of time specified by RSC_END_TIME_UNIT\( \text{mod } 16 \), at which the mobile station is to exit the reduced slot cycle mode.

- **PSMM_POS** – Pilot Strength Measurement Message position.
  The mobile station shall set this field to an index corresponding to the position, within the last sent Pilot Strength Measurement Message (see 2.7.2.3.2.5) or Extended Pilot Strength Measurement Message (see 2.7.2.3.2.34), of the Active-Set pilot whose strength is being reported. The mobile station shall use a value of 0 to report the pilot represented by the REF_PN field in the last sent Pilot Strength Measurement Message or Extended Pilot Strength Measurement Message. The mobile station shall use a value of n, where n is an integer greater than 0, to report the pilot represented by the n\(^{th}\) occurrence of the PILOT_PN_PHASE field in the last sent Pilot Strength Measurement Message or Extended Pilot Strength Measurement Message.

- **PILOT_STRENGTH** – Pilot strength in dB.
  The mobile station shall set this field to
  \[
  \lfloor -2 \times 10 \times \log_{10} PS \rfloor,
  \]
  where PS is the strength of this Active-Set pilot, measured as specified in [2]. If this value is less than 0, the mobile station shall set this field to ‘000000’. If this value is greater than ‘111111’, the mobile station shall set this field to ‘111111’.

- **RANK** – Rank order.
  The mobile station shall set this field to the rank order of the pilot whose strength is being reported, relative to all other pilots in the current Active Set. The mobile station shall use a value of 0 to report the strongest pilot in the current Active Set.

1) \( \{0 \text{ or } \text{NUM_BCMC_PROGRAMS} + 1 \} \)

2 GATING_DISCONNECT_IND - Reverse pilot gating or service disconnect indicator.

3 If the mobile station requests that reverse pilot gating operation to be performed, the mobile station shall set this field to '1'; otherwise (if the mobile station requests that the service option connection specified by CON_REF to be released), the mobile station shall set this field to '0'.

4 CON_REF - Connection reference.

5 If the GATING_DISCONNECT_IND field is set to '1', the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

6 To request the release of a service option connection, the mobile station shall set this field to the connection reference corresponding to one of the service option connections requested to be released; otherwise the mobile station shall set this field to '00000000'.

7 PURGE_SERVICE - Purge service instance indicator.

8 If the GATING_DISCONNECT_IND field is set to '1', the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

9 If the CON_REF is not set to '00000000' and if the packet data service instance identified by CON_REF has been inactivated, the mobile station shall set this field to '1'; otherwise, the mobile station shall set this field to '0'. When CON_REF is set to '00000000', this field does not have any significance.

10 ADD_CON_REF_INCL - Additional connection reference included indicator.

11 If the GATING_DISCONNECT_IND field is set to '1', the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

12 If at least one occurrence of the ADD_CON_REF field is included in this message, then the mobile station shall set this field to '1'; otherwise, the mobile station shall set this field to '0'.

13 NUM_ADD_CON_REF - Number of additional connection references.
If the ADD_CON_REF_INCL field is included and set to ‘1’, the mobile station shall include this field and set it to one less than the number of occurrences of the ADD_CON_REF field included in this message; otherwise, the mobile station shall omit this field.

ADD_CON_REF - Additional connection reference.

The mobile station shall set this field to the connection reference corresponding to a service option connection that is requested to be released.

ADD_PURGE_SERVICE - Additional purge service instance indicator.

If the packet data service instance identified by the ADD_CON_REF field has been inactivated, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

BCMC_INFO_INCL - BCMC information includes indicator.

If the mobile station includes BCMC related fields in this message, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

NUM_BCMC_PROGRAMS - Number of BCMC Programs

If the GATING_DISCONNECT_IND field is set to ‘01’ or if P_REV_IN_USE is less than 11, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

If the mobile station is requesting the release of all the BCMC programs being monitored, the mobile station shall set this field to ‘000000’; otherwise, the mobile station shall set this field to the number of BCMC programs included in this message minus 1.

The mobile station shall include NUM_BCMC_PROGRAMS+1 occurrences of the following variable length record:

BCMC_PROGRAM_ID_LEN - Length of BCMC_PROGRAM_ID field

The mobile station shall set this field to one less than the length, in bits, of the BCMC_PROGRAM_ID of this program.

BCMC_PROGRAM_ID - BCMC program Identifier

The length of this field shall be one more than the value of BCMC_PROGRAM_ID_LEN bits.
The mobile station shall set this field to the identifier of the BCMC program corresponding to one or more flows that the mobile station is requesting to release.

BCMC_FLOW_DISCRIMINATOR_LEN - Length of BCMC_FLOW_DISCRIMINATOR field

The mobile station shall set this field to the length, in bits, of the BCMC_FLOW_DISCRIMINATOR of this program. To request release of all flows associated with this BCMC_PROGRAM_ID, the mobile station may set this field to ‘000’.

NUM_FLOW_DISCRIMINATOR - Number of BCMC flow discriminators

The length of this field shall be determined by the value of the BCMC_FLOW_DISCRIMINATOR_LEN as follows: if BCMC_FLOW_DISCRIMINATOR_LEN is set to ‘000’, this field is omitted; otherwise, the length of this field shall be BCMC_FLOW_DISCRIMINATOR_LEN bits.

The mobile station shall set this field to the number of flow discriminators included for this program minus one.

If NUM_FLOW_DISCRIMINATOR field is included, the mobile station shall include NUM_FLOW_DISCRIMINATOR+1 occurrences of the following variable length record; otherwise, the mobile station shall include 1 occurrence of the following variable length record:

BCMC_FLOW_DISCRIMINATOR – BCMC Flow discriminator.

The length of this field shall be determined by the value of the BCMC_FLOW_DISCRIMINATOR_LEN as follows: if BCMC_FLOW_DISCRIMINATOR_LEN is set to ‘000’, this field is omitted; otherwise, the length of this field shall be BCMC_FLOW_DISCRIMINATOR_LEN bits.

The mobile station shall set this field to the BCMC flow discriminator that is requested to be released.

1  TAG  – Call initiation transaction identifier.

2  The mobile station shall set this field to the identifier for the
transaction corresponding to SR_ID.

4  CH_IND  – Channel indicator.

5  The mobile station shall set this field as shown in Table
2.7.2.3.2.32-1, to request physical resources.
Table 2.7.2.3.2.32-1. Channel Indicator

</tr>
</tbody>
</table>

EXT_CH_IND - Extended Channel Indicator.

If CH_IND is set to ‘111, then the mobile station shall set this field as shown in Table 2.7.1.3.2.4-11; otherwise, the mobile station shall omit this field.
SR_ID – Service reference identifier.

If the SYNC_ID_INCL field is set to ‘0’, the mobile station shall set this field as follows:

- If the service instance provides a service reference identifier, the mobile station shall set this field to the service reference identifier specified by the service instance. If the service instance does not provide a service reference identifier, the mobile station shall set this field to the smallest unused service reference identifier value between 1 and 6 (inclusive).

Otherwise, the mobile station shall set this field as follows:

- If the mobile station requests the restoration of a single service option connection from the stored service configuration, the mobile station shall set this field to the corresponding service reference identifier.

- Otherwise (that is, the mobile station requests the restoration of all remaining service option connections from the stored service configuration), the mobile station shall set this field to ‘111’.

GLOBAL_EMERGENCY_CALL – Global emergency call indicator.

The mobile station shall set this field to ‘1’, if the mobile station recognizes that this is an emergency call; otherwise, the mobile station shall set this field to ‘0’.

MS_INIT_POS_LOC_IND – Mobile Initiated Position Location Session indicator.

If the GLOBAL_EMERGENCY_CALL field is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and shall set it as follows:

The mobile station shall set this field to ‘1’ if MS_INIT_POS_LOC_SUP_IND is equal to ‘1’ and if the mobile station is to initiate a position location session associated with this emergency call; otherwise, the mobile station shall set this field to ‘0’.
NEW_SINFO_INCL  – Encryption fields included.

The mobile station shall set this field to ‘1’ if the encryption related fields are included; otherwise the mobile station shall set this field to ‘0’. The mobile station shall set this field to ‘0’ if the base station does not support encryption or the mobile station does not support any of the encryption modes supported by the base station.

UI_ENCRYPT_REQ  – Request for user information encryption on the traffic channel indicator.

If NEW_SINFO_INCL is set to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to ‘1’ to request user information encryption, and to ‘0’ to request no user information encryption.

UI_ENCRYPT_SUP  – User information encryption supported indicator.

If NEW_SINFO_INCL is set to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to indicate the supported user information encryption algorithms.

This field consists of the subfields shown in Table 2.7.1.3.2.4-9.

The mobile station shall set each subfield to ‘1’ if the corresponding user information encryption algorithm is supported by the mobile station; otherwise, the mobile station shall set the subfield to ‘0’.

The mobile station shall set the RESERVED subfield to ‘000000’.

SERVICE_OPTION  – Requested service option for this origination.

The mobile station shall set this field to the value specified in [30], corresponding to the requested service option.

MORE_SO_INFO_INCL  – More service option information included.

If MAX_NUM_ALT_SO is equal to ‘000’, the mobile station shall set this field to ‘0’; otherwise, the mobile station shall set this field as follows:

If any alternate service option number or/and service option bitmap is to be included in this message, the mobile station shall set this field to ‘1’, otherwise, the mobile station shall set this field to ‘0’. In other words, MORE_SO_INFO_INCL is set to ‘1’, if NUM_ALT_SO is included and not set to ‘000’ or/and SO_BITMAP_IND is included and not set to ‘00’.

NUM_ALT_SO  – Number of alternative service options.
If \texttt{MORE\_SO\_INFO\_INCL} is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall set this field to the number of supported alternative service options which either have no service option group number assigned or do not belong to the same service option group whose bitmap is included in the message.

The mobile station shall include \texttt{NUM\_ALT\_SO} occurrences of the following field:

\begin{itemize}
  \item \texttt{ALT\_SO} – Alternative service option.
  \item \texttt{SO\_BITMAP\_IND} – SO bitmap indicator.
  \item \texttt{SO\_GROUP\_NUM} – Service option group number.
  \item \texttt{SO\_BITMAP} – Service option bitmap.
  \item \texttt{DRS} – Data ready to send indicator.
\end{itemize}
If the service instance corresponding to SR_ID has data to send, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

**PREV_SID_INCL** - Previous System Identification (SID) included indicator.

The mobile station shall set this field to ‘1’ if:
- The mobile station determines that the SID has been changed after a packet data dormant handoff, and
- This message includes the main service instance (see [42]).

Otherwise, the mobile station shall set this field to ‘0’.

**PREV_SID** - Previous System Identification.

If PREV_SID_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to the previous SID.

**PREV_NID_INCL** - Previous Network Identification (NID) included indicator.

The mobile station shall set this field to ‘1’ if:
- The mobile station determines that NID has been changed after a packet data dormant handoff, and
- This message includes the main service instance (see [42]).

Otherwise, the mobile station shall set this field to ‘0’.

**PREV_NID** - Previous Network Identification.

If PREV_NID_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to the previous NID.

**PREV_PZID_INCL** - Previous Packet Zone ID (PZID) included indicator.

The mobile station shall set this field to ‘1’ if:
- The mobile station determines that the Packet Zone ID has been changed after a packet data dormant handoff, and
- This message includes the main service instance (see [42]).

Otherwise, the mobile station shall omit this field.

**PREV_PZID** - Previous Packet Zone ID.

If PREV_PZID_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:
The mobile station shall set this field to the previous PZID.

**DIALED_DIGS_INCL** - Dialed digits included indicator.

The mobile station shall set this field to ‘1’ if the dialed digits related fields are included in this message; otherwise, the mobile station shall set this field to ‘0’.

**DIGIT_MODE** - Digit mode indicator.

If the DIALED_DIGS_INCL field is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and shall set it as follows:

This field indicates whether the dialed digits are 4-bit DTMF codes or 8-bit ASCII codes using a specified numbering plan.

To originate the call using the binary representation of DTMF digits (i.e., CHARi fields are represented in Table 2.7.1.3.2.4-4), the mobile station shall set this field to ‘0’. To originate the call using ASCII characters, the mobile station shall set this field to ‘1’.

**NUMBER_TYPE** - Type of number.

If the DIALED_DIGS_INCL field is set to ‘0’, or if P_REV_IN_USEs < 11 and DIGIT_MODE is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and shall set it as follows:

The mobile station shall set this field to the NUMBER_TYPE value shown in Table 2.7.1.3.2.4-2 corresponding to the type of the number as defined in [7], Section 4.5.9.

If this field is included and the mobile station determines that the user has entered an international number (for example, with a leading “+” as specified in [39] for Plus Code Dialing or an international access code), the mobile station should set this field to ‘001’.

**NUMBER_PLAN** - Numbering plan.

If the DIALED_DIGS_INCL field is set to ‘0’ or if the DIGIT_MODE field is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and shall set it as follows:
The mobile station shall set this field to the NUMBER_PLAN value shown in Table 2.7.1.3.2.4-3 corresponding to the requested numbering plan as defined in [7], Section 4.5.9.

NUM_FIELDS – Number of dialed digits in this message.

If the DIALED_DIGS_INCL field is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall include this field and shall set it as follows:

The mobile station shall set this field to the number of dialed digits included in this message.

The mobile station shall include NUM_FIELDS occurrences of the following field:

CHARi – A dialed digit or character.

If the DIGIT_MODE field is set to '0', the mobile station shall set each occurrence of this field to the code value shown in Table 2.7.1.3.2.4-4 corresponding to the dialed digit. If the DIGIT_MODE field is set to '1', the mobile station shall set each occurrence of this field to the ASCII representation corresponding to the dialed digit, as specified in [9], with the most significant bit set to '0'.

NUM_RECS – Number of records.

The mobile station shall set this field to the number of information records included with this message.

The mobile station shall include NUM_RECS occurrences of the following three-field record.

RECORD_TYPE – Information record type.

The mobile station shall set this field to the record type value shown in Table 2.7.4-1.

The mobile station shall not include the record type for QoS Parameters information record if MOB_QOSs is equal to '0'.

RECORD_LEN – Information record length.

The mobile station shall set this field to the number of octets in the type-specific fields included in this record.

Type-specific fields – Type-specific fields.

The mobile station shall include type-specific fields as specified in 2.7.4.
SYNC_ID_INCL - Service Configuration synchronization identifier included indicator.

The mobile station shall set this field to ‘1’ if the SYNC_ID field is included in this message; otherwise, the mobile station shall set this field to ‘0’.

If SYNC_ID_SUPPORTED is equal to ‘0’, the mobile station shall set this field to ‘0’.

SYNC_ID_LEN - Service Configuration synchronization identifier length indicator.

If the SYNC_ID_INCL field is set to ‘0’, the mobile station shall omit this field; otherwise the mobile station shall include this field and set it as follows:

The mobile station shall set this field to the length of the SYNC_ID field included in this message.

SYNC_ID - Service Configuration synchronization identifier.

If the SYNC_ID_INCL field is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to the Service Configuration synchronization identifier corresponding to the stored service configuration.

ADD_SERV_INSTANCE_INCL - Additional service instances included indicator.

If SR_ID is included and set to ‘111’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

If at least one occurrence of the ADD_SR_ID field is included in this message, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

If SYNC_ID_INCL is equal to ‘0’ and MAX_ADD_SERV_INSTANCE is equal to ‘0’, the mobile station shall set this field to ‘0’.

NUM_ADD_SERV_INSTANCE - Number of additional service instances included.

If ADD_SERV_INSTANCE_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it to the number of additional service instances included in this message.
If SYNC_ID_INCL is equal to ‘0’, the mobile station shall set this field to a value less than or equal to MAX_ADD_SERV_INSTANCEs.

If ADD_SERV_INSTANCE_INCL is set to ‘1’, the mobile station shall include NUM_ADD_SERV_INSTANCE occurrences of the following variable-field record:

**ADD_SR_ID** – Additional service reference identifier.

If SYNC_ID_INCL is set to ‘0’, the mobile station shall set this field as follows:

- If the service instance provides a service reference identifier, the mobile station shall set this field to the service reference identifier specified by the service instance. If the service instance does not provide a service reference identifier, the mobile station shall set this field to the smallest unused service reference identifier value between 1 and 6 (inclusive).

Otherwise, the mobile station shall set this field to the service reference identifier corresponding to the service option connection that the mobile station requests to be restored from the stored service configuration.

**ADD_DRS** – Additional Data Ready to Send indicator.

If the service instance corresponding to the ADD_SR_ID field of this record has data to send, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

**ADD_TAG** – Additional call initiation transaction identifier.

The mobile station shall set this field to the identifier for the transaction corresponding to the ADD_SR_ID field of this record.

**ADD_SERVICE_OPTION_INCL** – Additional service option included indicator.

If SYNC_ID_INCL is set to ‘1’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to ‘0’ if the requested service option number of the service instance corresponding to the ADD_SR_ID field of this record is the same as SERVICE_OPTION; otherwise, the mobile station shall set this field to ‘1’.
ADD_SERVICE_OPTION – Additional service option number.

If the ADD_SERVICE_OPTION_INCL field of this record is not included or is included and is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it to the value specified in [30], corresponding to the requested service option number of the service instance corresponding to the ADD_SR_ID field of this record.

ADD_NUM_RECS – Additional number of records.

The mobile station shall set this field to the number of information records included in this record for the service instance corresponding to the ADD_SR_ID field in this record.

The mobile station shall include ADD_NUM_RECS occurrences of the following three-field record.

ADD_RECORD_TYPE – Additional information record type.

The mobile station shall set this field to the record type value shown in Table 2.7.4-1.

The mobile station shall not include the record type for QoS Parameters information record if MOB_QOS is equal to ‘0’.

ADD_RECORD_LEN – Additional information record length.

The mobile station shall set this field to the number of octets in the type-specific fields included in this record.

Type-specific fields – Type-specific fields.

The mobile station shall include type-specific fields as specified in 2.7.4.

ADD_QOS_PARMS_INCL – Additional QoS parameters included indicator.

If SYNC_ID_INCL is set to ‘1’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

If QoS parameters for the service instance corresponding to the ADD_SR_ID field of this record are included in this message, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

The mobile station shall not set this field to ‘1’ if MOB_QOS is set to ‘0’.

ADD_QOS_PARMS_LEN – Additional Length of the block of QoS parameters.
If the ADD_QOS_PARMS_INCL field of this record is not included or is included and is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it to the combined length of the ADD_QOS_PARMS field and the ADD_QOS_RESERVED field of this record, in octets.

**ADD_QOS_PARMS** — Additional QoS parameters block.

If the ADD_QOS_PARMS_INCL field of this record is not included or is included and is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it to the set of QoS parameter values as defined in accordance with the requirements for the requested service option and/or for the user, per subscription.

**ADD_QOS_RESERVED** — Additional QoS reserved bits.

If the ADD_QOS_PARMS_INCL field of this record is not included or is included and is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall include the minimum number of bits of '0', such that the combined length of the QOS_PARMS field and of this field is an integer number of octets.

**BCMC_INCL** — BCMC information included indicator

If the P_REV_IN_USE field is less than 11, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to '1' if one or more BCMC_PROGRAM_IDs are included in the message; otherwise, the mobile station shall set this field to '0'.

**BCMC_ORIG_ONLY_IND** — BCMC origination only indicator

If the BCMC_INCL field is not included or is included and is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to '1' to indicate that this origination is only for BCMC and no point to point call is requested in this message; otherwise the mobile station shall set this field to '0'.

**AUTH_SIGNATURE_INCL** — Authorization signature included indication.

If the BCMC_INCL field is not included or is included and is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to '1' to indicate that the authorization signature is included in this message for some of the BCMC flows included in this message; otherwise, the mobile station shall set this field to '0'.

**TIME_STAMP_SHORT_LENGTH** — Length of time stamp included in this message.
If the AUTH_SIGNATURE_INCL field is not included or is included and is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to the length of the time stamp, in units of bits, included in this message.

**TIME_STAMP_SHORT** - Time stamp short.

If the AUTH_SIGNATURE_INCL field is not included or is included and is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to the **TIME_STAMP_SHORT_LENGTH** least significant bits of the time stamp parameter used to generate the Authorization signature included in this message.

**NUM_BCMC_PROGRAMS** - Number of BCMC Programs

If the BCMC_INCL field is not included or is included and is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to the number of BCMC programs included in this message minus 1.

The mobile station shall include **NUM_BCMC_PROGRAMS+1** occurrences of the following variable length record:

**BCMC_PROGRAM_ID_LEN** - Length of BCMC_PROGRAM_ID field

The mobile station shall set this field to one less than the length, in bits, of the BCMC_PROGRAM_ID of this program.

**BCMC_PROGRAM_ID** - BCMC program Identifier

The length of this field shall be one more than the value of **BCMC_PROGRAM_ID_LEN** bits.

The mobile station shall set this field to the identifier of the BCMC program corresponding to one or more flows that the mobile station will continue to monitor or start to monitor upon receiving confirmation of delivery of this message or is requesting transmission.

**BCMC_FLOW_DISCRIMINATOR_LEN** - Length of BCMC_FLOW_DISCRIMINATOR field

The mobile station shall set this field to the length, in bits, of the **BCMC_FLOW_DISCRIMINATOR** of this program. To request all flows associated with this **BCMC_PROGRAM_ID**, the mobile station may set this field to ‘000’.

---

2-897
NUM_FLOW_DISCRIMINATOR - Number of BCMC flow discriminators included for this program.

The length of this field shall be determined by the value of the BCMC_FLOW_DISCRIMINATOR_LEN field as follows: if BCMC_FLOW_DISCRIMINATOR_LEN is set to '000', this field is omitted; otherwise, the length of this field shall be BCMC_FLOW_DISCRIMINATOR_LEN bits.

The mobile station shall set this field to the number of flow discriminators included for this program minus one.

If NUM_FLOW_DISCRIMINATOR field is included, the mobile station shall include NUM_FLOW_DISCRIMINATOR+1 occurrences of the following variable length record; otherwise, the mobile station shall include 1 occurrence of the following variable length record:

BCMC_FLOW_DISCRIMINATOR - BCMC Flow discriminator.

The length of this field shall be determined by the value of the BCMC_FLOW_DISCRIMINATOR_LEN field as follows: if BCMC_FLOW_DISCRIMINATOR_LEN is set to '000', this field is omitted; otherwise, the length of this field shall be BCMC_FLOW_DISCRIMINATOR_LEN bits.

The mobile station shall set this field to the BCMC flow discriminator requested.

AUTH_SIGNATURE_IND - Authorization signature indicator.

If the AUTH_SIGNATURE_INCL field is not included or is included and is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to '1' to indicate that the authorization signature is included in this message for this BCMC flow; otherwise, the mobile station shall set this field to '0'.

AUTH_SIGNATURESAME_IND - Authorization signature same as previous BCMC flow indicator.

If the AUTH_SIGNATURE_IND field is not included or is included and is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to '1' to indicate that the authorization signature generated for this BCMC flow is the same as the one generated for the BCMC flow listed prior to this BCMC flow in this message; otherwise, the mobile station shall set this field to '0'.

2-898
For the first BCMC flow listed in this message, the mobile station shall set this field to '0'.

**BAK_ID** - BAK identifier.

If the AUTH_SIGNATURESAME_IND field is not included or is included and is set to '1', the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to BAK identifier used to generate the Authorization signature included in this message.

**AUTH_SIGNATURE** - Authorization signature.

If the AUTH_SIGNATURESAME_IND field is not included or is included and is set to '1', the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to the Authorization signature computed for this BCMC flow as specified in 2.6.13.9.

**CON_REF_INCL** – Connection reference included indicator.

The mobile station shall set this field to ‘1’ if the connection reference field is included in this message; otherwise, it shall set this field to ‘0’.

**CON_REF** – Connection reference.

If the CON_REF_INCL field is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and shall set it to the value of the connection reference assigned to the service option connection of the call, to which this message corresponds.

**NUM_REC** – Number of records.

The mobile station shall set this field to the number of information records included with this message.

The mobile station shall include NUM_REC occurrence of the following three-field record:
<table>
<thead>
<tr>
<th></th>
<th>RECORD_TYPE</th>
<th>Information record type.</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>

\[
\{(0 \text{ or NUM_PILOTS})
\]

REF_PN – Time reference PN sequence offset.

The mobile station shall set this field to the PN sequence offset of the pilot used by the mobile station to derive its time reference, relative to the zero offset pilot PN sequence in units of 64 PN chips.
PILOT_STRENGTH – Pilot strength in dB.

The mobile station shall set this field to

\[-2 \times 10 \log_{10} PS\],

where PS is the strength of the pilot used by the mobile station to derive its time reference (see [2]), measured as specified in 2.6.6.2.2. If this value \([-2 \times 10 \log_{10} PS]\) is less than 0, the mobile station shall set this field to ‘000000’. If this value is greater than ‘111111’, the mobile station shall set this field to ‘111111’.

KEEP – Keep pilot indicator.

If the handoff drop timer (see 2.6.6.2.3) corresponding to the pilot used by the mobile station to derive its time reference (see [2]) has expired, the mobile station shall set this field to ‘0’; otherwise, the mobile station shall set this field to ‘1’.

REF_PILOT_REC_INCL – Reference pilot information included indicator.

The mobile station shall set this field to ‘1’ if additional reference pilot information listed in the REF_PILOT_REC_TYPE and REF_RECORD_LEN fields are included. The mobile station shall set this field to ‘0’ if the corresponding pilot is the common pilot and there is no additional pilot information included.

REF_PILOT_REC_TYPE – Reference pilot record type.

If REF_PILOT_REC_INCL is set to ‘1’, the mobile station shall set this field to the REF_PILOT_REC_TYPE value shown in Table 2.7.2.3.2.34-1 corresponding to the type of Pilot Record specified by this record.

Table 2.7.2.3.2.34-1. Pilot Record Types

<table>
<thead>
<tr>
<th>Description</th>
<th>REF_PILOT_REC_TYPE (binary)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Auxiliary Pilot</td>
<td>000</td>
</tr>
<tr>
<td>All other REF_PILOT_REC_TYPE or PILOT_REC_TYPE values are reserved</td>
<td></td>
</tr>
</tbody>
</table>

If REF_PILOT_REC_INCL is set to ‘0’, the mobile station shall omit this field.

REF_RECORD_LEN – Reference pilot record length.

If REF_PILOT_REC_INCL is set to ‘1’, the mobile station shall set this field to the number of octets in the type-specific fields of this pilot record.
If REF_PILOT_REC_INCL is set to ‘0’, the mobile station shall omit this field.

Type-specific fields - Pilot record type-specific fields.

If REF_PILOT_REC_INCL is set to ‘1’, the mobile station shall include type-specific fields based on the REF_PILOT_REC_TYPE of this pilot record.

If REF_PILOT_REC_INCL is set to ‘0’, the mobile station shall omit this field.

If REF_PILOT_REC_TYPE is equal to ‘000’, the mobile station shall include the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>QOF</td>
<td>2</td>
</tr>
<tr>
<td>WALSH_LENGTH</td>
<td>3</td>
</tr>
<tr>
<td>PILOT_WALSH</td>
<td>(WALSH_LENGTH + 6)</td>
</tr>
<tr>
<td>RESERVED</td>
<td>0 to 7 (as needed)</td>
</tr>
</tbody>
</table>

QOF - Quasi-orthogonal function index.

The mobile station shall set this field to the index of the Quasi-orthogonal function of the corresponding Auxiliary Pilot.

WALSH_LENGTH - Length of the Walsh code for the reference pilot.

The mobile station shall set this field to the WALSH_LENGTH value shown in Table 2.7.2.3.2.34-2 corresponding to the length of the Walsh code for the pilot that is used as the Auxiliary Pilot.

**Table 2.7.2.3.2.34-2. Walsh Code Length**

<table>
<thead>
<tr>
<th>WALSH_LENGTH (binary)</th>
<th>Length of the Walsh Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>‘000’</td>
<td>64</td>
</tr>
<tr>
<td>‘001’</td>
<td>128</td>
</tr>
<tr>
<td>‘010’</td>
<td>256</td>
</tr>
<tr>
<td>‘011’</td>
<td>512</td>
</tr>
<tr>
<td>‘100’ – ‘111’</td>
<td>Reserved</td>
</tr>
</tbody>
</table>
PILOT_WALSH - Walsh code for the Auxiliary Pilot used by the mobile station to derive its time reference. The mobile station shall set this field to the Walsh code corresponding to the Auxiliary Pilot.

RESERVED - Reserved bits. The mobile station shall set all the bits of this field to ‘0’ to make the entire record octet-aligned.

SF_RX_PWR – The received power spectral density of the Serving Frequency. The mobile station shall set this field to

\[ \left\lfloor \frac{10 \times \log_{10}(\text{spec\_density}) + 120}{2} \right\rfloor \]

where \text{spec\_density} is the mobile station received power spectral density of the Serving Frequency, in mW/1.23MHz, averaged over the last N_{12m} frames (see 2.6.6.2.5.1).

If this value is less than 0, the mobile station shall set this field to ‘00000’.

NUM_PILOTS – Number of pilots reported. The mobile station shall set this field to the number of pilots being reported other than the reference pilot.

The mobile station shall include NUM_PILOTS occurrences of the following record: one occurrence for each pilot in the Active Set, for each pilot in the Candidate Set whose strength exceeds T_ADD, and for each pilot in the Candidate Set whose strength satisfies the following inequality:

\[
10 \times \log_{10}\left( \frac{\text{SOFT\_SLOPE}_s \times 10 \times \log_{10} \sum_{i \in A} \text{PS}_i + \text{ADD\_INTERCEPT}_s}{8} \right) > \text{PS}
\]

where the summation is performed over all pilots currently in the Active Set. The mobile station shall not include these fields for the pilot identified by the REF_PN field.

The mobile station shall order any occurrences of the following record which correspond to pilots in the Active Set such that they occur before any occurrences of the following record which correspond to pilots in the Candidate Set.

PILOT_PN_PHASE – Pilot measured phase. The mobile station shall set this field to the phase of the pilot PN sequence relative to the zero offset pilot PN sequence of this pilot, in units of one PN chip, as specified in 2.6.6.2.4.

PILOT_STRENGTH – Pilot strength in dB. The mobile station shall set this field to

\[ \left\lfloor -2 \times 10 \log_{10} \text{PS} \right\rfloor \]
where PS is the strength of this pilot, measured as specified in 2.6.6.2.2. If this value \( \left( 9.2 \times 10^{10} \log_{10} \text{PS} \right) \) is less than 0, the mobile station shall set this field to '000000'. If this value is greater than '111111', the mobile station shall set this field to '111111'.

**KEEP** – Keep pilot indicator.

If the handoff drop timer (see 2.6.6.2.3) corresponding to this pilot has expired, the mobile station shall set this field to '0'; otherwise, the mobile station shall set this field to '1'.

**PILOT_REC_INCL** - Additional pilot information included indicator.

The mobile station shall set this field to '1' if additional pilot information listed in the PILOT_REC_TYPE and RECORD_LEN fields are included. The mobile station shall set this field to '0' if the corresponding pilot is the common pilot and there is no additional pilot information included.

**PILOT_REC_TYPE** - Reference pilot record type.

If PILOT_REC_INCL is set to '1', the mobile station shall set this field to the PILOT_REC_TYPE value shown in Table 2.7.2.3.2.34-1 corresponding to the type of Pilot Record specified by this record.

If PILOT_REC_INCL is set to '0', the mobile station shall omit this field.

**RECORD_LEN** - Pilot record length.

If PILOT_REC_INCL is set to '1', the mobile station shall set this field to the number of octets in the type-specific fields of this pilot record.

If PILOT_REC_INCL is set to '0', the mobile station shall omit this field.

**Type-specific fields** - Pilot record type-specific fields.

If PILOT_REC_INCL is set to '1', the mobile station shall include type-specific fields based on the PILOT_REC_TYPE of this pilot record as described in 3.7.6.1.

If PILOT_REC_INCL is set to '0', the mobile station shall omit this field.

**RESQ_IND_INCL** - Call rescue flag included indicator.
The mobile station shall set this field to ‘1’ if a pilot in the mobile station’s Active Set was autonomously promoted since the last *Extended Handoff Direction Message*, *General Handoff Direction Message*, or *Universal Handoff Direction Message* was received; otherwise, the mobile station shall set this field to ‘0’. If RESQ_IND_INCL is set to ‘1’, the mobile station shall include NUM_PILOTS occurrences of the following one-field record in the same order as the pilots listed above.

**RESQ_IND** - Call rescue flag.

The mobile station shall set this field to ‘1’ if the corresponding pilot was autonomously promoted to the Active Set since the last *Extended Handoff Direction Message*, *General Handoff Direction Message*, or *Universal Handoff Direction Message* was received; otherwise, the mobile station shall set this field to ‘0’.
2.7.2.3.2.35 Extended Handoff Completion Message

<tr>
<td>Type-specific fields</td>
<td>0 or 8 × RECORD_LEN</td>
</tr>
</tbody>
</table>

LAST_HDM_SEQ – Extended Handoff Direction Message, General Handoff Direction Message, or Universal Handoff Direction Message sequence number.

The mobile station shall set this field to the value of the HDM_SEQ field from the Extended Handoff Direction Message, General Handoff Direction Message, or the Universal Handoff Direction Message that determined the current Active Set.

NUM.PILOTS – Number of pilots reported.

The mobile station shall set this field to the number of pilots in the current Active Set.

The mobile station shall include NUM.PILOTS occurrences of the following record: one occurrence for each pilot in the Active Set. If the Active Set contains more than one pilot, the mobile station shall include the pilot information in the same order as in the Extended Handoff Direction Message, the General Handoff Direction Message, or the Universal Handoff Direction Message that determined the current Active Set.

PILOT_PN - Pilot PN sequence offset.

The mobile station shall set this field to the pilot PN sequence offset, relative to the zero offset pilot PN sequence in units of 64 PN chips, for this pilot.

PILOT_REC_INCL - Additional pilot information included indicator.
The mobile station shall set this field to ‘1’ if additional pilot information listed in the PILOT_REC_TYPE and RECORD_LEN fields are included. The mobile station shall set this field to ‘0’ if the corresponding pilot is the common pilot and there is no additional pilot information included.

**PILOT_REC_TYPE** - Reference pilot record type.

If PILOT_REC_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall set this field to the PILOT_REC_TYPE value shown in Table 2.7.2.3.2.34-1 corresponding to the type of Pilot Record specified by this record.

**RECORD_LEN** - Pilot record length.

If PILOT_REC_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall set this field to the number of octets in the type-specific fields of this pilot record.

**Type-specific fields** - Pilot record type-specific fields.

If PILOT_REC_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include type-specific fields based on the PILOT_REC_TYPE of this pilot record as described in 2.7.2.3.2.34.

**UI_ENC_INCL** – User information encryption fields included.

The mobile station shall set this field to ‘1’ if the user information encryption related fields are included in this message; otherwise, the mobile station shall set this field to ‘0’.

**UI_ENCRYPT_SUP** – User information encryption supported indicator.

If UI_ENC_INCL is equal to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to indicate the supported user information encryption algorithms.
This field consists of the subfields shown in Table 2.7.1.3.2.4-9.

The mobile station shall set each subfield to ‘1’ if the corresponding user information encryption algorithm is supported by the mobile station; otherwise, the mobile station shall set the subfield to ‘0’.

The mobile station shall set the RESERVED subfield to ‘000000’.

NUM_REC – Number of user information encryption records.

If UI_ENC_INCL is equal to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to number of user information encryption records included in this message minus 1.

The mobile station shall include NUM_REC + 1 occurrences of the following two field record

CON_REF – Connection reference corresponding to the service instance requesting for encryption.

If UI_ENC_INCL is equal to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to the connection reference of the service option connection corresponding to this user information encryption request record.

UI_ENCRYPT_REQ – Request for user information encryption on the traffic channel indicator.

The mobile station shall set this field to ‘1’ to request user information encryption for the user information corresponding to the service option connection identified by CON_REF; otherwise, the mobile station shall set this field to ‘0’.

SIG_ENC_INCL – Signaling encryption fields included.

The mobile station shall set this field to ‘1’ if the following two fields related to signaling encryption fields are included in this message. Otherwise, the mobile station shall set this field to ‘0’.

SIG_ENCRYPT_SUP – Signaling encryption supported indicator.

If SIG_ENC_INCL is equal to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile shall set this field to indicate the supported signaling encryption algorithms supported by the mobile station.
This field consists of the subfields shown in Table 2.7.1.3.2.1-5.

If this field is included, the mobile station shall set the subfields as follows:

The mobile station shall set the CMEA subfield to ‘1’.

The mobile station shall set each other subfield to ‘1’ if the corresponding signaling encryption algorithm is supported by the mobile station; otherwise, the mobile station shall set the subfield to ‘0’.

The mobile station shall set the RESERVED subfield to ‘00000’.

D_SIG_ENCRYPT_REQ – Dedicated channel signaling encryption request indicator. If SIG_ENC_INCL is equal to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If included the mobile station shall set this field to ‘1’ to request signaling encryption to be turned on for signaling messages sent on f-dsch and r-dsch, and to ‘0’ to request signaling encryption to be turned off for signaling messages sent on f-dsch and r-dsch.

NEW_SSEQ_H_INCL – The NEW_SSEQ included indicator. The mobile station shall set this field to ‘1’ if NEW_SSEQ_H is included in this message; otherwise, the mobile station shall set this field to ‘0’.

If MSG_INTEGRITY_SUP is equal to ‘0’, the mobile station shall set this field to ‘1’ if the mobile station is to include the NEW_SSEQ_H and NEW_SSEQ_H_SIG fields.

If MSG_INTEGRITY_SUP is equal to ‘1’, the mobile station shall set this field to ‘0’.

NEW_SSEQ_H – The 24-bit value used to initialize the 24 MSB of crypto-sync. If NEW_SSEQ_H_INCL is set to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to a 24-bit value that will be used as the initial value of the 24 MSB of the crypto-sync for both forward and reverse link message integrity.

NEW_SSEQ_H_SIG – The signature of NEW_SSEQ_H. If NEW_SSEQ_H is included, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to the digital signature of the NEW_SSEQ_H computed as described in 2.3.12.4.5.
MSG_INT_INFO_INCL – Signaling message integrity information included indicator.
   If MSG_INTEGRITY_SUP is equal to ‘0’, the mobile station shall set this field to ‘0’; otherwise, the mobile station shall set this field to ‘1’.

SIG_INTEGRITY_SUP_INCL – Signaling message integrity information included indicator.
   If MSG_INT_INFO_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:
   - If the mobile station supports other integrity algorithm(s) in addition to the default integrity algorithm, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

SIG_INTEGRITY_SUP – Signaling integrity algorithm supported by the mobile station.
   If SIG_INTEGRITY_SUP_INCL is included and is set to ‘1’, the mobile station shall set this field as follows; otherwise, the mobile station shall omit this field.
   - The mobile station shall set this field to indicate the supported message integrity algorithm in addition to the default integrity algorithm.
   - This field consists of the subfields shown in Table 2.7.1.3.2.1-6.
   - The mobile station shall set each subfield to ‘1’ if the corresponding message integrity algorithm is supported by the mobile station; otherwise, the mobile station shall set the subfield to ‘0’.
   - The mobile station shall set the RESERVED subfield to ‘00000000’.

SIG_INTEGRITY_REQ – Signaling message integrity algorithm request indicator.
   If SIG_INTEGRITY_SUP_INCL is included and is set to ‘1’, the mobile station shall set this field as follows; otherwise, the mobile station shall omit this field.
   - The mobile station shall include this field and set it to the value corresponding to the message integrity algorithm requested as shown in Table 2.7.1.3.2.1-7.
2.7.2.3.2.37 Call Cancel Message

NUM_ADD_TAG occurrences of the following field:

{ (NUM_ADD_TAG)
  ADD_TAG 4
} (NUM_ADD_TAG)

TAG – Transaction identifier.
The mobile station shall set this field to the TAG value in the list TAG_OUTSTANDING_LIST in the Enhanced Origination Message sent to originate this call.

ADD_TAG_INCL - Additional call initiation transaction identifiers included indicator.
If at least one occurrence of the ADD_TAG field is included in this message, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

NUM_ADD_TAG - Number of additional call initiation transaction identifiers included.
If ADD_TAG_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it to the number of occurrences of the ADD_TAG field included in this message.

If ADD_TAG_INCL is set to ‘1’, the mobile station shall include NUM_ADD_TAG occurrences of the following field:

ADD_TAG – Additional call initiation transaction identifier.
The mobile station shall set this field to the TAG value in the Enhanced Origination Message.

{ (NUM_INFO_RECORDS)
  RECORD_TYPE 8
  RECORD_LEN 8
  Type-specific fields 8 × RECORD_LEN
}
```

**WLL_DEVICE_TYPE** – WLL device type indicator.

The mobile station shall set this field to the WLL_DEVICE_TYPE value shown in Table 2.7.1.3.2.1-3 corresponding to the mobile station device type.

**NUM_INFO_RECORDS** – Number of information records included.

The mobile station shall set this field to the number of information records which are included.

The mobile station shall include one occurrence of the following fields for each information record which is included:

**RECORD_TYPE** – Information record type.

The mobile station shall set this field to the record type code shown in Table 2.7.4-1 corresponding to the type of this information record.

**RECORD_LEN** – Information record length.

The mobile station shall set this field to the number of octets in the type-specific fields of this record.

**Type-specific fields** – Type-specific fields.

The mobile station shall set these fields as specified in 2.7.4 for this type of information record.

</tbody>
</table>

If QUAL_INFO_TYPE is equal to ‘00000001’, the mobile station shall use the following fixed-length format for the type-specific fields:
<table>
<thead>
<tr>
<th>Type-specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAND_CLASS</td>
<td>5</td>
</tr>
<tr>
<td>OP_MODE</td>
<td>8</td>
</tr>
<tr>
<td>RESERVED</td>
<td>3</td>
</tr>
</tbody>
</table>

1. **BAND_CLASS** - Band class.
   The mobile station shall set this field to the CDMA band class, as specified in [30].

2. **OP_MODE** - Operating mode.
   The mobile station shall set this field as shown in Table 3.7.2.3.2.15-3 to specify the operating mode qualification information.

3. **RESERVED** - Reserved bits.
   The mobile station shall set this field to ‘000’.

4. **NUM_RECORD** - Number of requested record fields in this message.
   The mobile station shall set this field to the number of occurrences of RECORD_TYPE field in this message.

5. **RECORD_TYPE** - Information record type.
   The mobile station shall set this field to the record type value shown in Table 2.7.2.3.2.39-1 corresponding to the information record requested.

   **Table 2.7.2.3.2.39-1. Base Station Status Request Information Record Types**

<table>
<thead>
<tr>
<th>Information Record Requested</th>
<th>Record Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pilot Information</td>
<td>00000000</td>
</tr>
<tr>
<td>Reserved</td>
<td>00000001-1111111</td>
</tr>
</tbody>
</table>

6. **RECORD_LENGTH** - Information record length.
   The mobile station shall set this field to the length, in octets, of the record type specific fields included in this record.

7. **Record type specific fields** - Record type specific fields
   The mobile station shall set this field to the type specific fields corresponding to this record type.

8. If the RECORD_TYPE field is set to ‘00000000’, the mobile
station shall set the record type specific field as follows:

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>NUM_PILOTS</td>
<td>4</td>
</tr>
<tr>
<td>SID_NID_REQ</td>
<td>1</td>
</tr>
</tbody>
</table>

NUM_PILOTS occurrences of the following one field record:

\[
\text{NUM_PILOTS}
\]

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>PILOT_PN</td>
<td>9</td>
</tr>
</tbody>
</table>

\[
\text{LAT_LONG_REQ}
\]

RESERVED - Reserved bits.

The mobile station shall set the record type specific field as follows:

2 NUM_PILOTS - Number of Pilots reported.

The mobile station shall set this field to the number of pilots whose information is requested in this message.

The mobile station shall set this field to a number equal or greater than one.

7 SID_NID_REQ - SID, NID information requested indicator.

The mobile station shall set this field to ‘1’ if it also requests the SID and NID information for these pilots; otherwise, the mobile station shall set this field to ‘0’.

The mobile station shall include NUM_PILOTS occurrences of the following one-field record:

13 PILOT_PN - Pilot PN sequence offset index.

The mobile station shall set this field to the pilot PN sequence offset for the base station, in units of 64 PN chips, whose Base Station identification number information is being requested.

18 LAT_LONG_REQ - Base station LAT/LONG information requested indicator.

The mobile station shall set this field to ‘1’ if it also requests the LAT/LONG information for these pilots; otherwise, the mobile station shall set this field to ‘0’.

22 RESERVED - Reserved bits.

The mobile station shall add reserved bits as needed in order to make the length of the record equal to an integer number.
of octets. The mobile station shall set these bits to ‘0’.
2.7.2.3.2.40 CDMA Off Time Report Message

**MSG_TAG:** COTRM

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>CDMA_OFF_TIME_ENABLE</td>
<td>1</td>
</tr>
<tr>
<td>CDMA_OFF_TIME_START</td>
<td>0 or 6</td>
</tr>
<tr>
<td>CDMA_OFF_TIME_UNIT</td>
<td>0 or 2</td>
</tr>
<tr>
<td>CDMA_OFF_TIME_MODE</td>
<td>0 or 1</td>
</tr>
<tr>
<td>CDMA_OFF_TIME</td>
<td>0 or 4</td>
</tr>
<tr>
<td>CDMA_OFF_TIME_PERIOD</td>
<td>0 or 6</td>
</tr>
</tbody>
</table>

**CDMA_OFF_TIME_ENABLE** – Off time reporting enable
The mobile station shall set this field to ‘1’ if the mobile station plans to suspend its CDMA Traffic Channel processing. The mobile station shall set this field to ‘0’ to cancel a previously reported CDMA Traffic Channel processing suspension.

**CDMA_OFF_TIME_START** – The start time when the mobile station moves away from the CDMA Traffic Channel.
If **CDMA_OFF_TIME_ENABLE** is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:
The mobile station shall set this field to the System Time, in units of 80 ms (modulo 64), at which the mobile station plans to go away from the CDMA Traffic Channel.

**CDMA_OFF_TIME_UNIT** – Time unit used in **CDMA_OFF_TIME**
If **CDMA_OFF_TIME_ENABLE** is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:
The mobile station shall set this field to the time unit used in **CDMA_OFF_TIME**, as specified in Table 2.7.2.3.2.40-1.
Table 2.7.2.3.2.40-1. CDMA Off Time Unit

<table>
<thead>
<tr>
<th>CDMA_OFF_TIME_UNIT (binary)</th>
<th>Time Unit (decimal)</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>80 ms</td>
</tr>
<tr>
<td>01</td>
<td>0.5 sec</td>
</tr>
<tr>
<td>10</td>
<td>1 sec</td>
</tr>
<tr>
<td>11</td>
<td>RESERVED</td>
</tr>
</tbody>
</table>

CDMA_OFF_TIME_MODE – CDMA off time mode

If CDMA_OFF_TIME_ENABLE is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to ‘1’ if CDMA_OFF_TIME is periodic; otherwise, the mobile station shall set this field to ‘0’.

CDMA_OFF_TIME – The total time that the mobile station plans to be away from the CDMA Traffic Channel.

If CDMA_OFF_TIME_ENABLE is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to one less than the mobile station’s estimate of the total time it is off the CDMA Traffic Channel, in units of CDMA_OFF_TIME_UNIT.

CDMA_OFF_TIME_PERIOD – The time between CDMA_OFF_TIME

If CDMA_OFF_TIME_MODE is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to the time minus 10 seconds, in units of 10 seconds, between the beginning of successive CDMA_OFF_TIME.
2.7.2.3.2.41 Authentication Response Message

MSG_TAG: AURSPM

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES</td>
<td>128</td>
</tr>
<tr>
<td>SIG_INTEGRITY_SUP_INCL</td>

<tr>
<td>SIG_INTEGRITY_REQ</td>
<td>0 or 3</td>
</tr>
<tr>
<td>NEW_KEY_ID</td>
<td>2</td>
</tr>
<tr>
<td>NEW_SSEQ_H</td>
<td>24</td>
</tr>
</tbody>
</table>

RES — The output, RES, of the User Authentication Function.

The mobile station shall set this field to the output, RES, of the function as specified in Figure 2.3.12.5.2-2. If the UIM returns a RES value with length smaller than 128, the mobile station shall store the RES value in the most significant bits of the RES field and pad the least significant bits with '0's.

SIG_INTEGRITY_SUP_INCL — Signaling message integrity information included indicator.

If the mobile station supports other integrity algorithm(s) in addition to the default integrity algorithm, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

SIG_INTEGRITY_SUP — Signaling integrity algorithm supported by the mobile station.

If SIG_INTEGRITY_SUP_INCL is set to ‘1’, the mobile station shall set this field as follows; otherwise, the mobile station shall omit this field.

The mobile station shall set this field to indicate the supported message integrity algorithms in addition to the default integrity algorithm.

This field consists of the subfields shown in Table 2.7.1.3.2.1-6.

The mobile station shall set each subfield to ‘1’ if the corresponding message integrity algorithm is supported by the mobile station; otherwise, the mobile station shall set the subfield to ‘0’.

The mobile station shall set the RESERVED subfield to ‘00000000’.
SIG_INTEGRITY_REQ – Signaling message integrity algorithm requested by the mobile station. If SIG_INTEGRITY_SUP_INCL is set to ‘1’, the mobile station shall set this field as follows; otherwise, the mobile station shall omit this field. The mobile station shall include this field and set it to the value corresponding to the message integrity algorithm requested as shown in Table 2.7.1.3.2.1-7.

NEW_KEY_ID – New key identifier. The mobile station shall set this field as follows:
- If LAST_3G_KEY_ID equals ‘10’, the mobile station shall set this field to ‘11’.
- If LAST_3G_KEY_ID equals ‘11’, the mobile station shall set this field to ‘10’.

NEW_SSEQ_H – The 24-bit value used to initialize the 24 MSB of the crypto-sync. The mobile station shall set this field to a 24-bit value that will be used as the initial value of the 24 MSB of the crypto-sync for both forward and reverse link message integrity.
2.7.2.3.2.42 Authentication Resynchronization Message

MSG_TAG: AURSYNM

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>CON_MS_SQN</td>
<td>48</td>
</tr>
<tr>
<td>MAC_S</td>
<td>64</td>
</tr>
</tbody>
</table>

CON_MS_SQN – The concealed sequence number of the authentication vector. The mobile station shall set this field to the output, CON_MS_SQN, of the function as specified in Figure 2.3.12.5.2-3.

MAC_S – Message authentication code for resynchronization. The mobile station shall set this field to the output, MAC_S, of the function as specified in Figure 2.3.12.5.2-3.
### 2.7.2.3.2.43 ITBSPM Request Message

**MSG_TAG: ITBSPMRM**

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>BCMC_REQ_TYPE</td>
<td>4</td>
</tr>
<tr>
<td>NUM_BCMC_PROGRAMS</td>
<td>0 or 68</td>
</tr>
</tbody>
</table>

If NUM_BCMC_PROGRAMS field is included, NUM_BCMC_PROGRAMS+1 occurrences of the following record:

```
{ (NUM_BCMC_PROGRAMS+1)
    BCMC_PROGRAM_ID_LEN  5
    BCMC_PROGRAM_ID      Variable (Value of BCMC_PROGRAM_ID_LEN + 1)
    BCMC_FLOW_DISCRIMINATOR_LEN  3
    NUM_FLOW_DISCRIMINATOR Variable (Value of BCMC_FLOW_DISCRIMINATOR_LEN)

    NUM_FLOW_DISCRIMINATOR+1 or 1 occurrences of the following variable length record:
    { (NUM_FLOW_DISCRIMINATOR+1) or 1
      BCMC_FLOW_DISCRIMINATOR Variable (Value of BCMC_FLOW_DISCRIMINATOR_LEN)
    } (NUM_BCMC_PROGRAMS+1)
```

**BCMC_REQ_TYPE** – BCMC Request Type.

The mobile station shall set this field as specified in Table 2.7.2.3.2.43-1 to request transmission of ITBSPM over traffic channel.

#### Table 2.7.2.3.2.43-1 BCMC Request Type

<table>
<thead>
<tr>
<th>Value (binary)</th>
<th>BCMC Request</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Request Information for all BCMC_FLOW_IDS

<table>
<thead>
<tr>
<th>0000</th>
<th>Request information for all BCMC_FLOW_IDS</th>
</tr>
</thead>
<tbody>
<tr>
<td>0001</td>
<td>Request information for Traffic Channel BCMC_FLOW_IDS</td>
</tr>
<tr>
<td>0010</td>
<td>Request information for BCMC_FLOW_IDS (See section 2.6.13.11) specified in this message</td>
</tr>
<tr>
<td>0011-1111</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

1 NUM_BCMC_PROGRAMS – Number of BCMC programs included.

2 If BCMC_REQ_TYPE is not set to ‘0010’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.

3 The mobile station shall set this field to the number of BCMC programs included in this message minus 1.

4 If the NUM_BCMC_PROGRAMS field is included, the mobile station shall include NUM_BCMC_PROGRAMS+1 occurrences of the following record:

5 **BCMC_PROGRAM_ID_LEN** - Length of BCMC_PROGRAM_ID field

6 The mobile station shall set this field to one less than the length, in bits, of the BCMC_PROGRAM_ID of this program.

7 **BCMC_PROGRAM_ID** - BCMC program Identifier

8 The length of this field shall be one more than the value of BCMC_PROGRAM_ID_LEN bits.

9 The mobile station shall set this field to the identifier of the BCMC program corresponding to one or more flows that the mobile station will continue to monitor or start to monitor upon receiving confirmation of delivery of this message or is requesting transmission.

10 **BCMC_FLOW_DISCRIMINATOR_LEN** - Length of BCMC_FLOW_DISCRIMINATOR field

11 The mobile station shall set this field to the length, in bits, of the BCMC_FLOW_DISCRIMINATOR of this program. To request all flows associated with this BCMC_PROGRAM_ID, the mobile station may set this field to ‘000’.
NUM_FLOW_DISCRIMINATOR - Number of BCMC flow discriminators

The length of this field shall be determined by the value of the BCMC_FLOW_DISCRIMINATOR_LEN as follows: if BCMC_FLOW_DISCRIMINATOR_LEN is set to ‘000’, this field is omitted; otherwise, the length of this field shall be BCMC_FLOW_DISCRIMINATOR_LEN bits.

The mobile station shall set this field to the number of flow discriminators included for this program minus one.

If NUM_FLOW_DISCRIMINATOR field is included, the mobile station shall include NUM_FLOW_DISCRIMINATOR+1 occurrences of the following variable length record; otherwise, the mobile station shall include 1 occurrence of the following variable length record:

BCMC_FLOW_DISCRIMINATOR – BCMC Flow Discriminator.

The length of this field shall be determined by the value of the BCMC_FLOW_DISCRIMINATOR_LEN as follows: if BCMC_FLOW_DISCRIMINATOR_LEN is set to ‘000’, this field is omitted; otherwise, the length of this field shall be BCMC_FLOW_DISCRIMINATOR_LEN bits.

The mobile station shall set this field to the discriminator of the BCMC flow.
2.7.3 Orders

*Order Messages* are sent by the mobile station on the r-csch and on the r-dsch. The general PDU format used on the r-csch is defined in 2.7.1.3.2.2, and the general PDU format used on the r-dsch is defined in 2.7.2.3.2.1. There are many specific types of *Order Messages*, as shown in Table 2.7.3-1.

The mobile station may send on the r-csch any type of order shown in Table 2.7.3-1 with a ‘Y’ in the first column, but shall not send on the r-csch any type of order with an ‘N’ in the first column. The mobile station may send on the r-dsch any type of order shown in Table 2.7.3-1 with a ‘Y’ in the second column, but shall not send on the r-dsch any type of order with an ‘N’ in the second column. The mobile station shall be capable of sending all types of orders shown in Table 2.7.3-1 with a ‘Y’ in the sixth column.

An order consists of a 6-bit order code and zero or more order-specific fields. The mobile station shall set the ORDER field in the *Order Message* to the order code shown in Table 2.7.3-1 corresponding to the type of order being sent.

If the order qualification code in the fourth column of Table 2.7.3-1 is ‘00000000’ and there are no other additional fields as shown by an ‘N’ in the fifth column, the mobile station shall include no order qualification code or other order-specific fields in the *Order Message*. The order qualification code of such a message is implicitly ‘00000000’.

If the order qualification code is not ‘00000000’ and there are no other additional fields as shown in Table 2.7.3-1 by an ‘N’ in the fifth column, the mobile station shall include the order qualification code as the only order-specific field in the *Order Message*.

If there are other additional fields as shown in Table 2.7.3-1 by a ‘Y’ in the fifth column, the mobile station shall include order-specific fields as specified in the corresponding subsection of this section.

2.7.3.1 Base Station Challenge Order

<table>
<thead>
<tr>
<th>Order-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORDQ</td>
<td>8</td>
</tr>
<tr>
<td>RANDBS</td>
<td>32</td>
</tr>
</tbody>
</table>

ORDQ – Order qualification code. The mobile station shall set this field to ‘00000000’.

RANDBS – Random challenge data. The mobile station shall set this field as specified in 2.3.12.1.5.
2.7.3.2 Service Option Request Order

<table>
<thead>
<tr>
<th>Order-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORDQ</td>
<td>8</td>
</tr>
<tr>
<td>SERVICE_OPTION</td>
<td>16</td>
</tr>
</tbody>
</table>

ORDQ – Order qualification code. The mobile station shall set this field to ‘00000000’.

SERVICE_OPTION – Service option. The mobile station shall set this field to the service option code specified in [30], corresponding to the requested or alternative service option.
2.7.3.3 Service Option Response Order

<table>
<thead>
<tr>
<th>Order-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORDQ</td>
<td>8</td>
</tr>
<tr>
<td>SERVICE_OPTION</td>
<td>16</td>
</tr>
</tbody>
</table>

ORDQ – Order qualification code. The mobile station shall set this field to ‘00000000’.

SERVICE_OPTION – Service option. The mobile station shall set this field to the service option code specified in [30], corresponding to the accepted service option, or to ‘0000000000000000’ to reject the proposed service option. See 2.6.4.1.2.2.1.
### 2.7.3.4 Mobile Station Reject Order

<table>
<thead>
<tr>
<th>Order-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORDQ</td>
<td>8</td>
</tr>
<tr>
<td>REJECTED_TYPE</td>
<td>8</td>
</tr>
</tbody>
</table>

If the order is sent on the Access Channel or Enhanced Access Channel and

REJECTED_TYPE is ‘00000111’,
or if the order is sent on the Reverse Traffic Channel and

REJECTED_TYPE is ‘00000001’,

the order-specific fields also include the following two fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RESERVED_1</td>
<td>2</td>
</tr>
<tr>
<td>REJECTED_ORDER</td>
<td>6</td>
</tr>
<tr>
<td>REJECTED_ORDQ</td>
<td>8</td>
</tr>
</tbody>
</table>

If the order is sent on the Reverse Traffic Channel and

REJECTED_TYPE is ‘00001100’,

the order-specific fields also include the following field:

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>REJECTED_PARAM_ID</td>
<td>16</td>
</tr>
</tbody>
</table>

If the order is sent on the Access Channel or Enhanced Access Channel and

REJECTED_TYPE is ‘00001100’,
or if the order is sent on the Reverse Traffic Channel and

REJECTED_TYPE is ‘00000011’, ‘00101000’, ‘00001110’, or ‘00101010’,

the order-specific fields also include the following field:

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>REJECTED_RECORD</td>
<td>8</td>
</tr>
</tbody>
</table>

If the ORDQ is ‘00010000’, ‘00010001’, or ‘00010010’, the order-specific fields also include the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>CON_REF</td>
<td>8</td>
</tr>
</tbody>
</table>

If the ORDQ is ‘00010011’, the order-specific fields also include the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>CON_REF</td>
<td>8</td>
</tr>
<tr>
<td>TAG</td>
<td>4</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>REJECTED_PDU_TYPE</td>
<td>0 or 2</td>
</tr>
<tr>
<td>RESERVED_2</td>
<td>0 - 7 (as needed)</td>
</tr>
</tbody>
</table>
ORDQ – Order qualification code.
The mobile station shall set this field to the ORDQ value shown in Table 2.7.3-1 corresponding to the reason for rejecting the message.

REJECTED_TYPE – Message type of rejected message.
The mobile station shall set this field to the value of the MSG_TYPE or the MSG_ID (see [4]) field of the message being rejected. If the MSG_TYPE or the MSG_ID (see [4]) field is not 8 bits, the mobile station shall set the least significant bits of this field to the value of the MSG_TYPE field and set all the remaining bits to ‘0’.

RESERVED_1 - Reserved bits.
The mobile station shall set this field to ‘00’.

REJECTED_ORDER – Order type of rejected message.
If the rejected message was an Order Message, the mobile station shall set this field to the value of the ORDER field in the rejected message. Otherwise, the mobile station shall omit this field.

REJECTED_ORDQ – Order qualification code of rejected message.
If the rejected message was an Order Message including an ORDQ field, the mobile station shall set this field to the value of the ORDQ field in the rejected message. If the rejected message was an Order Message not including an ORDQ field, the mobile station shall set this field to ‘00000000’. Otherwise, the mobile station shall omit this field.

REJECTED_PARAM_ID – Parameter identification of the rejected parameter.
If the rejected message was a Set Parameters Message, the mobile station shall set this field to the PARAMETER_ID of the first parameter for which the requested operation could not be completed. Otherwise, the mobile station shall omit this field.

REJECTED_RECORD – Record type of the rejected information record.
If the rejected message was a Feature Notification Message, an Alert With Information Message, Extended Alert With Information Message, Extended Flash With Information Message, or a Flash With Information Message, the mobile station shall set this field to the RECORD_TYPE field of the first information record that could not be accepted. Otherwise, the mobile station shall omit this field.

CON_REF – Connection reference.
The mobile station shall set this field to the value of the connection reference of the service option connection corresponding to the call.

**TAG** – Transaction identifier.

The mobile station shall set this field to the transaction identifier (received from the base station) of the call assignment being rejected.

**REJECTED_PDU_TYPE** – PDU type of the rejected message.

If P_REV_IN_USE is less than six, the mobile station shall omit this field; otherwise, the mobile station shall set this field to the REJECTED_PDU_TYPE code shown in Table 2.7.3.4-1 corresponding to the PDU type of the message being rejected.

### Table 2.7.3.4-1. REJECTED_PDU_TYPE codes

<table>
<thead>
<tr>
<th>REJECTED_PDU_TYPE (binary)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>20 ms regular message</td>
</tr>
<tr>
<td>01</td>
<td>5 ms mini message</td>
</tr>
<tr>
<td>01</td>
<td>Reserved</td>
</tr>
<tr>
<td>11</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

**RESERVED_2** – Reserved bits.

The mobile station shall add reserved bits as needed in order to make the total length of this record containing order-specific fields equal to an integer number of octets. The mobile station shall set these bits to ‘0’.
2.7.3.5 Release Order

<table>
<thead>
<tr>
<th>Order-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORDQ</td>
<td>8</td>
</tr>
</tbody>
</table>

If the ORDQ is ‘00000011’, the mobile station shall include the following order-specific record:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>RSC_MODE_IND</td>
<td>1</td>
</tr>
<tr>
<td>RSCI</td>
<td>0 or 4</td>
</tr>
<tr>
<td>RSC_END_TIME_UNIT</td>
<td>0 or 2</td>
</tr>
<tr>
<td>RSC_END_TIME_VALUE</td>
<td>0 or 4</td>
</tr>
</tbody>
</table>

ORDQ – Order qualification code. The mobile station shall set this field to the order qualification code, in accordance with Table 2.7.3-1.

RSC_MODE_IND – Reduced slot cycle mode indicator. If ORDQ is equal to ‘00000011’, the mobile station shall include this field and set it as specified below; otherwise, the mobile station shall omit this field. The mobile station shall set this field to ‘1’ to indicate that it will operate in the reduced slot cycle mode following release of the traffic channel; otherwise, the mobile station shall set this field to ‘0’.

RSCI – Reduced slot cycle index. If RSC_MODE_IND is included and equal to ‘1’, the mobile station shall include this field and set it to the value of the reduced slot cycle index, as specified in Table 2.7.1.3.2.1-8; otherwise, the mobile station shall omit this field.
The mobile station shall set this field to a value less than the registered slot cycle index, SLOT_CYCLE_INDEX_REG.

RSC_END_TIME_UNIT - Reduced slot cycle mode end time unit.

If RSC_MODE_IND is equal to '0', the mobile station shall omit this field; otherwise, the mobile station shall set this field according to Table 2.7.3.5-1 to indicate the units of the RSC_END_TIME_VALUE field.

Table 2.7.3.5-1. RSC_END_TIME_UNIT and MAX_RSC_END_TIME_UNIT values

<table>
<thead>
<tr>
<th>Field (binary)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>unit is 4 seconds</td>
</tr>
<tr>
<td>01</td>
<td>unit is 20 seconds</td>
</tr>
<tr>
<td>10</td>
<td>unit is 100 seconds</td>
</tr>
<tr>
<td>11</td>
<td>RESERVED</td>
</tr>
</tbody>
</table>

RSC_END_TIME_VALUE - Reduced slot cycle mode end time value.

If RSC_MODE_IND is equal to '0', the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to the system time (modulo 16), in units of time specified by RSC_END_TIME_UNIT (modulo 16), at which the mobile station is to exit the reduced slot cycle mode.
2.7.3.6 Fast Call Setup Order

<table>
<thead>
<tr>
<th>Order-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORDQ</td>
<td>8</td>
</tr>
<tr>
<td>RSC_MODE_IND</td>
<td>1</td>
</tr>
<tr>
<td>RSCI</td>
<td>0 or 4</td>
</tr>
<tr>
<td>RSC_END_TIME_UNIT</td>
<td>0 or 2</td>
</tr>
<tr>
<td>RSC_END_TIME_VALUE</td>
<td>0 or 4</td>
</tr>
</tbody>
</table>

ORDQ – Order qualification code.

The mobile station shall set this field to the ORDQ value shown in Table 2.7.3-1.

RSC_MODE_IND – Reduced slot cycle mode indicator.

The mobile station shall set this field to ‘1’ to indicate that it will operate in the reduced slot cycle mode; otherwise, the mobile station shall set this field to ‘0’.

RSCI - Reduced slot cycle index.

If RSC_MODE_IND is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it to the value of the reduced slot cycle index, as specified in Table 2.7.1.3.2.1-8.

The mobile station shall set this field to a value less than the registered slot cycle index, SLOT_CYCLE_INDEX_REG.

RSC_END_TIME_UNIT – Reduced slot cycle mode end time unit.

If RSC_MODE_IND is equal to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall set this field according to Table 2.7.3.5-1 to indicate the units of the RSC_END_TIME_VALUE field.

RSC_END_TIME_VALUE – Reduced slot cycle mode end time value.

If RSC_MODE_IND is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to the system time \(\text{(modulo 16)}\), in units of time specified by RSC_END_TIME_UNIT \(\text{(modulo 16)}\), at which the mobile station is to exit the reduced slot cycle mode.
2.7.4 Information Records

On the r-csch, information records may be included in the *Status Response Message*, the *Extended Status Response Message*, the *Origination Message*, and the *Device Information Message*. On the r-dsch, information records may be included in the *Origination Continuation Message*, the *Enhanced Origination Message*, the *Flash With Information Message*, the *Extended Flash With Information Message*, the *Service Request Message*, the *Service Response Message*, the *Status Message*, and the *Status Response Message*. Table 2.7.4-1 lists the information record type values that may be used with each message type. The following sections describe the contents of each of the record types in detail.
### Table 2.7.4-1. Information Record Types (Part 1 of 3)

“Flash” refers to either the Flash With Information Message or the Extended Flash With Information Message.

“DIM” refers to the Device Information Message.

[1] This information record may be included in a Status Message, a Status Response Message, or an Extended Status Response Message.

[2] This information record may be included in a Status Response Message or an Extended Status Response Message.
1 2.7.4.1 Reserved
2.7.4.2 Keypad Facility

This information record can be included in a Flash With Information Message and allows the user to send characters entered via a keyboard or other such terminal.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHARi</td>
<td>8</td>
</tr>
</tbody>
</table>

One or more occurrences of the following field:

```
{ 
  CHARi
}
```

CHARi – Character.

The mobile station shall include one occurrence of this field for each character entered. The mobile station shall set each occurrence of this field to the ASCII representation corresponding to the character entered, as specified in [9], with the most significant bit set to ‘0’.
2.7.4.3 Called Party Number

This information record identifies the called party’s number.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>NUMBER_TYPE</td>
<td>3</td>
</tr>
<tr>
<td>NUMBER_PLAN</td>
<td>4</td>
</tr>
</tbody>
</table>

Zero or more occurrences of the following field:

{CHAR_i 8}

| RESERVED  | 1 |

NUMBER_TYPE – Type of number.

The mobile station shall set this field to the NUMBER_TYPE value shown in Table 2.7.1.3.2.4-2 corresponding to the type of the called number, as defined in [7], Section 4.5.9.

If the mobile station determines that the user has entered an international number (for example, with a leading “+” as specified in [39] for Plus Code Dialing or an international access code), the mobile station should set this field to ‘001’.

NUMBER_PLAN – Numbering plan.

The mobile station shall set this field to the NUMBER_PLAN value shown in Table 2.7.1.3.2.4-3 corresponding to the numbering plan used for the called number, as defined in [7], Section 4.5.9.

CHAR_i – Character.

The mobile stations shall include one occurrence of this field for each character in the called number. The mobile station shall set each occurrence of this field to the ASCII representation corresponding to the character, as specified in [9], with the most significant bit set to ‘0’.

RESERVED – Reserved bit.

The mobile station shall set this field to ‘0’.
2.7.4.4 Calling Party Number

This information record can be included in a *Flash With Information Message* and identifies the calling party’s number.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>

</tr>
</tbody>
</table>

Zero or more occurrences of the following field:

```
/  
CHARi 8  
/  
RESERVED 5  
```

- **NUMBER_TYPE** – Type of number.
  - The mobile station shall set this field to the NUMBER_TYPE value shown in Table 2.7.1.3.2.4.2 corresponding to the type of the calling number, as defined in [7], Section 4.5.9.
  - If the mobile station determines that this number is an international number (for example, with a leading “+” as specified in [39] for Plus Code Dialing or an international access code), the mobile station should set this field to ‘001’.

- **NUMBER_PLAN** – Numbering plan.
  - The mobile station shall set this field to the NUMBER_PLAN value shown in Table 2.7.1.3.2.4.3 corresponding to the numbering plan used for the calling number, as defined in [7], Section 4.5.9.

- **PI** – Presentation indicator.
  - This field indicates whether or not the calling number should be displayed.
  - The mobile station shall set this field to the PI value shown in Table 2.7.4.4.1 corresponding to the presentation indicator, as defined in [7], Section 4.5.9.
Table 2.7.4.4-1. Presentation Indicators

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

CHARi – Character.

The mobile stations shall include one occurrence of this field for each character in the calling number. The mobile station shall set each occurrence of this field to the ASCII representation corresponding to the character, as specified in [9], with the most significant bit set to ‘0’.

RESERVED – Reserved bits.

The mobile station shall set this field to ‘00000’.
1 2.7.4.5 Reserved
2
2.7.4.6 Call Mode

This information record can be included in a Status Message or a Status Response Message to return the mobile station's preferred call mode and call-related information.

If \( P_{\text{REV_{IN\_USE}}} \) is equal to or greater than seven, this information record will not be requested by the base station (see 3.7.2.3.2.15 & 3.7.4.4).

<table>
<thead>
<tr>

<tr>
<td>PRI_SERVICE</td>
<td>16</td>
</tr>
<tr>
<td>SEC_SERVICE</td>
<td>16</td>
</tr>
<tr>
<td>RESERVED</td>
<td>7</td>
</tr>
</tbody>
</table>

ORIG_MODE – Origination mode indicator.

If the current call is a mobile-originated call, the mobile station shall set this field to ‘0’. If the current call is a mobile-terminated call, the mobile station shall set this field to ‘1’.

PRI_SERVICE – Primary service option.

The mobile station shall set this field to the value specified in [30], corresponding to the current primary service option. If no primary service option is active, the mobile station shall set this field to ‘0000000000000000’.

SEC_SERVICE – Secondary service option.

The mobile station shall set this field to the value specified in [30], corresponding to the current secondary service option. If no secondary service option is active, the mobile station shall set this field to ‘0000000000000000’.

RESERVED – Reserved bits.

The mobile station shall set this field to ‘0000000’.
2.7.4.7 Terminal Information

This information record can be included in a *Status Message*, a *Status Response Message*, or an *Extended Status Response Message* to return configuration information about the mobile station.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>

<tr>
<td>SCM</td>
<td>8</td>
</tr>
<tr>
<td>LOCAL_CTRL</td>
<td>1</td>
</tr>
<tr>
<td>SLOT_CYCLE_INDEX</td>
<td>3</td>
</tr>
</tbody>
</table>

One or more occurrences of the following field:

\[
\{
\begin{align*}
\text{SERVICE OPTION} & \quad 16 \\
\text{SIGN_SLOT_CYCLE_INDEX} & \quad 0 \text{ or } 1 \\
\text{RESERVED} & \quad 0 - 7 \text{ (as needed) }
\end{align*}
\]

MOB_P_REV – Protocol revision of the mobile station.

If the status request does not specify a band class, the mobile station shall set this field to ‘00001011’; otherwise, the mobile station shall set this field to the MOB_P_REV associated with the requested band class and operating mode.

MOB_MFG_CODE – Manufacturer code.

This field identifies the manufacturer of the mobile station.

The mobile station shall set this field to the manufacturer code assigned to its manufacturer.

MOB_MODEL – Model number.

This number is assigned by the manufacturer for a particular model.

The mobile station shall set this field to the model number assigned by the manufacturer for this mobile station.
MOB_FIRM_REV – Firmware revision number. This number is assigned by the manufacturer for a particular firmware version. The mobile station shall set this field to the revision number assigned by the manufacturer for the firmware version running in this mobile station.

SCM – Station class mark. The mobile station shall set this field to its station class mark. See 2.3.3.

LOCAL_CTRL – Local control indicator. If local control is enabled, the mobile station shall set this field to ‘1’. If local control is disabled, the mobile station shall set this field to ‘0’. See [6].

SLOT_CYCLE_INDEX – Slot cycle index. If the requested operating mode is not CDMA and the mobile station is not configured for slotted mode operation, the mobile station shall set this field to ‘000’; otherwise, the mobile station shall set this field as follows:

- If \( P_{REV\_IN\_USE} \) is less than eleven, the mobile station shall set this field to \( \min(0, \text{SLOT\_CYCLE\_INDEX\_REG}) \) (see 2.6.2.1.1).

- If \( P_{REV\_IN\_USE} \) is greater or equal to eleven, the mobile station shall set this field to the absolute value of the registered slot cycle index, \( \text{SLOT\_CYCLE\_INDEX\_REG} \) (see 2.6.2.1.1); otherwise, the mobile station shall set this field to ‘000’. The sign of the registered slot cycle, \( \text{SLOT\_CYCLE\_INDEX\_REG} \), is specified in the SIGN_SLOT_CYCLE_INDEX field of this message (see Table 2.7.1.3.2.1-8).

SERVICE_OPTION – Supported service option. If the requested operating mode is CDMA, the mobile station shall include one occurrence of this field for each service option supported by the mobile station (see [30]); otherwise, the mobile station shall include one occurrence of this field with the value set to ‘0000000000000000’.

SIGN_SLOT_CYCLE_INDEX – Sign of the slot cycle index. If the SLOT_CYCLE_INDEX field is set to ‘000’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

- The mobile station shall set this field as specified in Table 2.7.1.3.2.1-8 to the sign of the registered slot cycle index, \( \text{SLOT\_CYCLE\_INDEX\_REG} \) (see 2.6.2.1.1). The absolute value of the registered slot cycle index, \( \text{SLOT\_CYCLE\_INDEX\_REG} \), is specified in the SLOT_CYCLE_INDEX field of this message.
reserved – Reserved bits.

The mobile station shall add reserved bits as needed in order to make the length of the entire information record equal to an integer number of octets. The mobile station shall set these bits to '0'. The mobile station shall set this field to '000'.
2.7.4.8 Roaming Information

This information record can be included in a Status Message, a Status Response Message, or an Extended Status Response Message to return roaming information about the mobile station.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCOLC</td>
<td>4</td>
</tr>
<tr>
<td>MOBTERM_HOME</td>
<td>1</td>
</tr>
<tr>
<td>MOBTERM_FOR_SID</td>
<td>1</td>
</tr>
<tr>
<td>MOBTERM_FOR_NID</td>
<td>1</td>
</tr>
</tbody>
</table>

Zero or more occurrences of the following record:

```
{
  SID          15
  NID          16
}
```

RESERVED          0 - 7 (as needed)

ACCOLC – Overload class.

The mobile station shall set this field to the access overload class assigned to the mobile station.

MOBTERM_HOME – Home (non-roaming) registration enable indicator.

If the mobile station is configured to receive mobile station terminated calls when not roaming, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’. See 2.6.5.3.

MOBTERM_FOR_SID – Foreign SID roaming registration enable indicator.

If the mobile station is configured to receive mobile station terminated calls when it is a foreign SID roamer, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’. See 2.6.5.3.

MOBTERM_FOR_NID – Foreign NID roaming registration enable indicator.

If the mobile station is configured to receive mobile station terminated calls when it is a foreign NID roamer, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’. See 2.6.5.3.
The mobile station shall include one occurrence of the following two-field record for each home (non-roaming) (SID, NID) pair (see 2.6.5.2):

- **SID** – System identification. The mobile station shall set this field to the SID value for this (SID, NID) pair.

- **NID** – Network identification. The mobile station shall set this field to the NID value for this (SID, NID) pair.

- **RESERVED** – Reserved bits. The mobile station shall add reserved bits as needed in order to make the length of the entire information record equal to an integer number of octets. The mobile station shall set these bits to ‘0’.
2.7.4.9 Security Status

This information record can be included in a Status Message or a Status Response Message to return the authentication, encryption, and voice privacy modes of the mobile station.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUTH_MODE</td>
<td>2</td>

<tr>
<td>ENCRYPT_MODE</td>
<td>2</td>
</tr>
<tr>
<td>PRIVATE_LCM</td>
<td>1</td>
</tr>
<tr>
<td>RESERVED</td>
<td>3</td>
</tr>
</tbody>
</table>

- **AUTH_MODE** – Authentication mode.
- If the mobile station provided standard authentication information at the initiation of this call, the mobile station shall set this field to ‘01’; otherwise, the mobile station shall set this field to ‘00’. All other values are reserved.

- **ENCRYPT_MODE** – Message encryption mode.
- The mobile station shall set this field to the value shown in Table 3.7.2.3.2.8-2 corresponding to the message encryption mode currently in use for this call.

- **PRIVATE_LCM** – Private long code mask indicator.
- If the mobile station is using the private long code mask for this call, the mobile station shall set this field to ‘1’. If the mobile station is using the public long code mask for this call, the mobile station shall set this field to ‘0’.

- **RESERVED** – Reserved bits.
- The mobile station shall set this field to ‘000’.
2.7.4.10 Connected Number

This information record can be included in a *Flash With Information Message* to identify the responding party to a call.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>NUMBER_TYPE</td>

</tr>
<tr>
<td>SI</td>
<td>2</td>
</tr>
</tbody>
</table>

Zero or more occurrences of the following field:

```plaintext
{ CHARi 8 }
```

- **NUMBER_TYPE** - Type of number.
  - The mobile station shall set this field to the NUMBER_TYPE value shown in Table 2.7.1.3.2.4-2 corresponding to the type of the connected number as defined [7], Section 4.5.9.
  - If the mobile station determines that this number is an international number (for example, with a leading “+” as specified in [39] for Plus Code Dialing or an international access code), the mobile station should set this field to ‘001’.

- **NUMBER_PLAN** - Numbering plan.
  - The mobile station shall set this field to the NUMBER_PLAN value shown in Table 2.7.1.3.2.4-3 corresponding to the numbering plan used for the connected number, as defined, in [7], Section 4.5.9.

- **PI** - Presentation indicator.
  - This field indicates whether or not the connected number should be displayed. The mobile station shall set this field to the PI value shown in Table 2.7.4.4-1 corresponding to the presentation indicator, as defined in [7], Section 4.5.9.

- **SI** - Screening indicator.
  - This field indicates how the connected number was screened. The mobile station shall set this field to the SI value shown in Table 2.7.4.4-2 corresponding to the screening indicator value, as defined in [7], Section 4.5.9.
<table>
<thead>

<td>7</td>
</tr>
<tr>
<td>IMSI_O_S</td>
<td>34</td>
</tr>
<tr>
<td>RESERVED</td>
<td>1</td>
</tr>
</tbody>
</table>

- **IMSI_CLASS** – If IMSI_O is a class 0 IMSI, the mobile station shall set this field to ‘0’; otherwise, the mobile station shall set this field to ‘1’.
- **IMSI_ADDR_NUM** – Number of IMSI_O address digits.
  - If IMSI_O is a class 1 IMSI, the mobile station shall set this field to four less than the number of digits in the NMSI; otherwise, the mobile station shall set this field to ‘000’.
- **MCC_O** – Mobile Country Code of the operational IMSI.
  - The mobile station shall set this field to MCC_O’s. (see 2.3.1).
- **IMSI_O_11_12** – The 11th and 12th digits of the operational IMSI.
  - The mobile station shall set this field to IMSI_O_11_12’s. (see 2.3.1).
- **IMSI_O_S** – Last ten digits of the operational IMSI.
  - The mobile station shall set this field to IMSI_O_S. (see 2.3.1).
- **RESERVED** – Reserved bit.
  - The mobile station shall set this field to ‘0’.
2.7.4.12 ESN

This information record can be included in a *Status Message*, a *Status Response Message*, or an *Extended Status Response Message* to return the mobile station ESN.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESN</td>
<td>32</td>
</tr>
</tbody>
</table>

ESN – Mobile station electronic serial number.

If the mobile station has a R-UIM which indicates that UIM ID is to be used, the mobile station shall set this field to UIM ID (see [40]); otherwise, the mobile station shall set this field to its ESNp (see 2.3.2).
2.7.4.13 Band Class Information

This information record can be included in a Status Response Message, or an Extended Status Response Message to return band class information about the mobile station.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAND_CLASS_INFO</td>
<td>8 × RECORD_LEN</td>
</tr>
</tbody>
</table>

BAND_CLASS_INFO – Band class information.

This field indicates which band classes are supported by the mobile station.

The mobile station shall set the Nth most significant bit of this field to ‘1’ if the Nth band class defined in [45] is supported by the mobile station; otherwise, the mobile station shall set the Nth most significant bit of this field to ‘0’. Example of this field coding is shown in Figure 2.7.4.13-1.

![Figure 2.7.4.13-1. BAND_CLASS_INFO field coding](image)

The mobile station shall add reserved bits as needed in order to make the length of the entire information record equal to an integer number of octets. The mobile station shall set these bits to ‘0’.
2.7.4.14 Power Class Information

This information record can be included in a Status Response Message, or an Extended Status Response Message to return power class information about the mobile station.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAX_EIRP</td>
<td>8</td>
</tr>
</tbody>
</table>

- **MAX_EIRP** – Maximum effective isotropic radiated power (EIRP).

The mobile station shall set this field to the minimum EIRP at maximum output (in dBW) for the mobile station plus 60 (see [11]). When the mobile station output power is expressed in ERP, it may be converted to EIRP by adding 2 dB to the ERP value.\(^7\)

\(^7\) For example, if a mobile station has a minimum ERP at maximum output of -4 dBW, then the mobile station sets this field to 58.
2.7.4.15 Operating Mode Information

This information record can be included in a Status Response Message or an Extended Status Response Message to return operating mode information about the mobile station.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>OP_MODE_INFO</td>
<td>8 × RECORD_LEN</td>
</tr>
</tbody>
</table>

OP_MODE_INFO – Operating mode information.

This field indicates which operating modes are supported by the mobile station in the band class for which information is requested.

This field currently consists of the following subfields which are included in the information record in the order shown in Table 2.7.4.15-1 for P_REV_IN_USEs less than or equal to three and in Table 2.7.4.15-2 for P_REV_IN_USEs greater than three.

**Table 2.7.4.15-1. OP_MODE for P_REV_IN_USEs Less Than or Equal to Three**

<td>–</td>
</tr>
</tbody>
</table>

The mobile station shall set each subfield to ‘1’, if the corresponding operating mode is supported by the mobile station; otherwise, the mobile station shall set the subfield to ‘0’.

RESERVED – Reserved bits.

The mobile station shall set each bit in this field to ‘0’.

When more operating modes are defined, the reserved bits will be used for the new corresponding subfields. Sufficient octets will also be added to this field to accommodate the corresponding new subfields. All the undefined bits in an additional octet will be reserved bits.

If all bits are set to ‘0’ in an octet and all succeeding octets, the mobile station shall omit the octet and the succeeding octets.

<sup>8</sup> The mobile station shall set OP_MODE1 the same as OP_MODE0.
2.7.4.16 Service Option Information

This information record can be included in a Status Response Message, or an Extended Status Response Message to return service option information about the mobile station.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>

<td>16</td>
</tr>
</tbody>
</table>

The mobile station shall include one occurrence of the following record for each service option supported:

- **RESERVED** – Reserved bits. The mobile station shall set this field to ‘000000’.
- **FORWARD_SUPPORT** – Support indicator for Forward Traffic Channel. The mobile station shall set this field to ‘1’ if the service option specified in the SERVICE_OPTION field is supported on the Forward Traffic Channel.
- **REVERSE_SUPPORT** – Support indicator for Reverse Traffic Channel. The mobile station shall set this field to ‘1’ if the service option specified in the SERVICE_OPTION field is supported on the Reverse Traffic Channel.
- **SERVICE_OPTION** – Service option. The mobile station shall set this field to the value specified in [30] for the service option supported.
2.7.4.17 Multiplex Option Information

This information record can be included in a Status Response Message or an Extended Status Response Message to return multiplex option information about the mobile station. The mobile station shall include at least one, and not more than six, instances of the record within the type-specific field according to the following rules:

- Within the type-specific field, the mobile station may include one instance of a record in which MULTIPLEX_OPTION is set to 1. If this instance is included, the mobile station shall support Multiplex Option 1 for forward and reverse operation.
- Within the type-specific field, the mobile station may include one instance of a record in which MULTIPLEX_OPTION is set to 2. If this instance is included, the mobile station shall support Multiplex Option 2 for forward and reverse operation.
- Within the type-specific field, the mobile station may include one instance of a record in which MULTIPLEX_OPTION is set to 3, 5, 7, 9, 11, 13, or 15 and with FOR_NUM_BITS set to ‘00000000’. If this instance is included, the mobile station shall set MULTIPLEX_OPTION to the highest numbered multiplex option from the set {3, 5, 7, 9, 11, 13, 15} which the mobile station supports for reverse operation, and the mobile station shall support all multiplex options less than or equal to MULTIPLEX_OPTION from that set for reverse operation.
- Within the type-specific field, the mobile station may include one instance of a record in which MULTIPLEX_OPTION is set to 4, 6, 8, 10, 12, 14, or 16 and with FOR_NUM_BITS set to ‘00000000’. If this instance is included, the mobile station shall set MULTIPLEX_OPTION to the highest numbered multiplex option from the set {4, 6, 8, 10, 12, 14, 16} which the mobile station supports for reverse operation, and the mobile station shall support all multiplex options less than or equal to MULTIPLEX_OPTION from that set for reverse operation.
- Within the type-specific field, the mobile station may include one instance of a record in which MULTIPLEX_OPTION is set to 3, 5, 7, 9, 11, 13, or 15 and with REV_NUM_BITS set to ‘00000000’. If this instance is included, the mobile station shall set MULTIPLEX_OPTION to the highest numbered multiplex option from the set {3, 5, 7, 9, 11, 13, 15} which the mobile station supports for forward operation, and the mobile station shall support all multiplex options less than or equal to MULTIPLEX_OPTION from that set for forward operation.
- Within the type-specific field, the mobile station may include one instance of a record in which MULTIPLEX_OPTION is set to 4, 6, 8, 10, 12, 14, or 16 and with REV_NUM_BITS set to ‘00000000’. If this instance is included, the mobile station shall set MULTIPLEX_OPTION to the highest numbered multiplex option from the set {4, 6, 8, 10, 12, 14, 16} which the mobile station supports for forward operation, and the mobile station shall support all multiplex options less than or equal to MULTIPLEX_OPTION from that set for forward operation.
- Within the type-specific field, the mobile station shall include at least one instance of a record in which FOR_NUM_BITS is set to a value other than ‘00000000’.

2-971
Within the type-specific field, the mobile station shall include at least one instance of a record in which REV_RATES is set to a value other than ‘00000000’.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>MULTIPLEX_OPTION</td>
<td>16</td>
</tr>
<tr>
<td>FOR_NUM_BITS</td>
<td>8</td>
</tr>
<tr>
<td>REV_NUM_BITS</td>
<td>8</td>
</tr>
</tbody>
</table>

The mobile station shall include one occurrence of the following record for each specified multiplex option according to the previously stated rules:

MULTIPLEX_OPTION – Supported multiplex option.

The mobile station shall set this field to the number of the supported multiplex option from the set {1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16} (e.g., 1 corresponds to Multiplex Option 1).

FOR_NUM_BITS – Forward Traffic Channel number of bits per frame.

If FOR_NUM_BITS = ‘00000000’, then the specified multiplex option in this record shall indicate the supported multiplex option for the Reverse Traffic Channel only. In this case, no further interpretation of the FOR_NUM_BITS field shall be made. The mobile station shall not set both FOR_NUM_BITS and REV_NUM_BITS equal to ‘00000000’ in the same information record.

If MULTIPLEX_OPTION is equal to 1, 3, 5, 7, 9, 11, 13, or 15, this field consists of the subfields specified in Table 2.7.4.17-1 which are included in the information record in the order shown in the table. The subfields in Table 2.7.4.17-1 refer to the number of bits per frame supported on the Fundamental Channel of the Forward Traffic Channel.
Table 2.7.4.17-1. Forward Fundamental Traffic Channel
Number of Bits per Frame for Forward Multiplex Option 1

<table>
<thead>
<tr>
<th>Subfield</th>
<th>Length (bits)</th>
<th>Subfield Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RS1_9600_FOR</td>
<td>1</td>
<td>172 bits per F-FCH frame</td>
</tr>
<tr>
<td>RS1_4800_FOR</td>
<td>1</td>
<td>80 bits per F-FCH</td>
</tr>
<tr>
<td>RS1_2400_FOR</td>
<td>1</td>
<td>40 bits per F-FCH frame</td>
</tr>
<tr>
<td>RS1_1200_FOR</td>
<td>1</td>
<td>16 bits per F-FCH frame</td>
</tr>
<tr>
<td>RESERVED</td>
<td>4</td>
<td>Reserved Bits</td>
</tr>
</tbody>
</table>

If MULTIPLEX_OPTION is equal to 2, 4, 6, 8, 10, 12, 14, or 16, this field consists of the subfields specified in Table 2.7.4.17-2 which are included in the information record in the order shown in the table. The subfields in Table 2.7.4.17-2 refer to the number of bits per frame supported on the Fundamental Channel of the Forward Traffic Channel.

Table 2.7.4.17-2. Forward Fundamental Traffic Channel
Number of Bits per Frame for Forward Multiplex Option equal to 2

<table>
<thead>
<tr>
<th>Subfield</th>
<th>Length (bits)</th>
<th>Subfield Description</th>

</tr>
<tr>
<td>RS2_1800_FOR</td>
<td>1</td>
<td>21 bits per F-FCH frame</td>
</tr>
<tr>
<td>RESERVED</td>
<td>4</td>
<td>Reserved Bits</td>
</tr>
</tbody>
</table>

The mobile station shall set the subfields specified in Tables 2.7.4.17-1 and 2.7.4.17-2, corresponding to the Forward Traffic Channel number of bits per frame supported by the mobile station for this multiplex option to ‘1’, and shall set the remaining subfields to ‘0’. The mobile station shall set RESERVED to ‘0000’.

REV_NUM_BITS – Reverse Traffic Channel transmission rates.

If REV_NUM_BITS is equal to ‘00000000’, then the specified multiplex option in this record indicate the supported multiplex option for the Forward Traffic Channel only. In this case, no further interpretation of the REV_NUM_BITS field shall be made. The mobile station shall not set both FOR_NUM_BITS and REV_NUM_BITS equal to ‘00000000’ in the same information record.
If MULTIPLEX_OPTION is equal to 1, 3, 5, 7, 9, 11, 13, or 15, this field consists of the subfields specified in Table 2.7.4.17-3 which are included in the information record in the order shown in the table. The subfields in Table 2.7.4.17-3 refer to the number of bits per frame supported on the Fundamental Channel of the Reverse Traffic Channel.

Table 2.7.4.17-3. Reverse Fundamental Traffic Channel
Number of Bits per Frame for Reverse Multiplex Option equal to 1

<table>
<thead>
<tr>
<th>Subfield</th>
<th>Length (bits)</th>

<td>1</td>
<td>40 bits per R-FCH frame</td>
</tr>
<tr>
<td>RS1_1200_REV</td>
<td>1</td>
<td>16 bits per R-FCH frame</td>
</tr>
<tr>
<td>RESERVED</td>
<td>4</td>
<td>Reserved Bits</td>
</tr>
</tbody>
</table>

If MULTIPLEX_OPTION is equal to 2, 4, 6, 8, 10, 12, 14, or 16, this field consists of the subfields specified in Table 2.7.4.17-4 which are included in the information record in the order shown in the table. The subfields in Table 2.7.4.17-4 refer to the number of bits per frame supported on the Fundamental Channel of the Reverse Traffic Channel.

Table 2.7.4.17-4. Reverse Fundamental Traffic Channel
Number of Bits per Frame for Reverse Multiplex Option equal to 2

<table>
<thead>
<tr>
<th>Subfield</th>
<th>Length (bits)</th>
<th>Subfield Description</th>

<tr>
<td>RS2_1800_REV</td>
<td>1</td>
<td>21 bits per R-FCH frame</td>
</tr>
<tr>
<td>RESERVED</td>
<td>4</td>
<td>Reserved Bits</td>
</tr>
</tbody>
</table>
The mobile station shall set the subfields specified in Table 2.7.4.17-3 and Table 2.7.4.17-4 corresponding to the Reverse Traffic Channel transmission number of bits per frame supported by the mobile station for this multiplex option to ‘1’, and shall set the remaining subfields to ‘0’. The mobile station shall set RESERVED to ‘0000’.
2.7.4.18 Service Configuration

The format of the Service Configuration information record is defined in 3.7.5.7.
2.7.4.19 Called Party Subaddress

This information record identifies the called party subaddress.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXTENSION_BIT</td>
<td>1</td>
</tr>
<tr>
<td>SUBADDRESS_TYPE</td>

</tr>
<tr>
<td>RESERVED</td>
<td>3</td>
</tr>
</tbody>
</table>

Zero or more occurrences of the following field:

```
{
   CHARi 8
}
```

EXTENSION_BIT – The extension bit. The mobile station shall set this field to ‘1’.

SUBADDRESS_TYPE – Type of subaddress. The mobile station shall set this field to the SUBADDRESS_TYPE value shown in Table 2.7.4.19-1 corresponding to the type of the subaddress, as defined in [7], Section 4.5.8.

<table>
<thead>
<tr>
<th>Description</th>
<th>SUBADDRESS TYPE (binary)</th>
</tr>
</thead>
<tbody>
<tr>
<td>NSAP (see [34])</td>
<td>000</td>
</tr>
<tr>
<td>User specified</td>
<td>010</td>
</tr>
<tr>
<td>Reserved</td>
<td>others</td>
</tr>
</tbody>
</table>

ODD/EVEN_INDICATOR – The indicator of odd/even bits. The mobile station shall set this field to the ODD/EVEN_INDICATOR value shown in Table 2.7.4.19-2 corresponding to the indicator of even/odd bits, as defined in [7], Section 4.5.8. This field is only used when the type of subaddress is “User specified” and the coding is BCD.
Table 2.7.4.19-2. Odd/Even Indicator

<table>
<thead>
<tr>
<th>Description</th>
<th>ODD/EVEN INDICATOR (binary)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Even number of address signals</td>
<td>0</td>
</tr>
<tr>
<td>Odd number of address signals</td>
<td>1</td>
</tr>
</tbody>
</table>

2

RESERVED – Reserved bits.

The mobile station shall set this field to '000'.

CHARi – Character.

The mobile station shall include one occurrence of this field for each character in the called party subaddress.

When the SUBADDRESS_TYPE field is equal to ‘000’, the NSAP address shall be encoded using the preferred binary encoding specified in [35].

When the SUBADDRESS_TYPE field is set to ‘010’, the user-specified subaddress field is encoded according to the user specification, subject to a maximum length of 20 octets.

When interworking with CCITT Recommendation X.25 networks, BCD coding should be applied.
2.7.4.20 Calling Party Subaddress

This information record identifies the calling party subaddress.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXTENSION_BIT</td>
<td>1</td>
</tr>
<tr>
<td>SUBADDRESS_TYPE</td>

</tr>
<tr>
<td>RESERVED</td>
<td>3</td>
</tr>
</tbody>
</table>

Zero or more occurrences of the following field:

```
/  
  
CHARi 8

/  
```

EXTENSION_BIT – The extension bit.

The mobile station shall set this field to ‘1’.

SUBADDRESS_TYPE – Type of subaddress.

The mobile station shall set this field to the SUBADDRESS_TYPE value shown in Table 2.7.4.19-1 corresponding to the type of the subaddress, as defined in [7], Section 4.5.10.

ODD/EVEN_INDICATOR – The indicator of odd/even bits.

The mobile station shall set this field to the ODD/EVEN_INDICATOR value shown in Table 2.7.4.19-2 corresponding to the indicator of even/odd bits, as defined in [7], Section 4.5.10. It is only used when the type of subaddress is “User specified” and the coding is BCD.

RESERVED – Reserved bits.

The mobile station shall set this field to ‘000’.

CHARi – Character.

The mobile station shall include one occurrence of this field for each character in the calling party subaddress.

When the SUBADDRESS_TYPE field is equal to ‘000’, the NSAP address shall be encoded using the preferred binary encoding specified in [35].

When the SUBADDRESS_TYPE field is set to ‘010’, user-specified subaddress field is encoded according to the user specification, subject to a maximum length of 20 octets. When interworking with [36] networks, BCD coding should be applied.
2.7.4.21 Connected Subaddress

This information record identifies the subaddress of the responding party.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXTENSION_BIT</td>
<td>1</td>
</tr>
<tr>

<td>1</td>
</tr>
<tr>
<td>RESERVED</td>
<td>3</td>
</tr>
</tbody>
</table>

Zero or more occurrences of the following field:

\[
\{ \text{CHAR}_i \}^{8}\]

EXTENSION_BIT – The extension bit. The mobile station shall set this field to ‘1’.

SUBADDRESS_TYPE – Type of subaddress. The mobile station shall set this field to the SUBADDRESS_TYPE value shown in Table 2.7.4.19-1 corresponding to the type of the subaddress, as defined in [7], Section 4.5.14.

ODD/EVEN_INDICATOR – The indicator of odd/even bits. The mobile station shall set this field to the ODD/EVEN_INDICATOR value shown in Table 2.7.4.19-2 corresponding to the indicator of even/odd bits, as defined in [7], Section 4.5.14. It is only used when the type of subaddress is “User specified” and the coding is BCD.

RESERVED – Reserved bits. The mobile station shall set this field to ‘000’.

CHARi – Character. The mobile station shall include one occurrence of this field for each character in the connected subaddress.

When the SUBADDRESS_TYPE field is equal to ‘000’, the NSAP address shall be encoded using the preferred binary encoding specified in [35].

When the SUBADDRESS_TYPE field is set to ‘010’, user-specified subaddress field is encoded according to the user specification, subject to a maximum length of 20 octets. When interworking with [36] networks, BCD coding should be applied.
2.7.4.22 Power Control Information

This information record can be included in a Status Response Message, or an Extended Status Response Message to return the minimum power control step size supported by the mobile station (see 2.1.2.3.2).

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>MIN_PWR_CNTL_STEP</td>
<td>3</td>
</tr>
<tr>
<td>RESERVED</td>
<td>5</td>
</tr>
</tbody>
</table>

- MIN_PWR_CNTL_STEP – Minimum power control step size
  - The mobile station shall set this field to the PWR_CNTL_STEP value associated with the minimum closed loop power control step size shown in Table 3.7.3.3.25-1 that the mobile station supports.

- RESERVED – Reserved bits.
  - The mobile station shall set this field to ‘00000’.
2.7.4.23 IMSI

This information record can be included in a Status Response Message, or an Extended Status Response Message to return the mobile station’s IMSI_Mp.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMSI_M_CLASS</td>
<td>1</td>
</tr>
<tr>
<td>IMSI_M_ADDR_NUM</td>

<tr>
<td>IMSI_M_11_12</td>
<td>7</td>
</tr>
<tr>
<td>IMSI_M_S</td>
<td>34</td>
</tr>
<tr>
<td>RESERVED</td>
<td>1</td>
</tr>
</tbody>
</table>

- **IMSI_M_CLASS** – IMSI_M Class assignment of the mobile station.
  - The mobile station shall set this field to ‘0’.

- **IMSI_M_ADDR_NUM** – Number of IMSI_Mp address digits.
  - The mobile station shall set this field to ‘000’.

- **MCC_M** – Mobile Country Code of the MIN based IMSI.
  - The mobile station shall set this field the MCC_Mp. See 2.3.1.

- **IMSI_M_11_12** – The 11th and 12th digits of IMSI_M.
  - The mobile station shall set this field to IMSI_M_11_12p. See 2.3.1.

- **IMSI_M_S** – Last ten digits of the IMSI_M.
  - The mobile station shall set this field to IMSI_M_Sp. See 2.3.1.

- **RESERVED** – Reserved bit.
  - The mobile station shall set this field to ‘0’.
2.7.4.24 IMSI_T

This information record can be included in a *Status Response Message*, or an *Extended Status Response Message* to return the mobile station’s IMSI_T.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMSI_T_CLASS</td>
<td>1</td>
</tr>
<tr>
<td>IMSI_T_ADDR_NUM</td>

<tr>
<td>IMSI_T_S</td>
<td>34</td>
</tr>
<tr>
<td>RESERVED</td>
<td>1</td>
</tr>
</tbody>
</table>

**IMSI_T_CLASS** – IMSI_T Class assignment of the mobile station.

If the mobile station’s IMSI_T is a class 0 IMSI, the mobile station shall set this field to ‘0’; otherwise, the mobile station shall set this field to ‘1’.

**IMSI_T_ADDR_NUM** – Number of IMSI_T address digits.

If the mobile station’s IMSI_T is a class 1 IMSI, the mobile station shall set this field to four less than the number of digits in the NMSI; otherwise, the mobile station shall set this field to ‘000’.

**MCC_T** – Mobile Country Code of the IMSI_T.

The mobile station shall set this field to the MCC_T.

See 2.3.1.

**IMSI_T_11_12** – The 11th and 12th digits of the IMSI_T.

The mobile station shall set this field to IMSI_T_11_12.

See 2.3.1.

**IMSI_T_S** – Last ten digits of the IMSI_T.

The mobile station shall set this field to IMSI_T_S.

See 2.3.1.

**RESERVED** – Reserved bit.

The mobile station shall set this field to ‘0’.
2.7.4.25 Capability Information

This information record identifies whether the following optional or MOB_P_REV dependent features are supported by the mobile station.

<table>

ACCESS_ENTRY_HO – Access Entry Handoff Support.

This field identifies the mobile station’s support for access entry handoff (see 2.6.2.3). The mobile station shall set this field to ‘1’ if access entry handoff is supported; otherwise, the mobile station shall set this field to ‘0’.

ACCESS_PROBE_HO – Access Probe Handoff Support.

This field identifies the mobile station’s support for access probe handoff (see 2.6.3.1.3.3). The mobile station shall set this field to ‘1’ if access probe handoff is supported; otherwise, the mobile station shall set this field to ‘0’.

ANALOG_SEARCH – Analog Search Support.
This field identifies the mobile station’s support for analog searching (see 2.6.6.2.10). The mobile station shall set this field to ‘1’ if analog searching is supported; otherwise, the mobile station shall set this field to ‘0’.

**HOPPING_BEACON** – Hopping Beacon Support.

This field identifies the mobile station’s support for hopping pilot beacons. The mobile station shall set this field to ‘1’ if hopping pilot beacons are supported; otherwise, this field shall be set to ‘0’.

**MAHHO** – Mobile Assisted Hard Handoff Support.

This field identifies the mobile station’s support for mobile assisted hard handoff. The mobile station shall set this field to ‘1’.

**PUF** – Location Power Up Function Support.

This field identifies the mobile station’s support for location power up function (see 2.6.4.1.7).

If MOB_P_REVp is equal to ‘00000101’, the mobile station shall set this field to ‘1’; otherwise the mobile station shall set this field as follows:

If the mobile station supports location power up function, the mobile station shall set this field to ‘1’, otherwise, the mobile station shall set this field to ‘0’.

**ANALOG_553A** – Analog Support.

This field identifies the mobile station’s compatibility with [12]. The mobile station shall set this field to ‘1’.

**QPCH** – Quick Paging Channel Support.

This field identifies the mobile station’s support for the Quick Paging Channel. The mobile station shall set this field to ‘1’ if the Quick Paging Channel is supported; otherwise, the mobile station shall set this field to ‘0’.

**SLOTTED_TIMER** – Slotted Timer Support.

This field identifies the mobile station’s support for the Slotted Timer. The mobile station shall set this field to ‘1’ if the Slotted Timer is supported; otherwise, the mobile station shall set this field to ‘0’.

**CHM_SUPPORTED** – Control Hold Mode supported indicator.

The mobile station shall set this field to ‘1’ to indicate that the mobile station supports the Control Hold Mode; otherwise, the mobile station shall set this field to ‘0’.

**GATING_RATE_SET** – Set of supported Reverse Pilot gating rates.

If CHS_SUPPORTED is included and is set to ‘1’, the mobile station shall set this field to value shown in Table 2.7.4.25-1 corresponding to the set of supported reverse pilot gating rates; otherwise the mobile station shall omit this field.

---

1. **EXT_CAP_INCLUDED** — Extended Capabilities Included indicator.
   - The mobile station shall set this field to ‘1’ to indicate that extended capability indicators are included in this record; otherwise, the mobile station shall set this field to ‘0’.

2. **MABO** — Mobile Assisted Burst Operation capability indicator.
   - If **EXT_CAP_INCLUDED** is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:
   - The mobile station shall set this field to ‘1’ if it supports the Mobile Assisted Burst Operation capability; otherwise, the mobile station shall set this field to ‘0’.

3. **SDB** — Short Data Burst supported indicator.
   - If **EXT_CAP_INCLUDED** is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:
   - If MOB_P_REVp is greater or equal to 11 and if the mobile station supports packet data service as specified in [42], the mobile station shall set this field to ‘1’.
   - Otherwise, the mobile station shall set this field to ‘1’ if it supports Short Data Burst capability; otherwise, the mobile station shall set this field to ‘0’.

4. **RLP_INFO_LEN** — RLP capability information length.
   - The mobile station shall set this field to ‘000’ if the RLP_BLOB field is not included in this record; otherwise, it shall set this field to the size of the RLP_BLOB field in integer number of octets.

---

9 Short Data Burst Capability support is mandatory for the mobile station with MOB_P_REVp greater than or equal to 11 that supports packet data service as specified in [42]
If the RLP_INFO_LEN field is set to ‘000’, the mobile station shall omit this field; otherwise, the mobile station shall set this field as follows:

If \( P_{REV\_IN\_USE_s} \) is equal or greater than seven\(^{10} \), the mobile station shall set this field to the Radio Link Protocol information block of bits (see [42]).

If \( P_{REV\_IN\_USE_s} \) equals six, the mobile station shall set this field to the Radio Link Protocol capability information block of bits, as shown in Table 2.7.4.25-2.

</table>

\(^{10} \) \( P_{REV\_IN\_USE_s} \geq 7 \) can not work with TIA/EIA/IS-707-A
R_FCH_FLEX_SUPPORTED – Reverse Fundamental channel flexible rate feature supported indicator.

The mobile station shall include this field only if FLEX_SUPPORTED is equal to ‘1’. If this field is included, the mobile station shall set this field to ‘1’ if it supports the flexible rate feature for the Reverse Fundamental Channel; otherwise, the mobile station shall set this field to ‘0’.

F_DCCH_FLEX_SUPPORTED – Forward Dedicated Control channel flexible rate feature supported indicator.

The mobile station shall include this field only if FLEX_SUPPORTED is equal to ‘1’. If this field is included, the mobile station shall set this field to ‘1’ if it supports the flexible rate feature for the Forward Dedicated Control Channel; otherwise, the mobile station shall set this field to ‘0’.

R_DCCH_FLEX_SUPPORTED – Reverse Dedicated Control channel flexible rate feature supported indicator.

The mobile station shall include this field only if FLEX_SUPPORTED is equal to ‘1’. If this field is included, the mobile station shall set this field to ‘1’ if it supports the flexible rate feature for the Reverse Dedicated Control Channel; otherwise, the mobile station shall set this field to ‘0’.

F_SCH_FLEX_SUPPORTED – Forward Supplemental channel flexible rate feature supported indicator.

The mobile station shall include this field only if FLEX_SUPPORTED is equal to ‘1’. If this field is included, the mobile station shall set this field to ‘1’ if it supports the flexible rate feature for the Forward Supplemental Channel; otherwise, the mobile station shall set this field to ‘0’.

R_SCH_FLEX_SUPPORTED – Reverse Supplemental channel flexible rate feature supported indicator.

The mobile station shall include this field only if FLEX_SUPPORTED is equal to ‘1’. If this field is included, the mobile station shall set this field to ‘1’ if it supports the flexible rate feature for the Reverse Supplemental Channel; otherwise, the mobile station shall set this field to ‘0’.

VAR_SUPPORTED – Variable rate feature supported indicator.

The mobile station shall set this field to ‘1’ if it supports the variable rate feature (the capability to support rate determination) on any of the forward or reverse Supplemental channels; otherwise, the mobile station shall set this field to ‘0’.

F_SCH_VAR_SUPPORTED – Forward Supplemental Channel Variable Rate supported indicator.

The mobile station shall include this field only if VAR_SUPPORTED is equal to ‘1’. If this field is included, the mobile station shall set this field to ‘1’ if it supports the variable rate feature on the Forward Supplemental Channels.

**R_SCH_VAR_SUPPORTED** – Reverse Supplemental Channel Variable Rate supported indicator.

The mobile station shall include this field only if VAR_SUPPORTED is equal to ‘1’. If this field is included, the mobile station shall set this field to ‘1’ if it supports the variable rate feature on the Reverse Supplemental Channels.

**MAX_SUM_NUM_BITS_C** – Maximum sum of number of bits corresponding to Convolutional rates in the variable rate set.

The mobile station shall include this field only if F_SCH_VAR_SUPPORTED is equal to ‘1’. If this field is included, the mobile station shall set this field to the maximum of the sum of possible information bits per 20 ms corresponding to the Convolutional Code rates in the Variable Rate Set for a Forward Supplemental Channel below which the mobile station is capable of performing rate determination on the forward supplemental channel when Convolutional coding is used.

**MAX_SUM_NUM_BITS_T** – Maximum sum of number of bits corresponding to Turbo Code rates in the variable rate set

The mobile station shall include this field only if F_SCH_VAR_SUPPORTED is equal to ‘1’. If this field is included, the mobile station shall set this field to the maximum of the sum of possible information bits per 20 ms corresponding to the Turbo Code rates in the Variable Rate Set for a Forward Supplemental Channel below which the mobile station is capable of performing rate determination on the forward supplemental channel when Turbo coding is used.

**CS_SUPPORTED** – Concurrent Services supported indicator.

If the mobile station supports concurrent services, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

**F_SCH_LTU_TAB_SUPPORTED** – Forward Supplemental Channel Downloadable LTU tables supported indicator.

If the mobile station supports downloadable LTU Tables for Forward Supplemental Channel, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

**R_SCH_LTU_TAB_SUPPORTED** – Reverse Supplemental Channel Downloadable LTU tables supported indicator.

If the mobile station supports downloadable LTU Tables for Reverse Supplemental Channel, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.
ERAM_SUPPORTED – Enhanced Rate Adaptation Mode supported indicator.

If FLEX_SUPPORTED or VAR_SUPPORTED is set to ‘1’, the mobile station shall include this field; otherwise, the mobile station shall omit this field. If included, the mobile station shall set this field to ‘1’ if the mobile station supports the Enhanced Rate Adaptation Mode; otherwise, the mobile station shall set this field to ‘0’.

PDCH_CHM_SUPPORTED – PDCH Control Hold Mode supported indicator.

The mobile station shall set this field to ‘1’ to indicate that the mobile station supports the PDCH Control Hold Mode; otherwise, the mobile station shall set this field to ‘0’.

REV_FCH_GATING_SUPPORTED – Reverse Fundamental eighth gating mode supported indicator.

If the Reverse Fundamental Traffic Channel gating mode is supported, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

RER_MODE_SUPPORTED – Radio environment reporting mode supported indicator.

The mobile station shall set this field to ‘1’ if it supports radio environment reporting mode; otherwise, the mobile station shall set this field to ‘0’.

ADD_NUM_SYNC_ID_INCL – Additional number of synchronization identifiers included indicator.

If this record is to contain the ADD_NUM_SYNC_ID field, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

ADD_NUM_SYNC_ID – Additional number of synchronization identifiers.

If ADD_NUM_SYNC_ID_INCL field is set to ‘1’, the mobile station shall include this field and set it to the number of SYNC_ID’s supported minus 5; otherwise it shall omit this field.

RSC_MODE_SUPPORTED – Reduced Slot Cycle Mode supported indicator.

The mobile station shall set this field to ‘1’ if it supports the reduced slot cycle mode; otherwise, the mobile station shall set this field to ‘0’.

TKZ_MODE_SUPPORTED – Tracking zone mode supported indicator.

The mobile station shall set this field to ‘1’ if it supports tracking zone mode; otherwise, the mobile station shall set this field to ‘0’.

RESERVED – Reserved bits.

The mobile station shall add reserved bits as needed in order to make the length of the entire information record equal to an integer number of octets. The mobile station shall set these bits to ‘0’.
2.7.4.26 Extended Record Type - International

The use of this record type is country-specific. The first ten bits of the type-specific fields shall include the Mobile Country Code (MCC) associated with the national standards organization administering the use of the record type. Encoding of the MCC shall be as specified in 2.3.1.3. The remaining six bits of the first two octets of the type-specific fields shall be used to specify the country-specific record type.
2.7.4.27 Channel Configuration Capability Information

This information record can be included in a Status Response Message or an Extended Status Response Message to return channel configuration capability information about the mobile station.

</table>

OTD_SUPPORTED – OTD supported indicator.
The mobile station shall set this field to ‘1’ if the mobile station supports orthogonal transmission diversity; otherwise, the mobile station shall set this field to ‘0’.

FCH_SUPPORTED – Fundamental Channel supported indicator.

The mobile station shall set this field to ‘1’, if the mobile station supports the Fundamental Channel; otherwise, the mobile station shall set this field to ‘0’.

FCH Type-specific fields – Fundamental Channel configuration capability information.

If the FCH_SUPPORTED field is set to ‘1’, the mobile station shall include this field and set it as described in 2.7.4.27.1; otherwise the mobile station shall omit this field.

DCCH_SUPPORTED – Dedicated Control Channel supported indicator.

The mobile station shall set this field to ‘1’ if the mobile station supports the Dedicated Control Channel; otherwise, the mobile station shall set this field to ‘0’.

DCCH Type specific fields – Fundamental Channel configuration capability information.

If the DCCH_SUPPORTED field is set to ‘1’, the mobile station shall include this field and set it as described in 2.7.4.27.2; otherwise the mobile station shall omit this field.

FOR_SCH_SUPPORTED – Forward Supplemental Channel supported indicator.

The mobile station shall set this field to ‘1’ if the mobile station supports the Forward Supplemental Channel; otherwise, the mobile station shall set this field to ‘0’.

FOR_SCH Type-specific fields – Forward Supplemental Channel Configuration Capability Information.

If the FOR_SCH_SUPPORTED field is set to ‘1’, the mobile station shall include this field and set it as described in 2.7.4.27.3; otherwise the mobile station shall omit this field.

REV_SCH_SUPPORTED – Reverse Supplemental Channel supported indicator.

The mobile station shall set this field to ‘1’ if the mobile station supports the Reverse Supplemental Channel; otherwise, the mobile station shall set this field to ‘0’.

REV_SCH Type-specific fields – Reverse Supplemental Channel Configuration capability information.

If the REV_SCH_SUPPORTED field is set to ‘1’, the mobile station shall include this field and set it as described in 2.7.4.27.4; otherwise the mobile station shall omit this field.

RESERVED_1 – Reserved bits.

If both the FOR_SCH_SUPPORTED and REV_SCH_SUPPORTED fields are set to ‘0’, the mobile station shall omit this field. Otherwise, the mobile station shall include this field and set this field to ‘00’.
STS_SUPPORTED – STS supported indicator.

The mobile station shall set this field to ‘1’ if the mobile station supports Space Time Spreading Transmit Diversity; otherwise, the mobile station shall set this field to ‘0’.

3X_CCH_SUPPORTED – 3X Common Channel supported.

The mobile station shall set this field to ‘1’ if the mobile station supports the Spreading Rate 3 common channels (3X BCCH, 3X F-CCCH, and 3X R-EACH); otherwise, the mobile station shall set this field to ‘0’.

CCSH_SUPPORTED – CCSH supported indicator.

If the FOR_SCH_SUPPORTED field is set to ‘0’, the mobile station shall omit this field; otherwise the mobile station shall include this field and set it as follows:

- If the mobile station supports Code Combining Soft Handoff, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

FOR_PDCH_SUPPORTED – Forward Packet Data Channel supported indicator.

If the mobile station supports the Forward Packet Data Channel, then the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

FOR_PDCH Capability

Type-specific fields – Forward Packet Data Channel capability information.

If the FOR_PDCH_SUPPORTED field is set to ‘1’, the mobile station shall include this field and set it as described in 2.7.4.27.5; otherwise the mobile station shall omit this field.

FOR_PDCH_SCH_SUPPORTED – Simultaneous support of F-PDCH and F-SCH indicator.

If FOR_PDCH_SUPPORTED is set to ‘0’, or FOR_SCH_SUPPORTED is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

- The mobile station shall set this field to ‘1’ if it supports the simultaneous assignment of F-PDCH and F-SCH; otherwise, the mobile station shall set this field to ‘0’.

REV_PDCH_SUPPORTED – Reverse Packet Data Channel supported indicator.

If FOR_PDCH_SUPPORTED is not included or is included and is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

- If the mobile station supports the Reverse Packet Data Channel (R-PDCH), the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

REV_PDCH Capability

Type-specific fields – Forward Packet Data Channel capability information.
If the REV_PDCH_SUPPORTED field included and is set to ‘1’, the mobile station shall include this field and set it as described in 2.7.4.27.6; otherwise the mobile station shall omit this field.

FUNDICATED_BCMC_SUPPORTED – Fundicated Channel BCMC supported indicator.

The mobile station shall set this field to ‘1’ to indicate that the mobile station supports the BCMC reception on shared Forward Fundicated Channels in Mobile Station Control on the Traffic Channel State; otherwise, the mobile station shall set this field to ‘0’.

FUNDICATED_BCMC Type-specific fields – Fundicated Channel BCMC capability information.

If the FUNDICATED_BCMC_SUPPORTED field is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as described in 2.7.4.27.7.

SCH_BCMC_SUPPORTED – Supplemental Channel BCMC supported indicator.

The mobile station shall set this field to ‘1’ to indicate that the mobile station supports the BCMC reception on shared Forward Supplemental Channels in Mobile Station Control on the Traffic Channel State; otherwise, the mobile station shall set this field to ‘0’.

RESERVED – Reserved bits.

The mobile station shall add reserved bits as needed in order to make the length of the entire information record equal to an integer number of octets. The mobile station shall set these bits to ‘0’.
2.7.4.27.1 FCH Type-specific Fields

The Fundamental Channel configuration capability information included in the FCH Type-specific fields contains the following subfields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FCH_FRAME_SIZE</td>
<td>Fundamental Channel Frame Size capability indicator.</td>
</tr>
<tr>
<td>FOR_FCH_LEN</td>
<td>Forward Fundamental Channel Configuration information length.</td>
</tr>
<tr>
<td>FOR_FCH_RC_MAP</td>
<td>Forward Fundamental Radio Configuration information.</td>
</tr>
<tr>
<td>REV_FCH_LEN</td>
<td>Reverse Fundamental Channel Configuration information length.</td>
</tr>
<tr>
<td>REV_FCH_RC_MAP</td>
<td>Reverse Fundamental Radio Configuration information.</td>
</tr>
</tbody>
</table>

- **FCH_FRAME_SIZE**: If in addition to the 20 ms frame size the mobile station also supports the 5 ms frame size on the Fundamental Channel, the mobile station shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

- **FOR_FCH_LEN**: The mobile station shall set this field to the number of 3 bit units required to specify the length, in bits, of the FOR_FCH_RC_MAP field.

- **FOR_FCH_RC_MAP**: The mobile station shall set this field as described below to indicate which Radio Configurations (see [2] Table 3.1.3.1-1) are supported by the mobile station on the Forward Fundamental Channel.

  - This field consists of the sequence of 1-bit indicators, each indicating the mobile station support for specific Radio Configuration. Bit positions of these indicators in the field and corresponding Radio Configurations are specified in Table 2.7.4.27.1-1.

  - The mobile station shall set each indicator to ‘1’ if the corresponding Radio Configuration on the Forward Fundamental Channel is supported by the mobile station; otherwise, the mobile station shall set the indicator to ‘0’. The mobile station shall set any unused bits in the field to ‘0’.
### Table 2.7.4.27.1-1. Forward Channel Radio Configurations Supported

</tr>
</tbody>
</table>

**REV_FCH_LEN** – Reverse Fundamental Channel Configuration information length.

The mobile station shall set this field to the number of 3 bit units required to specify the length, in bits, of the REV_FCH_RC_MAP field.

**REV_FCH_RC_MAP** – Reverse Fundamental Radio Configuration information.

The mobile station shall set this field as described below to indicate which Radio Configurations (see [2] Table 2.1.3.1-1) are supported by the mobile station on the Reverse Fundamental Channel.

This field consists of the sequence of 1-bit indicators, each indicating the mobile station support for specific Radio Configuration. Bit positions of these indicators in the field and corresponding Radio Configurations are specified in Table 2.7.4.27.1-2.

The mobile station shall set each indicator to ‘1’ if the corresponding Radio Configuration on the Reverse Fundamental Channel is supported by the mobile station; otherwise, the mobile station shall set the indicator to ‘0’. The mobile station shall set any unused bits in the field to ‘0’.
### Table 2.7.4.27.1-2. Reverse Channel Radio Configurations Supported

</tbody>
</table>
2.7.4.27.2 DCCH Type-Specific Fields

The Dedicated Control Channel configuration capability information included in the DCCH Type-specific fields contains the following subfields:

<table>
<thead>
<tr>
<th>DCCH_FRAME_SIZE</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Either 5 ms or 20 ms frame sizes (not dynamically switchable)</td>
</tr>
<tr>
<td>01</td>
<td>20 ms frame size only</td>
</tr>
<tr>
<td>10</td>
<td>5 ms frame size only</td>
</tr>
<tr>
<td>11</td>
<td>Both 5 ms and 20 ms frame sizes (Dynamically switchable)</td>
</tr>
</tbody>
</table>

Table 2.7.4.27.2-1. DCCH Frame Size Supported

FOR_DCCH_LEN – Forward Dedicated Control Channel Configuration information length.

The mobile station shall set this field to the number of 3 bit units required to specify the length, in bits, of the FOR_DCCH_RC_MAP field.

FOR_DCCH_RC_MAP – Forward Dedicated Channel Radio Configuration information.

The mobile station shall set this field as described below to indicate which Radio Configurations (see [2]) are supported by the mobile station on the Forward Dedicated Control Channel.

This field consists of the sequence of 1-bit indicators, each indicating the mobile station support for specific Radio Configuration. Bit positions of these indicators in the field and corresponding Radio Configurations are specified in Table 2.7.4.27.1-1.
The mobile station shall set each indicator to ‘1’ if the corresponding Radio Configuration on the Forward Dedicated Control Channel is supported by the mobile station; otherwise, the mobile station shall set the indicator to ‘0’. The mobile station shall set any unused bits in the field to ‘0’.

```
REV_DCCH_LEN  - Reverse Dedicated Control Channel Configuration information length.

The mobile station shall set this field to the number of 3 bit units required to specify the length, in bits, of the REV_DCCH_RC_MAP field.

REV_DCCH_RC_MAP  - Reverse Dedicated Control Channel Radio Configuration information.

The mobile station shall set this field as described below to indicate which Radio Configurations (see [2]) are supported by the mobile station on the Reverse Dedicated Control Channel.

This field consists of the sequence of 1-bit indicators, each indicating the mobile station support for specific Radio Configuration. Bit positions of these indicators in the field and corresponding Radio Configurations are specified in Table 2.7.4.27.1-2.

The mobile station shall set each indicator to ‘1’ if the corresponding Radio Configuration on the Reverse Dedicated Control Channel is supported by the mobile station; otherwise, the mobile station shall set the indicator to ‘0’. The mobile station shall set any unused bits in the field to ‘0’.
```
2.7.4.27.3 FOR_SCH Type-Specific Fields

The Forward Supplemental Channel configuration capability information included in the FOR_SCH Type-specific fields contains the following subfields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Subfield</th>
</tr>
</thead>
<tbody>
<tr>
<td>FOR_SCH_LEN</td>
<td>3</td>
</tr>
<tr>
<td>FOR_SCH_RC_MAP</td>
<td>3 \times FOR_SCH_LEN</td>
</tr>
<tr>
<td>FOR_SCH_NUM</td>
<td>2</td>
</tr>
</tbody>
</table>

FOR_SCH_NUM occurrences of the following fields:

```plaintext
{ (FOR_SCH_NUM)
  FOR_TURBO_SUPPORTED 1
  FOR_MAX_TURBO_BLOCK_SIZE 0 or 4
  FOR_CONV_SUPPORTED 1
  FOR_MAX_CONV_BLOCK_SIZE 0 or 4
  FOR_FRAME_40_SUPPORTED 1
  FOR_FRAME_80_SUPPORTED 1
  FOR_MAX_RATE 4
}
```

FOR_SCH_LEN – Forward Supplemental Channel information length in units of 3 bits. The mobile station shall set this field to the number of 3 bit units required to specify the length, in bits, of the FOR_SCH_RC_MAP field.

FOR_SCH_RC_MAP – Forward Supplemental Channel Radio Configuration capability. The mobile station shall set this field as described below to indicate which Radio Configurations (see [2] Table 3.1.3.1-1) are supported by the mobile station on the Forward Supplemental Channel.

This field consists of the sequence of 1-bit indicators, each indicating the mobile station support for specific Radio Configuration. Bit positions of these indicators in the field and corresponding Radio Configurations are specified in Table 2.7.4.27.1-1.

The mobile station shall set each indicator to ‘1’ if the corresponding Radio Configuration on the Forward Supplemental Channel is supported by the mobile station; otherwise, the mobile station shall set the indicator to ‘0’. The mobile station shall set any unused bits in the field to ‘0’.
FOR_SCH_NUM – Number of Forward Supplemental Channels.

The mobile station shall set this field to the number of Forward Supplemental Channels supported by the mobile station.

If the FOR_SCH_NUM field is greater than zero, the mobile station shall include one occurrence of the following 8 fields for each Forward Supplemental Channel supported by the mobile station. The first occurrence is SCH0 related information. The second occurrence (if any) is SCH1 related information.

FOR_TURBO_SUPPORTED – Forward Turbo Coding supported indicator.

If the mobile station supports Turbo Coding on this Forward Supplemental Channel, it shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

FOR_MAX_TURBO_BLOCK_SIZE – Forward maximum Turbo Coding block size.

If the field FOR_TURBO_SUPPORTED is set to ‘0’, the mobile station shall omit this field; otherwise the mobile station shall include this field and set it to the maximum block size allowed for Turbo coding (see Table 2.7.4.27.3-1).

<td>REV_MAX_RATE</td>
<td>4</td>
</tr>
</tbody>
</table>

\} (REV_SCH_NUM)

REV_SCH_LEN – Reverse Supplemental Channel information length in units of 3 bits.

The mobile station shall set this field to the number of 3 bit units required to specify the length, in bits, of the REV_SCH_RC_MAP field.

REV_SCH_RC_MAP – Reverse Supplemental Channel Radio Configuration capability.

The mobile station shall set this field as described below to indicate which Radio Configurations (See [2] Table 2.1.3.1-1) are supported by the mobile station on the Reverse Supplemental Channel.

This field consists of the sequence of 1-bit indicators, each indicating the mobile station support for specific Radio Configuration. Bit positions of these indicators in the field and corresponding Radio Configurations are specified in Table 2.7.4.27.1-2.

The mobile station shall set each indicator to ‘1’ if the corresponding Radio Configuration on the Reverse Supplemental Channel is supported by the mobile station; otherwise, the mobile station shall set the indicator to ‘0’. The mobile station shall set any unused bits in the field to ‘0’.
REV_SCH_NUM – Number of Reverse Supplemental Channels

The mobile station shall set this field to the number of Reverse Supplemental Channels supported by the mobile station.

If the REV_SCH_NUM field is greater than zero, the mobile station shall include one occurrence of the following 8 fields for each Reverse Supplemental Channel supported by the mobile station. The first occurrence is SCH0 related information. The second occurrence (if any) is SCH1 related information.

REV_TURBO_SUPPORTED – Reverse Turbo Coding supported indicator.

If the mobile station supports Turbo Coding on this Reverse Supplemental Channel, it shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

REV_MAX_TURBO_BLOCK_SIZE – Reverse maximum Turbo Coding block size.

If the field REV_TURBO_SUPPORTED is set to ‘0’, the mobile station shall omit this field; otherwise the mobile station shall include this field and set it to the maximum block size allowed for Turbo coding (see Table 2.7.4.27.3-1).

REV_CONV_SUPPORTED – Reverse Convolutional Coding supported indicator.

If the mobile station supports Convolutional Coding on this Reverse Supplemental Channel, it shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

REV_MAX_CONV_BLOCK_SIZE – Reverse maximum Convolutional Coding block size.

If the field REV_CONV_SUPPORTED is set to ‘0’, the mobile station shall omit this field; otherwise the mobile station shall include this field and set it to the maximum block size allowed for Convolutional coding (see Table 2.7.4.27.3-1).

REV_FRAME_40_SUPPORTED – Reverse 40ms frame indicator.

If the mobile station supports 40 ms frames on this Reverse Supplemental Channel, it shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

REV_FRAME_80_SUPPORTED – Reverse 80ms frame indicator.

If the mobile station supports 80 ms frames on this Reverse Supplemental Channel, it shall set this field to ‘1’; otherwise, the mobile station shall set this field to ‘0’.

REV_MAX_RATE – Maximum reverse supplemental channels rate

The mobile station shall set this field according to Table 2.7.4.27.3-2 to indicate the maximum reverse supplemental channel frame rate supported.
2.7.4.27.5 FOR_PDCH Type-specific Fields

The Forward Packet Data Channel configuration capability information included in the FOR_PDCH Type-specific fields contains the following subfields:

<table>
<thead>
<tr>
<th>Subfield</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACK_DELAY</td>
<td>Delay for the acknowledgment sent on the Reverse Acknowledgment Channel.</td>
</tr>
<tr>
<td>NUM_ARQ_CHAN</td>
<td>Number of Physical Layer ARQ Channels supported.</td>
</tr>
<tr>
<td>FOR_PDCH_LEN</td>
<td>Forward Packet Data Channel Configuration information length.</td>
</tr>
<tr>
<td>FOR_PDCH_RC_MAP</td>
<td>Forward Packet Data Channel Radio Configuration information.</td>
</tr>
<tr>
<td>CH_CONFIG_SUP_MAP_LEN</td>
<td>Length of the CH_CONFIG_SUP_MAP subfield.</td>
</tr>
<tr>
<td>CH_CONFIG_SUP_MAP</td>
<td>Length of the CH_CONFIG_SUP_MAP subfield.</td>
</tr>
</tbody>
</table>

- ACK_DELAY – Delay for the acknowledgment sent on the Reverse Acknowledgment Channel.
  If the mobile station requires a 2-slot delay to send an acknowledgment on the R-ACKCH, then the mobile station shall set this subfield to ‘1’; otherwise (the mobile station requires a 1-slot delay), the mobile station shall set this subfield to ‘0’.

- NUM_ARQ_CHAN – Number of Physical Layer ARQ Channels supported.
  The mobile station shall set this subfield to the number of Physical Layer ARQ Channels that it supports, minus two.
  The mobile station shall not set this field to ‘11’.

- FOR_PDCH_LEN – Forward Packet Data Channel Configuration information length.
  The mobile station shall set this subfield to one less than the number of 3 bit units required to specify the length of the FOR_PDCH_RC_MAP subfield.

- FOR_PDCH_RC_MAP – Forward Packet Data Channel Radio Configuration information.
  The mobile station shall set this subfield as described below to indicate which Radio Configurations (see [2]) are supported by the mobile station on the Forward Packet Data Channel.
  This subfield consists of the sequence of 1-bit indicators, each indicating the mobile station support for a specific Radio Configuration. Bit positions of these indicators in the subfield and corresponding Radio Configurations are specified in Table 2.7.4.27.5-1.
The mobile station shall set each indicator to ‘1’ if the corresponding Radio Configuration on the Forward Packet Data Channel is supported by the mobile station; otherwise, the mobile station shall set the indicator to ‘0’. The mobile station shall set any unused bits in the subfield to ‘0’.

**Table 2.7.4.27.5-1. Forward Packet Data Channel Radio Configurations Supported**

</tr>
</tbody>
</table>

**CH_CONFIG_SUP_MAP_LEN** – Channel Configuration Supported Bitmap length.

The mobile station shall set this field to one less than the number of 3 bit units required to specify the length, in bits, of the CH_CONFIG_SUP_MAP field.

**CH_CONFIG_SUP_MAP** – Channel Configuration Supported Bitmap.

The mobile station shall set this subfield as described below to indicate which physical channel configurations are supported by the mobile station.

This subfield consists of the sequence of 1-bit indicators, each indicating the mobile station support for a specific channel configuration. Bit positions of these indicators in the subfield and corresponding channel configurations are specified in Table 2.7.4.27.5-2.

The mobile station shall set each indicator to ‘1’ if the corresponding channel configuration is supported by the mobile station; otherwise, the mobile station shall set the indicator to ‘0’. The mobile station shall set any unused bits in the field to ‘0’.

The mobile station shall set the subfield F-PDCH_1 to ‘1’, or the subfield F-PDCH_2 to ‘1’, or the subfields F-PDCH_1 and F-PDCH_2 to ‘1’.

The mobile station shall set the subfields F-PDCH_1 and F-PDCH_3 to the same value.

The mobile station shall set the subfields F-PDCH_2 and F-PDCH_4 to the same value.

REV_PDCH_CH_CONFIG_SUP_MAP_LEN – Reverse Packet Data Channel Channel Configuration Supported Bitmap length.

The mobile station shall set this field to one less than the number of 3 bit units required to specify the length, in bits, of the REV_PDCH_CH_CONFIG_SUP_MAP field.

REV_PDCH_CH_CONFIG_SUP_MAP – Reverse Packet Data Channel Channel Configuration Supported Bitmap.

The mobile station shall set this subfield as described below to indicate which physical channel configurations are supported by the mobile station.

This subfield consists of the sequence of 1-bit indicators, each indicating the mobile station support for a specific channel configuration. Bit positions of these indicators in the subfield and corresponding channel configurations are specified in Table 2.7.4.27.6-2.

The mobile station shall set each indicator to ‘1’ if the corresponding channel configuration is supported by the mobile station; otherwise, the mobile station shall set the indicator to ‘0’. The mobile station shall set any unused bits in the field to ‘0’. The mobile station shall set the indicator corresponding to the channel configuration F/R-PDCH_0 to ‘1’.

The mobile station shall set the subfield F/R-PDCH_1 to ‘1’, or the subfield F/R-PDCH_2 to ‘1’, or the subfields F/R-PDCH_1 and F/R-PDCH_2 to ‘1’.

The mobile station shall set the subfields F/R-PDCH_1 and F/R-PDCH_3 to the same value.

The mobile station shall set the subfields F/R-PDCH_2 and F/R-PDCH_4 to the same value.

<table>
<thead>
<tr>
<th>Subfield</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FUNDICATED_BCMC_CH_SUP_MAP_LEN</td>
<td>2</td>
</tr>
<tr>
<td>FUNDICATED_BCMC_CH_SUP_MAP</td>
<td>3 × (FUNDICATED_BCMC_CH_SUP_MAP_LEN + 1)</td>
</tr>
</tbody>
</table>

FUNDICATED_BCMC_CH_SUP_MAP_LEN – Fundicated Channel BCMC channel configurations supported bitmap length.

The mobile station shall set this field to one less than the number of 3 bit units required to specify the length, in bits, of the FUNDICATED_BCMC_CH_SUP_MAP field.

FUNDICATED_BCMC_CH_SUP_MAP – Fundicated Channel BCMC channel configurations supported bitmap.

The mobile station shall set this subfield as described below to indicate which physical channel configurations are supported by the mobile station.

This subfield consists of the sequence of 1-bit indicators, each indicating the mobile station support for a specific channel configuration. Bit positions of these indicators in the subfield and corresponding channel configurations are specified in Table 2.7.4.27.7-1.

The mobile station shall set each indicator to ‘1’ if the corresponding channel configuration is supported by the mobile station; otherwise, the mobile station shall set the indicator to ‘0’. The mobile station shall set any unused bits in the field to ‘0’.

The mobile station shall not set all the indicators in this subfield to ‘0’.

NUM_MO_REV_FCH – Number of Reverse Fundamental Channel Multiplex Options.

The mobile station shall set this field to the number of the Reverse Fundamental Channel Multiplex Options supported by the mobile station.

If NUM_MO_REV_FCH is not equal to ‘0000’, the mobile station shall include NUM_MO_REV_FCH occurrences of the following two fields for each supported Reverse Fundamental Channel multiplex option:

MO_REV_FCH – Reverse Fundamental Channel multiplex option.

The mobile station shall set this field to the Reverse Fundamental Channel multiplex option.

REV_NUM_BITS_FCH – Reverse Fundamental Channel number of bits per frame.
The mobile station shall set this field as described below to indicate which number of bits per frame are supported by the mobile station on the Reverse Fundamental Channel.

This field consists of the sequence of 1-bit indicators, each indicating the mobile station support for number of bits per frame. Bit positions of these indicators in the field and corresponding number of bits per frame are specified in Table 2.7.4.28-4 if MO_REV_FCH is equal to 1, Table 2.7.4.28-5 if MO_REV_FCH is equal to 2, and Table 2.7.4.28-6 if MO_REV_FCH is equal to 0x704.

The mobile station shall set each indicator to ‘1’ if the corresponding number of bits per frame on the Reverse Fundamental Channel is supported by the mobile station; otherwise, the mobile station shall set the indicator to ‘0’.

</table>

NUM_MO_FOR_DCCH – Number of Forward Dedicated Control Channel Multiplex Options.

The mobile station shall set this field to the number of the Forward Dedicated Control Channel Multiplex Options supported by the mobile station.

If NUM_MO_FOR_DCCH is not equal to ‘0000’, the mobile station shall include NUM_MO_FOR_DCCH occurrence of the following one field for each supported Forward Dedicated Control Channel multiplex option:

MO_FOR_DCCH – Forward Dedicated Control Channel multiplex option.

The mobile station shall set this field to the Forward Dedicated Control Channel multiplex option.
NUM_MO_REV_DCCH – Number of Reverse Dedicated Control Channel Multiplex Options. The mobile station shall set this field to the number of the Reverse Dedicated Control Channel Multiplex Options supported by the mobile station. If NUM_MO_REV_DCCH is not equal to ‘0000’, the mobile station shall include NUM_MO_REV_DCCH occurrence of the following one field for each supported Reverse Dedicated Control Channel multiplex option:

MO_REV_DCCH – Reverse Dedicated Control Channel multiplex option. The mobile station shall set this field to the Reverse Dedicated Control Channel multiplex option.

NUM_MO_FOR_SCH – Number of Forward Supplemental Channel Multiplex Options. The mobile station shall set this field to the number of Forward Supplemental Channel Multiplex Options supported by the mobile station included in this message. The mobile station shall include the multiplex option associated with the highest data rate it supports for each combination of MuxPDU type, rate set, and block size. If NUM_MO_FOR_SCH is not equal to ‘0000’, the mobile station shall include NUM_MO_FOR_SCH occurrence of the following two fields:

FOR_SCH_ID – Forward Supplemental Channel identifier. The mobile station shall set this field to specify the Forward Supplemental Channel to which the Forward Supplemental multiplex option supported by the mobile station corresponds.

MO_FOR_SCH – Forward Supplemental Channel multiplex option. The mobile station shall set this field to the Forward Supplemental Channel multiplex option associated with the maximum data rate (see [3]) that the mobile station supports.

NUM_MO_REV_SCH – Number of Reverse Supplemental Channel Multiplex Options.

---

11 If any Rate Set 1 multiplex option is included, then mobile station support of MuxPDU Type 1 is implied and the mobile station is not required to include multiplex option 0x03. If any Rate Set 2 multiplex option is included, then mobile station support of MuxPDU Type 2 is implied and the mobile station is not required to include multiplex option 0x04 (see [3]).

12 If the mobile station supports the multiplex option associated with the maximum data rate, the mobile station shall support all lower data rates as specified in [3].
The mobile station shall set this field to the number of Reverse Supplemental Channel Multiplex Options included in this message. The mobile station shall include the multiplex option associated with the highest data rate it supports for each combination of MuxPDU type, rate set, and block size\( ^{13} \).

If NUM_MO_REV_SCH is not equal to ‘0000’, the mobile station shall include NUM_MO_REV_SCH occurrence of the following two fields:

- **REV_SCH_ID** – Reverse Supplemental Channel identifier.
  - The mobile station shall set this field to specify the Reverse Supplemental Channel to which the Reverse Supplemental multiplex option supported by the mobile station corresponds.

- **MO_REV_SCH** – Reverse Supplemental Channel multiplex option.
  - The mobile station shall set this field to the Reverse Supplemental Channel multiplex option associated with the maximum data rate (see [3]) that the mobile station supports\( ^{14} \).

If NUM_MO_FOR_PDCH is not equal to ‘0000’, the mobile station shall include NUM_MO_FOR_PDCH occurrences of the following one-field record:

- **MO_FOR_PDCH** – Forward Packet Data Channel multiplex option.
  - The mobile station shall set this field to the Forward Packet Data Channel multiplex option.

If NUM_MO_REV_PDCH is not equal to ‘0000’, the mobile station shall include NUM_MO_REV_PDCH occurrences of the following one-field record:

\[ \text{(13) If any Rate Set 1 multiplex option is included, then mobile station support of MuxPDU Type 1 is implied and the mobile station is not required to include multiplex option 0x03. If any Rate Set 2 multiplex option is included, then mobile station support of MuxPDU Type 2 is implied and the mobile station is not required to include multiplex option 0x04 (see [3]).} \]

\[ \text{(14) If the mobile station supports the multiplex option associated with the maximum data rate, the mobile station shall support all lower data rates as specified in [3].} \]
MO_REV_PDCCH – Reverse Packet Data Channel multiplex option.

The mobile station shall set this field to the Reverse Packet Data Channel multiplex option (see [3]).

RESERVED – Reserved bits.

The mobile station shall add reserved bits as needed in order to make the length of the entire information record equal to an integer number of octets. The mobile station shall set these bits to ‘0’.
2.7.4.29 Geo-Location Capability

This information record identifies the geo-location capabilities of the mobile station. The mobile station shall use the following fixed-length format for the type-specific fields:

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>GEO_LOC</td>
<td>3</td>
</tr>
<tr>
<td>RESERVED</td>
<td>5</td>
</tr>
</tbody>
</table>

GEO_LOC – Geo-location.

The mobile station shall set this field to the value shown in Table 2.7.4.29-1.

<table>
<thead>
<tr>
<th>GEO_LOC (binary)</th>
<th>Type of Wireless Assisted GPS Identifiers</th>
</tr>
</thead>
<tbody>
<tr>
<td>000</td>
<td>No mobile station assisted geo-location capabilities</td>
</tr>
<tr>
<td>001</td>
<td>IS-801 capable (Advanced Forward Link Triangulation only)</td>
</tr>
<tr>
<td>010</td>
<td>IS-801 capable (Advanced Forward Link Triangulation and Global Positioning Systems)</td>
</tr>
<tr>
<td>011</td>
<td>Global Positioning Systems only</td>
</tr>
</tbody>
</table>

All other GEO_LOC_TYPE values are reserved.

RESERVED – Reserved bit.

The mobile station shall set this field to ‘00000’.
2.7.4.30 Band Subclass Information

This information record can be included in a *Status Response Message*, or an *Extended Status Response Message* to return band subclass information about the mobile station.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAND_SUBCLASS_INFO</td>
<td>$8 \times \text{RECORD_LEN}$</td>
</tr>
</tbody>
</table>

**BAND_SUBCLASS_INFO** – Band subclass information.

This field indicates which band subclasses are supported by the mobile station.

The mobile station shall set this field to the band subclass information corresponding to the BAND_CLASS specified in the *Status Request Message*.

The mobile station shall set this field as follows:

- **If the mobile station does support the BAND_CLASS specified in the Status Request Message but there is no subclass defined for this band class,** the mobile station shall set this field to ‘10000000’ and set the RECORD_LEN field for this record to ‘00000001’.

- **Otherwise,** the mobile station shall set the Nth most significant bit of this field to ‘1’ if the Nth sub-band class defined in [45] corresponding to the BAND_CLASS specified in the Status Request Message is supported by the mobile station; otherwise, the mobile station shall set the Nth most significant bit of this field to ‘0’. **Example of this field coding is shown in Figure 2.7.4.30-1.**

**Figure 2.7.4.30-1. BAND_SUBCLASS_INFO field coding**

The mobile station shall add reserved bits as needed in order to make the length of the entire information record equal to an integer number of octets. The mobile station shall set these bits to ‘0’.
2.7.4.31 Global Emergency Call

This information record identifies that an emergency call is being originated. This record may be included in a *Flash With Information Message* or an *Extended Flash With Information Message* and allows the user to originate an emergency call.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>NUM_INCL</td>
<td>1</td>
</tr>
<tr>
<td>DIGIT_MODE</td>
<td>0 or 1</td>
</tr>
<tr>
<td>NUMBER_TYPE</td>
<td>0 or 3</td>
</tr>
<tr>
<td>NUMBER_PLAN</td>
<td>0 or 4</td>
</tr>
<tr>
<td>NUM_CHAR</td>
<td>0 or 8</td>
</tr>
</tbody>
</table>

NUM_CHAR occurrences of the following field:

```
/* (NUM_CHAR)
CHARi 4 or 8
*/ (NUM_CHAR)
```

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>MS_ORIG_POS_LOC_IND</td>
<td>1</td>
</tr>
<tr>
<td>RESERVED</td>
<td>0 to 7 (as needed)</td>
</tr>
</tbody>
</table>

**NUM_INCL** – Dialed number included indicator.

The mobile station shall set this field to ‘1’ to indicate that the dialed digits are included in this information record; otherwise, the mobile station shall set this field to ‘0’.

**DIGIT_MODE** – Digit mode indicator.

If NUM_INCL is set to ‘1’, the mobile station shall set this field to indicate whether the dialed digits are 4-bit DTMF codes or 8-bit ASCII codes using a specified numbering plan; otherwise, the mobile station shall omit this field.

To originate the call using the binary representation of DTMF digits, the mobile station shall set this field to ‘0’. To originate the call using ASCII characters, the mobile station shall set this field to ‘1’.

**NUMBER_TYPE** – Type of number.

If NUM_INCL is set to ‘1’ and the DIGIT_MODE field is set to ‘1’, the mobile station shall set this field to the NUMBER_TYPE value shown in Table 2.7.1.3.2.4-2 corresponding to the type of the called number, as defined in [7], Section 4.5.9; otherwise, the mobile station shall omit this field.

**NUMBER_PLAN** – Numbering plan.
If NUM_INCL is set to ‘1’ and the DIGIT_MODE field is set to ‘1’, the mobile station shall set this field to the NUMBER_PLAN value shown in Table 2.7.1.3.2.4-3 corresponding to the numbering plan used for the called number, as defined in [7], Section 4.5.9; otherwise, the mobile station shall omit this field.

NUM_CHAR – Number of characters.

If NUM_INCL is set to ‘1’, the mobile station shall set this field to the number of characters included in this record; otherwise, the mobile station shall omit this field.

CHARi – Character.

If the NUM_INCL is set to ‘1’, the mobile stations shall include NUM_CHAR occurrences of this field.

If the DIGIT_MODE field is set to ‘0’, the mobile station shall set each occurrence of this field to the code value shown in Table 2.7.1.3.2.4-4 corresponding to the dialed digit. If the DIGIT_MODE field is set to ‘1’, the mobile station shall set each occurrence of this field to the ASCII representation corresponding to the character, as specified in [9], with the most significant bit set to ‘0’.

MS_INIT_POS_LOC_IND – Mobile Initiated Position Location Session indicator.

The mobile station shall set this field to ‘1’ if MS_INIT_POS_LOC_SUP_IND is equal to ‘1’ and if the mobile station is to initiate a position location session associated with this emergency call; otherwise, the mobile station shall set this field to ‘0’.

RESERVED – Reserved bits.

The mobile station shall add reserved bits as needed in order to make the length of the entire information record equal to an integer number of octets. The mobile station shall set these bits to ‘0’.
2.7.4.32 Hook Status

This information record shall indicate the status of the hook switch in Wireless Local Loop mobile stations. The mobile station shall use the following fixed-length format for the type-specific fields:

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>HOOK_STATUS</td>
<td>4</td>
</tr>
<tr>
<td>RESERVED</td>
<td>4</td>
</tr>
</tbody>
</table>

HOOK_STATUS – WLL terminal hook status.

The mobile station shall set this sub-field to the value shown in Table 2.7.3.2.1-4 corresponding to the hook state.

RESERVED – Reserved bits.

The mobile station shall set this field to ‘0000’.
2.7.4.33 QoS Parameters

This information record conveys to the user the QoS parameters associated with the service to be provided:

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>QoS Parameters</td>
<td>variable</td>
</tr>
<tr>
<td>RESERVED</td>
<td>0 - 7 (as needed)</td>
</tr>
</tbody>
</table>

QoS Parameters - Block containing the QoS Parameters.

The mobile station shall set this field to the QoS parameters associated with the user (per subscription), service type (e.g., assured vs. non-assured services) and the service option. The details of the QoS parameters may be found in documents describing the service options.

RESERVED - Reserved bits for octet alignment.

The mobile station shall add the minimum number of bits necessary to make the record length in bits an integral multiple of 8. The mobile station shall set these bits to '0'.
2.7.4.34 Encryption Capability

This information record identifies the encryption capability of the mobile station.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>SIG_ENCRYPT_SUP</td>
<td>8</td>
</tr>
<tr>
<td>UI_ENCRYPT_SUP</td>
<td>8</td>
</tr>
</tbody>
</table>

**SIG_ENCRYPT_SUP** – Signaling Encryption supported indicator.

The mobile station shall set this field to indicate which signaling encryption algorithms are supported by the mobile station, as shown in Table 2.7.1.3.2.1-5.

The mobile station shall set the subfields as follows:

- The mobile station shall set the CMEA subfield to ‘1’.
- The mobile station shall set each subfield to ‘1’ if the corresponding signaling encryption algorithm is supported by the mobile station; otherwise, the mobile station shall set the subfield to ‘0’.
- The mobile station shall set the RESERVED subfield to ‘00000’.

**UI_ENCRYPT_SUP** – User information encryption supported indicator.

The mobile station shall set this field to indicate the supported user information encryption algorithms, as shown in Table 2.7.1.3.2.4-9.

The mobile station shall set each subfield to ‘1’ if the corresponding user information encryption algorithm is supported by the mobile station; otherwise, the mobile station shall set the subfield to ‘0’.

The mobile station shall set the RESERVED subfield to ‘000000’.
2.7.4.35 Signaling Message Integrity Capability

This information record identifies the signaling message integrity capability of the mobile station.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>SIG_INTEGRITY_SUP</td>
<td>8</td>
</tr>
</tbody>
</table>

SIG_INTEGRITY_SUP — Signaling message integrity supported by the mobile station.

The mobile station shall set this field to indicate the supported message integrity algorithm in addition to the default integrity algorithm.

This field consists of the subfields shown in Table 2.7.1.3.2.1-6.

The mobile station shall set each subfield to ‘1’ if the corresponding message integrity algorithm is supported by the mobile station; otherwise, the mobile station shall set the subfield to ‘0’.

The mobile station shall set the RESERVED subfield to ‘00000000’.
This information record can be included in a Status Response Message or an Extended Status Response Message to return the mobile station UIM_ID.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>UIM_ID_LEN</td>
<td>4</td>
</tr>
<tr>
<td>UIM_ID</td>
<td>$8 \times UIM_ID_LEN$</td>
</tr>
<tr>
<td>RESERVED</td>
<td>0 - 7 (as needed)</td>
</tr>
</tbody>
</table>

UIM_ID_LEN – The length of mobile station User Identity Module identifier.

The mobile station shall set this field to the length, in units of octets, of its User Identity Module identifier. If the mobile station does not have a User Identity Module identifier, the mobile station shall set this field to ‘0000’.

UIM_ID – Mobile station User Identity Module identifier.

The mobile station shall set this field to its User Identity Module identifier (see [40]).

RESERVED - Reserved bits for octet alignment.

The mobile station shall add the minimum number of bits necessary to make the record length in bits an integral multiple of 8. The mobile station shall set these bits to ‘0’. 
2.7.4.37 ESN_ME

This information record can be included in a Status Response Message or an Extended Status Response Message to return the mobile station ESN_ME.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESN_ME_LEN</td>
<td>4</td>
</tr>
<tr>
<td>ESN_ME</td>
<td>$8 \times \text{ESN_ME_LEN}$</td>
</tr>
<tr>
<td>RESERVED</td>
<td>0 - 7 (as needed)</td>
</tr>
</tbody>
</table>

- ESN_ME_LEN – The length of mobile equipment electronic serial number. The mobile station shall set this field to the length, in units of octets, of its mobile equipment electronic serial number.
- ESN_ME\textsuperscript{15} – Mobile equipment electronic serial number. The mobile station shall set this field to ESN_p (see 2.3.2).
- RESERVED – Reserved bits for octet alignment. The mobile station shall add the minimum number of bits necessary to make the record length in bits an integral multiple of 8. The mobile station shall set these bits to '0'.

\textsuperscript{15} The ESN_ME field is always set to ESN_p and never carries UIM ID value.
2.7.4.38 MEID

This information record can be included in a Status Response Message or an Extended Status Response Message to return the mobile station MEID.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>MEID_LEN</td>
<td>4</td>
</tr>
<tr>
<td>MEID</td>
<td>8 × MEID_LEN</td>
</tr>
<tr>
<td>RESERVED</td>
<td>0 - 7 (as needed)</td>
</tr>
</tbody>
</table>

MEID_LEN – The length of mobile station Mobile Equipment Identifier.

The mobile station shall set this field to the length, in units of octets, of its Mobile Equipment Identifier.

MEID – Mobile Equipment Identifier.

The mobile station shall set this field to MEID_p.

RESERVED – Reserved bits for octet alignment.

The mobile station shall add the minimum number of bits necessary to make the record length in bits an integral multiple of 8. The mobile station shall set these bits to ‘0’.
2.7.4.39 Extended Keypad Facility

This information record can be included in a *Flash With Information Message* and allows the user to send characters entered via a keyboard or other such terminal.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>NUMBER_INFO_INCL</td>
<td>1</td>
</tr>
<tr>
<td>NUMBER_TYPE</td>
<td>0 or 3</td>
</tr>
<tr>
<td>NUMBER_PLAN</td>
<td>0 or 4</td>
</tr>
<tr>
<td>NUM_FIELDS</td>
<td>6</td>
</tr>
</tbody>
</table>

NUM_FIELDS occurrences of the following field:

```
{ CHARi 8 }
```

| RESERVED | 0 - 7 (as needed) |

5

NUMBER_INFO_INCL – Number included indicator.

The mobile station shall set this field to ‘1’ if NUMBER_TYPE and NUMBER_PLAN fields are included in this record; otherwise, the mobile station shall set this field to ‘0’.

NUMBER_TYPE – Type of number.

If NUMBER_INFO_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall set this field to the NUMBER_TYPE value shown in Table 2.7.1.3.2.4-2 corresponding to the characters included in this record, as defined in [7], Section 4.5.9.

If the mobile station determines that this number is an international number (for example, with a leading “+” or as specified in [39] for Plus Code Dialing or an international access code), the mobile station should set this field to ‘001’.

NUMBER_PLAN – Numbering plan.

If NUMBER_INFO_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall set this field to the NUMBER_PLAN value shown in Table 2.7.1.3.2.4-3 corresponding to the numbering plan used for the characters in this record, as defined in [7], Section 4.5.9.

NUM_FIELDS – Number of characters in this message.

The mobile station shall set this field to the number of CHARi fields in this message.
The mobile station shall include one occurrence of this field for each character entered. The mobile station shall set each occurrence of this field to the ASCII representation corresponding to the character entered, as specified in [9], with the most significant bit set to ‘0’.

The mobile station shall add the minimum number of bits necessary to make the record length in bits an integral multiple of 8. The mobile station shall set these bits to ‘0’.
2.7.4.40 SYNC_ID

This information record can be included in a Status Response Message or an Extended Status Response Message to return the SYNC_IDs corresponding to stored service configurations.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>NUM_SYNC_ID</td>
<td>5</td>
</tr>
<tr>
<td>SID</td>
<td>0 or 15</td>
</tr>
<tr>
<td>NID</td>
<td>0 or 16</td>
</tr>
</tbody>
</table>

NUM_SYNC_ID occurrences of the following fields:

\[
\{ (NUM\_SYNC\_ID) \\
\quad \text{SYNC\_ID\_LEN} & 4 \\
\quad \text{SYNC\_ID} & (8 \times \text{SYNC\_ID\_LEN}) \\
\} (NUM\_SYNC\_ID) \\
\]

RESERVED 0 - 7 (as needed)

NUM_SYNC_ID - The number of SYNC_IDs included in this message.

The mobile station shall set this field to the number of SYNC_IDs, corresponding to the stored service configurations associated with SID_s and NID_s, included in this message. If the mobile station does not have any stored service configuration associated with SID_s and NID_s, the mobile station shall set this field to ‘00000’.

SID - System identification.

If the NUM_SYNC_ID field is set to ‘00000’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to SID_s.

NID - Network identification.

If the NUM_SYNC_ID field is set to ‘00000’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

The mobile station shall set this field to NID_s.
The mobile station shall include NUM_SYNC_ID occurrences of the following variable length record:

- **SYNC_ID_LEN** - Service Configuration synchronization identifier length.
  - The mobile station shall set this field to the length (in octets) of the SYNC_ID field included in this message. The mobile station shall set this field to a value larger than zero.

- **SYNC_ID** - Service Configuration synchronization identifier.
  - The mobile station shall set this field to the synchronization identifier corresponding to a stored service configuration associated with SID and NID included in this message.

- **RESERVED** - Reserved bits for octet alignment.
  - The mobile station shall add the minimum number of bits necessary to make the record length in bits an integral multiple of 8. The mobile station shall set these bits to ‘0’.
2.7.4.41 Extended Terminal Information

This information record can be included in a Status Response Message, or an Extended Status Response Message to return configuration information about the mobile station.

<table>

</table>

- **MOB_P_REV** – Protocol revision of the mobile station.
  - If the status request does not specify a band class, the mobile station shall set this field to ‘00001011’; otherwise, the mobile station shall set this field to the MOB_P_REV associated with the requested band class and operating mode.

- **MOB_MFG_CODE** – Manufacturer code.
  - This field identifies the manufacturer of the mobile station.
  - The mobile station shall set this field to the manufacturer code assigned to its manufacturer.
MOB_MODEL – Model number.
This number is assigned by the manufacturer for a particular model.
The mobile station shall set this field to the model number assigned by the manufacturer for this mobile station.

MOB_FIRM_REV – Firmware revision number.
This number is assigned by the manufacturer for a particular firmware version.
The mobile station shall set this field to the revision number assigned by the manufacturer for the firmware version running in this mobile station.

SCM – Station class mark.
The mobile station shall set this field to its station class mark. See 2.3.3.

LOCAL_CTRL – Local control indicator.
If local control is enabled, the mobile station shall set this field to ‘1’. If local control is disabled, the mobile station shall set this field to ‘0’. See [6].

SLOT_CYCLE_INDEX – Slot cycle index.
If the requested operating mode is CDMA and the mobile station is configured for slotted mode operation, the mobile station shall set this field to the absolute value of the registered slot cycle index, SLOT_CYCLE_INDEX_REG (see 2.6.2.1.1); otherwise, the mobile station shall set this field to ‘000’. The sign of the registered slot cycle, SLOT_CYCLE_INDEX_REG, is specified in the SIGN_SLOT_CYCLE_INDEX field of this message (see Table 2.7.1.3.2.1-8).

SIGN_SLOT_CYCLE_INDEX – Sign of the slot cycle index.
If the SLOT_CYCLE_INDEX field is set to ‘000’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:
The mobile station shall set this field as specified in Table 2.7.1.3.2.1-8 to the sign of the registered slot cycle index, SLOT_CYCLE_INDEX_REG (see 2.6.2.1.1). The absolute value of the registered slot cycle index, SLOT_CYCLE_INDEX_REG, is specified in the SLOT_CYCLE_INDEX field of this message.

SO_INCL – Service option inclusion indicator.
If there is a service option supported by the mobile station which does not belong to any service option group assigned (see [30]), the mobile station shall set this field ‘1’; otherwise, the mobile station shall set this field to ‘0’.

NUM_SO – Number of service option included indicator.
If the SO_INCL is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall set this field to the number of service option to be included minus one.

If SO_INCL is set to '1', the mobile station shall include NUM_SO + 1 occurrences of the following variable-field record:

**SERVICE_OPTION** – Supported service option.

If the SO_INCL is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall set this field as follow:

If the requested operating mode is CDMA, the mobile station shall includes one occurrence of this field for each service option supported by the mobile station (see [30]) which has no service option group number assigned.

**SO_GROUP_INCL** - Service option group inclusion indicator.

If the requested operating mode is CDMA, the mobile station shall set this field to '1' if any of the supported service option belongs to a service option group; otherwise, the mobile station shall set this field to '0'.

**NUM_SO_GROUP** - Number of service option group included indicator.

If SO_GROUP_INCL is set to '0', the mobile station shall omit this field; otherwise, the mobile station shall set this field to the number of service option groups to be included minus one.

If SO_GROUP_INCL is set to '1', the mobile station shall include NUM_SO_GROUP + 1 occurrences of the following variable-field record:

**SO_BITMAP_IND** - Service option bitmap indicator.

The mobile station shall set this field as defined in Table 2.7.1.3.2.4-10.

**SO_GROUP_NUM** - Service option group number.

If SO_BITMAP_IND is included and not set to '00', the mobile station shall include this field and set this field to service option group number defined in [30], of the bitmap to be included in this message; otherwise, the mobile station shall omit this field.

**SO_BITMAP** – Service option bitmap.

If SO_BITMAP_IND is included and is not set to '00', the mobile station shall include the bitmap of the service option group (SO_GROUP_NUM); otherwise, the mobile station shall omit this field.

When the service option bitmap is included, if there are more than \(2^{\text{SO_GROUP_NUM}}\) service options defined in [30] for the service option group [SO_GROUP_NUM], the mobile station shall include the bitmap containing the least significant bits \(2^{\text{SO_GROUP_NUM}}\) for the service option group.
RESERVED – Reserved bits.

The mobile station shall set this field to ‘0’ to make the entire record octet-aligned.
2.7.4.42 Extended Service Option Information

This information record can be included in a Status Response Message or an Extended Status Response Message to return service option information about the mobile station or the service option group information requested by the base station.

SO_GROUP_INCL - Service option group inclusion indicator.

If the requested operating mode is CDMA, the mobile station shall set this field to ‘1’ if any of the supported service option belongs to a service option group; otherwise, the mobile station shall set this field to ‘0’.

NUM_SO_GROUP - Number of service option group included indicator.
If the SO_GROUP_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall set this field to the number of service option groups to be included minus one.

If SO_GROUP_INCL is set to ‘1’, the mobile station shall include NUM_SO_GORUP +1 occurrences of the following variable-field record:

SO_BITMAP_IND - Service option bitmap indicator.
The mobile station shall set this field as defined in Table 2.7.1.3.2.4-10.

SO_GROUP_NUM - Service option group number.
If SO_BITMAP_IND is included and not set to ‘00’, the mobile station shall include this field and set this field to service option group number defined in [30], of the bitmap to be included in this message; otherwise, the mobile station shall omit this field.

REV_BITMAP_INCL - Reverse traffic channel bitmap included indicator.
If SO_BITMAP_IND is included and set to ‘00’, the mobile station shall omit this field; otherwise the mobile station shall set this field as follow:
The mobile station shall set this field to ‘0’ to indicate FOR_SUP_SO_BITMAP is used to specify the service option supports for both forward traffic channel and reverse traffic channel; otherwise the mobile station shall set this field to ‘1’.

FOR_SUP_SO_BITMAP - Support bitmap indicator for Forward Traffic Channel.
If SO_BITMAP_IND is included and set to ‘00’, the mobile station shall omit this field; otherwise the mobile station shall include the bitmap of the service option group (SO_GROUP_NUM) as follow:

If REV_BITMAP_INCL is set to ‘1’:

- If the service option specified by FOR_SUP_SO_BITMAP is supported on forward traffic channel, the mobile station shall set the corresponding bit to ‘1’; otherwise, the mobile station shall set this bit to ‘0’.

Otherwise,

- If the service option specified by FOR_SUP_SO_BITMAP is supported on forward traffic channel and on reverse traffic channel, the mobile station shall set the corresponding bit to ‘1’; otherwise, the mobile station shall set this bit to ‘0’.

REV_SUP_SO_BITMAP - Support bitmap indicator for Reverse Traffic Channel.
If REV_BITMAP_INCL is included and set to ‘0’, the mobile station shall omit this field; otherwise the mobile station shall include the bitmap of the service option group (SO_GROUP_NUM) as follow:

If the service option specified by REV_SUP_SO_BITMAP is supported on reverse traffic channel, the mobile station shall set the corresponding bit to ‘1’; otherwise, the mobile station shall set this bit to ‘0’.

SO_INCL - Service option inclusion indicator.

If there is a service option supported by the mobile station which does not belong to any service option group assigned (see [30]), the mobile station shall set this field ‘1’; otherwise, the mobile station shall set this field to ‘0’.

NUM_SO - Number of service option included indicator.

If the SO_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall set this field to the number of service option to be included minus one.

REVERSE_SUPPORT_INCL - Reverse service option support included indicator.

If the SO_INCL is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follow:

The mobile station shall set this field to ‘0’ to indicate FORWARD_SUPPORT is used to specify the service option supports for both forward traffic channel and reverse traffic channel; otherwise the mobile station shall set this field to ‘1’.

If SO_INCL is set to ‘1’, the mobile station shall include NUM_SO + 1 occurrences of the following variable-field record:

FORWARD_SUPPORT – Support indicator for Forward Traffic Channel.

The mobile station shall set this field as follow:

If REVERSE_SUPPORT_INCL is set to ‘1’, the mobile station shall set this field to ‘1’ if the service option specified in the SERVICE OPTION field is supported on the Forward Traffic Channel.

If REVERSE_SUPPORT_INCL is set to ‘0’, the mobile station shall set this field to ‘1’ if the service option specified in the SERVICE OPTION field is supported on the forward traffic channel and on reverse traffic channel.

REVERSE_SUPPORT – Support indicator for Reverse Traffic Channel.

If REVERSE_SUPPORT_INCL field is not included or is set to ‘0’, the mobile station shall omit this field; otherwise the mobile station shall include this field and set it as follows:
The mobile station shall set this field to ‘1’ if the service option specified in the SERVICE_OPTION field is supported on the Reverse Traffic Channel.

**SERVICE_OPTION** – Service option.

If the requested operating mode is CDMA, the mobile station shall include one occurrence of this field for each service option supported by the mobile station (see [30]) which has no service option group number assigned.

**RESERVED** – Reserved bits.

The mobile station shall set all the bits of this field to ‘0’ to make the entire record octet-aligned.
2.7.4.43 Band Class and Band Subclass Information

When this information record is included in a Status Response Message or an Extended Status Response Message, the mobile station shall include all the band classes and band subclasses that it supports.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>} (NUM_BAND_CLASS + 1)</td>
<td></td>
</tr>
<tr>
<td>RESERVED</td>
<td>0 – 7 (as needed)</td>
</tr>
</tbody>
</table>

**NUM_BAND_CLASS** – Number of band classes.

The mobile station shall set this field to the number of band classes included in the record minus one.

The mobile station shall include NUM_BAND_CLASS + 1 occurrences of the following record:

**BAND_CLASS_REC_LEN** – Band class information record length.

The mobile station shall set this field to the number of octets included in this record starting from this field and ending with BAND_CLASS_RESERVED.

**BAND_CLASS** – Band class

This field specifies a band class supported by the mobile station. The mobile station shall set this field according to the values defined in [45].

**SUBCLASS_INFO_INCL** – Band subclass information included
The mobile station shall set this field to ‘0’ when it is not aware of any band subclasses associated with the BAND_CLASS field above; otherwise, the base station shall set this field to ‘1’.

SUBCLASS_REC_LEN – Band subclass subrecord length

If SUBCLASS_INFO_INCL is set to ‘0’, the base station shall omit this field; otherwise, the mobile station shall set this field to the number of band subclass supported indicator fields included in the subrecord minus 1.

If the SUBCLASS_REC_LEN field is included, the mobile station shall include SUBCLASS_REC_LEN + 1 occurrences of the following subrecord. The first field included corresponds to band subclass ‘0’ and the Nth field included corresponds to band subclass ‘N-1’.

SUBCLASS_SUP – Band subclass supported indicator

The mobile station shall set this field to ‘1’ if the corresponding band subclass is supported for the associated BAND_CLASS; otherwise, the mobile station shall set this field to ‘0’.

BAND_CLASS_RESERVED – Reserved bits.

The mobile station shall add reserved bits as needed in order to make the length of the record equal to an integer number of octets. The mobile station shall set each of these bits to ‘0’.

RESERVED – Reserved bits.

The mobile station shall add reserved bits as needed in order to make the length of the entire record equal to an integer number of octets. The mobile station shall set each of these bits to ‘0’.
2.7.4.44 EXT_UIM_ID

This information record can be included in a Status Response Message or an Extended Status Response Message to return the mobile station EXT_UIM_ID.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXT_UIM_ID_LEN</td>
<td>4</td>
</tr>
<tr>
<td>EXT_UIM_ID</td>
<td>8 \times EXT_UIM_ID_LEN</td>
</tr>
<tr>
<td>RESERVED</td>
<td>0 - 7 (as needed)</td>
</tr>
</tbody>
</table>

EXT_UIM_ID_LEN – The length of mobile station Extended User Identity Module identifier.

The mobile station shall set this field to the length, in units of octets, of its Extended User Identity Module identifier. If the mobile station does not have an Extended User Identity Module identifier, the mobile station shall set this field to ‘0000’.

EXT_UIM_ID – Mobile station Extended User Identity Module identifier.

The mobile station shall set this field to its Extended User Identity Module identifier (see [40]).

RESERVED – Reserved bits for octet alignment.

The mobile station shall add the minimum number of bits necessary to make the record length in bits an integral multiple of 8. The mobile station shall set these bits to ‘0’.
No text.
3. REQUIREMENTS FOR BASE STATION CDMA OPERATION

This section defines requirements that are specific to CDMA base station equipment and operation.

3.1 Reserved

3.2 Reserved

3.3 Security and Identification

3.3.1 Authentication

The base station may be equipped with a database that includes unique mobile station authentication keys, shared secret data, or both for each registered mobile station in the system. This database is used for authentication of mobile stations that are equipped for authentication operation.

If the base station supports mobile station authentication, it shall provide the following capabilities: The base station shall send and receive authentication messages and perform the authentication calculations described in 2.3.12.1. If the base station supports 800 MHz analog operation, the base station should set the RAND parameter of the Access Parameters Message to the same value transmitted on the forward analog control channel (see [6]).

3.3.2 Encryption

If the base station supports mobile station authentication (see 3.3.1), it may also support message encryption by providing the capability to send encryption control messages and the ability to perform the operations of encryption and decryption as specified in 2.3.12.2.

3.3.3 Voice Privacy

If the base station supports mobile station authentication (see 3.3.1), it may also support voice privacy using the private long code mask, as specified in 2.3.12.3.

3.3.4 Extended-Encryption

If the base station supports mobile station authentication (see 3.3.1), it may also support Extended-Encryption for Signaling Messages and User Information as specified in 2.3.12.4.

3.3.5 Message Integrity

If the base station supports message integrity, it shall provide the message integrity capability as specified in 2.3.12.5.5.

3.4 Supervision

3.4.1 Access Channel or Enhanced Access Channel

The base station shall continually monitor each active Access Channel or Enhanced Access
Channel or both. The base station should provide control in cases of overload by using either the Access Parameters Message or the Enhanced Access Parameters Message.

3.4.2 Reverse Traffic Channel

The base station shall continually monitor each active Reverse Traffic Channel to determine if the call is active. If the base station detects that the call is no longer active, the base station shall declare loss of Reverse Traffic Channel continuity (see 3.6.4).

3.5 Reserved

3.6 Layer 3 Processing

This section describes base station Layer 3 processing. It contains frequent references to the messages that flow between the base station and the mobile station. While reading this section, it may be helpful to refer to the message formats (see 2.7 and 3.7), and to the call flow examples (see Annex B and Annex C). The values for the time and numeric constants used in this section (e.g., T₁b and N₄m) are specified in Annex D.

Base station processing consists of the following types of processing:

- **Pilot and Sync Channel Processing** - During Pilot and Sync Channel Processing, the base station transmits the Pilot Channel and Sync Channel which the mobile station uses to acquire and synchronize to the CDMA system while the mobile station is in the Mobile Station Initialization State.

- **Common Channel Processing** - During Common Channel Processing, the base station transmits the Paging Channel and/or the Forward Common Control Channel/Broadcast Control Channel which the mobile station monitors to receive messages while the mobile station is in the Mobile Station Idle State and the System Access State.

- **Access Channel and Enhanced Access Channel Processing** - During Access Channel and Enhanced Access Channel Processing, the base station monitors the Access Channel and/or the Enhanced Access Channel to receive messages which the mobile station sends while the mobile station is in the System Access State.

- **Traffic Channel Processing** - During Traffic Channel Processing, the base station uses the Forward and Reverse Traffic Channels to communicate with the mobile station while the mobile station is in the Mobile Station Control on the Traffic Channel State.

3.6.1 Pilot and Sync Channel Processing

During Pilot and Sync Channel Processing, the base station transmits the Pilot and Sync Channels which the mobile station uses to acquire and synchronize to the CDMA system while the mobile station is in the Mobile Station Initialization State.

3.6.1.1 Preferred Set of CDMA Channels

The preferred set of frequency assignments are the CDMA Channels on which the mobile station attempts to acquire the CDMA system (see [2]).
The base station shall support at least one member of the preferred set of frequency assignments. The base station may support additional CDMA Channels.

3.6.1.2 Pilot Channel Operation

The Pilot Channel (see [2]) is a reference channel which the mobile station uses for acquisition, timing, and as a phase reference for coherent demodulation.

The base station shall continually transmit a Pilot Channel for every CDMA Channel supported by the base station, unless the base station is classified as a hopping pilot beacon.

3.6.1.3 Sync Channel Operation

The Sync Channel (see [2]) provides the mobile station with system configuration and timing information.

The base station shall transmit at most one Sync Channel for each supported CDMA Channel. The base station shall support a Sync Channel on at least one member of the preferred set of frequency assignments that it supports. The base station should support a Sync Channel on every member of the preferred set of frequency assignments that it supports.

If the base station operates in Band Class 0 or Band Class 3, and supports the Primary CDMA Channel, then the base station shall transmit a Sync Channel on the Primary CDMA Channel.

The base station shall continually send the Sync Channel Message on each Sync Channel that the base station transmits.

3.6.2 Common Channel Processing

3.6.2.1 Paging Channel and Forward Common Control Channel Procedures

During Common Channel Processing, the base station transmits the Paging Channel or the Forward Common Control Channel (see [2]) which the mobile station monitors to receive messages while the mobile station is in the Mobile Station Idle State and the System Access State.

The base station may transmit up to seven Paging Channels on each supported CDMA Channel. The base station may transmit up to seven Forward Common Control Channels and one Primary Broadcast Control Channel on each supported CDMA Channel.

For each Paging Channel that the base station transmits, the base station shall continually send valid Paging Channel messages (see 3.7.2), which may include the Null Message (see [4]).
The base station shall not send any message which is not completely contained within two consecutive Paging Channel or Forward Common Control Channel slots, unless the processing requirements for the message explicitly specify a different size limitation.\(^1\)

### 3.6.2.1.1 CDMA Channel Determination

The base station may send the **CDMA Channel List Message** and the **Extended CDMA Channel List Message** on the Paging Channel. When the base station supports Broadcast Control Channel, the base station shall send the **Extended CDMA Channel List Message** on the Primary Broadcast Control Channel.

**When the base station sends a CDMA Channel List Message or an Extended CDMA Channel List Message on the Paging Channel or on the Primary Broadcast Control Channel, the base station shall determine the assigned band and CDMA Channel using the mobile station hashing procedures for the corresponding P\_REV\_IN\_USE.**

**When the base station sends the CDMA Channel List Message on the Paging Channel, the base station shall determine the assigned CDMA Channel using the hash function specified in 2.6.7.1 with the following inputs:**

- IMSI\_S based on the IMSI with which the mobile station registered (see 2.3.1)
- Number of CDMA Channels in the **CDMA Channel List Message** in accordance with the procedures defined in 2.6.2.2.12.1 for mobile stations with:
  - MOB\_P\_REV\_s less than six.
  - MOB\_P\_REV\_s equal to six if the base station does not send the **Extended CDMA Channel List Message** on the Paging Channel.
  - MOB\_P\_REV\_s greater than or equal to seven, if the base station does not send the **Extended CDMA Channel List Message** on the paging channel and does not support Primary Broadcast Control Channel.

**When the base station sends the Extended CDMA Channel List Message on the Paging Channel, the base station shall determine the assigned CDMA Channel using the hash function specified in 2.6.7.1 with the following inputs:**

- IMSI\_S based on the IMSI with which the mobile station registered (see 2.3.1)
- Number of CDMA Channels of the selected channel subset of CDMA channels in the **Extended CDMA Channel List Message** in accordance with the procedures defined in 2.6.2.2.12.1 for mobile stations with:
  - MOB\_P\_REV\_s equal to six.
  - MOB\_P\_REV\_s greater than or equal to seven, if the base station does not support Primary Broadcast Control Channel.

\(^1\)See, for example, [14] which specifies processing requirements for the **Data Burst Message**.
When the base station sends the *Extended CDMA Channel List Message* on the Primary Broadcast Control Channel, the base station shall determine the assigned CDMA Channel for MOB_P_REVs greater than or equal to seven using the hash function specified in 2.6.7.1 with the following inputs:

- IMSI_S based on the IMSI with which the mobile station registered (see 2.3.1)
- Number of CDMA Channels of the selected channel subset of CDMA channels in the *Extended CDMA Channel List Message* in accordance with the procedures defined in 2.6.2.2.12.2.

### 3.6.2.1.2 Common Channel Determination

To determine the mobile station’s assigned Paging Channel or Forward Common Control Channel, the base station shall use the hash function specified in 2.6.7.1 with the following inputs:

- IMSI_S based on the IMSI with which the mobile station registered (see 2.3.1)
- Number of Paging Channels or Forward Common Control Channels which the base station transmits on the mobile station’s assigned CDMA Channel.

### 3.6.2.1.3 Paging Slot Determination

To determine the assigned Paging Channel or Forward Common Control Channel slots for a mobile station with a given slot cycle index, the base station shall select a number PGSLOT using the hash function specified in 2.6.7.1 with the following inputs:

- IMSI_S based on the IMSI with which the mobile station registered (see 6.3.1)
- Maximum number of Paging Channel or Forward Common Control Channel slots (2048).

The assigned Paging Channel or Forward Common Control Channel slots for the mobile station are those slots for which

\[ \left( \frac{t}{4} \right) - \text{PGSLOT} \mod (16 \times T) = 0, \]

where \(t\) is the System Time in 20ms frames, and \(T\) is the slot cycle length in units of 1.28 seconds given by

\[ T = 2^i, \]

where \(i\) is the slot cycle index which can take the values -4, -3, -2, -1, 0, 1, 2, 3, 4, 5, 6, and 7.

When the base station is able to determine that the mobile station is operating in the slotted mode and is able to determine the mobile station’s preferred slot cycle index, the base station determines the slot cycle index to use for the mobile station as follows:

- If the base station is able to determine that the mobile station is operating in the reduced slot cycle mode, the base station uses \(\min(\text{reduced slot cycle index}, \text{preferred slot cycle index}, \text{maximum slot cycle index})\) for the mobile station’s slot cycle index.
• Otherwise:
  – If the base station supports negative values of slot cycle index, the base station uses min(preferred slot cycle index, maximum slot cycle index) for the mobile station’s slot cycle index.
  – Otherwise, the base station uses max(0, min(preferred slot cycle index, maximum slot cycle index)) for the mobile station’s slot cycle index.

When the base station is not able to determine whether the mobile station is operating in the slotted mode, or the base station is not able to determine the mobile station’s preferred slot cycle index, the base station uses for the mobile station’s slot cycle index the smaller of the maximum slot cycle index and 1.

3.6.2.1.4 Message Transmission and Acknowledgment Procedures

The Paging Channel or Forward Common Control Channel acknowledgment procedures facilitate the reliable exchange of messages between the base station and the mobile station on the f-csch and r-csch. The acknowledgment procedures and requirements are described in [4].

3.6.2.2 Overhead Information

The base station sends overhead messages to provide the mobile station with the information that it needs to operate with the base station. If the base station supports the Primary Broadcast Control Channel for overhead messages and is not a pilot beacon, it shall support the Forward Common Control Channel for all other general page information.

The base station with a P_REV greater than six that supports Broadcast Control Channel shall send overhead messages on the Primary Broadcast Control Channel. The base station with a P_REV greater than six that does not support the Broadcast Control Channel shall send overhead messages on each Paging Channel. The overhead messages sent on the Primary Broadcast Control Channel are:

1. ANSI-41 System Parameters Message
2. User Zone Identification Message
3. Private Neighbor List Message
4. Extended Global Service Redirection Message
5. Extended CDMA Channel List Message
6. MC-RR Parameters Message
7. Universal Neighbor List Message
8. Enhanced Access Parameters Message
9. ANSI-41 RAND Message
10. BCMC Service Parameters Message

The overhead messages on the Paging Channel are:
1. System Parameters Message
2. Neighbor List Message (Band Class 0 only)
3. Access Parameters Message
4. CDMA Channel List Message
5. Extended System Parameters Message
6. Extended Neighbor List Message (band classes other than Band Class 0)
7. General Neighbor List Message
8. Global Service Redirection Message
9. User Zone Identification Message
10. Private Neighbor List Message
11. Extended Global Service Redirection Message
12. Extended CDMA Channel List Message
13. BCMC Service Parameters Message

The base station shall maintain a configuration sequence number (CONFIG_SEQ) for configuration messages transmitted on the Paging Channel, and shall increment CONFIG_SEQ modulo 64 whenever the base station modifies the following messages:

1. System Parameters Message
2. Neighbor List Message (Band Class 0 only)
3. CDMA Channel List Message
4. Extended System Parameters Message
5. Extended Neighbor List Message (band classes other than Band Class 0)
6. General Neighbor List Message
7. Global Service Redirection Message
8. User Zone Identification Message
9. Private Neighbor List Message
10. Extended Global Service Redirection Message
11. Extended CDMA Channel List Message

The base station shall maintain a configuration sequence number (CONFIG_SEQ) for configuration messages transmitted on the Primary Broadcast Control Channel, and shall increment CONFIG_SEQ modulo 64 whenever the base station modifies the following messages:

1. ANSI-41 System Parameters Message
2. User Zone Identification Message
3. Private Neighbor List Message
4. **Extended Global Service Redirection Message**

5. **Extended CDMA Channel List Message**

6. **MC-RR Parameters Message**

7. **Universal Neighbor List Message**

The base station shall maintain an access configuration sequence number (ACC_CONFIG_SEQ) for the Access Channel, and shall increment ACC_CONFIG_SEQ modulo 64 whenever the base station modifies the *Access Parameters Message*.

The base station shall maintain an access configuration sequence number (ACC_CONFIG_SEQ) for the Enhanced Access Channel, and shall increment ACC_CONFIG_SEQ modulo 64 whenever the base station modifies the *Enhanced Access Parameters Message*.

On each Primary Broadcast Control Channel which the base station transmits, the base station shall send each of the following system overhead messages at least once per T_{1b} seconds:

1. **Extended CDMA Channel List Message**

2. **ANSI-41 System Parameters Message**

3. **MC-RR Parameters Message**

4. **Enhanced Access Parameters Message**

5. **Universal Neighbor List Message**

If the base station supports Primary Broadcast Control Channels, and the base station is sending the *ANSI-41 RAND Message*, it shall send it at least once per T_{1b} seconds.

On each of the Paging Channels the base station transmits, the base station shall send each of the following system overhead messages at least once per T_{1b} seconds:

1. **Access Parameters Message**

2. **CDMA Channel List Message**

3. **Extended System Parameters Message**

4. **System Parameters Message**

For the messages sent on the Paging Channel, if the base station is operating in Band Class 1, Band Class 3, or Band Class 4 and MIN_P_REV is less than seven, the base station shall send the *Extended Neighbor List Message*, and may also send the *General Neighbor List Message*. If the base station is operating in Band Class 0 and MIN_P_REV is less than seven, the base station shall send the *Neighbor List Message*, and may also send the *General Neighbor List Message*. If the base station is sending the *Neighbor List Message*, it shall send it at least once per T_{1b} seconds. If the base station is sending the *Extended Neighbor List Message*, it shall send it at least once per T_{1b} seconds. If the base station is sending the *General Neighbor List Message*, it shall send it at least once per T_{1b} seconds.

Overhead Messages sent on the Primary Broadcast Control Channel shall be transmitted on a continuous basis, consecutively.
If the base station uses addressing modes requiring use of only the IMSI_M_S, independent of values of the IMSI_M_11_12 and MCC_M, the base station shall set IMSI_T_SUPPORTED to ‘0’, MCC to ‘1111111111’, and IMSI_11_12 to ‘1111111’ in the Extended System Parameters Message, MC-RR Parameters Message, and ANSI-41 System Parameters Message.

If the base station sets IMSI_T_SUPPORTED to ‘1’, the base station shall not set PREF_MSID_TYPE to ‘00’ in the Extended System Parameters Message and ANSI-41 System Parameters Message.

The base station may send a Global Service Redirection Message on any given Paging Channel. If the message is sent, the base station shall send it at least once per $T_{1b}$ seconds.

If P_REV is greater than or equal to six, the base station may send an Extended Global Service Redirection Message. If the message is sent, the base station shall send it at least once per $T_{1b}$ seconds. The base station may send this message to redirect only those mobile stations with MOB_P_REV equal to or greater than six.

When both the Global Service Redirection Message and the Extended Global Service Redirection Message are sent, the base station shall use the Global Service Redirection Message for mobile stations with MOB_P_REV less than six, and shall use the Extended Global Service Redirection Message for mobile stations with MOB_P_REV equal to or greater than six. When only the Global Service Redirection Message is sent and this message is for mobile station with MOB_P_REV less than six, the base station shall set EXCL_P_REV_MS to ‘1’.

If only the Global Service Redirection Message is sent and this message is for redirecting all mobile stations, the base station shall set EXCL_P_REV_MS to ‘0’.

The base station may send a User Zone Identification Message. If the message is sent, the base station shall send it at least once per $T_{1b}$ seconds.

The base station may send a Private Neighbor List Message. If the message is sent, the base station shall send it at least once per $T_{1b}$ seconds.

The base station may send an Extended CDMA Channel List Message. If the message is sent, the base station shall send it at least once per $T_{1b}$ seconds.

3.6.2.3 Mobile Station Directed Messages

The base station may send the following messages directed to a mobile station on the f-csch. If the base station sends a message, the base station shall comply with the specified requirements for sending the message, if any:

1. Abbreviated Alert Order
2. Audit Order
3. Authentication Challenge Message
4. Base Station Challenge Confirmation Order
5. Channel Assignment Message (if $P_{REV_{IN\_USE}} < 8$)

</tbody>
</table>

The base station shall not send the Channel Assignment Message if P_REV_IN_USE is greater than or equal to nine.

The base station should send at least one General Page Message in each Paging Channel slot. The base station shall not omit a General Page Message in two adjacent Paging Channel slots.

The base station should send at least one General Page Message or Universal Page Message in each Forward Common Control Channel slot. The base station shall not omit both a General Page Message and a Universal Page Message in two adjacent slots.
3.6.2.3.1 Processing when the General Page Message is Used

The base station shall use the following rules for selecting the Paging Channel or Forward Common Control Channel slot in which to send a message to a mobile station:

- If the base station is able to determine that the mobile station is operating in the non-slotted mode, the base station may send the message to the mobile station in any Paging Channel or Forward Common Control Channel slot.

- If the base station is able to determine that the mobile station is operating in the slotted mode and is able to determine the mobile station’s slot cycle index (see 2.6.2.1.1.3), the base station shall send the message at least once in an assigned Paging Channel slot for the mobile station (see 3.6.2.1.3), with the position within the slot subject to the following limitations:
  - If the mobile station has registered with a class 0 IMSI, the base station shall not send the message in the assigned Paging Channel slot after sending a General Page Message with CLASS_0_DONE set to ‘1’ in that slot.
  - If the mobile station has registered with a class 1 IMSI, the base station shall not send the message in the assigned Paging Channel slot after sending a General Page Message with CLASS_1_DONE set to ‘1’ in that slot.
  - If the mobile station has been assigned a TMSI, the base station shall not send the message in the assigned Paging Channel slot after sending a General Page Message with TMSI_DONE set to ‘1’ in that slot.

- If the base station is able to determine that the mobile station is operating in the slotted mode and that the mobile station is not waiting for a priority access channel assignment and that the slotted timer in the mobile station is not active, and the base station is able to determine the mobile station’s slot cycle index (see 2.6.2.1.1.3), the base station shall send the message at least once in an assigned Forward Common Control Channel slot for the mobile station (see 3.6.2.1.3), with the position within the slot subject to the following limitations:
  - If the mobile station has registered with a class 0 IMSI, the base station shall not send the message in the assigned Forward Common Control Channel slot after sending a General Page Message with CLASS_0_DONE set to ‘1’ in that slot.
  - If the mobile station has registered with a class 1 IMSI, the base station shall not send the message in the assigned Forward Common Control Channel slot after sending a General Page Message with CLASS_1_DONE set to ‘1’ in that slot.
  - If the mobile station has been assigned a TMSI, the base station shall not send the message in the assigned Forward Common Control Channel slot after sending a General Page Message with TMSI_DONE set to ‘1’ in that slot.
If the base station is able to determine that the mobile station is operating in the slotted mode and that the mobile station is waiting for a priority access channel assignment, or that the slotted timer in the mobile station is active, the base station may send the message to the mobile station in any Forward Common Control Channel slot with the position within the slot subject to the following limitation:

- If the mobile station has registered with a class 0 IMSI, the base station shall not send the message in any Forward Common Control Channel slot after sending a General Page Message with CLASS_0_DONE set to ‘1’ in that slot.

- If the mobile station has registered with a class 1 IMSI, the base station shall not send the message in any Forward Common Control Channel slot after sending a General Page Message with CLASS_1_DONE set to ‘1’ in that slot.

- If the mobile station has been assigned a TMSI, the base station shall not send the message in any Forward Common Control Channel slot after sending a General Page Message with TMSI_DONE set to ‘1’ in that slot.

If the base station is not able to determine whether the mobile station is operating in the non-slotted mode, or the base station is not able to determine the mobile station’s slot cycle index, the base station shall assume that the mobile station is operating in the slotted mode with a slot cycle index which is the smaller of MAX_SLOT_CYCLE_INDEX and 1. The base station shall send the message at least once in an assigned Paging Channel or Forward Common Control Channel slot for the mobile station (see 3.6.2.1.3), with the position within the slot subject to the following limitations:

- If the mobile station has registered with a class 0 IMSI, the base station shall not send the message in the assigned Paging Channel or Forward Common Control Channel slot after sending a General Page Message with CLASS_0_DONE set to ‘1’ in that slot.

- If the mobile station has registered with a class 1 IMSI, the base station shall not send the message in the assigned Paging Channel or Forward Common Control Channel slot after sending a General Page Message with CLASS_1_DONE set to ‘1’ in that slot.

- If the mobile station has been assigned a TMSI, the base station shall not send the message in the assigned Paging Channel or Forward Common Control Channel slot after sending a General Page Message with TMSI_DONE set to ‘1’ in that slot.

The base station should send messages directed to mobile stations operating in the slotted mode as the first messages in the slot.

If the base station sends a General Page Message with ORDERED_TMSIS set to ‘1’ in a slot, the base station shall order page records with PAGE_CLASS equal to ‘10’ in ascending order such that if a particular TMSI_CODE value for one page record is greater than the TMSI_CODE value for another page record, the page record with the greater TMSI_CODE value is sent later in the slot.
3.6.2.3.2 Processing when the Universal Page Message is Used

The base station shall use the following rules for selecting the Forward Common Control Channel slot in which to send a message to a mobile station:

- If the base station is able to determine that the mobile station is operating in the non-slotted mode, the base station may send the message to the mobile station in any Forward Common Control Channel slot.

- If the base station is able to determine that the mobile station is capable of operating in the slotted mode and that the mobile station is waiting for a priority access channel assignment, or that the slotted timer in the mobile station is active, the base station may send the message to the mobile station in any Forward Common Control Channel slot with the position within the slot subject to the following limitation:
  - The base station shall not send the message later in the slot than a *Universal Page Message* which lacks a mobile station-directed message announcement and which lacks a mobile station-addressed page (see 3.7.2.3.2.36) for that mobile station.

- If the base station is able to determine that the mobile station is operating in the slotted mode and that the mobile station is not waiting for a priority access channel assignment and that the slotted timer in the mobile station is not active and the base station is able to determine the mobile station’s slot cycle index (see 2.6.2.1.1.3.3), the base station shall send the message at least once in an assigned Forward Common Control Channel slot for the mobile station (see 3.6.2.1.3) or in the following slot, with the position within these two slots subject to the following limitation:
  - The base station shall not send the message later in the slot than a *Universal Page Message* that lacks a mobile station-directed message announcement and which lacks a mobile station-addressed page (see 3.7.2.3.2.36) for that mobile station.

- If the base station is not able to determine whether the mobile station is operating in the non-slotted mode, or the base station is not able to determine the mobile station’s slot cycle index, the base station shall assume that the mobile station is operating in the slotted mode with a slot cycle index which is the smaller of MAX_SLOT_CYCLE_INDEX and 1. The base station shall send the message at least once in an assigned Forward Common Control Channel slot for the mobile station (see 3.6.2.1.3), or in the following slot, with the position within these two slots subject to the following limitation:
  - The base station shall not send the message later in the slot than a *Universal Page Message* that lacks a mobile station-directed message announcement and which lacks a mobile station-addressed page (see 3.7.2.3.2.36) for that mobile station.

The base station should send messages directed to both mobile stations operating in the slotted mode and mobile stations operating in the non-slotted mode later in the slot than
the *Universal Page Message*.

3.6.2.4 Broadcast Messages

3.6.2.4.1 Broadcast Messages Sent on the Paging Channel

The base station may transmit *Data Burst Messages* directed to broadcast addresses. When transmitting broadcast messages that are to be received by mobile stations operating in the slotted mode, the base station may use broadcast page records (see 3.7.2.3.2.17) in accordance with the broadcast procedures specified in 3.6.2.4.1 to announce the presence of broadcast *Data Burst Messages* on the Paging Channel. The base station should use the rules specified in 3.6.2.4.1.1 for selecting the Paging Channel slot in which to send a broadcast *Data Burst Message*.

3.6.2.4.1.1 Broadcast Procedures for Slotted Mode

The base station may announce the presence of broadcast *Data Burst Messages* on the Paging Channel by paging, using a broadcast address with PAGE_CLASS equal to ‘11’ and PAGE_SUBCLASS equal to ‘00’.

3.6.2.4.1.1.1 General Overview

The base station may transmit *Data Burst Messages* directed to broadcast addresses. Since mobile stations operating in slotted mode do not constantly monitor a Paging Channel, it is necessary to use special procedures to ensure that mobile stations operating in the slotted mode are able to receive the message. The base station may either send a broadcast message in many slots, or may send a broadcast message in a predetermined paging slot. This single transmission of the pending broadcast message may be announced by a preceding “broadcast page”. A broadcast page is a *General Page Message* record with the PAGE_CLASS field set to ‘11’.

If pending transmission of the broadcast message is announced by the broadcast page, mobile stations use the BC_ADDR and the BURST_TYPE fields of the broadcast page record to determine whether or not to receive the announced broadcast message. The base station sets the value of the BC_ADDR according to the requirements of the standards related to the BURST_TYPE. There is a predetermined timing relationship between the sending of the broadcast page and the sending of the related broadcast message. This timing relationship allows mobile stations to determine which slot to monitor in order to receive the broadcast message.

To reduce the overhead for sending broadcast pages or broadcast messages, a base station may use periodic broadcast paging (see 3.6.2.4.1.1.2.1.2). When periodic broadcast paging is enabled, broadcast pages or broadcast messages are sent only once during a broadcast paging cycle. Mobile stations that are operating in the slotted mode and are configured to receive broadcast messages monitor the paging channel during the slot in which the broadcast pages or broadcast messages are sent. For the purpose of periodic broadcast paging, system time is divided into broadcast paging cycles, each having a duration of \((B + 3)\) Paging Channel slots, where \(B\) is a power of two. In each broadcast paging cycle, the first paging slot may contain broadcast pages or broadcast messages.
3.6.2.4.1.2 Requirements for Sending Broadcast Messages

3.6.2.4.1.2.1 Broadcast Delivery Options

When transmitting broadcast messages that are to be received by mobile stations operating in the slotted mode and monitoring the Paging Channel, the base station shall use one of the two following procedures to transmit a broadcast message.

3.6.2.4.1.2.1.1 Method 1: Multi-Slot Broadcast Message Transmission

The base station may send a broadcast message using this method without regard to whether periodic broadcast paging is enabled or disabled (see 3.6.2.4.1.2.3).

When using this method, the base station shall send the broadcast message in a sufficient number of paging slots such that it may be received by any mobile station that is operating in the slotted mode. For example, the base station may send the broadcast message in \( M \) successive paging slots where \( M \) is the number of slots in a maximum paging cycle as defined in 2.6.2.1.1.3.3.

3.6.2.4.1.2.1.2 Method 2: Periodic Broadcast Paging

If the base station sends a broadcast message using this method, then the base station shall enable periodic broadcast paging (see 3.6.2.4.1.2.3).

To deliver a broadcast message using this method, the base station should perform the following:

- If the number and size of the broadcast messages waiting to be sent are such that the messages can be sent in a single slot, the base station should send the broadcast messages in the first slot of the next broadcast paging cycle (see 2.6.2.1.1.3.3).
- If there is a single broadcast message waiting to be sent, the base station should send the broadcast message beginning in the first slot of the next broadcast paging cycle (see 2.6.2.1.1.3.3).
- Otherwise, the base station should first include a broadcast page for each broadcast message to be sent, in a General Page Message that is sent in the first slot of the next broadcast paging cycle (see 2.6.2.1.1.3.3). The base station should then send the related broadcast messages in the paging slots specified in 3.6.2.4.1.2.4.

3.6.2.4.1.2.2 Duplicate Broadcast Message Transmission

If the base station sends a broadcast message or a broadcast page and an associated broadcast message more than once when periodic broadcast paging is enabled (see 3.6.2.4.1.2.3), then all repetitions of the broadcast message or the broadcast page and the associated broadcast message should be sent within \( 4 \times (B + 3) \) paging slots of the paging slot in which the broadcast message or broadcast page was first sent. \( B + 3 \) is the duration of the broadcast paging cycle as defined in 2.6.2.1.1.3.3).

When a base station sends a broadcast message or a broadcast page when periodic broadcast paging is enabled (see 3.6.2.4.1.2.3), and the base station has a second,
different broadcast message to send which contains identical BURST_TYPE and BC_ADDR fields, then the base station shall wait $4 \times (B + 3)$ paging slots after the first slot of the broadcast paging cycle containing the final sending of the first broadcast message or broadcast page before sending the second, different broadcast message or related broadcast page.

3.6.2.4.1.2.3 Periodic Broadcast Paging

The base station uses the BCAST_INDEX field of the *Extended System Parameters Message* to specify the current state of periodic broadcast paging to all mobile stations.

To enable periodic broadcast paging, the base station shall set the BCAST_INDEX field of the *Extended System Parameters Message* to an unsigned 3-bit number in the range 1-7, equal to the broadcast slot cycle index as defined in 2.6.2.1.1.3.3. The value of the BCAST_INDEX field may exceed the value of the MAX_SLOT_CYCLE_INDEX field sent in the *System Parameters Message*.

To indicate that periodic broadcast paging is either disabled or is not supported by the base station, the base station shall set the BCAST_INDEX field to ‘000’.

3.6.2.4.1.2.4 Broadcast Message Slot Determination

When a base station uses broadcast paging, it shall determine the slot in which to send the corresponding broadcast message using the following procedures:

- The base station shall consider a broadcast page to have been sent in the paging slot in which the *General Page Message* containing the broadcast page began.
- The reference slot is defined as the paging slot in which the broadcast page was sent.
- Let $n$ represent the ordinal number of the broadcast page relative to other broadcast pages that are contained in the same *General Page Message* ($n = 1, 2, 3,...$). The base station shall send the broadcast message announced by broadcast page $n$ in the paging slot that occurs $n \times 3$ paging slots after the reference slot.

3.6.2.4.2 Broadcast Messages Sent on the Broadcast Control Channel

The base station may transmit *Data Burst Messages* directed to broadcast addresses when **NUM_BCCH_BCAST** does not equal ‘000’. When transmitting broadcast messages that are to be received by mobile stations operating in the slotted mode, the base station may use enhanced broadcast pages (see 3.7.2.3.2.17 and 3.7.2.3.2.36) in accordance with the broadcast procedures specified in 3.6.2.4.2 to announce the presence of broadcast *Data Burst Messages* on the Broadcast Control Channel. The base station should use the rules specified in 3.6.2.4.2.1 for selecting the Broadcast Control Channel slot in which to send a broadcast *Data Burst Message*.

3.6.2.4.2.1 Broadcast Procedures for Slotted Mode

The base station may announce the presence of broadcast *Data Burst Messages* on the Broadcast Control Channel by sending an enhanced broadcast page.
3.6.2.4.2.1.1 General Overview

The base station may transmit *Data Burst Messages* directed to broadcast addresses. Since mobile stations operating in slotted mode do not constantly monitor a Broadcast Control Channel, it is necessary to use special procedures to ensure that mobile stations operating in the slotted mode are able to receive the message. The base station may either send an enhanced broadcast page in many Forward Common Control Channel slots, directing the mobile station to the appropriate Broadcast Control Channel slot, or the base station may also send an enhanced broadcast page in a predetermined slot, called a broadcast slot, on the Forward Common Control Channel, directing the mobile station to a specified Broadcast Control Channel slot or Forward Common Control Channel slot. The Forward Common Control Channel is used for transmission of broadcast messages only when there is not a secondary Broadcast Control Channel allocated, i.e., NUM_BCCH_BCAST equals 0.

If pending transmission of the broadcast message is announced by the enhanced broadcast page, mobile stations use the BC_ADDR and the BURST_TYPE fields of the enhanced broadcast page record to determine whether or not to receive the announced broadcast message. The base station sets the value of the BC_ADDR according to the requirements of the standards related to the BURST_TYPE. The timing relationship between the sending of the enhanced broadcast page and the sending of the related broadcast message is specified in the enhanced broadcast page. This timing relationship allows mobile stations to determine which Broadcast Control Channel slot or Forward Common Control Channel slot to monitor in order to receive the broadcast message.

To reduce the overhead for sending broadcast pages or broadcast messages, a base station may use Periodic Enhanced Broadcast Paging (see 3.6.2.4.2.1.2.1.2). When Periodic Enhanced Broadcast Paging is enabled, enhanced broadcast pages are sent only once during a broadcast paging cycle. Mobile stations that are operating in the slotted mode and are configured to receive broadcast messages monitor the Forward Common Control Channel during the broadcast slot in which the enhanced broadcast pages are sent. For the purpose of Periodic Enhanced Broadcast Paging, system time is divided into broadcast paging cycles, each having a duration of \((B + 7)\) Forward Common Control Channel slots, where \(B\) is a power of two. In each broadcast paging cycle, the first Forward Common Control Channel slot may contain enhanced broadcast pages.

3.6.2.4.2.1.2 Requirements for Sending Broadcast Messages

3.6.2.4.2.1.2.1 Broadcast Delivery Options

When transmitting broadcast messages that are to be received by mobile stations operating in the slotted mode and monitoring the Forward Common Control Channel/Broadcast Control Channel, the base station shall use one of the two following procedures to transmit a broadcast message.

3.6.2.4.2.1.2.1.1 Method 1: Multi-Slot Enhanced Broadcast Paging

The base station may send a broadcast message using this method without regard to whether Periodic Enhanced Broadcast Paging is enabled or disabled (see 3.6.2.4.2.1.2.3).
When using this method, the base station shall send the enhanced broadcast page in a sufficient number of Forward Common Control Channel slots such that it may be received by any mobile station that is operating in the slotted mode. The enhanced broadcast page then directs mobile stations to a subsequent Broadcast Control Channel slot, or to a subsequent Forward Common Control Channel slot when NUM_BCCH_BCAST equals 0.

The base station shall not send an enhanced broadcast page that directs a mobile station to receive a broadcast message on the Primary Broadcast Control Channel.

The base station shall not send a broadcast message on the Forward Common Control Channel when NUM_BCCH_BCAST is greater than 0.

3.6.2.4.2.1.2.1.2 Method 2: Periodic Enhanced Broadcast Paging

If the base station sends a broadcast message using this method, then the base station shall enable Periodic Enhanced Broadcast Paging (see 3.6.2.4.2.1.2.3).

To deliver a broadcast message using this method, the base station should perform the following:

- The base station should first include an enhanced broadcast page for each broadcast message to be sent, in a page that is sent on the Forward Common Control Channel in the first slot of the next broadcast paging cycle (see 2.6.2.1.1.3.3). The base station should then send the corresponding broadcast messages in the Broadcast Control Channel slots specified in 3.6.2.4.2.1.2.4 - when NUM_BCCH_BCAST is greater than 0.

The base station shall not send an enhanced broadcast page that directs a mobile station to receive a broadcast message on the Primary Broadcast Control Channel.

The base station shall not send a broadcast message on the Forward Common Control Channel when NUM_BCCH_BCAST is greater than 0.

3.6.2.4.2.1.2.2 Duplicate Broadcast Message Transmission

If the base station sends an enhanced broadcast page and an associated broadcast message more than once when Periodic Enhanced Broadcast Paging is enabled (see 3.6.2.4.2.1.2.3), then all repetitions of the enhanced broadcast page should be sent within $4 \times (B + 7)$ slots of the slot in which the enhanced broadcast page was first sent. $(B + 7)$ is the duration of the broadcast paging cycle as defined in 2.6.2.1.1.3.3).

When a base station sends an enhanced broadcast page when Periodic Enhanced Broadcast Paging is enabled (see 3.6.2.4.2.1.2.3), and the base station has a second, different broadcast message to send which contains identical BURST_TYPE and BC_ADDR fields, then the base station shall wait $4 \times (B + 7)$ paging slots after the first slot of the broadcast paging cycle containing the final sending of the first broadcast message or enhanced broadcast page before sending the second, different enhanced broadcast page.

3.6.2.4.2.1.2.3 Periodic Enhanced Broadcast Paging

The base station uses the BCAST_INDEX fields of the MC-RR Parameters Message to specify the current state of Periodic Enhanced Broadcast Paging to all mobile stations.
To enable Periodic Enhanced Broadcast Paging, the base station shall set the BCAST_INDEX field to a non-zero unsigned 3-bit number equal to the broadcast slot cycle index as defined in 2.6.2.1.1.3.3.

To indicate that Periodic Enhanced Broadcast Paging is either disabled or is not supported by the base station, the base station shall set the BCAST_INDEX field to ‘000’.

3.6.2.4.2.1.2.4 Broadcast Message Slot Determination

When a base station uses broadcast message announcement and transmits the broadcast message on a secondary Broadcast Control Channel, it shall determine the slot in which to send the corresponding broadcast message using the following procedures:

- The base station shall consider an enhanced broadcast page to have been sent in the Forward Common Control Channel slot in which the page message containing the enhanced broadcast page began.
- The reference slot is defined as the Forward Common Control Channel slot in which the enhanced broadcast page was sent.
- The base station shall send a first transmission of the broadcast message announced by the enhanced broadcast page in the Broadcast Control Channel slot which begins $40 \text{ ms} \times (1 + \text{TIME_OFFSET})$ later than the beginning of the slot in which the page message containing the enhanced broadcast page began. The base station may send a repetition of the broadcast message announced by the enhanced broadcast page in the Broadcast Control Channel slot which begins $40 \text{ ms} \times (1 + \text{REPEAT_TIME_OFFSET})$ later than the Broadcast Control Channel slot in which the first transmission began.

When a base station uses broadcast message announcement and transmits the broadcast message on a Forward Common Control Channel, it shall determine the slot in which to send the corresponding broadcast message using the following procedures:

- The base station shall consider an enhanced broadcast page to have been sent in the Forward Common Control Channel slot in which the page message containing the enhanced broadcast page began.
- The reference slot is defined as the Forward Common Control Channel slot in which the enhanced broadcast page was sent.
- The base station shall send a first transmission of the broadcast message announced by the enhanced broadcast page in the Forward Common Control Channel slot which begins $40 \text{ ms} \times (1 + \text{TIME_OFFSET})$ later than the beginning of the slot in which the page message containing the enhanced broadcast page began. The base station may send a repetition of the broadcast message announced by the enhanced broadcast page in the Forward Common Control Channel slot which begins $40 \text{ ms} \times (1 + \text{REPEAT_TIME_OFFSET})$ later than the Forward Common Control Channel slot in which the first transmission began.
3.6.2.4.3 Broadcast Messages Sent on the Forward Common Control Channel

The Forward Common Control Channel is used for transmission of broadcast messages only when there is not a secondary Broadcast Control Channel allocated, i.e., NUM_BCCH_BCAST equals ‘000’. The base station may transmit Data Burst Messages directed to broadcast addresses. When transmitting broadcast messages that are to be received by mobile stations operating in the slotted mode, the base station may use enhanced broadcast page records (see 3.7.2.3.2.17 and 3.7.2.3.2.36) in accordance with the broadcast procedures specified in 3.6.2.4.3 to announce the presence of broadcast Data Burst Messages on the Forward Common Control Channel. The base station shall send the broadcast messages on the Forward Common Control Channel where the enhanced broadcast page is sent. The base station should use the rules specified in 3.6.2.4.3.1 for selecting the Forward Common Control Channel slot in which to send a broadcast Data Burst Message.

3.6.2.4.3.1 Broadcast Procedures for Slotted Mode

The base station may announce the presence of broadcast Data Burst Messages on the Forward Common Control Channel by sending an enhanced broadcast page.

3.6.2.4.3.1.1 General Overview

The base station may transmit Data Burst Messages directed to broadcast addresses. Since mobile stations operating in slotted mode do not constantly monitor a Forward Common Control Channel, it is necessary to use special procedures to ensure that mobile stations operating in the slotted mode are able to receive the message. The base station may either send a broadcast message in many Forward Common Control Channel slots, or may send a broadcast message in a predetermined Forward Common Control slot. This single transmission of the pending broadcast message may be announced by a preceding “enhanced broadcast page”.

If pending transmission of the broadcast message is announced by the enhanced broadcast page, mobile stations use the BC_ADDR and the BURST_TYPE fields of the enhanced broadcast page record to determine whether or not to receive the announced broadcast message. The base station sets the value of the BC_ADDR according to the requirements of the standards related to the BURST_TYPE. There is a predetermined timing relationship between the sending of the enhanced broadcast page and the sending of the related broadcast message. This timing relationship allows mobile stations to determine which Forward Common Control Channel slot to monitor in order to receive the broadcast message.

To reduce the overhead for sending enhanced broadcast pages or broadcast messages, a base station may use periodic enhanced broadcast paging (see 3.6.2.4.3.1.2.1.2). When periodic enhanced broadcast paging is enabled, enhanced broadcast pages or broadcast messages are sent only once during a broadcast paging cycle. Mobile stations that are operating in the slotted mode and are configured to receive broadcast messages monitor the Forward Common Control Channel during the Forward Common Control Channel slot in which the enhanced broadcast pages or broadcast messages are sent. For the purpose of periodic enhanced broadcast paging, system time is divided into broadcast paging cycles.
each having a duration of \((B + 7)\) Forward Common Control Channel slots, where \(B\) is a power of two. In each broadcast paging cycle, the first Forward Common Control Channel slot may contain enhanced broadcast pages or broadcast messages.

3.6.2.4.3.1.2 Requirements for Sending Broadcast Messages

3.6.2.4.3.1.2.1 Broadcast Delivery Options

When transmitting broadcast messages that are to be received by mobile stations operating in the slotted mode and monitoring the Forward Common Control Channel, the base station shall use one of the two following procedures to transmit a broadcast message.

3.6.2.4.3.1.2.1.1 Method 1: Multi-Slot Broadcast Message Transmission

The base station may send a broadcast message using this method without regard to whether periodic enhanced broadcast paging is enabled or disabled (see 3.6.2.4.3.1.2.3).

When using this method, the base station shall send the broadcast message in a sufficient number of Forward Common Control Channel slots such that it may be received by any mobile station that is operating in the slotted mode. For example, the base station may send the broadcast message in \(M\) successive paging slots where \(M\) is the number of slots in a maximum paging cycle as defined in 2.6.2.1.1.3.3.

3.6.2.4.3.1.2.1.2 Method 2: Periodic Enhanced Broadcast Paging

If the base station sends a broadcast message using this method, then the base station shall enable periodic enhanced broadcast paging (see 3.6.2.4.3.1.2.3).

To deliver a broadcast message using this method, the base station should perform the following:

- If the number and size of the broadcast messages waiting to be sent are such that the messages can be sent in a single slot, the base station should send the broadcast messages in the first slot of the next broadcast paging cycle (see 2.6.2.1.1.3.3).

- If there is a single broadcast message waiting to be sent, the base station should send the broadcast message beginning in the first slot of the next broadcast paging cycle (see 2.6.2.1.1.3.3).

- Otherwise, the base station should first include an enhanced broadcast page for each broadcast message to be sent, in a General Page Message or a Universal Page Message that is sent in the first slot of the next broadcast paging cycle (see 2.6.2.1.1.3.3). The base station should then send the related broadcast messages in the Forward Common Control Channel slots specified in 3.6.2.4.3.1.2.4.

3.6.2.4.3.1.2.2 Duplicate Broadcast Message Transmission

If the base station sends a broadcast message or an enhanced broadcast page and an associated broadcast message more than once when periodic enhanced broadcast paging is enabled (see 3.6.2.4.3.1.2.3), then all repetitions of the broadcast message or the enhanced broadcast page and the associated broadcast message should be sent within \(4 \times (B + 7)\)
slots of the Forward Common Control Channel slot in which the broadcast message or
enhanced broadcast page was first sent. \( (B + 7) \) is the duration of the broadcast paging
cycle as defined in 2.6.2.1.3.3).

When a base station sends a broadcast message or an enhanced broadcast page when
periodic enhanced broadcast paging is enabled (see 3.6.2.4.3.1.2.3), and the base station
has a second, different broadcast message to send which contains identical BURST_TYPE
and BC_ADDR fields, then the base station shall wait \( 4 \times (B + 7) \) Forward Common Control
Channel slots after the first slot of the enhanced broadcast paging cycle containing the final
sending of the first broadcast message or enhanced broadcast page before sending the
second, different broadcast message or related enhanced broadcast page.

3.6.2.4.3.1.2.3 Periodic Enhanced Broadcast Paging

The base station uses the BCAST_INDEX field of the MC-RR Parameters Message to specify
the current state of periodic broadcast paging to all mobile stations.

To enable periodic enhanced broadcast paging, the base station shall set the
BCAST_INDEX field of the MC-RR Parameters Message to an unsigned 3-bit number in the
range 1-7, equal to the broadcast slot cycle index as defined in 2.6.2.1.3.3. The value of
the BCAST_INDEX field may exceed the value of the MAX SLOT CYCLE_INDEX field sent
in the System Parameters Message.

To indicate that periodic enhanced broadcast paging is either disabled or is not supported
by the base station, the base station shall set the BCAST_INDEX field to ‘000’.

3.6.2.4.3.1.2.4 Broadcast Message Slot Determination

When a base station uses enhanced broadcast paging, it shall determine the slot in which
to send the corresponding broadcast message using the following procedures:

- The base station shall consider an enhanced broadcast page to have been sent in
  the Forward Common Control Channel slot in which the General Page Message or
  the Universal Page Message containing the enhanced broadcast page began.

- The reference slot is defined as the Forward Common Control Channel slot in
  which the enhanced broadcast page was sent.

- The base station shall send a first transmission of the broadcast message
  announced by the enhanced broadcast page in the Forward Common Control
  Channel slot which begins \( 40 \text{ ms} \times (1 + \text{TIME_OFFSET}) \) later than the beginning of
  the slot in which the page message containing the enhanced broadcast page began.

- The base station may send a repetition of the broadcast message announced by the
  enhanced broadcast page in the Forward Common Control Channel slot which
  begins \( 40 \text{ ms} \times (1 + \text{REPEAT_TIME_OFFSET}) \) later than the Forward Common
  Control Channel slot in which the first transmission began.

3.6.2.5 Quick Paging Channel Processing

The base station may support a Quick Paging Channel. The base station may transmit up
to three Quick Paging Channels on each supported CDMA Channel.
When a Quick Paging Channel is supported, the base station shall transmit paging indicators to the mobile station in the assigned positions in the assigned Quick Paging Channel slot. The base station shall set the paging indicators to “ON” if the mobile station is operating in the slotted mode and is to receive the Paging Channel or Forward Common Control Channel in the assigned Paging Channel or Forward Common Control Channel slot following its assigned Quick Paging Channel slot.

When the base station changes CONFIG_MSG_SEQ, the base station should set the paging indicators for all mobile stations to “ON” for each Quick Paging Channel slot for a time interval $T$ (in units of 1.28 seconds), such that

$$T = N \times 2^{\text{MAX SLOT CYCLE INDEX}},$$

where $N$ is an integer greater than or equal to one.

If the base station supports configuration change indicators on the Quick Paging Channel, when the base station changes CONFIG_MSG_SEQ, the base station shall set all configuration change indicators to “ON” for each Quick Paging Channel slot for a time interval of $T_{31m}$ seconds. At all other times, the base station shall set all configuration change indicators to “OFF”.

If the base station does not support configuration change indicators on the Quick Paging Channel, then the base station shall set all configuration change indicators to “OFF”.

When the base station sends a broadcast message using Multi-Slot Broadcast Message Transmission (see 3.6.2.4.1.1.2.1.1), the base station should set all paging indicators to “ON” for the Quick Paging Channel slot which begins 100 ms prior to the beginning of the Paging Channel slot in which the broadcast message begins.

When the base station sends an enhanced broadcast page using Multi-Slot Enhanced Broadcast Paging (see 3.6.2.4.2.1.2.1.1), the base station should set all paging indicators to “ON” for the Quick Paging Channel slot which begins 100 ms prior to the beginning of the Forward Common Control Channel slot in which the message containing the enhanced broadcast page begins.

When the base station sends an enhanced broadcast page using Periodic Enhanced Broadcast Paging (see 3.6.2.4.2.1.2.1.2), the base station should set all broadcast indicators to “ON” for the Quick Paging Channel broadcast slot which begins 100 ms prior to the beginning of the Forward Common Control Channel slot in which the message containing the enhanced broadcast page begins. At all other times, the base station shall set all broadcast indicators for a Quick Paging Channel broadcast slot to “OFF”.

When the base station sends a broadcast page using Periodic Broadcast Paging (see 3.6.2.4.1.1.2.1.2), the base station should set all broadcast indicators to “ON” for the Quick Paging Channel broadcast slot which begins 100 ms prior to the beginning of the Paging Channel slot in which the message containing the broadcast page begins. At all other times, the base station shall set all broadcast indicators for a Quick Paging Channel broadcast slot to “OFF”.

The base station shall set all reserved indicators to “OFF”.

3-23
3.6.2.5.1 Quick Paging Channel Determination

To determine the mobile station’s assigned Quick Paging Channel, the base station shall use the hash function specified in 2.6.7.1 with the following inputs:

- IMSI_S based on the IMSI with which the mobile station registered (see 2.3.1)
- Number of Quick Paging Channels which the base station transmits on the mobile station’s assigned CDMA Channel.

3.6.2.5.2 Quick Paging Channel Slot Determination

The mobile station’s assigned Quick Paging Channel slots are those slots for which

\[
\left\lfloor \frac{(t+5)/4}{PGSLOT} \right\rfloor \mod (16 \times T) = 0,
\]

where \(t\) is the System Time in \(20\text{ms}\) frames, PGSLOT is selected in the range 0 to 2047 by using the hash function specified in 2.6.7.1, and \(T\) is the slot cycle length in units of 1.28 seconds such that

\[T = 2^i,\]

and \(i\) is the slot cycle index which can take the values -4, -3, -2, -1, 0, 1, 2, 3, 4, 5, 6, and 7.

3.6.2.5.3 Paging Indicator Position Determination

To determine the mobile station’s assigned paging indicators, the base station shall use the same formula as used by the mobile station (see 2.6.2.1.2.2).

3.6.2.5.4 Configuration Change Indicator Position Determination

Configuration change indicators are transmitted on the first Quick Paging Channel.

If the Quick Paging Channel data rate is 2400 bps (indicator rate is 4800 bps), the bit positions of the first pair of configuration change indicators in a Quick Paging Channel slot shall be the last two bits in the first 40 ms half of the Quick Paging Channel slot. The bit positions of the second pair of configuration change indicators in a Quick Paging Channel slot shall be the last two bits in the Quick Paging Channel slot.

If the Quick Paging Channel data rate is 4800 bps (indicator rate is 9600 bps), the bit positions of the first four configuration change indicators in a Quick Paging Channel slot shall be the last four bits in the first 40 ms half of the Quick Paging Channel slot. The bit position of the second four configuration change indicators in a Quick Paging Channel slot shall be the last four bits in the Quick Paging Channel slot.

3.6.2.5.5 Broadcast Indicator Position Determination

Broadcast indicators are transmitted on the first Quick Paging Channel.

On the first Quick Paging Channel, if the Quick Paging Channel data rate is 2400 bps (indicator rate is 4800 bps), the broadcast indicator positions are described as follows:

- The two Quick Paging Channel bit positions prior to the last two bits in the first 40 ms half of a Quick Paging Channel broadcast slot are broadcast indicators. The two
Quick Paging Channel bit positions prior to the last two bits in a Quick Paging Channel broadcast slot are also broadcast indicators.

On the first Quick Paging Channel, if the Quick Paging Channel data rate is 4800 bps (indicator rate is 9600 bps), the broadcast indicator positions are described as follows:

- The four Quick Paging Channel bit positions prior to the last four bits in the first 40 ms half of a Quick Paging Channel broadcast slot are broadcast indicators. The four Quick Paging Channel bit positions prior to the last four bits in a Quick Paging Channel broadcast slot are also broadcast indicators.

### 3.6.2.5.6 Reserved Indicator Positions

On the first Quick Paging Channel, if the Quick Paging Channel data rate is 2400 bps (indicator rate is 4800 bps), the reserved indicator positions are described as follows:

- The two Quick Paging Channel bit positions prior to the last two bits in the first 40 ms half of a Quick Paging Channel slot that is not a Quick Paging Channel Broadcast slot are reserved. The two Quick Paging Channel bit positions prior to the last two bits in a Quick Paging Channel slot that is not a Quick Paging Channel Broadcast slot are also reserved.

On the first Quick Paging Channel, if the Quick Paging Channel data rate is 4800 bps (indicator rate is 9600 bps), the reserved indicator positions are described as follows:

- The four Quick Paging Channel bit positions prior to the last four bits in the first 40 ms half of a Quick Paging Channel slot that is not a Quick Paging Channel Broadcast slot are reserved. The four Quick Paging Channel bit positions prior to the last four bits in a Quick Paging Channel slot that is not a Quick Paging Channel Broadcast slot are also reserved.

On Quick Paging Channels other than the first Quick Paging Channel, if the Quick Paging Channel data rate is 2400 bps (indicator rate is 4800 bps), the reserved indicator positions are described as follows:

- The last four Quick Paging Channel bit positions in the first 40 ms half of a Quick Paging Channel slot are reserved. The last four Quick Paging Channel bit positions in a Quick Paging Channel slot are also reserved.

On Quick Paging Channels other than the first Quick Paging Channel, if the Quick Paging Channel data rate is 4800 bps (indicator rate is 9600 bps), the reserved indicator positions are described as follows:

- The last eight Quick Paging Channel bit positions in the first 40 ms half of a Quick Paging Channel slot are reserved. The last eight Quick Paging Channel bit positions in a Quick Paging Channel slot are also reserved.

### 3.6.3 Access Channel and Enhanced Access Channel Processing

During *Access Channel Processing*, the base station monitors the Access Channel to receive messages which the mobile station sends while the mobile station is in the *System Access State*. 
Each Access Channel is associated with a Paging Channel. Up to 32 Access Channels can be associated with a Paging Channel. The number of Access Channels associated with a particular Paging Channel is specified in the *Access Parameters Message* sent on that Paging Channel.

If the base station supports Access Channels, the base station shall continually monitor all Access Channels associated with each Paging Channel that the base station transmits.

If the base station supports Enhanced Access Channels, then during *Enhanced Access Channel Processing*, the base station monitors the Enhanced Access Channel to receive messages which the mobile station sends while the mobile station is in the *System Access State*.

Each Enhanced Access Channel is associated with a Forward Common Control Channel. Up to 32 Enhanced Access Channels can be associated with a Forward Common Control Channel. The number of Enhanced Access Channels associated with a particular Forward Common Control Channel is specified in the *Enhanced Access Parameters Message* sent on the Primary Broadcast Control Channel.

If the base station supports Enhanced Access Channel, the base station shall continually monitor all Enhanced Access Channels associated with each Forward Common Control Channel that the base station transmits.

3.6.3.1 Reserved

3.6.3.2 Reserved

3.6.3.3 Response to Page Response Message and Reconnect Message

If the base station receives a *Page Response Message* or a *Reconnect Message* with the ORIG_IND field set to '0', the base station should send a *Channel Assignment Message* (if in response to a *Page Response Message*), an *Extended Channel Assignment Message*, or a *Release Order*. The base station may also start authentication procedures (see 2.3.12), start TMSI assignment procedures (see 2.3.15), send a *Data Burst Message*, or request status information records with the *Status Request Message*. If the base station is operating with the mobile station in Band Class 0, the base station may also request the status information records with the *Status Request Order*.

If the base station sends the *Extended Channel Assignment Message*, the base station may include more than one pilot to be in the Active Set.

If the base station sends a *Channel Assignment Message* or an *Extended Channel Assignment Message*, the base station shall perform the following:

- If the message directs the mobile station to a CDMA Traffic Channel, the base station shall begin *Traffic Channel Processing* (see 3.6.4) for the mobile station.
- If the message directs the mobile station to an 800 MHz wide analog voice channel, the base station shall follow the procedure described in [6].
- If the message directs the mobile station to an 800 MHz narrow analog voice channel, the base station shall follow the procedure described in [22].
• Layer 3 shall send a mobile station inactive on common channel indication to Layer 2 (see [4]).

The base station may instruct the mobile station to use the stored service configuration (that is, both the Service Configuration information record and the Non-negotiable Service Configuration information record) by setting the GRANTED_MODE field of the Extended Channel Assignment Message to ‘11’.

3.6.3.4 Response to Orders

No requirements.

3.6.3.5 Response to Origination Message and Reconnect Message

If the base station receives an Origination Message or a Reconnect Message with the ORIG_IND field set to ‘1’, the base station should send a Channel Assignment Message (if in response to an Origination Message), an Extended Channel Assignment Message, an Intercept Order, a Reorder Order, a Release Order, a Retry Order, a PACA Message, a Service Redirection Message or a Service Status Order. The base station may also commence authentication procedures (see 2.3.12) or TMSI assignment procedures (see 2.3.15). The base station may also request status information records with the Status Request Message. If the base station is operating with the mobile station in Band Class 0, the base station may also request status information records with the Status Request Order.

If the base station sends the Extended Channel Assignment Message, the base station may include more than one pilot to be in the Active Set.

If the base station sends a Channel Assignment Message or an Extended Channel Assignment Message, the base station shall perform the following:

• If the message directs the mobile station to a CDMA Traffic Channel, the base station shall begin Traffic Channel Processing (see 3.6.4) for the mobile station.

• If the message directs the mobile station to an 800 MHz wide analog voice channel, the base station shall follow the procedure described in [2].

• If the message directs the mobile station to an 800 MHz narrow analog voice channel, the base station shall follow the procedure described in [22].

• The base station shall raise a mobile station inactive on common channel indication for the mobile station.

If the base station sends a Channel Assignment Message, the base station shall not set RESPOND equal to ‘0’ when ASSIGN_MODE = ‘001’, ASSIGN_MODE = ‘010’, or ASSIGN_MODE = ‘101’. If the base station sends an Extended Channel Assignment Message, the base station shall not set RESPOND equal to ‘0’ when ASSIGN_MODE = ‘001’ or ASSIGN_MODE = ‘010’.

The base station may instruct the mobile station to use the stored service configuration (that is, both the Service Configuration information record and the Non-negotiable Service Configuration information record) by setting the GRANTED_MODE field of the Extended Channel Assignment Message to ‘11’.

3-27
If the base station receives an *Origination Message* and the GLOBAL_EMERGENCY_CALL indicator is set to ‘1’ and the service associated with this origination is a voice service, the base station shall recognize this as an emergency call and should process the message using an implementation-dependent procedure which may include ignoring the dialed digits. If the base station receives an *Origination Message* and the GLOBAL_EMERGENCY_CALL indicator is set to ‘1’ and the service associated with this origination is not a voice service, the base station may recognize this as an emergency call and should process the message using an implementation-dependent procedure which may include ignoring the dialed digits.

### 3.6.3.6 Response to Registration Message

If the base station receives a *Registration Message*, the base station may send a *Registration Accepted Order*, a *Registration Rejected Order*, or a *Service Redirection Message*. The base station may also start authentication procedures (see 2.3.12), may start TMSI assignment procedures (see 2.3.15), or may request status information records with the *Status Request Message*. If the base station is operating with the mobile station in Band Class 0, the base station may also request the status information records with a *Status Request Order*.

If the *Registration Message* specifies a power-down registration, Layer 3 shall send a *mobile station inactive on common channel* indication to Layer 2 (see [4]).

When responding to a *Registration Message* that requests extended encryption, if the base station decides to turn on extended encryption and the CMEAKEY is available at the base station, the base station shall send a *Registration Accepted Order* with encryption information. Before the CMEAKEY is available, the base station may send a *Registration Accepted Order* without any encryption information. When the CMEAKEY becomes available, if the base station decides to turn on extended encryption, the base station shall send a *Registration Accepted Order* with encryption information.

### 3.6.3.7 Response to Data Burst Message

If the base station receives a *Data Burst Message* with BURST_TYPE indicating Short Data Burst (see [30]), the base station may send a *Retry Order*.

### 3.6.3.8 Reserved

### 3.6.3.9 Reserved

### 3.6.3.10 Service Redirection

If the base station sends a *Service Redirection Message* to the mobile station, Layer 3 shall send a *mobile station inactive on common channel* indication to Layer 2 (see [4]).

### 3.6.4 Traffic Channel Processing

During *Traffic Channel Processing*, the base station uses the Forward and Reverse Traffic Channels to communicate with the mobile station while the mobile station is in the *Mobile Station Control on the Traffic Channel State*.

Traffic Channel processing consists of the following substates:
• **Traffic Channel Initialization Substate** - In this substate, the base station begins transmitting on the Forward Traffic Channel and receiving on the Reverse Traffic Channel.

• **Traffic Channel Substate** - In this substate, the base station exchanges Traffic Channel frames with the mobile station in accordance with the current service configuration. While in this substate, one or more Call Control instances can be activated (see 3.6.8).

• **Release Substate** - In this substate, the base station disconnects the calls and the physical channels.

3.6.4.1 Special Functions and Actions

The base station performs the following special functions and actions in one or more of the Traffic Channel processing substates:

3.6.4.1.1 Forward Traffic Channel Power Control

Forward Traffic Channel Power Control procedures do not apply to Forward Packet Data Channel.

When the base station enables Forward Traffic Channel power control, the mobile station reports frame error rate statistics to the base station using the *Power Measurement Report Message*.

The base station may enable Forward Traffic Channel power control using the *System Parameters Message* sent on the Paging Channel and the *Power Control Parameters Message* sent on the Forward Traffic Channel. The base station may enable Forward Traffic Channel power control using the *MC-RR Parameters Message* sent on the Primary Broadcast Control Channel and the *Power Control Parameters Message* sent on the Forward Traffic Channel. The base station may enable periodic reporting which causes the mobile station to report frame error rate statistics at specified intervals. The base station may also enable threshold reporting which causes the mobile station to report frame error rate statistics when the frame error rate reaches a specified threshold.\(^2\)

The base station may use the reported frame error rate statistics to adjust the transmit power of the Forward Traffic Channel.

3.6.4.1.2 Service Configuration and Negotiation

During Traffic Channel operation, the mobile station and base station communicate through the exchange of Forward and Reverse Traffic Channel Configurations. The mobile station and base station use a common set of attributes for building and interpreting Traffic Channel frames. This set of attributes, referred to as a service configuration, consists of both negotiable and non-negotiable parameters.

\(^2\)In this section the term base station may imply multiple cells or sectors.
The set of negotiable service configuration parameters consists of the following:

1. **Forward and Reverse Multiplex Options**: These control the way in which the information bits of the Forward and Reverse Traffic Channel frames, respectively, are divided into various types of traffic, such as signaling traffic, primary traffic and secondary traffic. A multiplex option together with a radio configuration specifies the frame structures and transmission rates (see [3]). The Multiplex Options which support Supplemental Code Channel transmission and Supplemental Channel transmission on the Forward and Reverse Traffic Channels are included in [3]. Invocation of Supplemental Code Channel operation on the Forward or Reverse Traffic Channels occurs by transmission of the *Supplemental Channel Request Message*, the *Supplemental Channel Assignment Message*, and the *General Handoff Direction Message*. The Multiplex Options which support Supplemental Code Channel transmission and Supplemental Channel transmission on the Forward and Reverse Traffic Channels are included in [3]. The multiplex option used for the Forward Traffic Channel can be the same as that used for the Reverse Traffic Channel, or it can be different.

2. **Forward and Reverse Traffic Channel Configurations**: These include the radio configurations and other necessary attributes for the Forward and Reverse Traffic Channels. The Traffic Channel Configuration used can be different for the Forward and Reverse Traffic Channels or it can be the same.

3. **Forward and Reverse Traffic Channel Transmission Rates**: These are the transmission rates actually used for the Forward and Reverse Traffic Channels, respectively. The transmission rates for the Forward Traffic Channel can include all of the transmission rates supported by the radio configuration associated with the Forward Traffic Channel multiplex option, or a subset of the supported rates. Similarly, the transmission rates used for the Reverse Traffic Channel can include all rates supported by the radio configuration associated with the Reverse Traffic Channel multiplex option, or a subset of the supported rates. The transmission rates used for the Forward Traffic Channel can be the same as those used for the Reverse Traffic Channel, or they can be different.

4. **Service Option Connections**: These are the services in use on the Traffic Channel. There can be multiple service option connections. It is also possible that there is no service option connection, in which case the base station uses the Forward Traffic Channel as follows:
   - Sends signaling traffic and null traffic on the Forward Fundamental Channel.
   - Sends signaling traffic on the Forward Dedicated Control Channel.
   - If F-CPCCH is assigned, sends power control bits on the F-CPCCH; otherwise, sends power control bits on the Forward Fundamental Channel if FPC_PRI_CHAN is set to ‘0’; sends power control bits on the Forward Dedicated Control Channel if FPC_PRI_CHAN is set to ‘1’.
Associated with each service option connection are a service option, a Forward
Traffic Channel traffic type, a Reverse Traffic Channel traffic type, and a service
option connection reference. The associated service option formally defines the
way in which traffic bits are processed by the mobile station and base station. The
associated Forward and Reverse Traffic Channel traffic types specify the types of
traffic used to support the service option. A service option can require the use of a
particular type of traffic, such as primary or secondary, or it can accept more than
one traffic type. A service option can be one-way, in which case it can be
supported on the Forward Traffic Channel only or the Reverse Traffic Channel
only. Alternatively, a service option can be two-way, in which case it can be
supported on the Forward and Reverse Traffic Channels simultaneously.

Connected service options can also invoke operation on Supplemental Code
Channels in either one or both of the Forward and Reverse Traffic Channels by
negotiating a multiplex option that supports operation on Supplemental Code
Channels (see [3] for Multiplex Options applicable to Supplemental Code
Channels), and by using the appropriate Supplemental Code Channel related
messages (i.e., the Supplemental Channel Request Message, the Supplemental
Channel Assignment Message, and the General Handoff Direction Message). After
Supplemental Code Channels have been assigned by the base station, the
connected service option can transmit primary and/or secondary traffic on
Supplemental Code Channels. Connected service options can also invoke
operation on Supplemental Channels in either one or both of the Forward and
Reverse Traffic Channels by negotiating a multiplex option that supports operation
on Supplemental Channels (see [3] for Multiplex Options applicable to
Supplemental Channels) and by using the appropriate Supplemental Channel
related messages (i.e., the Supplemental Channel Request Message, the Universal
Handoff Direction Message, the Supplemental Channel Request Mini Message, the
Extended Supplemental Channel Assignment Message, the Forward Supplemental
Channel Assignment Mini Message, and the Reverse Supplemental Channel
Assignment Mini Message). After Supplemental Channels have been assigned by
the base station, the connected service option can transmit primary and/or
secondary traffic on Supplemental Channels. The associated service option
connection reference provides a means for uniquely identifying the service option
connection. The reference serves to resolve ambiguity when there are multiple
service option connections in use.

The non-negotiable service configuration parameters are sent from the base station to the
mobile stations only, and consist of the following:

1. Reverse Pilot Gating Rate: This controls the way in which the reverse pilot is gated
on the Reverse Pilot Channel. The base station specifies the reverse pilot gating rate
to be used in the Service Connect Message, the General Handoff Direction Message,
and the Universal Handoff Direction Message.
2. **Forward and Reverse Power Control Parameters**: These consist of forward power control operation mode, outer loop power control parameters (e.g. target frame error rate, minimum $E_b/N_t$ setpoint, and maximum $E_b/N_t$ setpoint) for the Forward Fundamental Channel and Forward Dedicated Control Channel, and Power Control Subchannel indicator which indicates where the mobile station is to perform the primary inner loop estimation and the base station is to multiplex the Power Control Subchannel.

3. **Logical to Physical Mapping**: This is a table of logical to physical mapping entries, consisting of service reference identifier, logical resource, physical resource, forward flag, reverse flag, and priority.

4. **Partition Table**: The base station may include this table to specify the number of bits allocated for each service in the Fundamental Channel or Dedicated Control Channel.

5. **SCH LTU Size Table**: The base station may include this table to specify the number of bits per supplemental channel LTU.

6. Information related to Variable Rate feature (the capability to support rate determination) on Forward and Reverse Supplemental Channels

7. Information related to Flexible Rate feature (the capability to support non-listed rates) on Forward and Reverse Fundamental Channel, Dedicated Control Channel, and Supplemental Channels

The mobile station can request a default service configuration associated with a service option at call origination, and can request new service configurations during Traffic Channel operation. A requested service configuration can differ greatly from its predecessor or it can be very similar. For example, the mobile station can request a service configuration in which all of the service option connections are different from those of the existing configuration; or the mobile station can request a service configuration in which the existing service option connections are maintained with only minor changes, such as a different set of transmission rates or a different mapping of service option connections to Forward and Reverse Traffic Channel traffic types.

If the mobile station requests a service configuration that is acceptable to the base station, they both begin using the new service configuration. If the mobile station requests a service configuration that is not acceptable to the base station, the base station can reject the requested service configuration or propose an alternative service configuration. If the base station proposes an alternative service configuration, the mobile station can accept or reject the base station’s proposed service configuration, or propose yet another service configuration. This process, called service negotiation, ends when the mobile station and base station find a mutually acceptable service configuration, or when either the mobile station or base station rejects a service configuration proposed by the other.

It is also possible for the base station to request a default service configuration, associated with a service option, when paging the mobile station and to request new service configurations during Traffic Channel operation. The service negotiation proceeds as described above, but with the roles of the mobile station and base station reversed.
For CDMA mode operation in Band Class 0, the mobile station and base station can also
use an alternative method for negotiating a service configuration known as service option
negotiation. Service option negotiation is similar to service negotiation, but offers less
flexibility for specifying the attributes of the service configuration. During service option
negotiation, the base station or mobile station specifies only which service option is to be
used. There is no facility for explicitly specifying the multiplex options, traffic types or
transmission rates to be used on the Forward and Reverse Traffic Channels in conjunction
with the service option. Instead, implicit service configuration attributes are assumed. In
particular, the Forward and Reverse Multiplex Options and transmission rates are
assumed to be the default multiplex options and transmission rates associated with the
requested service option, and the traffic type for both the Forward and Reverse Traffic
Channels is assumed to be primary traffic. Furthermore, a service configuration
established using service option negotiation is restricted to having only a single service
option connection.

At mobile station origination and termination, the type of negotiation to use, either service
negotiation or service option negotiation, is indicated in the Channel Assignment Message.
Service negotiation is always used with the Extended Channel Assignment Message. If a
CDMA-to-CDMA hard handoff occurs during the call, the type of negotiation to use
following the handoff is indicated in the Extended Handoff Direction Message, General
Handoff Direction Message, or Universal Handoff Direction Message.

For CDMA mode operation in band classes other than Band Class 0, only service
negotiation is to be used.

The following messages are used to support service negotiation:

1. **Service Request Message**: The mobile station can use this message to propose a
   service configuration, or to accept or reject a service configuration proposed in a
   Service Response Message. The base station can use this message to propose a
   service configuration, or to reject a service configuration proposed in a Service
   Response Message.

2. **Service Response Message**: The mobile station can use this message to accept or
   reject a service configuration proposed in a Service Request Message, or to propose
   an alternative service configuration. The base station can use this message to
   reject a service configuration proposed in a Service Request Message, or to propose
   an alternative service configuration.

3. **Service Connect Message**: The base station can use this message to accept a
   service configuration proposed in a Service Request Message or Service Response
   Message, and instruct the mobile station to begin using the service configuration.
   The base station may use this message to instruct the mobile station to use the
   stored service configuration (that is, both the Service Configuration information
   record and the Non-negotiable Service Configuration information record) based on
   the value of the SYNC_ID that the mobile station has reported in the Origination
   Message or Page Response Message. If P_REV_IN_USE is greater than or equal to
   11, the base station can use this message to instruct the mobile station to use the
   stored service configuration (that is, both the Service Configuration information
record and the Non-negotiable Service Configuration information record) based on the value of the SYNC_ID that the base station has included in this message.

4. **Service Connect Completion Message:** The mobile station can use this message to acknowledge the transition to a new service configuration.

5. **Service Option Control Message:** The mobile station and base station can use this message to invoke service option specific functions.

6. **Extended Channel Assignment Message:** The base station can use this message to accept or reject the initial service configuration proposed by the mobile station in an *Origination Message* or a *Page Response Message*.

The following messages are used to support service option negotiation:

1. **Service Option Request Order:** The mobile station and base station can use this message either to request a service option or suggest an alternative service option.

2. **Service Option Response Order:** The mobile station and base station can use this message to accept or reject a service option request.

3. **Service Option Control Order:** The mobile station and base station can use this message to invoke service option specific functions.

The following messages are used to support both service negotiation and service option negotiation:

1. **Origination Message:** The mobile station can use this message to propose an initial service configuration.

2. **Channel Assignment Message:** The base station can use this message to accept or reject the initial service configuration proposed by the mobile station in an *Origination Message* or a *Page Response Message*, and to indicate which type of negotiation, either service negotiation or service option negotiation, is to be used during the call.

3. **Extended Handoff Direction Message:** The base station can use this message to indicate which type of negotiation, either service negotiation or service option negotiation, is to be used following a CDMA-to-CDMA hard handoff.

4. **General Handoff Direction Message:** The base station can use this message to indicate which type of negotiation, either service negotiation or service option negotiation, is to be used following a CDMA-to-CDMA hard handoff. The base station can use this message to accept a service configuration proposed in a *Service Request Message* or *Service Response Message*. The base station can also use this message to instruct the mobile station to begin using the service configuration.

5. **General Page Message** or **Universal Page Message:** The base station can use a mobile-station-addressed page in a *General Page Message* or *Universal Page Message* to propose an initial service configuration.

6. **Page Response Message:** The mobile station can use this message to accept or reject the initial service configuration proposed by the base station in a mobile-station-addressed page, or to propose an alternative initial service configuration.
7. **Status Request Message**: The base station can use this message to request service capability information from the mobile station.

8. **Status Response Message**: The mobile station can use this message to return the service capability information requested by the base station in a Status Request Message.

9. **Extended Status Response Message**: The mobile station can use this message to return the service capability information requested by the base station in a Status Request Message.

10. **Universal Handoff Direction Message**: The base station can use this message to indicate which type of negotiation, either service negotiation or service option negotiation, is to be used following a CDMA-to-CDMA hard handoff. The base station can use this message to accept a service configuration proposed in a Service Request Message or Service Response Message. The base station can also use this message to instruct the mobile station to begin using the service configuration.

3.6.4.1.2.1 Use of Variables

3.6.4.1.2.1.1 Maintaining the Service Request Sequence Number

The base station shall maintain a service request sequence number variable, SERV_REQ_NUM, for use with service negotiation. Upon beginning Traffic Channel processing, the base station shall set SERV_REQ_NUM to 0. Each time the base station sends a new Service Request Message, it shall set the SERV_REQ_SEQ field of the message to the current value of SERV_REQ_NUM and shall then set SERV_REQ_NUM equal to (SERV_REQ_NUM + 1) modulo 8.

3.6.4.1.2.1.2 Maintaining the Service Connect Sequence Number

The base station shall maintain a service connect sequence number variable, SERV_CON_NUM, for use with service negotiation. Upon beginning Traffic Channel processing, the base station shall set SERV_CON_NUM to 0. Each time the base station sends a new Service Connect Message, a General Handoff Direction Message, or a Universal Handoff Direction Message containing a service configuration record, it shall set the SERV_CON_SEQ field of the message to the current value of SERV_CON_NUM and shall then set SERV_CON_NUM equal to (SERV_CON_NUM + 1) modulo 8.

3.6.4.1.2.1.3 Assigning Service Option Connection References

When the base station assigns a service option connection reference for use in identifying a new service option connection during service negotiation, the base station shall use the following criteria:

1. The base station shall not assign a reference equal to '00000000'; and
2. The base station shall not assign a reference that is associated with a service option connection of the current service configuration; and
3. If there was a previous service configuration, the base station shall not assign a reference that was associated with a service option connection of the previous service configuration.

3.6.4.1.2.1.4 Maintaining the Service Negotiation Indicator Variable

The base station shall maintain a service negotiation indicator variable, SERV_NEG, to indicate which type of negotiation to use, either service negotiation or service option negotiation. The base station shall set SERV_NEG to enabled whenever service negotiation is to be used, and shall set SERV_NEG to disabled whenever service option negotiation is to be used. The precise rules for setting SERV_NEG are specified in 3.6.4.2 and 3.6.6.2.2.2. For CDMA operation in band classes other than Band Class 0, the base station shall set SERV_NEG to enabled.

3.6.4.1.2.1.5 Maintaining the Service Option Request Number

The base station shall maintain a service option request number variable, SO_REQ, for use with service option negotiation. The base station shall set SO_REQ to a special value, NULL, if the base station does not have an outstanding service option request. If the base station has an outstanding service option request, the base station shall set SO_REQ to the number of the service option associated with the outstanding request.

3.6.4.1.2.2 Service Subfunctions

As illustrated in Figure 3.6.4.1.2.2-1, the base station supports service configuration and negotiation by performing the following set of service subfunctions.

- **Normal Service Subfunction** - While this subfunction is active, the base station processes service configuration requests from the mobile station and sends service configuration requests to the mobile station.

- **Waiting for Service Request Message Subfunction** - While this subfunction is active, the base station waits to receive a Service Request Message.

- **Waiting for Service Response Message Subfunction** - While this subfunction is active, the base station waits to receive a Service Response Message.

- **Waiting for Service Action Time Subfunction** - While this subfunction is active, the base station waits for the action time associated with a new service configuration.

- **Waiting for Service Connect Completion Message Subfunction** - While this subfunction is active, the base station waits to receive a Service Connect Completion Message, a Handoff Completion Message, or an Extended Handoff Completion Message.

- **SO Negotiation Subfunction** - While this subfunction is active and the base station is operating in Band Class 0, the base station supports service option negotiation with the mobile station.

The **SO Negotiation Subfunction** supports service option negotiation. All of the other service subfunctions support service negotiation.
At any given time during Traffic Channel processing, only one of the service subfunctions is active. For example, when the base station first begins Traffic Channel processing, either the Normal Service Subfunction or the SO Negotiation Subfunction is active. Each of the other service subfunctions may become active in response to various events which occur during the Traffic Channel substates. Typically, the base station processes events pertaining to service configuration and negotiation in accordance with the requirements for the active service subfunction. However, some Traffic Channel substates do not allow for the processing of certain events pertaining to service configuration and negotiation, or specify requirements for processing such events which supersede the requirements of the active service subfunction.
Figure 3.6.4.1.2.2-1. Base Station Service Subfunctions

Notes:
- SCM stands for Service Connect Message.
- GHDM stands for General Handoff Direction Message.
- UHDM stands for Universal Handoff Direction Message.
- Processing for special cases, such as timeouts and errors, is not shown in this diagram.
3.6.4.1.2.2.1 Normal Service Subfunction

While this subfunction is active, the base station processes service configuration requests from the mobile station and sends service configuration requests to the mobile station.

While the Normal Service Subfunction is active, the base station shall perform the following:

- The base station shall process Forward and Reverse Traffic Channel frames in accordance with the current service configuration. The base station shall discard any Reverse Traffic Channel frame which has a format that is not supported by the base station. The base station may discard any type of Reverse Traffic Channel traffic that is not signaling traffic and is not part of the current service configuration.

- To initiate service negotiation for a new service configuration, the base station shall send a Service Request Message to propose the new service configuration and shall activate the Waiting for Service Response Message Subfunction.

- For any service option connection that is part of the current service configuration, the base station may send a Service Option Control Message to invoke a service option specific function in accordance with the requirements for the associated service option.

- The base station may send a Service Connect Message, a General Handoff Direction Message, or a Universal Handoff Direction Message containing a service configuration record. If the base station sends this message, the base station shall activate the Waiting for Service Action Time Subfunction.

- If SERV_NEG changes from enabled to disabled (see 3.6.6.2.2.2, 3.6.6.2.2.10, and 3.6.6.2.2.11), the base station shall activate the SO Negotiation Subfunction.

- If the base station receives one of the following service negotiation messages, the base station shall process the message according to the specified requirements, if any:

  1. Service Connect Completion Message

  2. Service Option Control Message: If the service option connection specified by the message is part of the current service configuration, and the service option specified by the message is the same as the service option associated with the service option connection, the base station shall process the message in accordance with the requirements for the service option.

  3. Service Request Message: The base station shall process the message as follows:

     • If the purpose of the message is to propose a service configuration, the base station shall process the message as follows:
If the base station accepts the proposed service configuration, the base station shall send a Service Connect Message, a General Handoff Direction Message, or a Universal Handoff Direction Message containing a service configuration record and shall activate the Waiting for Service Action Time Subfunction.

- If the base station does not accept the proposed service configuration and does not have an alternative service configuration to propose, the base station shall send a Service Response Message to reject the proposed service configuration.

If the base station does not accept the proposed service configuration and has an alternative service configuration to propose, the base station shall perform one of the following actions:

  o Send a Service Response Message to propose the alternative service configuration and shall activate the Waiting for Service Request Message Subfunction, or
  o Send a Service Connect Message, a General Handoff Direction Message, or a Universal Handoff Direction Message containing a service configuration record and shall activate the Waiting for Service Action Time Subfunction.

4. Service Response Message

  • If the base station receives one of the following service option negotiation messages, the base station shall process the message according to the specified requirements, if any:
    1. Service Option Request Order
    2. Service Option Response Order
    3. Service Option Control Order

3.6.4.1.2.2.2 Waiting for Service Request Message Subfunction

While this subfunction is active, the base station waits to receive a Service Request Message.

While the Waiting for Service Request Message Subfunction is active, the base station shall perform the following:

  • If the base station does not receive a Service Request Message, the base station shall activate the Normal Service Subfunction.
• The base station shall process Forward and Reverse Traffic Channel frames in
  accordance with the current service configuration. The base station shall discard
  any Reverse Traffic Channel frame which has a format that is not supported by the
  base station. The base station may discard any type of Reverse Traffic Channel
  traffic that is not signaling traffic and is not part of the current service
  configuration.

• For any service option connection that is part of the current service configuration,
  the base station may send a Service Option Control Message to invoke a service
  option specific function in accordance with the requirements for the associated
  service option.

• If SERV_NEG changes from enabled to disabled (see 3.6.6.2.2.2, 3.6.6.2.2.10, and
  3.6.6.2.2.11), the base station shall activate the SO Negotiation Subfunction.

• If the base station receives one of the following service negotiation messages, the
  base station shall process the message according to the specified requirements, if
  any:

  1. Service Connect Completion Message

  2. Service Option Control Message: If the service option connection specified by the
     message is part of the current service configuration, and the service option
     specified by the message is the same as the service option associated with the
     service option connection, the base station shall process the message in
     accordance with the requirements for the service option.

  3. Service Request Message: The base station shall process the message as follows:
     • If the purpose of the message is to accept a proposed service configuration,
       the base station shall perform one of the following actions:
         – The base station shall send a Service Connect Message, General Handoff
           Direction Message, or Universal Handoff Direction Message and shall
           activate the Waiting for Service Action Time Subfunction.
         – The base station shall send a Service Request Message to propose an
           alternative service configuration and shall activate the Waiting for Service
           Response Message Subfunction.
     • If the purpose of the message is to reject a proposed service configuration,
       the base station shall activate the Normal Service Subfunction.
     • If the purpose of the message is to propose a service configuration, the base
       station shall process the message as follows:
       – If the base station accepts the proposed service configuration, the base
         station shall send a Service Connect Message, a General Handoff Direction
         Message, or a Universal Handoff Direction Message containing a service
         configuration record and shall activate the Waiting for Service Action Time
         Subfunction.
– If the base station does not accept the proposed service configuration and does not have an alternative service configuration to propose, the base station shall send a Service Response Message to reject the proposed service configuration. The base station shall activate the Normal Service Subfunction.

– If the base station does not accept the proposed service configuration and has an alternative service configuration to propose, the base station shall perform one of the following actions:

  o Send a Service Response Message to propose the alternative service configuration, or

  o Send a Service Connect Message, a General Handoff Direction Message, or a Universal Handoff Direction Message containing a service configuration record and shall activate the Waiting for Service Action Time Subfunction.

4. Service Response Message

• If the base station receives one of the following service option negotiation messages, the base station shall process the message according to the specified requirements, if any:

  1. Service Option Request Order

  2. Service Option Response Order

  3. Service Option Control Order

3.6.4.1.2.2.3 Waiting for Service Response Message Subfunction

While this subfunction is active, the base station waits to receive a Service Response Message.

While the Waiting for Service Response Message Subfunction is active, the base station shall perform the following:

• If the base station does not receive a Service Response Message, the base station shall activate the Normal Service Subfunction.

• The base station shall process Forward and Reverse Traffic Channel frames in accordance with the current service configuration. The base station shall discard any Reverse Traffic Channel frame which has a format that is not supported by the base station. The base station may discard any type of Reverse Traffic Channel traffic that is not signaling traffic and is not part of the current service configuration.

• For any service option connection that is part of the current service configuration, the base station may send a Service Option Control Message to invoke a service option specific function in accordance with the requirements for the associated service option.
• If SERV_NEG changes from enabled to disabled (see 3.6.6.2.2.2, 3.6.6.2.2.10, and 3.6.6.2.2.11), the base station shall activate the SO Negotiation Subfunction.

• If the base station receives one of the following service negotiation messages, the base station shall process the message according to the specified requirements, if any:

1. Service Connect Completion Message

2. Service Option Control Message: If the service option connection specified by the message is part of the current service configuration, and the service option specified by the message is the same as the service option associated with the service option connection, the base station shall process the message in accordance with the requirements for the service option.

3. Service Request Message: The base station should not process the Layer 3 fields of the message.

4. Service Response Message: The base station shall process the message as follows:

   • If the service request sequence number (SERV_REQ_SEQ) from the message does not match the sequence number of the Service Request Message for which the base station is expecting a response, the base station shall not process the Layer 3 fields of the message.

   • If the purpose of the message is to accept a proposed service configuration, the base station shall perform one of the following actions:

     – The base station shall send a Service Connect Message, a General Handoff Direction Message, or a Universal Handoff Direction Message containing a service configuration record and shall activate the Waiting for Service Action Time Subfunction. Or

     – The base station shall send a Service Request Message to propose an alternative service configuration.

   • If the purpose of the message is to reject a proposed service configuration, the base station shall activate the Normal Service Subfunction.

   • If the purpose of the message is to propose a service configuration, the base station shall process the message as follows:

     – If the base station accepts the proposed service configuration, the base station shall send a Service Connect Message, a General Handoff Direction Message, or a Universal Handoff Direction Message containing a service configuration record and shall activate the Waiting for Service Action Time Subfunction.
– If the base station does not accept the proposed service configuration and does not have an alternative service configuration to propose, the base station shall send a Service Request Message to reject the proposed service configuration. The base station shall activate the Normal Service Subfunction.

– If the base station does not accept the proposed service configuration and has an alternative service configuration to propose, the base station shall perform one of the following actions:
  o Send a Service Request Message to propose the alternative service configuration, or
  o Send a Service Connect Message, a General Handoff Direction Message, or a Universal Handoff Direction Message containing a service configuration record and shall activate the Waiting for Service Action Time Subfunction

• If the base station receives one of the following service option negotiation messages, the base station shall process the message according to the specified requirements, if any:
  1. Service Option Request Order
  2. Service Option Response Order
  3. Service Option Control Order

3.6.4.1.2.2.4 Waiting for Service Action Time Subfunction
While this subfunction is active, the base station waits for the action time associated with a new service configuration.

While the Waiting for Service Action Time Subfunction is active, the base station shall perform the following:

• Prior to the action time associated with the Service Connect Message, a General Handoff Direction Message, or Universal Handoff Direction Message containing a service configuration record, the base station shall process Forward and Reverse Traffic Channel frames in accordance with the current service configuration. The base station shall discard any Reverse Traffic Channel frame which has a format that is not supported by the base station. The base station may discard any type of Reverse Traffic Channel traffic that is not signaling traffic and is not part of the current service configuration.
• At the action time associated with the Service Connect Message, General Handoff Direction Message, or Universal Handoff Direction Message containing a service configuration record, the base station shall begin to use the service configuration specified by the Service Connect Message, the General Handoff Direction Message, or the Universal Handoff Direction Message containing a service configuration record, as the current service configuration and shall begin to process Forward and Reverse Traffic Channel frames accordingly. The base station shall activate the Waiting for Service Connect Completion Message Subfunction.

• If SERV_NEG changes from enabled to disabled (see 3.6.6.2.2.2, 3.6.6.2.2.10, and 3.6.6.2.2.11), the base station shall activate the SO Negotiation Subfunction.

• If the base station receives one of the following service negotiation messages, the base station shall process the message according to the specified requirements, if any:
  1. Service Connect Completion Message
  2. Service Option Control Message: If the service option connection specified by the message is part of the current or pending service configuration, and the service option specified by the message is the same as the service option associated with the service option connection, the base station shall process the message in accordance with the requirements for the service option.
  3. Service Request Message
  4. Service Response Message

• If the base station receives one of the following service option negotiation messages, the base station shall process the message according to the specified requirements, if any:
  1. Service Option Request Order
  2. Service Option Response Order
  3. Service Option Control Order

3.6.4.1.2.2.5 Waiting for Service Connect Completion Message Subfunction

While this subfunction is active, the base station waits to receive a Service Connect Completion Message, a Handoff Completion Message, or an Extended Handoff Completion Message.

While the Waiting for Service Connect Completion Message Subfunction is active, the base station shall perform the following:

• If the base station has sent a Service Connect Message and does not receive a Service Connect Completion Message, or if the base station has sent a General Handoff Direction Message or a Universal Handoff Direction Message containing a Service Configuration record and does not receive a Handoff Completion Message, or an Extended Handoff Completion Message, the base station shall activate the Normal Service Subfunction.
• The base station shall process Forward and Reverse Traffic Channel frames in accordance with the current service configuration. The base station shall discard any Reverse Traffic Channel frame which has a format that is not supported by the base station. The base station may discard any type of Reverse Traffic Channel traffic that is not signaling traffic and is not part of the current service configuration.

• The base station shall not initiate service negotiation for a new service configuration.

• If SERV_NEG changes from enabled to disabled (see 3.6.6.2.2.2, 3.6.6.2.2.10, and 3.6.6.2.2.11), the base station shall activate the SO Negotiation Subfunction.

• If the base station receives one of the following service negotiation messages, the base station shall process the message according to the specified requirements, if any:

  1. Service Connect Completion Message, Handoff Completion Message, or Extended Handoff Completion Message: The base station shall activate the Normal Service Subfunction.

  2. Service Option Control Message: If the service option connection specified by the message is part of the current service configuration, and the service option specified by the message is the same as the service option associated with the service option connection, the base station shall process the message in accordance with the requirements for the service option.

  3. Service Request Message

  4. Service Response Message

• If the base station receives one of the following service option negotiation messages, the base station shall process the message according to the specified requirements, if any:

  1. Service Option Request Order

  2. Service Option Response Order

  3. Service Option Control Order

3.6.4.1.2.2.6 SO Negotiation Subfunction

While this subfunction is active, the base station supports service option negotiation with the mobile station.

Upon activating the SO Negotiation Subfunction, the base station shall set SO_REQ to NULL. The base station shall delete from the current service configuration any service option connection which does not use primary traffic on both the Forward and Reverse Traffic Channels.

While the SO Negotiation Subfunction is active, the base station shall perform the following:
• If the current service configuration includes a service option connection, the base
station shall process the received primary traffic bits in accordance with the
requirements for the service option associated with the service option connection;
otherwise, the base station shall discard the received primary traffic bits.

• If the current service configuration includes a service option connection, the base
station shall transmit primary traffic bits in accordance with the requirements for
the service option associated with the service option connection; otherwise, the base
station shall transmit null traffic and power control bits on the Forward
Fundamental Channel, if the Fundamental channel is present to transmit power
control bits on the Forward Dedicated Control Channel, if only the Dedicated
Control Channel is present.

• If the current service configuration includes a service option connection, the base
station may send a Service Option Control Order to invoke a service option specific
function in accordance with the requirements for the service option associated with
the service option connection.

• To initiate service option negotiation, the base station shall set SO_REQ to the
number of the requested service option and shall send a Service Option Request
Order containing the requested service option number.

• If SERV_NEG changes from disabled to enabled (see 3.6.6.2.2.2, 3.6.6.2.2.10, and
3.6.6.2.2.11), the base station shall activate the Normal Service Subfunction.

• The base station shall process a service option request received in an Origination
Message, a Page Response Message, or a Service Option Request Order as follows:
  – If the base station accepts the requested service option, the base station shall
    set SO_REQ to NULL and shall send a Service Option Response Order accepting
    the requested service option within T4b seconds. The base station shall begin
    using the service configuration implied by the requested service option in
    accordance with the requirements for the requested service option. The implied
    service configuration shall include the default Forward and Reverse Multiplex
    Options and transmission radio configurations associated with the requested
    service option. This implied service configuration shall include one service
    option connection for which the service option connection reference is 1, for
    which the service option is the requested service option, and for which the
    Forward and Reverse Traffic Channel types are both primary traffic.
  – If the base station does not accept the requested service option and has an
    alternative service option to request, the base station shall set SO_REQ to the
    alternative service option number and shall send a Service Option Request Order
    requesting the alternative service option within T4b seconds.
  – If the base station does not accept the requested service option and does not
    have an alternative service option to request, the base station shall set SO_REQ
    to NULL and shall send a Service Option Response Order to reject the request
    within T4b seconds. The base station shall continue to use the current service
    configuration.
• If the base station receives a Service Option Response Order, it shall process the order as follows:
  – If the service option number specified in the order is equal to SO_REQ, the base station shall set SO_REQ to NULL and shall begin using the service configuration implied by the specified service option in accordance with the requirements for the service option. The implied service configuration shall include the default Forward and Reverse Multiplex Options and radio configurations associated with the requested service option. This implied service configuration shall include one service option connection for which the service option connection reference is 1, for which the service option is the requested service option, and for which the Forward and Reverse Traffic Channel types are both primary traffic.
  – If the order indicates a service option rejection, the base station shall set SO_REQ to NULL. The base station shall continue to use the current service configuration.
  – If the order does not indicate a service option rejection and the service option specified in the order is not equal to SO_REQ, the base station shall set SO_REQ to NULL, should send a Release Order (ORDQ = ‘00000010’), and should enter the Release Substate.
• If the base station receives a Service Option Control Order, the base station shall process the order as follows:
  – If the current service configuration includes a service option connection, the base station shall process the received Service Option Control Order in accordance with the requirements for the service option associated with the service option connection.
• If the base station receives one of the following service negotiation messages, the base station shall process the message according to the specified requirements, if any:
  1. Service Connect Completion Message
  2. Service Option Control Message
  3. Service Request Message
  4. Service Response Message

3.6.4.1.3 Ordering of Messages
The Layer 2 protocol does not guarantee delivery of messages in any order. If the base station requires that the mobile station receive a set of messages in a certain order, the base station shall send each message in assured mode requiring confirmation of delivery and shall wait for the confirmation of delivery of each message before transmitting the next message in the set.
3.6.4.1.4 Message Action Times

A Forward Traffic Channel message without a USE_TIME field or with a USE_TIME field set to ‘0’ has an implicit action time. A message that has its USE_TIME field set to ‘1’ has an explicit action time that is specified in the ACTION_TIME field of the message.

A message with an explicit action time is called a pending message.

Unless otherwise specified, a message having an implicit action time shall take effect no later than the first 80 ms boundary (relative to System Time plus FRAME_OFFSET_s × 1.25 ms) occurring at least 80 ms after the end of the frame containing the last bit of the message. A message with an explicit action time, except for a Power Up Function Message, shall take effect when System Time minus FRAME_OFFSET_s × 1.25 ms (in 80 ms units) modulo 64 becomes equal to the message’s ACTION_TIME field. A Power Up Function Message shall take effect ACTION_TIME_FRAME frames after the time when System Time minus FRAME_OFFSET_s × 1.25 ms (in 80 ms units) modulo 64 becomes equal to the message’s ACTION_TIME field. The difference in time between ACTION_TIME and the end of the frame containing the last bit of the message shall be at least 80 ms.

The base station shall support two pending messages at any given time, not including pending Service Option Control Orders, Service Option Control Messages, or Power Up Function Messages. The number of pending Service Option Control Orders or Service Option Control Messages that the base station is required to support is specific to the service option (see the relevant service option descriptions). In addition, the base station shall support one pending Power Up Function Message.

3.6.4.1.5 Long Code Transition Request Processing

If a request for voice privacy is specified in the Origination Message or Page Response Message, the base station may send a Long Code Transition Request Order (ORDQ = ‘00000001’) requesting a transition to the private long code.

The base station shall process the Long Code Transition Request Order as follows:

- If the Long Code Transition Request Order requests a transition to the private long code and the base station accepts the request, the base station shall send a Long Code Transition Request Order (ORDQ = ‘00000001’). If the base station does not accept the private long code transition request, the base station shall send a Long Code Transition Request Order (ORDQ = ‘00000000’).

- If the Long Code Transition Request Order requests a transition to the public long code and the base station accepts the request, the base station shall send a Long Code Transition Request Order (ORDQ = ‘00000000’). If the base station does not accept the public long code transition request, the base station shall send a Long Code Transition Request Order (ORDQ = ‘00000001’).

The base station shall process the Long Code Transition Response Order as follows:
• If the Long Code Transition Response Order indicates that the mobile station accepts the long code transition requested in the Long Code Transition Request Order sent by the base station, the base station shall use the requested long code mask on both the Forward Traffic Channel and the Reverse Traffic Channel. The base station shall specify an explicit action time in the Long Code Transition Request Order. The base station shall begin using the requested long code mask using the explicit action time (see 3.6.4.1.4).

3.6.4.1.6 Processing Resource Request Messages

The base station shall process Resource Request Message and Resource Request Mini Message, as follows:

• The base station may send one of the messages that assign appropriate resources (e.g. Extended Supplemental Channel Assignment Message, Resource Allocation Message, Resource Allocation Mini Message, Universal Handoff Direction Message, Retry Order, etc) to the mobile station. If the base station sends one of these messages and a Forward Packet Data Channel is not assigned, the base station shall set PILOT_GATING_USE_RATE to ‘0’ and start transmitting the Forward Power Control Subchannel with the maximum rate at the action time of the message.

• The base station may send a Retry Order to the mobile station.

3.6.4.1.7 Response to Enhanced Origination Message

If the base station receives an Enhanced Origination Message, the base station should perform the following:

• If the base station does not accept this call request from the mobile station, the base station should send one of the following messages:

  + A Call Assignment Message to the mobile station, with the RESPONSE_IND field set to ‘1’, the ACCEPT_IND field set to ‘0’, and the TAG field set to the value of the TAG or ADD_TAG field of the Enhanced Origination Message.

  + A Retry Order if the Enhanced Origination Message is for a packet data service option.

• If the base station accepts this call request from the mobile station, the base station should send a Call Assignment Message, Service Connect Message, or Universal Handoff Direction Message (with the Service Configuration information record included) to assign the call:

  − If the GLOBAL_EMERGENCY_CALL indicator is set to ‘1’ and the service associated with this origination is a voice service, the base station shall recognize this as an emergency call and should process the message using an implementation-dependent procedure which may include ignoring the dialed digits. If the base station receives an Origination Message and the GLOBAL_EMERGENCY_CALL indicator is set to ‘1’ and the service associated with this origination is not a voice service, the base station may recognize this
as an emergency call and should process the message using an implementation-dependent procedure which may include ignoring the dialed digits.

- If the Enhanced Origination Message includes a SYNC_ID field, then based on the value of the SYNC_ID received, the base station may instruct the mobile station to restore one or more of the service option connections from the stored service configuration, and if so, the base station shall send a Call Assignment Message, Universal Handoff Direction Message, or Service Connect Message to the mobile station as follows:

  + If the base station sends a Call Assignment Message, the base station shall perform the following:
    
    o The base station shall set the RESPONSE_IND field to ‘1’, the ACCEPT_IND field to ‘1’, and the TAG field to the value of the TAG or ADD_TAG field of the Enhanced Origination Message.
    
    o The base station shall set the USE_OLD_SERV_CONFIG field to ‘1’.

  + If the base station sends a Service Connect Message, the base station shall perform the following:
    
    o The base station shall set the USE_OLD_SERV_CONFIG field to ‘11’.

  + If the mobile station is to restore all remaining service option connections from the stored service configuration, the base station shall set the SR_ID field to ‘111’; if the mobile station is to restore more than one but not all remaining service option connections from the stored service configuration, the base station shall set the SR_ID field to ‘000’ and the SR_ID_RESTORE_BITMAP field to the bitmap of service reference identifiers corresponding to the service option connections to be restored; otherwise, the base station shall set the SR_ID field to the service reference identifier corresponding to the service option connection to be restored.

  + At the action time corresponding to this message, the base station shall restore the indicated service option connection(s) from the stored service configuration; Layer 3 shall instantiate a Call Control instance (as specified in 3.6.8) for each of the restored service option connections with a ‘restore indication’ and Layer 3 shall identify each of these Call Control instances by the value of the CON_REF field corresponding to the restored service option connection.

- If the base station sends a Call Assignment Message to assign the call, the base station shall perform the following:

  + The base station shall set the RESPONSE_IND field to ‘1’, the ACCEPT_IND field to ‘1’, and the TAG field to the value of the TAG or ADD_TAG field of the Enhanced Origination Message. The base station shall set the CON_REF_INCL field of the message to ‘1’ and the CON_REF field of the message to the value of the connection reference of the service option connection corresponding to this call.
A service option connection corresponding to this call (if not already established) shall be established by performing service negotiation; the base station should initiate service negotiation to establish the service option connection, if permitted by the current service negotiation subfunction.

At the action time corresponding to this message, the Layer 3 shall instantiate a Call Control instance (as specified in 3.6.8). The Layer 3 shall identify this Call Control instance by the value of the CON_REF field included in the Call Assignment Message.

If the base station sends a Service Connect Message or a Universal Handoff Direction Message (with the Service Configuration information record included), to assign the call, the base station shall perform the following:

+ The base station shall set the call control parameters corresponding to this call included in the message as follows: The base station shall set the RESPONSE_IND field to ‘1’, and the TAG field to the value of the TAG or ADD_TAG field of the Enhanced Origination Message.

At the action time corresponding to this message, the Layer 3 shall instantiate a Call Control instance (as specified in 3.6.8). The Layer 3 shall identify this Call Control instance by the value of the CON_REF assigned to the service option connection corresponding to this call.

3.6.4.1.8 Processing Resource Release Request Message and Resource Release Request Mini Message

The base station may perform the following in response to receiving a Resource Release Request Message or a Resource Release Request Mini Message from the mobile station:

- If the mobile station requests to release a service option connection, the base station may send a Service Connect Message, General Handoff Direction Message, or a Universal Handoff Direction Message to release the service option connection.

- If the mobile station requests to commence reverse pilot gating operation, the base station may send a Extended Release Message, Extended Release Mini Message, or a Universal Handoff Direction Message to instruct the mobile station to commence the reverse pilot gating operation.

3.6.4.1.9 Processing Base Station Status Request Message

If the requested RECORD_TYPE equals ‘00000000’ (Pilot Information), the base station should send a Base Station Status Response Message with a RECORD_TYPE of ‘00000000’ (Pilot Information) to the mobile station:

- For each pilot being requested by the mobile station, the base station shall include the corresponding Base Station Identification number.
• If SID and NID information is being requested by the mobile station, the base station shall include the SID and NID information corresponding to these pilots.

• If LAT and LONG information is being requested by the mobile station, the base station should include the LAT and LONG information corresponding to these pilots.

3.6.4.1.10 Base Station assigned PLCM

If PLCM_TYPE field is included in Extended Channel Assignment Message or Universal Handoff Direction Message and is set to ‘0001’, the base station shall include PLCM_39 field in the message and shall set it as follows:

P38 P37 are set as specified in the Table 3.6.4.1.10-1:

<table>
<thead>
<tr>
<th>P38 P37 (binary)</th>
<th>Descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Proprietary Approach</td>
</tr>
<tr>
<td>01</td>
<td>Latitude-Longitude Approach</td>
</tr>
<tr>
<td>10</td>
<td>Reserved</td>
</tr>
<tr>
<td>11</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

If P38 P37 is equal to ‘01’; the base station shall set the fields as follows:

\[ P_{36}, P_{35}, P_{34}, P_{33}, P_{32}, P_{31}, P_{30}, P_{29}, P_{28}, P_{27}, P_{26} = (\text{BASE\_LONG} >> 5) \times \cos|\text{BASE\_LAT}| \mod 2^{11}, \]

\[ P_{25}, P_{24}, P_{23}, P_{22}, P_{21}, P_{20}, P_{19}, P_{18}, P_{17}, P_{16}, P_{15} = (\text{BASE\_LAT} >> 5) \mod 2^{11}, \]

\[ P_{14}, P_{13}, \ldots, P_{2}, P_1, P_0 = \text{identifiers assigned by the base station,} \]

where:

BASE_LONG is the longitude of the base station in units of 0.25 seconds, expressed as a two’s complement signed number with positive numbers signifying East longitude, and,

BASE_LAT is the latitude of the base station in units of 0.25 seconds, expressed as a two’s complement signed number with positive numbers signifying North latitudes.
3.6.4.2 Traffic Channel Initialization Substate

In this substate, the base station begins transmitting on the Forward Traffic Channel and acquires the Reverse Traffic Channel.

Upon entering the Traffic Channel Initialization Substate, the base station shall perform the following:

- Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to reset the message acknowledgment procedures as specified in [4].
- The base station shall set its Forward and Reverse Traffic Channel long code masks to the public long code mask (see [2]).
- The base station shall set its Forward and Reverse Traffic Channel frame offsets (see [2]) to the frame offset assigned to the mobile station.
- If the base station set the ASSIGN_MODE field of the Channel Assignment Message to ‘000’, the base station shall set SERV_NEG to disabled. If the base station set the ASSIGN_MODE field of the Channel Assignment Message to ‘100’, the base station shall set SERV_NEG to enabled. For operation in band classes other than Band Class 0, SERV_NEG is always equal to enabled.
- If the base station uses the Extended Channel Assignment Message, the base station shall set the SERV_NEG to enabled.
- The base station shall determine the initial service configuration as follows:
  - If SERV_NEG is equal to disabled, the initial service configuration shall include Multiplex Option 1 and Radio Configuration 1 for both the Forward and Reverse Traffic Channels, and shall include no service option connections.
  - If SERV_NEG is equal to enabled and the base station sets the GRANTED_MODE field of the Channel Assignment Message or the Extended Channel Assignment Message to ‘00’, the initial service configuration shall include the multiplex option and radio configuration for the Forward and Reverse Traffic Channels as specified by the DEFAULT_CONFIG field, and shall include no service option connections.
  - If SERV_NEG is equal to enabled and the base station sets the GRANTED_MODE field of the Extended Channel Assignment Message to ‘01’ or ‘10’, the initial service configuration shall include the default Forward and Reverse Traffic Channel multiplex options that are derived from the radio configurations corresponding to Table 3.7.2.3.2.21-3 and shall include no service option connections.
- If SERV_NEG is equal to enabled and the base station sets the
  GRANTED_MODE field of the Channel Assignment Message to ‘01’ or ‘10’, the
  initial service configuration shall include the default Forward and Reverse
  Traffic Channel multiplex options and transmission rates corresponding to the
  service option requested by the mobile station in the Origination Message, in the
  case of a mobile station originated call, or the Page Response Message, in the
  case of a mobile station terminated call, and shall include no service option
  connections.

- If SERV_NEG is equal to enabled and the base station sets the
  GRANTED_MODE field of the Extended Channel Assignment Message to ‘11’, the
  base station shall begin to use the stored service configuration corresponding to
  the SYNC_ID conveyed to the mobile station as the current service configuration
  and shall begin to process Forward and Reverse Traffic Channel frames
  accordingly. The set of service option connections to be restored are determined
  as follows:

  + If the base station sets the SR_ID_RESTORE field of the Extended Channel
    Assignment Message to ‘111’, the base station shall restore all the service
    option connections from the stored service configuration.
  + If the base station sets the SR_ID_RESTORE field of the Extended Channel
    Assignment Message to ‘000’, the base station shall restore the service
    option connections indicated by the SR_ID_RESTORE_BITMAP field of the
    Extended Channel Assignment Message from the stored service
    configuration.
  + Otherwise, the base station shall restore the service option connection
    corresponding to the SR_ID field of the Extended Channel Assignment
    Message from the stored service configuration.

- If SERV_NEG is equal to disabled, the base station shall activate the SO Negotiation
  Subfunction (see 3.6.4.1.2.2.6); otherwise, the base station shall activate the Normal
  Service Subfunction (see 3.6.4.1.2.2.1).

  The base station shall set PILOT_GATING_USE_RATE to ‘0’.

While in the Traffic Channel Initialization Substate, the base station shall perform the
following:

- If the Forward Fundamental Channel is assigned, the base station shall transmit
  null Traffic Channel data on the Forward Fundamental Channel, except when
  transmitting signaling traffic.

- If F-CPCCH is assigned, the base station shall transmit power control bits on the F-
  CPCCH; otherwise, if FPC_PRI_CHAN is set to ‘0’, the base station shall transmit
  power control bits on the Forward Fundamental Channel. If FPC_PRI_CHAN is set
  to ‘1’, the base station shall transmit power control bits on the Forward Dedicated
  Control Channel.
• If the base station acquires the Reverse Traffic Channel, Layer 3 shall send a reverse dedicated channel acquired indication to Layer 2 (see [4]). The base station shall perform the following:
  - If SERV_NEG is equal to enabled and the base station sets the GRANTED_MODE field of the Extended Channel Assignment Message to ‘11’, the base station shall perform the following:
    + For each service option connection (with corresponding connection reference CON_REF_i) in the stored service configuration record, Layer 3 shall instantiate a Call Control instance (as specified in 3.6.8) with a ‘restore indication’. The base station shall identify each of these Call Control instances by the corresponding CON_REF_i. Furthermore, the base station shall also identify the Call Control instance corresponding to the first service option connection listed in this restored Service Configuration information record by the NULL identifier.

  - Otherwise, the base station shall perform the following:
    + The Layer 3 shall instantiate a Call Control instance (as specified in 3.6.8). The Layer 3 shall assign the default identifier of NULL to this Call Control instance. The Layer 3 shall enter the Traffic Channel Substate.

• If the base station fails to acquire the Reverse Traffic Channel, the base station should perform one of the following:
  - retransmit the Channel Assignment Message or the Extended Channel Assignment Message on the Paging Channel and remain in the Traffic Channel Initialization Substate
  - retransmit the Extended Channel Assignment Message on the Forward Common Control Channel and remain in the Traffic Channel Initialization Substate, or
  - disable transmission on the Forward Traffic Channel and discontinue the Traffic Channel Processing for the mobile station.

3.6.4.3 Traffic Channel Substate
In this substate, the base station may exchange Traffic Channel frames with the mobile station in accordance with the current service configuration.
Upon entering the Traffic Channel Substate, the base station shall perform the following:
  • If SERV_NEG is equal to enabled and the base station sets the GRANTED_MODE field of the Extended Channel Assignment Message to ‘11’, the base station should not send a Service Connect Message to the mobile station.

  • If the call is a mobile station terminated call and the base station set BYPASS_ALERT_ANSWER to ‘0’, the base station shall perform the following:
If SERVNEG is equal to disabled, the base station shall process the service option request specified in the Page Response Message in accordance with the requirements for the active service subfunction (see 3.6.4.1.2.2).

If SERVNEG is equal to enabled and the base station sets the GRANTED_MODE field of the Channel Assignment Message or the Extended Channel Assignment Message to ‘00’ or ‘01’, the base station should initiate service negotiation to request a service configuration in accordance with the requirements for the active service subfunction (see 3.6.4.1.2.2).

If SERVNEG is equal to enabled and the base station sets the GRANTED_MODE field of the Channel Assignment Message or the Extended Channel Assignment Message to ‘10’, the base station should send a Service Connect Message in accordance with the requirements for the active service subfunction (see 3.6.4.1.2.2).

Otherwise, the base station shall perform the following:

- If SERVNEG equals enabled, the call is mobile-station-originated and the base station sets the GRANTED_MODE field of the Channel Assignment Message or the Extended Channel Assignment Message to ‘10’, the base station should send a Service Connect Message in accordance with the requirements for the active service subfunction (see 3.6.4.1.2.2).

- If SERVNEG equals disabled and the call is mobile-station-originated, the base station shall process the service option request specified in the Origination Message in accordance with the requirements for the active service subfunction (see 3.6.4.1.2.2).

While in the Traffic Channel Substate, the base station shall perform the following:

- The base station shall transmit the power control subchannel as specified in [2].

- The base station shall process Forward and Reverse Traffic Channel frames in accordance with the requirements for the active service subfunction (see 3.6.4.1.2.2).

- When PILOT_GATING_USE_RATE is equal to ‘0’ and the base station is to establish a Forward or Reverse Fundamental Channel or a Forward or Reverse Dedicated Control Channel, or a Forward Packet Data Channel, the base station shall send a Universal Handoff Direction Message to the mobile station.

- When a Forward Packet Data Channel is not assigned, PILOT_GATING_USE_RATE is equal to ‘1’ and the base station has data to send, the base station may send a Resource Allocation Message, Resource Allocation Mini Message, Extended Supplemental Channel Assignment Message, Forward Supplemental Channel Assignment Mini Message, Reverse Supplemental Channel Assignment Mini Message, or Universal Handoff Direction Message and set PILOT_GATING_USE_RATE to ‘0’ to start transmitting the Forward Power Control Subchannel with the maximum rate at the action time of the message and start the exchange of user information.
• When a Forward Packet Data Channel is assigned, PILOT_GATING_USE_RATE is equal to ‘1’, and the base station has data or signaling messages to send, the base station may transition to the Active Mode. If the base station determines to transition to the Active Mode, the base station shall perform the following:
  – If a Forward Dedicated Control Channel is assigned, the base station shall perform one of the following:
    + The base station shall send a Resource Allocation Message, Resource Allocation Mini Message, Extended Supplemental Channel Assignment Message, Forward Supplemental Channel Assignment Mini Message, Reverse Supplemental Channel Assignment Mini Message, or Universal Handoff Direction Message and set PILOT_GATING_USE_RATE to ‘0’ at the action time of the message, or
    + The base station shall set PILOT_GATING_USE_RATE to ‘0’ (see [3]).
  – Otherwise (i.e., Forward Dedicated Control Channel is not assigned), the base station shall set PILOT_GATING_USE_RATE to ‘0’.
• When a Forward Packet Data Channel is assigned, PILOT_GATING_USE_RATE is equal to ‘1’, and the base station has detected continuous reverse pilot channel or a valid Reverse Fundicated Channel frame is received, the base station shall set PILOT_GATING_USE_RATE to ‘0’.
• If the base station is to release any but not all traffic channels, the base station shall send a Universal Handoff Direction Message, Extended Release Message, or an Extended Release Mini Message to the mobile station.
• If the base station is to assign R-FCH, the base station may send a Universal Handoff Direction Message or Shared Channel Configuration Order (ORDQ = 00000000) to the mobile station. If the base station is to release R-FCH, the base station may send a Universal Handoff Direction Message, Extended Release Message, Extended Release Mini Message, or Shared Channel Configuration Order (ORDQ = 00000001) to the mobile station.
• When PILOT_GATING_USE_RATE is equal to ‘0’, the base station does not have any data to send, and the base station has determined that the mobile station does not have any data to send, then the base station may send an Extended Release Message, Extended Release Mini Message or Universal Handoff Direction Message. At the action time of the message, the base station may perform the following:
  – Set PILOT_GATING_USE_RATE to ‘1’.
  – If the channel configuration in the message does not include a Forward Packet Data Channel, start transmitting the Forward Power Control Subchannel with the specified rate and stop the exchange of user information.
  – If the channel configuration in the message includes a Forward Packet Data Channel, stop the exchange of user information and signaling messages.
• If the base station declares a loss of Reverse Traffic Channel continuity (see 3.4), the base station should send a *Release Order* to the mobile station. If the base station sends a *Release Order*, the Layer 3 shall send a “release indication” to all Call Control instances, and shall enter the *Release Substate*.

• The base station may perform Forward Traffic Channel power control as specified in 3.6.4.1.1.

• The base station may request a new service configuration by initiating service negotiation or service option negotiation in accordance with the requirements for the active service subfunction (see 3.6.4.1.2.2).

• The base station may send a *Service Option Control Message* or *Service Option Control Order* to invoke a service option specific function in accordance with the requirements for the active service subfunction (see 3.6.4.1.2.2).

• The base station may request a long code transition, as specified in 3.6.4.1.5, either autonomously or in response to a request for voice privacy specified in the *Origination Message* or *Page Response Message*.

• The base station may perform authentication procedures as specified in 3.3.1.

• The base station may perform TMSI assignment procedures (see 2.3.15).

• For the first call, if the call is mobile-station-originated and the PACA_REORIG field of the *Origination Message* is equal to ‘1’, the Layer 3 shall send a “paca reorig indication” to the Call Control instance.

• The base station may control operation of the Forward or Reverse Supplemental Code Channels by including Supplemental Code Channel assignment information in the *Supplemental Channel Assignment Message*, or the *General Handoff Direction Message*.

• If neither a Forward Fundamental Channel, nor a Forward Dedicated Control Channel is assigned, the base station shall not assign a Forward Supplemental Channels to the mobile station.

• If a Reverse Packet Data Channel is assigned, the base station shall not assign a Reverse Supplemental Channel to the mobile station.

• The base station may control operation of the Forward or Reverse Supplemental Channels by including Supplemental Channel assignment information in the *Extended Supplemental Channel Assignment Message*, the *Forward Supplemental Channel Assignment Mini Message*, or the *Reverse Supplemental Channel Assignment Mini Message*.

• The base station may assign a new call by sending a *Call Assignment Message*, *Service Connect Message*, or *Universal Handoff Direction Message* (with the Service Configuration information record included) to assign the call:

  – If the base station sends a *Call Assignment Message* to assign the call, the base station shall perform the following:
The base station shall set the RESPONSE_IND field to ‘0’.

The base station shall set the CON_REF_INCL field of the message to ‘1’ and the CON_REF field of the message to the value of the connection reference of the service option connection corresponding to this call.

A service option connection corresponding to this call (if not already established) shall be established by performing service negotiation; the base station should initiate service negotiation to establish the service option connection, if permitted by the current service negotiation subfunction.

At the action time corresponding to this message, the Layer 3 shall instantiate a Call Control instance (as specified in 3.6.8). The Layer 3 shall identify this Call Control instance by the value of the CON_REF field included in the Call Assignment Message.

If the base station sends a Service Connect Message or Universal Handoff Direction Message (with the Service Configuration information record included) to assign the call, the base station shall perform the following:

+ The base station shall set the call control parameters corresponding to this call included in the message as follows: The base station shall set the RESPONSE_IND field to ‘0’, and the BYPASS_ALERT_ANSWER field as required.

+ At the action time corresponding to this message, the Layer 3 shall instantiate a Call Control instance (as specified in 3.6.8). The Layer 3 shall identify this Call Control instance by the value of the CON_REF assigned to the service option connection corresponding to this call.

The base station may instruct the mobile station to restore one or more of the service option connection records from the stored service configuration by sending a Call Assignment Message or Service Connect Message as follows:

If the base station sends a Call Assignment Message, the base station shall perform the following:

+ The base station shall set the RESPONSE_IND field to ‘1’, the ACCEPT_IND field to ‘1’, and the TAG field to the value of the TAG field of the Enhanced Origination Message.

+ The base station shall set the USE_OLD_SERV_CONFIG field to ‘1’.

If the base station sends a Service Connect Message, the base station shall perform the following:

+ The base station shall set the USE_OLD_SERV_CONFIG field to ‘11’.
If the mobile station is to restore all remaining service option connection records from the stored service configuration, the base station shall set the SR_ID field to ‘111’; otherwise, the base station shall set the SR_ID field to the service reference identifier corresponding to the service option connection record to be restored.

At the action time corresponding to this message, the base station shall restore the indicated service option connection record(s) from the stored service configuration; Layer 3 shall instantiate a Call Control instance (as specified in 3.6.8) for each of the restored service option connections with a ‘restore indication’ and Layer 3 shall identify each of these Call Control instances by the value of the CON_REF field corresponding to the restored service option connection.

- If the Layer 3 receives a ‘call release request’ from a Call Control instance, the Layer 3 shall perform the following:
  - If the service option connection corresponding to this call is the only one connected, the base station should send the mobile station a Release Order and enter the Release Substate.
  - If the service option connection corresponding to this call is not the only one connected, the base station should release this service option connection. At the action time of the message, the Layer 3 shall terminate this Call Control instance.

- The base station may send the following messages. Some of these messages are generated by the Call Control Instance. If the base station sends a message, the base station shall comply with the specified requirements for sending the message, if any:
  1. Alert With Information Message:
  2. Analog Handoff Direction Message: The base station shall perform the following:
     - If the CON_REF_INCL field was set to ‘0’, the Layer 3 shall terminate all Call Control instances (if there are any) except the one identified by NULL; otherwise, the Layer 3 shall terminate all Call Control instances (if there are any) except the one identified by CON_REF field set in the message. The base station shall perform the following (see [6] for handoff to a wide analog channel and [22] for handoff to an 800 MHz narrow analog channel):
       + If this Call Control instance is in the Waiting for Order Substate, the base station shall enter the Waiting for Order Task.
       + If this Call Control instance is in the Waiting for Answer Substate, the base station shall enter the Waiting for Answer Task.
       + If this Call Control instance is in the Conversation Substate, the base station shall enter the Conversation Task.

60. **TMSI Assignment Message**

61. **Universal Handoff Direction Message**

62. **User Zone Reject Message**

63. **User Zone Update Message**

• If the base station receives one of the following messages from the mobile station, the base station shall process the message according to the specified requirements, if any:

1. **Base Station Challenge Order:** The base station shall process the message as described in 2.3.12.1.5.

2. **Base Station Status Request Message:** The base station shall process the message as described in 3.6.4.1.9

3. **Call Cancel Message**

4. **Candidate Frequency Search Report Message:** The base station shall process the message as described in 3.6.6.2.2.6.

5. **Candidate Frequency Search Response Message:** The base station shall process the message as described in 3.6.6.2.2.4.

6. **CDMA Off Time Report Message**

7. **Connect Order:** If the CON_REF_INCL field is not included in this message or if the CON_REF_INCL field equals '0', the Layer 3 shall deliver this message to the Call Control instance identified by NULL; otherwise, the Layer 3 shall deliver this message to the Call Control instance identified by CON_REF.

8. **Continuous DTMF Tone Order:** If the CON_REF_INCL field is not included in this message or if the CON_REF_INCL field equals '0', the Layer 3 shall deliver this message to the Call Control instance identified by NULL; otherwise, the Layer 3 shall deliver this message to the Call Control instance identified by CON_REF.
9. **Data Burst Message**: The base station may respond with a *Retry Order*.

10. **Enhanced Origination Message**: The base station shall process the message as described in 3.6.4.1.7.

11. **Extended Flash With Information Message**: If CON_REF_INCL equals '0', the Layer 3 shall deliver this message to the Call Control instance identified by NULL; otherwise, the Layer 3 shall deliver this message to the Call Control instance identified by CON_REF.

12. **Extended Handoff Completion Message**: The base station shall process the message as described in 3.6.6.2.2.7.

13. **Extended Pilot Strength Measurement Message**: The base station shall process the message as described in 3.6.6.2.2.1.

14. **Extended Release Response Message**.

15. **Extended Release Response Mini Message**.

16. **Flash With Information Message**: The Layer 3 shall deliver this message to the Call Control instance identified by NULL.

17. **Handoff Completion Message**: The base station shall process the message as described in 3.6.6.2.2.7.

18. **Local Control Response Order**

19. **Long Code Transition Request Order**: The base station shall process the message as described in 3.6.4.1.5.

20. **Long Code Transition Response Order**

21. **Mobile Station Reject Order**: If the CON_REF_INCL field is included in this message, Layer 3 shall perform the following: if the CON_REF_INCL field equals '0', Layer 3 shall send a 'messages rejected indication' to the Call Control instance identified by NULL; otherwise, Layer 3 shall send a 'messages rejected indication' to the Call Control instance identified by CON_REF.

22. **Origination Continuation Message**: The Layer 3 shall deliver this message to the Call Control instance identified by NULL.

23. **Outer Loop Report Message**

24. **Parameters Response Message**

25. **Parameter Update Confirmation Order**

26. **Periodic Pilot Strength Measurement Message**

27. **Pilot Strength Measurement Message**: The base station shall process the message as described in 3.6.6.2.2.1.

28. **Pilot Strength Measurement Mini Message**

29. **Power Measurement Report Message**: The base station may process the message as described in 3.6.4.1.1.
30. **Release Order**: The base station shall send the mobile station a *Release Order* within T2b seconds, and the Layer 3 shall send a “release indication” to all Call Control instances, and enter the *Release Substate*; otherwise, the Layer 3 shall send a “send alert with info message indication” to all Call Control instances.

31. **Resource Release Request Message**: The base station shall process the message as described in 3.6.4.1.8.

32. **Resource Release Request Mini Message**: The base station shall process the message as described in 3.6.4.1.8.

33. **Resource Request Message**: The base station shall process the message as described in 3.6.4.1.6.

34. **Resource Request Mini Message**: The base station shall process the message as described in 3.6.4.1.6.

35. **Request Analog Service Order**: The base station may respond with an *Analog Handoff Direction Message*.

36. **Request Narrow Analog Service Order**: The base station may respond with an *Analog Handoff Direction Message*.

37. **Request Wide Analog Service Order**: The base station may respond with an *Analog Handoff Direction Message*.

38. **Send Burst DTMF Message**: If the CON_REF_INCL field is not included in this message or if the CON_REF_INCL field equals ‘0’, the Layer 3 shall deliver this message to the Call Control instance identified by NULL; otherwise, the Layer 3 shall deliver this message to the Call Control instance identified by CON_REF.

39. **Service Connect Completion Message**: The base station shall process the message in accordance with the requirements for the active service subfunction (see 3.6.4.1.2.2).

40. **Service Option Control Message**: The base station shall process the message in accordance with the requirements for the active service subfunction (see 3.6.4.1.2.2).

41. **Service Option Control Order**: The base station shall process the message in accordance with the requirements for the active service subfunction (see 3.6.4.1.2.2).

42. **Service Option Request Order**: The base station shall process the message in accordance with the requirements for the active service subfunction (see 3.6.4.1.2.2).

43. **Service Option Response Order**: The base station shall process the message in accordance with the requirements for the active service subfunction (see 3.6.4.1.2.2).

44. **Service Request Message**: The base station shall process the message in accordance with the requirements for the active service subfunction (see 3.6.4.1.2.2).
45. **Service Response Message**: The base station shall process the message in accordance with the requirements for the active service subfunction (see 3.6.4.1.2.2).

46. **SSD Update Confirmation Order**

47. **SSD Update Rejection Order**

48. **Status Response Message**

49. **Status Message**

50. **Supplemental Channel Request Message**: The base station may respond with a Supplemental Channel Assignment Message, an Extended Supplemental Channel Assignment Message, or a Retry Order.

51. **Supplemental Channel Request Mini Message**: The base station may respond with a Forward Supplemental Channel Assignment Mini Message or a Reverse Supplemental Channel Assignment Mini Message, or both. The base station may also respond with a Retry Order.

52. **TMSI Assignment Completion Message**

53. **User Zone Update Request Message**: The base station shall process this message as specified in 3.6.7.2.

### 3.6.4.4 Release Substate

In this substate, the base station disconnects all calls and physical channels.

While in the **Release Substate**, the base station shall perform the following:

- The base station shall transmit the power control subchannel as specified in [2].

- The base station shall transmit on the Forward Traffic Channel for at least $T_{3b}$ seconds. The base station shall transmit null traffic and power control bits on the Forward Fundamental Channel, except when transmitting signaling traffic, if the Fundamental Channel is present or transmit power control bits on the Forward Dedicated Control Channel, if only the dedicated Control Channel is present. After $T_{3b}$ seconds, the base station should stop transmitting on the Forward Traffic Channel.

- When a Forward Packet Data Channel and a Forward Common Power Control Channel subchannel are assigned to this mobile station, the base station shall transmit on the Forward Common Power Control Channel subchannel for at least $T_{3b}$ seconds. After $T_{3b}$ seconds, the base station should stop transmitting on the Forward Common Power Control Channel subchannel. If no response is received to the Layer 3 message sent to the mobile station to release the call, the base station should wait $T_{5b}$ before assigning this Forward Common Power Control Channel subchannel to another mobile station.

- The base station shall process Reverse Traffic Channel signaling traffic and may discard other types of Reverse Traffic Channel traffic.

- The base station may perform TMSI assignment procedures (see 2.3.15).
• The base station may perform Forward Traffic Channel power control as specified in 3.6.4.1.1.

• The base station may send a Service Option Control Message to invoke a service option specific function in accordance with the requirements for the active service subfunction (see 3.6.4.1.2.2).

• The base station may send the following messages. Some of these messages are generated by the Call Control Instance. If the base station sends a message, the base station shall comply with the specified requirements for sending the message, if any.

  1. Alert With Information Message
  2. Audit Order
  3. Candidate Frequency Search Request Message
  4. Candidate Frequency Search Control Message
  5. Data Burst Message
  6. Extended Alert With Information Message
  7. Extended Handoff Direction Message
  8. Extended Neighbor List Update Message
  9. Extended Release Message
 10. Extended Supplemental Channel Assignment Message
 11. Forward Supplemental Channel Assignment Mini Message
 12. General Handoff Direction Message
 13. In-Traffic System Parameters Message
 14. Local Control Order
 15. Lock Until Power-Cycled Order: The base station should send this order in unassured mode.
 16. Maintenance Order
 17. Maintenance Required Order
 18. Mobile Assisted Burst Operation Parameters Message
 19. Mobile Station Registered Message

4 If the base station determines that the current P_REV_IN_USE is less than or equal to three, the base station does not send an In-Traffic System Parameters Message to change the P_REV_IN_USE to greater than or equal to nine.
20. **Neighbor List Update Message**: The base station shall not send this message if **P_REV_IN_USE** is greater than or equal to eight.

21. **Parameter Update Order** (see 2.3.12.1.3 or 3.7.4).

22. **Power Control Message**

23. **Power Control Parameters Message**

24. **Power Up Function Message**

25. **Power Up Function Completion Message**

26. **Release Order**

27. **Resource Allocation Message**

28. **Resource Allocation Mini Message**

29. **Resource Release Request Message**

30. **Resource Release Request Mini Message**

31. **Resource Request Message**

32. **Resource Request Mini Message**

33. **Retrieve Parameters Message**

34. **Reverse Supplemental Channel Assignment Mini Message**

35. **Service Option Control Message**: The base station shall send the message in accordance with the requirements for the active service subfunction (see 3.6.4.1.2.2).

36. **Service Option Control Order**

37. **Status Request Message**

38. **Status Request Order**: The base station shall not send this message if **P_REV_IN_USE** is greater than or equal to eight.

39. **Supplemental Channel Assignment Message**

40. **TMSI Assignment Message**

41. **Universal Handoff Direction Message**

42. **User Zone Reject Message**

43. **User Zone Update Message**

• If the base station receives one of the following messages from the mobile station, the base station shall process the message according to the specified requirements, if any:

   1. **Base Station Challenge Order**: The base station shall process the message as described in 2.3.12.1.5.

   2. **Call Cancel Message**
3. **Candidate Frequency Search Report Message**: The base station shall process the message as described in 3.6.6.2.2.6.

4. **Candidate Frequency Search Response Message**: The base station shall process the message as described in 3.6.6.2.2.4.

5. **Connect Order**: If the CON_REF_INCL field is not included in this message or if the CON_REF_INCL field equals ‘0’, the Layer 3 shall deliver this message to the Call Control instance identified by NULL; otherwise, the Layer 3 shall deliver this message to the Call Control instance identified by CON_REF.

6. **Continuous DTMF Tone Order**: If the CON_REF_INCL field is not included in this message or if the CON_REF_INCL field equals ‘0’, the Layer 3 shall deliver this message to the Call Control instance identified by NULL; otherwise, the Layer 3 shall deliver this message to the Call Control instance identified by CON_REF.

7. **Data Burst Message**

8. **Enhanced Origination Message**

9. **Extended Flash With Information Message**: If CON_REF_INCL equals ‘0’, the Layer 3 shall deliver this message to the Call Control instance identified by NULL; otherwise, the Layer 3 shall deliver this message to the Call Control instance identified by CON_REF.

10. **Extended Handoff Completion Message**: The base station shall process the message as described in 3.6.6.2.2.7.

11. **Extended Pilot Strength Measurement Message**: The base station shall process the message as described in 3.6.6.2.2.1.

12. **Extended Release Response Message**

13. **Flash With Information Message**: The Layer 3 shall deliver this message to the Call Control instance identified by NULL.

14. **Handoff Completion Message**: The base station shall process the message as described in 3.6.6.2.2.7.

15. **Local Control Response Order**

16. **Long Code Transition Request Order**

17. **Long Code Transition Response Order**

18. **Mobile Station Reject Order**: If the CON_REF_INCL field is included in this message, Layer 3 shall perform the following: if the CON_REF_INCL field equals ‘0’, Layer 3 shall send a ‘messages rejected indication’ to the Call Control instance identified by NULL; otherwise, Layer 3 shall send a ‘messages rejected indication’ to the Call Control instance identified by CON_REF.

19. **Origination Continuation Message**: The Layer 3 shall deliver this message to the Call Control instance identified by NULL.

20. **Parameter Update Confirmation Order**
21. Parameters Response Message

22. Periodic Pilot Strength Measurement Message

23. Pilot Strength Measurement Message: The base station shall process the message as described in 3.6.6.2.2.1.

25. Release Order

26. Request Analog Service Order

27. Request Narrow Analog Service Order

28. Request Wide Analog Service Order

29. Send Burst DTMF Message: If the CON_REF_INCL field is not included in this message or if the CON_REF_INCL field equals '0', the Layer 3 shall deliver this message to the Call Control instance identified by NULL; otherwise, the Layer 3 shall deliver this message to the Call Control instance identified by CON_REF.

30. Service Connect Completion Message

31. Service Option Control Message: The base station shall process the message in accordance with the requirements for the active service subfunction (see 3.6.4.1.2.2).

32. Service Option Control Order

33. Service Option Request Order

34. Service Option Response Order

35. Service Request Message

36. Service Response Message:

37. SSD Update Confirmation Order

38. SSD Update Rejection Order

39. Status Response Message

40. Status Message

41. TMSI Assignment Completion Message

42. User Zone Update Request Message: The base station shall process this message as specified in 3.6.7.2.

3.6.5 Registration

Registration is the process by which a mobile station notifies the base station of its location, status, identification, slot cycle, and other characteristics. The base station can make use of location information to efficiently page the mobile station when establishing a mobile station terminated call. Registration also provides the mobile station's SLOT_CYCLE_INDEX parameter so that the base station can determine which Paging Channel or Forward Common Control Channel slots a mobile station operating in the
slotted mode is monitoring. Registration also provides the protocol revision number so that the base station knows the capabilities of the mobile station.

The CDMA system supports eleven different forms of registration:

1. Power-up registration. The mobile station registers when it powers on, or switches from using the analog system.
2. Power-down registration. The mobile station registers when it powers off if previously registered in the current serving system.
3. Timer-based registration. The mobile station registers when a timer expires.
4. Distance-based registration. The mobile station registers when the distance between the current base station and the base station in which it last registered exceeds a threshold.
5. Zone-based registration. The mobile station registers when it enters a new zone.
6. Parameter-change registration. The mobile station registers when certain of its stored parameters change or when it enters a new system.
7. Ordered registration. The mobile station registers when the base station requests it.
8. Implicit registration. When a mobile station successfully sends an *Origination Message*, *Reconnect Message*, or *Page Response Message*, the base station can infer the mobile station’s location. This is considered an implicit registration.
9. Traffic Channel registration. Whenever the base station has registration information for a mobile station that has been assigned to a Traffic Channel, the base station can notify the mobile station that it is registered.
10. User Zone Registration. The mobile station registers when it selects an active User Zone (see 2.6.9.1.2).
11. Encryption/Message Integrity re-sync required registration. The mobile station registers when extended encryption is turned on and the mobile station determines that it can not decrypt any messages from the base station (see 2.3.12.4.1.3) or the mobile station registers when message integrity is supported and the mobile station determines that it can not validate the MACI of any messages from the base station.

The first five forms of registration, User Zone Registration, and Encryption/Message Integrity re-sync required registration, as a group, are called autonomous registration and are conditioned, in part, by roaming status and by indicators contained in the *System Parameters Message* and ANSI-41 *System Parameters Message* (see 2.6.5.3). The base station may initiate ordered registration through the *Registration Request Order*.

The base station can obtain registration information by sending the *Status Request Message* to the mobile station on the Paging Channel, the Forward Common Control Channel, or the Forward Traffic Channel. If the base station is operating with the mobile station in Band Class 0, the base station can also obtain registration information by sending the *Status Request Order* to the mobile station on the Forward Traffic Channel.
The base station may notify the mobile station that it is registered through the *Mobile Station Registered Message*.

3.6.5.1 Registration on the Common Channels

The base station shall specify the forms of registration that are enabled, the corresponding registration parameters, and the roaming status conditions for which registration is enabled in the *System Parameters Message* and *ANSI-41 System Parameters Message*. If any of the autonomous registration forms are enabled, the base station should also enable parameter-change registration.

The base station should process an *Origination Message*, *Reconnect Message*, or *Page Response Message* sent on the r-csch as an implicit registration of the mobile station sending the message. The base station can obtain complete registration information about the mobile station at any time by sending a *Registration Request Order* to the mobile station.

3.6.5.2 Registration on the Traffic Channels

The base station can obtain registration information from a mobile station on the Traffic Channel by means of the *Status Request Message* or the *Status Request Order*. When the base station has registration information for a mobile station, the base station may send a *Mobile Station Registered Message* to the mobile station, specifying the base station’s registration system, zone, and location information.

3.6.6 Handoff Procedures

3.6.6.1 Overview

3.6.6.1.1 Types of Handoff

The base station supports the following three handoff procedures:

- **Soft Handoff**: A handoff in which a new base station commences communications with the mobile station without interrupting the communications with the old base station. The base station can direct the mobile station to perform a soft handoff only when all Forward Traffic Channels assigned to the mobile station have identical band classes, frequency assignments and frame offsets. Soft handoff provides diversity of Forward Traffic Channels and Reverse Traffic Channel paths on the boundaries between base stations.

- **CDMA-to-CDMA Hard Handoff**: A handoff in which the base station directs the mobile station to transition between disjoint sets of base stations, different band classes, different frequency assignments, different long code masks or different frame offsets.

---

5In this section the term base station may imply multiple cells or sectors.
CDMA-to-Analog Handoff: A handoff in which the base station directs the mobile station from a Forward Traffic Channel to an analog voice channel.

Base station support of CDMA-to-CDMA hard handoff between different band classes and support of CDMA-to-analog handoff is optional.

Section 2.6.6 describes the mobile station requirements during handoff.

3.6.6.1.2 Active Set
The Active Set contains the pilots (see 2.6.6.1.2) associated with the Forward Traffic Channels assigned to the mobile station. Initially the base station informs the mobile station of the contents of the Active Set using the Channel Assignment Message or the Extended Channel Assignment Message; subsequent changes to the contents of the Active Set are provided using the Extended Handoff Direction Message, General Handoff Direction Message, or Universal Handoff Direction Message.

3.6.6.2 Requirements

3.6.6.2.1 Overhead Information
The base station sends the following messages governing the pilot search procedures performed by the mobile station:
- System Parameters Message
- In-Traffic System Parameters Message
- Neighbor List Message
- Extended Neighbor List Message
- Neighbor List Update Message
- Extended Neighbor List Update Message
- General Neighbor List Message
- General Handoff Direction Message
- Extended Handoff Direction Message
- Candidate Frequency Search Request Message
- Candidate Frequency Search Control Message
- Universal Handoff Direction Message
- Universal Neighbor List Message
- MC-RR Parameters Message

3.6.6.2.1.1 System Parameters
The base station sends handoff related parameters on the Paging Channel in the System Parameters Message and the Extended System Parameters Message, and on the Primary Broadcast Control Channel in the MC-RR Parameters Message.
The base station may revise handoff related parameters for a mobile station operating on the Traffic Channel by sending the In-Traffic System Parameters Message.

The base station may modify the values of the parameters SRCH_WIN_A, T_ADD, T_DROP, T.COMP, and T_TDROP through the Extended Handoff Direction Message, the General Handoff Direction Message, or the Universal Handoff Direction Message. In addition, the base station may also modify the values of the parameters SRCH_WIN_N, SRCH_WIN_R, SOFT_SLOPE, ADD_INTERCEPT, DROP_INTERCEPT, and T_TDROP_RANGE through the General Handoff Direction Message or the Universal Handoff Direction Message.

3.6.6.2.1.2 Neighbor List

The base station sends a Neighbor List on the Paging Channel in the Neighbor List Message, the Extended Neighbor List Message, or the General Neighbor List Message. The base station should list the pilots in the Neighbor List Message in descending priority order (see 2.6.6.2.6.3).

The base station may revise the Neighbor List for a mobile station operating on the Traffic Channel by sending a Neighbor List Update Message or an Extended Neighbor List Update Message.

The base station shall not include a pilot that is a member of the mobile station’s Active Set in a Neighbor List Update Message or an Extended Neighbor List Update Message. The base station shall not specify more than $N_{8m}$ pilots in the Neighbor List Message, Extended Neighbor List Message, General Neighbor List Message, or in the Extended Neighbor List Update Message. The base station shall not specify more than 20 pilots in the Neighbor List Update Message. The base station should list the pilots in the Neighbor List Update Message in descending priority order (see 2.6.6.2.6.3).

The base station may also indicate the availability of neighboring analog systems in the General Neighbor List Message to assist the mobile station in performing system reselection (see 2.6.2.1.6).

3.6.6.2.1.3 Candidate Frequency Neighbor List

The base station sends a Candidate Frequency Neighbor List and inter-frequency hard handoff related parameters in the Candidate Frequency Search Request Message. The base station shall not specify more than $N_{8m}$ pilots in the Candidate Frequency Search Request Message.

3.6.6.2.1.4 Candidate Frequency Search List

The base station designates a subset of the Candidate Frequency Neighbor List included in the Candidate Frequency Search Request Message as the Candidate Frequency Search List. For each pilot belonging to the Candidate Frequency Search List, the base station shall set the corresponding SEARCH_SET field of the Candidate Frequency Search Request Message to ‘1’.

3.6.6.2.2 Call Processing During Handoff

When a mobile station performs a handoff from a base station with a P_REV lower than the
mobile station’s MOB_P_REV to a base station with a P_REV greater than the P_REV of the
previous base station, the base station should send the service configuration to the mobile
station.

3.6.6.2.2.1 Processing the Pilot Strength Measurement Message
The base station should use the pilot strength measurements in the Pilot Strength
Measurement Message or the Extended Pilot Strength Measurement Message to determine a
new Active Set.

The base station may also use the PN phase measurements in the Pilot Strength
Measurement Message or the Extended Pilot Strength Measurement Message to estimate the
propagation delay to the mobile station. This estimate can be used to reduce Reverse
Traffic Channel acquisition time.

The base station may respond to a Pilot Strength Measurement Message or an Extended Pilot
Strength Measurement Message received from the mobile station by sending the Extended
Handoff Direction Message, the General Handoff Direction Message, or the Universal Handoff
Direction Message.

3.6.6.2.2.2 Processing the Extended Handoff Direction Message
The base station shall maintain a handoff message sequence number. If the base station
specifies that the mobile station is to use service negotiation, the base station shall set the
SERV_NEG variable (see 3.6.4.1.2.1.4) to be enabled at the action time of the message.
The sequence number shall be initialized to zero prior to the transmission of the first
Extended Handoff Direction Message, General Handoff Direction Message (see 3.6.6.2.2.10),
or the Universal Handoff Direction Message to the mobile station. The base station shall
increment the sequence number modulo 4 each time the base station modifies the pilot list
(including the order in which pilots are specified within the list) or the code channels
(including a change in the ordering such that the first code channel occurrence for any
pilot is changed) sent to the mobile station in an Extended Handoff Direction Message, a
General Handoff Direction Message, or a Universal Handoff Direction Message.

Following a hard handoff, the base station should set the handoff message sequence
number to the value of the LAST_HDM_SEQ field of the Handoff Completion Message or
Extended Handoff Completion Message and should use the pilot order contained in the
Handoff Completion Message or Extended Handoff Completion Message to interpret the

The base station shall set the contents of an Extended Handoff Direction Message according
to the following rules:

• An Extended Handoff Direction Message shall list no more than $N_{6m}$ pilots in the
  new Active Set.

• An Extended Handoff Direction Message shall identify the identical power control
  subchannels (i.e., those carrying identical power control bits).

• An Extended Handoff Direction Message may change the code channel associated
  with an Active Set pilot that remains in the new Active Set.
• The base station specifies the long code mask to be used on the new Forward Traffic Channel by using the PRIVATE_LCM field of the **Extended Handoff Direction Message**. The base station may change the long code mask to be used on the new Forward Traffic Channel via the PRIVATE_LCM field of the **Extended Handoff Direction Message** only for CDMA-to-CDMA hard handoffs. If a change of long code mask is specified and the base station does not specify an explicit action time in the **Extended Handoff Direction Message**, the base station shall begin using the new long code mask on the first 80 ms boundary (relative to System Time) occurring at least 80 ms after the end of the frame containing the last bit of the message.

• For CDMA-to-CDMA handoffs, the base station may require the mobile station to perform a reset of the acknowledgment procedures by using the RESET_L2 field of the **Extended Handoff Direction Message**. If the base station requires the mobile station to reset the acknowledgment procedures, Layer 3 shall send an indication to Layer 2 to reset the acknowledgment procedures (see [4]). The acknowledgment procedures shall be reset immediately after the action time of the **Extended Handoff Direction Message**.

• For CDMA-to-CDMA hard handoffs, the base station may alter the frame offset by setting the FRAME_OFFSET field to a new value. If the base station specifies a new frame offset and does not specify an explicit action time, the base station shall change its Forward and Reverse Traffic Channel frame offsets at the second 80 ms boundary (relative to System Time) after the end of transmission of the **Extended Handoff Direction Message**, unless the end of transmission of the message coincides with an 80 ms boundary, in which case the change in frame offsets shall occur 80 ms after the end of transmission.

• For CDMA-to-CDMA hard handoffs to Band Class 0 or Band Class 3, the base station may alter the nominal transmit power offset after handoff by setting the NOM_PWR field to the new nominal transmit power offset. For CDMA-to-CDMA hard handoffs to band classes other than Band Class 0 and Band Class 3, the base station may alter the nominal transmit power offset after handoff by setting both the NOM_PWR and NOM_PWR_EXT fields to the new nominal transmit power offset.

• The base station may specify a different band class by setting the BAND_CLASS and CDMA_FREQ fields to the band class and CDMA frequency assignment respectively. The base station shall not specify a band class not supported by the mobile station.

• If the base station sends the **Extended Handoff Direction Message** in assured mode, the base station should set the action time of the message such that there is sufficient time for the mobile station to transmit a message containing the acknowledgment prior to the action time.
• For CDMA-to-CDMA hard handoffs, the base station may specify whether the mobile station is to use service negotiation or service option negotiation by setting the SERV_NEG_TYPE field of the Extended Handoff Direction Message. If the base station specifies that the mobile station is to use service negotiation, the base station shall set the SERV_NEG variable (see 3.6.4.1.2.1.4) to enabled at the action time of message. If the base station specifies that the mobile station is to use service option negotiation, the base station shall set SERV_NEG to disabled at the action time of the message.

3.6.6.2.2.3 Processing the Candidate Frequency Search Request Message

The base station may send a Candidate Frequency Search Request Message to direct the mobile station to perform a single or periodic search on the Candidate Frequency.

The base station may request the mobile station to perform an aligned search of the Candidate Frequency Search Set (see 2.6.6.2.8.3). If the base station requests the mobile station to perform an aligned search, the base station shall specify an explicit action time for the Candidate Frequency Search Request Message.

The base station shall maintain a search message sequence number. The sequence number shall be initialized to zero prior to the transmission of the first Candidate Frequency Search Request Message to the mobile station. Each time the base station sends a new Candidate Frequency Search Request Message to the mobile station, it shall set the CFSRM_SEQ field to the current value of the sequence number, and increment the sequence number modulo 4.

3.6.6.2.2.4 Processing the Candidate Frequency Search Response Message

The base station should use the mobile station’s search capabilities as reported in the Candidate Frequency Search Response Message to determine an appropriate period for the mobile station’s periodic search on the Candidate Frequency.

3.6.6.2.2.5 Processing the Candidate Frequency Search Control Message

The base station may send a Candidate Frequency Search Control Message to direct the mobile station to perform a single search, or to start or stop a periodic search on the Candidate Frequency.

The base station may request the mobile station to perform an aligned search of the Candidate Frequency Search Set (see 2.6.6.2.8.3). If the base station requests the mobile station to perform an aligned search, the base station shall specify an explicit action time for the Candidate Frequency Search Control Message.

Each time the base station sends a new Candidate Frequency Search Control Message to the mobile station, it shall set the CFSCM_SEQ field to the current value of the sequence number, and increment the sequence number modulo 4.
3.6.6.2.2.6 Processing the Candidate Frequency Search Report Message

The base station should use the value of the LAST_SRCH_MSG field and of the
LAST_SRCH_MSG_SEQ field of the Candidate Frequency Search Report Message to interpret
the contents of the message.

If the SEARCH_MODE field of the Candidate Frequency Search Report Message is equal to
‘0000’, the base station should use the pilot strength measurements in the message to
determine whether to direct the mobile station to perform a CDMA-to-CDMA inter-
frequency handoff, and to determine the new Active Set. If the SEARCH_MODE field of the
Candidate Frequency Search Report Message is equal to ‘0001’, the base station should use
the analog frequency strength measurements in the message to determine whether to
direct the mobile station to perform a CDMA-to-Analog handoff.

3.6.6.2.2.7 Transmitting During Handoff

The base station shall continue transmission to the mobile station on the Fundamental
Channel or the Dedicated Control Channel of a Forward Traffic Channel removed from the
Active Set until it receives the Handoff Completion Message or Extended Handoff Completion
Message from the mobile station or determines that the call has been released.

The base station should discontinue transmission to the mobile station on the
Fundamental Channel or the Dedicated Control Channel of a Forward Traffic Channel
removed from the Active Set after it receives the Handoff Completion Message or Extended
Handoff Completion Message.

For Forward Multiplex Options 3 through 16, the base station should discontinue
transmission of Forward Supplemental Code Channels removed from the Code Channel
List according to the following rules:

• If a General Handoff Direction Message is used to remove one or more Forward
  Supplemental Code Channels, the base station should discontinue transmission on
  those code channels no later than the action time of the General Handoff Direction
  Message.

• If a Supplemental Channel Assignment Message is used to remove one or more
  Forward Supplemental Code Channels, the base station should discontinue
  transmission on those Forward Supplemental Code Channels no later than the
  implicit action time of the Supplemental Channel Assignment Message.

3.6.6.2.2.8 Ordering Pilot Measurements From the Mobile Station

The base station may direct the mobile station to send a Pilot Strength Measurement
Message by sending a Pilot Measurement Request Order.

The base station may send a Periodic Pilot Measurement Request Order to direct the mobile
station to send pilot strength measurements one time or periodically. In response to the
order, the mobile station reports the pilot strength measurements using the Periodic Pilot
Strength Measurement Message.
3.6.6.2.9 Processing the Supplemental Channel Assignment Message

The base station may use this message to specify Supplemental Code Channel assignment parameters for the mobile station’s Forward Traffic Channel, Reverse Traffic Channel, or both. This information includes the parameters that control the timing of the Supplemental Code Channel assignment (e.g., starting time and duration), and parameters that control the number of Supplemental Code Channels which will be used during the assignment (e.g., the number of Reverse Supplemental Code Channels on which the mobile station may transmit and the set of Walsh codes on which the mobile station receives Forward Supplemental Code Channels for each pilot in the mobile station’s Active Set).

The Supplemental Channel Assignment Message shall be used only with Multiplex Options 3 through 16.

The base station shall set the content of a Supplemental Channel Assignment Message according to the following rules:

- The base station may set USE_RETRY_DELAY to ‘1’ and RETRY_DELAY to a delay in 320 ms units starting at the next 80 ms system time boundary during which the mobile station is to refrain from sending subsequent Supplemental Channel Request Messages. The base station may set RETRY_DELAY to ‘11111111’ to indicate that the mobile station is to refrain from transmitting Supplemental Channel Request Messages indefinitely. Otherwise, the base station shall set USE_RETRY_DELAY to ‘0’ and omit RETRY_DELAY in which case the mobile station is to reset any previously set RETRY_DELAY indication.

- The base station shall set REV_DTX_DURATION to the maximum duration of time in units of 20 ms that the mobile station is allowed to stop transmission on a Reverse Supplemental Code Channel before resuming transmission on the Reverse Supplemental Code Channel within the reverse assignment duration. The base station shall set this field to ‘0000’ if the mobile station is to stop using a Reverse Supplemental Code Channel once it has stopped transmitting on that Reverse Supplemental Code Channel. The base station shall set this field to ‘1111’ if the mobile station is allowed to resume transmission on a Reverse Supplemental Code Channel at any time within the reverse assignment duration.

- A Supplemental Channel Assignment Message may specify Reverse Supplemental Code Channel assignments. If Reverse Supplemental Code Channel assignment information is included, the base station shall set REV_INCLUDED to ‘1’ and include the appropriate Reverse Supplemental Code Channel assignment information. Otherwise, the base station shall set REV_INCLUDED to ‘0’.

- The base station shall indicate the implicit, explicit, or linked start time for a Reverse Supplemental Code Channel assignment as follows:
  - The base station may set EXPL_REV_START_TIME to ‘1’ and set REV_START_TIME to the System Time, in units of 80 ms (modulo 64), at which the mobile station is to start transmitting on the Reverse Supplemental Code Channels.
– The base station may set USE_REV_HDM_SEQ to ‘1’ and set REV_LINKED_HDM_SEQ to the sequence number of the General Handoff Direction Message (HDM_SEQ) with which this message is linked to indicate that the mobile station is to start processing the Reverse Supplemental Code Channels at the action time of the linked General Handoff Direction Message.

– The base station may set EXPL_REV_START_TIME to ‘0’ and USE_REV_HDM_SEQ to ‘0’ to indicate that the mobile station is to start processing Reverse Supplemental Code Channels at the implicit action time of this message.

– The base station shall not set both EXPL_REV_START_TIME and USE_REV_HDM_SEQ to ‘1’.

• The base station may set USE_REV_DURATON to ‘1’ and REV_DURATON to the time interval, in units of 80 ms, after the implicit, explicit, or linked action time for the message (as specified in 2.6.6.2.5.1), during which the mobile station is to transmit on the specified Reverse Supplemental Code Channels. The base station may set USE_REV_DURATON to ‘0’ to indicate an infinite duration for the assignment of Reverse Supplemental Code Channels. If NUM_REV_CODES is ‘000’, then the base station shall set USE_REV_DURATON to ‘0’.

• If Reverse Supplemental Code Channel assignment information is included, the base station shall set NUM_REV_CODES to the number of Reverse Supplemental Code Channels to be used in this Reverse Supplemental Code Channel assignment. The base station shall not set NUM_REV_CODES to be greater than the number of codes supported by the currently negotiated multiplex option.

• The base station may set USE_T_ADD_ABORT, the Reverse Supplemental Code Channel assignment T_ADD abort indicator, to ‘1’ to indicate that the mobile station is to abort Reverse Supplemental Code Channel assignments implicitly when a T_ADD trigger occurs. Otherwise, the base station shall set USE_T_ADD_ABORT to ‘0’. If NUM_REV_CODES is set to ‘000’, the base station shall set USE_T_ADD_ABORT to ‘0’.

• If the base station is sending this message in response to a Supplemental Channel Request Message which includes a Supplemental Channel Request Message sequence number and the mobile station is to clear the IGNORE_SCAM field, the base station shall set USE_SCRM_SEQ_NUM to ‘1’ and set SCRM_SEQ_NUM to the sequence number corresponding to the SCRM_SEQ_NUM field in a Supplemental Channel Request Message to which the mobile station is to match this message. Otherwise, the base station shall set USE_SCRM_SEQ_NUM to ‘0’ and omit SCRM_SEQ_NUM.

• A Supplemental Channel Assignment Message may specify Forward Supplemental Code Channel assignments. If Forward Supplemental Code Channel assignment information is included, the base station shall set FOR_INCLUDED to ‘1’ and include the appropriate Forward Supplemental Code Channel assignment information. Otherwise, the base station shall set FOR_INCLUDED to ‘0’.
• The base station shall set FOR_SUP_CONFIG to ‘00’ if the mobile station is to stop processing the forward supplemental code after the action time of the Supplemental Channel Assignment Message. The base station should not transmit to the mobile station on the Forward Supplemental Code Channels after the message takes effect.

• The base station shall set FOR_SUP_CONFIG to ‘01’ if the mobile station is to start processing the Forward Supplemental Code Channels in the Code Channel List at the implicit, explicit, or linked action time for the message as specified in 2.6.6.2.5.1.

• The base station shall set FOR_SUP_CONFIG to ‘10’ if the Forward Supplemental Code Channels associated with the pilots in the Active set are specified in the Supplemental Channel Assignment Message and is to stop processing Forward Supplemental Code Channels at the implicit action time of the message. The base station should not transmit to the mobile station on the Forward Supplemental Code Channels after the message takes effect.

• The base station shall set FOR_SUP_CONFIG to ‘11’ if the Forward Supplemental Code Channels associated with the pilots in the Active set are specified in the Supplemental Channel Assignment Message and the mobile station is to start processing the Forward Supplemental Code Channels at the implicit, explicit, or linked action time for the message as specified in 2.6.6.2.5.1.

• The base station shall set FOR_DURATION to the time interval, in units of 80 ms, after the implicit, explicit, or linked action time for the message (as specified in 2.6.6.2.5.1), during which the mobile station is to process the specified Forward Supplemental Code Channels. The base station may set USE_FOR_DURATION to ‘0’ to indicate an infinite duration for the allocation of Forward Supplemental Code Channels. The base station should not transmit to the mobile station on the Forward Supplemental Code Channels outside the time interval specified by FOR_DURATION.

• The base station may set EXPL_FOR_START_TIME to ‘1’ and set FOR_START_TIME to the System Time, in units of 80 ms (modulo 64), at which the mobile station is to start processing the Forward Supplemental Code Channels.

• The base station may set USE_FOR_HDM_SEQ to ‘1’ and set FOR_LINKED_HDM_SEQ to the sequence number of the General Handoff Direction Message (HDM_SEQ) with which this message is linked to indicate that the mobile station is to start processing the Forward Supplemental Code Channels at the action time of the linked General Handoff Direction Message.

• The base station shall not set both USE_FOR_HDM_SEQ and EXPL_FOR_START_TIME within a Supplemental Channel Assignment Message to ‘1’.

• The number of Supplemental Code Channels assigned by Supplemental Channel Assignment Message shall not exceed the maximum number of Supplemental Code Channels for the negotiated Forward Multiplex Option.
• The base station may set EXPL_FOR_START_TIME to ‘0’ and USE_FOR_HDM_SEQ to ‘0’ to indicate that the mobile station is to start processing Forward Supplemental Code Channels at the implicit action time of this message.

3.6.6.2.2.10 Processing the General Handoff Direction Message

The base station shall maintain a handoff message sequence number. The sequence number shall be initialized to zero prior to the transmission of the first Extended Handoff Direction Message, General Handoff Direction Message, or Universal Handoff Direction Message (see 3.6.6.2.2.11) to the mobile station (see 2.6.6.2.2.2). The base station shall increment the sequence number modulo 4 each time the base station modifies the pilot list (including the order in which pilots are specified within the list) or the code channels (including a change in the ordering such that the first code channel occurrence for any pilot is changed) sent to the mobile station in an Extended Handoff Direction Message, General Handoff Direction Message, or Universal Handoff Direction Message.

Following a hard handoff, the base station should set the handoff message sequence number to the value of the LAST_HDM_SEQ field of the Handoff Completion Message or Extended Handoff Completion Message and should use the pilot order contained in the Handoff Completion Message or Extended Handoff Completion Message to interpret the contents of subsequent Power Measurement Report Messages.

The base station shall set the contents of a General Handoff Direction Message according to the following rules:

• A General Handoff Direction Message shall list no more than $N_{6m}$ pilots in the new Active Set.

• The base station may include a Service Configuration Information Record in the General Handoff Direction Message to accept a service configuration proposed in a Service Request Message or Service Response Message, and instruct the mobile station to begin using the service configuration.

• A General Handoff Direction Message shall identify the identical power control subchannels (i.e., those carrying identical power control bits).

• A General Handoff Direction Message shall identify the transmit power level of the power control subchannels to the transmit power level of 20 ms frames at a 9600 bps or 14400 bps rate on their respective associated channels (Forward Fundamental Channel or Forward Dedicated Control Channel).

• For CDMA-to-CDMA handoffs, the base station may specify Power Control Subchannel Gain action time [PC_ACTION_TIME]. If PC_ACTION_TIME is included in this message, the base station shall apply the new FPC_SUBCHAN_GAIN at the time specified by PC_ACTION_TIME. If the PC_ACTION_TIME is not included in this message but the explicit action time is included, the base station shall apply the new FPC_SUBCHAN_GAIN at the action time of the General Handoff Direction Message. If the implicit action time is used, the base station should gradually apply any change in FPC_SUBCHAN_GAIN.
• A General Handoff Direction Message may change the code channel associated with an Active Set pilot that remains in the new Active Set.

• The base station specifies the long code mask to be used on the new Forward Traffic Channel by using the PRIVATE_LCM field of the General Handoff Direction Message. The base station may change the long code mask to be used on the new Forward Traffic Channel via the PRIVATE_LCM field of the General Handoff Direction Message only for CDMA-to-CDMA hard handoffs. If a change of long code mask is specified and the base station does not specify an explicit action time in the General Handoff Direction Message, the base station shall begin using the new long code mask on the first 80 ms boundary (relative to System Time) occurring at least 80 ms after the end of the frame containing the last bit of the message.

• For CDMA-to-CDMA handoffs, the base station may require the mobile station to perform a reset of the acknowledgment procedures by using the RESET_L2 field of the General Handoff Direction Message. If the base station requires the mobile station to reset the acknowledgment procedures, Layer 3 shall send an indication to Layer 2 to reset the acknowledgment procedures (see [4]). The acknowledgment procedures of the base station that the mobile station is to handoff to shall be reset immediately after the action time of the General Handoff Direction Message.

• For CDMA-to-CDMA hard handoffs, the base station may alter the frame offset by setting the FRAME_OFFSET field to a new value. If the base station specifies a new frame offset and does not specify an explicit action time, the base station shall change its Forward and Reverse Traffic Channel frame offsets at the second 80 ms boundary (relative to System Time) after the end of transmission of the General Handoff Direction Message, unless the end of transmission of the message coincides with an 80 ms boundary, in which case the change in frame offsets shall occur 80 ms after the end of transmission.

• For CDMA-to-CDMA hard handoffs to Band Class 0 or Band Class 3, the base station may alter the nominal transmit power offset after handoff by setting the NOM_PWR field to the new nominal transmit power offset. For CDMA-to-CDMA hard handoffs to band classes other than Band Class 0 and Band Class 3, the base station may alter the nominal transmit power offset after handoff by setting both the NOM_PWR and NOM_PWR_EXT fields to the new nominal transmit power offset.

• The base station may specify a different band class by setting the BAND_CLASS and CDMA_FREQ fields to the band class and CDMA frequency assignment respectively. The base station shall not specify a band class not supported by the mobile station.

• If the base station sends the General Handoff Direction Message in assured mode, the base station should set the action time of the message such that there is sufficient time for the mobile station to transmit a message containing the acknowledgment prior to the action time.
• For CDMA-to-CDMA hard handoffs, the base station may specify whether the mobile station is to use service negotiation or service option negotiation by setting the SERV_NEG_TYPE field of the *General Handoff Direction Message*. If the base station specifies that the mobile station is to use service negotiation, the base station shall set the SERV_NEG variable (see 3.6.4.1.2.1.4) to enabled at the action time of message. If the base station specifies that the mobile station is to use service option negotiation, the base station shall set SERV_NEG to disabled at the action time of the message.

• The base station may specify whether the mobile station is to restore its configuration to what it was before the handoff attempt, if it fails in the handoff attempt using criteria specified in the *Candidate Frequency Search Request Message*, by using the RETURN_IF_HANDOFF_FAIL field of the *General Handoff Direction Message*. The base station may specify whether the mobile station is to periodically search a CDMA Candidate Frequency for useable pilots, using criteria specified in the *Candidate Frequency Search Request Message*, by using the PERIODIC_SEARCH field of the *General Handoff Direction Message*.

• The base station may include Forward Supplemental Code Channel assignment information in the *General Handoff Direction Message* if the Forward Multiplex Option for the currently connected service option is 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, or 16. If Forward Supplemental Code Channel assignment information is included, the base station shall include FOR_INCLUDED, set FOR_INCLUDED to ‘1’, and include the appropriate Forward Supplemental Code Channel assignment information.

• The number of Forward Supplemental Code Channels assigned by the *General Handoff Direction Message* shall not exceed the maximum number of Forward Supplemental Code Channels for the negotiated Forward Multiplex Option.

• The base station shall set FOR_SUP_CONFIG to ‘00’ if the mobile station is to stop processing the Forward Supplemental Code Channel after the action time of *General Handoff Direction Message*. The base station should not transmit to the mobile station on the Forward Supplemental Code Channels after the message takes effect.

• The base station shall set FOR_SUP_CONFIG to ‘01’ if the mobile station is to start processing the Forward Supplemental Code Channels in the Code Channel List at the action time of the message.

• The base station shall set FOR_SUP_CONFIG to ‘10’ if the Forward Supplemental Code Channels associated with the pilots in the Active set are specified in the *General Handoff Direction Message* and the mobile station is to stop processing Forward Supplemental Code Channels at the implicit action time of the message. The base station should not transmit to the mobile station on the Forward Supplemental Code Channels after the message takes effect.

• The base station shall set FOR_SUP_CONFIG to ‘11’ if the Forward Supplemental Code Channels associated with the pilots in the Active set are specified in the *General Handoff Direction Message* and the mobile station is to start processing the Forward Supplemental Code Channels at the action time of the message.
• The base station shall set FOR_DURATION to the time interval after the action time of the message, in units of 80 ms, during which the mobile station is to process the specified Forward Supplemental Code Channels. The base station may set USE_FOR_DURATION to ‘0’ to indicate an infinite duration for the allocation of Forward Supplemental Code Channels. The base station should not transmit to the mobile station on the Forward Supplemental Code Channels outside the time interval specified by FOR_DURATION.

• If FOR_INCLUDED is included in the message, the base station shall include EXPL_CODE_CHAN for each pilot included in the message. If EXPL_CODE_CHAN is included and set to ‘1’ for a pilot, the code channels associated with the pilot in the General Handoff Direction Message shall be ordered such that the first code channel occurrence is associated with the Forward Fundamental Channel and the successive occurrences are associated with Forward Supplemental Code Channels. If EXPL_CODE_CHAN is included and is set to ‘0’, for each pilot in the new Active Set, the base station shall include BASE_CODE_CHAN and set it to the base code channel index in the range of 1 to (63 - NUM_FOR_SUP + 1), inclusive, that the mobile station is to use as the first Forward Supplemental Code Channel associated with this pilot. The mobile station is to use NUM_FOR_SUP adjacent code channels beginning with index BASE_CODE_CHAN (i.e., BASE_CODE_CHAN through BASE_CODE_CHAN + NUM_FOR_SUP - 1) for the Forward Supplemental Code Channels associated with this pilot.

• The base station may include Reverse Supplemental Code Channel assignment information in the General Handoff Direction Message if the Reverse Multiplex Option is 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, or 16. If Reverse Supplemental Code Channel assignment information is included, the base station shall include REV_INCLUDED, set REV_INCLUDED to ‘1’, and include the appropriate Reverse Supplemental Code Channel assignment information in the additional fields.

• If Reverse Supplemental Code Channel assignment information is included, the base station shall set NUM_REV_CODES to the number of Reverse Supplemental Code Channels to be used by the mobile station. The base station shall not set NUM_REV_CODES to be greater than the number of codes supported by the currently negotiated multiplex option.

• The base station may set USE_T_ADD_ABORT, the Reverse Supplemental Code Channel assignment T_ADD abort indicator, to ‘1’ to indicate that the mobile station is to abort Reverse Supplemental Code Channel assignments implicitly when a T_ADD trigger occurs. Otherwise, the base station shall set USE_T_ADD_ABORT to ‘0’. If NUM_REV_CODES is set to ‘000’, the base station shall set USE_T_ADD_ABORT to ‘0’.
• The base station shall set REV_DTX_DURATION to the maximum duration of time in units of 20 ms that the mobile station is allowed to stop transmission on a Reverse Supplemental Code Channel before resuming transmission on the Reverse Supplemental Code Channel. The base station shall set this field to ‘0000’ if the mobile station is to stop using a Reverse Supplemental Code Channel once it has stopped transmitting on that Reverse Supplemental Code Channel. The base station shall set this field to ‘1111’ if the mobile station is allowed to resume transmission on a Reverse Supplemental Code Channel at any time within the reverse assignment duration.

• The base station may set CLEAR_RETRY_DELAY to ‘1’ to indicate that the mobile station is to cancel any previously stored retry delay. Otherwise, the base station shall set CLEAR_RETRY_DELAY to ‘0’ to indicate that the mobile station is to continue to honor any previously stored retry delay (see 2.6.6.2.5.1).

• The base station may indicate a duration for the Reverse Supplemental Code Channel assignment (in 80 ms superframes) by setting USE_REV_DURATION to ‘1’ and indicating the desired duration in the REV_DURATION field. If USE_REV_DURATION is set to ‘0’, a duration of infinity is indicated, and the base station shall set the REV_DURATION to ‘00000000’. If NUM_REV_CODES is ‘000’, then the base station shall set USE_REV_DURATION to ‘0’ and shall set REV_DURATION to ‘00000000’.

• The base station may set USE_REV_DURATION to ‘1’ and REV_DURATION to the time interval after the action time of the message, in units of 80 ms, during which the mobile station may transmit on the assigned Reverse Supplemental Code Channels. The base station may set USE_REV_DURATION to ‘0’ to indicate an infinite duration for the allocation of Forward Supplemental Code Channels.

• The base station may specify a closed loop power control step size by setting USE_PWR_CNTL_STEP to ‘1’ and indicating the desired power control step size in the PWR_CNTL_STEP field (see 2.1.2.3.2). Otherwise, the base station shall set USE_PWR_CNTL_STEP to ‘0’. The base station shall not specify a power control step size not supported by the mobile station.

3.6.6.2.2.11 Processing the Universal Handoff Direction Message

The base station shall maintain a handoff message sequence number. The sequence number shall be initialized to zero prior to the transmission of the first Extended Handoff Direction Message (see 3.6.6.2.2.2), General Handoff Direction Message (see 3.6.6.2.2.10), or Universal Handoff Direction Message to the mobile station. The base station shall increment the sequence number modulo 4 each time the base station modifies the pilot list (including the order in which pilots are specified within the list) or the code channels (including a change in the ordering such that the first code channel occurrence for any pilot is changed) sent to the mobile station in an Extended Handoff Direction Message, a General Handoff Direction Message, or an Universal Direction Message.

Following a hard handoff, the base station should set the handoff message sequence number to the value of the LAST_HDM_SEQ field of the Handoff Completion Message or

3-87
Extended Handoff Completion Message and should use the pilot order contained in the Handoff Completion Message or Extended Handoff Completion Message to interpret the contents of subsequent Power Measurement Report Messages.

The base station shall set the contents of a Universal Handoff Direction Message according to the following rules:

- A Universal Handoff Direction Message shall list no more than $N_{6m}$ pilots in the new Active Set.
- The base station may include a Service Configuration Information Record in the Universal Handoff Direction Message to accept a service configuration proposed in a Service Request Message or Service Response Message, and instruct the mobile station to begin using the service configuration.
- A Universal Handoff Direction Message shall identify the identical power control subchannels (i.e., those carrying identical power control bits).
- A Universal Handoff Direction Message shall identify the transmit power level of the power control subchannels to the transmit power level of 20 ms frames at a 9600 bps or 14400 bps rate on their respective associated channels (Forward Fundamental Channel or Forward Dedicated Control Channel).
- For CDMA-to-CDMA handoffs, the base station may specify Power Control Subchannel Gain action time (PC_ACTION_TIME). If PC_ACTION_TIME is included in this message, the base station shall apply the new FPC_SUBCHAN_GAIN at the time specified by PC_ACTION_TIME. If the PC_ACTION_TIME is not included in this message but the explicit action time is included, the base station shall apply the new FPC_SUBCHAN_GAIN at the action time of the Universal Handoff Direction Message. If the implicit action time is used, the base station should gradually apply any change in FPC_SUBCHAN_GAIN.
- A Universal Handoff Direction Message may change the code channel associated with an Active Set pilot that remains in the new Active Set.
- A Universal Handoff Direction Message may delete the code channel associated with an Active Set pilot that remains in the new Active Set.
- A Universal Handoff Direction Message may add the code channel associated with an Active Set pilot that remains in the new Active Set.
- The base station specifies the long code mask to be used on the new Forward Traffic Channel by using the PRIVATE_LCM and PLCM_TYPE fields of the Universal Handoff Direction Message. The base station may change the contents of the PRIVATE_LCM this field only for CDMA-to-CDMA hard handoffs. If a change of long code mask is specified and the base station does not specify an explicit action time in the Universal Handoff Direction Message, the base station shall begin using the new long code mask on the first 80 ms boundary (relative to System Time) occurring at least 80 ms after the end of the frame containing the last bit of the message.
• For CDMA-to-CDMA handoffs, the base station may require the mobile station to perform a reset of the acknowledgment procedures by using the RESET_L2 field of the *Universal Handoff Direction Message*. If the base station requires the mobile station to reset the acknowledgment procedures, Layer 3 shall send an indication to Layer 2 to reset the acknowledgment procedures (see [4]). The acknowledgment procedures of the base station that the mobile station is to handoff to shall be reset immediately after the action time of the *General Handoff Direction Message*.

• For CDMA-to-CDMA hard handoffs, the base station may alter the frame offset by setting the FRAME_OFFSET field to a new value. If the base station specifies a new frame offset and does not specify an explicit action time, the base station shall change its Forward and Reverse Traffic Channel frame offsets at the second 80 ms boundary (relative to System Time) after the end of transmission of the *Universal Handoff Direction Message*, unless the end of transmission of the message coincides with an 80 ms boundary, in which case the change in frame offsets shall occur 80 ms after the end of transmission.

• For CDMA-to-CDMA hard handoffs to Band Class 0 or Band Class 3, the base station may alter the nominal transmit power offset after handoff by setting the NOM_PWR field to the new nominal transmit power offset. For CDMA-to-CDMA hard handoffs to band classes other than Band Class 0 and Band Class 3, the base station may alter the nominal transmit power offset after handoff by setting both the NOM_PWR and NOM_PWR_EXT fields to the new nominal transmit power offset.

• The base station may specify a different band class by setting the BAND_CLASS and CDMA_FREQ fields to the band class and CDMA frequency assignment respectively. The base station shall not specify a band class not supported by the mobile station.

• If the base station sends the *Universal Handoff Direction Message* in assured mode, the base station should set the action time of the message such that there is sufficient time for the mobile station to transmit a message containing the acknowledgment prior to the action time.

• For CDMA-to-CDMA handoffs, the base station may specify whether the mobile station is to use service negotiation or service option negotiation by setting the SERV_NEG_TYPE field of the *Universal Handoff Direction Message*. If the base station specifies that the mobile station is to use service negotiation, the base station shall set the SERV_NEG variable (see 3.6.4.1.2.1.4) to enabled at the action time of message. If the base station specifies that the mobile station is to use service option negotiation, the base station shall set SERV_NEG to disabled at the action time of the message.
• The base station may specify whether the mobile station is to restore its configuration to what it was before the handoff attempt, if it fails in the handoff attempt using criteria specified in the Candidate Frequency Search Request Message, by using the RETURN_IF_HANDOFF_FAIL field of the Universal Handoff Direction Message. The base station may specify whether the mobile station is to periodically search a CDMA Candidate Frequency for useable pilots, using criteria specified in the Candidate Frequency Search Request Message, by using the PERIODIC_SEARCH field of the Universal Handoff Direction Message.

• The base station specifies Active Set for the Fundamental Channel only, the Dedicated Control Channel only, or both. The Active Set of the Dedicated Control Channel shall be the same as the Active Set of the Fundamental Channel when both the Fundamental Channel and Dedicated Control Channel are assigned.

• The base station may specify the Active Set of the Supplemental Channels. The Active Set of the Supplemental Channels shall be a subset of the Active Set of the Fundamental Channel or the Dedicated Control Channel.

• If a Reverse Packet Data Channel assignment is not included, a Universal Handoff Direction Message may specify a Reverse Supplemental Channel assignment. If Reverse Supplemental Channel assignment information is included, this message contains information that specifies the start time, duration, and the data transfer rate associated with this Reverse Supplemental Channel assignment.

• If a Reverse Packet Data Channel assignment is included, a Universal Handoff Direction Message shall not specify a Reverse Supplemental Channel assignment.

• A Universal Handoff Direction Message may specify a Forward Supplemental Channel assignment. If Forward Supplemental Channel assignment information is included, this message contains the start time, duration, and SCCL_INDEX associated with this Forward Supplemental Channel assignment.

• A Universal Handoff Direction Message may update the mapping between a particular SCCL_INDEX and a set of fields that specifies the data transfer rate, QOF index, Forward Supplemental Channel Walsh code for each PILOT_PN, and the active set for the Forward Supplemental Channel associated with FOR_SCH_ID.

• A Universal Handoff Direction Message may update REV_WALSH_ID field which specifies the Reverse Supplemental Walsh cover.

• The base station may set CLEAR_RETRY_DELAY to ‘1’ to indicate that the mobile station is to cancel any previously stored retry delay. Otherwise, the base station shall set CLEAR_RETRY_DELAY to ‘0’ to indicate that the mobile station is to continue to honor any previously stored retry delay (see 2.6.6.2.5.1).

3.6.6.2.2.12 Processing of Extended Supplemental Channel Assignment Message

If the Reverse Packet Data Channel is not assigned, the base station may use this message to carry Forward Supplemental Channel assignment information or Reverse Supplemental Channel assignment information.

If the Reverse Packet Data Channel is assigned, the base station may use this message to
carry Forward Supplemental Channel assignment information, and the base station shall
not use this message to carry Reverse Supplemental Channel assignment information.

If Forward Supplemental Channel assignment information is included, this message
contains the start time, duration, and SCCL_INDEX associated with this Forward
Supplemental Channel assignment. If Reverse Supplemental Channel assignment
information is included, this message contains information that specifies the start time,
duration, and the number of information bits per frame (or set of number of bits per frame
if RSCH_VAR_TABLE_IDs[REV_SCH_ID] is not equal to '000') associated with this Reverse
Supplemental Channel assignment.

This message may specify the mapping between a particular SCCL_INDEX and a set of
fields that specifies the number of information bits per frame (or set of number of bits per frame
if FSCH_VAR_TABLE_IDs[FOR_SCH_ID] is not equal to '000'), QOF index, Forward
Supplemental Channel Walsh code for each PILOT_PN, and the active set for the Forward
Supplemental Channel associated with FOR_SCH_ID.

This message may also include REV_WALSH_ID field which specifies the Reverse
Supplemental Walsh cover.

This message also includes START_TIME_UNIT for this message, Forward Supplemental
Channel Assignment Mini Messages, or Reverse Supplemental Channel Assignment Mini
Messages, or Universal Handoff Direction Message.

The base station shall set the contents of an Extended Supplemental Channel Assignment
Message according to the following rules:

- An Extended Supplemental Channel Assignment Message may specify a Reverse
Supplemental Channel assignment. The base station shall set NUM_REV_SCH to
the number of Reverse Supplemental Channels to be assigned. If the Reverse Packet
Data Channel is assigned, the base station shall set NUM REV_SCH to 0.

- An Extended Supplemental Channel Assignment Message may specify a Forward
Supplemental Channel assignment. The base station shall set NUM_FOR_SCH to
the number of Forward Supplemental Channels to be assigned.

- The base station shall set the START_TIME_UNIT field to indicate the unit of the
FOR_SCH_START_TIME included in this message, and the Forward Supplemental
Channel Assignment Mini Messages and the Universal Handoff Direction Message
and REV_SCH_START_TIME included in this message, and the Reverse
Supplemental Channel Assignment Mini Messages and the Universal Handoff
Direction Message. The base station shall set this field to one less than the number
of 20 ms intervals that is to be used by the mobile station for calculating the start
time included in Forward Supplemental Channel assignments or Reverse
Supplemental Channel assignments.

- An Extended Supplemental Channel Assignment Message may specify Forward
Supplemental Channel configuration information. The base station shall set
NUM_FOR_SCH_CFG to the number of Forward Supplemental Channel to be
configured.
• The base station shall set the NUM_REC field to the number of instances of the
following record minus one included in this message. The base station shall set the
fields within each record as follows:
  – The base station shall set the SCCL_INDEX field to the index of the
    Supplemental Channel Code Information Record in the Supplemental Channel
    Code List Table.
  – The base station shall set the FOR_SCH_NUM_BITS_IDX field to the Forward
    Supplemental Channel number of information bits index associated with
    SCCL_INDEX.
  – The base station shall set the NUM_SUP_SHO field to the number of Forward
    Supplemental Channels minus one, corresponding to the FOR_SCH_ID and the
    SCCL_INDEX, for which the frames are to be soft-combined by the mobile
    station. The base station shall set the fields within each record as follows:
    + The base station shall set the PILOT_PN field to the pilot PN sequence offset
      for this pilot in units of 64 PN chips.
    + The base station shall set the QOF_MASK_ID_SCH field to the ID of the
      Quasi Orthogonal Function mask ID corresponding to the Forward
      Supplemental Channel Code index.
    + The base station shall set the CODE_CHAN_SCH field to the code channel
      on the Supplemental Channel corresponding to the PILOT_PN.
• REV_SCH_DTX_DURATI0N: The base station shall set REV_SCH_DTX_DURATION
  to the maximum duration of time in units of 20 ms that the mobile station is
  allowed to stop transmission on a Reverse Supplemental Channel before resuming
  transmission on the Reverse Supplemental Channel within the reverse assignment
duration. The base station shall set this field to ‘0000’ if the mobile station is to
  stop using a Reverse Supplemental Channel once it has stopped transmitting on
  that Reverse Supplemental Channel. The base station shall set this field to ‘1111’ if
  the mobile station is allowed to resume transmission on a Reverse Supplemental
  Channel at any time within the reverse assignment duration.
• The base station may set USE_T_ADD_ABORT, the Reverse Supplemental Channel
  assignment T_ADD abort indicator, to ‘1’ to indicate that the mobile station is to
  abort Reverse Supplemental Channel assignments when a T_ADD trigger occurs.
  Otherwise, the base station shall set USE_T_ADD_ABORT to ‘0’.
• If the base station is sending this message in response to a Supplemental Channel
  Request Message which includes a Supplemental Channel Request Message
  sequence number and the mobile station is to clear the IGNORE_ESCAM field, the
  base station shall set USE_SCRM_SEQ_NUM to ‘1’ and set SCRM_SEQ_NUM to the
  sequence number corresponding to the SCRM_SEQ_NUM field in a Supplemental
  Channel Request Message to which the mobile station is to match this message.
  Otherwise, the base station shall set USE_SCRM_SEQ_NUM to ‘0’ and omit
  SCRM_SEQ_NUM.
If Forward Supplemental Channel burst assignment is included, the base station may include additional Forward Supplemental Channel configuration information including radio configuration, multiplex option, coding type, frame length, and maximum supplemental channel rate; if so, the base station shall set \( \text{FOR\_SCH\_CC\_INCL} \) to ‘1’.  

If Reverse Supplemental Channel burst assignment is included, the base station may include additional Reverse Supplemental Channel configuration information including radio configuration, multiplex option, coding type, frame length, and maximum supplemental channel rate; if so, the base station shall set \( \text{REV\_SCH\_CC\_INCL} \) to ‘1’.

### 3.6.6.2.2.13 Processing of Forward Supplemental Channel Assignment Mini Message

The base station may use this message to specify Forward Supplemental Channel assignment parameters for the mobile station’s Forward Supplemental Channel. This information includes the \( \text{FOR\_SCH\_ID} \), duration, start time, and the index to the previously specified Forward Supplemental Channel Code List, which determines number of information bits per frame (or set of number of bits per frame if \( \text{FSCH\_VAR\_TABLE\_IDS}[\text{FOR\_SCH\_ID}] \) is not equal to ‘000’), code channel index, and the identifier of the Quasi Orthogonal Function corresponding to the assignment.

The base station shall set the content of a Forward Supplemental Channel Assignment Mini Message according to the following rules:

- The base station shall set the \( \text{FOR\_SCH\_ID} \) to Forward Supplemental Channel identifier of the burst assignment that this message carries.

- The base station shall set the \( \text{FOR\_SCH\_DURATION} \) field to ‘0000’ to indicate that the mobile station should stop processing the Forward Supplemental Channel starting at the explicit start time of the message specified by \( \text{FOR\_SCH\_START\_TIME} \). The base station shall set the \( \text{FOR\_SCH\_DURATION} \) field to ‘1111’ to indicate that the mobile station should process the Forward Supplemental Channel, starting at the explicit start time of the message specified by \( \text{FOR\_SCH\_START\_TIME} \), until a subsequent Forward Supplemental Channel Assignment Mini Message or an Extended Supplemental Channel Assignment Message with the same \( \text{FOR\_SCH\_ID} \) field is received. The base station shall set the \( \text{FOR\_SCH\_DURATION} \) field to the duration in units of 20 ms (see Table 33.7.3.3.2.37-3), starting at the explicit start time of the message specified by \( \text{FOR\_SCH\_START\_TIME} \), during which the mobile station is to process the Forward Supplemental Channel.

- The base station shall set the \( \text{FOR\_SCH\_START\_TIME} \) field to the System Time, in units of time specified by \( \text{START\_TIME\_UNIT} \) (modulo 32) at which the mobile station is to start processing the Forward Supplemental Channel specified in this message. The explicit start time for processing Forward Supplemental Channels is the time for which:

\[
\left\lfloor \frac{t}{(\text{START\_TIME\_UNIT}+1)} \right\rfloor - \text{FOR\_SCH\_START\_TIME} \mod 32 = 0,
\]
where \( t \) is the System Time in units of 20 ms.

- The base station shall set the SCCL_INDEX field to the index of the record in the Forward Supplemental Channel Code list corresponding to the FOR_SCH_ID.

- If the PILOT_GATING_USE_RATE to equal to ‘1’, the base station shall set PILOT_GATING_USE_RATE to ‘0’ and start transmitting the Forward Power Control Subchannel with the maximum rate at the action time of the message.

3.6.6.2.2.14 Processing of Reverse Supplemental Channel Assignment Mini Message

If the Reverse Packet Data Channel is assigned, the base station shall not send this message.

If the Reverse Packet Data Channel is not assigned, the base station may use this message to specify Reverse Supplemental Channel assignment parameters for the mobile station Reverse Supplemental Channel. This information includes the reverse supplemental channel identifier (REV_SCH_ID), the duration of transmission on the Reverse Supplemental Channel, the start time for the burst assignment, and the number of information bits per frame that the mobile station may transmit.

The base station shall set the content of the Reverse Supplemental Channel Assignment Mini Message according to the following rules:

- The base station shall set the REV_SCH_DURATION field to ‘0000’ to indicate that the mobile station should stop transmitting on the Reverse Supplemental Channel specified by REV_SCH_ID at the start time specified by REV_SCH_START_TIME. The base station shall set this field to ‘1111’ to indicate that the mobile station may transmit on the Reverse Supplemental Channel specified by REV_SCH_ID, starting at the start time specified by REV_SCH_START_TIME. The base station shall set the REV_SCH_DURATION field to the allocated duration (see Table 3.7.3.3.2.37-3), starting at the start time specified by REV_SCH_START_TIME, during which the mobile station may transmit on the Reverse Supplemental Channel specified by REV_SCH_ID.

- The base station shall set the REV_SCH_START_TIME field to the System Time, in units of time specified by START_TIME_UNIT, (modulo 32) at which the mobile station may start transmitting on the Reverse Supplemental Channel specified in this message. The explicit start time for transmitting on the Reverse Supplemental Channel is the time for which:

\[
\lfloor t/(\text{START\_TIME\_UNIT}+1) \rfloor - \text{REV\_SCH\_START\_TIME} \mod 32 = 0,
\]

where \( t \) is the System Time in units of 20 ms.

- The base station shall set the REV_SCH_BITS_IDX (see Table 3.7.3.3.2.37-2) to indicate the Reverse Supplemental Channel number of information bits per frame index.
• If the PILOT_GATING_USE_RATE to equal to ‘1’, the base station shall set
  PILOT_GATING_USE_RATE to ‘0’ and start transmitting the Forward Power Control
  Subchannel with the maximum rate at the action time of the message.

3.6.6.2.15 Processing of the Mobile Assisted Burst Operation Parameters Message

The base station may use this message to specify the operating parameters in the mobile
station for Mobile Assisted Burst Operation procedures.

• A Mobile Assisted Burst Operation Parameters Message may specify pilot strength
  order change reporting information. If order change reporting information is
  included, the base station shall set ORDER_FLAG to ‘1’ and include the appropriate
  order change reporting fields. Otherwise, the base station shall set ORDER_FLAG
to ‘0’. If ORDER_FLAG is set to ‘1’, the base station shall perform the following
  procedures:

  – The base station shall set PS_MIN_DELTA to one less than the minimum pilot
    strength measurement difference between any two pilots in the Active Set (in
    units of 0.5 dB) that must be measured in order for the mobile station to send a
    Pilot Strength Measurement Mini Message.

  – The base station shall set ORDER_INTERVAL to the minimum interval (in 20 ms
    units) during which the indicated pilot strength measurement difference (greater
    than or equal to PS_MIN_DELTA + 1, in units of 0.5 dB) must be measured by
    the mobile station in order for the mobile station to send a Pilot Strength
    Measurement Mini Message.

• A Mobile Assisted Burst Operation Parameters Message may specify periodic pilot
  strength reporting. If periodic reporting information is included, the base station
  shall set PERIODIC_FLAG to ‘1’ and include the appropriate periodic reporting
  fields. Otherwise, the base station shall set PERIODIC_FLAG to ‘0’. If
  PERIODIC_FLAG is set to ‘1’, the base station shall perform the following
  procedures:

  – The base station shall set NUM_PILOTS to the number of pilots for which the
    mobile station is to send Pilot Strength Measurement Mini Messages.

  – The base station shall set PERIODIC_INTERVAL to the interval (in 20 ms units)
    between Pilot Strength Measurement Mini Messages.

• A Mobile Assisted Burst Operation Parameters Message may specify threshold based
  pilot strength reporting. If threshold based reporting information is included, the
  base station shall set THRESHOLD_FLAG to ‘1’ and include the appropriate
  threshold based reporting fields. Otherwise, the base station shall set
  THRESHOLD_FLAG to ‘0’. If THRESHOLD_FLAG is set to ‘1’, the base station shall
  perform the following procedures:

  – The base station shall set PS_FLOOR_HIGH to the high water mark for lower
    limit threshold for which the mobile station is to send Pilot Strength
    Measurement Mini Messages.
– The base station shall set PS_FLOOR_LOW to the low water mark for lower limit threshold for which the mobile station is to send *Pilot Strength Measurement Mini Messages*.

– The base station shall set PS_CEILING_HIGH to the high water mark for upper limit threshold for which the mobile station is to send *Pilot Strength Measurement Mini Messages*.

– The base station shall set PS_CEILING_LOW to the low water mark for upper limit threshold for which the mobile station is to send *Pilot Strength Measurement Mini Messages*.

– The base station shall set THRESHOLD_INTERVAL to the interval (in 20 ms units) between *Pilot Strength Measurement Mini Messages*.

### 3.6.6.2.3 Active Set Maintenance

The base station shall maintain an Active Set for each mobile station under its control as follows:

- When the base station sends the *Channel Assignment Message*, it shall initialize the Active Set to contain only the pilot associated with the assigned Forward Traffic Channel.

- When the base station sends the *Extended Channel Assignment Message*, it shall initialize the Active Set to contain all pilots included in the message.

- When the base station sends an *Extended Handoff Direction Message*, *General Handoff Direction Message*, or *Universal Handoff Direction Message*, it shall add to the Active Set, before the action time of the message, all pilots included in the message, if they are not already in the Active Set.

- The base station shall delete the pilots that were not included in the most recent *Extended Handoff Direction Message*, *General Handoff Direction Message*, or *Universal Handoff Direction Message*, from the Active Set upon receipt of the *Handoff Completion Message* or *Extended Handoff Completion Message*.

### 3.6.6.2.4 Soft Handoff

The base station should use soft handoff when directing a mobile station from one Forward Traffic Channel to another Forward Traffic Channel having the same frequency assignment.

#### 3.6.6.2.4.1 Receiving During Soft Handoff

Each base station in the Active Set shall demodulate the Reverse Traffic Channel. The base station should provide diversity combining of the demodulated signals obtained by each base station in the Active Set.

#### 3.6.6.2.4.2 Transmitting During Soft Handoff

The base station shall begin transmitting identical modulation symbols on all Forward Traffic Channels specified in an *Extended Handoff Direction Message* or *General Handoff Direction Message*.
Direction Message, or Universal Handoff Direction Message (with the possible exception of the power control subchannel) by the action time of the message.

The base station shall transmit identical power control bits on all identical power control subchannels that were identified as such in the last Extended Handoff Direction Message, or General Handoff Direction Message, or Universal Handoff Direction Message.

The base station shall use the same long code mask on all Forward Traffic Channels whose associated pilots are in the Active Set.

3.6.6.2.4.3 Call Rescue Soft Handoff

The base station shall support the call rescue feature.

The call rescue feature can be enabled or disabled by the base station. If the call rescue feature is enabled and the base station detects that a mobile station having MOB_P_REV greater than seven has disabled its transmitters, then the base station shall initiate call rescue procedures.

A base station that is configured with a Rescue Channel shall allocate a Walsh Code for the Rescue Channel. If the base station is designated as a rescue cell candidate, then the base station shall monitor the Reverse Traffic Channel in order to acquire a mobile station attempting call rescue soft handoff. If the base station acquires the mobile station, then it should begin immediately transmitting to the mobile station using the Rescue Channel Walsh Code.

3.6.6.2.5 CDMA-to-Analog Hard Handoff

The base station may direct the mobile station to perform a handoff from the CDMA system to an analog system in a band class that the mobile station supports by sending an Analog Handoff Direction Message.

3.6.7 CDMA Tiered Services

3.6.7.1 Overview

3.6.7.1.1 Definition

The base station may support Tiered Services to provide individual users or groups of users with custom services and special features based upon their location. The base station may also support Tiered Services to provide private network support. Important to the operation of CDMA Tiered Services is the concept of User Zones. It is via User Zones by which the base station offers custom services based upon the mobile station location.

User Zones are associated with a set of features and services, plus a geographic area in which the User Zone features/services are made available to the customers that have subscribed to that User Zone. The boundary of the User Zone Geographic area may be established based on the coverage area of a public or private base station, or it may be established independent of RF topology.

User Zones may be supported by the public system on the same frequency as the serving base station, or they may be supported on a private system operating on a different
3.6.7.2 Types of User Zones

User Zones may be of two basic types:

• **Broadcast User Zones**: Broadcast User Zones are identified to the mobile station using the Paging Channel or the Primary Broadcast Control Channel. In this case, the base station broadcasts messages on the Paging Channel or the Primary Broadcast Control Channel identifying the User Zones that fall within the coverage area of the particular cell/sector. A mobile station, as part of its monitoring of the Paging Channel or the Primary Broadcast Control Channel, will identify the presence of a particular User Zone.

• **Mobile Specific User Zones**: Mobile Specific User Zones are not broadcast by the base station. A mobile station may use other overhead message parameters and compare them with internally stored User Zone parameters to identify the presence of a particular User Zone. These parameters may include: SID, NID, BASE_ID, BASE_LAT, and BASE_LONG.

3.6.7.2 Requirements

If the base station supports CDMA Tiered Services, the base station sends the following messages to assist the mobile station in identifying the presence of User Zones and to validate the User Zone requested by a mobile station:

• **User Zone Identification Message**

• **Private Neighbor List Message**

• **User Zone Reject Message**

• **User Zone Update Message**

3.6.7.2.1 User Zone Identification Message

The base station identifies Broadcast User Zones supported by the base station by sending the **User Zone Identification Message** on the Paging Channel or the Primary Broadcast Control Channel. The base station should list the UZID of each Broadcast User Zone supported by the base station.

3.6.7.2.2 Private Neighbor List Message

The base station sends a Private Neighbor List and identifies the User Zones supported by its private neighbor base stations by sending the **Private Neighbor List Message** on the Paging Channel or the Primary Broadcast Control Channel. The **Private Neighbor List Message** shall list no more than Nₜₘ private neighbors.

3.6.7.2.3 User Zone Update Message and User Zone Reject Message on f-dsch

For a mobile station operating in the **Traffic Channel Substate** or **Release Substate** of the **Mobile Station Control on the Traffic Channel State**, the base station may update the User
Zone associated with the mobile station by sending a User Zone Update Message. The base station may also send a User Zone Reject Message to reject the User Zone requested by the mobile station in the Origination Message, Page Response Message, or User Zone Update Request Message. The base station may include the ASSIGN_UZID field in the User Zone Reject Message to assign a User Zone to the mobile station to replace the rejected User Zone.

3.6.7.2.4 User Zone Reject Message on f-csch
The base station may send the User Zone Reject Message on the Paging Channel or the Forward Common Control Channel to reject the User Zone requested by the mobile station in the Registration Message, Origination Message, or Page Response Message. The base station may include the ASSIGN_UZID field in the User Zone Reject Message record to assign a User Zone to the mobile station to replace the rejected User Zone.

3.6.8 Call Control Processing
The Call Control consists of the following states:

- Waiting for Order Substate - In this substate, the Call Control instance sends the Alert With Information Message or the Extended Alert With Information Message to the mobile station.

- Waiting for Answer Substate - In this substate, the Call Control instance waits for the Connect Order from the mobile station.

- Conversation Substate - In this substate, the parties involved in this call exchanges Traffic Channel frames in accordance with the current service configuration.

- Call Release Substate - In this substate, the Call Control instance waits for the call to be disconnected.

The following messages are processed by the Call Control:

- Alert With Information Message
- Extended Alert with Information Message
- Flash With Information Message
- Extended Flash With Information Message
- Send Burst DTMF Message
- Origination Continuation Message

The following orders are processed by the Call Control:

- Continuous DTMF Tone Order
Upon instantiation, the Call Control instance shall perform the following:

- If the call is a mobile station terminated call and the base station set BYPASS_ALERT_ANSWER to ‘1’, the Call Control instance shall enter the Conversation Substate (see 3.6.8.2). If the call is a mobile station terminated call and the base station set BYPASS_ALERT_ANSWER to ‘0’, the Call Control instance shall enter the Waiting for Order Substate (see 3.6.8.1.1).

- If the call is a mobile-station-originated call, the Call Control instance shall enter the Conversation Substate (see 3.6.8.2).

3.6.8.1 Alerting

3.6.8.1.1 Waiting for Order Substate

In this substate, the Call Control instance sends an Alert With Information Message or an Extended Alert With Information Message to the mobile station.

While in the Waiting for Order Substate, the Call Control instance shall perform the following:

- If the Call Control instance receives a “release indication” from the Layer 3, the Call Control instance shall enter the Call Release Substate.

- If the Call Control instance receives a “send alert with info message indication” from the Layer 3, the Call Control instance shall send an Alert with Information Message or an Extended Alert With Information Message to the mobile station within T2b seconds, and enter the Waiting for Answer Substate.

- The Call Control instance may send the following messages:

  1. Alert With Information Message: The Call Control instance shall enter the Waiting for Answer Substate.

  2. Extended Alert With Information Message: The Call Control instance shall enter the Waiting for Answer Substate.

  3. Maintenance Order: The Call Control instance shall enter the Waiting for Answer Substate.

3.6.8.1.2 Waiting for Answer Substate

In this substate, the Call Control instance waits for a Connect Order from the mobile station.

While in the Waiting for Answer Substate, the Call Control instance shall perform the
If the Call Control instance receives a “release indication” from the Layer 3, the Call Control instance shall enter the Call Release Substate.

If the Call Control instance receives a “send alert with info message indication” from the Layer 3, the Call Control instance shall send an Alert with Information Message or an Extended Alert with Information Message to the mobile station, within T2b seconds, and enter the Waiting for Answer Substate.

The Call Control instance may send the following messages:

1. Alert With Information Message
2. Extended Alert With Information Message
3. Maintenance Order

If the Call Control instance receives one of the following messages from the Layer 3, the Call Control instance shall process the message according to the specified requirements, if any:

1. Connect Order: The Call Control instance shall enter the Conversation Substate.
2. Flash With Information Message: If the message contains a Keypad Facility record with feature codes indicating User Selective Call Forwarding with a pre-registered number, a stored number, or voice mail, the Call Control instance may send a ‘call release request’ to the Layer 3. If this message contains the Global Emergency Call information record and the call associated with this Call Control instance is a voice call, the base station shall recognize this as an emergency call and should process the message using an implementation-dependent procedure which may include ignoring the dialed digits. If this message contains the Global Emergency Call information record and the call associated with this Call Control instance is not a voice call, the base station may recognize this as an emergency call and should process the message using an implementation-dependent procedure which may include ignoring the dialed digits.
3. Extended Flash With Information Message: If the message contains a Keypad Facility record with feature codes indicating User Selective Call Forwarding with a pre-registered number, a stored number, or voice mail, the Call Control instance may send a ‘call release request’ to the Layer 3. If this message contains the Global Emergency Call information record and the call associated with this Call Control instance is a voice call, the base station shall recognize this as an emergency call and should process the message using an implementation-dependent procedure which may include ignoring the dialed digits. If this message contains the Global Emergency Call information record
and the call associated with this Call Control instance is not a voice call, the base station may recognize this as an emergency call and should process the message using an implementation-dependent procedure which may include ignoring the dialed digits.

4. **Origination Continuation Message**

3.6.8.2 **Conversation Substate**

While in the **Conversation Substate**, the Call Control instance shall perform the following:

- If the Call Control instance receives a “release indication” from the Layer 3, the Call Control instance shall enter the **Call Release Substate**.

- If the Call Control instance receives a “paca reorig indication” from the Layer 3, the Call Control instance should send either an **Alert With Information Message/Extended Alert With Information Message** which contains a signal information record with the SIGNAL_TYPE field set to ‘01’ or ‘10’, or an **Alert With Information Message/Extended Alert With Information Message** which does not contain a signal information record.

- If the Call Control instance receives a “send alert with info message indication” from Layer 3, the Call Control instance shall send an **Alert with Information Message** or an **Extended Alert With Information Message** to the mobile station within T2b seconds, and enter the **Waiting for Answer Substate**.

- The Call Control instance may send the following messages:

  1. **Alert With Information Message**: If the message contains a signal information record with the SIGNAL_TYPE field set to ‘01’ or ‘10’, or if the message does not contain a signal information record, the Call Control instance shall enter the **Waiting for Answer Substate**.

  2. **Extended Alert With Information Message**: If the message contains a signal information record with the SIGNAL_TYPE field set to ‘01’ or ‘10’, or if the message does not contain a signal information record, the Call Control instance shall enter the **Waiting for Answer Substate**.

  3. **Continuous DTMF Tone Order**

  4. **Flash With Information Message**

  5. **Extended Flash With Information Message**

  6. **Maintenance Order**: The Call Control instance shall enter the **Waiting for Answer Substate**.

  7. **Send Burst DTMF Message**
• If the Call Control instance receives one of the following messages from Layer 3, the
Call Control instance shall process the message according to the specified
requirements, if any:

1. **Continuous DTMF Tone Order**

2. **Flash With Information Message**: If this message contains the Global Emergency
Call information record and the call associated with this Call Control instance is
a voice call, the base station shall recognize this as an emergency call and
should process the message using an implementation-dependent procedure
which may include ignoring the dialed digits. If this message contains the Global
Emergency Call information record and the call associated with this Call Control
instance is not a voice call, the base station may recognize this as an emergency
call and should process the message using an implementation-dependent
procedure which may include ignoring the dialed digits.

3. **Extended Flash With Information Message**: If this message contains the Global
Emergency Call information record and the call associated with this Call Control
instance is a voice call, the base station shall recognize this as an emergency
call and should process the message using an implementation-dependent
procedure which may include ignoring the dialed digits. If this message contains
the Global Emergency Call information record and the call associated with this
Call Control instance is not a voice call, the base station may recognize this as
an emergency call and should process the message using an implementation-dependent
procedure which may include ignoring the dialed digits.

4. **Origination Continuation Message**

5. **Send Burst DTMF Message**

3.6.8.3 Call Release Substate

• The Call Control instance may send the following messages:

1. **Alert With Information Message**: If the message contains a signal information
record with the SIGNAL_TYPE field set to ‘01’ or ‘10’, or if the message does not
contain a signal information record, the base station shall enter the Waiting for
Answer Substate.

2. **Extended Alert With Information Message**: If the message contains a signal
information record with the SIGNAL_TYPE field set to ‘01’ or ‘10’, or if the message does not contain a signal information record, the base station shall enter the Waiting for Answer Substate.

3. **Maintenance Order**: The Call Control instance shall enter the Waiting for Answer Substate.
• If the Call Control instance receives one of the following messages from Layer 3, the
  Call Control instance shall process the message according to the specified
  requirements, if any:

  1. *Connect Order*

  2. *Continuous DTMF Tone Order*

  3. *Flash With Information Message:* If this message contains the Global Emergency
    Call information record and the call associated with this Call Control instance is
    a voice call, the base station shall recognize this as an emergency call and
    should process the message using an implementation-dependent procedure
    which may include ignoring the dialed digits. If this message contains the Global
    Emergency Call information record and the call associated with this Call Control
    instance is not a voice call, the base station may recognize this as an emergency
    call and should process the message using an implementation-dependent
    procedure which may include ignoring the dialed digits.

  4. *Extended Flash With Information Message:* If this message contains the Global
    Emergency Call information record and the call associated with this Call Control
    instance is a voice call, the base station shall recognize this as an emergency
    call and should process the message using an implementation-dependent
    procedure which may include ignoring the dialed digits. If this message contains
    the Global Emergency Call information record and the call associated with this
    Call Control instance is not a voice call, the base station may recognize this as
    an emergency call and should process the message using an implementation-
    dependent procedure which may include ignoring the dialed digits.

  5. *Origination Continuation Message*

  6. *Send Burst DTMF Message*

   3.6.9 MEID procedures when communicating with MOB_P_REV 6, 7, 8, 9, 10 Mobile
   Stations

   The base station shall conform to the requirements in [47] when communicating with a
   MOB_P_REV 6, 7, 8, 9, or 10 mobile station equipped with an MEID.
1. No text.
3.7 PDU Formats for Messages

The following sections specify the requirements on the PDU formats transmitted on the f-csch, and the f-dsch.

In any multi-bit field in the following messages, the most significant bit (MSB) shall be transmitted first.

3.7.1 Reserved

3.7.2 f-csch

The f-csch is used to send control information to mobile stations that have not been assigned to a Traffic Channel.

3.7.2.1 Reserved

3.7.2.2 Reserved
3.7.2.3 PDU Formats for Messages on the f-csch

The messages sent on the f-csch are summarized in Table 3.7.2.3-1.

^6 P_REV_IN_USE in this context means P_REV for overhead messages (see 2.6.2.2). P_REV_IN_USE equal to "All" implies all values applicable to the Band Class.

^7 When the Data Burst Message is used as a broadcast message, it can be sent on a Broadcast Control Channel other than the Primary Broadcast Control Channel, or on the Forward Common Control Channel when a secondary Broadcast Control Channel is not allocated, i.e., NUM_BCCH_BCAST_S equals 0 (see 2.6.2.1.1.3).

2

PILOT_PN - Pilot PN sequence offset index.
3
4 The base station shall set this field to the pilot PN sequence offset for this base station, in units of 64 PN chips.
5
6 CONFIG_MSG_SEQ - Configuration message sequence number.
7 The base station shall set this field to CONFIG_SEQ (see 3.6.2.2).
8
9 SID - System identification.
The base station shall set this field to the system identification number for this system (see 2.6.5.2).

NID - Network identification.

This field serves as a sub-identifier of a system as defined by the owner of the SID.

The base station shall set this field to the network identification number for this network (see 2.6.5.2).

REG_ZONE - Registration zone.

The base station shall set this field to its registration zone number (see 2.6.5.1.5).

TOTAL_ZONES - Number of registration zones to be retained.

The base station shall set this field to the number of registration zones the mobile station is to retain for purposes of zone-based registration (see 2.6.5.1.5).

If zone-based registration is to be disabled, the base station shall set this field to ‘000’.

ZONE_TIMER - Zone timer length.

The base station shall set this field to the ZONE_TIMER value shown in Table 3.7.2.3.2.1-1 corresponding to the length of the zone registration timer to be used by mobile stations.

MULT_SIDS - Multiple SID storage indicator.

If mobile stations may store entries of SID_NID_LIST containing different SIDs, the base station shall set this field to ‘1’; otherwise the base station shall set this field to ‘0’.

<table>

Table 3.7.2.3.2.1-1. Value of Zone Timer
MULT_NIDS - Multiple NID storage indicator.
If mobile stations may store multiple entries of SID_NID_LIST having the same SID (with different NIDs), the base station shall set this field to ‘1’; otherwise the base station shall set this field to ‘0’.

BASE_ID - Base station identification.
The base station shall set this field to its identification number.

BASE_CLASS - Base station class.
The base station shall set this field as follows:
For Band Class 1 and 4, the base station shall set this field to ‘0001’; otherwise, the base station shall set this field to ‘0000’.

PAGE_CHAN - Number of Paging Channels.
The base station shall set this field to the number of Paging Channels on this CDMA Channel. The base station shall not set this field to ‘000’.

MAX_SLOT_CYCLE_INDEX - Maximum slot cycle index.
The base station shall set this field to the SLOT_CYCLE_INDEX value corresponding to the maximum slot cycle length permitted (see 2.6.2.1.1).

HOME_REG - Home registration indicator.
If mobile stations that are not roaming (see 2.6.5.3) and have MOB_TERM_HOME equal to ‘1’ are to be enabled for autonomous registrations, the base station shall set this field to ‘1’. If such mobile stations are not to be enabled for autonomous registration, the base station shall set this field to ‘0’.

FOR_SID_REG - SID roamer registration indicator.
If mobile stations that are foreign SID roamers (see 2.6.5.3) and have MOB_TERM_FOR_SID equal to ‘1’ are to be enabled for autonomous registration, the base station shall set this field to ‘1’. If such mobile stations are not to be enabled for autonomous registration, the base station shall set this field to ‘0’.

FOR_NID_REG - NID roamer registration indicator.
If mobile stations that are foreign NID roamers (see 2.6.5.3) and have MOB_TERM_FOR_NID equal to ‘1’ are to be enabled for autonomous registration, the base station shall set this field to ‘1’. If such mobile stations are not to be enabled for autonomous registration, the base station shall set this field to ‘0’.

POWER_UP_REG - Power-up registration indicator.
If mobile stations enabled for autonomous registration are to register immediately after powering on and receiving the system overhead messages, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**POWER_DOWN_REG** - Power-down registration indicator.

If mobile stations enabled for autonomous registration are to register immediately before powering down, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**PARAMETER_REG** - Parameter-change registration indicator.

If mobile stations are to register on parameter change events as specified in 2.6.5.1.6, the base station shall set this field to ‘1’. If not, the base station shall set this field to ‘0’.

**REG_PRD** - Registration period.

If mobile stations are not to perform timer-based registration, the base station shall set this field to ‘0000000’. If mobile stations are to perform timer-based registration, the base station shall set this field to the value in the range 29 to 85 inclusive, such that the desired timer value is

\[ \left\lfloor \frac{2^{REG_PRD/4}}{4} \right\rfloor \times 0.08 \text{ seconds}. \]

**BASE_LAT** - Base station latitude.

The base station shall set this field to its latitude in units of 0.25 second, expressed as a two’s complement signed number with positive numbers signifying North latitudes. The base station shall set this field to a value in the range -1296000 to 1296000 inclusive (corresponding to a range of -90° to +90°).

**BASE_LONG** - Base station longitude.

The base station shall set this field to its longitude in units of 0.25 second, expressed as a two’s complement signed number with positive numbers signifying East longitude. The base station shall set this field to a value in the range -2592000 to 2592000 inclusive (corresponding to a range of -180° to +180°).

**REG_DIST** - Registration distance.

If mobile stations are to perform distance-based registration, the base station shall set this field to the non-zero “distance” beyond which the mobile station is to re-register (see 2.6.5.1.4). If mobile stations are not to perform distance-based registration, the base station shall set this field to 0.

**SRCH_WIN_A** - Search window size for the Active Set and Candidate Set.

The base station shall set this field to the value shown in Table 2.6.6.2.1-1 corresponding to the search window size to be used by mobile stations for the Active Set and Candidate Set.

**SRCH_WIN_N** - Search window size for the Neighbor Set.
The base station shall set this field to the value shown in Table 2.6.6.2.1-1 corresponding to the search window size to be used by mobile stations for the Neighbor Set.

**SRCH_WIN_R** - Search window size for the Remaining Set.

The base station shall set this field to the value shown in Table 2.6.6.2.1-1 corresponding to the search window size to be used by mobile stations for the Remaining Set.

**NGHBR_MAX_AGE** - Neighbor Set maximum AGE.

The base station shall set this field to the maximum AGE value beyond which mobile stations are to drop members from the Neighbor Set (see 2.6.6.2.6.3).

**PWR_REP_THRESH** - Power control reporting threshold.

The base station shall set this field to the number of bad frames (see [2]) to be received in a measurement period on the channel which carries the Power Control Subchannel before mobile stations are to generate a *Power Measurement Report Message* (see 2.6.4.1.1). If the base station sets **PWR_THRESH_ENABLE** to ‘1’, it shall not set this field to ‘00000’.

**PWR_REP_FRAMES** - Power control reporting frame count.

The base station shall set this field to the value such that the number given by

\[ \left\lfloor \frac{2(\text{PWR_REP_FRAMES}/2) \times 5}{\text{frames}} \right\rfloor \]

is the number of frames over which mobile stations are to count frame errors.

**PWR_THRESH_ENABLE** - Threshold report mode indicator.

If mobile stations are to generate threshold *Power Measurement Report Messages*, the base station shall set this field to ‘1’. If mobile stations are not to generate threshold *Power Measurement Report Messages*, the base station shall set this field to ‘0’.

**PWR_PERIOD_ENABLE** - Periodic report mode indicator.

If mobile stations are to generate periodic *Power Measurement Report Messages*, the base station shall set this field to ‘1’. If mobile stations are not to generate periodic *Power Measurement Report Messages*, the base station shall set this field to ‘0’.

**PWR_REP_DELAY** - Power report delay.

The period that mobile stations wait following a *Power Measurement Report Message* before restarting frame counting for power control purposes.

The base station shall set this field to the power report delay value, in units of 4 frames (see 2.6.4.1.1).

**RESCAN** - Rescan indicator.
If mobile stations are to re-initialize and re-acquire the system upon receiving this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

T_ADD - Pilot detection threshold.

This value is used by the mobile station to trigger the transfer of a pilot from the Neighbor Set or Remaining Set to the Candidate Set (see 2.6.6.2.6) and to trigger the sending of the Pilot Strength Measurement Message or Extended Pilot Strength Measurement Message initiating the handoff process (see 2.6.6.2.5.2).

The base station shall set this field to the pilot detection threshold, expressed as an unsigned binary number equal to \[ \lfloor -2 \times 10 \times \log_{10} \left(\frac{E_c}{I_o}\right) \rfloor. \]

T_DROP - Pilot drop threshold.

This value is used by mobile stations to start a handoff drop timer for pilots in the Active Set and the Candidate Set (see 2.6.6.2.3).

The base station shall set this field to the pilot drop threshold, expressed as an unsigned binary number equal to \[ \lfloor -2 \times 10 \times \log_{10} \left(\frac{E_c}{I_o}\right) \rfloor. \]

T_COMP - Active Set versus Candidate Set comparison threshold.

Mobile stations transmit a Pilot Strength Measurement Message or an Extended Pilot Strength Measurement Message when the strength of a pilot in the Candidate Set exceeds that of a pilot in the Active Set by this margin (see 2.6.6.2.5.2).

The base station shall set this field to the threshold Candidate Set pilot to Active Set pilot ratio, in units of 0.5 dB.

T_TDROP - Drop timer value.

Timer value after which an action is taken by mobile stations for a pilot that is a member of the Active Set or Candidate Set, and whose strength has not become greater than T_DROP. If the pilot is a member of the Active Set, a Pilot Strength Measurement Message or an Extended Pilot Strength Measurement Message is issued. If the pilot is a member of the Candidate Set, it will be moved to the Neighbor Set.

The base station shall set this field to the T_TDROP value shown in Table 2.6.6.2.3-1 corresponding to the drop timer value to be used by mobile stations.

EXT_SYS_PARAMETER - Extended System Parameters Message indicator.

The base station shall set this field to ‘1’.

EXT_NGHBR_LST - Extended Neighbor List Message indicator.

The base station sets this field to ‘1’ when it sends the Extended Neighbor List Message on the Paging Channel; otherwise the base station sets this field to ‘0’.
If the base station is operating in Band Class 1, Band Class 3, or Band Class 4 with MIN_P_REV less than seven, it shall set this field to ‘1’. If the base station is operating in Band Class 0, it shall set this field to ‘0’.

**GEN_NGHBR_LST** - General Neighbor List Message indicator.

If the base station is sending the General Neighbor List Message on the Paging Channel, it shall set this field to ‘1’; otherwise, it shall set this field to ‘0’.

If the base station is operating in Band Class 1, Band Class 3, or Band Class 4 with MIN_P_REV greater than or equal to seven, and if EXT_NGHBR_LST is set to ‘0’, the base station shall set this field to ‘1’.

If the base station is operating in Band Class 0 with MIN_P_REV greater than or equal to seven and if the Neighbor List Message is not sent, the base station shall set this field to ‘1’.

If the base station is operating in a band class other than Band Class 1, Band Class 3, or Band Class 4, and if EXT_NGHBR_LST is set to ‘0’, the base station shall set this field to ‘1’.

**GLOBAL_REDIRECT** - Global Service Redirection Message indicator.

If the base station is sending the Global Service Redirection Message on the Paging Channel, it shall set this field to ‘1’; otherwise, it shall set this field to ‘0’.

**PRI_NGHBR_LST** - Private Neighbor List Message indicator.

If the base station is sending the Private Neighbor List Message on the Paging Channel, it shall set this field to ‘1’; otherwise, it shall set this field to ‘0’.

**USER_ZONE_ID** - User Zone Identification Message indicator.

If the base station is sending the User Zone Identification Message on the Paging Channel, it shall set this field to ‘1’; otherwise, it shall set this field to ‘0’.

**EXT_GLOBAL_REDIRECT** - Extended Global Service Redirection Message indicator.

If the base station is sending the Extended Global Service Redirection Message on the Paging Channel, it shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**EXT_CHAN_LST** - Extended CDMA Channel List Message indicator.

The base station shall set this field to ‘1’, if the Extended Channel List Message is sent on the Paging Channel, otherwise, it shall set this field to ‘0’.

**T_TDROP_RANGE_INCL** - Drop timer range value included indicator.

The base station shall set this field to ‘1’ if the T_TDROP_RANGE field is included in this message; otherwise, the base station shall set this field to ‘0’.
T_TDROP_RANGE - Drop timer range value.

Timer range value to use in association with the T_TDROP parameter when determining the drop timer expiration.

If T_TDROP_RANGE_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field to the T_TDROP_RANGE value shown in Table 2.6.6.2.3-2 corresponding to the timer expiration range value to be used by the mobile station.

NEG_SLOT_CYCLE_INDEX_SUP - Negative slot cycle index supported indicator.

The base station shall set this field to the '1' if it supports negative values of the preferred slot cycle index (SLOT_CYCLE_INDEXp); otherwise, the base station shall set this field to '0'.

```

PILOT_PN - Pilot PN sequence offset index.

The base station shall set this field to the pilot PN sequence offset for this base station, in units of 64 PN chips.

ACC_MSG_SEQ - Access parameters message sequence number.

The base station shall set this field to ACC_CONFIG_SEQ (see 3.6.2.2).
ACC_CHAN - Number of Access Channels.
The base station shall set this field to one less than the number of Access Channels associated with this Paging Channel.

NOM_PWR - Nominal transmit power offset.
The base station shall set this field to the correction factor to be used by mobile stations in the open loop power estimate, expressed as a two’s complement value in units of 1 dB (see [2]).

INIT_PWR - Initial power offset for access.
The base station shall set this field to the correction factor to be used by mobile stations in the open loop power estimate for the initial transmission on an Access Channel, expressed as a two’s complement value in units of 1 dB (see [2]).

PWR_STEP - Power increment.
The base station shall set this field to the value by which mobile stations are to increase their transmit power between successive access probes in an access probe sequence, in units of 1 dB.

NUM_STEP - Number of access probes.
The base station shall set this field to one less than the maximum number of access probes mobile stations are to transmit in a single access probe sequence.

MAX_CAP_SZ - Maximum Access Channel message capsule size.
The base station shall set this field to the value in the range 0 to 7, three less than the maximum number of Access Channel frames in an Access Channel message capsule.

PAM_SZ - Access Channel preamble length.
The base station shall set this field to one less than the number of Access Channel frames that mobile stations are to transmit in each Access Channel preamble.

PSIST(0-9) - Persistence value for access overload classes 0 through 9.
If mobile stations in access overload classes 0 through 9 are permitted to transmit requests on the Access Channel, the base station shall set this field to the persistence value to be used. If such mobile stations are not permitted to transmit requests on the Access Channel, the base station shall set this field to ‘111111’.

PSIST(10) - Persistence value for access overload class 10 (test mobile stations).
If mobile stations in access overload class 10 are permitted to transmit requests on the Access Channel, the base station shall set this field to the persistence value to be used. If such mobile stations are not permitted to transmit requests on the Access Channel, the base station shall set this field to ‘111’.
PSIST(11)  - Persistence value for access overload class 11 (emergency mobile stations).

If mobile stations in access overload class 11 are permitted to transmit requests on the Access Channel, the base station shall set this field to the persistence value to be used. If such mobile stations are not permitted to transmit requests on the Access Channel, the base station shall set this field to ‘111’.

PSIST(12)  - Persistence value for access overload class 12.

If mobile stations in access overload class 12 are permitted to transmit requests on the Access Channel, the base station shall set this field to the persistence value to be used. If such mobile stations are not permitted to transmit requests on the Access Channel, the base station shall set this field to ‘111’.

PSIST(13)  - Persistence value for access overload class 13.

If mobile stations in access overload class 13 are permitted to transmit requests on the Access Channel, the base station shall set this field to the persistence value to be used. If such mobile stations are not permitted to transmit requests on the Access Channel, the base station shall set this field to ‘111’.

PSIST(14)  - Persistence value for access overload class 14.

If mobile stations in access overload class 14 are permitted to transmit requests on the Access Channel, the base station shall set this field to the persistence value to be used. If such mobile stations are not permitted to transmit requests on the Access Channel, the base station shall set this field to ‘111’.

PSIST(15)  - Persistence value for access overload class 15.

If mobile stations in access overload class 15 are permitted to transmit requests on the Access Channel, the base station shall set this field to the persistence value to be used. If such mobile stations are not permitted to transmit requests on the Access Channel, the base station shall set this field to ‘111’.

MSG_PSIST  - Persistence modifier for Access Channel attempts for message transmissions.

A mobile station multiplies its transmission probability by $2^{-\text{MSG\_PSIST}}$ for such attempts.

The base station shall set this field to the persistence modifier for Access Channel attempts for message transmissions.

REG_PSIST  - Persistence modifier for Access Channel attempts for registrations which are not responses to the Registration Request Order.

A mobile station multiplies its transmission probability by $2^{-\text{REG\_PSIST}}$ for such attempts.

The base station shall set this field to the persistence modifier for Access Channel attempts for registrations which are not responses to the Registration Request Order.
PROBE_PN_RAN - Time randomization for Access Channel probes.

A mobile station delays its transmission from System Time by RN PN chips, where RN is a number determined by hashing between 0 and $2^{\text{PROBE_PN_RAN}} - 1$ PN chips.

The base station shall set this field to the value in the range 0 to 9 inclusive such that the time randomization range is $2^{\text{PROBE_PN_RAN}} - 1$ PN chips.

ACC_TMO - Acknowledgment timeout.

The base station shall set this field to two less than the length of time mobile stations are to wait after the end of an Access Channel transmission before determining that the base station did not receive the transmission, in units of 80 ms.

PROBE_BKOFF - Access Channel probe backoff range.

The base station shall set this field to one less than the maximum number of slots mobile stations are to delay due to random backoff between consecutive access probes.

BKOFF - Access Channel probe sequence backoff range.

The base station shall set this field to one less than the maximum number of slots mobile stations are to delay due to random backoff between successive access probe sequences and before the first access probe sequence of a response.

MAX_REQ_SEQ - Maximum number of access probe sequences for an Access Channel request.

The base station shall set this field to the maximum number of access probe sequences mobile stations are to transmit for an Access Channel request. The base station shall set this field to a value greater than 0.

MAX_RSP_SEQ - Maximum number of access probe sequences for an Access Channel response.

The base station shall set this field to the maximum number of access probe sequences mobile stations are to transmit for an Access Channel response. The base station shall set this field to a value greater than 0.

AUTH - Authentication mode.

If mobile stations are to include standard authentication data in Access Channel messages, the base station shall set this field to ‘01’. If mobile stations are not to include authentication data in Access Channel messages, the base station shall set this field to ‘00’. All other values are reserved.

RAND - Random challenge value.
If the AUTH field is set to ‘01’, the base station shall set this field to the random challenge value to be used by mobile stations for authentication. If the AUTH field is set to any other value, the base station shall omit this field.

**NOM_PWR_EXT** - Extended nominal transmit power.

If the base station is operating in Band Class 0 or Band Class 3, it shall set this field to ‘0’; otherwise, it shall set this field as follows:

If the correction factor to be used by mobile stations in the open loop power estimate is between -24 dB and -9 dB inclusive, the base station shall set this field to ‘1’; otherwise (the correction factor is in the range -8 dB to 7 dB inclusive), the base station shall set this field to ‘0’.

**PSIST_EMG_INCL** - Emergency persistence included indicator.

If PSIST_EMG is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’. The base station shall not include PSIST_EMG in this message if the base station supports the Enhanced Access Channel.

**PSIST_EMG** - Persistence value for emergency call for access overload classes 0 through 9.

If PSIST_EMG_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

If a mobile station in access overload classes 0 through 9 is permitted to transmit emergency requests on the Access Channel, the base station shall set this field to the persistence value to be used for the emergency calls. If such a mobile station is not permitted to transmit emergency requests on the Access Channel, the base station shall set this field to ‘111’.

**ACCT_INCL** - Access Control based on Call Type (ACCT) information included indicator.

If the base station enables ACCT for at least one service option, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

If the base station sets this field to ‘1’, then the base station shall also set at least one of ACCT_SO_INCL or ACCT_SO_GRP_INCL to ‘1’.

**ACCT_INCL_EMG** - Access Control based on Call Type (ACCT) includes emergency calls indicator.

If ACCT_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
The base station shall set this field to ‘0’ if the mobile station
is not to apply ACCT to a call that is recognized by the mobile
station to be an emergency call; otherwise, the base station
shall set this field to ‘1’.

ACCT_AOC_BITMAP_INCL - Access Control based on Call Type (ACCT) access overload
class bitmap included indicator.

If ACCT_INCL is set to ‘0’, the base station shall omit this
field; otherwise, the base station shall include this field and
set it as follows:

The base station shall set this field to ‘0’ if all mobile stations
are to apply ACCT regardless of their access overload classes;
otherwise, the base station shall set this field to ‘1’ to indicate
that the mobile station is to apply ACCT according to its
access overload class.

ACCT_SO_INCL - Access Control based on Call Type (ACCT) service option
included indicator.

If ACCT_INCL is set to ‘0’, the base station shall omit this
field; otherwise, the base station shall include this field and
set it as follows:

The base station shall set this field to ‘1’ if at least one
occurrence of the ACCT_SO field is included in this message;
otherwise, the base station shall set this field to ‘0’.

NUM_ACCT_SO - Number of service options for Access Control based on Call
Type (ACCT).

If ACCT_SO_INCL is not included, or is included and set to ‘0’,
then the base station shall omit this field; otherwise, the base
station shall include this field and set it to one less than the
number of occurrences of the ACCT_SO field included in this
message.

If ACCT_SO_INCL is included and set to ‘1’, then the base station shall include
NUM_ACCT_SO + 1 occurrences of the following variable-field record:

ACCT_AOC_BITMAP1 - Access Control based on Call Type (ACCT) access overload
class bitmap.

If ACCT_AOC_BITMAP_INCL is set to ‘0’, then the base station
shall omit this field; otherwise, the base station shall include
this field and set it as follows:

This field consists of the subfields defined in Table 3.7.2.3.2.2-1.
**Table 3.7.2.3.2-1. ACCT Access Overload Class Bitmap**

<table>
<thead>
<tr>
<th>Subfield</th>
<th>Length (bits)</th>
<th>Subfield Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCOLC_0_1</td>
<td>1</td>
<td>Access overload classes 0 and 1</td>
</tr>
<tr>
<td>ACCOLC_2_3</td>
<td>1</td>
<td>Access overload classes 2 and 3</td>
</tr>
<tr>
<td>ACCOLC_4_5</td>
<td>1</td>
<td>Access overload classes 4 and 5</td>
</tr>
<tr>
<td>ACCOLC_6_7</td>
<td>1</td>
<td>Access overload classes 6 and 7</td>
</tr>
<tr>
<td>ACCOLC_8_9</td>
<td>1</td>
<td>Access overload classes 8 and 9</td>
</tr>
</tbody>
</table>

The base station shall set a subfield to ‘1’ to indicate that mobile stations having the corresponding access overload class are not permitted to perform access attempts using the associated service option ACCT_SO; otherwise, the base station shall set the subfield to ‘0’.

ACCT_SO - Access Control based on Call Type (ACCT) service option number.

The base station shall set this field to the value of the service option number (as specified in [30]) that has ACCT enabled.

ACCT_SO_GRP_INCL - Access Control based on Call Type (ACCT) service option group included indicator.

If ACCT_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if at least one occurrence of the ACCT_SO_GRP field is included in this message; otherwise, the base station shall set this field to ‘0’.

NUM_ACCT_SO_GRP - Number of service option groups for Access Control based on Call Type (ACCT).

If ACCT_SO_GRP_INCL is not included, or is included and set to ‘0’, then the base station shall omit this field; otherwise, the base station shall include this field and set it to one less than the number of occurrences of the ACCT_SO_GRP field included in this message.

If ACCT_SO_GRP_INCL is included and set to ‘1’, then the base station shall include NUM_ACCT_SO_GRP + 1 occurrences of the following variable-field record:

ACCT_AOC_BITMAP2 - Access Control based on Call Type (ACCT) access overload class bitmap.

If ACCT_AOC_BITMAP_INCL is set to ‘0’, then the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
This field consists of the subfields defined in Table 3.7.2.3.2.2-1. The base station shall set a subfield to ‘1’ to indicate that mobile stations having the corresponding access overload class are not permitted to perform access attempts using a service option specified by the associated ACCT_SO_GRP field; otherwise, the base station shall set the subfield to ‘0’.

ACCT_SO_GRP - Access Control based on Call Type (ACCT) service option group number.

The base station shall set this field to the value of the service option group number (as specified in [30]) whose members all have ACCT enabled.
3.7.2.3.2.3 Neighbor List Message

MSG_TAG: NLM

<table>
<thead>
<tr>

</table>

Zero or more occurrences of the following record:

```
{
    NGHBR_CONFIG 3
    NGHBR_PN 9
}
```

3

PILOT_PN - Pilot PN sequence offset index.

The base station shall set this field to the pilot PN sequence offset for this base station, in units of 64 PN chips.

CONFIG_MSG_SEQ - Configuration message sequence number.

The base station shall set this field to CONFIG_SEQ (see 3.6.2.2).

PILOT_INC - Pilot PN sequence offset index increment.

A mobile station searches for Remaining Set pilots at pilot PN sequence index values that are multiples of this value.

The base station shall set this field to the largest increment such that the pilot PN sequence offsets of all its neighbor base stations are integer multiples of that increment.

The base station shall set this field to a value in the range 1 to 15 inclusive.

The base station shall include one occurrence of the following two-field record for each member mobile stations are to place in their Neighbor Sets. The base station may include zero or more occurrences of the following record.

NGHBR_CONFIG - Neighbor configuration.

The base station shall set this field to the value shown in Table 3.7.2.3.2.3-1 corresponding to the configuration of this neighbor.
Table 3.7.2.3.2.3-1. Neighbor Configuration Field

<table>

</table>

One or more occurrences of the following field:

```
{ CDMA_FREQ 11 }
```

- **PILOT_PN** - Pilot PN sequence offset index.
  
  The base station shall set this field to the pilot PN sequence offset for this base station, in units of 64 PN chips.

- **CONFIG_MSG_SEQ** - Configuration message sequence number.
  
  The base station shall set this field to CONFIG_SEQ (see 3.6.2.2).

- **CDMA_FREQ** - CDMA Channel frequency assignment.
  
  The order in which occurrences of this field are included gives the designations of the supported CDMA Channels as CDMA Channel 1 through CDMA Channel N.
  
  Each occurrence of this field shall correspond to a CDMA Channel containing a Paging Channel that is supported by this base station. If the supported CDMA Channels are in the preferred set of CDMA frequency assignments (see [2]), the base station shall include their occurrences of this field first.
  
  The base station shall set each occurrence of this field to the CDMA channel number corresponding to the CDMA frequency assignment for that CDMA Channel (see [2]).

ORDER - Order code.
The base station shall set this field to the ORDER code (see 3.7.4) for this type of order.

ADD_RECORD_LEN - Additional record length.
The base station shall set this field to the number of octets in the order-specific fields included in this order record.

Order-specific fields - Order-specific fields.
The base station shall include order-specific fields as specified in 3.7.4 for this type of order.
3.7.2.3.2.8 Channel Assignment Message

</tbody>
</table>

All other values are reserved.

ADD_RECORD_LEN - Additional record length.
The base station shall set this field to the number of octets in the additional record fields included in this assignment record.

Additional record fields - Additional record fields.
The additional record fields are determined by the value of ASSIGN_MODE, as described below.

If the ASSIGN_MODE field is set to ‘000’, the base station shall include the following fields:

FREQ_INCL - Frequency included indicator.
If the CDMA_FREQ field is included in this assignment record, the base station shall set this bit to ‘1’. If the CDMA_FREQ field is not included in this assignment record, the base station shall set this bit to ‘0’.

CODE_CHAN - Code channel.
The base station shall set this field to the code channel index (see [2]) in the range 1 to 63 inclusive that the mobile station is to use on the Fundamental Channel of the Forward Traffic Channel.

CDMA_FREQ - Frequency assignment.
If the FREQ_INCL bit is set to ‘1’, the base station shall set this field to the CDMA Channel number corresponding to the CDMA frequency assignment for the CDMA Channel containing the Forward Traffic Channel the mobile station is to use. If the FREQ_INCL bit is set to ‘0’, the base station shall omit this field.
FRAME_OFFSET - Frame offset.

The Forward and Reverse Traffic Channel frames are delayed \( \text{FRAME_OFFSET} \times 1.25 \text{ ms} \) relative to system timing (see [2]).

The base station shall set this field to the Forward and Reverse Traffic Channel frame offset.

ENCRIPT_MODE - Message encryption mode.

The base station shall set this field to the ENCRYPT_MODE value shown in Table 3.7.2.3.2.8-2 corresponding to the encrypting mode that is to be used for signaling messages, as specified in 2.3.12.2.

Table 3.7.2.3.2.8-2. Message Encryption Modes

<td>Enhanced encryption of call control messages</td>
</tr>
<tr>
<td>11</td>
<td>Extended encryption of call control messages</td>
</tr>
</tbody>
</table>

D_SIG_ENCRYPT_MODE - Dedicated channel signaling encryption mode indicator.

If ENCRYPT_MODE is set to ‘11’, the base station shall include this field and shall set it to the dedicated channel signaling encryption mode, as shown in Table 3.7.4.5-1; otherwise the base station shall omit this field.

ENC_KEY_SIZE - Encryption key size indication.

If ENCRYPT_MODE is set to ‘10’ or ‘11’, the base station shall include this field and shall set it to the encryption key size, as shown in Table 3.7.4.5-2; otherwise, the base station shall omit this field.

C_SIG_ENCRYPT_MODE_INCL - Common channel signaling encryption mode included indicator.

If common channel signaling encryption information is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

C_SIG_ENCRYPT_MODE - Common channel signaling encryption mode indicator.
If C_SIG_ENCRYPT_MODE_INCL is set to ‘1’, the base station shall include this field and shall set it to the common channel signaling encryption mode, as shown in Table 3.7.4.5-1; otherwise, the base station shall omit this field.

**RESERVED** - Reserved bits.

The base station shall add reserved bits as needed in order to make the total length of the fields after the preceding ADD_RECORD_LEN field through this RESERVED field equal to an integer number of octets. The base station shall set these bits to ‘0’.

If the ASSIGN_MODE field is set to ‘001’, the base station shall include the following fields:

**RESPOND** - Respond on new Access Channel indicator.

If the mobile station is to retransmit an *Origination Message* or *Page Response Message* after processing this channel assignment, the base station shall set this field to ‘1’. The base station may set this field to ‘0’ only in response to a *Page Response Message*.

**FREQ_INCL** - Frequency included indicator.

If the CDMA_FREQ field is included in this assignment record, the base station shall set this bit to ‘1’. If the CDMA_FREQ field is not included in this assignment record, the base station shall set this bit to ‘0’.

**CDMA_FREQ** - Frequency assignment.

If the FREQ_INCL bit is set to ‘1’, the base station shall set this field to the CDMA Channel number corresponding to the CDMA frequency assignment for the CDMA Channel containing the Paging Channel the mobile station is to use. If the FREQ_INCL bit is set to ‘0’, the base station shall omit this field.

**PILOT_PN** - Pilot PN sequence offset index.

The base station shall include one occurrence of this field for each base station whose Paging Channel may be monitored by the mobile station. For each occurrence, the base station shall set this field to the pilot PN sequence offset for a base station, in units of 64 PN chips. The base station having this pilot PN sequence offset should support a Primary Paging Channel with the same Paging Channel rate as the current base station.

**RESERVED** - Reserved bits.

The base station shall add reserved bits as needed in order to make the total length of the fields, after the preceding ADD_RECORD_LEN field through this RESERVED field, equal to an integer number of octets. The base station shall set these bits to ‘0’.

If the ASSIGN_MODE field is set to ‘010’, the base station shall include the following fields:

**RESPOND** - Respond on analog control channel indicator.
If the mobile station is to retransmit an **Origination Message** or **Page Response Message** on the analog control channel (see [6]) after processing this channel assignment, the base station shall set this field to ‘1’. The base station may set this field to ‘0’ only in response to a **Page Response Message**.

**ANALOG_SYS** - System indicator.

If USE_ANALOG_SYS is equal to ‘0’, the base station shall set this field to ‘0’. Otherwise, the base station shall set this field to ‘0’ if the mobile station is to use analog system A, or to ‘1’ if the mobile station is to use analog system B.

**USE_ANALOG_SYS** - Use analog system indicator.

The base station shall set this field to ‘1’ to direct the mobile station to the analog system specified by ANALOG_SYS; otherwise, the base station shall set this field to ‘0’.

**BAND_CLASS** - Band class.

The base station shall set this field according to values defined in [30].

If the ASSIGN.MODE field is set to ‘011’, the base station shall include the following fields:

**SID** - System identification of the analog system.

The base station shall set this field to the system identification of the analog system supporting the assigned voice channel for this assignment (see [6]).

**VMAC** - Voice mobile station attenuation code.

The base station shall set this field to the mobile station power level associated with the assigned voice channel for this assignment (see [6]).

**ANALOG_CHAN** - Voice channel number.

The base station shall set this field to the voice channel number for this assignment (see [6]).

**SCC** - SAT color code.

The base station shall set this field to the supervisory audio tone color code associated with the assigned voice channel. If the assignment is to a narrow analog channel, the base station shall set this field to the two least significant bits of the DSCC.

**MEM** - Message encryption mode indicator.

If analog control message encryption is to be enabled on the assigned forward and reverse analog voice channels, the base station shall set this bit to ‘1’; otherwise, the base station shall set this bit to ‘0’.

**AN_CHAN_TYPE** - Analog voice channel type.
The base station shall set this field to the analog channel type as specified in Table 3.7.3.3.2.6-1. If the mobile station does not have narrow analog capability, the base station shall set this field to ‘00’.

**DSCC_MSB** - Digital supervisory audio tone color code most significant bit.

The base station shall set this field to ‘0’ when directing handoff to a wide analog channel. The base station shall set this field to the most significant bit of the DSCC when directing handoff to a narrow analog channel.

**BAND_CLASS** - Band class.

The base station shall set this field according to values defined in [30].

If the ASSIGN_MODE field is set to ‘100’, the base station shall include the following fields:

**FREQ_INCL** - Frequency included indicator.

If the BAND_CLASS and CDMA_FREQ fields are included in this assignment record, the base station shall set this bit to ‘1’. If the BAND_CLASS and CDMA_FREQ fields are not included in this assignment record, the base station shall set this bit to ‘0’.

**RESERVED** - Reserved bits.

The base station shall set this field to ‘000’.

**BYPASS_ALERT_ANSWER** - Bypass alert indicator.

If the MOB_P_REV of the current band class of the mobile station is less than or equal to three, the base station shall set this field to ‘0’; otherwise, the base station shall set this field as follows:

If the mobile station is to bypass the *Waiting for Order Substate* and the *Waiting for Mobile Station Answer Substate*, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**DEFAULT_CONFIG** - Default Configuration.

If the GRANTED_MODE field is set to ‘00’, the base station shall set this field as specified in Table 3.7.2.3.2.8-3 to indicate an initial multiplex option and radio configuration for the Forward and Reverse Traffic Channels.
### Table 3.7.2.3.2.8-3. Default Configuration

<table>
<thead>
<tr>
<th>Value (binary)</th>
<th>Default Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>000</td>
<td>Multiplex Option 1 and Radio Configuration 1 for both the Forward Traffic Channel and the Reverse Traffic Channel</td>
</tr>
<tr>
<td>001</td>
<td>Multiplex Option 2 and Radio Configuration 2 for both the Forward Traffic Channel and the Reverse Traffic Channel</td>
</tr>
<tr>
<td>010</td>
<td>Multiplex Option 1 and Radio Configuration 1 for the Forward Traffic channel; Multiplex Option 2 and Radio Configuration 2 for the Reverse Traffic channel</td>
</tr>
<tr>
<td>011</td>
<td>Multiplex Option 2 and Radio Configuration 2 for the Forward Traffic channel; Multiplex Option 1 and Radio Configuration 1 for the Reverse Traffic channel</td>
</tr>
<tr>
<td></td>
<td>All other values are reserved.</td>
</tr>
</tbody>
</table>

**GRANTED_MODE** - Granted mode.

The base station shall set this field to ‘00’ to indicate that the mobile station is to use an initial service configuration consisting of the multiplex option and radio configuration defined by the DEFAULT_CONFIG field for the Forward and Reverse Traffic Channels, and to indicate that service negotiation is to take place before the base station sends the first Service Connect Message.

The base station shall set this field to ‘01’ to indicate that the mobile station is to use an initial service configuration consisting of the default multiplex option and transmission rates corresponding to the service option requested by the mobile station either in the *Origination Message*, or *Page Response Message*, and to indicate that service negotiation is to take place before the base station sends the first Service Connect Message.
The base station shall set this field to ‘10’ to indicate that the mobile station is to use an initial service configuration consisting of the default multiplex option and transmission rates corresponding to the service option requested by the mobile station either in the *Origination Message*, or *Page Response Message*, and to indicate that service negotiation is not to take place before the base station sends the first *Service Connect Message*.

**CODE_CHAN** - Code channel.

The base station shall set this field to the code channel index (see [2]) in the range 1 to 63 inclusive that the mobile station is to use on the Fundamental Channel of the Forward Traffic Channel.

**FRAME_OFFSET** - Frame offset.

The Forward and Reverse Traffic Channel frames are delayed $\text{FRAME_OFFSET} \times 1.25$ ms relative to system timing (see [2]).

The base station shall set this field to the Forward and Reverse Traffic Channel frame offset.

**ENCRIPT_MODE** - Message encryption mode.

The base station shall set this field to the ENCRYPT_MODE value shown in Table 3.7.2.3.2.8-2 corresponding to the encrypting mode that is to be used for signaling messages, as specified in 2.3.12.2.

**BAND_CLASS** - Band class.

If the FREQ_INCL bit is set to ‘1’, the base station shall set this field to the CDMA band class, as specified in [30], corresponding to the CDMA frequency assignment for the CDMA Channel containing the Forward Traffic Channel the mobile station is to use. If the FREQ_INCL bit is set to ‘0’, the base station shall omit this field.

**CDMA_FREQ** - Frequency assignment.

If the FREQ_INCL bit is set to ‘1’, the base station shall set this field to the CDMA Channel number, in the specified CDMA band class, corresponding to the CDMA frequency assignment for the CDMA Channel containing the Forward Traffic Channel the mobile station is to use. If the FREQ_INCL bit is set to ‘0’, the base station shall omit this field.

**D_SIG_ENCRYPT_MODE** - Dedicated channel signaling encryption mode indicator.

If ENCRYPT_MODE is set to ‘11’, the base station shall include this field and shall set it to the dedicated channel signaling encryption mode, as shown in Table 3.7.4.5-1; otherwise the base station shall omit this field.

**ENC_KEY_SIZE** - Encryption key size indication.
If ENCRYPT_MODE is set to ‘10’ or ‘11’, the base station shall include this field and shall set it to the encryption key size, as shown in Table 3.7.4.5-2; otherwise, the base station shall omit this field.

C_SIG_ENCRYPT_MODE_INCL - Common channel signaling encryption mode included indicator.

If common channel signaling encryption information is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

C_SIG_ENCRYPT_MODE - Common channel signaling encryption mode indicator.

If C_SIG_ENCRYPT_MODE_INCL is set to ‘1’, the base station shall include this field and shall set it to the common channel signaling encryption mode, as shown in Table 3.7.4.5-1; otherwise, the base station shall omit this field.

RESERVED - Reserved bits.

The base station shall add reserved bits as needed in order to make the total length of the fields after the preceding ADD_RECORD_LEN field through this RESERVED field equal to an integer number of octets. The base station shall set these bits to ‘0’.

If the ASSIGN_MODE field is set to ‘101’, the base station shall include the following fields:

RESPOND - Respond on new Access Channel indicator.

If the mobile station is to retransmit an Origination Message or Page Response Message after processing this channel assignment, the base station shall set this field to ‘1’. The base station may set this field to ‘0’ only in response to a Page Response Message.

FREQ_INCL - Frequency included indicator.

If the BAND_CLASS and CDMA_FREQ fields are included in this assignment record, the base station shall set this bit to ‘1’. If the BAND_CLASS and CDMA_FREQ fields are not included in this assignment record, the base station shall set this bit to ‘0’.

BAND_CLASS - Band class.

If the FREQ_INCL bit is set to ‘1’, the base station shall set this field to the CDMA band class, as specified in [30], corresponding to the CDMA frequency assignment for the CDMA Channel containing the Paging Channel the mobile station is to use. If the FREQ_INCL bit is set to ‘0’, the base station shall omit this field.

CDMA_FREQ - Frequency assignment.
If the FREQ_INCL bit is set to ‘1’, the base station shall set this field to the CDMA Channel number, in the specified CDMA band class, corresponding to the CDMA frequency assignment for the CDMA Channel containing the Paging Channel the mobile station is to use. If the FREQ_INCL bit is set to ‘0’, the base station shall omit this field.

PILOT_PN - Pilot PN sequence offset index.

The base station shall include one occurrence of this field for each base station whose Paging Channel may be monitored by the mobile station. For each occurrence, the base station shall set this field to the pilot PN sequence offset for a base station, in units of 64 PN chips. The base station having this pilot PN sequence offset should support a Primary Paging Channel with the same Paging Channel rate as the current base station.

RESERVED - Reserved bits.

The base station shall add reserved bits as needed in order to make the total length of the fields after the preceding ADD_RECORD_LEN field through this RESERVED field equal to an integer number of octets. The base station shall set these bits to ‘0’.
3.7.2.3.2.9 Data Burst Message

MSG_TAG: DBM

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>MSG_NUMBER</td>
<td>8</td>
</tr>
<tr>
<td>BURST_TYPE</td>
<td>6</td>
</tr>
<tr>
<td>NUM_MSGS</td>
<td>8</td>
</tr>
<tr>
<td>NUM_FIELDS</td>
<td>8</td>
</tr>
</tbody>
</table>

NUM_FIELDS occurrences of the following field:

```
( NUM_FIELDS )
CHARI          8
```

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MSG_NUMBER</td>
<td>Message number. The base station shall set this field to the number of this message within the data burst stream.</td>
</tr>
<tr>
<td>BURST_TYPE</td>
<td>Data burst type. The base station shall set the value of this field for the type of this data burst as defined in [30]. If the mobile station sets this field equal to ‘111110’, it shall set the first two CHARI fields of this message equal to EXTENDED_BURST_TYPE INTERNATIONAL as described in the definition of CHARI below. If the base station sets this field equal to ‘111111’, it shall set the first two CHARI fields of this message equal to the EXTENDED_BURST_TYPE as described in the definition of CHARI below.</td>
</tr>
<tr>
<td>NUM_MSGS</td>
<td>Number of messages in the data burst stream. The base station shall set this field to the number of messages in this data burst stream.</td>
</tr>
<tr>
<td>NUM_FIELDS</td>
<td>Number of characters in this message. The base station shall set this field to the number of occurrences of the CHARI field included in this message.</td>
</tr>
<tr>
<td>CHARI</td>
<td>Character. The base station shall include NUM_FIELDS occurrences of this field. The base station shall set these fields to the corresponding octet of the data burst stream.</td>
</tr>
</tbody>
</table>
If the BURST_TYPE field of this message is equal to '111110', the first two CHARi octets shall represent a 16 bit EXTENDED_BURST_TYPETERNATIONAL field, which is encoded as shown below. The first ten bits of this field contain a binary mapping of the Mobile Country Code (MCC) associated with the national standards organization administering the use of the remaining octets of the message. Encoding of the MCC shall be as specified in 2.3.1.3. The remaining six bits of the EXTENDED_BURST_TYPEINTERNATIONAL field shall specify the COUNTRY_BURST_TYPE. The base station shall set the value of the COUNTRY_BURST_TYPE according to the type of this data burst as defined in standards governed by the country where this data burst type is to be used.

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mobile Country Code</td>
<td>10</td>
</tr>
<tr>
<td>COUNTRY_BURST_TYPE</td>
<td>6</td>
</tr>
<tr>
<td>Remaining CHARi fields</td>
<td>8 \times (NUM_FIELDS - 2)</td>
</tr>
</tbody>
</table>

If the BURST_TYPE field of this message is equal to ‘111111’, the first two CHARi octets shall represent a single, 16 bit EXTENDED_BURST_TYPE field, as shown below. The base station shall set the value of the EXTENDED_BURST_TYPE according to the type of this data burst as defined in [30].

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXTENDED_BURST_TYPE (first two CHARi fields)</td>
<td>16</td>
</tr>
<tr>
<td>Remaining CHARi fields</td>
<td>8 \times (NUM_FIELDS - 2)</td>
</tr>
</tbody>
</table>
3.7.2.3.2.10 Authentication Challenge Message

MSG_TAG: AUCM

<table>
<thead>
<tr>

<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RANDU</td>
<td>24</td>
</tr>
<tr>
<td>GEN_CMEAKEY</td>
<td>1</td>
</tr>
</tbody>
</table>

RANDU - Random challenge data.

The base station shall set this field to the random challenge data (as specified in 2.3.12.1.4).

GEN_CMEAKEY - Generate CMEAKEY indicator.

The base station shall set this field to ‘1’ if it wants the MS to generate the CMEAKEY during the Unique Challenge-Response procedure (see 2.3.12.1.4); otherwise, the base station shall set this field to ‘0’.
3.7.2.3.2.11 SSD Update Message

MSG_TAG: SSDUM

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>

</tr>
</tbody>
</table>

One or more occurrences of the following record:

```
/   
  RECORD_TYPE  8
  RECORD_LEN  8
Type-specific fields  8 × RECORD_LEN
```

RELEASE - Origination completion indicator.

The base station shall set this field to ‘1’ if this message is used to complete an origination request from the mobile station (see 2.6.3.5); otherwise, the base station shall set this field to ‘0’.

The base station shall include occurrences of the following three-field record as specified in 3.7.5.

RECORD_TYPE - Information record type.

The base station shall set this field as specified in 3.7.5.

RECORD_LEN - Information record length.

The base station shall set this field to the number of octets in the type-specific fields included in this record.

Type-specific fields - Type-specific fields.

The base station shall include type-specific fields as specified in 3.7.5.

PILOT_PN - Pilot PN sequence offset index. The base station shall set this field to the pilot PN sequence offset for this base station, in units of 64 PN chips.

CONFIG_MSG_SEQ - Configuration message sequence number. The base station shall set this field to CONFIG_SEQ (see 3.6.2.2).

DELETE_FOR_TMSI - Delete foreign TMSI. The base station shall set this field to ‘1’ to cause the mobile station to delete its TMSI if the TMSI was assigned in a different TMSI zone from that specified by the TMSI_ZONE field of this message; otherwise, the base station shall set this field to ‘0’.

USE_TMSI - Use TMSI indicator. The base station shall set this field to the value shown in Table 3.7.2.3.2.13-1 corresponding to the type of MSID that the mobile station is to use on the Access Channel.

PREF_MSID_TYPE - Preferred Access Channel Mobile Station Identifier Type. The base station shall set this field to the value shown in Table 3.7.2.3.2.13-1 and Table 3.7.2.3.2.13-1a corresponding to the type of MSID that the mobile station is to use on the Access Channel.

IMSI and MEID |

All other values are reserved.

   The base station shall set this field to the MCC (see 2.3.1).

2. **IMSI_11_12** - 11th and 12th digits of the IMSI.
   The base station shall set this field to the IMSI_11_12 (see 2.3.1).

3. **TMSI_ZONE_LEN** - TMSI zone length.
   The base station shall set this field to the number of octets included in the TMSI_ZONE. The base station shall set this field to a value in the range 1 to 8 inclusive.

4. **TMSI_ZONE** - TMSI zone.
   The base station shall set this field to the TMSI zone number as specified in [27].
BCAST_INDEX - Broadcast slot cycle index.
To enable periodic broadcast paging, the base station shall set this field to an unsigned 3-bit number in the range 1-7, equal to the broadcast slot cycle index as defined in 2.6.2.1.1.3.3.
To disable periodic broadcast paging, the base station shall set this field to ‘000’.

IMSI_T_SUPPORTED - IMSI_T support indicator.
The base station shall set this field to ‘1’ to indicate support for a 15-digit IMSI_T addressing according to [18].
P_REV - Protocol revision level.
The base station shall set this field to ‘0001011’.
MIN_P_REV - Minimum protocol revision level.
The base station sets this field to prevent mobile stations which cannot be supported by the base station from accessing the system.
The base station shall set this field to the minimum protocol revision level that it supports.
SOFT_SLOPE - The slope in the inequality criterion for adding a pilot to the Active Set, or dropping a pilot from the Active Set (see 2.6.6.2.3 and 2.6.6.2.5.2).
The base station shall set this field as an unsigned binary number.
ADD_INTERCEPT - The intercept in the inequality criterion for adding a pilot to the Active Set (see 2.6.6.2.5.2).
The base station shall set this field as a two’s complement signed binary number, in units of 0.5 dB.
DROP_INTERCEPT - The intercept in the inequality criterion for dropping a pilot from the Active Set (see 2.6.6.2.3).
The base station shall set this field as a two’s complement signed binary number, in units of 0.5 dB.
PACKET_ZONE_ID - Packet data services zone identifier.
If the base station supports a packet data service zone, the base station shall set this field to its non-zero packet data services zone identifier.
If the base station does not support a packet data service zone, the base station shall set this field to ‘00000000’.
MAX_NUM_ALT_SO - Maximum number of alternative service options.
The base station shall set this field to the maximum number of alternative service option numbers that the mobile station is allowed to include in the Origination Message or the Page Response Message.
For mobile stations with MOB_P_REVS less than seven, the alternative service options are those service options defined in [30] and related to SERVICE_OPTION in Origination Message and the Page Response Message.
For mobile stations with MOB_P_REVs equal to or greater than seven, the alternative service options are those service options defined in [30] without service option group number assigned and related to SERVICE_OPTION in Origination Message and the Page Response Message.

If the base station sets this field to a value greater than zero, in addition, the base station shall allow the mobile station with MOB_P_REV equal to or greater than seven to include:

- a 4 or 8-bit service option bitmap in the Origination Message and the Page Response Message;
- alternate service option numbers, not limited to MAX_ALT_SO_NUM, in the Enhanced Origination Message.

RESELECT_INCLUDED - System reselection parameters included.

If the base station is including system reselection parameters, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

EC_THRESH - Pilot power threshold.

If RESELECT_INCLUDED is set to ‘1’, the base station shall include the field EC_THRESH and set this field to:

\[
\left\lfloor \frac{\text{pilot_power_threshold} + 115}{2}\right\rfloor
\]

where \(\text{pilot_power_threshold}\) is the pilot power, \(E_c\), in dBm/1.23 MHz, below which the mobile station is to perform system reselection; otherwise, the base station shall omit this field.

EC_I00_THRESH - Pilot \(E_c/I_0\) threshold.

If RESELECT_INCLUDED is set to ‘1’, the base station shall include the field EC_I00_THRESH and set this field to:

\[
\left\lfloor -20 \times \log_{10} (\text{pilot_threshold}) \right\rfloor
\]

where \(\text{pilot_threshold}\) is the pilot \(E_c/I_0\) below which the mobile station is to perform system reselection; otherwise, the base station shall omit this field.

PILOT_REPORT - Pilot reporting indicator.

The base station shall set this field to ‘1’ if the mobile station is to report the additional pilots which have pilot strengths exceeding \(T_{ADD}\) in all Access Channel messages. The base station shall set this field to ‘0’ if the mobile station is to report the additional pilots which have pilot strengths exceeding \(T_{ADD}\) only in the Origination Message, the Reconnect Message, and the Page Response Message.

NGHBR_SET_ENTRY_INFO - Neighbor Set access entry handoff information included indicator.

If the base station is including information on the Neighbor Set access entry handoff, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

ACC_ENT_HO_ORDER - Access entry handoff permitted indicator.
If NGHBR_SET_ENTRY_INFO is set to ‘1’, the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

The base station shall set this field to ‘1’ if the mobile station is permitted to perform an access entry handoff after receiving a message while performing the Mobile Station Order and Message Processing Operation in the Mobile Station Idle State (see 2.6.2.4); otherwise, the base station shall set this field to ‘0’.

NGHBR_SET_ACCESS_INFO - Neighbor Set access handoff included indicator.

If the base station is including information on the Neighbor Set access handoff or access probe handoff, the base station shall set this field to ‘1’, otherwise, the base station shall set this field to ‘0’.

ACCESS_HO - Access handoff permitted indicator.

If NGHBR_SET_ACCESS_INFO is set to ‘1’, the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

The base station shall set this field to ‘1’ if the mobile station is permitted to perform an access handoff (see 2.6.3.1.3.2); otherwise, the base station shall set this field to ‘0’.

ACCESS_HO_MSG_RSP - Access handoff permitted for message response indicator.

If ACCESS_HO is set to ‘1’, the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

The base station shall set this field to ‘1’ if the mobile station is permitted to perform an access handoff after receiving a message and before responding to that message in the System Access State; otherwise, the base station shall set this field to ‘0’.

ACCESS_PROBE_HO - Access probe handoff permitted indicator.

If NGHBR_SET_ACCESS_INFO is set to ‘1’, the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

The base station shall set this field to ‘1’ if the mobile station is permitted to perform an access probe handoff (see 2.6.3.1.3.3); otherwise, the base station shall set this field to ‘0’.

ACC_HO_LIST_UPD - Access handoff list update permitted indicator.

If ACCESS_PROBE_HO is included and is set to ‘1’, the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

The base station shall set this field to ‘1’ if the mobile station is permitted to update the access handoff list during an access attempt (see 2.6.3.1.7.2); otherwise, the base station shall set this field to ‘0’.
ACC_PROBE_HO_OTHER_MSG - Access probe handoff permitted for messages other than the Origination Message, the Reconnect Message, and the Page Response Message.

If ACCESS_PROBE_HO is set to ‘1’, the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

The base station shall set this field to ‘1’ if the mobile station is permitted to perform an access probe handoff for messages other than the Origination Message, the Reconnect Message, and the Page Response Message. The base station shall set this field to ‘0’ if the mobile station is permitted to perform an access probe handoff only for the Origination Message, the Reconnect Message, and the Page Response Message. See 2.6.3.1.3.3.

MAX_NUM_PROBE_HO - Maximum number of times that the mobile station is permitted to perform an access probe handoff.

If ACCESS_PROBE_HO is set to ‘1’, the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

The base station shall set this field to the maximum number of times the mobile station is allowed to perform an access probe handoff within an access attempt minus one.

NGHBR_SET_SIZE - Size of the Neighbor Set.

If NGHBR_SET_ENTRY_INFO or NGHBR_SET_ACCESS_INFO is equal to ‘1’, the base station shall set this field to the number of pilots included in the Neighbor List Message, Extended Neighbor List Message, or General Neighbor List Message; otherwise, the base station shall omit this field.

If NGHBR_SET_ENTRY_INFO is equal to ‘1’, the base station shall include NGHBR_SET_SIZE occurrences of the following field:

ACCESS_ENTRY_HO - Access entry handoff permitted when entering the System Access State.

The base station shall set this field to ‘1’ if the mobile station is permitted to perform an access entry handoff to the base station associated with the corresponding pilot between the time it receives a message on the Paging Channel when in the Mobile Station Idle State and it enters the System Access State to respond to the message; otherwise, the base station shall set this field to ‘0’. The base station shall use the same order for the ACCESS_ENTRY_HO fields in this message as is used for pilots which are listed in the Neighbor List Message, Extended Neighbor List Message, or General Neighbor List Message. Specifically, the $i^{th}$ occurrence of the ACCESS_ENTRY_HO field shall correspond the $i^{th}$ pilot in the Neighbor List Message, Extended Neighbor List Message, or General Neighbor List Message.

If NGHBR_SET_ACCESS_INFO is equal to ‘1’, the base station shall include NGHBR_SET_SIZE occurrences of the following field:
ACCESS_HO_ALLOWED - Access handoff and access probe handoff permitted for the corresponding pilot while in the System Access State.

The base station shall set this field to ‘1’ if the mobile station is permitted to perform an access handoff or access probe handoff to the base station associated with the corresponding pilot when the mobile station is in the System Access State (see 2.6.3.1.8 and 2.6.3.1.9); otherwise, the base station shall set this field to ‘0’. The base station shall use the same order for the ACCESS_HO_ALLOWED fields in this message as is used for pilots which are listed in the Neighbor List Message, Extended Neighbor List Message, or General Neighbor List Message. Specifically, the \( i \)th occurrence of the ACCESS_HO_ALLOWED field shall correspond the \( i \)th pilot in the Neighbor List Message, Extended Neighbor List Message, or General Neighbor List Message.

The base station shall set this field to ‘0’ if this pilot does not support a Reverse Access Channel (R-ACH).

BROADCAST_GPS_ASST - Broadcast GPS Assist Indicator.

The base station shall set this field to ‘1’ if it supports Broadcast GPS Assist capability; otherwise, the base station shall set this field to ‘0’.

QPCH_SUPPORTED - Quick Paging Channel Supported Indication.

If the base station supports Quick Paging Channel operation, the base station shall set this field to ‘1’; otherwise the base station shall set this field to ‘0’.

NUM_QPCH - Number of Quick Paging Channels.

If the base station sets QPCH_SUPPORTED to ‘1’, the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

The base station shall set this field to the number of Quick Paging Channels on this CDMA Channel. The base station shall not set this field to ‘00’.

QPCH_RATE - Quick Paging Channel indicator rate.

If the base station sets QPCH_SUPPORTED to ‘1’, the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

The base station shall set this field to the QPCH_RATE field value shown in Table 3.7.2.3.2.13-2 corresponding to the indicator rate used by the Quick Paging Channel in the system.
Table 3.7.2.3.2.13-2. QPCH Indicator Data Rate

<table>

</table>

QPCH_POWER_LEVEL_PAGE - Quick Paging Channel paging indicator transmit power level.

If the base station sets QPCH_SUPPORTED to ‘1’, the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

The base station shall set this field to the Quick Paging Channel paging indicator transmit power level relative to that of the Pilot Channel as specified in Table 3.7.2.3.2.13-3.

Table 3.7.2.3.2.13-3 Quick Paging Channel Transmit Power Level

<table>

</tbody>
</table>
QPCH_CCI_SUPPORTED - Quick Paging Channel configuration change indicator supported.

If QPCH_SUPPORTED is set to ‘1’, the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

If the base station supports configuration change indicators on the Quick Paging Channel, the base station shall set this field to ‘1’; otherwise the base station shall set this field to ‘0’.

QPCH_POWER_LEVEL_CONFIG - Quick Paging Channel configuration change indicator transmit power level.

If the base station includes the QPCH_CCI_SUPPORTED field and sets it to ‘1’, the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

The base station shall set this field to the Quick Paging Channel configuration change indicator transmit power level relative to that of the Pilot Channel as specified in Table 3.7.2.3.2.13-3.

SDB_SUPPORTED - Short Data Burst supported indicator.

The base station shall set this field to ‘1’ if the mobile station is permitted to send a Short Data Burst; otherwise, the base station shall set this field to ‘0’.

RLGAIN_TRAFFIC_PILOT - Gain adjustment of the Reverse Traffic Channel relative to the Reverse Pilot Channel for Radio Configurations greater than 2.

The base station shall set this field to the correction factor to be used by mobile stations in setting the power of a reverse traffic channel, expressed as a two’s complement value in units of 0.125 dB (see [2]).

REV_PWR_CNTL_DELAY_INCL - Reverse Power Control Delay included indicator.

The base station shall set this field to ‘1’ if the base station includes the REV_PWR_CNTL_DELAY field in this message; otherwise, the base station shall set this field to ‘0’.

REV_PWR_CNTL_DELAY - The reverse power control delay.

If REV_PWR_CNTL_DELAY_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the closed-loop reverse power control delay minus one (the closed-loop reverse power control delay is the time between the end of a gated-on reverse PCG and the beginning of the reverse PCG where the corresponding feedback is sent on the Forward Power Control Subchannel, see [2]), in units of 1.25 ms.

AUTO_MSG_SUPPORTED - Autonomous message supported indicator.
If the base station allows the autonomous delivery of the *Device Information Message* on the r-csch, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**AUTO_MSG_-INTERVAL** - Autonomous message interval.

If **AUTO_MSG_SUPPORTED** is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and shall set this field to the **AUTO_MSG_INTERVAL** value shown in Table 3.7.2.3.2.13-4 to indicate the minimum time interval between autonomous messages sent by a mobile station to the infrastructure. This parameter is intended to allow the infrastructure to limit the frequency of autonomous messages sent by a mobile station on the r-csch.

Table 3.7.2.3.2.13-4. **AUTO_MSG_INTERVAL** Values

</tbody>
</table>

**MOB_QOS** - Indicator granting permission to the mobile station to request QoS parameter settings in the *Origination Message*, *Origination Continuation Message*, or *Enhanced Origination Message*.

The base station shall set this field to ‘1’, if the mobile station is allowed to include a QoS record in the *Origination Message*, *Origination Continuation Message*, or *Enhanced Origination Message*; otherwise, the base station shall set this field to ‘0’.

**ENC_SUPPORTED** - Encryption fields included.

The base station shall set this field to ‘1’ if the encryption related fields are included; otherwise the base station shall set this field to ‘0’.

**SIG_ENCRYPT_SUP** - Signaling encryption supported indicator.

If **ENC_SUPPORTED** is equal to ‘1’, the base station shall include this field; otherwise, the base station shall omit this field. If this field is included, this field indicates which signaling encryption algorithms are supported by the base station.
This field consists of the subfields shown in Table 2.7.1.3.2.1-5.

If this field is included, the base station shall set the subfields as follows:

The base station shall set the CMEA subfield to ‘1’.

The base station shall set each other subfield to ‘1’ if the corresponding signaling encryption algorithm is supported by the base station; otherwise, the base station shall set the subfield to ‘0’.

The base station shall set the RESERVED subfield to ‘00000’.

**UI_ENCRYPT_SUP** – User information encryption supported indicator.

If ENC_SUPPORTED is equal to ‘1’, the base station shall include this field; otherwise, the base station shall omit this field. If this field is included, the base station shall set this field to indicate the supported user information encryption algorithms.

This field consists of the subfields shown in Table 2.7.1.3.2.4-9.

The base station shall set each subfield to ‘1’ if the corresponding user information encryption algorithm is supported by the base station; otherwise, the base station shall set the subfield to ‘0’.

**USE_SYNC_ID** – Sync ID supported indicator.

The base station shall set this field to ‘1’ to indicate that the mobile station is permitted to include the SYNC_ID field in the Page Response Message, the Reconnect Message, the Origination Message, and the Enhanced Origination Message; otherwise, the base station shall set this field to ‘0’.

**CS_SUPPORTED** – Concurrent Services supported indicator.

If the base station supports concurrent services, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**BCCH_SUPPORTED** – Primary Broadcast Control Channel Supported Indicator.

If the base station supports Primary Broadcast Control Channel, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**MS_INIT_POS_LOC_SUP_IND** – Mobile station initiated position location determination supported indicator.

If the base station supports mobile station initiated position determination, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**PILOT_INFO_REQ_SUPPORTED** – Pilot information request supported indicator.
If the base station supports mobile station request for pilot information using the “Pilot Information” record in the Base Station Status Request Message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

QPCH_BI_SUPPORTED – Quick Paging Channel broadcast indicator supported.

If QPCH_SUPPORTED is included and set to ‘1’, the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

If the base station supports broadcast indicators on the Quick Paging Channel, the base station shall set this field to ‘1’; otherwise the base station shall set this field to ‘0’.

QPCH_POWER_LEVEL_BCAST – Quick Paging Channel broadcast indicator transmit power level.

If QPCH_BI_SUPPORTED is included and set to ‘1’, the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

The base station shall set this field to the Quick Paging Channel broadcast indicator transmit power level relative to that of the Pilot Channel as specified in Table 3.7.2.3.2.31-3.

BAND_CLASS_INFO_REQ – Band class information request indicator.

The base station shall set this field to ‘1’ if the ALT_BAND_CLASS field is included in this message; otherwise, the base station shall set this field to ‘0’.

ALT_BAND_CLASS – Alternate band class.

If BAND_CLASS_INFO_REQ is set to ‘0’, then the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to an alternate CDMA band class (see [30]) supported by the base station. The mobile station is to indicate its capability to support the alternate band class in the Origination Message and Page Response Message.

CDMA_OFF_TIME_REP_SUP_IND – CDMA off time report supported indicator.

If the base station supports mobile station report for CDMA off time information using the CDMA Off Time Report Message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

CDMA_OFF_TIME_REP_THRESHOLD_UNIT – CDMA off time report threshold unit

If CDMA_OFF_TIME_REP_SUP_IND is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the time unit used in CDMA_OFF_TIME_REP_THRESHOLD, as specified in Table 3.7.2.3.2.13-5.
Table 3.7.2.3.2.13-5. CDMA Off Time Report Threshold Unit

<table>
<thead>
<tr>
<th>CDMA_OFF_TIME_REP_UNIT (binary)</th>
<th>Time Unit (decimal)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>80 ms</td>
</tr>
<tr>
<td>1</td>
<td>0.5 sec</td>
</tr>
</tbody>
</table>

CDMA_OFF_TIME_REP_THRESHOLD – CDMA off time report threshold

If CDMA_OFF_TIME_REP_SUP_IND is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the time in units of CDMA_OFF_TIME_REP_THRESHOLD_UNIT such that if the mobile station goes away from the CDMA traffic channel longer than this value, the mobile station is to send a CDMA Off Time Report Message.

CHM_SUPPORTED – Control Hold Mode supported indicator.

The base station shall set this field to ‘1’ to indicate that the base station supports the Control Hold Mode; otherwise, the base station shall set this field to ‘0’.

RELEASE_TO_IDLE_IND – Release to Idle State allowed indicator.

If the mobile station is allowed to return to the Mobile Station Idle State upon call release, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

RECONNECT_MSG_IND – Reconnect Message supported indicator.

The base station shall set this field to ‘0’ if the mobile station is not allowed to send a Reconnect Message instead of an Origination Message or a Page Response Message; otherwise, the base station shall set this field to ‘1’.

MSG_INTEGRITY_SUP – Message integrity supported indicator.

If the base station supports message integrity, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.
SIG_INTEGRITY_SUP_INCL - Signaling message integrity information included indicator.
If MSG_INTEGRITY_SUP is set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.
If the base station supports other integrity algorithm(s) in addition to the default integrity algorithm, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

SIG_INTEGRITY_SUP - Signaling integrity algorithm supported by the base station.
If SIG_INTEGRITY_SUP_INCL is included and set to ‘1’, the base station shall set this field as follows; otherwise, the base station shall omit this field.
The base station shall set this field to indicate the supported message integrity algorithms in addition to the default integrity algorithm.
This field consists of the subfields shown in Table 2.7.1.3.2.1-6.
The base station shall set each subfield to ‘1’ if the corresponding message integrity algorithm is supported by the base station; otherwise, the base station shall set the subfield to ‘0’.
The base station shall set the RESERVED subfield to ‘00000000’.

FOR_PDCH_SUPPORTED - Forward Packet Data Channel supported indicator.
If the base station supports the Forward Packet Data Channel (F-PDCH), the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

PDCH_CHM_SUPPORTED - PDCH Control Hold Mode supported indicator.
If FOR_PDCH_SUPPORTED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
The base station shall set this field to ‘1’ to indicate that the base station supports the PDCH Control Hold Mode; otherwise, the base station shall set this field to ‘0’.

PDCH_PARMS_INCL - Forward Packet Data Channel related parameters included indicator.
If FOR_PDCH_SUPPORTED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:
The base station shall set this field to ‘1’ if the following F-PDCH related fields are included in this message; otherwise, the base station shall set this field to ‘0’.

FOR_PDCH_RLGAIN_INCL - Forward Packet Data Channel parameters related to reverse link adjustment gains included indicator.
If PDCH_PARMS_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to '1' if the following F-PDCH gain related fields are included in this message; otherwise, the base station shall set this field to '0'.

RLGAIN_ACKCH_PILOT - Reverse Acknowledgment Channel to pilot adjustment gain.

If FOR_PDCH_RLGAIN_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to the Reverse Acknowledgment Channel to pilot adjustment gain expressed as a two's complement value in units of 0.125 dB (see [2]).

RLGAIN_CQICH_PILOT - Reverse Channel Quality Indicator Channel to pilot adjustment gain.

If FOR_PDCH_RLGAIN_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to the Reverse Channel Quality Indicator Channel to pilot adjustment gain expressed as a two's complement value in units of 0.125 dB (see [2]).

NUM_SOFT_SWITCHING_FRAMES - Number of frames for R-CQICH soft switching.

If PDCH_PARMS_INCL is not included, or is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the duration of the cell switching period, in units of 20 ms, minus one, during which the mobile station is to transmit the cell switch sequence on the R-CQICH when it switches between two pilots which are in different groups (see [3]).

NUM_SOFTER_SWITCHING_FRAMES - Number of frames for R-CQICH softer switching.

If PDCH_PARMS_INCL is not included, or is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the duration of the cell switching period, in units of 20 ms, minus one, during which the mobile station is to transmit the cell switch sequence on the R-CQICH when it switches between two pilots which are in the same group (see [3]).

NUM_SOFT_SWITCHING_SLOTS - Number of slots per frame for R-CQICH soft switching.

If PDCH_PARMS_INCL is not included, or is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
The base station shall set this field to the duration of the cell switching slots within a switching frame, in units of 1.25 ms as specified in Table 3.7.2.3.2.21-10, during which the mobile station is to transmit the cell switch indication by using Walsh cover of target on the R-CQICH when it switches between two pilots which are in different groups.

**NUM_SOFTER_SWITCHING_SLOTS** - Number of slots per frame for R-CQICH softer switching.

If PDCH_PARMS_INCL is not included, or is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the duration of the cell switching slots within a switching frame, in units of 1.25 ms as specified in Table 3.7.2.3.2.21-10, during which the mobile station is to transmit the cell switch indication by using Walsh cover of target on the R-CQICH when it switches between two pilots which are in different groups.

**PDCH_SOFT_SWITCHING_DELAY** - F-PDCH soft switching delay.

If PDCH_PARMS_INCL is not included, or is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the minimum interruption seen by the mobile station, in units of 10 ms, minus one, when the mobile station is to transmit the cell switch sequence on the R-CQICH channel when it switches between two pilots which are in different groups (see [3]).

**PDCH_SOFTER_SWITCHING_DELAY** - F-PDCH softer switching delay.

If PDCH_PARMS_INCL is not included, or is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the minimum interruption seen by the mobile station, in units of 10 ms, minus one, when the mobile station is to transmit the cell switch sequence on the R-CQICH channel when it switches between two pilots which are in the same group (see [3]).

**WALSH_TABLE_ID** - The index of the Walsh Table used.

If PDCH_PARMS_INCL is not included, or is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Walsh Table being used by the Packet Data Channel. (See [3]).

**NUM_PDCCH** - The number of Packet Data Control Channels supported.

If PDCH_PARMS_INCL is not included, or is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
The base station shall set this field to '000' if the pilot supports one Packet Data Control Channel. The base station shall set this field to '001' if the pilot supports two Packet Data Control Channels. The base station shall not set this field to any other value.

The base station shall include \textit{NUM\_PDCCH+1} occurrences of the field \textit{FOR\_PDCCH\_WALSH}:

- \textit{FOR\_PDCCH\_WALSH} - Forward Packet Data Control Channel Walsh code assignment.

  If \textit{PDCH\_PARMS\_INCL} is not included, or is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

  The base station shall set this field to the Walsh code assignment for the Forward Packet Data Control Channel.

  If \textit{NUM\_PDCCH} is set to '001', the Walsh code of PDCCH0 shall be included first, followed by the Walsh code for PDCCH1.

- \textit{IMSI\_10\_INCL} - IMSI_10 included.

  If the MNC is a 3-digit number and the base station wants to convey the third digit of the MNC to the mobile station, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

- \textit{IMSI\_10} - The least significant digit of MNC when the MNC is a 3-digit number.

  If \textit{IMSI\_10\_INCL} is set to '0', the base station shall omit this field; otherwise, the base station shall set this field to the least significant digit of MNC converted to binary by the standard decimal-to-binary conversion as shown in Table 2.3.1.1-1.

- \textit{MAX\_ADD\_SERV\_INSTANCE} - Maximum number of additional service reference identifiers allowed in origination.

  If the \textit{CS\_SUPPORTED} field is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

  The base station shall set this field to the maximum number of additional service reference identifiers that can be included in the \textit{Origination Message} or \textit{Enhanced Origination Message}.

- \textit{RER\_MODE\_SUPPORTED} - Radio environment reporting mode supported indicator.

  If the base station supports radio environment reporting mode, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

- \textit{TKZ\_MODE\_SUPPORTED} - Tracking zone mode supported indicator.

  The base station shall set this field to '1' if the tracking zone mode is supported; otherwise, the base station shall set this field to '0'.
TKZ_ID - Tracking zone identifier. If TKZ_MODE_SUPPORTED is set to ‘1’, the base station shall set this field to its tracking zone identifier; otherwise, the base station shall omit this field.

PZ_HYST_ENABLED - Packet zone hysteresis enabled. If the PACKET_ZONE_ID field is set to ‘00000000’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the packet zone hysteresis feature is to be enabled at the mobile station, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

PZ_HYST_INFO_INCL - Packet zone hysteresis information included indicator. If the PZ_HYST_ENABLED field is included and is set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

If the base includes the PZ_HYST_LIST_LEN, PZ_HYST_ACT_TIMER and PZ_HYST_TIMER fields, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

PZ_HYST_LIST_LEN - Packet zone hysteresis list length. If the PZ_HYST_INFO_INCL field is included and is set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to the length of the packet zone hysteresis list. This field shall be within the range ‘0001’ through ‘1111’, inclusive.

PZ_HYST_ACT_TIMER - Packet zone hysteresis activation timer. If the PZ_HYST_INFO_INCL field is included and is set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

The base station shall set to the value of the packet zone hysteresis activation timer (in units of seconds). This field shall be within the range ‘00000001’ through ‘11111111’, inclusive.

PZ_HYST_TIMER_MUL - Packet zone hysteresis timer multiplier. If the PZ_HYST_INFO_INCL field is included and is set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

The base station shall set the field to x, where \( x \times 8^y \) seconds is the value of the hysteresis timer and y is the value indicated in the PZ_HYST_TIMER_EXP field. The base station shall set this field to a value that is between 1 and 7 inclusive. The value 0 is reserved.

PZ_HYST_TIMER_EXP - Packet zone hysteresis timer exponent.
If the PZ_HYST_INFO_INCL field is included and is set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

The base station shall set the field to \( y \), where \( x \times 8^y \) seconds is the value of the hysteresis timer and \( x \) is the value indicated in the PZ_HYST_TIMER_MUL field. The base station shall set this field to a value that is between 0 and 4 inclusive. All the other values are reserved.

**EXT_PREF_MSID_TYPE** - Extended Preferred Access Channel Mobile Station Identifier Type.

The base station shall set this field to the value shown in Table 3.7.2.3.2.13-1 and Table 3.7.2.3.2.13-1a corresponding to the type of MSID that the mobile station is to use on the Access Channel.

**MEID_REQD** - MEID Required Indicator.

If EXT_PREF_MSID_TYPE is set to ‘11’ and PREF_MSID_TYPE is set to either ‘00’ or ‘11’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ to indicate that network requires MEID (of mobile stations having R-UIM) in registrations; otherwise the base station shall set this field to ‘0’.

**AUTO_FCSO_ALLOWED** - Autonomous Fast Call Setup Order allowed indicator.

The base station shall set this field to ‘1’ if the mobile station is allowed to send an autonomous Fast Call Setup Order; otherwise, the base station shall set this field to ‘0’.

**REV_PDCH_SUPPORTED** - Reverse Packet Data Channel supported indicator.

If FOR_PDCH_SUPPORTED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the base station supports the Reverse Packet Data Channel (R-PDCH), the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**REV_PDCH_PARMS_INCL** - Reverse Packet Data Channel related parameters included indicator.

If REV_PDCH_SUPPORTED is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if the R-PDCH parameters are included in this message; otherwise, the base station shall set this field to ‘0’.

**REV_PDCH_RLGAIN_INCL** - Reverse Packet Data Channel parameters related to reverse link adjustment gains included indicator.
If REV_PDCH_PARMS_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to ‘1’ if the following R-PDCH gain related fields are included in this message; otherwise, the base station shall set this field to ‘0’.

**RLGAIN_SPICH_PILOT** - Reverse Secondary Pilot Channel to pilot adjustment gain.

If REV_PDCH_RLGAIN_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to the Reverse Secondary Pilot Channel to pilot adjustment gain expressed as a two’s complement value in units of 0.125 dB (see [2]).

**RLGAIN_REQCH_PILOT** - Reverse Request Channel to pilot adjustment gain.

If REV_PDCH_RLGAIN_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to the Reverse Request Channel to pilot adjustment gain expressed as a two’s complement value in units of 0.125 dB (see [2]).

**RLGAIN_PDCCH_PILOT** - Reverse Packet Data Control Channel to pilot adjustment gain.

If REV_PDCH_RLGAIN_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to the Reverse Packet Data Channel to pilot adjustment gain expressed as a two’s complement value in units of 0.125 dB (see [2]).

**REV_PDCH_PARMS_1_INCL** - Reverse Packet Data Channel parameters subset included indicator.

If REV_PDCH_PARMS_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to ‘1’ if the following R-PDCH parameters are included in this message; otherwise, the base station shall set this field to ‘0’.

**REV_PDCH_TABLE_SEL** - Reverse Packet Data Channel Table selector.

If REV_PDCH_PARMS_1_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to the Reverse Packet Data Channel Table selector (see [2]).

**REV_PDCH_MAX_AUTO_TPR** - Reverse Packet Data Channel maximum traffic to pilot ratio for autonomous transmission.
If REV_PDCH_PARMS_1_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the maximum traffic to pilot ratio for autonomous transmission on the Reverse Packet Data Channel (see [2] and [3]).

The base station shall set this field to a value in the range 0 to 18 dB inclusive in units of 0.125 dB.

REV_PDCH_NUM_ARQ_ROUNDS_NORMAL - Maximum number of allowed ARQ rounds on the Reverse PDCH in the non-boosted mode.

If REV_PDCH_PARMS_1_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to one less the maximum number of allowed ARQ rounds on the Reverse PDCH in the non-boosted mode. The base station shall set this field to 0, 1, or 2 corresponding to 1, 2, or 3 rounds respectively (See [3]).

REV_PDCH_OPER_PARMS_INCL - Reverse Packet Data Channel operational parameters included indicator.

If REV_PDCH_PARMS_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to '1' if the following R-PDCH operational parameters are included in this message; otherwise, the base station shall set this field to '0'.

REV_PDCH_MAX_SIZE_ALLOWED_ENCODER_PACKET - Maximum Allowed Reverse PDCH encoder packet size.

If REV_PDCH_OPER_PARMS_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the maximum size encoder packet that the mobile station is allowed to use. (see [2] and [3]).

The base station shall set this field to a value in the range 0 to 10 inclusive, corresponding to the encoder packet sizes 192, 408, 792, 1560, 3096, 4632, 6168, 9240, 12312, 15384, and 18456 bits respectively.

REV_PDCH_DEFAULT_PERSISTENCE - Reverse Packet Data Channel default initial persistence.

If REV_PDCH_OPER_PARMS_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
The base station shall set this field to ‘1’ if the mobile station is to be persistent at the call setup; otherwise, the base station shall set this field to ‘0’ (See [3]).

REV_PDCH_RESET_PERSISTENCE - Reverse Packet Data Channel reset persistence indicator.

If REV_PDCH_OPER_PARMS_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if, at the end of a persistent grant, the mobile station shall reset its persistent indicator to persistent; otherwise, the base station shall set this field to ‘0’ if the mobile station shall reset its persistent indicator to non-persistent (See [3]).

REV_PDCH_GRANT_PRECEDENCE - Reverse Packet Data Channel Grant Precedence Indicator.

If REV_PDCH_OPER_PARMS_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if unicast Forward Grant Channel messages have precedence over Rate Control commands; otherwise, the base station shall set this field to ‘0’ to indicate that Rate Control down commands from non-serving sectors have precedence over Forward Grant Channel messages (see [3]).

REV_PDCH_MSIB_SUPPORTED - Reverse PDCH MSIB usage indicator.

If REV_PDCH_OPER_PARMS_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if the mobile station is to use the MSIB bit on the Reverse Packet Data Control Channel; otherwise, the base station shall set this field to ‘0’ (see [3]).

REV_PDCH_SOFT_HANDOFF_SWITCHING_RESET_IND - Reverse Packet Data Channel soft handoff switching reset indicator.

If REV_PDCH_OPER_PARMS_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if the mobile station is to initialize RPDCHCF when soft selection occurs in the FPDCHCF; otherwise, the base station shall set this field to ‘0’ (see [3]).

SDB_IN_RCNM_IND - Short Data Burst allowed in Reconnect Message indicator.
If RECONNECT_MSG_IND is set to ‘0’ or SDB_SUPPORTED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if the mobile station is allowed to include a Short Data Burst (see [30]) in the *Reconnect Message*; otherwise, the base station shall set this field to ‘0’.

**SENDING_BSPM** - *BCMC Service Parameters Message* indicator.

If the base station is sending the *BCMC Service Parameters Message* on the Paging Channel, it shall set this field to ‘1’; otherwise, it shall set this field to ‘0’.

**BSPM_PERIOD_INDEX** - *BSPM Transmission Periodicity Index*.

If the SENDING_BSPM field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the BSPM transmission periodicity index corresponding to the periodicity with which the BSPM with DIFF_BSPM equal to ‘0’ is transmitted on the paging channel as specified in Table 2.7.3.5-1.

The base station shall start transmitting a *BCMC Service Parameters Message* within four F-PCH slots of the F-PCH BSPM slot given by

\[ \left\lfloor \frac{t}{4} \right\rfloor \mod (B + 1) = 0, \]

where \( t \) represents system time in frames and \( B \) is given by

\[ B = 2^{\text{BSPM_PERIOD_INDEX}} \times 16 \]

**CAND_BAND_INFO_REQ** - Candidate band class information request indicator

The base station shall set this field to ‘1’ when requesting mobiles to report whether various candidate band class and band subclass (if applicable) combinations are supported; otherwise, the base station shall set this field to ‘0’.

The base station shall not include more than 16 band class-band subclass queries in this message.

**NUM_CAND_BAND_CLASS** - Number of candidate band classes

If CAND_BAND_INFO_REQ is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
The base station shall set this field to the number of candidate band classes included in the record minus one.

If CAND_BAND_INFO_REQ is set to ‘1’, the base station shall include NUM_CAND_BAND_CLASS + 1 occurrences of the following record:

CAND_BAND_CLASS - Candidate band class

The base station shall set this field (see [30]) to a band class for which the mobile is to report its capabilities upon system access. It may be used in conjunction with the BAND_SUBCLASS_IND fields to specify band subclass(es) for which the mobile is to report its capabilities upon system access.

SUBCLASS_INFO_INCL - Band subclass information included

The base station shall set this field to ‘0’ when no band subclasses are associated with CAND_BAND_CLASS or if the base station requires only the band class capabilities of the mobile station. Otherwise, the base station shall set this field to ‘1’.

SUBCLASS_REC_LEN - Band subclass subrecord length

If SUBCLASS_INFO_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the number of band subclass indicator fields included in the subrecord minus one. The number of subclass indicator fields included depends on the highest band subclass being queried for mobile support for the associated CAND_BAND_CLASS (i.e. if the highest band subclass being queried is K, then SUBCLASS_REC_LEN = K).

If the SUBCLASS_REC_LEN field is included, the base station shall include SUBCLASS_REC_LEN +1 occurrences of the following subrecord. The first field included corresponds to band subclass ‘0’ and the Nth field included corresponds to band subclass ‘N-1’.

BAND_SUBCLASS_IND - Band subclass indicator

The base station shall set this field to ‘1’ if it requires the mobile to report whether it supports this band subclass for the associated CAND_BAND_CLASS; otherwise, the base station shall set this field to ‘0’.

The mobile station is to indicate its capability to support the candidate band class and band subclass (if applicable) combination in the Registration Message, Origination Message, and Page Response Message.

TX_PWR_LIMIT_INCL - Transmit Power Limit Inclusion for the current base station

If the transmit power limit field is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.
TX_PWR_LIMIT - Transmit Power Limit for the current base station

If TX_PWR_LIMIT_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set to as follows.

The base station shall set this field to thirty dB more than transmit power limit in dBm EIRP, in steps of 1 dB. This field can take the values 30 to 53 corresponding to maximum transmit power values 0 dBm to 23 dBm.

BYPASS_REG_IND - Indication to bypass the power up registration upon the change of bands, serving systems and frequency blocks.

The base station shall set this field to ‘00’ if the mobile station is to perform a power up registration upon band, frequency block or serving system change.

The base station shall set this field to ‘01’ if the mobile station is to bypass the power up registration requirement upon band, frequency block or serving system changes due to processing the Extended CDMA Channel List Message.

The base station shall set this field to ‘10’ if the mobile station is to bypass the power up registration requirement upon band, frequency block or serving system change when the SID remains the same.

The base station shall set this field to ‘11’ if the mobile station is to bypass the power up registration requirement upon band, frequency block or serving system change.

NGHBR_PN 9
SEARCH_PRIORITY 2
FREQ_INCL 1
NGHBR_BAND 0 or 5
NGHBR_FREQ 0 or 11

/```

PILOT_PN - Pilot PN sequence offset index.

The base station shall set this field to the pilot PN sequence offset for this base station, in units of 64 PN chips.

CONFIG_MSG_SEQ - Configuration message sequence number.

The base station shall set this field to CONFIG_SEQ (see 3.6.2.2).

PILOT_INC - Pilot PN sequence offset index increment.

A mobile station searches for Remaining Set pilots at pilot PN sequence index values that are multiples of this value.

The base station shall set this field to the largest increment such that the pilot PN sequence offsets of all its neighbor base stations are integer multiples of that increment.

The base station shall set this field to a value in the range 1 to 15 inclusive.
The base station shall include one occurrence of the following record for each pilot that a mobile station is to place in its Neighbor Set.

NGHBR_CONFIG - Neighbor configuration.

The base station shall set this field to the value shown in Table 3.7.2.3.2.14-1 corresponding to the configuration of this neighbor.

### Table 3.7.2.3.2.14-1. Neighbor Configuration Field

<table>
<thead>
<tr>
<th>Value (binary)</th>
<th>Neighbor Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>000</td>
<td>The neighbor base station has the same number of frequencies having Paging Channels as the current base station. The neighbor base station has a CDMA frequency assignment corresponding to this CDMA frequency assignment with the same number of Paging Channels, and the neighbor CDMA frequency is given as follows:</td>
</tr>
<tr>
<td></td>
<td>• If FREQ_INCL equals ‘0’ for this record, this corresponding CDMA frequency assignment is the current CDMA frequency assignment.</td>
</tr>
<tr>
<td></td>
<td>• If FREQ_INCL equals ‘1’ for this record, this corresponding CDMA frequency assignment is given by NGHBR_BAND and NGHBR_FREQ.</td>
</tr>
<tr>
<td></td>
<td>The position of the neighbor CDMA frequency assignment in the CDMA Channel List Message or the Extended CDMA Channel List Message transmitted by the neighbor base station is the same as the position of this current CDMA frequency assignment in the CDMA Channel List Message or the Extended CDMA Channel List Message transmitted by the current base station.</td>
</tr>
</tbody>
</table>
001 The neighbor base station has the same number of frequencies having Paging Channels as the current base station. The neighbor base station has a CDMA frequency assignment corresponding to this CDMA frequency assignment with a different number of Paging Channels, and the neighbor CDMA frequency is given as follows:

- If FREQ_INCL equals ‘0’ for this record, this corresponding CDMA frequency assignment is the current CDMA frequency assignment.
- If FREQ_INCL equals ‘1’ for this record, this corresponding CDMA frequency assignment is given by NGHBR_BAND and NGHBR_FREQ.

The position of the neighbor CDMA frequency assignment in the CDMA Channel List Message or the Extended CDMA Channel List Message transmitted by the neighbor base station is the same as the position of this current CDMA frequency assignment in the CDMA Channel List Message or the Extended CDMA Channel List Message transmitted by the current base station.

This corresponding neighbor CDMA frequency assignment does have a Primary Paging Channel.

010 The neighbor base station may have a different number of frequencies having Paging Channels as the current base station. The neighbor base station has a Primary Paging Channel on the following CDMA frequency:

- If FREQ_INCL equals ‘0’ for this record, the neighbor base station has a Primary Paging Channel on the first CDMA Channel listed in the CDMA Channel List Message or the Extended CDMA Channel List Message transmitted by the current base station.
- If FREQ_INCL equals ‘1’ for this record, the neighbor base station has a Primary Paging Channel on the CDMA frequency assignment given by NGHBR_BAND and NGHBR_FREQ.
The neighbor base station configuration is unknown but the neighbor base station has a Pilot Channel on the following frequency:

- If FREQ_INCL equals ‘0’ for this record, the neighbor CDMA frequency assignment is the same as the current CDMA frequency assignment and has a Pilot Channel.
- If FREQ_INCL equals ‘1’ for this record, the CDMA frequency assignment given by NGHBR_BAND and NGHBR_FREQ has a Pilot Channel.

### Table 3.7.2.3.2.14-2. Search Priority Field

<table>
<thead>
<tr>
<th>Value (binary)</th>
<th>Search Priority</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Low</td>
</tr>
<tr>
<td>01</td>
<td>Medium</td>
</tr>
<tr>
<td>10</td>
<td>High</td>
</tr>
<tr>
<td>11</td>
<td>Very high</td>
</tr>
</tbody>
</table>

FREQ_INCL - Frequency included indicator.

If the NGHBR_BAND and NGHBR_FREQ fields are included for this neighbor base station, the base station shall set this bit to ‘1’. If the NGHBR_BAND and NGHBR_FREQ fields are not included for this neighbor base station, the base station shall set this bit to ‘0’.

NGHBR_BAND - Neighbor band class.

If the FREQ_INCL bit is set to ‘1’, the base station shall set this field to the CDMA band class, as specified in [30], corresponding to the CDMA frequency assignment for the CDMA Channel containing the Paging Channel the mobile station is to search. If the FREQ_INCL bit is set to ‘0’, the base station shall omit this field.
NGHBR_FREQ - Neighbor frequency assignment.

If the FREQ_INCL bit is set to '1', the base station shall set this field to the CDMA Channel number, in the specified CDMA band class, corresponding to the CDMA frequency assignment for the CDMA Channel containing the Paging Channel the mobile station is to search. If the FREQ_INCL bit is set to '0', the base station shall omit this field.
3.7.2.3.2.15 Status Request Message

MSG_TAG: STRQM

<table>

\]

<table>
<thead>
<tr>
<th>RECORD_TYPE</th>
<th>8</th>
</tr>
</thead>
</table>

\[
/ (\text{NUM_FIELDS})
\]

3

RESERVED - Reserved bits.

The base station shall set this field to ‘0000’.

6

QUAL_INFO_TYPE - Qualification information type.

The base station shall set this field to the value shown in Table 3.7.2.3.2.15-1 to show the inclusion of qualification information in the type-specific fields. The base station shall include the required qualification information in this message.

Table 3.7.2.3.2.15-1. Qualification Information Type

<table>
<thead>
<tr>
<th>Value (binary)</th>
<th>Included Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>00000000</td>
<td>None</td>
</tr>
<tr>
<td>00000001</td>
<td>BAND_CLASS</td>
</tr>
<tr>
<td>00000010</td>
<td>BAND_CLASS and OP_MODE</td>
</tr>
</tbody>
</table>

All other values are reserved.

14

QUAL_INFO_LEN - Qualification information length.

The base station shall set this field to the number of octets included in the type-specific fields of the qualification information.

18

Type-specific fields - Type-specific fields.

The base station shall set these fields to the qualification information according to the QUAL_INFO_TYPE field.
If QUAL_INFO_TYPE is equal to ‘00000000’, the type-specific fields are omitted.

If QUAL_INFO_TYPE is equal to ‘00000001’, the base station shall use the following fixed-length format for the type-specific fields:

<table>
<thead>
<tr>
<th>Type-specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAND_CLASS</td>
<td>5</td>
</tr>
<tr>
<td>RESERVED</td>
<td>3</td>
</tr>
</tbody>
</table>

If QUAL_INFO_TYPE is equal to ‘00000010’, the base station shall use the following fixed-length format for the type-specific fields:

<table>
<thead>
<tr>
<th>Type-specific Field</th>
<th>Length (bits)</th>

<tbody>
<tr>
<td>BAND_CLASS</td>
<td>5</td>
</tr>
<tr>
<td>OP_MODE</td>
<td>8</td>
</tr>
<tr>
<td>RESERVED</td>
<td>3</td>
</tr>
</tbody>
</table>

BAND_CLASS - Band class.

The base station shall set this field as defined in [30] to specify the band class qualification information.

OP_MODE - Operating mode.

The base station shall set this field as shown in Table 3.7.2.3.2.15-2 to specify the operating mode qualification information if MOB_P_REV of the current band class is less than or equal to three. The base station shall set this field as shown in Table 3.7.2.3.2.15-3 to specify the operating mode qualification information if MOB_P_REV of the current band class is greater than three.
Table 3.7.3.2.15-2. Operating Mode for MOB_P_REV

<td>[31]</td>
<td>00000110</td>
</tr>
</tbody>
</table>

All other values are reserved.

**NUM_FIELDS** - Number of requested fields in this message.

The base station shall set this field to the number of occurrences of RECORD_TYPE in this message.

The base station shall only request the status information records qualified by the included qualification information (see Table 2.7.4-1) in this message. The base station shall include one occurrence of the following field for each information record that is requested:

**RECORD_TYPE** - Information record type.

The base station shall set this field to the record type value shown in Table 2.7.4-1 corresponding to the information record requested.
If MOB_P_REV is equal to or greater than seven, the base station shall not request the Call Mode information record (record type ‘00000111’ in Table2.7.4-1).
### 3.7.2.3.2.16 Service Redirection Message

**MSG_TAG:** SRDM

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RETURN_IF_FAIL</td>
<td>1</td>
</tr>
<tr>

<tr>
<td>RECORD_LEN</td>
<td>8</td>
</tr>
<tr>
<td>Type-specific fields</td>
<td>8 x RECORD_LEN</td>
</tr>
</tbody>
</table>

**RETURN_IF_FAIL** - Return if fail indicator.

The base station shall set this field to ‘1’ if the mobile station is required to return to the system from which it is being redirected upon failure to obtain service using the redirection criteria specified in this message; otherwise, the base station shall set this field to ‘0’.

**DELETE_TMSI** - Delete TMSI indicator.

The base station shall set this field to ‘1’ if the mobile station is required to delete the TMSI assigned to the mobile station; otherwise, the base station shall set this field to ‘0’.

**REDIRECT_TYPE** - Redirect indicator.

The base station shall set this field to the REDIRECT_TYPE value shown in table 3.7.2.3.2.16-1 corresponding to the redirection type.

#### Table 3.7.2.3.2.16-1. Redirection Types

<table>
<thead>
<tr>
<th>Description</th>
<th>REDIRECT_TYPE (binary)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal redirection</td>
<td>0</td>
</tr>
<tr>
<td>NDSS redirection</td>
<td>1</td>
</tr>
</tbody>
</table>

**RECORD_TYPE** - Redirection record type.

The base station shall set this field to the RECORD_TYPE value shown in Table 3.7.2.3.2.16-2 corresponding to the type of redirection specified by this record.
### Table 3.7.2.3.2.16-2. Redirection Record Types

<table>
<thead>
<tr>
<th>Description</th>
<th>RECORD_TYPE (binary)</th>
</tr>
</thead>
<tbody>
<tr>
<td>NDSS off indication</td>
<td>00000000</td>
</tr>
<tr>
<td>Redirection to an analog system as defined in [12], [21], [22], [25], [24], and [6]</td>
<td>00000001</td>
</tr>
<tr>
<td>Redirection to a CDMA system as defined in [24] and [2]</td>
<td>00000010</td>
</tr>
<tr>
<td>Redirection to a TACS analog system as defined in Department of Trade and Industry’s TACS Mobile Station-Land Station Compatibility Specification, Issue 4, Amendment 1.</td>
<td>00000011</td>
</tr>
<tr>
<td>Redirection to a JTACS analog system as defined in ARIB's RCR STD-36.</td>
<td>00000100</td>
</tr>
<tr>
<td>Redirection to a DS-41 system as defined in [32].</td>
<td>00000101</td>
</tr>
</tbody>
</table>

All other RECORD_TYPE values are reserved.

**RECORD LEN** - Redirection record length.

If RECORD_TYPE equals to ‘00000000’, the base station shall set this field to ‘00000000’; otherwise, the base station shall set this field to the number of octets in the type-specific fields of this redirection record.

**Type-specific fields** - Redirection record type-specific fields.

The base station shall include type-specific fields based on the RECORD TYPE of this redirection record.

If RECORD_TYPE is equal to ‘00000000’, the base station shall not include the type-specific fields.

If RECORD_TYPE is equal to ‘00000001’, the base station shall include the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXPECTED_SID</td>
<td>15</td>
</tr>
<tr>
<td>IGNORE_CDMA</td>
<td>1</td>
</tr>
<tr>
<td>SYS_ORDERING</td>
<td>3</td>
</tr>
<tr>
<td>RESERVED</td>
<td>5</td>
</tr>
</tbody>
</table>
EXPECTED_SID - Expected SID.

If the base station is redirecting the mobile station to a specific system, the base station shall set this field to the SID of that system; otherwise, the base station shall set this field to 0.

IGNORE_CDMA - Ignore CDMA Available indicator.

The base station shall set this field to ‘1’ to indicate that the mobile station is to ignore the CDMA Capability Message on the analog system to which it is being redirected. The base station shall set this field to ‘0’ to indicate that the mobile station may discontinue service on the system to which it is being redirected if the mobile station receives a CDMA Capability Message with CDMA_AVAIL equal to ‘1’, and the preferred mode of the mobile station is CDMA.

SYS_ORDERING - System ordering.

The base station shall set this field to the SYS_ORDERING value shown in Table 3.7.2.3.2.16-3 corresponding to the order in which the mobile station is to attempt to obtain service on an analog system.
Table 3.7.2.3.2.16-3. SYS_ORDERING

<table>
<thead>
<tr>
<th>Description</th>
<th>SYS_ORDERING (binary)</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>custom system selection process (see 2.6.1.1.1).</td>
<td></td>
</tr>
<tr>
<td>Attempt to obtain service on System A only.</td>
<td>001</td>
</tr>
<tr>
<td>Attempt to obtain service on System B only.</td>
<td>010</td>
</tr>
<tr>
<td>Attempt to obtain service on System A first. If unsuccessful, attempt to</td>
<td>011</td>
</tr>
<tr>
<td>obtain service on System B.</td>
<td></td>
</tr>
<tr>
<td>Attempt to obtain service on System B first. If unsuccessful, attempt to</td>
<td>100</td>
</tr>
<tr>
<td>obtain service on System A.</td>
<td></td>
</tr>
<tr>
<td>Attempt to obtain service on either System A or System B. If unsuccessful,</td>
<td>101</td>
</tr>
<tr>
<td>attempt to obtain service on the alternate system (System A or System B).</td>
<td></td>
</tr>
</tbody>
</table>

All other SYS_ORDERING values are reserved

RESERVED - Reserved bits.
The base station shall set this field to ‘00000’.

If RECORD_TYPE is equal to ‘00000010’, the base station shall include the following fields:
1

<table>
<thead>
<tr>
<th>Subfield</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAND_CLASS</td>
<td>5</td>
</tr>
<tr>
<td>EXPECTED_SID</td>
<td>15</td>
</tr>
<tr>
<td>EXPECTED_NID</td>
<td>16</td>
</tr>
<tr>
<td>RESERVED</td>
<td>4</td>
</tr>
<tr>
<td>NUM_CHANS</td>
<td>4</td>
</tr>
</tbody>
</table>

NUM_CHANS occurrences of the following field:

\{' (NUM_CHANS)

| CDMA_CHAN        | 11            |

\}' (NUM_CHANS)

2

3 BAND_CLASS - Band class.
4 The base station shall set this field to the CDMA band class,
5 as specified in [30].

6 EXPECTED_SID - Expected SID.
7 If the base station is redirecting the mobile station to a
8 specific system, the base station shall set this field to the SID
9 of that system; otherwise, the base station shall set this field
10 to 0.

11 EXPECTED_NID - Expected NID.
12 If the base station is redirecting the mobile station to a
13 specific network, the base station shall set this field to the
14 NID of that network; otherwise, the base station shall set this
15 field to 65535.

16 RESERVED - Reserved bits.
17 The base station shall set this field to ‘0000’.

18 NUM_CHANS - Number of CDMA Channels.
19 The base station shall set this field to the number of
20 occurrences of the CDMA_CHAN field in this record.

21 CDMA_CHAN - CDMA Channel number.
22 For each CDMA Channel on which the mobile station is to
23 attempt to acquire a CDMA system, the base station shall
24 include one occurrence of this field specifying the associated
25 CDMA Channel number.

26 RESERVED - Reserved bits.
The base station shall add reserved bits as needed in order to make the length of the record equal to an integer number of octets. The base station shall set these bits to ‘0’.
3.7.2.3.2.17 General Page Message

MSG_TAG: GPM

When Layer 3 at the base station sends a PDU corresponding to the General Page Message to Layer 2, it also sends the GPM Common fields to Layer 2. These GPM Common fields and PDUs are used by Layer 2 to assemble a Layer 2 PDU corresponding to the General Page Message (see [4]).

GPM Common Fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONFIG_MSG_SEQ</td>
<td>6</td>
</tr>
<tr>
<td>ACC_MSG_SEQ</td>

</tr>
<tr>
<td>RESERVED</td>
<td>4</td>
</tr>
<tr>
<td>ADD_LENGTH</td>
<td>3</td>
</tr>
<tr>
<td>ADD_PFIELD</td>
<td>$8 \times ADD_LENGTH$</td>
</tr>
</tbody>
</table>

PDU Format for a mobile station-addressed page:

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>SERVICE_OPTION</td>
<td>0 or 16</td>
</tr>
</tbody>
</table>

PDU Format for a broadcast page: There are no Layer 3 fields associated with this record.

PDU Format for an enhanced broadcast page:
### Field Length (bits)

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>BCCH_INDEX_BCN</td>
<td>3</td>
</tr>
<tr>
<td>TIME_OFFSET</td>
<td>10</td>
</tr>
<tr>
<td>REPEAT_TIME_OFFSET</td>
<td>0 or 5</td>
</tr>
<tr>
<td>ADD_BCAST_RECORD</td>
<td>0 or 8 × extinction_BCAST_−SDU_LENGTH (see [4])</td>
</tr>
</tbody>
</table>

1

1. **CONFIG_MSG_SEQ** - Configuration message sequence number.
   - The base station shall set this field to CONFIG_SEQ (see 3.6.2.2).

2. **ACC_MSG_SEQ** - Access parameters message sequence number.
   - The base station shall set this field to ACC_CONFIG_SEQ (see 3.6.2.2).

3. **CLASS_0_DONE** - Class 0 pages are done.
   - If all messages and records directed to mobile stations operating in the slotted mode, active in this slot, and having an assigned class 0 IMSI have been sent by the end of this General Page Message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

4. **CLASS_1_DONE** - Class 1 pages are done.
   - If all messages and records directed to mobile stations operating in the slotted mode, active in this slot, and having an assigned class 1 IMSI have been sent by the end of this General Page Message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

5. **TMSI_DONE** - TMSI pages are done.
   - If all the page records having PAGE_CLASS equal to ‘10’ or other directed messages for mobile stations operating in the slotted mode, active in this slot, and having an assigned TMSI have been sent by the end of this General Page Message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

6. **ORDERED_TMSIS** - TMSIs sent in numerical order.
   - If all the page records of PAGE_CLASS equal to ‘10’ are sent such that the TMSI code values of the TMSI_CODE_ADDR fields for the mobile stations operating in the slotted mode are in ascending numerical order in all the General Page Messages sent within this slot, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

7. **BROADCAST_DONE** - Broadcast pages are done.
If all broadcast page records (PAGE_CLASS equal to ‘11’) have been sent by the end of this General Page Message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**RESERVED** - Reserved bits.

The base station shall set this field to ‘0000’.

**ADD_LENGTH** - Number of octets in the page message specific fields.

If there are no additional page message specific fields, the base station shall set this field to ‘000’.

**ADD_PFIELD** - Additional page message specific fields.

The base station shall not include any additional page message specific fields, if ADD_LENGTH is ‘000’.

**SERVICE_OPTION** - Service option.

If the base station requests a special service option (i.e., the SDU_INCLUDED field, see [4], is set to ‘1’), the base station shall set this field to the service option code shown in [30], corresponding to the requested service option; otherwise, the base station shall omit this field.

**BCCH_INDEX** - BCCH index

If NUM_BCCH_BCAST is equal to ‘000’, base station shall set this field to ‘000’ and this field is to be ignored by the mobile station.

Otherwise, The base station shall set this field to one less than Broadcast Control Channel Number (BCN) to which the mobile station is being redirected.

The base station shall not set this field to ‘000’ (reserved) or ‘001’.

**TIME_OFFSET** - BCCH time offset.

If NUM_BCCH_BCAST is equal to ‘000’, base station shall set this field to one less than the time offset, in units of 40 ms, from the beginning of the slot in which this message began to the beginning of the Forward Common Control Channel slot to which the mobile station is being directed.

Otherwise, The base station shall set this field to one less than the time offset, in units of 40 ms, from the beginning of the slot in which this message began to the beginning of the Broadcast Control Channel slot to which the mobile station is being directed.

**REPEAT_TIME_OFFSET** - BCCH offset of repeat.

If EXT_BCCH_SDU_LENGTH_IND (see [4]) is set to ‘01’ or ‘11’, the base station shall set this field as follows:
• If NUM_BCCH_BCAST is equal to ‘000’, the base station shall set this field to one less than the time offset, in units of 40 ms, from the time specified by TIME_OFFSET to the beginning of the Forward Common Control Channel slot to which the mobile station is being directed for a repeat of the broadcast message.

• Otherwise, the base station shall set this field to one less than the time offset, in units of 40 ms, from the time specified by TIME_OFFSET to the beginning of the Broadcast Control Channel slot to which the mobile station is being directed for a repeat of the broadcast message;

Otherwise, the base station shall omit this field.

ADD_BCAST_RECORD - Additional broadcast information record.

The base station shall omit this field if EXT_BCAST_SDU_LENGTH_IND (see [4]) is set to ‘00’ or ‘01’; otherwise, the base station shall include EXT_BCAST_SDU_LENGTH (see [4]) octets in this field.
3.7.2.3.2.18 Global Service Redirection Message

**MSG_TAG: GSRDM**

<table>
<thead>
<tr>

<td>1</td>
<td>Access overload class 15</td>
</tr>
</tbody>
</table>

The base station shall set the subfields corresponding to the access overload classes of mobile stations which are to be redirected to ‘1’, and shall set the remaining subfields to ‘0’.

RETURN_IF_FAIL - Return if fail indicator.

The base station shall set this field to ‘1’ if the mobile station is required to return to the system from which it is being redirected upon failure to obtain service using the redirection criteria specified in this message; otherwise, the base station shall set this field to ‘0’.

DELETE_TMSI - Delete TMSI indicator.

The base station shall set this field to ‘1’ if the mobile station, which the corresponding REDIRECT_ACCOLC subfield is set to ‘1’, is required to delete the TMSI assigned to the mobile station; otherwise, the base station shall set this field to ‘0’.

EXCL_P_REV_MS - Exclude redirection indicator.
If this message does not apply to mobile stations with MOB_P_REV greater than or equal to six, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**RECORD_TYPE** - Redirection record type.

The base station shall set this field to the RECORD_TYPE value shown in Table 3.7.2.3.2.16-2 corresponding to the type of redirection specified by this record.

**RECORD_LEN** - Redirection record length.

The base station shall set this field to the number of octets in the type-specific fields of this redirection record.

**Type-specific fields** - Redirection record type-specific fields.

The base station shall include type-specific fields based on the RECORD_TYPE of this redirection record.

If RECORD_TYPE is equal to ‘00000001’, the base station shall include the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXPECTED_SID</td>
<td>15</td>
</tr>
<tr>
<td>IGNORE_CDMA</td>
<td>1</td>
</tr>
<tr>
<td>SYS_ORDERING</td>
<td>3</td>
</tr>
<tr>
<td>MAX_REDIRECT_DELAY</td>
<td>5</td>
</tr>
</tbody>
</table>

**EXPECTED_SID** - Expected SID.

If the base station is redirecting the mobile station to a specific system, the base station shall set this field to the SID of that system; otherwise, the base station shall set this field to 0.

**IGNORE_CDMA** - Ignore CDMA Available indicator.

The base station shall set this field to ‘1’ to indicate that the mobile station is to ignore the CDMA Capability Message on the analog system to which it is being redirected. The base station shall set this field to ‘0’ to indicate that the mobile station may discontinue service on the system to which it is being redirected if the mobile station receives a CDMA Capability Message with CDMA_AVAIL equal to ‘1’, and the preferred mode of the mobile station is CDMA.

**SYS_ORDERING** - System ordering.

The base station shall set this field to the SYS_ORDERING value shown in Table 3.7.2.3.2.16-3 corresponding to the order in which the mobile station is to attempt to obtain service on an analog system.

**MAX_REDIRECT_DELAY** - Maximum delay upon redirection.
The base station shall set this field to the maximum delay time, in units of 8 second increments, to be used by mobile stations in the event of a global redirection to analog mode. This operation can be invoked to avoid overloading an underlying analog cell’s reverse control channel.

If RECORD_TYPE is equal to ‘00000010’, the base station shall include the following fields:

<table>
<thead>
<tr>
<th>Subfield</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAND_CLASS</td>
<td>5</td>
</tr>
<tr>
<td>EXPECTED_SID</td>
<td>15</td>
</tr>
<tr>
<td>EXPECTED_NID</td>
<td>16</td>
</tr>
<tr>
<td>RESERVED</td>
<td>4</td>
</tr>
<tr>
<td>NUM_CHANS</td>
<td>4</td>
</tr>
</tbody>
</table>

NUM_CHANS occurrences of the following field:

| CDMA_CHAN | 11 |

| RESERVED   | 0-7 (as needed) |

BAND_CLASS - Band class.
The base station shall set this field to the CDMA band class, as specified in [30].

EXPECTED_SID - Expected SID.
If the base station is redirecting the mobile station to a specific system, the base station shall set this field to the SID of that system; otherwise, the base station shall set this field to 0.

EXPECTED_NID - Expected NID.
If the base station is redirecting the mobile station to a specific network, the base station shall set this field to the NID of that network; otherwise, the base station shall set this field to 65535.

RESERVED - Reserved bits.
The base station shall set this field to ‘0000’.

NUM_CHANS - Number of CDMA Channels.
The base station shall set this field to the number of occurrences of the CDMA_CHAN field in this record.

CDMA_CHAN - CDMA Channel number.
For each CDMA Channel on which the mobile station is to attempt to acquire a CDMA system, the base station shall include one occurrence of this field specifying the associated CDMA Channel number.

RESERVED - Reserved bits.

The base station shall add reserved bits as needed in order to make the length of the record equal to an integer number of octets. The base station shall set these bits to '0'.
3.7.2.3.2.19 TMSI Assignment Message

MSG_TAG: TASM

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>

<td>32</td>
</tr>
<tr>
<td>TMSI_EXP_TIME</td>
<td>24</td>
</tr>
</tbody>
</table>

1. **RESERVED** - Reserved bits. The base station shall set this field to ‘00000’.
2. **TMSI_ZONE_LEN** - TMSI zone length. The base station shall set this field to the number of octets included in the TMSI_ZONE. The base station shall set this field to a value in the range 1 to 8 inclusive.
3. **TMSI_ZONE** - TMSI zone. The base station shall set this field to the TMSI zone number, as specified in [27].
4. **TMSI_CODE** - Temporary mobile station identity code. The base station shall set this field to the 32-bit TMSI code assigned to the mobile station.
5. **TMSI_EXP_TIME** - TMSI expiration time. If the base station is to deassign the TMSI, the base station shall set all the bits in this field to ‘1’.
6. The base station shall set this field to the System Time in the units of $80 \text{ ms} \times 2^{12}$ when the TMSI is to expire.
1 3.7.2.3.2.20 PACA Message
2 MSG_TAG: PACAM

<table>
<thead>
<tr>
<th>Field</th>

<tr>
<td>PURPOSE</td>
<td>4</td>
</tr>
<tr>
<td>Q_POS</td>
<td>8</td>
</tr>
<tr>
<td>PACA_TIMEOUT</td>
<td>3</td>
</tr>
</tbody>
</table>

3 RESERVED - Reserved bits.

The base station shall set this field to ‘0000000’.

4 PURPOSE - Purpose of the PACA Message.

The base station shall set this field to the appropriate PURPOSE code from Table 3.7.2.3.2.20-1 to indicate the purpose of the message.

Table 3.7.2.3.2.20-1. Purpose of PACA Message

<table>
<thead>
<tr>
<th>PURPOSE (binary)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>Indicates that the purpose of the message is to respond to an Origination Message.</td>
</tr>
<tr>
<td>0001</td>
<td>Indicates that the purpose of the message is to provide the queue position of the PACA call.</td>
</tr>
<tr>
<td>0010</td>
<td>Indicates that the purpose of the message is to instruct the mobile station to re-originate the PACA call.</td>
</tr>
<tr>
<td>0011</td>
<td>Indicates that the purpose of the message is to cancel the PACA call.</td>
</tr>
<tr>
<td>0100 – 1111</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

5 Q_POS - PACA queue position.
If the PURPOSE field of this message is set to ‘0000’ or ‘0001’, the base station shall set this field to the queue position of the PACA call. If the queue position exceeds 255, the base station shall set this field to ‘11111111’. If the queue position is unknown or the PURPOSE field of this message is set to ‘0010’ or ‘0011’, the base station shall set this field to ‘00000000’.

PACA_TIMEOUT - PACA state timer duration.

The base station shall set this field to the PACA_TIMEOUT value shown in Table 3.7.2.3.2.20-2 corresponding to the length of the PACA state timer to be used by the mobile stations.

**Table 3.7.2.3.2.20-2. Value of PACA State Timer**

</tbody>
</table>

All other values are reserved.

DIRECT_CH_ASSIGN_IND - Direct Channel Assignment Indicator.

If ASSIGN_MODE is set to a value other than ‘100’ or ‘101’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If any channel assigned by this message is to use Radio Configuration 1 or 2 (see [2]), then the base station shall set this field to ‘0’. Otherwise, base station shall set this field as follows:

If this message is for a mobile station terminated call using direct channel assignment, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

If this field is set to ‘1’, the base station should send this message in unassured mode.

RESERVED_2 - Reserved bits.

If ASSIGN_MODE is set to ‘100’ or ‘101’, the base station shall set this field to ‘0000’; otherwise, the base station shall set this field to ‘00000’.

Additional record fields - Additional record fields.

The additional record fields are determined by the value of ASSIGN_MODE, as described below.

If the ASSIGN_MODE field is set to ‘000’, the base station shall include the following fields:
FREQ_INCL - Frequency included indicator.
If the BAND_CLASS and CDMA_FREQ fields are included in this assignment record, the base station shall set this bit to ‘1’. If the BAND_CLASS and CDMA_FREQ fields are not included in this assignment record, the base station shall set this bit to ‘0’.

DEFAULT_CONFIG - Default Configuration.
If the GRANTED_MODE field is set to ‘00’, the base station shall set this field as specified in Table 3.7.2.3.2.21-2 to indicate an initial multiplex option and radio configuration for the Forward and Reverse Traffic Channels.
If MOB_P_REV is less than six, the base station shall not set this field to ‘100’.

Table 3.7.2.3.2.21-2. Default Configuration

<table>
<thead>
<tr>
<th>Value (binary)</th>

<td>Multiplex Option 2 and Radio Configuration 2 for the Forward Traffic channel; Multiplex Option 1 and Radio Configuration 1 for the Reverse Traffic channel</td>
</tr>
<tr>
<td>100</td>
<td>FOR_FCH_RC or FOR_RC included in this message for the Forward Fundamental Channel or the Forward Dedicated Control Channel and REV_FCH_RC or REV_RC included in this message for the Reverse Fundamental or the Reverse Dedicated Control Channel. Use 20ms frames. Use Multiplex Option 1 for radio configurations that include the bit rate of 9600 bps; Use Multiplex Option 2 for radio configurations that include the bit rate of 14400 bps.</td>
</tr>
</tbody>
</table>

All other values are reserved.
BYPASS_ALERT_ANSWER - Bypass alert indicator.
If the mobile station is to bypass the Waiting for Order Substate and the Waiting for Mobile Station Answer Substate, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

RESERVED - Reserved bit.
The base station shall set this field to ‘0’.

NUM_PILOTS - Number of pilots in the Active Set.
The base station shall set this field to number of pilots that are to be in the mobile station’s Active Set on the Traffic Channel minus one. The base station shall set this field to the value in the range 0 to N6m-1 inclusive.

GRANTED_MODE - Granted mode.
The base station shall set this field to ‘00’ to indicate that the mobile station is to use an initial service configuration consisting of the multiplex option and radio configuration defined by the DEFAULT_CONFIG field for the Forward and Reverse Traffic Channels, and to indicate that service negotiation may take place before the base station sends one of the following messages: Service Connect Message, General Handoff Direction Message (with SCR) or Universal Handoff Direction Message (with SCR).

The base station shall set this field to ‘01’ to indicate that the mobile station is to use an initial service configuration consisting of the default multiplex option that is derived from the radio configuration corresponding to Table 3.7.2.3.2.21-3, and to indicate that service negotiation may take place before the base station sends one of the following messages: Service Connect Message, General Handoff Direction Message (with SCR) or Universal Handoff Direction Message (with SCR).

The base station shall set this field to ‘10’ to indicate that the mobile station is to use an initial service configuration consisting of the default multiplex option that is derived from the radio configuration corresponding to Table 3.7.2.3.2.21-3, and to indicate that service negotiation is not to take place before the base station sends one of the following messages: Service Connect Message, General Handoff Direction Message (with SCR) or Universal Handoff Direction Message (with SCR).
<table>

Reverse Link: RC2, RC4 or RC 6 |
| Multiplex Option 0xf00 | Forward link: RC10  
Reverse Link: RC7 |

**Table 3.7.2.3.2.21-3. Mapping between Multiplex Options and Radio Configurations**

- **FRAME_OFFSET** - Frame offset.  
The Forward and Reverse Traffic Channel frames are delayed FRAME_OFFSET × 1.25 ms relative to system timing (see [2]).  
The base station shall set this field to the Forward and Reverse Traffic Channel frame offset.

- **ENCRYPT_MODE** - Message encryption mode.  
The base station shall set this field to the ENCRYPT_MODE value shown in Table 3.7.2.3.2.8-2 corresponding to the encrypting mode that is to be used for signaling messages, as specified in 2.3.12.2.

- **BAND_CLASS** - Band class.  
If the FREQ_INCL bit is set to ‘1’, the base station shall set this field to the CDMA band class, as specified in [30], corresponding to the CDMA frequency assignment for the CDMA Channel containing the Forward Traffic Channel the mobile station is to use. If the FREQ_INCL bit is set to ‘0’, the base station shall omit this field.
The base station shall include NUM_PILOTS plus one occurrences of the following three-field record, one for each member of the mobile station’s Active Set on the Traffic Channel.

**CDMA_FREQ** - Frequency assignment.

If the FREQ_INCL bit is set to ‘1’, the base station shall set this field to the CDMA Channel number, in the specified CDMA band class, corresponding to the CDMA frequency assignment for the CDMA Channel containing the Forward Traffic Channel the mobile station is to use. If the FREQ_INCL bit is set to ‘0’, the base station shall omit this field.

The base station shall include NUM_PILOTS plus one occurrences of the following three-field record, one for each member of the mobile station’s Active Set on the Traffic Channel.

**PILOT_PN** - Pilot PN sequence offset index.

The base station shall set this field to the pilot PN sequence offset for this pilot in units of 64 PN chips.

**PWR_COMB_IND** - Power control symbol combining indicator.

If the Forward Traffic Channel associated with this pilot will carry the same closed-loop power control subchannel bits as that of the previous pilot in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’. For the first occurrence of this record in the message, the base station shall set this field to ‘0’.

**CODE_CHAN** - Code channel index.

The base station shall set this field to the code channel index (see [2]) that the mobile station is to use on the Forward Traffic Channel associated with this pilot. If Radio Configuration 1, 2, 3, or 5 (see [2]) is used, the base station shall set this field in the range 1 to 63 inclusive. If Radio Configuration 4, 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

**FOR_FCH_RC** - Forward Fundamental Channel radio configuration

The base station shall set this field to the radio configuration (see Table 3.7.2.3.2.21-4) to be used by the mobile station on the Forward Fundamental Channel before the first *Service Connect Message* is sent to the mobile station.

If GRANTED_MODE is set to ‘00’, and DEFAULT_CONFIG is not set to ‘100’ (see Table 3.7.2.3.2.21-2), the base station shall set this field to either ‘00001’ or ‘00010’ (see Table 3.7.2.3.2.21-4).

**REV_FCH_RC** - Reverse Fundamental Channel radio configuration

The base station shall set this field to the radio configuration (see Table 3.7.2.3.2.21-4) to be used by the mobile station on the Reverse Fundamental Channel before the first *Service Connect Message* is sent to the mobile station.
If GRANTED_MODE is set to ‘00’, and DEFAULT_CONFIG is not set to ‘100’ (see Table 3.7.2.3.2.21-2), the base station shall set this field to either ‘00001’ or ‘00010’ (see Table 3.7.2.3.2.21-4).

</tbody>
</table>

All other values are reserved.

FPC_FCH_INIT_SETPT - Initial Fundamental Channel outer loop $E_b/N_t$ setpoint. The base station shall set this field to initial Fundamental Channel outer loop $E_b/N_t$ setpoint, in units of 0.125 dB.

FPC_SUBCHAN_GAIN - Forward power control subchannel relative gain. The base station shall set FPC_SUBCHAN_GAIN equal to the power level of the forward link power control subchannel relative to the power level of 20 ms frames at a 9600 bps or 14400 bps rate of the Forward Fundamental Channel that the Forward Power Control Subchannel is punctured on. The base station shall set the value in units of 0.25 dB.

RLGAIN_ADJ - Reverse Traffic Channel power relative to access power. The base station shall set this field to adjust the initial Traffic Channel transmission power relative to the Access Channel or Enhanced Access Channel transmission power. The base station shall set this field as a two’s complement signed binary number, in units of 1 dB.

FPC_FCH_FER - Fundamental Channel target Frame Error Rate. The base station shall set this field to the target Frame Error Rate on the Forward Fundamental Channel, as specified in Table 3.7.3.3.2.25-2.
C.S0005-D v2.0

1 FPC_FCH_MIN_SETPT - Minimum Fundamental Channel Outer Loop Eb/Nt setpoint.
2 The base station shall set this field to minimum Fundamental
3 Channel Outer Loop Eb/Nt setpoint, in units of 0.125 dB.
4
5 FPC_FCH_MAX_SETPT - Maximum Fundamental Channel Outer Loop Eb/Nt setpoint.
6 The base station shall set this field to maximum Fundamental
7 Channel Outer Loop Eb/Nt setpoint, in units of 0.125 dB.
8
9 REV_FCH_GATING_MODE - Reverse eighth gating mode indicator.
10 The base station shall set this field to ‘1’ if the mobile station
11 is allowed to perform the reverse eighth gating mode where
12 the 1/8th rate frames on the Reverse Fundamental Channel
13 are gated off for 10 ms per frame (see [2]); otherwise, the base
14 station shall set this field to ‘0’.
15
16 REV_PWR_CNTL_DELAY_INCL - Reverse power control delay included indicator.
17 If REV_FCH_GATING_MODE is set to ‘0’, the base station
18 shall omit this field; otherwise, the base station shall include
19 this field and set it as follows.
20
21 REV_PWR_CNTL_DELAY - The reverse power control delay.
22 If REV_PWR_CNTL_DELAY_INCL is set to ‘0’, the base station
23 shall omit this field; otherwise, the base station shall include
24 this field and set it as follows:
25
26 D_SIG_ENCRYPT_MODE - Dedicated channel signaling encryption mode indicator.
27 If ENCRYPT_MODE is set to ‘11’, the base station shall include
28 this field and shall set it to the dedicated channel signaling
29 encryption mode, as shown in Table 3.7.4.5-1; otherwise the base
30 station shall omit this field.
31
32 ENC_KEY_SIZE - Encryption key size indication.
If ENCRYPT_MODE is set to ‘10’ or ‘11’, the base station shall include this field and shall set it to the encryption key size, as shown in Table 3.7.4.5-2; otherwise, the base station shall omit this field.

**C_SIG_ENCRYPT_MODE_INCL** - Common channel signaling encryption mode included indicator.

If common channel signaling encryption information is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**C_SIG_ENCRYPT_MODE** - Common channel signaling encryption mode indicator.

If C_SIG_ENCRYPT_MODE_INCL is set to ‘1’, the base station shall include this field and shall set it to the common channel signaling encryption mode, as shown in Table 3.7.4.5-1; otherwise, the base station shall omit this field.

**MSG_INT_INFO_INCL** - Message integrity information included indicator

The base station shall set this field to ‘1’ if the base station supports message integrity; otherwise, the base station shall set this field to ‘0’. If this field is set to ‘1’, the base station shall require the LAC Layer to include a MACI in this message; otherwise, the base station shall require the LAC Layer not to include a MACI in this message.

**CHANGE_KEYS** - Change keys indicator

If MSG_INT_INFO_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘0’ to command the mobile station not to update the encryption key and integrity key. The base station shall set this field to ‘1’ to command the mobile station to update the encryption key and integrity key to the latest being generated.

**USE_UAK** - Use UAK indicator

If MSG_INT_INFO_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the base station receives an authentication vector with a UAK, the base station shall set this field to ‘1’ to indicate that the mobile station is to use UMAC; otherwise, the base station shall set this field to ‘0’ to indicate that the mobile station is to use MAC-I.

**PLCM_TYPE_INCL** - The Public Long Code Mask type included indicator.

The base station shall set this field to ‘1’ if the base station include PLCM_TYPE in the message; otherwise, the base station shall set this field to ‘0’.

**PLCM_TYPE** - The Public Long Code Mask type indicator.
If PLCM_TYPE_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to the corresponding Public Long Code Mask type as specified in Table 3.7.2.3.2.21-5.

PLCM_TYPE ‘0010’ shall not be used when the mobile station is not in its home country (i.e., the MCC of the mobile station is different from the MCC of this base station).

PLCM_TYPE ‘0011’ shall not be used when the mobile station is not in its home network (i.e., the MCC or MNC of the mobile station is different from the MCC or MNC of this base station).

</table>

PLCM_39 - The 39 LSBs bits of the Public Long Code Mask.

If PLCM_TYPE is not set to ‘0001’, the base station shall omit this field; otherwise, the base station shall include this field and set it to the 39 least significant bits of the public long code mask as defined in 3.6.4.1.5.

RESERVED - Reserved bits.

The base station shall add reserved bits as needed in order to make the total length of the fields after the preceding ADD_RECORD_LEN field through this RESERVED field equal to an integer number of octets. The base station shall set these bits to ‘0’.

If the ASSIGN_MODE field is set to ‘001’, the base station shall include the following fields:

RESPOND - Respond on new Access Channel indicator.

If the mobile station is to retransmit an Origination Message or Page Response Message after processing this channel assignment, the base station shall set this field to ‘1’. The base station may set this field to ‘0’ only in response to a Page Response Message.
FREQ_INCL - Frequency included indicator.

If the BAND_CLASS and CDMA_FREQ fields are included in this assignment record, the base station shall set this bit to ‘1’. If the BAND_CLASS and CDMA_FREQ fields are not included in this assignment record, the base station shall set this bit to ‘0’.

BAND_CLASS - Band class.

If the FREQ_INCL bit is set to ‘1’, the base station shall set this field to the CDMA band class, as specified in [30], corresponding to the CDMA frequency assignment for the CDMA Channel containing the Paging Channel the mobile station is to use. If the FREQ_INCL bit is set to ‘0’, the base station shall omit this field.

CDMA_FREQ - Frequency assignment.

If the FREQ_INCL bit is set to ‘1’, the base station shall set this field to the CDMA Channel number, in the specified CDMA band class, corresponding to the CDMA frequency assignment for the CDMA Channel containing the Paging Channel the mobile station is to use. If the FREQ_INCL bit is set to ‘0’, the base station shall omit this field.

NUM_PILOTS - Number of pilots whose Paging Channel may be monitored.

The base station shall set this field to the number of pilots whose Paging Channel may be monitored by the mobile station minus one. The base station shall set this field to the value in the range 0 to N8m – 1 inclusive.

PILOT_PN - Pilot PN sequence offset index.

The base station shall include one occurrence of this field for each base station whose Paging Channel may be monitored by the mobile station. For each occurrence, the base station shall set this field to the pilot PN sequence offset for a base station, in units of 64 PN chips. The base station having this pilot PN sequence offset should support a Primary Paging Channel with the same Paging Channel rate as the current base station.

RESERVED - Reserved bits.

The base station shall add reserved bits as needed in order to make the total length of the fields after the preceding ADD_RECORD_LEN field through this RESERVED field equal to an integer number of octets. The base station shall set these bits to ‘0’.

If the ASSIGN_MODE field is set to ‘010’, the base station shall include the following fields:

RESPOND - Respond on analog control channel indicator.
If the mobile station is to retransmit an *Origination Message* or *Page Response Message* on the analog control channel (see [6]) after processing this channel assignment, the base station shall set this field to ‘1’. The base station may set this field to ‘0’ only in response to a *Page Response Message*.

**ANALOG_SYS** - System indicator.

If USE_ANALOG_SYS is equal to ‘0’, the base station shall set this field to ‘0’; otherwise, the base station shall set this field to ‘0’ if the mobile station is to use analog system A, or to ‘1’ if the mobile station is to use analog system B.

**USE_ANALOG_SYS** - Use analog system indicator.

The base station shall set this field to ‘1’ to direct the mobile station to the analog system specified by ANALOG_SYS; otherwise, the base station shall set this field to ‘0’.

**BAND_CLASS** - Band class.

The base station shall set this field according to values defined in [30].

If the ASSIGN_MODE field is set to ‘011’, the base station shall include the following fields:

**SID** - System identification of the analog system.

The base station shall set this field to the system identification of the analog system supporting the assigned voice channel for this assignment (see [6]).

**VMAC** - Voice mobile station attenuation code.

The base station shall set this field to the mobile station power level associated with the assigned voice channel for this assignment (see [6]).

**ANALOG_CHAN** - Voice channel number.

The base station shall set this field to the voice channel number for this assignment (see [6]).

**SCC** - SAT color code.

The base station shall set this field to the supervisory audio tone color code associated with the assigned voice channel. If the assignment is to a narrow analog channel, the base station shall set this field to the two least significant bits of the DSCC.

**MEM** - Message encryption mode indicator.

If analog control message encryption is to be enabled on the assigned forward and reverse analog voice channels, the base station shall set this bit to ‘1’; otherwise, the base station shall set this bit to ‘0’.

**AN_CHAN_TYPE** - Analog voice channel type.
The base station shall set this field to the analog channel type as specified in Table 3.7.3.3.2.6-1. If the mobile station does not have narrow analog capability, the base station shall set this field to ‘00’.

DSCC_MSB - Digital supervisory audio tone color code most significant bit. The base station shall set this field to ‘0’ when directing handoff to a wide analog channel. The base station shall set this field to the most significant bit of the DSCC when directing handoff to a narrow analog channel.

BAND_CLASS - Band class.

The base station shall set this field according to values defined in [30].

If the ASSIGN_MODE field is set to ‘100’, the base station shall include the following fields:

FREQ_INCL - Frequency included indicator.

If the BAND_CLASS and CDMA_FREQ fields are included in this assignment record, the base station shall set this bit to ‘1’. If the BAND_CLASS and CDMA_FREQ fields are not included in this assignment record, the base station shall set this bit to ‘0’.

BAND_CLASS - Band class.

If the FREQ_INCL bit is set to ‘1’, the base station shall set this field to the CDMA band class, as specified in [30], corresponding to the CDMA frequency assignment for the CDMA Channel containing the Forward Traffic Channel(s) the mobile station is to use. If the FREQ_INCL bit is set to ‘0’, the base station shall omit this field.

CDMA_FREQ - Frequency assignment.

If the FREQ_INCL bit is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If FOR_RC is set to a Radio Configuration associated with Spreading Rate 1, the FREQ_INCL bit is set to ‘1’, the base station shall set this field to the CDMA Channel number, in the specified CDMA band class, corresponding to the CDMA frequency assignment for the CDMA Channel containing the Forward Traffic Channel(s) the mobile station is to use. If FOR_RC is set to a Radio Configuration associated with Spreading Rate 3, the base station shall set this field to the center SR3 frequency assignment containing the Forward Traffic Channel(s) the mobile station is to use.

BYPASS_ALERT_ANSWER - Bypass alert indicator.

If the mobile station is to bypass the Waiting for Order Substate and the Waiting for Mobile Station Answer Substate, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.
GRANTED_MODE - Granted mode.

The base station shall set this field to ‘00’ to indicate that the mobile station is to use an initial service configuration consisting of the multiplex option and Radio Configuration defined by the DEFAULT_CONFIG field for the Forward and Reverse Traffic channels, and to indicate that service negotiation may take place before the base station sends one of the following messages: Service Connect Message, General Handoff Direction Message (with SCR) or Universal Handoff Direction Message (with SCR).

The base station shall set this field to ‘01’ to indicate that the mobile station is to use an initial service configuration consisting of the default multiplex option that is derived from the radio configuration corresponding to Table 3.7.2.3.2.21-3, and to indicate that service negotiation may take place before the base station sends one of the following messages: Service Connect Message, General Handoff Direction Message (with SCR) or Universal Handoff Direction Message (with SCR).

The base station shall set this field to ‘10’ to indicate that the mobile station is to use an initial service configuration consisting of the default multiplex option that is derived from the radio configuration corresponding to Table 3.7.2.3.2.21-3, and to indicate that service negotiation is not to take place before the base station sends one of the following messages: Service Connect Message, General Handoff Direction Message (with SCR) or Universal Handoff Direction Message (with SCR).

The base station shall set this field to ‘11’ to instruct the mobile station to use the stored service configuration (that is, both the Service Configuration information record and the Non-negotiable Service Configuration information record).

SR_ID_RESTORE - Service reference identifier to be restored.

If the GRANTED_MODE field is not set to ‘11’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

- If the mobile station is to restore all the service option connections from the stored service configuration, the base station shall set this field to ‘111’.
- If the mobile station is to restore more than one but not all the service option connections from the stored service configuration, the base station shall set this field to ‘000’.
- Otherwise, the base station shall set this field to the service reference identifier corresponding to the service option connection to be restored.
SR_ID_RESTORE_BITMAP – Bitmap of service reference identifiers to be restored.

If the SR_ID_RESTORE field is included and set to ‘000’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

This field consists of the subfields defined in Table 3.7.2.3.2.21-6. The base station shall set a subfield to ‘1’ to indicate that the mobile station is to restore the service option connection of the corresponding service reference identifier; otherwise, the base station shall set the subfield to ‘0’.

DEFAULT_CONFIG - Default Configuration.

If the GRANTED_MODE field is set to ‘00’, the base station shall set this field as specified in Table 3.7.2.3.2.21-2 to indicate an initial multiplex option and Radio Configuration for the Forward and Reverse Traffic Channels.

FOR_RC - Forward Traffic Channel radio configuration.

The base station shall set this field to the radio configuration (see Table 3.7.2.3.2.21-4) to be used by the mobile station on the Forward Traffic (Fundamental and Dedicated Control) Channel before the first Service Connect Message is sent to the mobile station.

If GRANTED_MODE is set to ‘00’, and DEFAULT_CONFIG is not set to ‘100’ (see Table 3.7.2.3.2.21-2), the base station shall set this field to either ‘00001’ or ‘00010’ (see Table 3.7.2.3.2.21-4).

REV_RC - Reverse Traffic Channel radio configuration.

The base station shall set this field to the radio configuration (see Table 3.7.2.3.2.21-4) to be used by the mobile station on the Reverse Traffic (Fundamental and Dedicated Control) Channel before the first Service Connect Message is sent to the mobile station.
If GRANTED_MODE is set to ‘00’, and DEFAULT_CONFIG is not set to ‘100’ (see Table 3.7.2.3.2.21-2), the base station shall set this field to either ‘0001’ or ‘0010’ (see Table 3.7.2.3.21-3).

FRAME_OFFSET - Frame offset.
The Forward and Reverse Traffic Channel frames are delayed FRAME_OFFSET × 1.25 ms relative to system timing [see [2]].
The base station shall set this field to the Forward and Reverse Traffic Channel frame offset.

ENCRYPT_MODE - Message encryption mode.
The base station shall set this field to the ENCRYPT_MODE value shown in Table 3.7.2.3.2.8-2 corresponding to the encrypting mode that is to be used for signaling messages, as specified in 2.3.12.2.

FPC_SUBCHAN_GAIN - Forward Power Control Subchannel relative gain.
The base station shall set FPC_SUBCHAN_GAIN equal to the power level of the forward link power control subchannel relative to the power level of 20 ms frames at a 9600 bps or 14400 bps rate on the Forward Fundamental Channel or the Forward Dedicated Control Channel indicated by FPC_PRI_CHAN. The base station shall set the value in units of 0.25 dB.

RLGAIN_ADJ - Reverse Traffic Channel power.
If DIRECT_CH_ASSIGN_IND field is set to ‘0’, the base station shall set this field to adjust the initial Traffic Channel transmission power relative to the Access Channel or Enhanced Access Channel transmission power. The base station shall set this field as a two’s complement signed binary number, in units of 1 dB.
If DIRECT_CH_ASSIGN_IND field is set to ‘1’, the base station shall set this field to adjust the initial Traffic Channel transmission power as specified 2.6.4.2. The base station shall set this field as a two’s complement signed binary number, in units of 1 dB.

NUM_PILOTS - Number of pilots in the Active Set.
The base station shall set this field to number of pilots that are to be in the mobile station’s Active Set on the Traffic Channel minus one. The base station shall set this field to the value in the range 0 to N_{6m}-1 inclusive.

CH_IND - Channel indicator.
The base station shall set this field as shown in Table 3.7.2.3.2.21-7.
Table 3.7.2.3.21-7. Channel Indicator

<table>
<thead>
<tr>
<th>Value (Binary)</th>

<tr>
<td>10</td>
<td>Dedicated Control Channel only</td>
</tr>
<tr>
<td>11</td>
<td>Both Fundamental Channel and Dedicated Control Channel</td>
</tr>
</tbody>
</table>

CH_RECORD_LEN - Channel record length.
The base station shall set this field to the number of octets in the CH_RECORD_FIELDS included in this channel record.

CH_RECORD_FIELDS - Channel record fields.
The channel record fields are determined by the value of CH_IND, as described below.

REV_FCH_GATING_MODE - Reverse eighth gating mode indicator.
The base station shall set this field to ‘1’ if the mobile station is allowed to perform the reverse eighth gating mode where the 1/8th rate frames on the Reverse Fundamental Channel are gated off for 10 ms per frame (see [2]); otherwise, the base station shall set this field to ‘0’.
The base station shall not set this field to ‘1’ if REV_FCH_GATING_REQ included in the Origination Message or Page Response Message is set to ‘0’.

REV_PWR_CNTL_DELAY_INCL - Reverse power control delay included indicator.
If REV_FCH_GATING_MODE is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.
The base station shall set this field to ‘1’ if REV_PWR_CNTL_DELAY is included in this message; otherwise, the base station shall set this field to ‘0’.
If the REV_FCH_GATING_MODE field in this message is set to ‘1’ and the REV_PWR_CNTL_INCL field in the Extended System Parameters Message is set to ‘0’, the base station shall set this field to ‘1’.

REV_PWR_CNTL_DELAY - The reverse power control delay.
If REV_PWR_CNTL_DELAY_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
The base station shall set this field to the closed-loop reverse power control delay minus one (the closed-loop reverse power control delay is the time between the end of a gated-on reverse PCG and the beginning of the reverse PCG where the corresponding feedback is sent on the Forward Power Control Subchannel, see [2]), in units of 1.25 ms.

D_SIG_ENCRYPT_MODE - Dedicated channel encryption mode indicator.

If ENCRYPT_MODE is set to ‘11’, the base station shall include this field and shall set it to the dedicated channel signaling encryption mode, as shown in Table 3.7.4.5-1; otherwise the base station shall omit this field.

ENC_KEY_SIZE - Encryption key size indication.

If ENCRYPT_MODE is set to ‘10’ or ‘11’, the base station shall include this field and shall set it to the encryption key size, as shown in Table 3.7.4.5-2; otherwise, the base station shall omit this field.

C_SIG_ENCRYPT_MODE_INCL - Common channel signaling encryption mode included indicator.

If common channel signaling encryption information is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

C_SIG_ENCRYPT_MODE - Common channel signaling encryption mode indicator.

If C_SIG_ENCRYPT_MODE_INCL is set to ‘1’, the base station shall include this field and shall set it to the common channel signaling encryption mode, as shown in Table 3.7.4.5-1; otherwise, the base station shall omit this field.

3XFL_1XRL_INCL - 3X Forward Link and 1X Reverse Link indicator.

The base station shall set this field to ‘1’ if the base station is assigning 3X traffic channel on the Forward Link and 1X traffic channel on the Reverse Link; otherwise, the base station shall set this field to ‘0’.

1XRL_FREQ_OFFSET - 1X Reverse Link frequency offset.

If 3XFL_1XRL_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the value shown in Table 3.7.2.3.2.21-8 corresponding to the frequency offset of the 1X reverse link.
Table 3.7.2.3.2.21-8. 1X Reverse Link Frequency Offset

<table>
<thead>
<tr>
<th>1XRL_FREQ_OFFSET (Binary)</th>
<th>1X Reverse Link frequency offset</th>

<td>The Reverse Link is on the highest SR3 frequency</td>
</tr>
<tr>
<td>11</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

MSG_INT_INFO_INCL – Message integrity information included indicator
The base station shall set this field to ‘1’ if the base station supports message integrity; otherwise, the base station shall set this field to ‘0’. If this message is to include a MACI in the LAC Layer, the base station shall set this field to ‘1’.

CHANGE_KEYS – Change keys indicator
If MSG_INT_INFO_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
The base station shall set this field to ‘0’ to command the mobile station not to update the encryption key and integrity key. The base station shall set this field to ‘1’ to command the mobile station to update the encryption key and integrity key to the latest being generated.

USE_UAK – Use UAK indicator
If MSG_INT_INFO_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
If the base station receives an authentication vector with a UAK, the base station shall set this field to ‘1’ to indicate that the mobile station is to use UMAC; otherwise, the base station shall set this field to ‘0’ to indicate that the mobile station is to use MAC-I.

PLCM_TYPE_INCL – The Public Long Code Mask type included indicator.
The base station shall set this field to ‘1’ if the base station include PLCM_TYPE in the message; otherwise, the base station shall set this field to ‘0’.

If PLCM_TYPE_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to the corresponding Public Long Code Mask type as specified in Table 3.7.2.3.2.21-5.

PLCM_TYPE ‘0010’ shall not be used when the mobile station is not in its home country (i.e., the MCC of the mobile station is different from the MCC of this base station).

PLCM_TYPE ‘0011’ shall not be used when the mobile station is not in its home network (i.e., the MCC or MNC of the mobile station is different from the MCC or MNC of this base station).

PLCM_39 - The 39 LSB bits of the Public Long Code Mask.

If PLCM_TYPE is not set to ‘0001’, the base station shall omit this field; otherwise, the base station shall include this field and set it to the 39 least significant bits of the public long code mask as defined in 3.6.4.1.10.

SYNC_ID_INCL - Service Configuration synchronization identifier included indicator.

The base station shall omit this field if the GRANTED_MODE field is not set to '11'; otherwise, the base station shall include this field and set it as follows:

If DIRECT_CH_ASSIGN_IND field is set to ‘1’ or if DIRECT_CH_ASSIGN_IND field is set to ‘0’ and the mobile station is to use a different stored service configuration corresponding to SYNC_ID field included in this message then indicated by the mobile station in the Origination Message, the Reconnect Message, or Page Response Message, the base station shall set this field to ‘1’, otherwise, the base station shall set this field to ‘0’.

SYNC_ID_LEN - Service Configuration synchronization identifier length indicator.

If the SYNC_ID_INCL field is not included or is included and is set to '0', the base station shall omit this field; otherwise the base station shall include this field and set it as follows:

The base station shall set this field to the length of the SYNC_ID field included in this message.

SYNC_ID - Service Configuration synchronization identifier.

If the SYNC_ID_INCL field is not included or is included and is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the Service Configuration synchronization identifier corresponding to the stored service configuration that the mobile station is to use.

If any channel assigned by this message is to use Radio Configuration 1 or 2 (see [2]), then the base station shall set this field to ‘0’. The base station shall set this field to ‘0’ if GRANTED_MODE is not set to ‘11’.

**FIXED_NUM_PREAMBLE** - Traffic Channel preamble length.

If FIXED_PREAMBLE_TRANSMIT_IND is not included, or is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it to the minimum length of Traffic Channel preamble that the mobile station is to transmit, before entering the Traffic Channel Substate of the Mobile Station Control on the Traffic Channel State without having received a forward dedicated channel acquired indication from Layer 2 (see [4]).

The base station shall set FIXED_NUM_PREAMBLE to the value shown in Table 3.7.2.3.2.21-13 corresponding to the Traffic Channel preamble length in 1.25 ms units.

**Table 3.7.2.3.2.21-13 Traffic Channel Preamble Length**

**EARLY_RL_TRANSMIT_IND** - Early Reverse Link Transmission indicator.

The base station shall set this field to ‘1’ if, upon channel assignment, the mobile station is to enable the transmitter prior to receiving sufficient signal quality on the forward link; otherwise, the base station shall set this field to ‘0’.

**TX_PWR_LIMIT_INCL** - Transmit Power Limit Inclusion for the current base station

If the transmit power limit field is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**TX_PWR_LIMIT** - Transmit Power Limit for the current base station
If TX_PWR_LIMIT_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set to as follows.

The base station shall set this field to thirty dB more than transmit power limit in dBm EIRP, in steps of 1 dB. This field can take the values 30 to 53 corresponding to maximum transmit power values 0 dBm to 23 dBm.

RESERVED - Reserved bits.

The base station shall set all the bits of this field to '0' to make the entire record octet-aligned.

If the CH_IND field is set to '01', the base station shall include the following fields:

FPC_FCH_INIT_SETPT - Initial Fundamental Channel outer loop $E_b/N_t$ setpoint.

The base station shall set this field to initial Fundamental Channel outer loop $E_b/N_t$ setpoint, in units of 0.125 dB.

FPC_FCH_FER - Fundamental Channel target Frame Error Rate.

The base station shall set this field to the target Frame Error Rate on the Forward Fundamental Channel, as specified in Table 3.7.3.3.2.25-2.

FPC_FCH_MIN_SETPT - Minimum Fundamental Channel Outer Loop $E_b/N_t$ setpoint.

The base station shall set this field to minimum Fundamental Channel Outer Loop $E_b/N_t$ setpoint, in units of 0.125 dB.

FPC_FCH_MAX_SETPT - Maximum Fundamental Channel Outer Loop $E_b/N_t$ setpoint.

The base station shall set this field to maximum Fundamental Channel Outer Loop $E_b/N_t$ setpoint, in units of 0.125 dB.

The base station shall include NUM_PILOTS plus one occurrences of the following record, one for each member of the mobile station’s Active Set on the Traffic Channel.

PILOT_PN - Pilot PN sequence offset index.

The base station shall set this field to the pilot PN sequence offset for this pilot in units of 64 PN chips.

ADD_PILOT_REC_INCL - Additional pilot information included indicator.

The base station shall set this field to ‘1’ if additional pilot information listed in PILOT_REC_TYPE and RECORD_LEN fields are included. The base station shall set this field to ‘0’ if the corresponding pilot is the common pilot and there is no additional pilot information included.

PILOT_REC_TYPE - Pilot record type.

If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall set this field to the PILOT_REC_TYPE value shown in Table 3.7.3.3.2.21-9 corresponding to the type of Pilot Record specified by this record.

If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.
Table 3.7.2.3.21-9. Pilot Record Types

<table>
<thead>
<tr>
<th>Description</th>
<th>PILOT_REC_TYPE (binary)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1X Common Pilot with Transmit Diversity</td>
<td>000</td>

<tr>
<td>3X Auxiliary Pilot</td>
<td>100</td>
</tr>
<tr>
<td>All other PILOT_REC_TYPE values are reserved</td>
<td></td>
</tr>
</tbody>
</table>

RECORD_LEN - Pilot record length.

If ADD_PILOT_REC_INCL is set to '1', the base station shall set this field to the number of octets in the type-specific fields of this pilot record.

If ADD_PILOT_REC_INCL is set to '0', the base station shall omit this field.

Type-specific fields - Pilot record type-specific fields.

If ADD_PILOT_REC_INCL is set to '1', the base station shall include type-specific fields based on the PILOT_REC_TYPE of this pilot record as described in 3.7.6.1.

If ADD_PILOT_REC_INCL is set to '0', the base station shall omit this field.

PWR_COMB_IND - Power control symbol combining indicator.

If the Forward Fundamental Traffic Channel associated with this pilot will carry the same closed-loop power control subchannel bits as that of the previous pilot in this message, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'. For the first occurrence of this record in the message, the base station shall set this field to '0'.

CODE_CHAN_FCH - Code channel index for the Fundamental Channel.

If FOR_RC is set to a Radio Configuration associated with Spreading Rate 1, the base station shall set this field to the code channel index (see [2]) that the mobile station is to use on the Forward Fundamental Channel associated with this pilot. If FOR_RC is set to a Radio Configuration associated with Spreading Rate 3, the base station shall set this field to the code channel index that the mobile station is to use on the Forward Fundamental on the center SR3 frequency.
If Radio Configuration 1, 2, 3, or 5 (see [2]) is used, the base station shall set this field in the range 1 to 63 inclusive. If Radio Configuration 4, 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

QOF_MASK_ID_FCH - Quasi-Orthogonal Function Mask Identifier for the Fundamental Channel.

If FOR_RC is set to a Radio Configuration associated with Spreading Rate 1, the base station shall set this field to the quasi-orthogonal function mask identifier (see [2]) that the mobile station is to use on the Forward Fundamental Channel associated with this pilot. If FOR_RC is set to a Radio Configuration associated with Spreading Rate 3, the base station shall set this field to the quasi-orthogonal function mask identifier that the mobile station is to use on the Forward Fundamental Channel on the center SR3 frequency.

3X_FCH_INFO_INCL – 3X Fundamental Channel information included indicator.

If the 3X Fundamental Channel information is included, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

The base station shall include NUM_PILOTS plus one occurrences of the following record if 3X_FCH_INFO_INCL is set to ‘1’. The base station shall use the same order for the following fields as is used for the PILOT_PN fields listed in this message.

3X_FCH_LOW_INCL – FCH code channel on the lowest SR3 frequency included indicator.

If the Fundamental Channel on the lowest SR3 frequency has a different code channel than the Fundamental Channel on the center SR3 frequency, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

QOF_MASK_ID_FCH_LOW – QOF index for the Fundamental Channel on the lowest SR3 frequency.

If 3X_FCH_LOW_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) corresponding to the QOF index for the Fundamental Channel on the lowest SR3 frequency.

CODE_CHAN_FCH_LOW - Code channel for the Fundamental Channel on the lowest SR3 frequency.

If 3X_FCH_LOW_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:
The base station shall set this field to the code channel index (see [2]) that the mobile station is to use on the Fundamental Channel on the lowest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

3X_FCH_HIGH_INCL – FCH code channel on the highest SR3 frequency included indicator.

If the Fundamental Channel on the highest SR3 frequency has a different code channel than the Fundamental Channel on the center SR3 frequency, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

QOF_MASK_ID_FCH_HIGH – QOF index for the Fundamental Channel on the highest SR3 frequency.

If 3X_FCH_HIGH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2] corresponding to the QOF index for the Fundamental Channel on the highest SR3 frequency.

CODE_CHAN_FCH_HIGH – Code channel for the Fundamental Channel on the highest SR3 frequency.

If 3X_FCH_HIGH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the code channel index (see [2]) that the mobile station is to use on the Fundamental Channel on the highest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

RESERVED - Reserved bits.

The base station shall add reserved bits as needed in order to make the total length of the fields after the preceding CH_RECORD_LEN field through this RESERVED field equal to an integer number of octets. The base station shall set these bits to ‘0’.

If the CH_IND field is set to ‘10’, the base station shall include the following fields:

FPC_DCCH_INIT_SETPT - Initial Dedicated Control Channel outer loop Eb/Nt setpoint.

The base station shall set this field to initial Dedicated Control Channel outer loop Eb/Nt setpoint, in units of 0.125 dB.

FPC_DCCH_FER - Dedicated Control Channel target Frame Error Rate.
The base station shall set this field to the target Frame Error Rate on the Dedicated Control Channel, as specified in Table 3.7.3.3.2.25-2.

**FPC_DCCH_MIN_SETPT** - Minimum Dedicated Control Channel Outer Loop $E_b/N_t$ setpoint.

The base station shall set this field to minimum Dedicated Control Channel Outer Loop $E_b/N_t$ setpoint, in units of 0.125 dB.

**FPC_DCCH_MAX_SETPT** - Maximum Dedicated Control Channel Outer Loop $E_b/N_t$ setpoint.

The base station shall set this field to maximum Dedicated Control Channel Outer Loop $E_b/N_t$ setpoint, in units of 0.125 dB.

The base station shall include NUM_PILOTS plus one occurrences of the following three-field record for each member of the mobile station’s Active Set on the Traffic Channel.

- **PILOT_PN** - Pilot PN sequence offset index. The base station shall set this field to the pilot PN sequence offset for this pilot in units of 64 PN chips.

- **ADD_PILOT_REC_INCL** - Additional pilot information included indicator. The base station shall set this field to ‘1’ if additional pilot information listed in PILOT_REC_TYPE and RECORD_LEN fields are included. The base station shall set this field to ‘0’ if the corresponding pilot is the common pilot and there is no additional pilot information included.

- **PILOT_REC_TYPE** - Pilot record type. If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall set this field to the PILOT_REC_TYPE value shown in Table 3.7.2.3.2.21-9 corresponding to the type of Pilot Record specified by this record.

- **RECORD_LEN** - Pilot record length. If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.

- **Type-specific fields** - Pilot record type-specific fields. If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall include type-specific fields based on the PILOT_REC_TYPE of this pilot record.
PWR_COMB_IND - Power control symbol combining indicator.

If this pilot will carry the same closed-loop power control subchannel bits as that of the previous pilot in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’. The base station shall set this field to ‘0’ in the first record in the pilot list.

CODE_CHAN_DCCH - Code channel index for the Dedicated Control Channel.

If FOR_RC is set to a Radio Configuration associated with Spreading Rate 1, the base station shall set this field to the code channel index (see [2]), in the range of 1 to 127 inclusive, that the mobile station is to use on the Forward Dedicated Control Channel associated with this pilot. If FOR_RC is set to a Radio Configuration associated with Spreading Rate 3, the base station shall set this field to the code channel index in the range of 1 to 255 inclusive, that the mobile station is to use on the Forward Dedicated Control Channel on the center SR3 frequency.

If Radio Configuration 3 or 5 (see [2]) is used, the base station shall set this field in the range 1 to 63 inclusive. If Radio Configuration 4, 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

QOF_MASK_ID_DCCH - Quasi-Orthogonal Function Mask Identifier for the Dedicated Control Channel.

If FOR_RC is set to a Radio Configuration associated with Spreading Rate 1, the base station shall set this field to the quasi-orthogonal function mask identifier (see [2]) that the mobile station is to use on the Forward Dedicated Control Channel associated with this pilot. If FOR_RC is set to a Radio Configuration associated with Spreading Rate 3, the base station shall set this field to the quasi-orthogonal function mask identifier (see [2]) that the mobile station is to use on the Forward Dedicated Control Channel on the center SR3 frequency.

3X_DCCH_INFO_INCL - 3X Dedicated Control Channel information included indicator.

If the 3X Dedicated Control Channel information is included, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

The base station shall include NUM_PILOTS plus one occurrences of the following record if 3X_DCCH_INFO_INCL is set to ‘1’. The base station shall use the same order for the following fields as is used for the PILOT_PN fields listed in this message.

3X_DCCH_LOW_INCL - DCCH code channel on the lowest SR3 frequency included indicator.
If the Dedicated Control Channel on the lowest SR3 frequencies has a different code channel than the Dedicated Control Channel on the center SR3 frequency, the base station shall set this field to '1'; otherwise, the base station shall set this field to ‘0’.

QOF_MASK_ID_DCCH_LOW – QOF index for the Dedicated Control Channel on the lowest SR3 frequency.

If 3X_DCCH_LOW_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) corresponding to the QOF index for the Dedicated Control Channel on the lowest SR3 frequency.

CODE_CHAN_DCCH_LOW - Code channel for the Dedicated Control Channel on the lowest SR3 frequency.

If 3X_DCCH_LOW_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the code channel index (see [2]) that the mobile station is to use on the Dedicated Control Channel on the lowest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

3X_DCCH_HIGH_INCL – DCCH code channel on the highest SR3 frequency included indicator.

If the Dedicated Control Channel on the highest SR3 frequencies has a different code channel than the Dedicated Control Channel on the center SR3 frequency, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

QOF_MASK_ID_DCCH_HIGH – QOF index for the Dedicated Control Channel on the highest SR3 frequency.

If 3X_DCCH_HIGH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) corresponding to the QOF index for the Dedicated Control Channel on the highest SR3 frequency.

CODE_CHAN_DCCH_HIGH - Code channel for the Dedicated Control Channel on the highest SR3 frequency.

If 3X_DCCH_HIGH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:
The base station shall set this field to the code channel index (see [2]) that the mobile station is to use on the Dedicated Control Channel on the highest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

FUNDICATED_BCMC_IND – BCMC on fundicated channel Indicator.

If the channel assignment in this message contains a Forward Fundicated Channel used for BCMC transmission, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

If FUNDICATED_BCMC_IND is set to ‘1’, the base station shall include NUM_PILOT plus 1 occurrences of the following record:

FOR_CPCCH_WALSH - The Forward Common Power Control Channel Walsh code assignment.

The base station shall set this field to the Walsh code assignment for the Forward Common Power Control Channel.

FOR_CPCSCH - The Forward Common Power Control Channel Subchannel.

The base station shall set this field to the Forward Common Power Control Channel Subchannel associated with this base station.

RESERVED - Reserved bits.

The base station shall add reserved bits as needed in order to make the total length of the fields after the preceding CH_RECORD_LEN field through this RESERVED field equal to an integer number of octets. The base station shall set these bits to ‘0’.

If the CH_IND field is set to ‘11’, the base station shall include the following fields:

FPC_FCH_INIT_SETPT - Initial Fundamental Channel outer loop E_{b}/N_{t} setpoint.

The base station shall set this field to initial Fundamental Channel outer loop E_{b}/N_{t} setpoint, in units of 0.125 dB.

FPC_DCCH_INIT_SETPT - Initial Dedicated Control Channel outer loop E_{b}/N_{t} setpoint.

The base station shall set this field to initial Dedicated Control Channel outer loop E_{b}/N_{t} setpoint, in units of 0.125 dB.

FPC_PRI_CHAN - Power Control Subchannel indicator.

The base station shall set this field to ‘0’ if the mobile station is to perform the primary inner loop estimation on the received Forward Fundamental Channel. The base station shall set this field to ‘1’ if the mobile station is to perform the primary inner loop estimation on the received Forward Dedicated Control Channel.
If the F-CPCCH is assigned, the base station shall multiplex the Power Control Subchannel on the F-CPCCH; otherwise:

If this field is set to ‘0’, the base station shall multiplex the Power Control Subchannel on the Forward Fundamental Channel; otherwise, the base station shall multiplex the Power Control Subchannel on the Forward Dedicated Control Channel.

FPC_FCH_FER - Fundamental Channel target Frame Error Rate.

The base station shall set this field to the target Frame Error Rate on the Forward Fundamental Channel.

FPC_FCH_MIN_SETPT - Minimum Fundamental Channel Outer Loop $E_b/N_t$ setpoint.

The base station shall set this field to minimum Fundamental Channel Outer Loop $E_b/N_t$ setpoint, in units of 0.125 dB.

FPC_FCH_MAX_SETPT - Maximum Fundamental Channel Outer Loop $E_b/N_t$ setpoint.

The base station shall set this field to maximum Fundamental Channel Outer Loop $E_b/N_t$ setpoint, in units of 0.125 dB.

FPC_DCCH_FER - Dedicated Control Channel target Frame Error Rate.

The base station shall set this field to the target Frame Error Rate on the Dedicated Control Channel.

FPC_DCCH_MIN_SETPT - Minimum Dedicated Control Channel Outer Loop $E_b/N_t$ setpoint.

The base station shall set this field to minimum Dedicated Control Channel Outer Loop $E_b/N_t$ setpoint, in units of 0.125 dB.

FPC_DCCH_MAX_SETPT - Maximum Dedicated Control Channel Outer Loop $E_b/N_t$ setpoint.

The base station shall set this field to maximum Dedicated Control Channel Outer Loop $E_b/N_t$ setpoint, in units of 0.125 dB.

The base station shall include NUM_PILOTS plus one occurrences of the following three-field record, one for each member of the mobile station’s Active Set on the Traffic Channel.

PILOT_PN - Pilot PN sequence offset index.

The base station shall set this field to the pilot PN sequence offset for this pilot in units of 64 PN chips.

ADD_PILOT_REC_INCL - Additional pilot information included indicator.

The base station shall set this field to ‘1’ if additional pilot information listed in PILOT_REC_TYPE and RECORD_LEN fields are included. The base station shall set this field to ‘0’ if the corresponding pilot is the common pilot and there is no additional pilot information included.

PILOT_REC_TYPE - Pilot record type.
If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall set this field to the PILOT_REC_TYPE value shown in Table 3.7.2.3.2.21-9 corresponding to the type of Pilot Record specified by this record.

If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.

**RECORD_LEN** - Pilot record length.

If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall set this field to the number of octets in the type-specific fields of this pilot record.

If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.

**Type-specific fields** - Pilot record type-specific fields.

If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall include type-specific fields based on the PILOT_REC_TYPE of this pilot record as described in 3.7.6.1.

If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.

**PWR_COMB_IND** - Power control symbol combining indicator.

If this pilot will carry the same closed-loop power control subchannel bits as that of the previous pilot in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’. The base station shall set this field to ‘0’ in the first record in the pilot list.

**CODE_CHAN_FCH** - Code channel index for the Fundamental Channel.

If FOR_RC is set to a Radio Configuration associated with Spreading Rate 1, the base station shall set this field to the code channel index (see [2]) that the mobile station is to use on the Forward Channel associated with this pilot. If FOR_RC is set to a Radio Configuration associated with Spreading Rate 3, the base station shall set this field to the code channel index that the mobile station is to use on the Forward Channel on the center SR3 frequency.

If Radio Configuration 1, 2, 3, or 5 (see [2]) is used, the base station shall set this field in the range 1 to 63 inclusive. If Radio Configuration 4, 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

**QOF_MASK_ID_FCH** - Quasi-Orthogonal Function Mask Identifier for the Fundamental Channel.
If FOR_RC is set to a Radio Configuration associated with Spreading Rate 1, the base station shall set this field to the quasi-orthogonal function mask identifier (see [2]) that the mobile station is to use on the Forward Fundamental Channel associated with this pilot. If FOR_RC is set to a Radio Configuration associated with Spreading Rate 3, the base station shall set this field to the quasi-orthogonal function mask identifier that the mobile station is to use on the Forward Fundamental Channel on the center SR3 frequency.

**CODE_CHAN_DCCH** - Code channel index for the Dedicated Control Channel.

If FOR_RC is set to a Radio Configuration associated with Spreading Rate 1, the base station shall set this field to the code channel index (see [2]), in the range of 1 to 127 inclusive, that the mobile station is to use on the Dedicated Control Channel associated with this pilot. If FOR_RC is set to a Radio Configuration associated with Spreading Rate 3, the base station shall set this field to the code channel index in the range of 1 to 255 inclusive, that the mobile station is to use on the Dedicated Control Channel on the center SR3 frequency.

If Radio Configuration 3 or 5 (see [2]) is used, the base station shall set this field in the range 1 to 63 inclusive. If Radio Configuration 4, 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

**QOF_MASK_ID_DCCH** - Quasi-Orthogonal Function Mask Identifier for the Dedicated Control Channel.

If FOR_RC is set to a Radio Configuration associated with Spreading Rate 1, the base station shall set this field to the quasi-orthogonal function mask identifier (see [2]) that the mobile station is to use on the Forward Dedicated Control Channel associated with this pilot. If FOR_RC is set to a Radio Configuration associated with Spreading Rate 1, the base station shall set this field to the quasi-orthogonal function mask identifier that the mobile station is to use on the Forward Dedicated Control Channel on the center SR3 frequency.

**3X_FCH_INFO_INCL** - 3X Fundamental Channel information included indicator.

If the 3X Fundamental Channel information is included, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

The base station shall include NUM_PILOTS plus one occurrences of the following record if 3X_FCH_INFO_INCL is set to ‘1’. The base station shall use the same order for the following fields as is used for the PILOT_PN fields listed in this message.

**3X_FCH_LOW_INCL** - FCH code channel on the lowest SR3 frequency included indicator.
If the Fundamental Channel on the lowest SR3 frequencies has a different code channel than the Fundamental Channel on the center SR3 frequency, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

QOF_MASK_ID_FCH_LOW – QOF index for the Fundamental Channel on the lowest SR3 frequency.

If 3X_FCH_LOW_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) corresponding to the QOF index for the Fundamental Channel on the lowest SR3 frequency.

CODE_CHAN_FCH_LOW - Code channel for the Fundamental Channel on the lowest SR3 frequency.

If 3X_FCH_LOW_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the code channel index (see [2]) that the mobile station is to use on the Fundamental Channel on the lowest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

3X_FCH_HIGH_INCL – FCH code channel on the highest SR3 frequency included indicator.

If the Fundamental Channel on the highest SR3 frequencies has a different code channel than the Fundamental Channel on the center SR3 frequency, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

QOF_MASK_ID_FCH_HIGH – QOF index for the Fundamental Channel on the highest SR3 frequency.

If 3X_FCH_HIGH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) corresponding to the QOF index for the Fundamental Channel on the highest SR3 frequency.

CODE_CHAN_FCH_HIGH - Code channel for the Fundamental Channel on the highest SR3 frequency.

If 3X_FCH_HIGH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:
The base station shall set this field to the code channel index (see [2]) that the mobile station is to use on the Fundamental Channel on the highest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

3X_DCCH_INFO_INCL – 3X Dedicated Control Channel information included indicator. If the 3X Dedicated Control Channel information is included, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

The base station shall include NUM_PILOTS plus one occurrences of the following record if 3X_DCCH_INFO_INCL is set to ‘1’. The base station shall use the same order for the following fields as is used for the PILOT_PN fields listed in this message.

3X_DCCH_LOW_INCL – DCCH code channel on the lowest SR3 frequency included indicator. If the Dedicated Control Channel on the lowest SR3 frequencies has a different code channel than the Dedicated Control Channel on the center SR3 frequency, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

QOF_MASK_ID_DCCH_LOW – QOF index for the Dedicated Control Channel on the lowest SR3 frequency. If 3X_DCCH_LOW_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) corresponding to the QOF index for the Dedicated Control Channel on the lowest SR3 frequency.

CODE_CHAN_DCCH_LOW - Code channel for the Dedicated Control Channel on the lowest SR3 frequency. If 3X_DCCH_LOW_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the code channel index (see [2]) that the mobile station is to use on the Dedicated Control Channel on the lowest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

3X_DCCH_HIGH_INCL – DCCH code channel on the highest SR3 frequency included indicator.
If the Dedicated Control Channel on the highest SR3 frequencies has a different code channel than the Dedicated Control Channel on the center SR3 frequency, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

QOF_MASK_ID_DCCH_HIGH – QOF index for the Dedicated Control Channel on the highest SR3 frequency.

If 3X_DCCH_HIGH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) corresponding to the QOF index for the Dedicated Control Channel on the highest SR3 frequency.

CODE_CHAN_DCCH_HIGH – Code channel for the Dedicated Control Channel on the highest SR3 frequency.

If 3X_DCCH_HIGH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) that the mobile station is to use on the Dedicated Control Channel on the highest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

FUNDICATED_BCMC_IND – BCMC on fundicated channel Indicator.

If the channel assignment in this message contains a Forward Fundicated Channel used for BCMC transmission, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

REV_FCH_ASSIGNED – Reverse FCH channel assigned indicator.

If the FUNDICATED_BCMC_IND field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the reverse FCH is assigned in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

ADD_PLCM_FOR_FCH_INCL – Additional PLCM for forward FCH included indicator.

If the FUNDICATED_BCMC_IND field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the additional PLCM for forward FCH is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.
ADD_PLCM_FOR_FCH_TYPE - The Additional Public Long Code Mask for forward FCH type indicator.

If ADD_PLCM_FOR_FCH_INCL is not included or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to ‘1’ to indicate PLCM specified by the base station. The field value ‘0’ is reserved.

ADD_PLCM_FOR_FCH_39 - The 39 LSB bits of the additional Public Long Code Mask for forward FCH.

If ADD_PLCM_FOR_FCH_TYPE field is included and is set to ‘1’, the base station shall include this field and set it to the 39 least significant bits of the public long code mask used by the mobile station; otherwise, the base station shall omit this field.

FOR_CPCCH_INFO_INCL - CPCCH information included indicator.

If the FUNDICATED_BCMC_IND field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the F-CPCCH information is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

If the ASSIGN_MODE field is set to ‘101’, the base station shall include the following fields:

FREQ_INCL - Frequency included indicator.

If the BAND_CLASS and CDMA_FREQ fields are included in this assignment record, the base station shall set this bit to ‘1’. If the BAND_CLASS and CDMA_FREQ fields are not included in this assignment record, the base station shall set this bit to ‘0’.
BAND_CLASS - Band class.

If the FREQ_INCL bit is set to ‘1’, the base station shall set this field to the CDMA band class, as specified in [30], corresponding to the CDMA frequency assignment for the CDMA Channel containing the Forward Traffic Channel(s) the mobile station is to use. If the FREQ_INCL bit is set to ‘0’, the base station shall omit this field.

CDMA_FREQ - Frequency assignment.

If the FREQ_INCL bit is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

If the FREQ_INCL bit is set to ‘1’, the base station shall set this field to the CDMA Channel number, in the specified CDMA band class, corresponding to the CDMA frequency assignment for the CDMA Channel containing the Forward Traffic Channel(s) the mobile station is to use.

BYPASS_ALERT_ANSWER - Bypass alert indicator.

If the mobile station is to bypass the Waiting for Order Substate and the Waiting for Mobile Station Answer Substate, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

GRANTED_MODE - Granted mode.

The base station shall set this field to ‘01’ to indicate that the mobile station is to use an initial service configuration consisting of the default multiplex option that is derived from the radio configuration corresponding to Table 3.7.2.3.2.21-3, and to indicate that service negotiation may take place before the base station sends one of the following messages: Service Connect Message, General Handoff Direction Message (with SCR) or Universal Handoff Direction Message (with SCR).

The base station shall set this field to ‘10’ to indicate that the mobile station is to use an initial service configuration consisting of the default multiplex option that is derived from the radio configuration corresponding to Table 3.7.2.3.2.21-3, and to indicate that service negotiation is not to take place before the base station sends one of the following messages: Service Connect Message, General Handoff Direction Message (with SCR) or Universal Handoff Direction Message (with SCR).

The base station shall set this field to ‘11’ to instruct the mobile station to use the stored service configuration (that is, both the Service Configuration information record and the Non-negotiable Service Configuration information record).

The base station shall not set this field to ‘00’. 
SR_ID_RESTORE – Service reference identifier to be restored.

If the GRANTED_MODE field is not set to ‘11’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

- If the mobile station is to restore all the service option connections from the stored service configuration, the base station shall set this field to ‘111’.
- If the mobile station is to restore more than one but not all the service option connections from the stored service configuration, the base station shall set this field to ‘000’.
- Otherwise, the base station shall set this field to the service reference identifier corresponding to the service option connection to be restored.

SR_ID_RESTORE_BITMAP – Bitmap of service reference identifiers to be restored.

If the SR_ID_RESTORE field is included and set to ‘000’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

This field consists of the subfields defined in Table 3.7.2.3.2.21-6. The base station shall set a subfield to ‘1’ to indicate that the mobile station is to restore the service option connection of the corresponding service reference identifier; otherwise, the base station shall set the subfield to ‘0’.

FRAME_OFFSET - Frame offset.

The Forward and Reverse Traffic Channel frames are delayed \( \text{FRAME_OFFSET} \times 1.25 \text{ ms} \) relative to system timing (see [2]).

The base station shall set this field to the Forward and Reverse Traffic Channel frame offset (the frame offset does not apply to the F-PDCH).

ENCRIPT_MODE - Message encryption mode.

The base station shall set this field to the ENCRYPT_MODE value shown in Table 3.7.2.3.2.8-2 corresponding to the encrypting mode that is to be used for signaling messages, as specified in 2.3.12.2.

D_SIG_ENCRYPT_MODE - Dedicated channel encryption mode indicator.

If ENCRYPT_MODE is set to ‘11’, the base station shall include this field and shall set it to the dedicated channel signaling message mode, as shown in Table 3.7.4.5-1; otherwise the base station shall omit this field.

ENC_KEY_SIZE - Encryption key size indication.
If ENCRYPT_MODE is set to ‘10’ or ‘11’, the base station shall include this field and shall set it to the encryption key size, as shown in Table 3.7.4.5-2; otherwise, the base station shall omit this field.

C_SIG_ENCRYPT_MODE_INCL - Common channel signaling encryption mode included indicator.

If common channel signaling encryption information is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

C_SIG_ENCRYPT_MODE - Common channel signaling encryption mode indicator.

If C_SIG_ENCRYPT_MODE_INCL is set to ‘1’, the base station shall include this field and shall set it to the common channel signaling encryption mode, as shown in Table 3.7.4.5-1; otherwise, the base station shall omit this field.

MSG_INT_INFO_INCL – Message integrity information included indicator

The base station shall set this field to ‘1’ if the base station supports message integrity; otherwise, the base station shall set this field to ‘0’. If this message is to include a MACI in the LAC Layer, the base station shall set this field to ‘1’.

CHANGE_KEYS – Change keys indicator

If MSG_INT_INFO_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘0’ to command the mobile station not to update the encryption key and integrity key. The base station shall set this field to ‘1’ to command the mobile station to update the encryption key and integrity key to the latest being generated.

USE_UAK – Use UAK indicator

If MSG_INT_INFO_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the base station receives an authentication vector with a UAK, the base station shall set this field to ‘1’ to indicate that the mobile station is to use UMAC; otherwise, the base station shall set this field to ‘0’ to indicate that the mobile station is to use MAC-I.

PLCM_TYPE_INCL - The Public Long Code Mask type included indicator.

The base station shall set this field to ‘1’ if the base station include PLCM_TYPE in the message; otherwise, the base station shall set this field to ‘0’.

PLCM_TYPE - The Public Long Code Mask type indicator.

If PLCM_TYPE_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

3-266
The base station shall set this field to the corresponding Public Long Code Mask type as specified in Table 3.7.2.3.2.21-5.

PLCM_TYPE ‘0010’ shall not be used when the mobile station is not in its home country (i.e., the MCC of the mobile station is different from the MCC of this base station).

PLCM_TYPE ‘0011’ shall not be used when the mobile station is not in its home network (i.e., the MCC or MNC of the mobile station is different from the MCC or MNC of this base station).

PLCM_39 - The 39 LSB bits of the Public Long Code Mask.

If PLCM_TYPE is not set to ‘0001’, the base station shall omit this field; otherwise, the base station shall include this field and set it to the 39 least significant bits of the public long code mask as defined in 3.6.4.1.10.

RLGAIN_ADJ - Reverse Traffic Channel power.

If DIRECT_CH_ASSIGN_IND field is set to ‘0’, the base station shall set this field to adjust the initial Traffic Channel transmission power relative to the Access Channel or Enhanced Access Channel transmission power. The base station shall set this field as a two’s complement signed binary number, in units of 1 dB.

If DIRECT_CH_ASSIGN_IND field is set to ‘1’, the base station shall set this field to adjust the initial Traffic Channel transmission power. The base station shall set this field as a two’s complement signed binary number, in units of 1 dB.

NUM_PILOTS - Number of pilots in the Active Set.

The base station shall set this field to number of pilots that are to be in the mobile station’s Active Set on the Traffic Channel minus one. The base station shall set this field to the value in the range 0 to N_{6m-1} inclusive.

EXT_CH_IND - Extended Channel Indicator.

The base station shall set this field as shown in Table 2.7.1.3.2.4-11.

FPC_SUBCHAN_GAIN - Forward Power Control Subchannel relative gain.

If EXT_CH_IND signals the allocation of a F-FCH, or a F-DCCH, the base station shall include this field and shall set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to the power level of the forward link power control subchannel relative to the power level of 20 ms frames at a 9600 bps or 14400 bps rate on the Forward Fundamental Channel or the Forward Dedicated Control Channel indicated by FPC_PRI_CHAN_s.

The base station shall set the value in units of 0.25 dB.

REV_FCH_GATING_MODE - Reverse eighth gating mode indicator.
If EXT_CH_IND signals the allocation of R-FCH, the base
station shall include this field and shall set it as follows;
otherwise, the base station shall omit this field.

The base station shall set this field to ‘1’ if the mobile station
is allowed to perform the reverse eighth gating mode where
the 1/8th rate frames on the Reverse Fundamental Channel
are gated off for 10 ms per frame (see [2]); otherwise, the base
station shall set this field to ‘0’.

The base station shall not set this field to ‘1’ if
REV_FCH_GATING_REQ included in the Origination Message
or Page Response Message is set to ‘0’.

REV_PWR_CNTL_DELAY_INCL -  Reverse power control delay included indicator.

If REV_FCH_GATING_MODE is not included, or is included
and set to ‘0’, then the base station shall omit this field;
otherwise, the base station shall include this field and set it
as follows.

The base station shall set this field to ‘1’ if
REV_PWR_CNTL_DELAY is included in this message;
otherwise, the base station shall set this field to ‘0’.

If the REV_FCH_GATING_MODE field in this message is set to
‘1’ and the REV_PWR_CNTL_INCL field in the Extended
System Parameters Message is set to ‘0’, the base station shall
set this field to ‘1’.

REV_PWR_CNTL_DELAY -  The reverse power control delay.

If REV_PWR_CNTL_DELAY_INCL is not included, or is
included and set to ‘0’, then the base station shall omit this
field; otherwise, the base station shall include this field and
set it as follows:

The base station shall set this field to the closed-loop reverse
power control delay minus one (the closed-loop reverse power
control delay is the time between the end of a gated-on
reverse PCG and the beginning of the reverse PCG where the
corresponding feedback is sent on the Forward Power Control
Subchannel, see [2]), in units of 1.25 ms.

FULL_CI_FEEDBACK_IND -  Full C/I feedback rate indicator.

If the mobile station is to send full C/I feedback every 1.25
ms, the base station shall set this field to ‘1’. If the mobile
station is to transmit full C/I feedback every 20 ms, the base
station shall set this field to ‘0’.

FOR_CPCCH_RATE -  The Forward Common Power Control Channel Rate.

If EXT_CH_IND equals ‘01000’, the base station shall include
this field and shall set it as follows; otherwise, the base
station shall omit this field.

The base station shall set this field to the rate of the Forward
Common Power Control Channel as specified in Table
3.7.2.3.2.21-12.
Table 3.7.2.3.21-12 Rate of the Forward Common Power Control Channel.

</tbody>
</table>

FOR_CPCCH_UPDATE_RATE - Forward Common Power Control update rate.

If EXT_CH_IND equals ‘01000’, the base station shall include this field and shall set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to the update rate of the Forward Common Power Control as specified in Table 3.7.2.3.21-13 (see [2]).

Table 3.7.2.3.21-13 CPCCH/RCCH Update rate.

</tbody>
</table>

REV_CQICH_FRAME_OFFSET - Reverse Channel Quality Indicator Channel Frame Offset.

The C/I feedback reports on the Reverse Channel Quality Indicator Channel are delayed REV_CQICH_FRAME_OFFSET \( \times 1.25 \) ms relative to system timing (see [2]).

The base station shall set this field to the Reverse Channel Quality Indicator Channel frame offset.

REV_CQICH_REPS - Reverse Channel Quality Indicator Channel repetition factor.

The base station shall set this field according to Table 3.7.3.3.2.49-1.

REV_ACKCH_REPS - Reverse Acknowledgment Channel repetition factor.

The base station shall set this field according to Table 3.7.3.3.2.49-2.

FOR_PDCH_RC - Forward Packet Data Channel radio configuration.
The base station shall set this field to the radio configuration (see Table 3.7.2.3.2.21-4) to be used by the mobile station on the Forward Packet Data Channel.

**REV_PDCH_RC** - Reverse Packet Data Channel radio configuration.

If EXT_CH_IND signals the allocation of a R-PDCH, the base station shall include this field and shall set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to the radio configuration (see Table 3.7.2.3.2.21-4) to be used by the mobile station on the Reverse Packet Data Channel.

**FOR_FCH_DCCH_RC** - Forward Fundamental Channel or Forward Dedicated Control Channel radio configuration.

If EXT_CH_IND signals the allocation of a F-FCH, or a F-DCCH, the base station shall include this field and shall set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to the radio configuration (see Table 3.7.2.3.2.21-4) to be used by the mobile station on the Forward Fundamental Channel, or on the Forward Dedicated Control Channel, or on both.

The initial service configuration consisting of the default multiplex option that is to be used by the mobile station is derived from the radio configuration corresponding to Table 3.7.2.3.2.21-3.

**REV_FCH_DCCH_RC** - Reverse Fundamental Channel or Reverse Dedicated Control Channel radio configuration.

If EXT_CH_IND signals the allocation of a R-FCH, or a R-DCCH, the base station shall include this field and shall set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to the radio configuration (see Table 3.7.2.3.2.21-4) to be used by the mobile station on the Reverse Fundamental Channel, or on the Reverse Dedicated Control Channel, or on both.

The initial service configuration consisting of the default multiplex option that is to be used by the mobile station is derived from the radio configuration corresponding to Table 3.7.2.3.2.21-3.

**FPC_PRI_CHAN** - Power Control Subchannel indicator.

If EXT_CH_IND signals the allocation of a F-FCH and a F-DCCH, the base station shall set this field as follows; otherwise, the base station shall omit this field.

The base station shall set this field to ‘0’ if the mobile station is to perform the primary inner loop estimation on the received Forward Fundamental Channel. The base station shall set this field to ‘1’ if the mobile station is to perform the primary inner loop estimation on the received Forward Dedicated Control Channel.
If the F-CPCCH is assigned, the base station shall multiplex the Power Control Subchannel on the F-CPCCH; otherwise:

- If this field is set to ‘0’, the base station shall multiplex the Power Control Subchannel on the Forward Fundamental Channel; otherwise, the base station shall multiplex the Power Control Subchannel on the Forward Dedicated Control Channel.

**FPC_FCH_INIT_SETPT** - Initial Fundamental Channel outer loop $E_b/N_t$ setpoint.

- If EXT_CH_IND signals the allocation of a F-FCH, the base station shall include this field and shall set it as follows; otherwise it shall be omitted.
- The base station shall set this field to initial Fundamental Channel outer loop $E_b/N_t$ setpoint, in units of 0.125 dB.

**FPC_FCH_FER** - Fundamental Channel target Frame Error Rate.

- If EXT_CH_IND signals the allocation of a F-FCH, the base station shall include this field and shall set it as follows; otherwise it shall be omitted.
- The base station shall set this field to the target Frame Error Rate on the Forward Fundamental Channel, as specified in Table 3.7.3.3.2.25-2.

**FPC_FCH_MIN_SETPT** - Minimum Fundamental Channel outer loop $E_b/N_t$ setpoint.

- If EXT_CH_IND signals the allocation of a F-FCH, the base station shall include this field and shall set it as follows; otherwise it shall be omitted.
- The base station shall set this field to minimum Fundamental Channel outer loop $E_b/N_t$ setpoint, in units of 0.125 dB.

**FPC_FCH_MAX_SETPT** - Maximum Fundamental Channel outer loop $E_b/N_t$ setpoint.

- If EXT_CH_IND signals the allocation of a F-FCH, the base station shall include this field and shall set it as follows; otherwise it shall be omitted.
- The base station shall set this field to maximum Fundamental Channel outer loop $E_b/N_t$ setpoint, in units of 0.125 dB.

**FPC_DCCH_INIT_SETPT** - Initial Dedicated Control Channel outer loop $E_b/N_t$ setpoint.

- If EXT_CH_IND signals the allocation of a F-DCCH, the base station shall include this field and shall set it as follows; otherwise it shall be omitted.
- The base station shall set this field to initial Dedicated Control Channel outer loop $E_b/N_t$ setpoint, in units of 0.125 dB.

**FPC_DCCH_FER** - Dedicated Control Channel target Frame Error Rate.

- If EXT_CH_IND signals the allocation of a F-DCCH, the base station shall include this field and shall set it as follows; otherwise it shall be omitted.
The base station shall set this field to the target Frame Error Rate on the Dedicated Control Channel, as specified in Table 3.7.3.3.2.25-2.

FPC_DCCH_MIN_SETPT - Minimum Dedicated Control Channel Outer Loop Eb/Nt setpoint.

If EXT_CH_IND signals the allocation of a F-DCCH, the base station shall include this field and shall set it as follows; otherwise it shall be omitted.

The base station shall set this field to minimum Dedicated Control Channel Outer Loop Eb/Nt setpoint, in units of 0.125 dB.

FPC_DCCH_MAX_SETPT - Maximum Dedicated Control Channel Outer Loop Eb/Nt setpoint.

If EXT_CH_IND signals the allocation of a F-DCCH, the base station shall include this field and shall set it as follows; otherwise it shall be omitted.

The base station shall set this field to maximum Dedicated Control Channel Outer Loop Eb/Nt setpoint, in units of 0.125 dB.

PDCH_GROUP_IND_INCL - Packet Data Channel Group Indicator included flag.

The base station shall set this field to ‘1’ if the PDCH_GROUP_IND fields are included; otherwise, the base station shall set this field to ‘0’.

If this field is set to ‘0’, the mobile station is to use PWR_COMB_IND to determine whether the softer or soft reselection parameters are used when re-pointing between pilots in its Active Set (see [3]).

FOR_PDCH_PARMS_INCL - Indicator of the inclusion of Forward Packet Data Channel configuration fields.

The base station shall set this field to ‘1’ if the Forward Packet Data Channel configuration fields are included; otherwise, the base station shall set this field to ‘0’.

FOR_PDCH_RLGAIN_INCL - Forward Packet Data Channel parameters related to reverse link adjustment gains included indicator.

If FOR_PDCH_PARMS_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to ‘1’ if the following F-PDCH gain related fields are included in this message; otherwise, the base station shall set this field to ‘0’.

RLGAIN_ACKCH_PILOT - Reverse Acknowledgment Channel to pilot adjustment gain.

If FOR_PDCH_RLGAIN_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.
The base station shall set this field to the Reverse Acknowledgment Channel to pilot adjustment gain expressed as a two's complement value in units of 0.125 dB (see [2]).

**RLGAIN_CQICH_PILOT** - Reverse Channel Quality Indicator Channel to pilot adjustment gain.

If FOR_PDCH_RLGAIN_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows:

The base station shall set this field to the Reverse Channel Quality Indicator Channel to pilot adjustment gain expressed as a two's complement value in units of 0.125 dB (see [2]).

**NUM_SOFT_SWITCHING_FRAMES** - Number of frames for R-CQICH soft switching.

If FOR_PDCH_PARMS_INCL is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the duration of the cell switching period, in units of 20 ms, minus one, during which the mobile station is to transmit the cell switch sequence on the R-CQICH channel when it switches between two pilots which are in different groups.

If PDCH_GROUP_IND_INCL is set to ‘1’, these groups are indicated by PDCH_Group_IND; otherwise, they are indicated by PWR_COMB_IND.

**NUM_SOFTER_SWITCHING_FRAMES** - Number of frames for R-CQICH softer switching.

If FOR_PDCH_PARMS_INCL is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the duration of the cell switching period, in units of 20 ms, minus one, during which the mobile station is to transmit the cell switch sequence on the R-CQICH channel when it switches between two pilots which are in the same group.

If PDCH_GROUP_IND_INCL is set to ‘1’, these groups are indicated by PDCH_GROUP_IND; otherwise, they are indicated by PWR_COMB_IND.

**NUM_SOFT_SWITCHING_SLOTS** - Number of slots per frame for R-CQICH soft switching.

If FOR_PDCH_PARMS_INCL is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
The base station shall set this field to the duration of the cell switching slots within a switching frame, in units of 1.25 ms as specified in Table 3.7.2.3.2.21-10, during which the mobile station is to transmit the cell switch indication by using Walsh cover of target on the R-CQICH when it switches between two pilots which are in different groups.

If PDCH_GROUP_IND_INCL is set to ‘1’, these groups are indicated by PDCH_GROUP_IND; otherwise, they are indicated by PWR_COMB_IND.

<table>

</table>

If FOR_PDCH_PARMS_INCL is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the duration of the cell switching slots within a switching frame, in units of 1.25 ms as specified in Table 3.7.2.3.2.21-10, during which the mobile station is to transmit the cell switch indication by using Walsh cover of target on the R-CQICH when it switches between two pilots which are in the same group.

If PDCH_GROUP_IND_INCL is set to ‘1’, these groups are indicated by PDCH_GROUP_IND; otherwise, they are indicated by PWR_COMB_IND.

CHM_SWITCHING_PARMS_INCL - Control Hold Mode fields included indicator.

If FOR_PDCH_PARMS_INCL is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if the switching parameters for Control Hold Mode are included; otherwise, the base station shall set this field to ‘0’.
NUM_SOFT_SWITCHING_FRAMES_CHM - Number of frames for R-CQICH soft switching while in Control Hold.

If CHM_SWITCHING_PARMS_INCL is omitted or equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the duration of the cell switching period, in units of 20 ms, minus one, during which the mobile station, while in Control Hold, is to transmit the cell switch sequence on the R-CQICH when it switches between two pilots which are in different groups.

If PDCH_GROUP_IND_INCL is set to ‘1’, these groups are indicated by PDCH_GROUP_IND; otherwise, they are indicated by PWR_COMB_IND.

NUM_SOFTER_SWITCHING_FRAMES_CHM - Number of frames for R-CQICH softer switching while in Control Hold.

If CHM_SWITCHING_PARMS_INCL is omitted or equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the duration of the cell switching period, in units of 20 ms, minus one, during which the mobile station, while in Control Hold, is to transmit the cell switch sequence on the R-CQICH when it switches between two pilots which are in the same group.

If PDCH_GROUP_IND_INCL is set to ‘1’, these groups are indicated by PDCH_GROUP_IND; otherwise, they are indicated by PWR_COMB_IND.

NUM_SOFT_SWITCHING_SLOTS_CHM - Number of slots per frame for R-CQICH soft switching while in Control Hold.

If CHM_SWITCHING_PARMS_INCL is omitted or equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the duration of the cell switching slots within a switching frame, in units of 1.25 ms as specified in Table 3.7.2.3.2.21-10, during which the mobile station, while in Control Hold, is to transmit the cell switch indication by using Walsh cover of target on the R-CQICH when it switches between two pilots which are in different groups.

If PDCH_GROUP_IND_INCL is set to ‘1’, these groups are indicated by PDCH_GROUP_IND; otherwise, they are indicated by PWR_COMB_IND.

NUM_SOFTER_SWITCHING_SLOTS_CHM - Number of slots per frame for R-CQICH softer switching while in Control Hold.

If CHM_SWITCHING_PARMS_INCL is omitted or equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
The base station shall set this field to the duration of the cell switching slots within a switching frame, in units of 1.25 ms as specified in Table 3.7.2.3.2.21-10, during which the mobile station, while in Control Hold, is to transmit the cell switch indication by using Walsh cover of target on the R-CQICH when it switches between two pilots which are in the same group.

If PDCH_GROUP_IND_INCL is set to ‘1’, these groups are indicated by PDCH_GROUP_IND; otherwise, they are indicated by PWR_COMB_IND.

**PDCH_SOFT_SWITCHING_DELAY** - F-PDCH Soft Switching Delay.

If FOR_PDCH_PARMS_INCL is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the minimum interruption seen by the mobile station, in units of 10 ms, minus one, when the mobile station is to transmit the cell switch sequence on the R-CQICH when it switches between two pilots which are in different groups.

If PDCH_GROUP_IND_INCL is set to ‘1’, these groups are indicated by PDCH_GROUP_IND; otherwise, they are indicated by PWR_COMB_IND.

**PDCH_SOFTER_SWITCHING_DELAY** - F-PDCH Soft Switching Delay.

If FOR_PDCH_PARMS_INCL is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the minimum interruption seen by the mobile station, in units of 10 ms, minus one, when the mobile station is to transmit the cell switch sequence on the R-CQICH when it switches between two pilots which are in the same group.

If PDCH_GROUP_IND_INCL is set to ‘1’, these groups are indicated by PDCH_GROUP_IND; otherwise, they are indicated by PWR_COMB_IND.

**TX_DISABLED_TIMER_INCL** - Transmitter disabled timer included flag.

The base station shall set this field to ‘1’ if the following **TX_DISABLED_TIMER** field is included; otherwise, the base station shall set this field to ‘0’.

**TX_DISABLED_TIMER** - Transmitter disabled timer.

If **TX_DISABLED_TIMER_INCL** FOR_PDCH_PARMS_INCL is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
The base station shall set this field to the maximum time, in units of 20ms; the mobile station’s transmitter can be disabled before the MAC Layer is to perform Forward Packet Data Channel initialization. [See [3]].

FOR_GCH_ASSIGNED - Forward Grant Channel assignment indicator.

If EXT_CH_IND signals the allocation of a R-PDCH, the base station shall include this field and shall set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to ‘1’ if the mobile station is to listen to grants on the Forward Grant Channel; otherwise, the base station shall set this field to ‘0’ (see [3]).

FOR_RCCH_ASSIGNED - Forward Rate Control Channel assignment indicator.

If EXT_CH_IND signals the allocation of a R-PDCH, the base station shall include this field and shall set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to ‘1’ if the mobile station is to follow rate control indicators on the Forward Rate Control Channel; otherwise, the base station shall set this field to ‘0’ (see [3]).

FOR_RCCH_DRC_MODE - Forward Rate Control Channel Dedicated Rate Control Mode Indicator.

If FOR_RCCH_ASSIGNED is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to ‘1’ if the dedicated rate control mode is being used on the Forward Rate Control Channel; otherwise, the base station shall set this field to ‘0’ if the common rate control mode is being used (see [3]).

FOR_RCCH_REPETITION - Forward Rate Control Subchannel repetition factor.

If FOR_RCCH_ASSIGNED is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to the subchannel repetition factor of the Rate Control Subchannel on all pilots as specified in Table 3.7.2.3.2.21-11. [See [2]].

<table>
<thead>
<tr>
<th>FOR_RCCH_REPETITION (binary)</th>
<th>Repetition factor for the F-RCCH</th>
</tr>
</thead>
</table>

Table 3.7.2.3.2.21-11 Repetition factor for the F-RCCH.
FOR_RCCH_UPDATE_RATE - Forward Rate Control Subchannel update rate.

If FOR_RCCH_ASSIGNED is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to the update rate of the Rate Control Subchannel on all pilots as specified in Table 3.7.2.3.2.21-13. See [2].

FOR_ACKCH_ASSIGNED - Forward Acknowledgment Channel assignment indicator.

If EXT_CH_IND signals the allocation of a R-PDCH, the base station shall include this field and shall set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to ‘1’ if the mobile station is to listen to acknowledgments on the Forward Acknowledgment Channel; otherwise, the base station shall set this field to ‘0’ (see [2] and [3]).

FOR_ACKCH_MODE - Forward Acknowledgment Channel Mode.

If FOR_ACKCH_ASSIGNED is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to the Acknowledgment Channel operation mode identifier that governs how the Acknowledgment channel is demodulated. See [2] and [3] for the details.

The base station shall set this field to ‘00’ if the mobile station is to attempt the reception of the Forward Acknowledgment Channel from all members of the reduced active set of the Forward Packet Data Channel, and is not to softer combine acknowledgments.

The base station shall set this field to ‘01’ if the mobile station is to attempt reception of the Forward Acknowledgment Channel from all members of the reduced active set, and is to combine the acknowledgments from all sectors in the same combining indicator set.

The base station shall set this field to ‘10’ if the mobile station is to attempt reception of the Forward Acknowledgment Channel from the serving sector only.

The base station shall set this field to ‘11’ if the mobile station is to combine the Forward Acknowledgment Channel from all sectors in the same combining indicator set as the serving sector.
| FOR_ACKCH_COMB_SEL- | Forward Acknowledgment Channel Combining method selector. If FOR_ACKCH_ASSIGNED is omitted, or if it is included and set to '0', or if FOR_ACKCH_MODE is omitted, or if it is included and set to '00' or '10', or if PDCH_GROUP_IND_INCL is set to '0', the base station shall omit this field; otherwise, it shall include it and set it as follows. The base station shall set this field to '0' if the mobile station is to use PWR_COMB_IND as a combining indicator when receiving the Forward Acknowledgment Channel; otherwise, it shall set it to '1' if the mobile station is to use PDCH_GROUP_IND as the indicator for combining sectors. |
| REV_PDCH_PARMS_INCL | Reverse Packet Data Channel related parameters included indicator. If EXT_CH_IND signals the allocation of a R-PDCH, the base station shall include this field and shall set it as follows; otherwise, the base station shall omit this field. The base station shall set this field to '1' if the following R-PDCH parameters are included in this message; otherwise, the base station shall set this field to '0'. |
| REV_PDCH_RLGAIN_INCL | Reverse Packet Data Channel parameters related to reverse link adjustment gains included indicator. If REV_PDCH_PARMS_INCL is omitted, or if it is included and set to '0', the base station shall include this field, and set it as follows. The base station shall set this field to '1' if the following R-PDCH gain related fields are included in this message; otherwise, the base station shall set this field to '0'. |
| RLGAIN_SPICH_PILOT | Reverse Secondary Pilot Channel to pilot adjustment gain. If REV_PDCH_RLGAIN_INCL is omitted, or if it is included and set to '0', the base station shall include this field, and set it as follows. The base station shall set this field to the Reverse Secondary Pilot Channel to pilot adjustment gain expressed as a two’s complement value in units of 0.125 dB (see [2]). |
| RLGAIN_REQCH_PILOT | Reverse Request Channel to pilot adjustment gain. If REV_PDCH_RLGAIN_INCL is omitted, or if it is included and set to '0', the base station shall include this field, and set it as follows. The base station shall set this field to the Reverse Request Channel to pilot adjustment gain expressed as a two’s complement value in units of 0.125 dB (see [2]). |
| RLGAIN_PDCCH_PILOT | Reverse Packet Data Control Channel to pilot adjustment gain. |

| 3-279 |
If REV_PDCH_RLGAIN_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to the Reverse Packet Data Channel to pilot adjustment gain expressed as a two's complement value in units of 0.125 dB (see [2]).

REV_PDCH_PARMS_1_INCL - Reverse Packet Data Channel parameters subset included indicator.

If REV_PDCH_PARMS_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to '1' if the following R-PDCH parameters are included in this message; otherwise, the base station shall set this field to '0'.

REV_PDCH_TABLE_SEL - Reverse Packet Data Channel Table selector.

If REV_PDCH_PARMS_1_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to the Reverse Packet Data Channel Table selector (see [2]).

REV_PDCH_MAX_AUTO_TPR - Reverse Packet Data Channel maximum traffic to pilot ratio for autonomous transmission.

If REV_PDCH_PARMS_1_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to the maximum traffic to pilot ratio for autonomous transmission on the Reverse Packet Data Channel (see [2] and [3]).

The base station shall set this field to a value in the range 0 to 18 dB inclusive in units of 0.125 dB.

The base station shall include NUM_PILOTS plus one occurrences of the following record, one for each member of the mobile station's Active Set on the Traffic Channel.

PILOT_PN - Pilot PN sequence offset index.

The base station shall set this field to the pilot PN sequence offset for this pilot in units of 64 PN chips.

ADD_PILOT_REC_INCL - Additional pilot information included indicator.

The base station shall set this field to '1' if additional pilot information listed in PILOT_REC_TYPE and RECORD_LEN fields are included. The base station shall set this field to '0' if the corresponding pilot is the common pilot and there is no additional pilot information included.

PILOT_REC_TYPE - Pilot record type.
If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall set this field to the PILOT_REC_TYPE value shown in Table 3.7.2.3.2.21-9 corresponding to the type of Pilot Record specified by this record.

If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.

RECORD_LEN - Pilot record length.

If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall set this field to the number of octets in the type-specific fields of this pilot record.

If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.

Type-specific fields - Pilot record type-specific fields.

If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall include type-specific fields based on the PILOT_REC_TYPE of this pilot record as described in 3.7.6.1.

If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.

FOR_PDCH_INCL - Forward Packet Data Channel assignment included indicator.

The base station shall set this field to ‘1’ if the MS is assigned resources on the F-PDCH channel; otherwise, the base station shall set this field to ‘0’. This field shall be set to ‘1’ for at least one of the pilots included in this message.

WALSH_TABLE_ID - The index of the Walsh Table used.

The base station shall set this field to the index of the Walsh Table being used by the Packet Data Channel. (See [3]).

NUM_PDCCH - The number of Packet Data Control Channels supported.

The base station shall include NUM_PDCCH+1 occurrences of the following one-field record:
FOR_PDCCH_WALSH - Forward Packet Data Control Channel Walsh code assignment.

If FOR_PDCH_PARMS_INCL is set to ‘1’, and FOR_PDCH_INCL is set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to the Walsh code assignment for the Forward Packet Data Control Channel.

If NUM_PDCCH is set to ‘001’, the Walsh code of PDCCH0 shall be included first, followed by the Walsh code for PDCCH1

MAC_ID - Medium Access Control index.

If FOR_PDCH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the MAC index assigned to the mobile station by this pilot.

The base station shall set this field to an integer value larger than 63.

REV_CQICH_COVER - Reverse Channel Quality Indicator Channel cover.

If FOR_PDCH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the index of the R-CQICH cover associated with this pilot (See [2]).

FOR_CPCCH_WALSH - The Forward Common Power Control Channel Walsh code assignment.

If EXT_CH_IND signals the allocation of a F-CPCCH, and either of the following conditions is true:

- EXT_CH_IND signals the allocation of a F-FCH or a F-DCCH

- all of the following conditions are true:
  + FOR_PDCH_INCL is set to ‘1’
  + EXT_CH_IND does not signal allocation of a F-FCH
  + EXT_CH_IND does not signal allocation of a F-DCCH

the base station shall include this field and shall set it as follows; otherwise, the base station shall omit this field

The base station shall set this field to the Walsh code assignment for the Forward Common Power Control Channel.
FOR_CPCCH_RATE - The Forward Common Power Control Channel Rate.

If FOR_PDCH_INCL is set to ‘1’, and if EXT_CH_IND equals ‘01000’, the base station shall include this field and shall set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to the rate of the Forward Common Power Control Channel as specified in Table 3.7.2.3.2.21-12.

Table 3.7.2.3.2.21-12 Rate of the Forward Common Power Control Channel.

FOR_CPCSCH - The Forward Common Power Control Channel Subchannel.

If EXT_CH_IND signals the allocation of a F-CPCCH, and either of the following conditions is true:

- EXT_CH_IND signals the allocation of a F-FCH or a F-DCCH
- all of the following conditions are true:
  - FOR_PDCH_INCL is set to ‘1’
  - EXT_CH_IND does not signal allocation of a F-FCH
  - EXT_CH_IND does not signal allocation of a F-DCCH

the base station shall include this field and shall set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to the Forward Common Power Control Channel Subchannel associated with this base station.

If FOR_CPCCH_RATE is omitted, or if it is included and set to ‘00’, the base station shall set this field to a value in the range 0 to 243 inclusive. If FOR_CPCCH_RATE is included and set to ‘01’, the base station shall set this field to a value in the range 0 to 487 inclusive. If FOR_CPCCH_RATE is included and set to ‘10’, the base station shall set this field to a value in the range 0 to 965 inclusive.

PWR_COMB_IND - Power control symbol combining indicator.
If this pilot will carry the same closed-loop power control subchannel bits as that of the previous pilot in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’. The base station shall set this field to ‘0’ in the first record in the pilot list.

PDCH_GROUP_IND - Packet Data Channel Group Indicator.

If PDCH_GROUP_IND_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

If the mobile station is to use the softer reselection parameters when re-pointing between this pilot and the previous pilot that has a F-PDCH assigned to this mobile station in this message (i.e. FOR_PDCH_INCL is set to ‘1’), the base station shall set this field to ‘1’ (see [3]).

If the mobile station is to use the soft reselection parameters when re-pointing between this pilot and the previous pilot in this message that has a F-PDCH assigned to this mobile station (i.e. FOR_PDCH_INCL is set to ‘1’), the base station shall set this field to ‘0’ (see [3]).

The base station shall set this field to ‘0’ in the first record in the pilot list that has a F-PDCH assigned to this mobile station (i.e. FOR_PDCH_INCL is set to ‘1’).

CODE_CHAN_FCH - Code channel on the Fundamental Channel.

If EXT_CH_IND signals the allocation of a F-FCH, the base station shall include this field and shall set it as follows; otherwise it shall be omitted.

The base station shall set this field to the code channel index (see [2]) that the mobile station is to use on the Fundamental Channel of the Forward Traffic Channel.

If Radio Configuration 1, 2, 3, or 5 (see [2]) is used, the base station shall set this field in the range 1 to 63 inclusive. If Radio Configuration 4 is used, the base station shall set this field in the range 1 to 127 inclusive.

QOF_MASK_ID_FCH - Quasi-orthogonal function index on the Fundamental Channel.

If EXT_CH_IND signals the allocation of a F-FCH, the base station shall include this field and shall set it as follows; otherwise it shall be omitted.

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]).

CODE_CHAN_DCCH - Code channel on the Dedicated Control Channel.

If EXT_CH_IND signals the allocation of a F-DCCH, the base station shall include this field and shall set it as follows; otherwise it shall be omitted.
The base station shall set this field to the code channel index (see [2]), in the range of 1 to 127 inclusive, that the mobile station is to use on the Dedicated Control Channel of the Forward Traffic Channel.

If Radio Configuration 3 or 5 (see [2]) is used, the base station shall set this field in the range 1 to 63 inclusive. If Radio Configuration 4 is used, the base station shall set this field in the range 1 to 127 inclusive.

QOF_MASK_ID_DCCH - Quasi-orthogonal function index on the Dedicated Control Channel.

If EXT_CH_IND signals the allocation of a F-DCCH, the base station shall include this field and shall set it as follows; otherwise it shall be omitted.

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]).

FOR_ACKCH_WALSH_INDEX - Walsh Code for the Forward Acknowledgment Channel.

If FOR_ACKCH_ASSIGNED is omitted, or if it is included and set to '0', or if FOR_PDCH_INCL is set to '0', or if EXT_CH_IND does not signal the allocation of a R-PDCH, the base station shall omit this field; otherwise, it shall include it and set it as follows.

The base station shall set this field to the Walsh code of the Forward Acknowledgment Channel (see [2]).

FOR_ACKSCH_INDEX - Forward Acknowledgment Subchannel Index.

If FOR_ACKCH_ASSIGNED is omitted, or if it is included and set to '0', or if FOR_PDCH_INCL is set to '0', or if EXT_CH_IND does not signal the allocation of a R-PDCH, the base station shall omit this field; otherwise, it shall include it and set it as follows.

The base station shall set this field to the subchannel index of the Forward Acknowledgment Channel (see [2]). The base station should not use FOR_ACKSCH_INDEX = 0, 1, or \textsuperscript{97}, or \textsuperscript{98}.

FOR_RCCH_INCL - Forward Rate Control Subchannel included flag.

If FOR_PDCH_INCL is set to '0', or if FOR_RCCH_ASSIGNED is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to '1' if a Forward Rate Control Channel Subchannel is allocated on this pilot (see [2]); otherwise, the base station shall set this field to '0'.

The base station shall set this field to a non zero value for at least one pilot in this message.

FOR_RCCH_WALSH_INDEX - Walsh Code for the Forward Rate Control Channel Subchannel.
If FOR_RCCH_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to the Walsh code of the Forward Rate Control Channel Subchannel (see [2]).

FOR_RCSCH_INDEX - Forward Rate Control Subchannel.

If FOR_RCCH_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to the subchannel index of the Rate Control Subchannel on this pilot (see [2]).

If FOR_RCCH_REPETITION is set to ‘00’, the base station shall set this field to a value in the range 0 to 95 inclusive. If FOR_RCCH_REPETITION is set to ‘01’, the base station shall set this field to a value in the range 0 to 47 inclusive. If FOR_RCCH_REPETITION is set to ‘10’, the base station shall set this field to a value in the range 0 to 23 inclusive.

The base station shall set this field to the subchannel offset of the Rate Control Subchannel on this pilot.

NUM_FOR_GCH - Number of Forward Grant Channels

If FOR_PDCH_INCL is set to ‘0’, or if FOR_GCH_ASSIGNED is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to the number of assigned Forward Grant Channels on this pilot. The base station shall set this field to 0, 1, or 2.

The base station shall set this field to a non zero value for at least one pilot in this message.

If FOR_PDCH_INCL is set to ‘1’, and if FOR_GCH_ASSIGNED is included and set to ‘1’, the base station shall include NUM_FOR_GCH occurrences of the field

FOR_GCH_WALSH_INDEX: - Walsh Code for the Forward Grant Channel.

The base station shall set this field to the Walsh code of the Forward Grant Channels (see [2]).

SYNC_ID_INCL - Service Configuration synchronization identifier included indicator.

The base station shall omit this field if the GRANTED_MODE field is not set to ‘11’; otherwise, the base station shall include this field and set it as follows:
If `DIRECT_CH_ASSIGN_IND` field is set to ‘1’ or if `DIRECT_CH_ASSIGN_IND` field is set to ‘0’ and the mobile station is to use a different stored service configuration corresponding to `SYNC_ID` field included in this message, then indicated by the mobile station in the `Origination Message`, the `Reconnect Message`, or `Page Response Message`, the base station shall set this field to ‘1’, otherwise, the base station shall set this field to ‘0’.

</tbody>
</table>
The base station shall set this field to ‘1’ if the mobile station is to respond to the
Extended Channel Assignment Message with a Page Response Message or Reconnect Message in unassured mode on the r-csch; otherwise, the base station shall set this field to ‘0’ to indicate that the mobile station is not to respond on the r-csch.

DIRECT_CH_ASSIGN_RECOVER_IND - Direct Channel Assignment Recover Indicator.

If DIRECT_CH_ASSIGN_IND is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
The base station shall set this field to ‘1’ if the mobile station is to transmit a Page Response Message or a Reconnect Message after failing to acquire the forward traffic channel assigned in this message; otherwise, the base station shall set this field to ‘0’.

EARLY_RL_TRANSMIT_IND - Early Reverse Link Transmission indicator.

If FOR_CPCCH_RATE is included and not set to ‘00’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.
The base station shall set this field to ‘1’ if, upon channel assignment, the mobile station is to enable the transmitter prior to receiving sufficient signal quality on the forward link; otherwise, the base station shall set this field to ‘0’.

FUNDICATED_BCMC_IND – BCMC on fundicated channel Indicator.

If the channel assignment in this message contains a Forward Fundicated Channel used for BCMC transmission, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

ADD_PLCM_FOR_FCH_INCL – Additional PLCM for forward FCH included indicator.

If the FUNDICATED_BCMC_IND field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
If the additional PLCM for forward FCH is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

ADD_PLCM_FOR_FCH_TYPE - The Additional Public Long Code Mask for forward FCH type indicator.

If ADD_PLCM_FOR_FCH_INCL is not included or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.
The base station shall set this field to ‘1’ to indicate PLCM specified by the base station. The field value ‘0’ is reserved.
ADD_PLCM_FOR_FCH_39 - The 39 LSB bits of the additional Public Long Code Mask for forward FCH.

If ADD_PLCM_FOR_FCH_TYPE field is included and is set to ‘1’, the base station shall include this field and set it to the 39 least significant bits of the public long code mask used by the mobile station; otherwise, the base station shall omit this field.

FIXED_PREAMBLE_TRANSMIT_IND - Fixed Number of Preambles Transmission Indicator.

If GRANTED_MODE is not set to ‘11’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ to indicate if the mobile station is allowed to enter Traffic Channel Substate of the Mobile Station Control on the Traffic Channel State after sending the number of pre-ambles specified in this message; otherwise the base station shall set this field to ‘0’.

If any channel assigned by this message is to use Radio Configuration 1 or 2 (see [2]), then the base station shall set this field to ‘0’ if GRANTED_MODE is not set to ‘11’.

FIXED_NUM_PREAMBLE - Traffic Channel preamble length.

If FIXED_PREAMBLE_TRANSMIT_IND is not included, or is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it to the minimum length of Traffic Channel preamble that the mobile station is to transmit, before entering the Traffic Channel Substate of the Mobile Station Control on the Traffic Channel State without having received a forward dedicated channel acquired indication from Layer 2 (see [4]).

The base station shall set FIXED_NUM_PREAMBLE to the value shown in Table 3.7.2.3.2.17 corresponding to the Traffic Channel preamble length in 1.25 ms-units.

TX_PWR_LIMIT_INCL - Transmit Power Limit inclusion for the current base station

If the transmit power limit field is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

TX_PWR_LIMIT - Transmit Power Limit for the current base station

If TX_PWR_LIMIT_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set to as follows.

The base station shall set this field to thirty dB more than transmit power limit in dBm EIRP, in steps of 1 dB. This field can take the values 30 to 53 corresponding to maximum transmit power values 0 dBm to 23 dBm.

} (NUM_HRPD_NGHBR)
```

1. **PILOT_PN** - Pilot PN sequence offset index.
   - The base station shall set this field to the pilot PN sequence offset for this base station, in units of 64 PN chips.

2. **CONFIG_MSG_SEQ** - Configuration message sequence number.
   - The base station shall set this field to CONFIG_SEQ (see 3.6.2.2).

3. **PILOT_INC** - Pilot PN sequence offset index increment.
   - A mobile station searches for Remaining Set pilots at pilot PN sequence index values that are multiples of this value.
The base station shall set this field to the pilot PN sequence increment, in units of 64 PN chips, that mobile stations are to use for searching the Remaining Set. The base station should set this field to the largest increment such that the pilot PN sequence offsets of all its neighbor base stations are integer multiples of that increment.

The base station shall set this field to a value in the range 1 to 15 inclusive.

**NGHBR_SRCH_MODE** - Search mode.

The base station shall set this field to the value shown in Table 3.7.2.3.2.22-1 corresponding to the search mode.

<table>
<thead>
<tr>
<th>Value (binary)</th>

</tbody>
</table>

**NGHBR_CONFIG_PN_INCL** - Neighbor configuration and PN offset included.

If neighbor configuration and PN offset fields are included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**FREQ_FIELDS_INCL** - Frequency fields included.

If frequency fields are included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**USE_TIMING** - Use timing indicator.

If base station timing information is included for neighbor base stations, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**GLOBAL_TIMING_INCL** - Global timing included.

If USE_TIMING is set to ‘1’, the base station shall include the field GLOBAL_TIMING_INCL and set this field as described below; otherwise, the base station shall omit this field.

If base station timing information is included globally for all neighbor base stations with TIMING_INCL equal to ‘1’, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**GLOBAL_TX_DURATION** - Global neighbor transmit time duration.
If GLOBAL_TIMING_INCL is included and is set to ‘1’, the base station shall include the field GLOBAL_TX_DURATION and shall set this field as described below; otherwise, the base station shall omit this field.

The base station shall set this field to the duration of the base station transmit window, during each period, in units of 80 ms. The base station should set this field to a value of 3 or greater.

GLOBAL_TX_PERIOD - Global neighbor transmit time period.

If GLOBAL_TIMING_INCL is included and is set to ‘1’, the base station shall include the field GLOBAL_TX_PERIOD and shall set this field as described below; otherwise, the base station shall omit this field.

The base station shall set this field to the duration of the period, in units of 80 ms.

NUM_NGHBR - Number of neighbor pilot PN sequences.

The base station shall set this field to the number of neighbors included in the message.

The base station shall include one occurrence of the following record for each pilot that a mobile station is to place in its Neighbor Set. The base station shall use the same order for the following record in this message as is used for pilots which are listed in the Neighbor List Message or Extended Neighbor List Message. Specifically, the $i^{th}$ occurrence of the following record shall correspond the $i^{th}$ pilot in the Neighbor List Message or in the Extended Neighbor List Message.

NGHBR_CONFIG - Neighbor configuration.

If NGHBR_CONFIG_PN_INCL = ‘1’, the base station shall set this field to the value shown in Table 3.7.2.3.2.22-2 corresponding to the configuration of this neighbor; otherwise, the base station shall omit this field.
### Table 3.7.2.3.22-2. Neighbor Configuration Field

<table>
<thead>
<tr>
<th>Value (binary)</th>
<th>Neighbor Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>000</td>
<td>The neighbor base station has the same number of frequencies having Paging Channels as the current base station. The neighbor base station has a CDMA frequency assignment corresponding to this current CDMA frequency assignment with the same number of Paging Channels, and the neighbor CDMA frequency is given as follows:</td>
</tr>
<tr>
<td></td>
<td>• If FREQ_INCL equals ‘0’ for this record, this corresponding CDMA frequency assignment is the current CDMA frequency assignment.</td>
</tr>
<tr>
<td></td>
<td>• If FREQ_INCL equals ‘1’ for this record, this corresponding CDMA frequency assignment is given by NGHBR_BAND and NGHBR_FREQ.</td>
</tr>
<tr>
<td></td>
<td>The position of the neighbor CDMA frequency assignment in the <em>CDMA Channel List Message</em> or the <em>Extended CDMA Channel List Message</em> transmitted by the neighbor base station is the same as the position of this current CDMA frequency assignment in the <em>CDMA Channel List Message</em> or the <em>Extended CDMA Channel List Message</em> transmitted by the current base station.</td>
</tr>
<tr>
<td>001</td>
<td>The neighbor base station has the same number of frequencies having Paging Channels as the current base station. The neighbor base station has a CDMA frequency assignment corresponding to this current CDMA frequency assignment but possibly with a different number of Paging Channels, and the neighbor CDMA frequency is given as follows:</td>
</tr>
<tr>
<td></td>
<td>• If FREQ_INCL equals ‘0’ for this record, this corresponding CDMA frequency assignment is the current CDMA frequency assignment.</td>
</tr>
<tr>
<td></td>
<td>• If FREQ_INCL equals ‘1’ for this record, this corresponding CDMA frequency assignment is given by NGHBR_BAND and NGHBR_FREQ.</td>
</tr>
<tr>
<td></td>
<td>The position of the neighbor CDMA frequency assignment in the <em>CDMA Channel List Message</em> or the <em>Extended CDMA Channel List Message</em> transmitted by the neighbor base station is the same as the position of this current CDMA frequency assignment in the <em>CDMA Channel List Message</em> or the <em>Extended CDMA Channel List Message</em> transmitted by the current base station.</td>
</tr>
<tr>
<td></td>
<td>This corresponding neighbor CDMA frequency assignment does have a Primary Paging Channel.</td>
</tr>
</tbody>
</table>
The neighbor base station may have a different number of frequencies having Paging Channels as the current base station.

The neighbor base station has a Primary Paging Channel on the following CDMA frequency:

- If FREQ_INCL equals ‘0’ for this record, the neighbor base station has a Primary Paging Channel on the first CDMA Channel listed in the CDMA Channel List Message or the Extended CDMA Channel List Message transmitted by the current base station.
- If FREQ_INCL equals ‘1’ for this record, the neighbor base station has a Primary Paging Channel on the CDMA frequency assignment given by NGHBR_BAND and NGHBR_FREQ.

The neighbor base station configuration is unknown but the neighbor base station has a Pilot Channel on the following frequency:

- If FREQ_INCL equals ‘0’ for this record, the neighbor CDMA frequency assignment is the same as the current CDMA frequency assignment and has a Pilot Channel.
- If FREQ_INCL equals ‘1’ for this record, the CDMA frequency assignment given by NGHBR_BAND and NGHBR_FREQ has a Pilot Channel.

NGHBR_PN - Neighbor pilot PN sequence offset index.
If NGHBR_CONFIG_PN_INCL = ‘1’, the base station shall set this field to the pilot PN sequence offset for this neighbor, in units of 64 PN chips; otherwise, the base station shall omit this field.

SEARCH_PRIORITY - Pilot Channel search priority.
If NGHBR_SRCH_MODE = ‘01’ or NGHBR_SRCH_MODE = ‘11’, then the base station shall set this field to the search priority for the Pilot Channel corresponding to NGHBR_PN.
The base station shall set the search priority as shown in Table 3.7.2.3.22-3. If NGHBR_SRCH_MODE is set to any other value, the base station shall omit this field.

100-111 Reserved.
Table 3.7.2.3.2.22-3. Search Priority Field

<table>
<thead>
<tr>
<th>Value (binary)</th>
<th>Search Priority</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Low</td>
</tr>
<tr>
<td>01</td>
<td>Medium</td>
</tr>
<tr>
<td>10</td>
<td>High</td>
</tr>
<tr>
<td>11</td>
<td>Very High</td>
</tr>
</tbody>
</table>

SRCH_WIN_NGHBR - Neighbor pilot channel search window size.

If NGHBR_SRCH_MODE = ‘10’ or ‘11’, then the base station shall set this field to the value shown in Table 2.6.6.2.1-1 corresponding to the search window size to be used by mobile stations for this neighbor. If NGHBR_SRCH_MODE is set to any other value, the base station shall omit this field.

FREQ_INCL - Frequency included indicator.

If FREQ_FIELDDS_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

If the NGHBR_BAND and NGHBR_FREQ fields are included for this neighbor base station, the base station shall set this bit to ‘1’. If the NGHBR_BAND and NGHBR_FREQ fields are not included in this assignment record, the base station shall set this bit to ‘0’.

NGHBR_BAND - Neighbor band class.

If the FREQ_INCL bit is included and is set to ‘1’, the base station shall set this field to the CDMA band class, as specified in [30], corresponding to the CDMA frequency assignment for the CDMA Channel containing the Paging Channel the mobile station is to search. If the FREQ_INCL bit is omitted or is set to ‘0’, the base station shall omit this field.

NGHBR_FREQ - Neighbor frequency assignment.

If the FREQ_INCL bit is omitted or is set to ‘0’, the base station shall omit this field.

If the FREQ_INCL bit is included and is set to ‘1’ and the corresponding neighbor has a 1X neighbor pilot record type, the base station shall set this field to the CDMA Channel number, in the specified CDMA band class, corresponding to the CDMA frequency assignment for the CDMA Channel containing the Paging Channel the mobile station is to search.
If the FREQ_INCL bit is included and is set to ‘1’ and the corresponding neighbor has a 3X neighbor pilot record type, the base station shall set this field to the CDMA Channel number, in the specified CDMA band class, corresponding to the center SR3 frequency assignment containing the Paging Channel the mobile station is to search.

**TIMING_INCL** - Timing included indicator.

If USE_TIMING is set to ‘1’, the base station shall include the field TIMING_INCL and set this field as described below; otherwise, the base station shall omit this field.

If base station timing information is included for this neighbor base station, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**NGHBR_TX_OFFSET** - Neighbor transmit time offset.

If TIMING_INCL is included and is set to ‘1’, the base station shall include the field NGHBR_TX_OFFSET and set this field as described below; otherwise, the base station shall omit this field.

The base station shall set this field to the time offset, in units of 80 ms, from the beginning of the neighbor timing period to the beginning of the first base station transmit window within the period. The beginning of the neighbor timing period occurs when $\left\lfloor t/4 \right\rfloor \mod (16384) = 0$.

**NGHBR_TX_DURATION** - Neighbor transmit time duration.

If TIMING_INCL is included and is set to ‘1’ and GLOBAL_TIMING_INCL is set to ‘0’, the base station shall include the field NGHBR_TX_DUR ATION and set this field as described below; otherwise, the base station shall omit this field.

The base station shall set this field to duration of the base station transmit window, during each period, in units of 80 ms. The base station should set this field to a value of 3 or greater.

**NGHBR_TX_PERIOD** - Neighbor transmit time period.

If TIMING_INCL is included and is set to ‘1’ and GLOBAL_TIMING_INCL is set to ‘0’, the base station shall include the field NGHBR_TX_PERIOD and set this field as described below; otherwise, the base station shall omit this field.

The base station shall set this field to duration of the period, in units of 80 ms.

**NUM_ANALOG_NGHB**R - Number of neighboring analog systems.

The base station shall set this field to the number of neighboring analog systems included in the message.
The base station shall include one occurrence of the following record for each neighboring analog system included in the message:

- **BAND_CLASS** - Band class.
  The base station shall set this field to the CDMA band class, as specified in [30].

- **SYS_A_B** - System A/B.
  If **BAND_CLASS** is set to ‘00000’ or to ‘00011’, the base station shall set this field to the value shown in Table 3.7.2.3.2.22-4 corresponding to the availability of neighboring analog systems; otherwise, the base station shall set this field to ‘00’.

<table>
<thead>
<tr>

<td>10</td>
</tr>
<tr>
<td>RESERVED</td>
<td>00</td>
</tr>
</tbody>
</table>

- **SRCH_OFFSET_INCL** - Neighbor pilot channel search window offset included.
  If **NGHBR_SRCH_MODE** = ‘10’ or ‘11’ and if the **SRCH_OFFSET_NGHBR** field is included in the following records, the base station shall set this bit to ‘1’; otherwise, the base station shall set this bit to ‘0’.

The base station shall include one occurrence of the following record for each pilot that a mobile station is to place in its Neighbor Set. The base station shall use the same order for the following record in this message as is used for pilots which are listed in the Neighbor List Message or Extended Neighbor List Message. Specifically, the $i^{th}$ occurrence of the following record shall correspond the $i^{th}$ pilot in the Neighbor List Message or in the Extended Neighbor List Message.

- **ADD_PILOT_REC_INCL** - Additional pilot information included indicator.
  The base station shall set this field to ‘1’ if additional pilot information listed in the **NGHBR_PILOT_REC_TYPE** and **RECORD_LEN** fields are included. The base station shall set this field to ‘0’ if the corresponding pilot is the common pilot and there is no additional pilot information included.

- **NGHBR_PILOT_REC_TYPE** - Neighbor Pilot record type
  If **ADD_PILOT_REC_INCL** is set to ‘1’, the base station shall set this field to the **NGHBR_PILOT_REC_TYPE** value shown in Table 3.7.2.3.2.22-5 corresponding to the type of Pilot Record specified by this record.
Table 3.7.2.3.22-5. Neighbor Pilot Record Types

<table>
<thead>
<tr>
<th>Description</th>
<th>NGHBR_PILOT_REC_TYPE (binary)</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

All other NGHBR_PILOT_REC_TYPE values are reserved

If NGHBR_PILOT_REC_TYPE is equal to ‘000’, the base station shall include the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>TD_POWER_LEVEL</td>
<td>2</td>
</tr>
<tr>
<td>TD_MODE</td>
<td>2</td>
</tr>
<tr>
<td>RESERVED</td>
<td>4</td>
</tr>
</tbody>
</table>

If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.

RECORD_LEN - Pilot record length.

If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall set this field to the number of octets in the type-specific fields of this pilot record.

If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.

Type-specific fields - Pilot record type-specific fields.

If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall include type-specific fields based on the NGHBR_PILOT_REC_TYPE of this pilot record.

If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.

If NGHBR_PILOT_REC_TYPE is equal to ‘000’, the base station shall include the following fields:

TD_POWER_LEVEL - TD Transmit Power Level.
The base station shall set this field to the TD transmit power level relative to that of the Forward Pilot Channel as specified in Table 3.7.2.3.2.26-4.

**TD_MODE** - Transmit Diversity mode.

The base station shall set this field to the Transmit Diversity mode, as specified in Table 3.7.2.3.2.26-3.

**RESERVED** - Reserved bits.

The base station shall set this field to ‘0000’.

If NGHBR_PILOT_REC_TYPE is equal to ‘001’, the base station shall include the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>QOF</td>
<td>2</td>

<td>WALSH_LENGTH+6</td>
</tr>
<tr>
<td>RESERVED</td>
<td>0 to 7 (as needed)</td>
</tr>
</tbody>
</table>

**QOF** - Quasi-orthogonal function index.

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]).

**WALSH_LENGTH** - Length of the Walsh Code.

The base station shall set this field to the WALSH_LENGTH value shown in Table 3.7.2.3.2.22–6 corresponding to the length of the Walsh code for the pilot that is used in as the Auxiliary pilot.

**Table 3.7.2.3.2.22-6. Walsh Code Length**

<table>

<tr>
<td>‘100’–‘111’</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

**AUX_PILOT_WALSH** - Walsh Code for the Auxiliary Pilot.

The base station shall set this field to the Walsh code corresponding to the Auxiliary pilot.

**RESERVED** - Reserved bits.
The base station shall set all the bits of this field to ‘0’ to make the entire record octet-aligned.

If NGHBR_PILOT_REC_TYPE is equal to ‘010’, the base station shall include the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field Length (bits)</td>
<td>2</td>
</tr>
<tr>
<td>QOF</td>

<td>0 to 7 (as needed)</td>
</tr>
</tbody>
</table>

QOF - Quasi-orthogonal function index for the Auxiliary Transmit Diversity Pilot. The base station shall set this field to the index of the Quasi-orthogonal function (see [2]).

WALSH_LENGTH - Length of the Walsh Code. The base station shall set this field to the WALSH_LENGTH value shown in 3.7.2.3.2.22-6 corresponding to the length of the Walsh code for the pilots that are used as Auxiliary pilot in the transmit diversity mode.

AUX_WALSH - Walsh Code for the Auxiliary Pilot. The base station shall set this field to the Walsh code corresponding to the Auxiliary Pilot.

AUX_TD_POWER_LEVEL - Auxiliary Transmit Diversity Pilot Power Level. The base station shall set this field to the Auxiliary Transmit Diversity Pilot transmit power level relative to that of the Auxiliary Pilot as specified in Table 3.7.2.3.2.22-7.
Table 3.7.2.3.22-7. Auxiliary Transmit Diversity Pilot

Transmit Power Level

<table>

<tr>
<td>SR3_PILOTPOWER2</td>
<td>3</td>
</tr>
</tbody>
</table>

SR3_PRIMARY_PILOT - Primary SR3 pilot. The base station shall set this field to the value shown in Table 3.7.2.3.26-5 corresponding to the position of the primary SR3 pilot.

SR3_PILOTPOWER1 - The primary SR3 pilot power level relative to that of the pilot on the lower frequency of the two remaining SR3 frequencies. The base station shall set this field to the value shown in Table 3.7.2.3.26-6 corresponding to the power level of the primary pilot with respect to the pilot on the lower frequency of the two remaining SR3 frequencies.

SR3_PILOTPOWER2 - The primary SR3 pilot power level relative to that of the pilot on the higher frequency of the two remaining SR3 frequencies.
The base station shall set this field to the value shown in Table 3.7.2.3.2.26-6 corresponding to the power level of the primary pilot with respect to the pilot on the higher frequency of the two remaining SR3 frequencies.

If NGHBR_PILOT_REC_TYPE is equal to ‘100’, the base station shall include the following fields:

<table>

</table>

SR3_PRIMARY_PILOT – Primary SR3 pilot.

The base station shall set this field to the value shown in Table 3.7.2.3.2.26-5 corresponding to the position of the primary SR3 pilot.

SR3_PILOT_POWER1 – The primary SR3 pilot power level relative to that of the pilot on the lower frequency of the two remaining SR3 frequencies.

The base station shall set this field to the value shown in Table 3.7.2.3.2.26-6 corresponding to the power level of the primary pilot with respect to the pilot on the lower frequency of the two remaining SR3 frequencies.

SR3_PILOT_POWER2 – The primary SR3 pilot power level relative to that of the pilot on the higher frequency of the two remaining SR3 frequencies.
The base station shall set this field to the value shown in Table 3.7.2.3.2.26-6 corresponding to the power level of the primary pilot with respect to the pilot on the higher frequency of the two remaining SR3 frequencies.

QOF - Quasi-orthogonal function index.

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) on the frequency of the primary pilot.

WALSH_LENGTH - Length of the Walsh Code.

The base station shall set this field to the WALSH_LENGTH value shown in Table 3.7.2.3.2.22-6 corresponding to the length of the Walsh code for the pilot that is used as the Auxiliary pilot on the frequency of the primary pilot.

AUX_PILOT_WALSH - Walsh Code for the Auxiliary Pilot.

The base station shall set this field to the Walsh code corresponding to the Auxiliary pilot on the frequency of the primary pilot.

ADD_INFO_INCL1 - Additional information included for the pilot on the lower frequency of the two remaining SR3 frequencies.

If the additional information for the pilot on the lower frequencies of the two remaining SR3 frequencies is the same as pilot on the primary frequency, the base station shall set this field to ‘0’; otherwise, the base station shall set this field to ‘1’.

QOF1 - Quasi-orthogonal function index for the pilot on the lower frequency of the two remaining SR3 frequencies.

If ADD_INFO_INCL1 is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

WALSH_LENGTH1 - Length of the Walsh Code for the pilot on the lower frequency of the two remaining SR3 frequencies.

If ADD_INFO_INCL1 is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

AUX_PILOT_WALSH1 - Walsh Code for the Auxiliary Pilot on the lower frequency of the two remaining SR3 frequencies.
If ADD_INFO_INCL1 is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the Walsh code corresponding to the Auxiliary pilot on the lower frequency of the two remaining SR3 frequencies.

ADD_INFO_INCL2 - Additional information included for the pilot on the higher frequency of the two remaining SR3 frequencies.

If the additional information for the pilot on the higher frequencies of the two remaining SR3 frequencies is the same as pilot on the primary frequency, the base station shall set this field to ‘0’; otherwise, the base station shall set this field to ‘1’.

QOF2 - Quasi-orthogonal function index for the pilot on the higher frequency of the two remaining SR3 frequencies.

If ADD_INFO_INCL2 is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) on the higher frequency of the two remaining SR3 frequencies.

WALSH_LENGTH2 - Length of the Walsh Code for the pilot on the higher frequency of the two remaining SR3 frequencies.

If ADD_INFO_INCL2 is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the WALSH_LENGTH value shown in Table 3.7.2.3.22–6 corresponding to the length of the Walsh code for the pilot that is used as the Auxiliary pilot on the higher frequency of the two remaining SR3 frequencies.

AUX_PILOT_WALSH2 - Walsh Code for the Auxiliary Pilot on the higher frequency of the two remaining SR3 frequencies.

If ADD_INFO_INCL2 is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the Walsh code corresponding to the Auxiliary pilot on the higher frequency of the two remaining SR3 frequencies.

RESERVED - Reserved bits.

The base station shall set all the bits of this field to ‘0’ to make the entire record octet-aligned.
SRCH_OFFSET_NGHBR - Neighbor pilot channel search window size offset.
If SRCH_OFFSET_INCL equals to ‘1’, then the base station shall set this field to the value shown in Table 2.6.6.2.1-2 corresponding to the search window offset to be used by mobile stations for this neighbor; otherwise, the base station shall omit this field.

BCCH_IND_INCL - BCCH support included indicator.
If the BCCH_SUPPORT field is included in the following records, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

If BCCH_IND_INCL is set to ‘1’, the base station shall include one occurrence of the following field for each pilot that a mobile station is to place in its Neighbor Set. The base station shall use the same order for the following record in this message as is used for pilots which are listed in the Neighbor List Message or Extended Neighbor List Message. Specifically, the $i^{th}$ occurrence of the following record shall correspond the $i^{th}$ pilot in the Neighbor List Message or in the Extended Neighbor List Message.

BCCH_SUPPORT - BCCH support indicator.
If this neighbor base station supports Broadcast Control Channel, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

RESQ_ENABLED – Call rescue feature enabled indicator.
The base station shall set this field to ‘1’ if the call rescue feature is enabled and there is at least one occurrence of NGHBR_RESQ_CONFIGURED set to ‘1’ in this message; otherwise, the base station shall set this field to ‘0’.

RESQ_DELAY_TIME – Call rescue delay timer value.
If RESQ_ENABLED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
The base station shall set this field to the value of the call rescue delay timer to be used by the mobile station, in units of 80 ms.

RESQ_ALLOWED_TIME – Call rescue allowed timer value.
If RESQ_ENABLED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
The base station shall set this field to the value of the call rescue allowed timer to be used by the mobile station, in units of 80 ms.

RESQ_ATTEMPT_TIME – Call rescue attempt timer value.
If RESQ_ENABLED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
The base station shall set this field to the value of the call rescue attempt timer to be used by the mobile station, in units of 40 ms.

**RESQ_CODE_CHAN** – Code channel index for the Rescue Channel.

If RESQ_ENABLED is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the code channel index (see [2]) that the mobile station is to use on the Forward Fundamental Channel when attempting Call Rescue Soft Handoff with the associated neighbor pilot.

If Radio Configuration 1, 2, 3, or 5 (see [2]) is used, the base station shall set this field in the range 1 to 63 inclusive. If Radio Configuration 4, 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive, If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

**RESQ_QOF** – Quasi-Orthogonal Function mask identifier for the Rescue Channel.

If RESQ_ENABLED is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the quasi-orthogonal function mask identifier (see [2]) that the mobile station is to use on the Forward Fundamental Channel when attempting Call Rescue Soft Handoff with the associated neighbor pilot.

**RESQ_MIN_PERIOD_INCL** – Minimum time between consecutive rescues included indicator.

If RESQ_ENABLED is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to '1' if the RESQ_MIN_PERIOD field is included in this message; otherwise, the base station shall set this field to '0'.

This field is set to '0' if there is no minimum time restriction between consecutive rescues.

**RESQ_MIN_PERIOD** – Minimum time between consecutive rescues.

If RESQ_MIN_PERIOD_INCL is not included, or is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to one less than the minimum time after a successful call rescue (i.e. receipt of $N_{3m}$ good frames by the mobile station after the rescue attempt timer is enabled) before any subsequent call rescue attempts can be initiated, in units of 2 seconds.
RESQ_NUM_TOT_TRANS_INCL – The required number of transmissions before declaring L2 Acknowledgment Failure when Call Rescue is enabled included indicator.

If RESQ_ENABLED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the required number of transmissions of a regular PDU and mini PDU before declaring L2 Acknowledgment Failure when Call Rescue is enabled is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

RESQ_NUM_TOT_TRANS_20MS – The required number of transmissions of a regular PDU before declaring L2 Acknowledgment Failure when Call Rescue is enabled.

If the RESQ_NUM_TOT_TRANS_INCL field is not included or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the required number of transmissions of a regular PDU before declaring L2 Acknowledgment Failure when Call Rescue is enabled.

The base station shall not set this field to a value greater than N1m.

RESQ_NUM_TOT_TRANS_5MS – The required number of transmissions of a mini PDU before declaring L2 Acknowledgment Failure when Call Rescue is enabled.

If the RESQ_NUM_TOT_TRANS_INCL field is not included or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the required number of transmissions of a mini PDU before declaring L2 Acknowledgment Failure when Call Rescue is enabled.

The base station shall not set this field to a value greater than N15m.

RESQ_NUM_PREAMBLE_RC1_RC2 – The Traffic Channel preamble length for Call Rescue Soft Handoff when operating in Radio Configuration 1 or 2.

If RESQ_ENABLED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it to the length of Traffic Channel preamble, in 20 ms units, that the mobile station is to send when performing a call rescue soft handoff.

RESQ_NUM_PREAMBLE – The Traffic Channel preamble Length for Call Rescue Soft Handoff when operating in Radio Configuration greater than 2.
If RESQ_ENABLED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it to the length of Traffic Channel preamble that the mobile station is to send when performing a call rescue soft handoff, as follows:

The base station shall set this field to the value shown in Table 3.7.3.3.2.17-1 corresponding to the Traffic Channel preamble length in 1.25 ms units.

**RESQ_POWER_DELTA** – The power level adjustment to be applied to the last closed-loop power level when re-enabling the transmitter for call rescue soft handoff.

If RESQ_ENABLED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field to a value by which mobile stations are to adjust the last closed-loop power level when re-enabling the transmitter for call rescue, expressed as a two’s complement value in units of 1 dB.

The base station shall include NUM_NGHBR occurrences of the following one-field record if RESQ_ENABLED is set to ‘1’. The base station shall use the same order for the following field as is used for the NGHBR_PN fields listed in this message.

**NGHBR_RESQ_CONFIGURED** – Neighbor Rescue Channel configured indicator.

The base station shall set this field to ‘1’ if a Rescue Channel is configured for this neighbor pilot; otherwise, the base station shall set this field to ‘0’.

The base station shall include NUM_NGHBR occurrences of the following variable length record. The base station shall use the same order for the following field as is used for the NGHBR_PN fields listed in this message.

**NGHBR_PDCH_SUPPORTED** – Neighbor PDCH supported indicator.

The base station shall set this field to ‘1’ if PDCH is configured for this neighbor pilot; otherwise, the base station shall set this field to ‘0’.

**HRPD_NGHBR_INCL** – HRPD neighbor information included indicator.

If this message contains information on HRPD neighbors, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**NUM_HRPD_NGHBR** – Number of HRPD neighbor pilot PN sequences.

If the HRPD_NGHBR_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it to the number of HRPD neighbors included in the message.
The base station shall include one occurrence of the following subrecord for each pilot that a mobile station is to place in its HRPD Neighbor Set.

**HRPD_NGHBR_REC_LEN** - HRPD neighbor record length

The base station shall set this field to one less than the number of octets included in this HRPD neighbor record including this field.

**NGHBR_PN** - Neighbor pilot PN sequence offset index.

The base station shall set this field to the pilot PN sequence offset for this neighbor, in units of 64 PN chips.

**NGHBR_FREQ_INCL** - Neighbor frequency information included indicator.

The base station shall set this field to ‘1’ if the neighbor frequency information is included in this message; otherwise, the base station shall set this field to ‘0’.

**NGHBR_BAND** - Neighbor band class.

If the NGHBR_FREQ_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the CDMA band class, as specified in [30], corresponding to the CDMA frequency assignment for the CDMA Channel containing this neighbor.

**NGHBR_FREQ** - Neighbor frequency assignment.

If the NGHBR_FREQ_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the CDMA Channel number, in the specified CDMA band class, corresponding to the CDMA frequency assignment for this neighbor.

**PN_ASSOCIATION_IND** - Neighbor PN association indicator.

The base station shall set this field to ‘1’ if the system identified by this system record has the same PN assignment as the MC system to which this BS belongs; otherwise, the base station shall set this field to ‘0’.

**DATA_ASSOCIATION_IND** - Neighbor data association indicator.

The base station shall set this field to ‘1’ if the system identified by this system record can reach the same set of PDSNs as the MC system to which this BS belongs; otherwise, the base station shall set this field to ‘0’.
HRPD_NGHBR_REC_RESERVED - HRPD neighbor record reserved bits.

The base station shall add reserved bits as needed in order to make the length of this record equal to an integer number of octets. The base station shall set these bits to ‘0’.
3.7.2.3.2.23 User Zone Identification Message

**MSG_TAG: UZIM**

<table>
<thead>
<tr>

NUM_UZID occurrences of the following record:

```plaintext
[NUM_UZID]

UZID         16
UZ_REV       4
TEMP_SUB     1
```

PILOT_PN - Pilot PN sequence offset index.

The base station shall set this field to the pilot PN sequence offset for this base station, in units of 64 PN chips.

CONFIG_MSG_SEQ - Configuration message sequence number.

The base station shall set this field to CONFIG_SEQ (see 3.6.2.2).

UZ_EXIT - User Zone Exit parameter.

The base station shall set this field to the User Zone exit parameter (see 2.6.9.2.1). The base station shall set this field to a value (in dB) in the range 0 to 15.

NUM_UZID - Number of User Zone identifiers.

The base station shall set this field to the number of user zone identifiers included in this message.

The base station shall include NUM_UZID occurrences of the following record.

UZID - User Zone identifier.

The base station shall set this field to the User Zone identifier (see 3.6.7) supported by the base station.

UZ_REV - User Zone update revision number.

The base station shall set this field to the User Zone update revision number.

TEMP_SUB - Temporary subscription flag.
1 If the corresponding User Zone allows for temporary
2 subscription, the base station shall set this field to ‘1’;
3 otherwise, the base station shall set this field to ‘0’.

```

3.7.2.3.2.24 Private Neighbor List Message

3.7.2.3.2.24 Private Neighbor List Message

1. PILOT_PN - Pilot PN sequence offset index. The base station shall set this field to the pilot PN sequence offset for this base station, in units of 64 PN chips.
2. CONFIG_MSG_SEQ - Configuration message sequence number. The base station shall set this field to CONFIG_SEQ (see 3.6.2.2).
3. NUM_RADIO_INTERFACE - Number of interface types. The base station shall set this field to the number of radio interface types for which private neighbors are included in this message.
4. The base station shall include NUM_RADIO_INTERFACE occurrences of the following record, one occurrence for each radio interface for which private neighbors are included in this message.
5. RADIO_INTERFACE_TYPE - The radio interface type. The base station shall set this field to the radio interface type of this record as specified in Table 3.7.2.3.2.24-1.
Table 3.7.2.3.2.24-1. Radio Interface Type

### Field Length (bits)

NUM_UZID occurrences of the following subrecord:

\[
\{( \text{NUM_UZID or 0}) \\
\text{UZID} \quad 0 \text{ or } 16 \\
\text{UZ_REV} \quad 0 \text{ or } 4 \\
\text{TEMP_SUB} \quad 0 \text{ or } 1 \\
\}( \text{NUM_UZID or 0}) \\
\}( \text{NUM_PRI_NGHBR}) \\
\text{RESERVED} \quad 0 \text{ - 7 (as needed)}
\]

### COMMON_INCL - Common configuration included indicator.

- If all private neighbor base stations included in this message are on the same CDMA band class and CDMA Channel number as specified in the COMMON_BAND_CLASS and COMMON_NGHBR_FREQ fields, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

### COMMON_BAND_CLASS - Neighbor band class.

- If COMMON_INCL is set to ‘1’, the base station shall set this field to the CDMA band class as specified in [30] corresponding to the CDMA frequency assignment for the CDMA Channel containing the Paging Channel or the Forward Common Control Channel for all private neighbors; otherwise, the base station shall omit this field.

### COMMON_NGHBR_FREQ - Neighbor frequency assignment.

- If the COMMON_INCL bit is set to ‘1’, the base station shall set this field to the CDMA Channel number, in the specified CDMA band class, corresponding to the CDMA frequency assignment for the CDMA Channel containing the Paging Channel or the Forward Common Control Channel for all private neighbor base station; otherwise, the base station shall omit this field.

### SRCH_WIN_N - Search window size for the Private Neighbor Set.

- The base station shall set this field to the value shown in Table 2.6.6.2.1-1 corresponding to the search window size to be used by mobile stations for the Private Neighbor Set.

### NUM_PRI_NGHBR - Number of private neighbor pilot PN sequences.

- The base station shall set this field to the number of private neighbors included in the message.
The base station shall include NUM_PRI_NGHBR occurrences of the following record.

**SID** - System Identification.

The base station shall set this field to the system identification number for this private neighbor system (see 2.6.5.2).

**NID** - Network Identification.

This field serves as a sub-identifier of a system as defined by the owner of the SID.

The base station shall set this field to the system identification number for this private neighbor network (see 2.6.5.2).

**PRI_NGHBR_PN** - Private neighbor pilot PN sequence offset index.

The base station shall set this field to the pilot PN sequence offset for this private neighbor, in units of 64 PN chips.

**ADD_PILOT_REC_INCL** - Additional pilot information included indicator.

The base station shall set this field to ‘1’ if additional pilot information listed in the NGHBR_PILOT_REC_TYPE and RECORD_LEN fields are included. The base station shall set this field to ‘0’ if the corresponding pilot is the common pilot and there is no additional pilot information included.

**NGHBR_PILOT_REC_TYPE** - Neighbor Pilot record type

If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall set this field to the NGHBR_PILOT_REC_TYPE value shown in Table 3.7.2.3.2.22-5 corresponding to the type of Pilot Record specified by this record.

If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.

**RECORD_LEN** - Pilot record length.

If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall set this field to the number of octets in the type-specific fields of this pilot record.

If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.

**Type-specific fields** - Pilot record type-specific fields.

If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall include type-specific fields based on the NGHBR_PILOT_REC_TYPE of this pilot record.

If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.

If NGHBR_PILOT_REC_TYPE is equal to ‘000’, the base station shall include the following fields:
Field | Length (bits)
---|---
TD_POWER_LEVEL | 2
TD_MODE | 2
RESERVED | 4

1
2 TD_POWER_LEVEL - TD Transmit Power Level.
3 The base station shall set this field to the TD transmit power level relative to that of the Forward Pilot Channel as specified in Table 3.7.2.3.2.26-4.
4
5 TD_MODE - Transmit Diversity mode.
6 The base station shall set this field to the Transmit Diversity mode, as specified in Table 3.7.2.3.2.26-3.
7
8 RESERVED - Reserved bits.
9 The base station shall set this field to ‘0000’.
10
11 If NGHBR_PILOT_REC_TYPE is equal to ‘001’, the base station shall include the following fields:

Field | Length (bits)
---|---
QOF | 2
WALSH_LENGTH | 3
AUX_PILOT_WALSH | WALSH_LENGTH+6
RESERVED | 0 to 7 (as needed)

13
14 QOF - Quasi-orthogonal function index.
15 The base station shall set this field to the index of the Quasi-orthogonal function (see [2]).
16
17 WALSH_LENGTH - Length of the Walsh Code.
18 The base station shall set this field to the WALSH_LENGTH value shown in Table 3.7.2.3.2.22–6 corresponding to the length of the Walsh code for the pilot that is used in as the Auxiliary pilot.
19
20 AUX_PILOT_WALSH - Walsh Code for the Auxiliary Pilot.
21 The base station shall set this field to the Walsh code corresponding to the Auxiliary pilot.
22
23 RESERVED - Reserved bits.
24 The base station shall set all the bits of this field to ‘0’ to make the entire record octet-aligned.
25
26 If NGHBR_PILOT_REC_TYPE is equal to ‘010’, the base station shall include the following fields:
Field Length (bits)

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>QOF</td>
<td>2</td>
</tr>
<tr>
<td>WALSH_LENGTH</td>
<td>3</td>
</tr>
<tr>
<td>AUX_WALSH</td>
<td>WALSH_LENGTH+6</td>
</tr>
<tr>
<td>AUX_TD_POWER_LEVEL</td>
<td>2</td>
</tr>
<tr>
<td>TD_MODE</td>
<td>2</td>
</tr>
<tr>
<td>RESERVED</td>
<td>0 to 7 (as needed)</td>
</tr>
</tbody>
</table>

QOF - Quasi-orthogonal function index for the Auxiliary Transmit Diversity Pilot. The base station shall set this field to the index of the Quasi-orthogonal function (see [2]).

WALSH_LENGTH - Length of the Walsh Code. The base station shall set this field to the WALSH_LENGTH value shown in 3.7.2.3.2.22-6 corresponding to the length of the Walsh code for the pilots that are used as Auxiliary pilot in the transmit diversity mode.

AUX_WALSH - Walsh Code for the Auxiliary Pilot. The base station shall set this field to the Walsh code corresponding to the Auxiliary Pilot.

AUX_TD_POWER_LEVEL - Auxiliary Transmit Diversity Pilot Power Level. The base station shall set this field to the Auxiliary Transmit Diversity Pilot transmit power level relative to that of the Auxiliary Pilot as specified in Table 3.7.2.3.2.22-7.

TD_MODE - Transmit Diversity mode. The base station shall set this field to the Transmit Diversity mode, as specified in Table 3.7.2.3.2.26-3.

RESERVED - Reserved bits. The base station shall set all the bits of this field to ‘0’ to make the entire record octet-aligned.

If NGHBR_PILOT_REC_TYPE is equal to ‘011’, the base station shall include the following fields:

Field Length (bits)

<table>

</table>
SR3_PRIMARY_PILOT – Primary SR3 pilot.
The base station shall set this field to the value shown in Table 3.7.2.3.2.26-5 corresponding to the position of the primary SR3 pilot.

SR3_PILOT_POWER1 – The primary SR3 pilot power level relative to that of the pilot on the lower frequency of the two remaining SR3 frequencies.
The base station shall set this field to the value shown in Table 3.7.2.3.2.26-6 corresponding to the power level of the primary pilot with respect to the pilot on the lower frequency of the two remaining SR3 frequencies.

SR3_PILOT_POWER2 – The primary SR3 pilot power level relative to that of the pilot on the higher frequency of the two remaining SR3 frequencies.
The base station shall set this field to the value shown in Table 3.7.2.3.2.26-6 corresponding to the power level of the primary pilot with respect to the pilot on the higher frequency of the two remaining SR3 frequencies.

If NGHBR_PILOT_REC_TYPE is equal to ‘100’, the base station shall include the following fields:

<table>

2 SR3_PRIMARY_PILOT – Primary SR3 pilot.

3 The base station shall set this field to the value shown in
4 Table 3.7.2.3.2.26-5 corresponding to the position of the
5 primary SR3 pilot.

6 SR3_PILOT_POWER1 – The primary SR3 pilot power level relative to that of the pilot
7 on the lower frequency of the two remaining SR3 frequencies.
8 The base station shall set this field to the value shown in
9 Table 3.7.2.3.2.26-6 corresponding to the power level of the
10 primary pilot with respect to the pilot on the lower frequency
11 of the two remaining SR3 frequencies.

12 SR3_PILOT_POWER2 – The primary SR3 pilot power level relative to that of the pilot
13 on the higher frequency of the two remaining SR3
14 frequencies.
15 The base station shall set this field to the value shown in
16 Table 3.7.2.3.2.26-6 corresponding to the power level of the
17 primary pilot with respect to the pilot on the higher frequency
18 of the two remaining SR3 frequencies.

19 QOF – Quasi-orthogonal function index.

20 The base station shall set this field to the index of the Quasi-
21 orthogonal function (see [2]) on the frequency of the primary
22 pilot.

23 WALSH_LENGTH – Length of the Walsh Code.

24 The base station shall set this field to the WALSH_LENGTH
25 value shown in Table 3.7.2.3.2.22–6 corresponding to the
26 length of the Walsh code for the pilot that is used as the
27 Auxiliary pilot on the frequency of the primary pilot.

28 AUX_PILOT_WALSH – Walsh Code for the Auxiliary Pilot.

29 The base station shall set this field to the Walsh code
30 corresponding to the Auxiliary pilot on the frequency of the
31 primary pilot.

32 ADD_INFO_INCL1 – Additional information included for the pilot on the lower
33 frequency of the two remaining SR3 frequencies.
34 If the additional information for the pilot on the lower
35 frequencies of the two remaining SR3 frequencies is the same
36 as pilot on the primary frequency, the base station shall set
37 this field to ‘0’; otherwise, the base station shall set this field
38 to ‘1’.

39 QOF1 – Quasi-orthogonal function index for the pilot on the lower
40 frequency of the two remaining SR3 frequencies.
41 If ADD_INFO_INCL1 is set to ‘0’, the base station shall omit
42 this field; otherwise, the base station shall set this field as
43 follows:
The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) on the lower frequency of the two remaining SR3 frequencies.

**WALSH_LENGTH1** - Length of the Walsh Code for the pilot on the lower frequency of the two remaining SR3 frequencies.

If `ADD_INFO_INCL1` is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the `WALSH_LENGTH` value shown in Table 3.7.2.3.2.22–6 corresponding to the length of the Walsh code for the pilot that is used as the Auxiliary pilot on the lower frequency of the two remaining SR3 frequencies.

**AUX_PILOT_WALSH1** - Walsh Code for the Auxiliary Pilot on the lower frequency of the two remaining SR3 frequencies.

If `ADD_INFO_INCL1` is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the Walsh code corresponding to the Auxiliary pilot on the lower frequency of the two remaining SR3 frequencies.

**ADD_INFO_INCL2** - Additional information included for the pilot on the higher frequency of the two remaining SR3 frequencies.

If the additional information for the pilot on the higher frequencies of the two remaining SR3 frequencies is the same as pilot on the primary frequency, the base station shall set this field to '0'; otherwise, the base station shall set this field to '1'.

**QOF2** - Quasi-orthogonal function index for the pilot on the higher frequency of the two remaining SR3 frequencies.

If `ADD_INFO_INCL2` is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) on the higher frequency of the two remaining SR3 frequencies.

**WALSH_LENGTH2** - Length of the Walsh Code for the pilot on the higher frequency of the two remaining SR3 frequencies.

If `ADD_INFO_INCL2` is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the `WALSH_LENGTH` value shown in Table 3.7.2.3.2.22–6 corresponding to the length of the Walsh code for the pilot that is used as the Auxiliary pilot on the higher frequency of the two remaining SR3 frequencies.
AUX_PILOT_WALSH2 - Walsh Code for the Auxiliary Pilot on the higher frequency of the two remaining SR3 frequencies.

If ADD_INFO_INCL2 is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the Walsh code corresponding to the Auxiliary pilot on the higher frequency of the two remaining SR3 frequencies.

RESERVED - Reserved bits.

The base station shall set all the bits of this field to ‘0’ to make the entire record octet-aligned.

BAND_CLASS - Neighbor band class.

If COMMON_INCL is set to ‘0’, the base station shall set this field to the CDMA band class as specified in [30] corresponding to the CDMA frequency assignment for the CDMA Channel containing the Paging Channel for the private neighbor; otherwise, the base station shall omit this field.

NGHBR_FREQ - Neighbor frequency assignment.

If the COMMON_INCL bit is set to ‘0’, the base station shall set this field to the CDMA Channel number, in the specified CDMA band class, corresponding to the CDMA frequency assignment for the CDMA Channel containing the Paging Channel for the private neighbor base station; otherwise, the base station shall omit this field.

UZID_INCL - User Zone identifier included indicator.

If the UZID information is included, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

NUM_UZID - Number of User Zone identifiers.

If UZID_INCL is set to ‘1’, the base station shall set this field to the number of occurrences of UZID supported by the private neighbor base station; otherwise, the base station shall omit this field.

If UZID_INCL is set to ‘1’, the base station shall include NUM_UZID occurrences of the following three-field subrecord; otherwise, the base station shall omit this subrecord.

UZID - User Zone identifiers.

The base station shall set this field to the User Zone identifier supported by the private neighbor base station.

UZ_REV - User Zone update revision number.

The base station shall set this field to the User Zone update revision number.

TEMP_SUB - Temporary subscription flag.
If the corresponding User Zone allows for temporary subscription, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

RESERVED - Reserved bits.

The base station shall add reserved bits as needed in order to make the length of the entire record equal to an integer number of octets. The base station shall set these bits to ‘0’.

</table>

1. **P_REV** - Protocol revision level.
   The base station shall set this field to '00001011'.

2. **MIN_P_REV** - Minimum protocol revision level.
   The base station sets this field to prevent mobile stations which cannot be supported by the base station from accessing the system.
   The base station shall set this field to the minimum protocol revision level that it supports.

3. **SID** - System identification.
   The base station shall set this field to the system identification number for this system (see 2.6.5.2).

   This field serves as a sub-identifier of a system as defined by the owner of the SID.
   The base station shall set this field to the network identification number for this network (see 2.6.5.2).

5. **PILOT_PN** - Pilot PN sequence offset index.
   The base station shall set this field to the pilot PN sequence offset for this base station, in units of 64 PN chips.

   The base station shall set this field to the long code state at the time given by the SYS_TIME field of this message.

7. **SYS_TIME** - System time.
The base station shall set this field to the System Time as of four Sync Channel superframes (320 ms) after the end of the last superframe containing any part of this Sync Channel Message, minus the pilot PN sequence offset, in units of 80 ms (see [2]).

**LP_SEC** - The number of leap seconds that have occurred since the start of System Time.

The base station shall set this field to the number of leap seconds that have occurred since the start of System Time, as of the time given by the SYS_TIME field of this message.

**LTM_OFF** - Offset of local time from System Time.

The base station shall set this field to the two's complement offset of local time from System Time, in units of 30 minutes.

The local time of day, in units of 80 ms, as of four Sync Channel superframes (320 ms) after the end of the last superframe containing any part of this Sync Channel Message, minus the pilot PN sequence offset, is equal to SYS_TIME - (LP_SEC × 12.5) + (LTM_OFF × 22500).

**DAYLT** - Daylight savings time indicator.

If daylight savings time is in effect, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**PRAT** - Paging Channel data rate.

The base station shall set this field to the PRAT field value shown in Table 3.7.2.3.2.26-1 corresponding to the data rate used by the Paging Channels in the system.

<table>
<thead>
<tr>
<th>PRAT Field (binary)</th>
<th>Paging Channel data rate</th>

<tr>
<td>10</td>
<td>Reserved</td>
</tr>
<tr>
<td>11</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

**CDMA_FREQ** - Frequency assignment.

The base station shall set this field to the CDMA Channel number corresponding to the CDMA frequency assignment for the CDMA Channel containing a Primary Paging Channel.8

---

8 If compatibility with IS-95-A mobile stations is desired in a Band Class 0 system, the CDMA_FREQ field is set to the CDMA frequency assignment containing this Sync Channel.
EXT_CDMA_FREQ - Extended frequency assignment.

The base station shall set this field to the CDMA Channel number corresponding to the CDMA frequency assignment for the CDMA Channel containing a Primary Paging Channel that a mobile station capable of Radio Configurations greater than 2 or capable of supporting Quick Paging Channel will use.

SR1_BCCH_NON_TD_INCL - Common Channel in non TD mode on Spreading Rate 1 information included indicator.

The base station shall set this field to ‘1’ if the base station includes common channels (BCCH/F-CCCH/EACH) information in non TD mode; otherwise, the base station shall set this field to ‘0’.

SR1_NON_TD_FREQ_INCL - Non Transmit Diversity frequency included indicator.

If SR1_BCCH_NON_TD_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to ‘1’ if SR1_CDMA_FREQ_NON_TD is included in the message. The base station shall set this field to ‘0’ if the frequency specified by the EXT_CDMA_FREQ field is used for BCCH frequency assignment.

SR1_CDMA_FREQ_NON_TD - Frequency assignment for non-transmit diversity operation.

If SR1_NON_TD_FREQ_INCL is not included, or is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the CDMA Channel number corresponding to the CDMA frequency assignment for the CDMA Channel containing a Broadcast Control Channel that does not support the TD operation.

SR1_BRAT_NON_TD - BCCH data rate in non-TD mode for Spreading Rate 1.

If SR1_BCCH_NON_TD_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the BRAT field value shown in Table 3.7.2.3.26-2 corresponding to the data rate used by the Primary Broadcast Control Channel in the system.
Table 3.7.2.3.2-26-2. Broadcast Control Channel Data Rate

</tbody>
</table>

SR1_CRAT_NON_TD – BCCH code rate in non Transmit Diversity mode for Spreading Rate 1.

If SR1_BCCH_NON_TD_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to ‘0’ if the BCCH Code Rate is 1/4 (see [2]). The base station shall set this field to ‘1’ if the BCCH code rate is 1/2 (see [2]).

SR1_BCCH_CODE_CHAN_NON_TD – Walsh code for the Spreading Rate 1 BCCH in non Transmit Diversity mode.

If SR1_BCCH_NON_TD_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the Walsh code corresponding to the Spreading Rate 1 BCCH in non Transmit Diversity mode.

SR1_TD_INCL – Spreading Rate 1 Transmit Diversity frequency information included indicator.

The base station shall set this field to ‘1’ if SR1_CDMA_FREQ_TD, SR1_BRAT_TD, SR1_CRAT_TD, SR1_TD_MODE, and SR1_TD_POWER_LEVEL are included in the message; otherwise, the base station shall set this field to ‘0’.

SR1_CDMA_FREQ_TD – Spreading Rate 1 frequency assignment for Transmit Diversity operation.

If SR1_TD_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the CDMA Channel number corresponding to the CDMA frequency assignment for the CDMA Channel containing a BCCH Channel that supports the TD operation.

SR1_BRAT_TD – BCCH data rate in Transmit Diversity mode for Spreading Rate 1.
If SR1_TD_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the BRAT field value shown in Table 3.7.2.3.2.26-2 corresponding to the data rate used by the Primary Broadcast Control Channel in the system.

**SR1_CRAT_TD** – BCCH code rate in Transmit Diversity mode for Spreading Rate 1.

If SR1_TD_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to ‘0’ if the BCCH Code Rate is 1/4 (see [2]). The base station shall set this field to ‘1’ if the BCCH Code Rate is 1/2 (see [2]).

**SR1_BCCH_CODE_CHAN_TD** – Walsh code for the Spreading Rate 1 BCCH in Transmit Diversity mode.

If SR1_TD_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the Walsh code corresponding to the Spreading Rate 1 BCCH in Transmit Diversity mode.

**SR1_TD_MODE** – Spreading Rate 1 Transmit Diversity Mode.

If SR1_TD_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field corresponding to Table 3.7.2.3.2.26-3.

SR3_INCL - Spreading Rate 3 information included indicator.

The base station shall set this field to ‘1’ if the Spreading Rate 3 information is included in this message; otherwise, the base station shall set this field to ‘0’.

SR3_CENTER_FREQ_INCL - Center SR3 frequency assignment included.

If SR3_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to ‘1’, if the CDMA Channel number corresponding to the SR3 center frequency assignment for the CDMA Channel containing a Broadcast Control Channel is different to EXT_CDMA_FREQ. Otherwise, the base station shall set this field to ‘0’.

SR3_CENTER_FREQ - Center SR3 frequency assignment.

If SR3_CENTER_FREQ_INCL is not included or is included but is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the CDMA Channel number corresponding to the SR3 center frequency assignment for the CDMA Channel containing a Broadcast Control Channel.

SR3_BRAT - Spreading Rate 3 BCCH data rate.

If SR3_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the BCCH rate field value shown in Table 3.7.2.3.2.26-2 corresponding to the data rate used by the Primary Broadcast Control Channel in the system.

SR3_BCCH_CODE_CHAN - Spreading Rate 3 BCCH Walsh code.

If SR3_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:
The base station shall set this field to the Walsh code corresponding to the Spreading Rate 3 BCCH.

**SR3_PRIMARY_PILOT**  – Primary SR3 pilot.

If SR3_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the value shown in Table 3.7.2.3.2.26-5 corresponding to the position of the primary SR3 pilot.

**Table 3.7.2.3.2.26-5. The Position of the Primary SR3 Pilot**

<table>
<thead>
<tr>

</tbody>
</table>

SR3_PILOT_POWER2 - The primary SR3 pilot power level relative to that of the pilot on the higher frequency of the two remaining SR3 frequencies.

If SR3_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field to the value shown in Table 3.7.2.3.2.26-6 corresponding to the power level of the primary pilot with respect to the pilot on the higher frequency of the two remaining SR3 frequencies.

DS_INCL - Direct Spread (DS) System and Information Available.

If the base station is a pilot beacon and includes the DS_BLOB field (containing information on how to access a DS system, see [32]), the base station shall set this field to ‘1’; otherwise the base station shall set this field to ‘0’.

DS_BLOB - Access Information about a Direct Spread (DS) System.

If DS_INCL is set to ‘1’, the base station shall include this field and set it as described in [32].

If DS_INCL is set to ‘0’, the base station shall omit this field.

**(NUM_ADD_RECORD)**

4

5  

PILOT_PN - Pilot PN sequence offset index.
The base station shall set this field to the pilot PN sequence offset for this base station, in units of 64 PN chips.

**CONFIG_MSG_SEQ** - Configuration message sequence number.

The base station shall set this field to `CONFIG_SEQ` (see 3.6.2.2).

**REDIRECT_ACCOLC** - Redirected access overload classes.

See `REDIRECT_ACCOLC` field defined in 3.7.2.3.2.18.

The base station shall set the subfields corresponding to the access overload classes of mobile stations which are to be redirected to ‘1’, and shall set the remaining subfields to ‘0’.
RETURN_IF_FAIL - Return if fail indicator.

The base station shall set this field to ‘1’ if the mobile station is required to return to the system from which it is being redirected upon failure to obtain service after attempting the redirection criteria specified in all qualified redirection records in this message; otherwise, the base station shall set this field to ‘0’.

DELETE_TMSI - Delete TMSI indicator.

The base station shall set this field to ‘1’ if the mobile station is required to delete the TMSI assigned to the mobile station; otherwise, the base station shall set this field to ‘0’.

REDIRECT_P_REV_INCL - Redirection mobile protocol revision included.

If the redirection specified in this message applies to the mobile stations of some specific protocol revisions, the base station shall set this field to ‘1’; otherwise, if this redirection applies to all mobile stations, the base station shall set this field to ‘0’.

EXCL_P_REV_IND - Excluding mobile protocol revision indicator.

If the REDIRECT_P_REV_INCL is set to ‘1’, the base station shall include this field and set this field as described below; otherwise, the base station shall omit this field.

REDIRECT_P_MIN - Minimum redirection protocol revision.

If REDIRECT_P_REV_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows. The base station shall set this field to the minimum protocol revision of which mobile stations are subjected to as specified by the action contained in EXCL_P_REV_IND (i.e., to be redirected or excluded from redirection). The base station shall set this field to a protocol revision equal to or greater than six.

REDIRECT_P_MAX - Maximum redirection protocol revision.

If REDIRECT_P_REV_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.
The base station shall set this field to the maximum protocol revision of which mobile stations are subjected to as specified by the action contained in EXCL_P_REV_IND (i.e., to be redirected or excluded from redirection). The base station shall set this field to a protocol revision equal to or greater than six.

**RECORD_TYPE** - Redirection record type.

The base station shall set this field to the RECORD_TYPE value shown in Table 3.7.2.3.2.16-2 corresponding to the type of redirection specified by this record.

**RECORD_LEN** - Redirection record length.

The base station shall set this field to the number of octets in the type-specific fields of this redirection record.

**Type-specific fields** - Redirection record type-specific fields.

The base station shall include type-specific fields based on the RECORD_TYPE of this redirection record, as specified below.

**LAST_SEARCH_RECORD_IND** - Last search record indicator.

The base station shall set this field to '0' if the mobile station is to attempt redirection per the next qualified redirection record in the message following failure to acquire the target system for the current redirection record; otherwise, the base station shall set this field to '1'.

**NUM_ADD_RECORD** - Number of additional redirection records.

The base station shall set this field to the number of additional redirection records.

The base station shall include NUM_ADD_RECORD occurrences of the following variable length additional redirection record.

**ADD_REDIRECT_ACCOLC** - Additional redirected access overload classes.

See REDIRECT_ACCOLC field defined in 3.7.2.3.2.18.

The base station shall set the subfields corresponding to the access overload classes of mobile stations which are to be redirected to ‘1’ and shall set the remaining subfields to ‘0’.
**ADD_DELETE_TMSI** - Additional delete TMSI indicator.

The base station shall set this field to ‘1’ if the mobile station is required to delete the TMSI assigned to the mobile station; otherwise, the base station shall set this field to ‘0’.

**ADD_REDIRECT_P_REV_INCL** - Additional redirection mobile protocol revision included.

If the redirection specified in this message applies to the mobile stations of some specific protocol revisions, the base station shall set this field to ‘1’; otherwise, if this redirection applies to all mobile stations, the base station shall set this field to ‘0’.

**ADD_EXCL_P_REV_IND** - Additional excluding mobile protocol revision indicator.

If the ADD_REDIRECT_P_REV_INCL is set to ‘1’, the base station shall include this field and set this field as described below; otherwise, the base station shall omit this field.

If mobile stations with MOB_P_REV in the range between ADD_REDIRECT_P_MIN and ADD_REDIRECT_P_MAX inclusive are excluded from this global service redirection, the base station shall set this field to ‘1’. Otherwise, if the mobile stations with MOB_P_REV in the protocol revision range specified in ADD_REDIRECT_P_MIN and ADD_REDIRECT_P_MAX are subjected to the redirection, the base station shall set this field to ‘0’.

**ADD_REDIRECT_P_MIN** - Additional minimum redirection protocol revision.

If ADD_REDIRECT_P_REV_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to the minimum protocol revision of which mobile stations are subjected to as specified by the action contained in ADD_EXCL_P_REV_IND (i.e., to be redirected or excluded from redirection). The base station shall set this field to a protocol revision equal to or greater than six.

**ADD_REDIRECT_P_MAX** - Additional maximum redirection protocol revision.

If ADD_REDIRECT_P_REV_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to the maximum protocol revision of which mobile stations are subjected to as specified by the action contained in ADD_EXCL_P_REV_IND (i.e., to be redirected or excluded from redirection). The base station shall set this field to a protocol revision equal to or greater than six.

**ADD_RECORD_TYPE** - Additional redirection record type.

The base station shall set this field to the RECORD_TYPE value shown in Table 3.7.2.3.2.16-2 corresponding to the type of redirection specified by this record.
ADD_RECORD_LEN - Additional redirection record length.
The base station shall set this field to the number of octets in
the type-specific fields of this redirection record.

Type-specific fields - Redirection record type-specific fields.
The base station shall include type-specific fields based on
the ADD_RECORD_TYPE of this redirection record, as
specified below.

ADD_LAST_SEARCH_RECORD_IND - Additional last search record indicator.
The base station shall set this field to '0' if the mobile station
is to attempt redirection per the next qualified redirection
record in the message following failure to acquire the target
system for the current redirection record; otherwise, the base
station shall set this field to '1'.

If RECORD_TYPE or ADD_RECORD_TYPE is equal to '00000001', the base station shall
include the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXPECTED_SID</td>
<td>15</td>
</tr>
<tr>
<td>IGNORE_CDMA</td>
<td>1</td>
</tr>
<tr>
<td>SYS_ORDERING</td>
<td>3</td>
</tr>
<tr>
<td>MAX_REDIRECT_DELAY</td>
<td>5</td>
</tr>
</tbody>
</table>

EXPECTED_SID - Expected SID.
If the base station is redirecting the mobile station to a
specific system, the base station shall set this field to the SID
of that system; otherwise, the base station shall set this field
to 0.

IGNORE_CDMA - Ignore CDMA Available indicator.
The base station shall set this field to '1' to indicate that the
mobile station is to ignore the CDMA Capability Message on
the analog system to which it is being redirected. The base
station shall set this field to '0' to indicate that the mobile
station may discontinue service on the system to which it is
being redirected if the mobile station receives a CDMA
Capability Message with CDMA_AVAIL equal to '1', and the
preferred mode of the mobile station is CDMA.

SYS_ORDERING - System ordering.
The base station shall set this field to the SYS_ORDERING
value shown in Table 3.7.2.3.2.16-3 corresponding to the
order in which the mobile station is to attempt to obtain
service on an analog system.

MAX_REDIRECT_DELAY - Maximum delay upon redirection.
The base station shall set this field to the maximum delay time, in units of 8 seconds, to be used by mobile stations in the event of a global redirection to analog mode. This operation can be invoked to avoid overloading an underlying analog cell’s reverse control channel.

If RECORD_TYPE or ADD_RECORD_TYPE is equal to ‘00000010’, the base station shall include the following field type specific fields:

<table>
<thead>
<tr>
<th>Subfield</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAND_CLASS</td>
<td>5</td>
</tr>
<tr>
<td>EXPECTED_SID</td>
<td>15</td>
</tr>
<tr>
<td>EXPECTED_NID</td>
<td>16</td>
</tr>
<tr>
<td>RESERVED</td>
<td>4</td>
</tr>
<tr>
<td>NUM_CHANS</td>
<td>4</td>
</tr>
</tbody>
</table>

NUM_CHANS occurrences of the following field:

{ (NUM_CHANS)

| CDMA_CHAN              | 11            |

} (NUM_CHANS)

SUBCLASS_INFO_INCL       | 1             |

SUBCLASS_REC_LEN         | 0 or 5        |

SUBCLASS_REC_LEN + 1 occurrences of the following subrecord:

{ (SUBCLASS_REC_LEN + 1)

| REDIRECT_SUBCLASS      | 1             |

} (SUBCLASS_REC_LEN + 1)

RESERVED                | 0 - 7 (as needed) |

BAND_CLASS - Band class. The base station shall set this field to the CDMA band class, as specified in [30].

EXPECTED_SID - Expected SID. If the base station is redirecting the mobile station to a specific system, the base station shall set this field to the SID of that system; otherwise, the base station shall set this field to ‘0’. 

EXPECTED_NID - Expected NID.
If the base station is redirecting the mobile station to a specific network, the base station shall set this field to the NID of that network; otherwise, the base station shall set this field to 65535.

**RESERVED** - Reserved bits.

The base station shall set this field to ‘0’

**NUM_CHANS** - Number of CDMA Channels.

The base station shall set this field to the number of occurrences of the CDMA_CHAN field in this record.

**CDMA_CHAN** - CDMA Channel number.

For each CDMA Channel on which the mobile station is to attempt to acquire a CDMA system, the base station shall include one occurrence of this field specifying the associated CDMA Channel number.

**SUBCLASS_INFO_INCL** - Band subclass information included

The base station shall set this field to ‘0’ when band subclass information is not included for the redirection record; otherwise, the base station shall set this field to ‘1’.

**SUBCLASS_REC_LEN** - Band subclass subrecord length

If SUBCLASS_INFO_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the number of redirection band subclass indicator fields included in the subrecord minus one. The number of redirection band subclass indicator fields included is limited to the highest band subclass associated with this redirection record (i.e. if the highest band subclass is K, then SUBCLASS_REC_LEN = K).

If the SUBCLASS_REC_LEN field is included, the base station shall include SUBCLASS_REC_LEN + 1 occurrences of the following subrecord. The first field included corresponds to band subclass ‘0’ and the N’th field included corresponds to band subclass ‘N-1’.

**REDIRECT_SUBCLASS** - Redirection band subclass indicator

The base station shall set this field to ‘1’ if the corresponding band subclass is associated with this redirection record; otherwise, the base station shall set this field to ‘0’.

**RESERVED** - Reserved bits.

The base station shall add reserved bits as needed in order to make the length of the entire record equal to an integer number of octets. The base station shall set these bits to ‘0’.
### 3.7.2.3.2.28 Extended CDMA Channel List Message

**MSG_TAG:** ECCLM

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>

NUM_FREQ occurrences of the following field:

```plaintext
{ (NUM_FREQ)
  CDMA_FREQ
} (NUM_FREQ)
```

#### Field: CDMA_FREQ
- 11 bits

### Field Length (bits)
- If RC_QPCH_SEL_INCL is equal to ‘1’, include NUM_FREQ occurrences of the following field:

```plaintext
{ (NUM_FREQ)
  RC_QPCH_HASH_IND
} (NUM_FREQ)
```

#### Field: RC_QPCH_HASH_IND
- 1 bit

### Field Length (bits)
- If TD_SEL_INCL is equal to ‘1’, include NUM_FREQ occurrences of the following fields:

```plaintext
{ (NUM_FREQ)
  TD_HASH_IND
  TD_POWER_LEVEL
} (NUM_FREQ)
```

#### Field: TD_SEL_INCL
- 1 bit

#### Field: TD_MODE
- 2 bits

#### Field: TD_HASH_IND
- 1 bit

#### Field: TD_POWER_LEVEL
- 2 bits

### Field Length (bits)
- If CDMA_BAND is equal to ‘1’, include SUBCLASS_INFO_INCL occurrences of the following subrecord:

```plaintext
{ (SUBCLASS_REC_LEN + 1)
  CDMA_SUBCLASS
} (SUBCLASS_REC_LEN + 1)
```

#### Field: CDMA_BAND
- 5 bits

#### Field: SUBCLASS_INFO_INCL
- 1 bit

#### Field: SUBCLASS_REC_LEN
- 0 or 5

#### Field: SUBCLASS_REC_LEN + 1 occurrences of the following subrecord:

```plaintext
{ (SUBCLASS_REC_LEN + 1)
  CDMA_SUBCLASS
} (SUBCLASS_REC_LEN + 1)
```

#### Field: CDMA_SUBCLASS
- 1 bit

### Field Length (bits)
- CDMA_BAND: 5
- SUBCLASS_INFO_INCL: 1
- SUBCLASS_REC_LEN: 0 or 5
- SUBCLASS_REC_LEN + 1 occurrences of the following subrecord:
  ```plaintext
  { (SUBCLASS_REC_LEN + 1)
    CDMA_SUBCLASS
  } (SUBCLASS_REC_LEN + 1)
  ```
- CDMA_SUBCLASS: 1

CDMA_FREQ_WEIGHT_INCL 1
If CDMA_FREQ_WEIGHT_INCL is equal to ‘1’, include NUM_FREQ occurrences of the following field:

\[ (NUM_FREQ) \]

\[ \begin{align*}
  \text{CDMA_FREQ_WEIGHT} & \quad 3 \\
\end{align*} \]

\[ (NUM_FREQ) \]

\[ \begin{align*}
  \text{NUM_BAND} & \quad 3 \\
\end{align*} \]

\[ (NUM_BAND) \]

\[ \begin{align*}
  \text{ADD_CDMA_BAND} & \quad 5 \\
  \text{ADD_SUBCLASS_INFO_INCL} & \quad 1 \\
  \text{ADD_SUBCLASS_REC_LEN} & \quad 0 \text{ or } 5 \\
\end{align*} \]

ADD_SUBCLASS_REC_LEN + 1 occurrences of the following subrecord:

\[ (ADD_SUBCLASS_REC_LEN + 1) \]

\[ \begin{align*}
  \text{ADD_CDMA_SUBCLASS} & \quad 1 \\
\end{align*} \]

\[ (ADD_SUBCLASS_REC_LEN + 1) \]

\[ \begin{align*}
  \text{ADD_TD_MODE} & \quad 0 \text{ or } 2 \\
  \text{BYPASS_SYS_DET_IND} & \quad 1 \\
  \text{NUM_ADD_FREQ} & \quad 4 \\
\end{align*} \]

NUM_ADD_FREQ occurrences of the following field:

\[ (NUM_ADD_FREQ) \]

\[ \begin{align*}
  \text{ADD_CDMA_FREQ} & \quad 11 \\
  \text{ADD_RC_QPCH_HASH_IND} & \quad 0 \text{ or } 1 \\
  \text{ADD_TD_HASH_IND} & \quad 0 \text{ or } 1 \\
  \text{ADD_TD_POWER_LEVEL} & \quad 0 \text{ or } 2 \\
  \text{ADD_CDMA_FREQ_WEIGHT} & \quad 0 \text{ or } 3 \\
\end{align*} \]

\[ (NUM_ADD_FREQ) \]

\[ (NUM_BAND) \]

PILOT_PN - Pilot PN sequence offset index.

The base station shall set this field to the pilot PN sequence offset for this base station, in units of 64 PN chips.

CONFIG_MSG_SEQ - Configuration message sequence number.

The base station shall set this field to CONFIG_SEQ (see 3.6.2.2).

NUM_FREQ - Number of CDMA Frequencies
The base station shall set this field to the number of occurrences of the CDMA_FREQ field included in this message.

The base station shall not set this field to ‘0000’.

The base station shall include NUM_FREQ occurrences of the following one-field record:

| CDMA_FREQ      | CDMA Channel frequency assignment. |

If this message is sent on the Paging Channel:

The base station shall set this field to the CDMA channel number corresponding to the CDMA frequency assignment for a CDMA Channel containing a Paging Channel (see [2]).

This CDMA channel shall reside in the same band class as the band class where this message is being transmitted. If SUBCLASS_INFO_INCL is equal to ‘1’, this CDMA channel shall also reside in at least one supported CDMA_SUBCLASS included in the message.

If this message is sent on the Primary Broadcast Control Channel:

The base station shall set this field to the CDMA channel number corresponding to the CDMA frequency assignment for a CDMA Channel containing a Primary Broadcast Control Channel and Forward Common Control Channel (see [2]).

This CDMA channel shall reside in the same band class as the band class where this message is being transmitted. If SUBCLASS_INFO_INCL is equal to ‘1’, this CDMA channel shall also reside in at least one supported CDMA_SUBCLASS included in the message.

If the base station supports a CDMA frequency assignment without transmit diversity, the base station should not set the first occurrence of this field to a CDMA channel number corresponding to a transmit diversity frequency assignment.

RC_QPCH_SEL_INCL - RC and QPCH Selection included indicator

The base station shall set this field to ‘1’, if NUM_FREQ occurrences of RC_QPCH_HASH_IND are included; otherwise, it shall set this field to ‘0’.

If the base station sets this field to ‘1’, the base station shall set the RC_QPCH_HASH_IND field to ‘1’ in at least one of the following one-field records:

| RC_QPCH_HASH_IND | RC_QPCH channel hashing indicator |

If RC_QPCH_SEL_INCL is set to ‘1’, the base station shall include NUM_FREQ occurrences of this field and set this field as follow; otherwise, the base station shall omit this field.
The base station shall set this field to ‘1’, if the corresponding CDMA channel is to be selected for channel hashing by mobile stations capable of Radio Configurations greater than two or capable of supporting Quick Paging Channel.

**TD_SEL_INCL** - Transmit diversity selection indicator included.

The base station shall set this field to ‘1’, if the base station includes transmit diversity selection information in this message; otherwise, the base station shall set this field to ‘0’.

When the *Extended CDMA Channel List Message* is sent on the Paging Channel, the base station shall set this field to ‘0’.

**TD_MODE** - Transmit diversity mode.

If the field **TD_SEL_INCL** is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the Transmit Diversity mode used on the band class where this message is being transmitted, as specified in Table 3.7.2.3.2.26-3.

If the **TD_SEL_INCL** is set to ‘1’, the base station shall include NUM_FREQ occurrences of the following two-field record, and shall set the **TD_HASH_IND** field to ‘1’ in at least one of the records:

**TD_HASH_IND** - Transmit diversity hash indicator.

If the associated CDMA_FREQ is to be selected for CDMA channel hashing by mobile stations capable of supporting transmit diversity **[TD_MODE]**, the base station shall set the field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**TD_POWER_LEVEL** - Transmit diversity power level.

If **TD_HASH_IND** is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it to the transmit diversity transmission power level relative to that of the Forward Pilot Channel, as specified in Table 3.7.2.3.2.26-4.

**CDMA_BAND** - Current band class.

The base station shall set this field to the CDMA band class (see [30]) corresponding to the CDMA frequency assignment for the CDMA Channel where this message is being transmitted.

**SUBCLASS_INFO_INCL** - Band subclass information included

The base station shall set this field to ‘0’ when no band subclasses are associated with the listed CDMA_FREQ channels or when band subclasses are not to be factored into the mobile station’s hashing algorithm; otherwise, the base station shall set this field to ‘1’.

**SUBCLASS_REC_LEN** - Band subclass subrecord length

3-348
If SUBCLASS_INFO_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the number of band subclass indicator fields included in the subrecord minus one. The number of band subclass indicator fields included is limited to the highest band subclass supported on any of the CDMA_FREQ channels listed above for the current band (i.e., if the highest band subclass is K, then SUBCLASS_REC_LEN = K).

If the SUBCLASS_REC_LEN field is included, the base station shall include SUBCLASS_REC_LEN + 1 occurrences of the following subrecord. The first field included corresponds to band subclass ‘0’ and the Nth field included corresponds to band subclass ‘N-1’.

CDMA_SUBCLASS - Band subclass indicator

The base station shall set this field to ‘1’ if the corresponding band subclass is supported on any of the CDMA_FREQ channels listed above; otherwise, the base station shall set this field to ‘0’.

CDMA_FREQ_WEIGHT_INCL - CDMA frequency weight included indicator

The base station shall set this field to ‘1’ if the CDMA_FREQ_WEIGHT fields are included in this message; otherwise, it shall set this field to ‘0’.

If CDMA_FREQ_WEIGHT_INCL is included and set to ‘1’, the base station shall include NUM_FREQ occurrences of the following one-field record:

CDMA_FREQ_WEIGHT - CDMA frequency weight

The base station shall set this field to one less than the weight for this CDMA channel to be used in channel hashing by the mobile station.

NUM_BAND - Number of CDMA Bands

The base station shall set this field to the number of additional bands listed in this message.

The base station shall include NUM_BAND occurrences of the following record:

ADD_CDMA_BAND - Band class.

The base station shall set this field to the CDMA band class, as specified in [30], corresponding to the additional CDMA frequencies (ADD_CDMA_FREQ) included in this record.

ADD_SUBCLASS_INFO_INCL - Band subclass information included

The base station shall set this field to ‘0’ when no band subclasses are associated with the listed band or when band subclasses are not to be factored into the mobile station’s hashing algorithm; otherwise, the base station shall set this field to ‘1’.

ADD_SUBCLASS_REC_LEN - Band subclass subrecord length
If ADD_SUBCLASS_INFO_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the number of band subclass indicator fields included in the subrecord minus one. The number of band subclass indicator fields included is limited to the highest band subclass supported on the band listed above (i.e., if the highest band subclass is K, then ADD_SUBCLASS_REC_LEN = K).

If the ADD_SUBCLASS_REC_LEN field is included, the base station shall include ADD_SUBCLASS_REC_LEN + 1 occurrences of the following subrecord. The first field included corresponds to band subclass ‘0’ and the Nth field included corresponds to band subclass ‘N-1’.

ADD_CDMA_SUBCLASS - Band subclass indicator

The base station shall set this field to ‘1’ if the corresponding band subclass is supported on the band listed above; otherwise, the base station shall set this field to ‘0’.

ADD_TD_MODE - Transmit diversity mode.

If TD_SEL_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the Transmit Diversity mode on the ADD_CDMA_BAND listed above, as specified in Table 3.7.2.3.2.26-3.

BYPASS_SYS_DET_IND - Direct to idle allowed indicator.

The base station shall set this field to ‘1’ if the mobile station is allowed to go directly to idle state on any CDMA channel belonging to the ADD_CDMA_BAND listed above.

NUM_ADD_FREQ - Number of additional CDMA Frequencies

The base station shall set this field to the number of occurrences of the ADD_CDMA_FREQ field included herafter.

The mobile station shall include NUM_ADD_FREQ occurrences of the following record:

ADD_CDMA_FREQ - CDMA Channel frequency assignment.

If this message is sent on the Paging Channel:

The base station shall set this field to the CDMA channel number corresponding to the CDMA frequency assignment for a CDMA Channel containing a Paging Channel (see [2]).

This CDMA channel resides in the band class listed in this ADD_CDMA_BAND record. If ADD_SUBCLASS_INFO_INCL is equal to ‘1’, this CDMA channel shall also reside in at least one supported ADD_CDMA_SUBCLASS included in this ADD_CDMA_BAND record.
If this message is sent on the Primary Broadcast Control Channel:

The base station shall set this field to the CDMA Channel number corresponding to the CDMA frequency assignment for a CDMA Channel containing a Primary Broadcast Control Channel and Forward Common Control Channel (see [2]).

This CDMA channel resides in the band class listed in this ADD_CDMA_BAND record. If ADD_SUBCLASS_INFO_INCL is equal to ‘1’, this CDMA channel shall also reside in at least one supported ADD_CDMA_SUBCLASS included in this ADD_CDMA_BAND record.

If the base station supports a CDMA frequency assignment without transmit diversity, the base station should not set the first occurrence of this field to a CDMA channel number corresponding to a transmit diversity frequency assignment.

ADD_RC_QPCH_HASH_IND - RC QPCH channel hashing indicator

If RC_QPCH_SEL_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’, if the corresponding CDMA channel is to be selected for channel hashing by mobile stations capable of Radio Configurations greater than two or capable of supporting Quick Paging Channel.

ADD_TD_HASH_IND - Transmit diversity hash indicator

If TD_SEL_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the associated ADD_CDMA_FREQ is to be selected for CDMA channel hashing by mobile stations capable of supporting transmit diversity [TD_MODE], the base station shall set the field to ‘1’; otherwise, the base station shall set this field to ‘0’.

ADD_TD_POWER_LEVEL - Transmit diversity power level

If ADD_TD_HASH_IND is not included or is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it to the transmit diversity transmission power level relative to that of the Forward Pilot Channel, as specified in Table 3.7.2.3.2.26-4.

ADD_CDMA_FREQ_WEIGHT - CDMA frequency weight

If CDMA_FREQ_WEIGHT_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
The base station shall set this field to one less than the weight for this CDMA channel to be used in channel hashing by the mobile station.
3.7.2.3.2.29 User Zone Reject Message

MSG_TAG: UZRM

</table>

REJECT_UZID - Rejected User Zone identifier.

The base station shall set this field to the User Zone identifier of the User Zone rejected by the base station.

REJECT_ACTION_INDI - Rejection action indicator.

The base station shall set this field to the value shown in Table 3.7.2.3.2.29-1 corresponding to the User Zone rejection action field to identify the mobile station action.

Table 3.7.2.3.2.29-1. Rejection Action Indicators

UZID_ASSIGN_INCL - User Zone identifier assignment included indicator.

If assigned UZID information is included, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

3-353
ASSIGN_UZID - Assigned User Zone identifiers.

The base station shall set this field to the User Zone identifier of the User Zone assigned to the mobile station.

</tbody>
</table>
PILOT_PN  - Pilot PN sequence offset index.  

The base station shall set this field to the pilot PN sequence offset for this base station, in units of 64 PN chips.

CONFIG_MSG_SEQ  - Configuration message sequence number.  

The base station shall set this field to CONFIG_SEQ (see 3.6.2.2).

SID  - System identification.  

The base station shall set this field to the system identification number for this system (see 2.6.5.2).

NID  - Network identification.  

This field serves as a sub-identifier of a system as defined by the owner of the SID.

The base station shall set this field to the network identification number for this network (see 2.6.5.2).

PACKET_ZONE_ID  - Packet data services zone identifier.  

If the base station supports a packet data service zone, the base station shall set this field to its non-zero packet data services zone identifier.

If the base station does not support a packet data service zone, the base station shall set this field to ‘00000000’.

REG_ZONE  - Registration zone.  

The base station shall set this field to its registration zone number (see 2.6.5.1.5).

TOTAL_ZONES  - Number of registration zones to be retained.  

The base station shall set this field to the number of registration zones the mobile station is to retain for purposes of zone-based registration (see 2.6.5.1.5).

If zone-based registration is to be disabled, the base station shall set this field to ‘000’.

ZONE_TIMER  - Zone timer length.  

The base station shall set this field to the ZONE_TIMER value shown in Table 3.7.2.3.2.30-1 corresponding to the length of the zone registration timer to be used by mobile stations.
Table 3.7.2.3.2.30-1. Value of Zone Timer

<td>45</td>
</tr>
<tr>
<td>111</td>
<td>60</td>
</tr>
</tbody>
</table>

MULT_SIDS - Multiple SID storage indicator.
If mobile stations may store entries of SID_NID_LIST containing different SIDs, the base station shall set this field to ‘1’; otherwise the base station shall set this field to ‘0’.

MULT_NIDS - Multiple NID storage indicator.
If mobile stations may store multiple entries of SID_NID_LIST having the same SID (with different NIDs), the base station shall set this field to ‘1’; otherwise the base station shall set this field to ‘0’.

HOME_REG - Home registration indicator.
If mobile stations that are not roaming (see 2.6.5.3) and have MOB_TERM_HOME equal to ‘1’ are to be enabled for autonomous registrations, the base station shall set this field to ‘1’. If such mobile stations are not to be enabled for autonomous registration, the base station shall set this field to ‘0’.

FOR_SID_REG - SID roamer registration indicator.
If mobile stations that are foreign SID roamers (see 2.6.5.3) and have MOB_TERM_FOR_SID equal to ‘1’ are to be enabled for autonomous registration, the base station shall set this field to ‘1’. If such mobile stations are not to be enabled for autonomous registration, the base station shall set this field to ‘0’.

FOR_NID_REG - NID roamer registration indicator.
If mobile stations that are foreign NID roamers (see 2.6.5.3) and have MOB_TERM_FOR_NID equal to ‘1’ are to be enabled for autonomous registration, the base station shall set this field to ‘1’. If such mobile stations are not to be enabled for autonomous registration, the base station shall set this field to ‘0’.
POWER_UP_REG - Power-up registration indicator.

If mobile stations enabled for autonomous registration are to register immediately after powering on and receiving the system overhead messages, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

POWER_DOWN_REG - Power-down registration indicator.

If mobile stations enabled for autonomous registration are to register immediately before powering down, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

PARAMETER_REG - Parameter-change registration indicator.

If mobile stations are to register on parameter change events as specified in 2.6.5.1.6, the base station shall set this field to ‘1’. If not, the base station shall set this field to ‘0’.

REG_PRD - Registration period.

If mobile stations are not to perform timer-based registration, the base station shall set this field to ‘0000000’. If mobile stations are to perform timer-based registration, the base station shall set this field to the value in the range 29 to 85 inclusive, such that the desired timer value is

\[ \left\lfloor \frac{2 \times \text{REG_PRD}}{4} \right\rfloor \times 0.08 \text{ seconds.} \]

DIST_REG_INCL - Distance-Based Registration Information Included.

The base station shall set this field to ‘1’ if it includes distance-based registration information in the message and mobile stations are to perform distance-based registration; otherwise, the base station shall set this field to ‘0’.

REG_DIST - Registration distance.

If DIST_REG_INCL is set to ‘1’, the base station shall include the field REG_DIST and shall set this field as shown below; otherwise, the base station shall omit this field.

The base station shall set this field to the non-zero “distance” beyond which the mobile station is to re-register (see 2.6.5.1.4).

DELETE_FOR_TMSI - Delete foreign TMSI.

The base station shall set this field to ‘1’ to cause the mobile station to delete its TMSI if the TMSI was assigned in a different TMSI zone from that specified by the TMSI_ZONE field of this message; otherwise, the base station shall set this field to ‘0’.

USE_TMSI - Use TMSI indicator.

The base station shall set this field to the value shown in Table 3.7.2.3.2.13-1 corresponding to the type of MSID that the mobile station is to use on the Enhanced Access Channel.

PREF_MSID_TYPE - Preferred Enhanced Access Channel Mobile Station Identifier Type.
The base station shall set this field to the value shown in Table 3.7.2.3.2.13-1 and Table 3.7.2.3.2.13-1a corresponding to the type of MSID that the mobile station is to use on the Enhanced Access Channel.

- **TMSI_ZONE_LEN**: TMSI zone length. The base station shall set this field to the number of octets included in the TMSI_ZONE. The base station shall set this field to a value in the range 1 to 8 inclusive.

- **TMSI_ZONE**: TMSI zone. The base station shall set this field to the TMSI zone number as specified in [27].

- **IMSI_T_SUPPORTED**: IMSI_T support indicator. The base station shall set this field to ‘1’ to indicate support for a 15-digit IMSI_T addressing according to [18].

- **MAX_NUM_ALT_SO**: Maximum number of alternative service options. The base station shall set this field to the maximum number of service option numbers defined in [30], corresponding to alternative service options with no service option group number assigned, that the mobile station is allowed to include in the **Origination Message**, and the **Page Response**.

  If the base station sets this field to a value greater than zero, in addition, the base station shall allow the mobile station to include:

  - a 4-bit or 8-bit service option bitmap in the **Origination Message** and the **Page Response Message**;
  - alternate service option numbers, not limited to **MAX_ALT_SO_NUM**, in the **Enhanced Origination Message**.

- **AUTO_MSG_SUPPORTED**: Autonomous message supported indicator. If the base station allows the autonomous delivery of the **Device Information Message** on the r-csch, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

- **AUTO_MSG_INTERVAL**: Autonomous message interval. If **AUTO_MSG_SUPPORTED** is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and shall set this field to the **AUTO_MSG_INTERVAL** value shown in Table 3.7.2.3.2.13-4 to indicate the minimum time interval between autonomous messages sent by a mobile station to the infrastructure. This parameter is intended to allow the infrastructure to limit the frequency of autonomous messages sent by a mobile station on the r-csch.

- **OTHER_INFO_INCL**: Other information included indicator. The base station shall set this field to ‘1’ if the MC-RR Parameters Message is not sent (see [32]); otherwise, the base station shall set this field to ‘0’.
BASE_ID - Base station identification.
If OTHER_INFO_INCL is set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.
The base station shall set this field to its identification number.

If OTHER_INFO_INCL is set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.
The base station shall set this field to the MCC (see 2.3.1).

IMSI_11_12 - 11th and 12th digits of the IMSI.
If OTHER_INFO_INCL is set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.
The base station shall set this field to the IMSI_11_12 (see 2.3.1).

BROADCAST_GPS_ASST - Broadcast GPS Assist Indicator.
If OTHER_INFO_INCL is set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.
The base station shall set this field to ‘1’ if it supports Broadcast GPS Assist capability; otherwise, the base station shall set this field to ‘0’.

SIG_ENCRYPT_SUP - Signaling encryption supported indicator.
If OTHER_INFO_INCL is set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.
This field consists of the subfields shown in Table 2.7.1.3.2.1-5.
If this field is included, the base station shall set the subfields as follows:
The base station shall set the CMEA subfield to ‘1’.
The base station shall set each other subfield to ‘1’ if the corresponding signaling encryption algorithm is supported by the base station; otherwise, the base station shall set the subfield to ‘0’.
The base station shall set the RESERVED subfield to ‘00000’.

CS_SUPPORTED - Concurrent Services supported indicator.
If the base station supports concurrent services, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.
MS_INIT_POS_LOC_SUP_IND - Mobile station initiated position location determination supported indicator. If the base station supports mobile station initiated position determination, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

MSG_INTEGRITY_SUP - Message integrity supported indicator. If the base station supports message integrity the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

SIG_INTEGRITY_SUP_INCL - Signaling message integrity information included indicator. If MSG_INTEGRITY_SUP is set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

SIG_INTEGRITY_SUP - Signaling integrity algorithm supported by the base station. If SIG_INTEGRITY_SUP_INCL is included and is set to ‘1’, the base station shall set this field as follows; otherwise, the base station shall omit this field.

The base station shall set this field to indicate the supported message integrity algorithms in addition to the default integrity algorithm.

This field consists of the subfields shown in Table 2.7.1.3.2.1-6.

The base station shall set each subfield to ‘1’ if the corresponding message integrity algorithm is supported by the base station; otherwise, the base station shall set the subfield to ‘0’.

The base station shall set the RESERVED subfield to ‘00000000’.

IMSI_10_INCL - IMSI_10 included. If the MNC is a 3-digit number and the base station wants to convey the third digit of the MNC to the mobile station, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

IMSI_10 - The least significant digit of MNC when the MNC is a 3-digit number. If IMSI_10_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field to the least significant digit of MNC converted to binary by the standard decimal-to-binary conversion as shown in Table 2.3.1.1-1.
MAX_ADD_SERV_INSTANCE - Maximum number of additional service reference identifiers allowed in origination

If the CS_SUPPORTED field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the maximum number of additional service reference identifiers that can be included in the Origination Message or Enhanced Origination Message.

TKZ_MODE_SUPPORTED - Tracking zone mode supported indicator.

The base station shall set this field to ‘1’ if tracking zone mode is supported; otherwise, the base station shall set this field to ‘0’.

TKZ_ID - Tracking zone identifier.

If TKZ_MODE_SUPPORTED is set to ‘1’, the base station shall set this field to its tracking zone identifier; otherwise, the base station shall omit this field.

PZ_HYST_ENABLED - Packet zone hysteresis enabled.

If the PACKET_ZONE_ID field is set to ‘00000000’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the packet zone hysteresis feature is to be enabled at the mobile station, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

PZ_HYST_INFO_INCL - Packet zone hysteresis information included indicator.

If the PZ_HYST_ENABLED field is included and is set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

If the base includes the PZ_HYST_LIST_LEN, PZ_HYST_ACT_TIMER and packet zone hysteresis timer related fields, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

PZ_HYST_LIST_LEN - Packet zone hysteresis list length.

If the PZ_HYST_INFO_INCL field is included and is set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to the length of the packet zone hysteresis list minus one. This field shall be within the range ‘0001’ through ‘1111’, inclusive.

PZ_HYST_ACT_TIMER - Packet zone hysteresis activation timer.

If the PZ_HYST_INFO_INCL field is included and is set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.
The base station shall set to the value of the packet zone hysteresis activation timer (in units of seconds). This field shall be within the range ‘00000001’ through ‘11111111’, inclusive.

PZ_HYST_TIMER_MUL - Packet zone hysteresis timer multiplier.

If the PZ_HYST_INFO_INCL field is included and is set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

The base station shall set the field to x, where \( x \times 8^y \) seconds is the value of the hysteresis timer and y is the value indicated in the PZ_HYST_TIMER_EXP field. The base station shall set this field to a value that is between 1 and 7 inclusive. The value 0 is reserved.

PZ_HYST_TIMER_EXP - Packet zone hysteresis timer exponent.

If the PZ_HYST_INFO_INCL field is included and is set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

The base station shall set the field to y, where \( x \times 8^y \) seconds is the value of the hysteresis timer and x is the value indicated in the PZ_HYST_TIMER_MUL field. The base station shall set this field to a value that is between 0 and 4 inclusive. All the other values are reserved.

EXT_PREF_MSID_TYPE - Extended Preferred Enhanced Access Channel Mobile Station Identifier Type.

The base station shall set this field to the value shown in Table 3.7.2.3.2.13-1 and Table 3.7.2.3.2.13-1a corresponding to the type of MSID that the mobile station is to use on the Enhanced Access Channel.

MEID_REQD - MEID Required Indicator.

If EXT_PREF_MSID_TYPE is set to ‘11’ and PREF_MSID_TYPE is set to either ‘00’ or ‘11’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ to indicate that network requires MEID (of mobile stations having R-UIM) in registrations; otherwise the base station shall set this field to ‘0’.

---

1. **PILOT_PN** - Pilot PN sequence offset index. The base station shall set this field to the pilot PN sequence offset for this base station, in units of 64 PN chips.

2. **CONFIG_MSG_SEQ** - Configuration message sequence number. The base station shall set this field to CONFIG_SEQ (see 3.6.2.2).

3. **BASE_ID** - Base station identification. The base station shall set this field to its identification number.

4. **P_REV** - Protocol revision level. The base station shall set this field to '00001011'.

5. **MIN_P_REV** - Minimum protocol revision level. The base station sets this field to prevent mobile stations, which cannot be supported by the base station from accessing the system.
The base station shall set this field to the minimum protocol revision level that it supports.

**SR3_INCL** - Spreading Rate 3 common channel parameters included indicator.

The base station shall set this field to ‘1’ if the base station includes SR3 related parameters in this message; otherwise, the base station shall set this field to ‘0’.

**SR3_CENTER_FREQ_INCL** - Center SR3 frequency assignment included.

If SR3_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to ‘1’, if the CDMA Channel number corresponding to the SR3 center frequency assignment for the CDMA Channel containing a Broadcast Control Channel is different from the current SR1 frequency assignment. Otherwise, the base station shall set this field to ‘0’.

**SR3_CENTER_FREQ** - Center SR3 frequency assignment.

If SR3_CENTER_FREQ_INCL is not included or is included but is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the CDMA Channel number corresponding to the SR3 center frequency assignment for the CDMA Channel containing a Broadcast Control Channel.

**SR3_BRAT** - Spreading Rate 3 BCCH data rate.

If SR3_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the BCCH rate field value shown in Table 3.7.2.3.2.26-2 corresponding to the data rate used by the Primary Broadcast Control Channel in the system.

**SR3_BCCH_CODE_CHAN** - Spreading Rate 3 BCCH Walsh code index.

If SR3_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the Walsh code index corresponding to the Spreading Rate 3 BCCH.

**SR3_PRIMARY_PILOT** - Primary SR3 pilot.

If SR3_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the value shown in Table 3.7.2.3.2.26-5 corresponding to the position of the primary SR3 pilot.

**SR3_PILOT_POWER1** - The primary SR3 pilot power level relative to that of the pilot on the lower frequency of the two remaining SR3 frequencies.
If SR3_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field to the value shown in Table 3.7.2.3.2.26-6 corresponding to the power level of the primary pilot with respect to the pilot on the lower frequency of the two remaining SR3 frequencies.

**SR3_PILOT_POWER2** - The primary SR3 pilot power level relative to that of the pilot on the higher frequency of the two remaining SR3 frequencies.

If SR3_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field to the value shown in Table 3.7.2.3.2.26-6 corresponding to the power level of the primary pilot with respect to the pilot on the higher frequency of the two remaining SR3 frequencies.

**SRCH_WIN_A** - Search window size for the Active Set and Candidate Set.

The base station shall set this field to the value shown in Table 2.6.6.2.1-1 corresponding to the search window size to be used by mobile stations for the Active Set and Candidate Set.

**SRCH_WIN_R** - Search window size for the Remaining Set.

The base station shall set this field to the value shown in Table 2.6.6.2.1-1 corresponding to the search window size to be used by mobile stations for the Remaining Set.

**T_ADD** - Pilot detection threshold.

This value is used by the mobile station to trigger the transfer of a pilot from the Neighbor Set or Remaining Set to the Candidate Set (see 2.6.6.2.6) and to trigger the sending of the *Pilot Strength Measurement Message* or *Extended Pilot Strength Measurement Message* initiating the handoff process (see 2.6.6.2.5.2).

The base station shall set this field to the pilot detection threshold, expressed as an unsigned binary number equal to 
\[
\left\lfloor -2 \times 10 \times \log_{10} \frac{E_c}{Io} \right\rfloor.
\]

**T_DROP** - Pilot drop threshold.

This value is used by mobile stations to start a handoff drop timer for pilots in the Active Set and the Candidate Set (see 2.6.6.2.3).

The base station shall set this field to the pilot drop threshold, expressed as an unsigned binary number equal to 
\[
\left\lfloor -2 \times 10 \times \log_{10} \frac{E_c}{Io} \right\rfloor.
\]

**T_COMP** - Active Set versus Candidate Set comparison threshold.

Mobile stations transmit a *Pilot Strength Measurement Message* or *Extended Pilot Strength Measurement Message* when the strength of a pilot in the Candidate Set exceeds that of a pilot in the Active Set by this margin (see 2.6.6.2.5.2).

The base station shall set this field to the threshold Candidate Set pilot to Active Set pilot ratio, in units of 0.5 dB.
T_TDROP - Drop timer value. Timer value after which an action is taken by mobile stations for a pilot that is a member of the Active Set or Candidate Set, and whose strength has not become greater than T_DROP. If the pilot is a member of the Active Set, a Pilot Strength Measurement Message or Extended Pilot Strength Measurement Message is issued. If the pilot is a member of the Candidate Set, it will be moved to the Neighbor Set.

The base station shall set this field to the T_TDROP value shown in Table 2.6.6.2.3-1 corresponding to the drop timer value to be used by mobile stations.

NGHBR_MAX_AGE - Neighbor Set maximum AGE.

The base station shall set this field to the maximum AGE value beyond which mobile stations are to drop members from the Neighbor Set (see 2.6.6.2.6.3).

SOFT_SLOPE - The slope in the inequality criterion for adding a pilot to the Active Set, or dropping a pilot from the Active Set (see 2.6.6.2.3 and 2.6.6.2.5.2).

The base station shall set this field as an unsigned binary number.

ADD_INTERCEPT - The intercept in the inequality criterion for adding a pilot to the Active Set (see 2.6.6.2.5.2).

The base station shall set this field as a two’s complement signed binary number, in units of 0.5 dB.

DROP_INTERCEPT - The intercept in the inequality criterion for dropping a pilot from the Active Set (see 2.6.6.2.3).

The base station shall set this field as a two’s complement signed binary number, in units of 0.5 dB.

ENC_SUPPORTED – Encryption fields included.

The base station shall set this field to ‘1’ if the encryption related fields are included; otherwise the base station shall set this field to ‘0’.

SIG_ENCRYPT_SUP – Signaling encryption supported indicator.

If ENC_SUPPORTED is equal to ‘1’, the base station shall include this field; otherwise, the base station shall omit this field. If this field is included, this field indicates which signaling encryption algorithms are supported by the base station.
This field consists of the subfields shown in Table 2.7.1.3.2.1-5.

If this field is included, the base station shall set the subfields as follows:

- The base station shall set the CMEA subfield to ‘1’.
- The base station shall set each other subfield to ‘1’ if the corresponding signaling encryption algorithm is supported by the base station; otherwise, the base station shall set the subfield to ‘0’.
- The base station shall set the RESERVED subfield to ‘00000’.

UI_ENCRYPT_SUP - User information encryption supported indicator.

- If ENC_SUPPORTED is equal to ‘1’, the base station shall include this field; otherwise, the base station shall omit this field. If this field is included, the base station shall set this field to indicate the supported user information encryption algorithms.

This field consists of the subfields shown in Table 2.7.1.3.2.4-9.

- The base station shall set each subfield to ‘1’ if the corresponding user information encryption algorithm is supported by the base station; otherwise, the base station shall set the subfield to ‘0’.

ADD_FIELDS_LEN - Additional fields length.

- The base station shall set this field to the number of octets included in the ADD_FIELDS.

ADD_FIELDS - Additional fields.

- If the ADD_FIELDS_LEN field is not equal to ‘00000000’, the base station shall include the following fields as additional fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RESERVED</td>
<td>0 – 7 (as needed)</td>
</tr>
</tbody>
</table>

CCH_INFO_INCL - Common Channel information included indicator.

- If the message is sent on the f-csch and additional information is included, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

- If CCH_INFO_INCL is set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

IMSI_11_12 - 11th and 12th digits of the IMSI.
If CCH_INFO_INCL is set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to the IMSI_11_12 (see 2.3.1).

**MAX_SLOT_CYCLE_INDEX** - Maximum slot cycle index.

If CCH_INFO_INCL is set to ‘1’, the base station shall include the field MAX_SLOT_CYCLE_INDEX and shall set this field as shown below; otherwise, the base station shall omit this field.

The base station shall set this field to the SLOT_CYCLE_INDEX value corresponding to the maximum slot cycle length permitted (see 2.6.2.1.1).

**PWR_REP_THRESH** - Power control reporting threshold.

If CCH_INFO_INCL is set to ‘1’, the base station shall include the field PWR_REP_THRESH and shall set this field as shown below; otherwise, the base station shall omit this field.

The base station shall set this field to the number of bad frames (see [2]) to be received in a measurement period on the channel which carries the Power Control Subchannel before mobile stations are to generate a Power Measurement Report Message (see 2.6.4.1.1). If the base station sets PWR_THRESH_ENABLE to ‘1’, it shall not set this field to ‘00000’.

**PWR_REP_FRAMES** - Power control reporting frame count.

If CCH_INFO_INCL is set to ‘1’, the base station shall include the field PWR_REP_FRAMES and shall set this field as shown below; otherwise, the base station shall omit this field.

The base station shall set this field to the value such that the number given by

\[
\left\lfloor 2 \left( \frac{\text{PWR_REP_FRAMES}}{2} \times 5 \right) \right\rfloor \text{frames}
\]

is the number of frames over which mobile stations are to count frame errors.

**PWR_THRESH_ENABLE** - Threshold report mode indicator.

If CCH_INFO_INCL is set to ‘1’, the base station shall include the field PWR_THRESH_ENABLE and shall set this field as shown below; otherwise, the base station shall omit this field.

If mobile stations are to generate threshold Power Measurement Report Messages, the base station shall set this field to ‘1’. If mobile stations are not to generate threshold Power Measurement Report Messages, the base station shall set this field to ‘0’.

**PWR_PERIOD_ENABLE** - Periodic report mode indicator.

If CCH_INFO_INCL is set to ‘1’, the base station shall include the field PWR_PERIOD_ENABLE and shall set this field as shown below; otherwise, the base station shall omit this field.
If mobile stations are to generate periodic \textit{Power Measurement Report Messages}, the base station shall set this field to ‘1’. If mobile stations are not to generate periodic \textit{Power Measurement Report Messages}, the base station shall set this field to ‘0’.

\begin{verbatim}
PWR_REP_DELAY - Power report delay.

The period that mobile stations wait following a \textit{Power Measurement Report Message} before restarting frame counting for power control purposes.

If CCH_INFO_INCL is set to ‘1’, the base station shall include the field PWR_REP_DELAY and shall set this field as shown below; otherwise, the base station shall omit this field.

The base station shall set this field to the power report delay value, in units of 4 frames (see 2.6.4.1.1).

RESELECT_INCLUDED - System reselection parameters included.

If CCH_INFO_INCL is set to ‘1’, the base station shall include the field RESELECT_INCLUDED and shall set this field as shown below; otherwise, the base station shall omit this field.

If the base station is including system reselection parameters, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

EC_THRESH - Pilot power threshold.

If RESELECT_INCLUDED is included and is set to ‘1’, the base station shall include the field EC_THRESH and shall set this field as shown below; otherwise, the base station shall omit this field.

The base station shall set this field to:

\[
\left\lceil \left(pilot\_power\_threshold + 115\right) \right\rceil
\]

where \textit{pilot\_power\_threshold} is the pilot power, \(E_c\), in dBm/1.23 MHz, below which the mobile station is to perform system reselection.

EC\_IQ0\_THRESH - Pilot \(E_c/I_0\) threshold.

If RESELECT_INCLUDED is included and is set to ‘1’, the base station shall include the field EC\_IQ0\_THRESH and shall set this field as shown below; otherwise, the base station shall omit this field.

The base station shall set this field to:

\[
\left\lfloor -20 \times \log_{10}(pilot\_threshold) \right\rfloor
\]

where \textit{pilot\_threshold} is the pilot \(E_c/I_{00}\) below which the mobile station is to perform system reselection.

BASE_LAT - Base station latitude.

If CCH_INFO_INCL is set to ‘1’, the base station shall include this field and set it as shown below; otherwise, the base station shall omit this field.
\end{verbatim}
The base station shall set this field to its latitude in units of 0.25 second, expressed as a two’s complement signed number with positive numbers signifying North latitudes. The base station shall set this field to a value in the range -12960000 to 12960000 inclusive (corresponding to a range of -90° to +90°).

**BASE_LONG** - Base station longitude.

If CCH_INFO_INCL is set to ‘1’, the base station shall include this field and set it as shown below; otherwise, the base station shall omit this field.

The base station shall set this field to its longitude in units of 0.25 second, expressed as a two’s complement signed number with positive numbers signifying East longitude. The base station shall set this field to a value in the range -25920000 to 25920000 inclusive (corresponding to a range of -180° to +180°).

**PILOT_REPORT** - Pilot reporting indicator.

If CCH_INFO_INCL is set to ‘1’, the base station shall include the field PILOT_REPORT and shall set this field as shown below; otherwise, the base station shall omit this field.

The base station shall set this field to ‘1’ if the mobile station is to report the additional pilots which have pilot strengths exceeding T_ADD in all Enhanced Access Channel messages. The base station shall set this field to ‘0’ if the mobile station is to report the additional pilots which have pilot strengths exceeding T_ADD only in the *Origination Message*, *Reconnect Message*, and the *Page Response Message*.

**ACC_ENT_HO_ORDER** - Access entry handoff permitted indicator.

If CCH_INFO_INCL is set to ‘1’, the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

The base station shall set this field to ‘1’ if the mobile station is permitted to perform an access entry handoff after receiving a message while performing the *Mobile Station Order and Message Processing Operation* in the *Mobile Station Idle State* (see 2.6.2.4); otherwise, the base station shall set this field to ‘0’.

**ACCESS_HO** - Access handoff permitted indicator.

If CCH_INFO_INCL is set to ‘1’, the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

The base station shall set this field to ‘1’ if the mobile station is permitted to perform an access handoff (see 2.6.3.1.3.2); otherwise, the base station shall set this field to ‘0’.

**ACCESS_HO_MSG_RSP** - Access handoff permitted for message response indicator.

If ACCESS_HO is included and set to ‘1’, the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.
The base station shall set this field to ‘1’ if the mobile station is permitted to perform an access handoff after receiving a message and before responding to that message in the System Access State; otherwise, the base station shall set this field to ‘0’.

**ACCESS_PROBE_HO** - Access probe handoff permitted indicator.

If CCH_INFO_INCL is set to ‘1’, the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

The base station shall set this field to ‘1’ if the mobile station is permitted to perform an access probe handoff (see 2.6.3.1.3.3); otherwise, the base station shall set this field to ‘0’.

**ACC_HO_LIST_UPD** - Access handoff list update permitted indicator.

If ACCESS_PROBE_HO is included and is set to ‘1’, the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

The base station shall set this field to ‘1’ if the mobile station is permitted to update the access handoff list during an access attempt (see 2.6.3.1.7.2); otherwise, the base station shall set this field to ‘0’.

**ACC_PROBE_HO_OTHER_MSG** - Access probe handoff permitted for messages other than the *Origination Message*, *Reconnect Message*, and the *Page Response Message*.

If ACCESS_PROBE_HO is included and set to ‘1’, the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

The base station shall set this field to ‘1’ if the mobile station is permitted to perform an access probe handoff for messages other than the *Origination Message*, *Reconnect Message*, and the *Page Response Message*. The base station shall set this field to ‘0’ if the mobile station is permitted to perform an access probe handoff only for the *Origination Message*, *Reconnect Message*, and the *Page Response Message*. See 2.6.3.1.3.3.

**MAX_NUM_PROBE_HO** - Maximum number of times that the mobile station is permitted to perform an access probe handoff.

If ACCESS_PROBE_HO is included and set to ‘1’, the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

The base station shall set this field to the maximum number of times the mobile station is allowed to perform an access probe handoff within an access attempt minus one.

**NUM_FCCCH** - Total number of Forward Common Control Channels.

If CCH_INFO_INCL is set to ‘1’, the base station shall include this field and shall set it as shown below; otherwise, the base station shall omit this field.
The base station shall set this field to the total number of Forward Common Control Channels on this CDMA Channel.

If this is not a pilot beacon base station, the base station shall set this field to an integer value greater than 0.

**FCCCH_RATE** – Rate words for the Forward Common Control Channels.

If CCH_INFO_INCL is set to ‘1’ and NUM_FCCCH is not equal to ‘0’, the base station shall include this field and shall set it as shown below; otherwise, the base station shall omit this field.

The base station shall set this field to the FCCCH rate field value shown in Table 3.7.2.3.2.31-1 corresponding to the data rate used on the Forward Common Control Channels in the system.

**Table 3.7.2.3.2.31-1. Forward Common Control Channel Rate Words**

<table>
<thead>
<tr>
<th>FCCCH Rate Field (binary)</th>
<th>Forward Common Control Channel rate word</th>
</tr>
</thead>
<tbody>
<tr>
<td>000</td>
<td>9600 bps, 20 ms frame size</td>

<tr>
<td>101</td>
<td>38400 bps, 5 ms frame size</td>
</tr>
<tr>
<td>110 – 111</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

**FCCCH_CODE_RATE** – Code Rate for the Forward Common Control Channels.

If CCH_INFO_INCL is set to ‘1’ and NUM_FCCCH is not equal to ‘0’, the base station shall include this field and shall set it as shown below; otherwise, the base station shall omit this field.

If the FCCCH is operating in Spreading Rate 1, the base station shall set this field to ‘0’ if the FCCCH Code Rate is 1/4 (see [2]). The base station shall set this field to ‘1’ if the FCCCH Code Rate is 1/2 (see [2]).

If the FCCCH is operating in Spreading Rate 3, the base station shall set this field to ‘0’.

The base station shall include NUM_FCCCH occurrences of the following one field record:

**FCCCH_CODE_CHAN** – Code channel index for the Forward Common Control Channel.
The base station shall set this field to the code channel index (see [2]) in the range 1 to 255 inclusive that the mobile station is to use on the Forward Common Control Channel.

**BCAST_INDEX** - Broadcast index.

- If CCH_INFO_INCL is set to ‘1’, the base station shall include the field BCAST_INDEX and shall set this field as shown below; otherwise, the base station shall omit this field.
- If Periodic Enhanced Broadcast Paging is disabled, the base station shall set this field to ‘000’; otherwise, the base station shall set this field to the Broadcast Index (see 2.6.2.1.1.3.3.2).

**NUM_BCCH_BCAST** - The number of Broadcast Control Channels used for transmitting broadcast messages.

- If CCH_INFO_INCL is set to ‘1’, the base station shall include this field and set it as shown below; otherwise, the base station shall omit this field.
- The base station shall set this field to the number of Broadcast Control Channels used for transmitting broadcast messages.

If the NUM_BCCH_BCAST field is included, the base station shall set NUM_BCCH_BCAST occurrences of the following three-field record, where the ith occurrence corresponds to a BCCH indexed by BCN of i+1:

**BCCH_CODE_CHAN** - The Walsh Code index for the Broadcast Control Channel.

- The base station shall set this field to the Walsh code corresponding to the Broadcast Control Channel.

**BRAT** - BCCH data rate.

- The base station shall set this field to the BRAT field value shown in Table 3.7.2.3.2.31-2 corresponding to the data rate used by the Broadcast Control Channel to which the mobile station is being directed.

**Table 3.7.2.3.2.31-2. Broadcast Control Channel Data Rate**

<table>
<thead>
<tr>
<th>BRAT Field (binary)</th>
<th>Broadcast Control Channel data rate</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>4800 bps</td>
</tr>
<tr>
<td>01</td>
<td>9600 bps</td>
</tr>
<tr>
<td>10</td>
<td>19200 bps</td>
</tr>
<tr>
<td>11</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

**BCCH_CODE_RATE** - BCCH code rate.
For spreading rate 1, the base station shall set this field to ‘0’ if the BCCH Code Rate is 1/4 (see [2]). For spreading rate 1, the base station shall set this field to ‘1’ if the BCCH code rate is 1/2 (see [2]). For spreading rate 3, the base station shall set this field to ‘0’.

QPCH_SUPPORTED - Quick Paging Channel Supported Indication.

If CCH_INFO_INCL is set to ‘1’, the base station shall include the field QPCH_SUPPORTED and shall set this field as shown below; otherwise, the base station shall omit this field.

If the base station supports Quick Paging Channel operation, the base station shall set this field to ‘1’; otherwise the base station shall set this field to ‘0’.

NUM_QPCH - Number of Quick Paging Channels.

If QPCH_SUPPORTED is included and set to ‘1’, the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

The base station shall set this field to the number of Quick Paging Channels on this CDMA Channel. The base station shall not set this field to ‘00’.

QPCH_RATE - Quick Paging Channel indicator rate.

If QPCH_SUPPORTED is included and set to ‘1’, the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

The base station shall set this field to the QPCH_RATE field value shown in Table 3.7.2.3.2.13-2 corresponding to the indicator rate used by the Quick Paging Channel in the system.

QPCH_POWER_LEVEL_PAGE - Quick Paging Channel paging indicator transmit power level.

If QPCH_SUPPORTED is included and set to ‘1’, the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

The base station shall set this field to the Quick Paging Channel paging indicator transmit power level relative to that of the Pilot Channel as specified in Table 3.7.2.3.2.31-3.
### Table 3.7.2.3.2.31-3. Quick Paging Channel Transmit Power Level

<table>
<thead>
<tr>
<th>QPCH_POWER_LEVEL_PAGE (binary)</th>
<th>Transmit Power Level</th>
</tr>
</thead>
<tbody>
<tr>
<td>000</td>
<td>5 dB below the Pilot Channel Transmit Power</td>
</tr>
<tr>
<td>001</td>
<td>4 dB below the Pilot Channel Transmit Power</td>
</tr>
<tr>
<td>010</td>
<td>3 dB below the Pilot Channel Transmit Power</td>
</tr>
<tr>
<td>011</td>
<td>2 dB below the Pilot Channel Transmit Power</td>
</tr>
<tr>
<td>100</td>
<td>1 dB below the Pilot Channel Transmit Power</td>
</tr>
<tr>
<td>101</td>
<td>Same as the Pilot Channel Transmit Power</td>
</tr>
<tr>
<td>110</td>
<td>1 dB above the Pilot Channel Transmit Power</td>
</tr>
<tr>
<td>111</td>
<td>2 dB above the Pilot Channel Transmit Power</td>
</tr>
</tbody>
</table>

**QPCH_CCI_SUPPORTED** - Quick Paging Channel configuration change indicator supported.

If QPCH_SUPPORTED is included and set to ‘1’, the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

If the base station supports configuration change indicators on the Quick Paging Channel, the base station shall set this field to ‘1’; otherwise the base station shall set this field to ‘0’.

**QPCH_POWER_LEVEL_CONFIG** - Quick Paging Channel configuration change indicator transmit power level.

If QPCH_CCI_SUPPORTED is included and set to ‘1’, the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

The base station shall set this field to the Quick Paging Channel configuration change indicator transmit power level relative to that of the Pilot Channel as specified in Table 3.7.2.3.2.31-3.
If SR3_INCL is set to ‘1’ and QPCH_SUPPORTED is included and set to ‘1’, the base station shall include NUM_QPCH occurrences of the following one field record:

**QPCH_CODE_CHAN** - Code channel index of the Quick Paging Channel for Spreading Rate 3.

The base station shall set this field to the code channel index (see [2]) in the range 1 to 255 inclusive that the mobile station is to use on the Quick Paging Channel for Spreading Rate 3.

**QPCH_BI_SUPPORTED** - Quick Paging Channel broadcast indicator supported.

If QPCH_SUPPORTED is included and set to ‘1’, the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

If the base station supports broadcast indicators on the Quick Paging Channel, the base station shall set this field to ‘1’; otherwise the base station shall set this field to ‘0’.

**QPCH_POWER_LEVEL_BCAST** - Quick Paging Channel broadcast indicator transmit power level.

If QPCH_BI_SUPPORTED is included and set to ‘1’, the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

The base station shall set this field to the Quick Paging Channel broadcast indicator transmit power level relative to that of the Pilot Channel as specified in Table 3.7.2.3.2.31-3.

**SDB_SUPPORTED** - Short Data Burst supported indicator.

If CCH_INFO_INCL is set to ‘1’, the base station shall include the field SDB_SUPPORTED and shall set this field as shown below; otherwise, the base station shall omit this field.

The base station shall set this field to ‘1’ if the mobile station is permitted to send a Short Data Burst; otherwise, the base station shall set this field to ‘0’.

**BROADCAST_GPS_ASST** - Broadcast GPS Assist Indicator.

If CCH_INFO_INCL is set to ‘1’, the base station shall include the field BROADCAST_GPS_ASST and shall set this field as shown below; otherwise, the base station shall omit this field.

The base station shall set this field to ‘1’ if it supports Broadcast GPS Assist capability; otherwise, the base station shall set this field to ‘0’.

**RLGAIN_TRAFFIC_PILOT** - Gain adjustment of the Reverse Traffic Channel relative to the Reverse Pilot Channel for Radio Configurations greater than 2.

If CCH_INFO_INCL is set to ‘1’, the base station shall include the field RLGAIN_TRAFFIC_PILOT and shall set this field as shown below; otherwise, the base station shall omit this field.
The base station shall set this field to the correction factor to be used by mobile stations in setting the power of a reverse traffic channel, expressed as a two’s complement value in units of 0.125 dB (see [2]).

REV_PWR_CNTL_DELAY_INCL - Reverse Power Control Delay included indicator.

If CCH_INFO_INCL is set to ‘1’, the base station shall include this field and set it as shown below; otherwise, the base station shall omit this field.

The base station shall set this field to ‘1’ if the base station includes the REV_PWR_CNTL_DELAY field in this message; otherwise, the base station shall set this field to ‘0’.

REV_PWR_CNTL_DELAY - The reverse power control delay.

If REV_PWR_CNTL_DELAY_INCL is included and set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to the closed-loop reverse power control delay minus one (the closed-loop reverse power control delay is the time between the end of a gated-on reverse PCG and the beginning of the reverse PCG where the corresponding feedback is sent on the Forward Power Control Subchannel, see [2]), in units of 1.25 ms.

MOB_QOS - Indicator granting permission to the mobile station to request QoS parameter settings in the Origination Message, Origination Continuation Message, or Enhanced Origination Message.

If CCH_INFO_INCL is set to ‘1’, the base station shall include this field and set it as shown below; otherwise, the base station shall omit this field.

The base station shall set this field to ‘1’, if the mobile station is allowed to include a QoS record in the Origination Message, Origination Continuation Message, or Enhanced Origination Message; otherwise, the base station shall set this field to ‘0’.

USE_SYNC_ID - Sync ID supported indicator.

If CCH_INFO_INCL is set to ‘1’, the base station shall include this field and set it as shown below; otherwise, the base station shall omit this field.

The base station shall set this field to ‘1’ to indicate that the mobile station is permitted to include the SYNC_ID field in the Page Response Message, the Reconnect Message, the Origination Message and the Enhanced Origination Message; otherwise, the base station shall set this field to ‘0’.

NUM_OPT_MSG - Number of optional overhead messages to be sent.

If CCH_INFO_INCL is set to ‘1’, the base station shall include this field and set this field as shown below; otherwise, the base station shall omit this field.

The base station shall set this field to the number of optional overhead messages to be sent.
SENDING_RAND - *ANSI-41 RAND Message* indicator.

If NUM_OPT_MSG is included and is equal to or greater than 1, the base station shall include the field SENDING_RAND and shall set this field as shown below; otherwise, the base station shall omit this field.

If the base station is sending the *ANSI-41 RAND Message* on the Primary Broadcast Control Channel, it shall set this field to ‘1’; otherwise, it shall set this field to ‘0’.

PRI_NGHBR_LST - *Private Neighbor List Message* indicator.

If NUM_OPT_MSG is included and is equal to or greater than 2, the base station shall include the field PRI_NGHBR_LST and shall set this field as shown below; otherwise, the base station shall omit this field.

If the base station is sending the *Private Neighbor List Message* on the Primary Broadcast Control Channel, it shall set this field to ‘1’; otherwise, it shall set this field to ‘0’.

USER_ZONE_ID - *User Zone Identification Message* indicator.

If NUM_OPT_MSG is included and is equal to or greater than 3, the base station shall include the field USER_ZONE_ID and shall set this field as shown below; otherwise, the base station shall omit this field.

If the base station is sending the *User Zone Identification Message* on the Primary Broadcast Control Channel, it shall set this field to ‘1’; otherwise, it shall set this field to ‘0’.

EXT_GLOBAL_REDIRECT - *Extended Global Service Redirection Message* indicator.

If NUM_OPT_MSG is included and is equal to or greater than 4, the base station shall include the field EXT_GLOBAL_REDIRECT and shall set this field as shown below; otherwise, the base station shall omit this field.

If the base station is sending the *Extended Global Service Redirection Message* on the Primary Broadcast Control Channel, it shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

RESERVED - Reserved bits.

If NUM_OPT_MSG is included and is equal to or greater than 5, the base station shall include the field RESERVED and shall set this field as shown below; otherwise, the base station shall omit this field.

The base station shall add (NUM_OPT_MSG – 4) reserved bits. The base station shall set these bits to ‘0’.

PILOT_INFO_REQ_SUPPORTED - Pilot information request supported indicator.

If CCH_INFO_INCL is set to ‘1’, the base station shall include this field and set it as shown below; otherwise, the base station shall omit this field.
If the base station supports mobile station request for pilot information using the “Pilot Information” record in the Base Station Status Request Message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

BAND_CLASS_INFO_REQ – Band class information request indicator.

If CCH_INFO_INCL is set to ‘1’, the base station shall include this field and set it as shown below; otherwise, the base station shall omit this field.

The base station shall set this field to ‘1’ if the ALT_BAND_CLASS field is included in this message; otherwise, the base station shall set this field to ‘0’.

ALT_BAND_CLASS – Alternate band class.

If BAND_CLASS_INFO_REQ is not included, or is included and set to ‘0’, then the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to an alternate CDMA band class (see [30]) supported by the base station. The mobile station is to indicate its capability to support the alternate band class in the Origination Message and Page Response Message.

CDMA_OFF_TIME_REP_SUP_IND – CDMA off time report supported indicator.

If the base station supports mobile station report for CDMA off time information using the CDMA Off Time Report Message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

CDMA_OFF_TIME_REP_THRESHOLD_UNIT – CDMA off time report threshold unit

If CDMA_OFF_TIME_REP_SUP_IND is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the time unit used in CDMA_OFF_TIME_REP_THRESHOLD, as specified in Table 3.7.2.3.2.13-5

CDMA_OFF_TIME_REP_THRESHOLD – CDMA off time report threshold

If CDMA_OFF_TIME_REP_SUP_IND is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the time in units of CDMA_OFF_TIME_REP_THRESHOLD_UNIT such that if the mobile station goes away from the CDMA traffic channel longer than this value, the mobile station is to send a CDMA Off Time Report Message.

CHM_SUPPORTED – Control Hold Mode supported indicator.
The base station shall set this field to ‘1’ to indicate that the base station supports the Control Hold Mode; otherwise, the base station shall set this field to ‘0’.

**RELEASE_TO_IDLE_IND** - Release to Idle State allowed indicator.

If the mobile station is allowed to return to the Mobile Station Idle State upon call release, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**RECONNECT_MSG_IND** - Reconnect Message supported indicator.

The base station shall set this field to ‘0’ if the mobile station is not allowed to send a Reconnect Message instead of an Origination Message or a Page Response Message; otherwise, the base station shall set this field to ‘1’.

**T_TDROP_RANGE_INCL** - Drop timer range value included indicator.

The base station shall set this field to ‘1’ if the T_TDROP_RANGE field is included in this message; otherwise, the base station shall set this field to ‘0’.

**T_TDROP_RANGE** - Drop timer range value.

Timer range value to use in association with the T_TDROP parameter when determining the drop timer expiration.

If T_TDROP_RANGE_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field to the T_TDROP_RANGE value shown in Table 2.6.6.2.3-2 corresponding to the timer expiration range value to be used by the mobile station.

**FOR_PDCH_SUPPORTED** - Forward Packet Data Channel supported indicator.

If the base station supports the Forward Packet Data Channel (F-PDCH), the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**PDCH_CHM_SUPPORTED** - PDCH Control Hold Mode supported indicator.

If FOR_PDCH_SUPPORTED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ to indicate that the base station supports the PDCH Control Hold Mode; otherwise, the base station shall set this field to ‘0’.

**PDCH_PARMS_INCL** - Forward Packet Data Channel related parameters included indicator.

If FOR_PDCH_SUPPORTED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to ‘1’ if the following F-PDCH related fields are included in this message; otherwise, the base station shall set this field to ‘0’.
FOR_PDCH_RLGAIN_INCL - Forward Packet Data Channel parameters related to reverse link adjustment gains included indicator.

If PDCH_PARMS_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to '1' if the following F-PDCH gain related fields are included in this message; otherwise, the base station shall set this field to '0'.

RLGAIN_ACKCH_PILOT - Reverse Acknowledgment Channel to pilot adjustment gain.

If FOR_PDCH_RLGAIN_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to the Reverse Acknowledgment Channel to pilot adjustment gain expressed as a two's complement value in units of 0.125 dB (see [2]).

RLGAIN_CQICH_PILOT - Reverse Channel Quality Indicator Channel to pilot adjustment gain.

If FOR_PDCH_RLGAIN_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to the Reverse Channel Quality Indicator Channel to pilot adjustment gain expressed as a two's complement value in units of 0.125 dB (see [2]).

NUM_SOFT_SWITCHING_FRAMES - Number of frames for R-CQICH soft switching.

If PDCH_PARMS_INCL is not included, or is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the duration of the cell switching period, in units of 20 ms, minus one, during which the mobile station is to transmit the cell switch sequence on the R-CQICH when it switches between two pilots which are in different groups (see [3]).

NUM_SOFTER_SWITCHING_FRAMES - Number of frames for R-CQICH softer switching.

If PDCH_PARMS_INCL is not included, or is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the duration of the cell switching period, in units of 20 ms, minus one, during which the mobile station is to transmit the cell switch sequence on the R-CQICH when it switches between two pilots which are in the same group (see [3]).

NUM_SOFT_SWITCHING_SLOTS - Number of slots per frame for R-CQICH soft switching.
If PDCH_PARMS_INCL is not included, or is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the duration of the cell switching slots within a switching frame, in units of 1.25 ms as specified in Table 3.7.2.3.2.21-10, during which the mobile station is to transmit the cell switch indication by using Walsh cover of target on the R-CQICH when it switches between two pilots which are in different groups.

**NUM_SOFTER_SWITCHING_SLOTS** - Number of slots per frame for R-CQICH softer switching.

If PDCH_PARMS_INCL is not included, or is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the duration of the cell switching slots within a switching frame, in units of 1.25 ms as specified in Table 3.7.2.3.2.21-10, during which the mobile station is to transmit the cell switch indication by using Walsh cover of target on the R-CQICH when it switches between two pilots which are in different groups.

**PDCH_SOFT_SWITCHING_DELAY** - F-PDCH soft switching delay.

If PDCH_PARMS_INCL is not included, or is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the minimum interruption seen by the mobile station, in units of 10 ms, minus one, when the mobile station is to transmit the cell switch sequence on the R-CQICH channel when it switches between two pilots which are in different groups (see [3]).

**PDCH_SOFTER_SWITCHING_DELAY** - F-PDCH softer switching delay.

If PDCH_PARMS_INCL is not included, or is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the minimum interruption seen by the mobile station, in units of 10 ms, minus one, when the mobile station is to transmit the cell switch sequence on the R-CQICH channel when it switches between two pilots which are in the same group (see [3]).

**WALSH_TABLE_ID** - The index of the Walsh Table used.

If PDCH_PARMS_INCL is not included, or is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Walsh Table being used by the Packet Data Channel. (See [3]).

**NUM_PDCCH** - The number of Packet Data Control Channels supported.
If PDCH_PARMS_INCL is not included, or is included and set
to '0', the base station shall omit this field; otherwise, the
base station shall include this field and set it as follows:
The base station shall set this field to ‘000’ if the pilot
supports one Packet Data Control Channel. The base station
shall set this field to ‘001’ if the pilot supports two Packet
Data Control Channels. The base station shall not set this
field to any other value.

The base station shall include $NUM_PDCCH+1$ occurrences of the following one-field record:

<table>
<thead>
<tr>
<th>FOR_PDCCH_WALSH</th>
<th>Forward Packet Data Control Channel Walsh code assignment.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>If PDCH_PARMS_INCL is not included, or is included and set</td>
</tr>
<tr>
<td></td>
<td>to '0', the base station shall omit this field; otherwise,</td>
</tr>
<tr>
<td></td>
<td>the base station shall include this field and set it as follows:</td>
</tr>
<tr>
<td></td>
<td>The base station shall set this field to the Walsh code</td>
</tr>
<tr>
<td></td>
<td>assignment for the Forward Packet Data Control Channel.</td>
</tr>
</tbody>
</table>

If NUM_PDCCH is set to '001', the Walsh code of PDCCH0
shall be included first, followed by the Walsh code for
PDCCH1.

NEG_SLOT_CYCLE_INDEX_SUP – Negative slot cycle index supported indicator.

The base station shall set this field to the ‘1’ if it supports
negative values of the preferred slot cycle index
$(\text{SLOT}_\text{CYCLE}_\text{INDEX}_p)$; otherwise, the base station shall set
this field to ‘0’.

IMSI_10_INCL - IMSI_10 included.

The base station shall set this field to the ‘1’ if it supports
negative values of the preferred slot cycle index
$(\text{SLOT}_\text{CYCLE}_\text{INDEX}_p)$; otherwise, the base station shall set
this field to ‘0’.

IMSI_10 - The least significant digit of MNC when the MNC is a 3-digit
number.

If IMSI_10_INCL is not included, or is included and set to ‘0’,
the base station shall omit this field; otherwise, the base
station shall set this field to the least significant digit of MNC
converted to binary by the standard decimal-to-binary
conversion as shown in Table 2.3.1.1-1.

NEG_SLOT_CYCLE_INDEX_SUP – Negative slot cycle index supported indicator.

The base station shall set this field to the ‘1’ if it supports
negative values of the preferred slot cycle index
$(\text{SLOT}_\text{CYCLE}_\text{INDEX}_p)$; otherwise, the base station shall set
this field to ‘0’.

RER_MODE_SUPPORTED - Radio environment reporting mode supported indicator.
If the base station supports radio environment reporting mode, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

**AUTO_FCSO_ALLOWED** - Autonomous *Fast Call Setup Order* allowed indicator.

The base station shall set this field to '1' if the mobile station is allowed to send an autonomous *Fast Call Setup Order*; otherwise, the base station shall set this field to '0'.

**SENDING_BSPM** - *BCMC Service Parameters Message* indicator.

If the base station is sending the *BCMC Service Parameters Message* on the Primary Broadcast Control Channel, it shall set this field to '1'; otherwise, it shall set this field to '0'.

**BSPM_PERIOD_INDEX** - BSPM Transmission Periodicity Index.

If the **SENDING_BSPM** field is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the BSPM transmission periodicity index corresponding to the periodicity with which the BSPM with **DIFF_BSPM** equal to '0' is transmitted on the Primary Broadcast Control Channel as specified in Table 2.7.3.5.1.

The base station shall start transmitting a *BCMC Service Parameters Message* within four F-BCCH slots of the F-BCCH BSPM slot given by

\[
\lfloor \frac{t}{4} \rfloor \mod (B + 1) = 0,
\]

where \( t \) represents system time in frames and \( B \) is given by

\[
B = 2^{\text{BSPM_PERIOD_INDEX}} \times 16
\]

**REV_PDCH_SUPPORTED** - Reverse Packet Data Channel supported indicator.

If **FOR_PDCH_SUPPORTED** is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the base station supports the Reverse Packet Data Channel (R-PDCH), the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

**REV_PDCH_PARMSS_INCL** - Reverse Packet Data Channel related parameters included indicator.

If **REV_PDCH_SUPPORTED** is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to '1' if the R-PDCH parameters are included in this message; otherwise, the base station shall set this field to '0'.

**REV_PDCH_RLGAIN_INCL** - Reverse Packet Data Channel parameters related to reverse link adjustment gains included indicator.
If REV_PDCH_PARMS_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to '1' if the following R-PDCH gain related fields are included in this message; otherwise, the base station shall set this field to '0'.

RLGAIN_SPICH_PILOT - Reverse Secondary Pilot Channel to pilot adjustment gain.

If REV_PDCH_RLGAIN_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to the Reverse Secondary Pilot Channel to pilot adjustment gain expressed as a two's complement value in units of 0.125 dB (see [2]).

RLGAIN_REQCH_PILOT - Reverse Request Channel to pilot adjustment gain.

If REV_PDCH_RLGAIN_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to the Reverse Request Channel to pilot adjustment gain expressed as a two's complement value in units of 0.125 dB (see [2]).

RLGAIN_PDCCH_PILOT - Reverse Packet Data Control Channel to pilot adjustment gain.

If REV_PDCH_RLGAIN_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to the Reverse Packet Data Channel to pilot adjustment gain expressed as a two's complement value in units of 0.125 dB (see [2]).

REV_PDCH_PARMS_1_INCL - Reverse Packet Data Channel parameters subset included indicator.

If REV_PDCH_PARMS_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to '1' if the following R-PDCH parameters are included in this message; otherwise, the base station shall set this field to '0'.

REV_PDCH_TABLE_SEL - Reverse Packet Data Channel Table selector.

If REV_PDCH_PARMS_1_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to the Reverse Packet Data Channel Table selector (see [2]).

REV_PDCH_MAX_AUTO_TPR - Reverse Packet Data Channel maximum traffic to pilot ratio for autonomous transmission.
If REV_PDCH_PARMS_1_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to the maximum traffic to pilot ratio for autonomous transmission on the Reverse Packet Data Channel (see [2] and [3]).

The base station shall set this field to a value in the range 0 to 18 dB inclusive in units of 0.125 dB.

REV_PDCH_NUM_ARQ_ROUNDS_NORMAL - Maximum number of allowed ARQ rounds on the Reverse PDCH in the non-boosted mode.

If REV_PDCH_PARMS_1_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to one less the maximum number of allowed ARQ rounds on the Reverse PDCH in the non-boosted mode. The base station shall set this field to 0, 1, or 2 corresponding to 1, 2, or 3 rounds respectively (See [3]).

REV_PDCH_OPER_PARMS_INCL - Reverse Packet Data Channel operational parameters included indicator.

If REV_PDCH_PARMS_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to ‘1’ if the following R-PDCH operational parameters are included in this message; otherwise, the base station shall set this field to ‘0’.

REV_PDCH_MAX_SIZE_ALLOWED_ENCODER_PACKET - Maximum Allowed Reverse PDCH encoder packet size.

If REV_PDCH_OPER_PARMS_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the maximum size encoder packet that the mobile station is allowed to use. (see [2] and [3]).

The base station shall set this field to a value in the range 0 to 10 inclusive, corresponding to the encoder packet sizes 192, 408, 792, 1560, 3096, 4632, 6168, 9240, 12312, 15384, and 18456 bits respectively.

REV_PDCH_DEFAULT_PERSISTENCE - Reverse Packet Data Channel default initial persistence.

If REV_PDCH_OPER_PARMS_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
The base station shall set this field to ‘1’ if the mobile station is to be persistent at the call setup; otherwise, the base station shall set this field to ‘0’ (See [3]).

**REV_PDCH_RESET_PERSISTENCE** - Reverse Packet Data Channel reset persistence indicator.

If REV_PDCH_OPER_PARMS_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if, at the end of a persistent grant, the mobile station shall reset its persistent indicator to persistent; otherwise, the base station shall set this field to ‘0’ if the mobile station shall reset its persistent indicator to non-persistent (See [3]).

**REV_PDCH_GRANT_PRECEDENCE** - Reverse Packet Data Channel Grant Precedence Indicator.

If REV_PDCH_OPER_PARMS_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if unicast Forward Grant Channel messages have precedence over Rate Control commands; otherwise, the base station shall set this field to ‘0’ to indicate that Rate Control down commands from non-serving sectors have precedence over Forward Grant Channel messages (see [3]).

**REV_PDCH_MSIB_SUPPORTED** - Reverse PDCH MSIB usage indicator.

If REV_PDCH_OPER_PARMS_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if the mobile station is to use the MSIB bit on the Reverse Packet Data Control Channel; otherwise, the base station shall set this field to ‘0’ (see [3]).

**REV_PDCH_SOFT_HANDOFF_SWITCHING_RESET_IND** - Reverse Packet Data Channel soft handoff switching reset indicator.

If REV_PDCH_OPER_PARMS_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if the mobile station is to initialize RPDCHCF when soft selection occurs in the FPDCHCF; otherwise, the base station shall set this field to ‘0’ (see [3]).

**SDB_IN_RCNM_IND** - Short Data Burst allowed in Reconnect Message indicator.
If RECONNECT_MSG_IND is set to ‘0’ or SDB_SUPPORTED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if the mobile station is allowed to include a Short Data Burst (see [30]) in the Reconnect Message; otherwise, the base station shall set this field to ‘0’.

**CAND_BAND_INFO_REQ** - Candidate band class information request indicator

If CCH_INFO_INCL is set to ‘1’, the base station shall include this field and set it as shown below; otherwise, the base station shall omit this field.

The base station shall set this field to ‘1’ when requesting mobiles to report whether various candidate band class and band subclass (if applicable) combinations are supported; otherwise, the base station shall set this field to ‘0’.

The base station shall not include more than 16 band class-band subclass queries in this message.

**NUM_CAND_BAND_CLASS** - Number of candidate band classes

If CAND_BAND_INFO_REQ is not included, or is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the number of candidate band classes included in the record minus one.

If CAND_BAND_INFO_REQ is included and set to ‘1’, the base station shall include

**NUM_CAND_BAND_CLASS** + 1 occurrences of the following record:

**CAND_BAND_CLASS** - Candidate band class

The base station shall set this field to a band class (see [30]) for which the mobile is to report its capabilities upon system access. It may be used in conjunction with the BAND_SUBCLASS_IND fields to specify band subclass(es) for which the mobile is to report its capabilities upon system access.

**SUBCLASS_INFO_INCL** - Band subclass information included

The base station shall set this field to ‘0’ when no band subclasses are associated with CAND_BAND_CLASS or if the base station requires only the band class capabilities of the mobile station. Otherwise, the base station shall set this field to ‘1’.

**SUBCLASS_REC_LEN** - Band subclass subrecord length
If SUBCLASS_INFO_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the number of band subclass indicator fields included in the subrecord minus one. The number of subclass indicator fields included depends on the highest band subclass being queried for mobile support for the associated CAND_BAND_CLASS (i.e. if the highest band subclass being queried is K, then SUBCLASS_REC_LEN = K).

If the SUBCLASS_REC_LEN field is included, the base station shall include SUBCLASS_REC_LEN + 1 occurrences of the following subrecord. The first field included corresponds to band subclass ‘0’ and the Nth field included corresponds to band subclass ‘N-1’.

**BAND_SUBCLASS_IND** - Band subclass indicator

The base station shall set this field to ‘1’ if it requires the mobile to report whether it supports this band subclass for the associated CAND_BAND_CLASS; otherwise, the base station shall set this field to ‘0’.

The mobile station is to indicate its capability to support the candidate band class and band subclass (if applicable) combination in the *Registration Message*, *Origination Message*, and *Page Response Message*.

**RESCAN** - Rescan indicator.

If mobile stations are to re-initialize and re-acquire the system upon receiving this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**TX_PWR_LIMIT_INCL** - Transmit Power Limit inclusion for the current base station

If the transmit power limit field is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**TX_PWR_LIMIT** - Transmit Power Limit for the current base station

If TX_PWR_LIMIT_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set to as follows.

The base station shall set this field to thirty dB more than transmit power limit in dBm EIRP, in steps of 1 dB. This field can take the values 30 to 53 corresponding to maximum transmit power values 0 dBm to 23 dBm.

**BYPASS_REG_IND** - Indication to bypass the power up registration upon the change of bands, serving systems, and frequency blocks.

The base station shall set this field to ‘00’ if the mobile station is to perform a power up registration upon band, frequency block or serving system change.
The base station shall set this field to ‘01’ if the mobile station is to bypass the power up registration requirement upon band, frequency block or serving system changes due to processing the Extended CDMA Channel List Message.

The base station shall set this field to ‘10’ if the mobile station is to bypass the power up registration requirement upon band, frequency block or serving system change when the SID remains the same.

The base station shall set this field to ‘11’ if the mobile station is to bypass the power up registration requirement upon band, frequency block or serving system change.

- **PILOT_PN** - Pilot PN sequence offset index. The base station shall set this field to the pilot PN sequence offset for this base station, in units of 64 PN chips.

- **ACC_MSG_SEQ** - Enhanced Access Parameters Message sequence number. The base station shall set this field to ACC_CONFIG_SEQ (see 3.6.2.2).

- **RAND** - Random challenge value. The base station shall set this field to the random challenge value to be used by mobile stations for authentication.

```

1 PILOT_PN - Pilot PN sequence offset index.
2 The base station shall set this field to the pilot PN sequence offset for this base station, in units of 64 PN chips.
ACC_MSG_SEQ - Enhanced Access Parameters Message sequence number.

The base station shall set this field to ACC_CONFIG_SEQ (see 2.6.2.2.15).

PSIST_PARMS_INCL - Persistence parameters included indicator.

If persistence parameters are included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

PSIST_PARMS_LEN - Length of persistence parameters record.

If PSIST_PARMS_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field to the total length, in octets, of persistence parameters included in the message, including the PSIST_PARMS_LEN and RESERVED fields.

PSIST(0-9)_EACH - Persistence value for access overload classes 0 through 9.

If PSIST_PARMS_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

If a mobile station in access overload classes 0 through 9 is permitted to transmit requests on the Enhanced Access Channel, the base station shall set this field to the persistence value to be used. If such a mobile station is not permitted to transmit requests on the Enhanced Access Channel, the base station shall set this field to ‘111111’.

PSIST(10)_EACH - Persistence value for access overload class 10 (test mobile stations).

If PSIST_PARMS_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

If a mobile station in access overload class 10 is permitted to transmit requests on the Enhanced Access Channel, the base station shall set this field to the persistence value to be used. If such a mobile station is not permitted to transmit requests on the Enhanced Access Channel, the base station shall set this field to ‘111’.

PSIST(11)_EACH - Persistence value for access overload class 11 (emergency mobile stations).

If PSIST_PARMS_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

If a mobile station in access overload class 11 is permitted to transmit requests on the Enhanced Access Channel, the base station shall set this field to the persistence value to be used. If such a mobile station is not permitted to transmit requests on the Enhanced Access Channel, the base station shall set this field to ‘111’.

PSIST(12)_EACH - Persistence value for access overload class 12.
If PSIST_PARMS_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

If a mobile station in access overload class 12 is permitted to transmit requests on the Enhanced Access Channel, the base station shall set this field to the persistence value to be used. If such a mobile station is not permitted to transmit requests on the Enhanced Access Channel, the base station shall set this field to ‘111’.

PSIST(13)_EACH - Persistence value for access overload class 13.

If PSIST_PARMS_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

If a mobile station in access overload class 13 is permitted to transmit requests on the Enhanced Access Channel, the base station shall set this field to the persistence value to be used. If such a mobile station is not permitted to transmit requests on the Enhanced Access Channel, the base station shall set this field to ‘111’.

PSIST(14)_EACH - Persistence value for access overload class 14.

If PSIST_PARMS_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

If a mobile station in access overload class 14 is permitted to transmit requests on the Enhanced Access Channel, the base station shall set this field to the persistence value to be used. If such a mobile station is not permitted to transmit requests on the Enhanced Access Channel, the base station shall set this field to ‘111’.

PSIST(15)_EACH - Persistence value for access overload class 15.

If PSIST_PARMS_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

If a mobile station in access overload class 15 is permitted to transmit requests on the Enhanced Access Channel, the base station shall set this field to the persistence value to be used. If such a mobile stations is not permitted to transmit requests on the Enhanced Access Channel, the base station shall set this field to ‘111’.

PSIST_EMG - Persistence value for emergency call for access overload classes 0 through 9.

If PSIST_PARMS_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:
If a mobile station in access overload classes 0 through 9 is permitted to transmit emergency requests on the Enhanced Access Channel, the base station shall set this field to the persistence value to be used for the emergency calls. If such a mobile station is not permitted to transmit emergency requests on the Enhanced Access Channel, the base station shall set this field to ‘111’.

**MSG_PSIST_EACH** - Persistence modifier for Enhanced Access Channel attempts for message transmissions.

If PSIST_PARMS_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field to the persistence modifier for Enhanced Access Channel attempts for message transmissions.

**REG_PSIST_EACH** - Persistence modifier for Enhanced Access Channel attempts for registrations which are not responses to the Registration Request Order.

If PSIST_PARMS_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field to the persistence modifier for Enhanced Access Channel attempts for registrations which are not responses to the Registration Request Order.

**RESERVED** - Reserved bits.

If PSIST_PARMS_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include as many bits as required to make the length of the persistence parameters record an integral number of octets. If this field is included, the base station shall set each of these bits to ‘0’.

**LAC_PARMS_LEN** - Length of Link Access Control parameter fields.

The base station shall set this field to the total length, in octets, of Link Access Control parameters included in the message, including the LAC_PARMS_LEN and RESERVED fields.

**ACC_TMO** - Acknowledgment timeout.

The base station shall set this field to one less than the length of time, in units of 20 ms, that a mobile station is to wait to receive a Layer 2 acknowledgment after the end of an Enhanced Access Channel transmission.

**RESERVED_1** - The reserved bits

The base station shall set this field to ‘0000’

**MAX_REQ_SEQ** - Maximum number of access probe sequences for an Enhanced Access Channel request.

The base station shall set this field to the maximum number of access probe sequences a mobile station is to transmit for an Enhanced Access Channel request. The base station shall set this field to a value greater than 0.
MAX_RSP_SEQ - Maximum number of access probe sequences for an Enhanced Access Channel response.  
The base station shall set this field to the maximum number of access probe sequences a mobile station is to transmit for an Enhanced Access Channel response. The base station shall set this field to a value greater than 0.

RESERVED - Reserved Bits.  
The base station shall include as many bits as required to make the length of the Link Access Control parameters record an integral number of octets. The base station shall set each of these bits to ‘0’.

NUM_MODE_SELECTION_ENTRIES - Number of entries of the Mode Selection Table.  
The base station shall set this field to the number of entries of the Mode Selection Table, minus one.

The base station shall include NUM_MODE_SELECTION_ENTRIES + 1 occurrences of the following three-field record:

ACCESS_MODE - Access Mode used for the Enhanced Access Channel.  
The base station shall set this field to the Access Mode value shown in Table 3.7.2.3.2.33-1 corresponding to the Access Mode used.

<table>
<thead>
<tr>
<th>ACCESS_MODE (binary)</th>
<th>Access Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>000</td>
<td>Basic Access Mode</td>
</tr>
<tr>
<td>001</td>
<td>Reservation Access Mode</td>
</tr>
<tr>
<td>010 – 011</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

ACCESS_MODE_MIN_DURATION - The minimum message duration for the corresponding Access Mode.  
The base station shall set this field to the minimum message duration for the corresponding Access Mode, in units of 5 ms. See [3].

ACCESS_MODE_MAX_DURATION - The maximum message duration for the corresponding Access Mode.  
The base station shall set this field to the maximum message duration for the corresponding Access Mode, in units of 5 ms. See [3].

RLGAIN_COMMON_PILOT - Gain adjustment of the Enhanced Access Channel or Reverse Common Control Channel relative to the Reverse Pilot Channel.
The base station shall set this field to the correction factor to be used by mobile stations in setting the power of a code channel, expressed as a two's complement value in units of 0.125 dB (see [2]).

IC_THRESH - Interference correction threshold. The threshold level at which the interference correction begins to be applied.

The base station shall set this field to the negative of the interference correction threshold to be used by mobile stations to determine the interference correction, in units of 1 dB (see [2]).

IC_MAX - The maximum interference correction that can be applied.

The base station shall set this field to the maximum interference correction that can be applied, in units of 1 dB (see [2]).

NUM_MODE_PARM_REC - The number of mode-specific parameter records.

The base station shall set this field to the number of mode-specific parameter records included in the message, minus one.

The base station shall include NUM_MODE_PARM_REC + 1 occurrences of the following record:

EACH_PARM_REC_LEN - Length of the mode-specific parameters record.

The base station shall set this field to the total length, in octets, of the mode-specific parameters record, including the EACH_PARM_REC_LEN and RESERVED fields.

APPLICABLE_MODES - Access modes to which the access parameters specified in this record apply.

The base station shall set each subfield of the APPLICABLE_MODES field as follows: the base station shall set the subfield to ‘1’ if the access parameters included in this record are applicable to the corresponding Access Mode in Table 3.7.2.3.2.33-2; otherwise, the base station shall set the subfield to ‘0’.

<table>
<thead>
<tr>

<td>Reservation Access Mode</td>
</tr>
<tr>
<td>RESERVED</td>
<td>6</td>
<td></td>
</tr>
</tbody>
</table>

EACH_NOM_PWR - Nominal transmit power offset for the Enhanced Access Channels.
The base station shall set this field to the correction factor to be used by a mobile station in the open loop power estimate, expressed as a two's complement value in units of 1 dB (see [2]).

EACH_INIT_PWR - Initial power offset for the Enhanced Access Channels.

The base station shall set this field to the correction factor to be used by a mobile station in the open loop power estimate for the initial transmission on an Enhanced Access Channel, expressed as a two's complement value in units of 1 dB (see [2]).

EACH_PWR_STEP - Power increment for the Enhanced Access Channels.

The base station shall set this field to the value by which a mobile station is to increase their transmit power between successive access probes in an access probe sequence, in units of 1 dB.

EACH_NUM_STEP - Number of access probes.

The base station shall set this field to one less than the maximum number of access probes a mobile station is to transmit in a single access probe sequence.

EACH_PREAMBLE_ENABLED - Preamble enabled indicator for the Enhanced Access Channel.

The base station shall set this field to ‘1’ if EACH preambles related information is included in this message; otherwise, the base station shall set this field to ‘0’.

EACH_PREAMBLE_NUM_FRAC - The number of fractional preambles on the Enhanced Access Channels.

If EACH_PREAMBLE_ENABLED is set to ‘1’, the base station shall set this field to the number of fractional preambles minus one on the Enhanced Access Channels; otherwise, the base station shall omit this field.

EACH_PREAMBLE_FRAC_DURATION - Fractional preamble duration on the Enhanced Access Channels.

If EACH_PREAMBLE_ENABLED is set to ‘1’, the base station shall set this field to the fractional preamble duration minus one on an Enhanced Access Channel, in units of 1.25 ms; otherwise, the base station shall omit this field.

EACH_PREAMBLE_OFF_DURATION - Fractional preamble gated-off duration on the Enhanced Access Channels.

If EACH_PREAMBLE_ENABLED is set to ‘1’, the base station shall set this field to the fractional preamble gated-off duration (in units of 1.25 ms) after the transmission of each fractional preamble on an Enhanced Access Channel; otherwise, the base station shall omit this field.

EACH_PREAMBLE_ADD_DURATION - Additional preamble duration on the Enhanced Access Channels.
If EACH_PREAMBLE_ENABLED is set to ‘1’, the base station shall set this field to the additional preamble duration on an Enhanced Access Channel, in units of 1.25 ms; otherwise, the base station shall omit this field.

**RESERVED** - Reserved bits.

The base station shall set this field to ‘000000’.

**EACH_PROBE_BKOFF** - Enhanced Access Channel probe backoff range.

The base station shall set this field to one less than the maximum number of slots a mobile station is to delay due to random backoff between consecutive enhanced access probes.

**EACH_BKOFF** - Enhanced Access Channel probe sequence backoff range.

The base station shall set this field to one less than the maximum number of slots a mobile station is to delay due to random backoff between successive enhanced access probe sequences and before the first enhanced access probe sequence of a response access.

**EACH_SLOT** - Slot duration for the Enhanced Access Channels.

The base station shall set this field to N where the slot duration of the Enhanced Access Channel is \((N+1) \times 1.25\) ms.

The base station shall set this field to a value between 0 and 63.

**EACH_SLOT_OFFSET1** - First slot offset for the Enhanced Access Channels.

The base station shall set this field so that the Enhanced Access Channel has a slot offset equal to \((EACH_ID \times EACH_SLOT_OFFSET2 + EACH_SLOT_OFFSET1) \mod (EACH_SLOT+1)\), where EACH_ID is the Enhanced Access Channel Index. The base station shall set this field to a value between 0 and 63, in units of 1.25 ms.

**EACH_SLOT_OFFSET2** - Relative slot offset for the Enhanced Access Channels.

The base station shall set this field so that the Enhanced Access Channel has a slot offset equal to \((EACH_ID \times EACH_SLOT_OFFSET2 + EACH_SLOT_OFFSET1) \mod (EACH_SLOT+1)\), where EACH_ID is the Enhanced Access Channel Index. The base station shall set this field to a value between 0 and 63, in units of 1.25 ms.

**RESERVED** - Reserved bits.

The base station shall include as many bits as required to make the length of the mode-specific parameters record an integral number of octets. The base station shall set each of these bits to ‘0’.

**BA_PARMS_LEN** - Length of Basic Access Mode parameter record.
The base station shall set this field to the total length, in octets, of Basic Access Mode parameters record included in the message, excluding the BA_PARMS_LEN but including the RESERVED fields. If there are no fields other than the BA_PARMS_LEN in this record, the base station shall set this field to ‘000’.

NUM_EACH_BA - Number of Enhanced Access Channels used for the Basic Access Mode.

If BA_PARMS_LEN is equal to ‘000’, the base station shall omit this field; otherwise, the base station shall include this field and set it to the number of Enhanced Access Channels used for the Basic Access mode minus one.

EACH_BA_RATES_SUPPORTED - Supported rate words for the Basic Access mode on the Enhanced Access Channels.

If BA_PARMS_LEN is equal to ‘000’, the base station shall omit this field; otherwise, the base station shall include this field and set each subfield of the EACH_BA_RATES_SUPPORTED field as follows: the base station shall set the subfield to ‘1’ if the corresponding mode in Table 3.7.2.3.2.33-3 is allowed; otherwise the base station shall set the subfield to ‘0’.

RESERVED - Reserved bits.

If BA_PARMS_LEN is equal to ‘000’, the base station shall omit this field; otherwise, the base station shall include as many bits as required to make the length of the Basic Access Mode record (excluding the BA_PARMS_LEN field but including the RESERVED field) an integral number of octets. The base station shall set each of these bits to ‘0’.

RA_PARMS_LEN - Length of Reservation Access Mode parameters record.
The base station shall set this field to the total length, in octets, of Reservation Access Mode parameters record included in the message, excluding the RA_PARMS_LEN but including the RESERVED field.

**NUM_EACH_RA** - Number of Enhanced Access Channels used for the Reservation Access Mode.

If RA_PARMS_LEN is equal to '00000', the base station shall omit this field; otherwise, the base station shall include this field and set it to the number of Enhanced Access Channels used for the Reservation Access mode minus one.

**NUM_CACH** - Number of Common Assignment Channels.

If RA_PARMS_LEN is equal to '00000', the base station shall omit this field; otherwise, the base station shall include this field and set it to the number of Common Assignment Channels supported by the system minus one.

**CACH_CODE_RATE** - Code Rate for the Common Assignment Channels.

If RA_PARMS_LEN is equal to '00000', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

- If the CACH is operating in Spreading Rate 1, the base station shall set this field to '0' if the CACH Code Rate is 1/4 (see [2]).
- The base station shall set this field to ‘1’ if the CACH Code Rate is 1/2 (see [2]).
- If the CACH is operating in Spreading Rate 3, the base station shall set this field to ‘0’.

If RA_PARMS_LEN is not equal to '00000', the base station shall include (NUM_CACH + 1) occurrences of the following one field record:

**CACH_CODE_CHAN** - Code channel index for the Common Assignment Channel.

The base station shall set this field to the code channel index (see [2]) in the range 1 to 255 inclusive that the mobile station is to use on the Common Assignment Channel.

**NUM_RCCCH** - Number of Reverse Common Control Channels used for the Reservation Mode.

If RA_PARMS_LEN is equal to '00000', the base station shall omit this field; otherwise, the base station shall include this field and set it to the number of Reverse Common Control Channels used for the Reservation mode minus one.

**RCCCH_RATES_SUPPORTED** - Supported rate words on the Reverse Common Control Channels.

If RA_PARMS_LEN is equal to '00000', the base station shall omit this field; otherwise, the base station shall include this field and set each bit of the RCCCH_RATES_SUPPORTED field as follows: the base station shall set the bit to ‘1’ if the corresponding mode in Table 3.7.2.3.2.33-3 is allowed; otherwise the base station shall set the bit to ‘0’.
RCCCH_PREAMBLE_ENABLED - Preamble enabled indicator for the Reverse Common Control Channel.

If RA_PARMS_LEN is equal to '00000', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If RCCCH preambles related information is included in this message, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

RCCCH_PREAMBLE_NUM_FRAC - Number of fractional preambles on the Reverse Common Control Channels.

If RCCCH_PREAMBLE_ENABLED is included and is set to '1', the base station shall set this field to the number of fractional preambles minus one on the Reverse Common Control Channels; otherwise, the base station shall omit this field.

RCCCH_PREAMBLE_FRAC_DURATION - Fractional preamble duration for the Reverse Common Control Channels.

If RCCCH_PREAMBLE_ENABLED is included and is set to '1', the base station shall set this field to the fractional preamble duration minus one on a Reverse Common Control Channel, in units of 1.25 ms; otherwise, the base station shall omit this field.

RCCCH_PREAMBLE_OFF_DURATION - Fractional preamble gated-off duration on Reverse Common Control Channels.

If RCCCH_PREAMBLE_ENABLED is included and is set to '1', the base station shall set this field to the fractional preamble gated-off duration (in units of 1.25 ms) after the transmission of each fractional preamble on a Reverse Common Control Channel; otherwise, the base station shall omit this field.

RCCCH_PREAMBLE_ADD_DURATION - Additional preamble duration on the Reverse Common Control Channels.

If RCCCH_PREAMBLE_ENABLED is included and is set to '1', the base station shall set this field to the additional preamble duration on a Reverse Common Control Channel, in units of 1.25 ms; otherwise, the base station shall omit this field.

RCCCH_SLOT - Slot interval for the Reverse Common Control Channels.

If RA_PARMS_LEN is equal to '00000', the base station shall omit this field; otherwise, the base station shall include this field and set it to N where the slot duration on the Reverse Common Control Channel is \((N+1) \times 1.25\) ms. The base station shall set this field to a value between 0 and 63.

RCCCH_SLOT_OFFSET1 - First slot offset for the Reverse Common Control Channels.
If RA_PARMS_LEN is equal to ‘00000’, the base station shall omit this field; otherwise, the base station shall include this field and set it so that Reverse Common Control Channel has a slot offset equal to [(RCCCH_ID × RCCCH_SLOT_OFFSET2 + RCCCH_SLOT_OFFSET1) mod (RCCCH_SLOT+1)], where RCCCH_ID is the Reverse Common Control Channel Index. The base station shall set this field to a value between 0 and 63, in units of 1.25 ms.

RCCCH_SLOT_OFFSET2 - Second slot offset for the Reverse Common Control Channels.

If RA_PARMS_LEN is equal to ‘00000’, the base station shall omit this field; otherwise, the base station shall include this field and set it so that Reverse Common Control Channel has a slot offset equal to [(RCCCH_ID × RCCCH_SLOT_OFFSET2 + RCCCH_SLOT_OFFSET1) mod (RCCCH_SLOT+1)], where RCCCH_ID is the Reverse Common Control Channel Index. The base station shall set this field to a value between 0 and 63, in units of 1.25 ms.

RCCCH_NOM_PWR - Nominal transmit power offset for the Reverse Common Control Channels.

If RA_PARMS_LEN is equal to ‘00000’, the base station shall omit this field; otherwise, the base station shall include this field and set it to the correction factor to be used by a mobile station in the open loop power estimate, expressed as a two’s complement value in units of 1 dB (see [2]).

RCCCH_INIT_PWR - Initial power offset for the Reverse Common Control Channels.

If RA_PARMS_LEN is equal to ‘00000’, the base station shall omit this field; otherwise, the base station shall include this field and set it to the correction factor to be used by a mobile station in the open loop power estimate for the initial transmission on a Reverse Common Control Channel, expressed as a two’s complement value in units of 1 dB (see [2]).

RA_PC_DELAY - Power control delay for the Reverse Common Control Channel.

If RA_PARMS_LEN is equal to ‘00000’, the base station shall omit this field; otherwise, the base station shall include this field and set it to the number of power control bits the mobile is to disregard after initiating transmission on a Reverse Common Control Channel.

EACAM_CACH_DELAY - Maximum time after an Enhanced Access Channel header transmission for receiving a response on the Common Assignment Channel when Reverse Common Control Channel soft handoff has not been requested.
If RA_PARMS_LEN is equal to '00000', the base station shall omit this field; otherwise, the base station shall include this field and set it to the number of complete Common Assignment Channel frames minus one, from the end of the 
*R-EACH Header*, for which a mobile station is to wait for the *Early Acknowledgment Channel Assignment Message* if the mobile station has not requested Reverse Common Control Channel soft handoff.

**RCCCH_HO_SUPPORTED** - Reverse Common Control Channel handoff supported indicator.

If RA_PARMS_LEN is equal to '00000', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if Reverse Common Control Channel handoff is supported by the base station; otherwise, the base station shall set this field to ‘0’.

**RCCCH_HO_THRESH** - Reverse Common Control Channel soft handoff threshold.

If RCCCH_HO_SUPPORTED is included and is set to ‘1’, the base station shall include this field; otherwise the base station shall omit this field.

If included, the base station shall set this field to:

\[ \left\lfloor -20 \times \log_{10} \text{pilot\_threshold} \right\rfloor \]

where \(\text{pilot\_threshold}\) is the pilot \(E_c/I_o\) threshold used to determine whether the mobile station requests Reverse Common Control Channel in soft handoff.

This is a positive value in units of 0.5 dB.

**EACAM_PCCAM_DELAY** - Maximum time after an Enhanced Access Channel header transmission for receiving a response on the Common Assignment Channel when Reverse Common Control Channel soft handoff has been requested.

If RCCCH_HO_SUPPORTED is included and is set to ‘1’, the base station shall include this field; otherwise the base station shall omit this field.

If included, the base station shall set this field to the number of complete Common Assignment Channel frames minus one, from the end of the *R-EACH Header*, for which a mobile station is to wait for the *Early Acknowledgment Channel Assignment Message* and *Power Control Channel Assignment Message* if the mobile station has requested Reverse Common Control Channel soft handoff (see [3]).

**NUM_CPCCH** - Number of Common Power Control Channels.

If RA_PARMS_LEN is equal to ‘00000’, the base station shall omit this field; otherwise, the base station shall include this field and set it to the number of Common Power Control Channels supported minus one.
CPCCH_RATE - Power control rate for the Common Power Control Channels.

If RA_PARMS_LEN is equal to ‘00000’, the base station shall omit this field; otherwise, the base station shall include this field and set it to the value shown in Table 3.7.2.3.2.33-4 corresponding to the power control rate for the Common Power Control Channels.

<table>
<thead>
<tr>
<th>CPCCH_RATE (Binary)</th>
<th>Power Control Rate</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>200 bps</td>
</tr>
<tr>
<td>01</td>
<td>400 bps</td>
</tr>
<tr>
<td>10</td>
<td>800 bps</td>
</tr>
<tr>
<td>11</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

If RA_PARMS_LEN is not equal to ‘00000’, the base station shall include (NUM_CPCCH + 1) occurrences of the following one field record:

CPCCH_CODE_CHAN - Code channel index for the Common Power Control Channel.

The base station shall set this field to the code channel index (see [2]) in the range 1 to 127 inclusive that the mobile station is to use on the Common Power Control Channel.

NUM_PCSCH_RA - Number of Power Control Subchannels used for the Reservation Access Mode.

If RA_PARMS_LEN is equal to ‘00000’, the base station shall omit this field; otherwise, the base station shall include this field and set it to the number of Power Control Subchannels used for the Reservation Access Mode minus one.

RESERVED - Reserved bits.

If RA_PARMS_LEN is equal to ‘00000’, the base station shall omit this field; otherwise, the base station shall include as many bits as required to make the length of the Reservation Access Mode record (excluding the RA_PARMS_LEN but including the RESERVED field) an integral number of octets.

The base station shall set each of these bits to ‘0’.

ACCT_INCL - Access Control based on Call Type (ACCT) information included indicator.

If the base station enables ACCT for at least one service option, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

If the base station sets this field to ‘1’, then the base station shall also set at least one of ACCT_SO_INCL or ACCT_SO_GRP_INCL to ‘1’.

3-415
ACCT_INCL_EMG - Access Control based on Call Type (ACCT) includes emergency calls indicator.

If ACCT_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to '0' if the mobile station is not to apply ACCT to a call that is recognized by the mobile station to be an emergency call; otherwise, the base station shall set this field to '1'.

ACCT_AOC_BITMAP_INCL - Access Control based on Call Type (ACCT) access overload class bitmap included indicator.

If ACCT_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to '0' if all mobile stations are to apply ACCT regardless of their access overload classes; otherwise, the base station shall set this field to '1' to indicate that the mobile station is to apply ACCT according to its access overload class.

ACCT_SO_INCL - Access Control based on Call Type (ACCT) service option included indicator.

If ACCT_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to '1' if at least one occurrence of the ACCT_SO field is included in this message; otherwise, the base station shall set this field to '0'.

NUM_ACCT_SO - Number of service options for Access Control based on Call Type (ACCT).

If ACCT_SO_INCL is not included, or is included and set to '0', then the base station shall omit this field; otherwise, the base station shall include this field and set it to one less than the number of occurrences of the ACCT_SO field included in this message.

If ACCT_SO_INCL is included and set to '1', then the base station shall include NUM_ACCT_SO + 1 occurrences of the following variable-field record:

ACCT_AOC_BITMAP1 - Access Control based on Call Type (ACCT) access overload class bitmap.

If ACCT_AOC_BITMAP_INCL is set to '0', then the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

This field consists of the subfields defined in Table 3.7.2.3.2.2-1.
The base station shall set a subfield to ‘1’ to indicate that mobile stations having the corresponding access overload class are not permitted to perform access attempts using the associated service option ACCT_SO; otherwise, the base station shall set the subfield to ‘0’.

**ACCT_SO** - Access Control based on Call Type (ACCT) service option number.

The base station shall set this field to the value of the service option number (as specified in [30]) that has ACCT enabled.

**ACCT_SO_GRP_INCL** - Access Control based on Call Type (ACCT) service option group included indicator.

If ACCT_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if at least one occurrence of the ACCT_SO_GRP field is included in this message; otherwise, the base station shall set this field to ‘0’.

**NUM_ACCT_SO_GRP** - Number of service option groups for Access Control based on Call Type (ACCT).

If ACCT_SO_GRP_INCL is not included, or is included and set to ‘0’, then the base station shall omit this field; otherwise, the base station shall include this field and set it to one less than the number of occurrences of the ACCT_SO_GRP field included in this message.

If ACCT_SO_GRP_INCL is included and set to ‘1’, then the base station shall include NUM_ACCT_SO_GRP + 1 occurrences of the following variable-field record:

**ACCT_AOC_BITMAP2** - Access Control based on Call Type (ACCT) access overload class bitmap.

If ACCT_AOC_BITMAP_INCL is set to ‘0’, then the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

This field consists of the subfields defined in Table 3.7.2.3.2.2-1. The base station shall set a subfield to ‘1’ to indicate that mobile stations having the corresponding access overload class are not permitted to perform access attempts using a service option specified by the associated ACCT_SO_GRP field; otherwise, the base station shall set the subfield to ‘0’.

**ACCT_SO_GRP** - Access Control based on Call Type (ACCT) service option group number.

The base station shall set this field to the value of the service option group number (as specified in [30]) whose members all have ACCT enabled.
### 3.7.2.3.2.34 Universal Neighbor List Message

</table>

- **PILOT_PN** - Pilot PN sequence offset index.
  - The base station shall set this field to the pilot PN sequence offset for this base station, in units of 64 PN chips.

- **CONFIG_MSG_SEQ** - Configuration message sequence number.
  - The base station shall set this field to CONFIG_SEQ (see 3.6.2.2).

- **NUM_RADIO_INTERFACE** - Number of interface types.
  - The base station shall set this field to the number of radio interface types for which neighbors are included in this message.
  - The base station shall include **NUM_RADIO_INTERFACE** occurrences of the following record, one occurrence for each radio interface for which neighbors are included in this message.

- **RADIO_INTERFACE_TYPE** - The radio interface type.
  - The base station shall set this field to the radio interface type of this record as specified in Table 3.7.2.3.2.34-1.

RESERVED | 0 – 7 (as needed)

PILOT_INC - Pilot PN sequence offset index increment.

A mobile station searches for Remaining-Set pilots at pilot PN sequence index values that are multiples of this value.

The base station shall set this field to the pilot PN sequence increment, in units of 64 PN chips, that mobile stations are to use for searching the Remaining Set. The base station should set this field to the largest increment such that the pilot PN sequence offsets of all its neighbor base stations are integer multiples of that increment.

The base station shall set this field to a value in the range 1 to 15 inclusive.

NGHBR_SRCH_MODE - Search mode.

The base station shall set this field to the value shown in Table 3.7.2.3.2.34-2 corresponding to the search mode.

</tbody>
</table>

SRCH_WIN_N - Search window size for the Neighbor Set.
If $\text{NGHBR\_SRCH\_MODE} = '00'$ or $\text{NGHBR\_SRCH\_MODE} = '01'$, the base station shall include the field $\text{SRCH\_WIN\_N}$ and shall set this field as described below; otherwise, the base station shall omit this field.

The base station shall set this field to the value shown in Table 2.6.6.2.1-1 corresponding to the search window size to be used by mobile stations for the Neighbor Set.

**SRCH\_OFFSET\_INCL** - Neighbor pilot channel search window offset included.

If $\text{SRCH\_OFFSET\_NGHBR}$ field is included in the following records, the base station shall set this bit to ‘1’; otherwise, the base station shall set this bit to ‘0’.

**FREQ\_FIELDS\_INCL** - Frequency fields included.

If frequency fields are included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**USE\_TIMING** - Use timing indicator.

If base station timing information is included for neighbor base stations, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**GLOBAL\_TIMING\_INCL** - Global timing included.

If $\text{USE\_TIMING}$ is set to ‘1’, the base station shall include the field $\text{GLOBAL\_TIMING\_INCL}$ and shall set this field as described below; otherwise, the base station shall omit this field.

If base station timing information is included globally for all neighbor base stations with $\text{TIMING\_INCL}$ equal to ‘1’, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**GLOBAL\_TX\_DURATION** - Global neighbor transmit time duration.

If $\text{GLOBAL\_TIMING\_INCL}$ is included and is set to ‘1’, the base station shall include the field $\text{GLOBAL\_TX\_DURATION}$ and shall set this field as described below; otherwise, the base station shall omit this field.

The base station shall set this field to the duration of the base station transmit window, during each period, in units of 80 ms. The base station should set this field to a value of 3 or greater.

**GLOBAL\_TX\_PERIOD** - Global neighbor transmit time period.

If $\text{GLOBAL\_TIMING\_INCL}$ is included and is set to ‘1’, the base station shall include the field $\text{GLOBAL\_TX\_PERIOD}$ and shall set this field as described below; otherwise, the base station shall omit this field.

The base station shall set this field to duration of the period, in units of 80 ms.
NGHBR_SET_ENTRY_INFO - Neighbor Set access entry handoff information included indicator.
If the base station is including information on the Neighbor Set access entry handoff, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

NGHBR_SET_ACCESS_INFO - Neighbor Set access handoff included indicator.
If the base station is including information on the Neighbor Set access handoff or access probe handoff, the base station shall set this field to ‘1’, otherwise, the base station shall set this field to ‘0’.

NUM_NGHBR - Number of neighbor pilot PN sequences.
The base station shall set this field to the number of neighbors included in the message.
The base station shall include one occurrence of the following subrecord for each pilot that
a mobile station is to place in its Neighbor Set.

NGHBR_CONFIG - Neighbor configuration.

The base station shall set this field to the value shown in
Table 3.7.2.3.2.34-3 corresponding to the configuration of this
neighbor.

Table 3.7.2.3.2.34-3. Neighbor Configuration Field

<table>
<thead>
<tr>
<th>Value (binary)</th>
<th>Neighbor Configuration</th>
</tr>
</thead>
</table>
| 000            | The neighbor base station has the same number of frequencies having Primary Broadcast Control Channel/Forward Common Control Channels as the current base station. The neighbor base station has a CDMA frequency assignment corresponding to this CDMA frequency assignment with the same number of Forward Common Control Channels, and the neighbor frequency is given as follows:

- If FREQ_INCL equals ‘0’ for this record, this corresponding CDMA frequency assignment is the current CDMA frequency assignment.
- If FREQ_INCL equals ‘1’ for this record, this corresponding CDMA frequency assignment is given by NGHBR_BAND and NGHBR_FREQ.

The position of the neighbor CDMA frequency assignment in the Extended CDMA Channel List Message transmitted by the neighbor base station is the same as the position of this current CDMA frequency assignment in the Extended CDMA Channel List Message transmitted by the current base station.

The rate, code rate, and code channel of the Primary Broadcast Control Channel on this corresponding CDMA frequency are the same values as the current ones.

The rate, code rate, and code channel of the corresponding Forward Common Control Channel on this corresponding CDMA frequency are the same values as the current ones.

If NGHBR_PILOT_REC_TYPE is included in this message, then neighbor pilot type is as specified in NGHBR_PILOT_REC_TYPE; otherwise, the neighbor pilot is a 1X common pilot. |
The neighbor base station does not have any frequencies with Primary Broadcast Control Channel/Forward Common Control Channel.

The neighbor base station has the same number of frequencies having Paging Channels as the current base station has frequencies having Primary Broadcast Control Channel/Forward Common Control Channel.

The neighbor base station has a CDMA frequency assignment corresponding to this CDMA frequency assignment but possibly with a different number of Paging Channels, and the neighbor frequency is given as follows:

- If FREQ_INCL equals ‘0’ for this record, this corresponding CDMA frequency assignment is the current CDMA frequency assignment.

- If FREQ_INCL equals ‘1’ for this record, this corresponding CDMA frequency assignment is given by NGHBR_BAND and NGHBR_FREQ.

The position of the neighbor CDMA frequency assignment in the *Extended CDMA Channel List Message* transmitted by the neighbor base station is the same as the position of this current CDMA frequency assignment in the *Extended CDMA Channel List Message* transmitted by the current base station.

This corresponding neighbor CDMA frequency assignment does have a Primary Paging Channel, at 9600 bps.
010  The neighbor base station may have a different number of frequencies having Primary Broadcast Control Channel/Forward Common Control Channel as the current base station.

The neighbor base station has a Primary Broadcast Control Channel on the following frequency:

- If FREQ_INCL equals ‘0’ for this record, the neighbor base station has a Primary Broadcast Control Channel on the first CDMA Channel listed in the *Extended CDMA Channel List Message* transmitted by the current base station.

- If FREQ_INCL equals ‘1’ for this record, the neighbor base station has a Primary Broadcast Control Channel on the CDMA frequency assignment given by NGHBR_BAND and NGHBR_FREQ.

The rate, code rate, and code channel of the Primary Broadcast Control Channel on this corresponding CDMA frequency are the same values as the current ones.

If NGHBR_PILOT_REC_TYPE is included in this message, then neighbor pilot type is as specified in NGHBR_PILOT_REC_TYPE; otherwise, the neighbor pilot is a 1X common pilot.

| 011  | The neighbor base station configuration is unknown but the neighbor base station has a Pilot Channel on the following frequency:

- If FREQ_INCL equals ‘0’ for this record, the neighbor CDMA frequency assignment is the same as the current CDMA frequency assignment and has a Pilot Channel.

- If FREQ_INCL equals ‘1’ for this record, the CDMA frequency assignment given by NGHBR_BAND and NGHBR_FREQ has a Pilot Channel. |
The neighbor base station has the same number of frequencies having Primary Broadcast Control Channel/Forward Common Control Channel as the current base station.

The neighbor base station has a CDMA frequency assignment corresponding to this CDMA frequency assignment with a Primary Broadcast Control Channel, and the neighbor CDMA frequency is given as follows:

- If FREQ_INCL equals ‘0’ for this record, this corresponding CDMA frequency assignment is the current CDMA frequency assignment.
- If FREQ_INCL equals ‘1’ for this record, this corresponding CDMA frequency assignment is given by NGHBR_BAND and NGHBR_FREQ.

The position of the neighbor CDMA frequency assignment in the *Extended CDMA Channel List Message* transmitted by the neighbor base station is the same as the position of this current CDMA frequency assignment in the *Extended CDMA Channel List Message* transmitted by the current base station.

The rate, code rate, and code channel of the Primary Broadcast Control Channel on this corresponding CDMA frequency are the same values as the current ones.

If NGHBR_PILOT_REC_TYPE is included in this message, then neighbor pilot type is as specified in NGHBR_PILOT_REC_TYPE; otherwise, the neighbor pilot is a 1X common pilot.

</table>

All other NGHBR_PILOT_REC_TYPE values are reserved

If NGHBR_PILOT_REC_TYPE is equal to ‘000’, the base station shall include the following fields:

If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.

RECORD_LEN - Pilot record length.

If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall set this field to the number of octets in the type-specific fields of this pilot record.

If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.

Type-specific fields - Pilot record type-specific fields.

If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall include type-specific fields based on the NGHBR_PILOT_REC_TYPE of this pilot record.

If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.
TD_POWER_LEVEL - TD Transmit Power Level.
The base station shall set this field to the TD transmit power level relative to that of the Forward Pilot Channel as specified in Table 3.7.2.3.2.26-4.

TD_MODE - Transmit Diversity mode.
The base station shall set this field to the Transmit Diversity mode, as specified in Table 3.7.2.3.2.26-3.

RESERVED - Reserved bits.
The base station shall set this field to ‘0000’.

If NGHBR_PILOT_REC_TYPE is equal to ‘001’, the base station shall include the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>QOF</td>
<td>2</td>
</tr>
<tr>
<td>WALSH_LENGTH</td>

<td>WALSH_LENGTH+6</td>
</tr>
<tr>
<td>RESERVED</td>
<td>0 to 7 (as needed)</td>
</tr>
</tbody>
</table>

QOF - Quasi-orthogonal function index.
The base station shall set this field to the index of the Quasi-orthogonal function (see [2]).

WALSH_LENGTH - Length of the Walsh Code.
The base station shall set this field to the WALSH_LENGTH value shown in Table 3.7.2.3.2.22–6 corresponding to the length of the Walsh code for the pilot that is used in as the Auxiliary pilot.

AUX_PILOT_WALSH - Walsh Code for the Auxiliary Pilot.
The base station shall set this field to the Walsh code corresponding to the Auxiliary pilot.

RESERVED - Reserved bits.
The base station shall set all the bits of this field to ‘0’ to make the entire record octet-aligned.
If NGHBR_PILOT_REC_TYPE is equal to ‘010’, the base station shall include the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>QOF</td>
<td>2</td>
</tr>
<tr>
<td>WALSH_LENGTH</td>
<td>3</td>

</tbody>
</table>

- **QOF**: Quasi-orthogonal function index for the Auxiliary Transmit Diversity Pilot.
- **WALSH_LENGTH**: Length of the Walsh Code.
- **AUX_WALSH**: Walsh Code for the Auxiliary Pilot.
- **AUX_TD_POWER_LEVEL**: Auxiliary Transmit Diversity Pilot Power Level.
- **TD_MODE**: Transmit Diversity mode.
- **RESERVED**: Reserved bits.

If NGHBR_PILOT_REC_TYPE is equal to ‘011’, the base station shall include the following fields:
The base station shall set this field to the value shown in Table 3.7.2.3.2.26-5 corresponding to the position of the primary SR3 pilot.

The base station shall set this field to the value shown in Table 3.7.2.3.2.26-6 corresponding to the power level of the primary pilot with respect to the pilot on the lower frequency of the two remaining SR3 frequencies.

The base station shall set this field to the value shown in Table 3.7.2.3.2.26-6 corresponding to the power level of the primary pilot with respect to the pilot on the higher frequency of the two remaining SR3 frequencies.

If NGHBR_PILOT_REC_TYPE is equal to '100', the base station shall include the following fields:

<table>
<thead>
<tr>
<th>Field</th>

</tbody>
</table>

1. **SR3_PRIMARY_PILOT** - Primary SR3 pilot.
   - The base station shall set this field to the value shown in Table 3.7.2.3.2.26-5 corresponding to the position of the primary SR3 pilot.

2. **SR3_PILOT_POWER1** - The primary SR3 pilot power level relative to that of the pilot on the lower frequency of the two remaining SR3 frequencies.
   - The base station shall set this field to the value shown in Table 3.7.2.3.2.26-6 corresponding to the power level of the primary pilot with respect to the pilot on the lower frequency of the two remaining SR3 frequencies.

3. **SR3_PILOT_POWER2** - The primary SR3 pilot power level relative to that of the pilot on the higher frequency of the two remaining SR3 frequencies.
   - The base station shall set this field to the value shown in Table 3.7.2.3.2.26-6 corresponding to the power level of the primary pilot with respect to the pilot on the higher frequency of the two remaining SR3 frequencies.

4. **QOF** - Quasi-orthogonal function index.
   - The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) on the frequency of the primary pilot.

The base station shall set this field to the WALSH_LENGTH value shown in Table 3.7.2.3.22–6 corresponding to the length of the Walsh code for the pilot that is used as the Auxiliary pilot on the frequency of the primary pilot.

AUX_PILOT_WALSH - Walsh Code for the Auxiliary Pilot.

The base station shall set this field to the Walsh code corresponding to the Auxiliary pilot on the frequency of the primary pilot.

ADD_INFO_INCL1 - Additional information included for the pilot on the lower frequency of the two remaining SR3 frequencies.

If the additional information for the pilot on the lower frequencies of the two remaining SR3 frequencies is the same as pilot on the primary frequency, the base station shall set this field to ‘0’; otherwise, the base station shall set this field to ‘1’.

QOF1 - Quasi-orthogonal function index for the pilot on the lower frequency of the two remaining SR3 frequencies.

If ADD_INFO_INCL1 is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) on the lower frequency of the two remaining SR3 frequencies.

WALSH_LENGTH1 - Length of the Walsh Code for the pilot on the lower frequency of the two remaining SR3 frequencies.

If ADD_INFO_INCL1 is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the WALSH_LENGTH value shown in Table 3.7.2.3.22–6 corresponding to the length of the Walsh code for the pilot that is used as the Auxiliary pilot on the lower frequency of the two remaining SR3 frequencies.

AUX_PILOT_WALSH1 - Walsh Code for the Auxiliary Pilot on the lower frequency of the two remaining SR3 frequencies.

If ADD_INFO_INCL1 is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the Walsh code corresponding to the Auxiliary pilot on the lower frequency of the two remaining SR3 frequencies.

ADD_INFO_INCL2 - Additional information included for the pilot on the higher frequency of the two remaining SR3 frequencies.
If the additional information for the pilot on the higher frequencies of the two remaining SR3 frequencies is the same as pilot on the primary frequency, the base station shall set this field to ‘0’; otherwise, the base station shall set this field to ‘1’.

QOF2 - Quasi-orthogonal function index for the pilot on the higher frequency of the two remaining SR3 frequencies.

If ADD_INFO_INCL2 is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) on the higher frequency of the two remaining SR3 frequencies.

WALSH_LENGTH2 - Length of the Walsh Code for the pilot on the higher frequency of the two remaining SR3 frequencies.

If ADD_INFO_INCL2 is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the WALSH_LENGTH value shown in Table 3.7.2.3.2.22–6 corresponding to the length of the Walsh code for the pilot that is used as the Auxiliary pilot on the higher frequency of the two remaining SR3 frequencies.

AUX_PILOT_WALSH2 - Walsh Code for the Auxiliary Pilot on the higher frequency of the two remaining SR3 frequencies.

If ADD_INFO_INCL2 is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the Walsh code corresponding to the Auxiliary pilot on the higher frequency of the two remaining SR3 frequencies.

RESERVED - Reserved bits.

The base station shall set all the bits of this field to ‘0’ to make the entire record octet-aligned.

SEARCH_PRIORITY - Pilot Channel search priority.

If NGHBR_SRCH_MODE = ‘01’ or NGHBR_SRCH_MODE = ‘11’, the base station shall include the field SEARCH_PRIORITY and shall set this field as described below; otherwise, the base station shall omit this field.

The base station shall set this field to the search priority for the Pilot Channel corresponding to NGHBR_PN. The base station shall set the search priority as shown in Table 3.7.2.3.2.34-5.
Table 3.7.2.3.2.34-5. Search Priority Field

2

SRCH_WIN_NGHBR - Neighbor pilot channel search window size.

3

If NGHBR_SRCH_MODE = ‘10’ or NGHBR_SRCH_MODE = ‘11’, the base station shall include the field SRCH_WIN_NGHBR and shall set this field as described below; otherwise, the base station shall omit this field.

4

The base station shall set this field to the value shown in Table 2.6.6.2.1-1 corresponding to the search window size to be used by mobile stations for this neighbor.

5

SRCH_OFFSET_NGHBR - Neighbor pilot channel search window size offset.

6

If SRCH_OFFSET_INCL equals to ‘1’, then the base station shall include the field SRCH_OFFSET_NGHBR and shall set this field as described below; otherwise, the base station shall omit this field.

7

The base station shall set this field to the value shown in Table 2.6.6.2.1-2 corresponding to the search window offset to be used by mobile stations for this neighbor.

8

FREQ_INCL - Frequency included indicator.

9

If FREQ_FIELDS_INCL is set to ‘1’, the base station shall include the field FREQ_INCL and shall set this field as described below; otherwise, the base station shall omit this field.

10

If the NGHBR_BAND and NGHBR_FREQ fields are included for this neighbor base station, the base station shall set this bit to ‘1’. If the NGHBR_BAND and NGHBR_FREQ fields are not included in this assignment record, the base station shall set this bit to ‘0’.

11

NGHBR_BAND - Neighbor band class.

12

If the FREQ_INCL field is included and is set to ‘1’, the base station shall include the field NGHBR_BAND and shall set this field as described below; otherwise, the base station shall omit this field.
The base station shall set this field to the CDMA band class, as specified in [30], corresponding to the CDMA frequency assignment for the CDMA Channel containing the Broadcast Control Channel/Forward Common Control Channel the mobile station is to search.

**NGHBR_FREQ** - Neighbor frequency assignment.

If the FREQ_INCL field is omitted or is set to ‘0’, the base station shall omit this field.

If the FREQ_INCL field is included and is set to ‘1’ and the corresponding neighbor has a 1X neighbor pilot record type, the base station shall set this field to the CDMA Channel number, in the specified CDMA band class, corresponding to the CDMA frequency assignment for the CDMA Channel containing the Broadcast Control Channel/Forward Common Control Channel the mobile station is to search.

If the FREQ_INCL field is included and is set to ‘1’ and the corresponding neighbor has a 3X neighbor pilot record type, the base station shall set this field to the CDMA Channel number, in the specified CDMA band class, corresponding to the center SR3 frequency assignment containing the Broadcast Control Channel/Forward Common Control Channel the mobile station is to search.

**TIMING_INCL** - Timing included indicator.

If USE_TIMING is set to ‘1’, the base station shall include the field TIMING_INCL and set this field as described below; otherwise, the base station shall omit this field.

If base station timing information is included for this neighbor base station, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**NGHBR_TX_OFFSET** - Neighbor transmit time offset.

If TIMING_INCL is included and is set to ‘1’, the base station shall include the field NGHBR_TX_OFFSET and shall set this field as described below; otherwise, the base station shall omit this field.

The base station shall set this field to the time offset, in units of 80 ms, from the beginning of the neighbor timing period to the beginning of the first base station transmit window within the period. The beginning of the neighbor timing period occurs when ⌊t/4⌋ mod (16384)= 0.

**NGHBR_TX_DURATION** - Neighbor transmit time duration.

If TIMING_INCL is included and is set to ‘1’ and GLOBAL_TIMING_INCL is set to ‘0’, the base station shall include the field NGHBR_TX_DURATION and shall set this field as described below; otherwise, the base station shall omit this field.
The base station shall set this field to duration of the base station transmit window, during each period, in units of 80 ms. The base station should set this field to a value of 3 or greater.

**NGHBR_TX_PERIOD** - Neighbor transmit time period.

If TIMING_INCL is included and is set to ‘1’ and GLOBAL_TIMING_INCL is set to ‘0’, the base station shall include the field NGHBR_TX_PERIOD and shall set this field as described below; otherwise, the base station shall omit this field.

The base station shall set this field to duration of the period, in units of 80 ms.

**ACCESS_ENTRY_HO** - Access entry handoff permitted when entering the System Access State.

If NGHBR_SET_ENTRY_INFO is equal to ‘1’, the base station shall include the field ACCESS_ENTRY_HO and shall set this field as described below; otherwise, the base station shall omit this field.

The base station shall set this field to ‘1’ if the mobile station is permitted to perform an access entry handoff to the base station associated with the corresponding pilot between the time it receives a message on the Paging Channel when in the Mobile Station Idle State and it enters the System Access State to respond to the message; otherwise, the base station shall set this field to ‘0’.

**ACCESS_HO_ALLOWED** - Access handoff and access probe handoff permitted for the corresponding pilot while in the System Access State.

If NGHBR_SET_ACCESS_INFO is equal to ‘1’, the base station shall include the field ACCESS_HO_ALLOWED and shall set this field as described below; otherwise, the base station shall omit this field.

The base station shall set this field to ‘1’ if the mobile station is permitted to perform an access handoff or access probe handoff to the base station associated with the corresponding pilot when the mobile station is in the System Access State (see 2.6.3.1.8 and 2.6.3.1.9); otherwise, the base station shall set this field to ‘0’.

**RESQ_ENABLED** - Call rescue feature enabled indicator.

The base station shall set this field to ‘1’ if the mobile station is permitted to perform a Reverse Enhanced Access Channel (R-EACH) [see 2.6.3.1.8 and 2.6.3.1.9]; otherwise, the base station shall set this field to ‘0’.
1 RESQ_DELAY_TIME  –  Call rescue delay timer value.
2 If RESQ_ENABLED is set to ‘0’, the base station shall omit
3 this field; otherwise, the base station shall include this field
4 and set it as follows:
5 The base station shall set this field to the value of the call
6 rescue delay timer to be used by the mobile station, in units
7 of 80 ms.

8 RESQ_ALLOWED_TIME  –  Call rescue allowed timer value.
9 If RESQ_ENABLED is set to ‘0’, the base station shall omit
10 this field; otherwise, the base station shall include this field
11 and set it as follows:
12 The base station shall set this field to the value of the call
13 rescue allowed timer to be used by the mobile station, in
14 units of 80 ms.

15 RESQ_ATTEMPT_TIME  –  Call rescue attempt timer value.
16 If RESQ_ENABLED is set to ‘0’, the base station shall omit
17 this field; otherwise, the base station shall include this field
18 and set it as follows:
19 The base station shall set this field to the value of the call
20 rescue attempt timer to be used by the mobile station, in
21 units of 40 ms.

22 RESQ_CODE_CHAN  –  Code channel index for the Rescue Channel.
23 If RESQ_ENABLED is set to ‘0’, the base station shall omit
24 this field; otherwise, the base station shall include this field
25 and set it as follows:
26 The base station shall set this field to the code channel index
27 (see [2]) that the mobile station is to use on the Forward
28 Fundamental Channel when attempting Call Rescue Soft
29 Handoff with the associated neighbor pilot.
30 If Radio Configuration 1, 2, 3, or 5 (see [2]) is used, the base
31 station shall set this field in the range 1 to 63 inclusive. If
32 Radio Configuration 4, 6 or 8 is used, the base station shall
33 set this field in the range 1 to 127 inclusive. If Radio
34 Configuration 7 or 9 is used, the base station shall set this
35 field in the range 1 to 255 inclusive.

36 RESQ_QOF  –  Quasi-Orthogonal Function mask identifier for the Rescue
37 Channel.
38 If RESQ_ENABLED is set to ‘0’, the base station shall omit
39 this field; otherwise, the base station shall include this field
40 and set it as follows:
41 The base station shall set this field to the quasi-orthogonal
42 function mask identifier (see [2]) that the mobile station is to
43 use on the Forward Fundamental Channel when attempting
44 Call Rescue Soft Handoff with the associated neighbor pilot.
RESQ_MIN_PERIOD_INCL – Minimum time between consecutive rescues included indicator.

If RESQ_ENABLED is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if the RESQ_MIN_PERIOD field is included in this message; otherwise, the base station shall set this field to ‘0’.

This field is set to ‘0’ if there is no minimum time restriction between consecutive rescues.

RESQ_MIN_PERIOD – Minimum time between consecutive rescues.

If RESQ_MIN_PERIOD_INCL is not included, or is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to one less than the minimum time after a successful call rescue (i.e. receipt of N3m good frames by the mobile station after the rescue attempt timer is enabled) before any subsequent call rescue attempts can be initiated, in units of 2 seconds.

RESQ_NUM_TOT_TRANS_INCL – The required number of transmissions before declaring L2 Acknowledgment Failure when Call Rescue is enabled included indicator.

If RESQ_ENABLED is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the required number of transmissions of a regular PDU and mini PDU before declaring L2 Acknowledgment Failure when Call Rescue is enabled is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

RESQ_NUM_TOT_TRANS_20MS – The required number of transmissions of a regular PDU before declaring L2 Acknowledgment Failure when Call Rescue is enabled.

If RESQ_NUM_TOT_TRANS_INCL field is not included or is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the required number of transmissions of a regular PDU before declaring L2 Acknowledgment Failure when Call Rescue is enabled. The base station shall not set this field to a value greater than N1m.

RESQ_NUM_TOT_TRANS_5MS – The required number of transmissions of a mini PDU before declaring L2 Acknowledgment Failure when Call Rescue is enabled.
If RESQ_NUM_TOT_TRANS_INCL field is not included or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the required number of transmissions of a mini PDU before declaring L2 Acknowledgment Failure when Call Rescue is enabled.

The base station shall not set this field to a value greater than N15m.

RESQ_NUM_PREAMBLE_RC1_RC2 – The Traffic Channel preamble length for Call Rescue Soft Handoff when operating in Radio Configuration 1 or 2.

If RESQ_ENABLED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it to the length of Traffic Channel preamble, in 20 ms units, that the mobile station is to send when performing a call rescue soft handoff.

RESQ_NUM_PREAMBLE – The Traffic Channel preamble Length for Call Rescue Soft Handoff when operating in Radio Configuration greater than 2.

If RESQ_ENABLED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it to the length of Traffic Channel preamble that the mobile station is to send when performing a call rescue soft handoff, as follows:

The base station shall set this field to the value shown in Table 3.7.3.2.17-1 corresponding to the Traffic Channel preamble length in 1.25 ms units.

RESQ_POWER_DELTA – The power level adjustment to be applied to the last closed-loop power level when re-enabling the transmitter for call rescue soft handoff.

If RESQ_ENABLED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field to a value by which mobile stations are to adjust the last closed-loop power level when re-enabling the transmitter for call rescue, expressed as a two’s complement value in units of 1 dB.

The base station shall include NUM_NGHBR occurrences of the following one-field record if RESQ_ENABLED is set to ‘1’. The base station shall use the same order for the following field as is used for the NGHBR_PN fields listed in this message.

NGHBR_RESQ_CONFIGURED – Neighbor Rescue Channel configured indicator.

The base station shall set this field to ‘1’ if a Rescue Channel is configured for this neighbor pilot; otherwise, the base station shall set this field to ‘0’.

The base station shall include NUM_NGHBR occurrences of the following variable length record. The base station shall use the same order for the following field as is used for the NGHBR_PN fields listed in this message.
NGHBR_PDCH_SUPPORTED – Neighbor PDCH supported indicator.

The base station shall set this field to ‘1’ if PDCH is configured for this neighbor pilot; otherwise, the base station shall set this field to ‘0’.

RESERVED - Reserved bits.

The base station shall add reserved bits as needed in order to make the length of the entire RADIO_INTERFACE_TYPE record equal to an integer number of octets. The base station shall set these bits to ‘0’.

If RADIO_INTERFACE_TYPE is equal to ‘0001’, the base station shall include the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>NUM_ANALOG_NGHBR</td>
<td>3</td>
</tr>
</tbody>
</table>

NUM_ANALOG_NGHBR occurrences of the following subrecord:

{(NUM_ANALOG_NGHBR)

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAND_CLASS</td>
<td>5</td>
</tr>
<tr>
<td>SYS_A_B</td>
<td>2</td>
</tr>
</tbody>
</table>

} (NUM_ANALOG_NGHBR)

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RESERVED</td>
<td>0 – 7 (as needed)</td>
</tr>
</tbody>
</table>

NUM_ANALOG_NGHBR - Number of neighboring analog systems.

The base station shall set this field to the number of neighboring analog systems included in the message.

The base station shall include one occurrence of the following subrecord for each neighboring analog system included in the message:

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAND_CLASS</td>
<td></td>
</tr>
<tr>
<td>SYS_A_B</td>
<td></td>
</tr>
</tbody>
</table>

BAND_CLASS - Band class.

The base station shall set this field to the CDMA band class, as specified in [30].

SYS_A_B - System A/B.

If BAND_CLASS is set to ‘00000’ or to ‘00011’, the base station shall set this field to the value shown in Table 3.7.2.3.2.34-6 corresponding to the availability of neighboring analog systems; otherwise, the base station shall set this field to ‘00’.
Table 3.7.2.3.2.34-6. Cellular System A/B

<table>
<thead>
<tr>
<th>Cellular System A/B</th>
<th>Value (Binary)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RESERVED</td>
<td>00</td>
</tr>
<tr>
<td>System A</td>
<td>01</td>
</tr>
<tr>
<td>System B</td>
<td>10</td>
</tr>
<tr>
<td>System A and B</td>
<td>11</td>
</tr>
</tbody>
</table>

RESERVED - Reserved bits.

The base station shall add reserved bits as needed in order to make the length of the entire RADIO_INTERFACE_TYPE record equal to an integer number of octets. The base station shall set these bits to '0'.

If RADIO_INTERFACE_TYPE is equal to '0010', the base station shall include the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>NUM_HRPD_NGHBR</td>
<td>6</td>
</tr>
<tr>
<td>HRPD_NGHBR_REC_LEN</td>
<td>8</td>
</tr>
<tr>
<td>NGHBR_PN</td>
<td>9</td>
</tr>
<tr>
<td>NGHBR_FREQ_INCL</td>
<td>1</td>
</tr>
<tr>
<td>NGHBR_BAND</td>
<td>0 or 5</td>
</tr>
<tr>
<td>NGHBR_FREQ</td>
<td>0 or 11</td>
</tr>
<tr>
<td>PN_ASSOCIATION_IND</td>
<td>1</td>
</tr>
<tr>
<td>DATA_ASSOCIATION_IND</td>
<td>1</td>
</tr>
<tr>
<td>HRPD_NGHBR_REC_RESERVED</td>
<td>0-7 (as needed)</td>
</tr>
</tbody>
</table>

NUM_HRPD_NGHBR - Number of neighbor pilot PN sequences.

The base station shall set this field to the number of HRPD neighbors included in the message.

The base station shall include one occurrence of the following subrecord for each pilot that a mobile station is to place in its HRPD Neighbor Set.

HRPD_NGHBR_REC_LEN - HRPD neighbor record length
The base station shall set this field to one less than the number of octets included in this HRPD neighbor record including this field.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NGHBR_PN</td>

3.7.2.3.2.35 Security Mode Command Message

**MSG_TAG: SMCM**

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>C_SIG_ENCRYPT_MODE</td>
<td>3</td>
</tr>
<tr>
<td>ENC_KEY_SIZE</td>
<td>0 or 3</td>
</tr>
<tr>
<td>MSG_INT_INFO_INCL</td>
<td>1</td>
</tr>
<tr>
<td>CHANGE_KEYS</td>
<td>0 or 1</td>
</tr>
<tr>
<td>USE_UAK</td>
<td>0 or 1</td>
</tr>
</tbody>
</table>

**C_SIG_ENCRYPT_MODE** - Common channel encryption mode indicator.

The base station shall set this field to the common channel signaling encryption mode, as shown in Table 3.7.4.5-1.

**ENC_KEY_SIZE** - Key size used for user information and signaling encryption

If C_SIG_ENCRYPT_MODE is equal to ‘001’, or ‘010’, the base station shall include this field and set this field to the encryption key size as shown in Table 3.7.4.5-2; otherwise, the base station shall omit this field.

**MSG_INT_INFO_INCL** – Message integrity information included indicator

The base station shall set this field to ‘1’ if the base station supports message integrity; otherwise, the base station shall set this field to ‘0’.

**CHANGE_KEYS** – Change keys indicator

If MSG_INT_INFO_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘0’ to command the mobile station not to update the encryption key and integrity key. The base station shall set this field to ‘1’ to command the mobile station to update the encryption key and integrity key to the latest being generated.

**USE_UAK** – Use UAK indicator

If MSG_INT_INFO_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the base station receives an authentication vector with a UAK, the base station shall set this field to ‘1’ to indicate that the mobile station is to use UMAC; otherwise, the base station shall set this field to ‘0’ to indicate that the mobile station is to use MAC-I.
3.7.2.3.2.36 Universal Page Message

MSG_TAG: UPM

When Layer 3 at the base station sends a PDU corresponding to the Universal Page Message to Layer 2, it also sends the UPM Common fields to Layer 2. These UPM Common fields and PDUs are used by Layer 2 to assemble the Layer 2 PDU or PDUs corresponding to the Universal Page Message (see [4]).

UPM Common Fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONFIG_MSG_SEQ</td>
<td>6</td>
</tr>
<tr>
<td>ACC_MSG_SEQ</td>
<td>6</td>
</tr>
<tr>
<td>READ_NEXT_SLOT</td>
<td>1</td>
</tr>
<tr>
<td>READ_NEXT_SLOT_BCAST</td>
<td>1</td>
</tr>
</tbody>
</table>

PDU Format for a mobile station-addressed page:

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>SERVICE_OPTION</td>
<td>16</td>
</tr>
<tr>
<td>ADD_MS_RECORD</td>
<td>0 or 8 × EXT_MS_SDU_LENGTH (see [4])</td>
</tr>
</tbody>
</table>

PDU Format for a mobile station-directed message announcement: There are no Layer 3 fields associated with this record.

PDU Format for an enhanced broadcast page:

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>BCCH_INDEX/BCN</td>
<td>3</td>
</tr>
<tr>
<td>TIME_OFFSET</td>
<td>10</td>
</tr>
<tr>
<td>REPEAT_TIME_OFFSET</td>
<td>0 or 5</td>
</tr>
<tr>
<td>ADD_BCAST_RECORD</td>
<td>0 or 8 × EXT_BCAST_LENGTH (see [4])</td>
</tr>
</tbody>
</table>
CONFIG_MSG_SEQ - Configuration message sequence number.
The base station shall set this field to CONFIG_SEQ (see 3.6.2.2).

ACC_MSG_SEQ - Access parameters message sequence number.
The base station shall set this field to ACC_CONFIG_SEQ (see 3.6.2.2).

READ_NEXT_SLOT - Pages carried into next slot indicator.
If all messages and records directed to mobile stations operating in the slotted mode and active in this slot, are included in this slot, the base station shall set this field to ‘0’; otherwise, the base station shall set this field to ‘1’.

READ_NEXT_SLOT_BCAST - Enhanced Broadcast Pages carried into next slot indicator.
If all enhanced broadcast pages directed to mobile stations operating in the slotted mode and active in this slot to receive enhanced broadcast pages are included in this slot, the base station shall set this field to ‘0’; otherwise, the base station shall set this field to ‘1’.

SERVICE_OPTION - Service option.
The base station shall set this field to the service option code shown in [30], corresponding to the requested service option.

ADD_MS_RECORD - Additional mobile station-addressed information record.
The base station shall omit this field if EXT_MS_SDU_LENGTH_INCL (see [4]) is set to ‘0’; otherwise, the base station shall include EXT_MS_SDU_LENGTH (see [4]) octets in this field.

BCCH_INDEX - BCCH index.
If NUM_BCCH_BCAST is equal to ‘000’, base station shall set this field to ‘000’ and this field is to be ignored by the mobile station.
Otherwise, The base station shall set this field to one less than Broadcast Control Channel Number (BCN) to which the mobile station is being redirected.
The base station shall not set this field to ‘000’[reserved] or ‘001’.

TIME_OFFSET - BCCH offset.
If NUM_BCCH_BCAST is equal to ‘000’, base station shall set this field to one less than the time offset, in units of 40 ms, from the beginning of the slot in which this message began to the beginning of the Forward Common Control Channel slot to which the mobile station is being directed.
The base station shall set this field to one less than the time offset, in units of 40 ms, from the beginning of the slot in which this message began to the beginning of the Broadcast Control Channel slot to which the mobile station is being directed.

**REPEAT_TIME_OFFSET** - BCCH offset of repeat.

If **EXT_BCAST_SDU_LENGTH_IND** (see [4]) is set to ‘01’ or ‘11’, the base station shall set this field as follows:

- If **NUM_BCCH_BCAST** is equal to ‘000’, the base station shall set this field to one less than the time offset, in units of 40 ms, from the time specified by **TIME_OFFSET** to the beginning of the Forward Common Control Channel slot to which the mobile station is being directed for a repeat of the broadcast message.

- **Otherwise**, the base station shall set this field to one less than the time offset, in units of 40 ms, from the time specified by **TIME_OFFSET** to the beginning of the Broadcast Control Channel slot to which the mobile station is being directed for a repeat of the broadcast message.

Otherwise, the base station shall omit this field.

**ADD_BCAST_RECORD** - Additional broadcast information record.

The base station shall omit this field if **EXT_BCAST_SDU_LENGTH_IND** (see [4]) is set to ‘00’ or ‘01’; otherwise, the base station shall include **EXT_BCAST_SDU_LENGTH** (see [4]) octets in this field.
### 3.7.2.3.2.37 Authentication Request Message

**MSG_TAG: AUREQM**

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RANDA</td>
<td>128</td>
</tr>
<tr>
<td>CON_SQN</td>
<td>48</td>
</tr>
<tr>
<td>AMF</td>
<td>16</td>
</tr>
<tr>
<td>MAC_A</td>
<td>64</td>
</tr>
</tbody>
</table>

- **RANDA** – The Random Challenge Number. The base station shall set this field to the value of the Random Challenge Number in the authentication vector.
- **CON_SQN** – Concealed Sequence Number. The base station shall set this field to SQN ⊕ AK (Concealed Sequence Number), where SQN and AK are the sequence number and the anonymity key in the authentication vector, respectively.
- **AMF** – Authentication Management Field. The base station shall set this field to the value of the Authentication Management Field in the authentication vector.
- **MAC_A** – Message Authentication Code. The base station shall set this field to the value of the Message Authentication Code in the authentication vector.

PILOT_PN - Pilot PN sequence offset index.
The base station shall set this field to the pilot PN sequence offset for this base station, in units of 64 PN chips.

BSPM_MSG_SEQ - BSPM sequence number.
The base station shall set this field to the BCMC Service Parameters Message sequence number.

BSPM_COMMON_RECORD_LEN - BSPM common part record length.
The base station shall set this field to one minus the number of octets included in this BSPM common part record including this field.

DIFF_BSPM - Differential BSPM indicator.
If this message contains all the information with respect to the last transmitted BCMC Service Parameters Message, the base station shall set this field to '0'; if this message contains only information that changed with respect to the last transmitted BCMC Service Parameters Message, the base station shall set this field to '1'.

AUTO_REQ_ALLOWED_IND - Autonomous BCMC request allowed indicator.
The base station shall set this field to '1' to indicate that the mobile station is allowed to request for a BCMC flow that is not included in this message; otherwise, the base station shall set this field to '0'.

FREQ_CHG_REG_REQUIRED - Frequency change BCMC registration required indication.
The base station shall set this field to ‘1’ to indicate that the mobile station is to send a Registration Message whenever mobile station changes frequency while monitoring at least one of the BCMC flows listed on this message; otherwise, the base station shall set this field to ‘0’.

FREQ_CHG_REG_TIMER_IND - Frequency change registration timer indicator.

The base station shall omit this field if the FREQ_CHG_REG_REQUIRED field is set to ‘0’; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ to indicate frequency change registration timer is enabled; otherwise, the base station shall set this field to ‘0’.

FREQ_CHG_REG_TIMER - Frequency change registration timer.

If the field FREQ_CHG_REG_TIMER_IND is not included or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to a value as specified in Table 3.7.2.3.2.38-1 to indicate the duration of time within which the mobile station is not to perform another registration due to a frequency change.

Table 3.7.2.3.2.38-1. Value of Frequency change registration timer

</table>

REGISTRATION_REQ_FLAG_INCL - Registration Required Flag Included.
The base station shall set this field to ‘1’ if the registration is required for at least one BCMC flow listed in this message; otherwise, the base station shall set this field to ‘0’.

**REGISTRATION_REQ_TIMER_PERIOD** - Registration Required Timer Period.

If **REGISTRATION_REQ_FLAG_INCL** is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it to \( \log_2 \) of the maximum value of the **RegistrationRequiredTimer** divided by 80 msec.

**BCMC_ON_TRAFFIC_SUP** - BCMC on traffic channel supported indicator.

The base station shall set this field to ‘1’ to indicate that the BCMC feature is supported on traffic channel; otherwise, the base station shall set this field to ‘0’.

**AUTH_SIGNATURE_REQUIRED** - Authorization signature required indication.

The base station shall set this field to ‘1’ to indicate that the mobile station is to include the authorization signature in the Registration Message, Origination Message, or Page Response Message for at least one of the BCMC flows included in this message; otherwise, the base station shall set this field to ‘0’.

**NON_DEFAULT_VALUE_INCLUDED** - Non-default values for Authorization signature included indicator.

If the **AUTH_SIGNATURE_REQUIRED** field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘0’ if default values are to be used to generate the Authorization signature; otherwise, the base station shall set this field to ‘1’.

**ACH_TIME_STAMP_SHORT_LENGTH** - Length of time stamp for use on r-csch.

If the **NON_DEFAULT_VALUE_INCLUDED** field is not included or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the length of the time stamp, in units of bits, included on the Registration Message, Origination Message, or Page Response Message transmitted on r-csch.

**TIME_STAMP_LONG_LENGTH** - Length of time stamp.

If the **NON_DEFAULT_VALUE_INCLUDED** field is not included or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the length of the time stamp, in units of bits, used to generate the Authorization signature.

**TIME_STAMP_UNIT** - Unit for time stamp length.
If the NON_DEFAULT_VALUE_INCLUDED field is not included or is included and is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the unit of the time stamp length field as follows: the unit of the time stamp field shall be $2^{\text{value of this field}}$.

**NUM_FSCH** - Number of Forward Broadcast Supplemental Channels.

The base station shall set this field to the number of Forward Broadcast Supplemental Channels being transmitted by this base station in any one of the frequencies.

**FSCH_PLCM_SCHEME_IND** - Forward Broadcast Supplemental Channel Public Long Code Mask Scheme Indicator.

The base station shall set this field as specified in Table 3.7.2.3.2.38-2 to indicate the Forward Supplemental Channel public long code mask scheme used.

**Table 3.7.2.3.2.38-2.** Forward Supplemental Channel PLCM scheme used

<table>
<thead>
<tr>

<tr>
<td>11</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

**NUM_BCMC_PROGRAMS** - Number of BCMC Programs.

The base station shall set this field to the number of BCMC programs available in this base station in any one of the frequencies minus one.

The base station shall not set this field to '000000'.

**USE_TIME** - Use action time indicator.
If an explicit action time is specified in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**ACTION_TIME** - Action time.

If the USE_TIME field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and shall set it to the System Time in units of 80 ms (modulo 64) at which this message takes effect.

**FRAMING_TYPE** - Framing type.

The base station shall set this field as specified in Table 3.7.2.3.2.38-7 to indicate the framing type used.

**Table 3.7.2.3.2.38-7. FRAMING_TYPE values**

<table>
<thead>
<tr>

</tbody>
</table>

**FCS_LENGTH** - FCS Length.

The base station shall omit this field if the FRAMING_TYPE field is set to ‘00’; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field as specified in Table 3.7.2.3.2.38-8 to indicate the length of FCS included in BCMC payload.

**Table 3.7.2.3.2.38-8. FCS_LENGTH values**

</tbody>
</table>

**BSPM_COMMON_RECORD_RESERVED** - BSPM common part record reserved bits.
The base station shall add reserved bits as needed in order to make the length of this BSPM common part record equal to an integer number of octets. The base station shall set these bits to '0'.

The base station shall include NUM_FSCH occurrences of the following variable length record:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FSCH_RECORD_LEN</td>
<td>Forward Broadcast Supplemental Channel record length.</td>

<tr>
<td></td>
<td>If the FSCH_CDMA_FREQ_INCL field is set to ‘0’, the base station shall</td>
</tr>
<tr>
<td></td>
<td>omit this field; otherwise, the base station shall include this field and</td>
</tr>
<tr>
<td></td>
<td>set it as follows:</td>
</tr>
<tr>
<td></td>
<td>The base station shall set this field to the CDMA Channel number corresponding</td>
</tr>
<tr>
<td></td>
<td>to the CDMA frequency assignment for the CDMA Channel containing this</td>
</tr>
<tr>
<td></td>
<td>Forward Broadcast Supplemental Channel.</td>
</tr>
<tr>
<td>FSCH_CODE_CHAN</td>
<td>Code channel index of the Forward Broadcast Supplemental Channel.</td>
</tr>
<tr>
<td></td>
<td>Code channel index of the Forward Broadcast Supplemental Channel.</td>
</tr>
</tbody>
</table>
The base station shall set this field to the code channel index of this **Forward Broadcast Supplemental Channel** as specified in [2].

If the FSCH_PLCM_SCHEME_IND field is not set to ‘10’, the base station shall omit this field; otherwise, the base stations shall include this field and set it as follows:

- If the index to generate PLCM for this Forward Supplemental Channel is signaled in this message, the base station shall set this field to ‘1’; otherwise if the PLCM for this Forward Supplemental Channel is autonomously generated from BCMC_FLOW_ID and BSR_ID corresponding to a BCMC flow on this Forward Supplemental Channel as specified in 2.6.13.10.1, the base station shall set this field to ‘0’.

The base station shall set this field to the index from which the public long code mask for this Forward Supplemental Channel is generated as specified in 2.6.13.10.2.

The base station shall set this field to the multiplex option of this **Forward Broadcast Supplemental Channel** as specified in [3].

The base station shall set this field to the radio configuration of this **Forward Broadcast Supplemental Channel** as specified in [2].

The base station shall set this field to ‘1’ if Convolutional Coding will be used when the number of channel bits per frame is less than 360 and Turbo Coding when the number of channel bits per frame is equal to or greater than 360. The base station shall set this field to ‘0’ if Convolutional Coding will be used for all block sizes.

The base station shall set this field to the radio configuration of this **Forward Broadcast Supplemental Channel** as specified in [2].

The base station shall set this field to ‘1’ if Convolutional Coding will be used when the number of channel bits per frame is less than 360 and Turbo Coding when the number of channel bits per frame is equal to or greater than 360. The base station shall set this field to ‘0’ if Convolutional Coding will be used for all block sizes.
The base station shall set this field to ‘1’ if the Forward Broadcast Supplemental Channel outer code information is included in this message; otherwise, the base station shall set this field to ‘0’.

**FSCH_OUTERCODE_RATE** - Outer Code Rate of the Forward Broadcast Supplemental Channel.

If the FSCH_OUTERCODE_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to specify the outer code rate of the Forward Broadcast Supplemental Channel as specified in Table 3.7.2.3.2.38-3

**Table 3.7.2.3.2.38-3. Forward Supplemental Channel Outer Code Rate**

<table>
<thead>
<tr>
<th>FSCH_OUTERCODE_RATE (binary)</th>
<th>FORWARD SUPPLEMENTAL CHANNEL Outer Code Rate</th>

</tbody>
</table>

**FSCH_OUTERCODE_OFFSET** - Outer Coding Buffer Offset of the Forward Broadcast Supplemental Channel.

If the FSCH_OUTERCODE_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to specify the outer coding buffer offset of the Forward Broadcast Supplemental Channel in units of 20ms as specified in [2]. The base station shall set this field to a value between 0 and 63 inclusive.

**FSCH_NUM_BITS_INDX** - Number of information bits index of the Forward Broadcast Supplemental Channel.

The base station shall set this field according to Table 3.7.3.3.2.37-4 to indicate the number of information bits per frame and the length of the CRC field for this Forward Broadcast Supplemental Channel.
FSCH_FRAME_40_USED - Forward Broadcast Supplemental Channel 40ms frame used indicator.

The base station shall set this field to ‘1’ if 40ms frame is used on this Forward Broadcast Supplemental Channel; otherwise, the base station shall set this field to ‘0’.

The base station shall not set both FSCH_FRAME_40_USED and FSCH_FRAME_80_USED fields to ‘1’.

FSCH_FRAME_80_USED - Forward Broadcast Supplemental Channel 80ms frame used indicator.

The base station shall set this field to ‘1’ if 80ms frame is used on this Forward Broadcast Supplemental Channel; otherwise, the base station shall set this field to ‘0’.

The base station shall not set both FSCH_FRAME_40_USED and FSCH_FRAME_80_USED fields to ‘1’.

TDM_STRUCTURE_IND - TDM structure used indicator.

The base station shall set this field to ‘1’ if a time-division multiplexing structure [i.e. BCMC TDM Mode] is used on this Forward Supplemental Channel; otherwise, the base station shall set this field to ‘0’.

TDM_SLOT_LENGTH - TDM slot length.

If the TDM_STRUCTURE_IND field is set to ‘0’ or if FSCH_OUTERCODE_INCL field in this record is set to ‘1’, the base station shall omit this field; otherwise, the base station shall include this field and shall set it as follows:

The base station shall set this field to the length of the TDM slot as specified in Table 3.7.2.3.2.38-4.

<table>
<thead>
<tr>
<th>TDM_SLOT_LENGTH (binary)</th>
<th>Length of the TDM slot</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>20 ms</td>
</tr>
<tr>
<td>01</td>
<td>40 ms</td>
</tr>
<tr>
<td>10</td>
<td>80 ms</td>
</tr>
<tr>
<td>11</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

TDM_SUPER_PERIOD_MASK_LEN - TDM super period mask length indicator.
If the TDM_STRUCTURE_IND field is set to ‘0’ or if the FSCH_OUTERCODE_INCL field corresponding to FSCH ID field included in this record is set to ‘1’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the TDM super period mask length as specified in Table 3.7.2.3.2.38-5.

<table>
<thead>
<tr>
<th>TDM SUPER PERIOD MASK LEN or TDM_MEGA_PERIOD_MASK_LEN</th>
<th>Bits in TDM SUPER PERIODIOD_MASK or TDM MEGA PERIODIOD MASK TDM period</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>4 slots</td>
</tr>
<tr>
<td>01</td>
<td>8 bits</td>
</tr>
<tr>
<td>10</td>
<td>16 bits</td>
</tr>
<tr>
<td>11</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

The base station shall set this field to the TDM mega period mask length as specified in Table 3.7.2.3.2.38-5.

FSCH_RECORD RESERVED - Forward Broadcast Supplemental Channel Forward Supplemental Channel record reserved bits.

The base station shall add reserved bits as needed in order to make the length of this Forward Broadcast Supplemental Channel Forward Supplemental Channel record equal to an integer number of octets. The base station shall set these bits to ‘0’.

The base station shall include NUM_BCMC_PROGRAMS plus one occurrences of the following variable length record:

<table>
<thead>
<tr>
<th>BCMC_FLOW_RECORD_LEN</th>
</tr>
</thead>
<tbody>
<tr>
<td>BCMC flow record length</td>
</tr>
</tbody>
</table>

The base station shall set this field to one minus the number of octets included in this BCMC flow record including this field.
BCMC_PROGRAM_ID_LEN - Length of BCMC_PROGRAM_ID field. The base station shall set this field to one less than the length in bits of the BCMC_PROGRAM_ID of this program.

BCMC_PROGRAM_ID - BCMC program Identifier. The length of this field shall be one more than the value of BCMC_PROGRAM_ID_LEN bits. The base station shall set this field to the BCMC program identifier of this program.

BCMC_FLOW_DISCRIMINATOR_LEN - Length of BCMC_FLOW_DISCRIMINATOR field. The base station shall set this field to the length in bits of the BCMC_FLOW_DISCRIMINATOR of this program.

NUM_FLOW_DISCRIMINATOR - Number of BCMC_flow_discriminators.

The length of this field shall be determined by the value of the BCMC_FLOW_DISCRIMINATOR_LEN as follows: if BCMC_FLOW_DISCRIMINATOR_LEN is set to '000', this field is omitted; otherwise, the length of this field shall be BCMC_FLOW_DISCRIMINATOR_LEN bits.

The base station shall set this field to the number of flow discriminators included for this program minus one.

If NUM_FLOW_DISCRIMINATOR field is included, the base station shall include NUM_FLOW_DISCRIMINATOR+1 occurrences of the following variable length record; otherwise, the base station shall include 1 occurrence of the following variable length record:

BCMC_FLOW_DISCRIMINATOR_HEADER_RECORD_LEN - BCMC_flow_discriminator_header record length.

The base station shall set this field to one less the number of octets included in this BCMC_flow_discriminator_header record including this field.

BCMC_FLOW_DISCRIMINATOR - BCMC flow discriminator.

The length of this field shall be determined by the value of the BCMC_FLOW_DISCRIMINATOR_LEN as follows: if BCMC_FLOW_DISCRIMINATOR_LEN is set to '000', this field is omitted; otherwise, the length of this field shall be BCMC_FLOW_DISCRIMINATOR_LEN bits.

The base station shall set this field to the BCMC flow discriminator of this flow.

FLOW_INFO_ON_OTHER_FREQ - BCMC flow information on another frequency indicator.

The base station shall set this field to ‘1’ if the information on this BCMC flow is available on another frequency; otherwise, the base station shall set this field to ‘0’.
BSPM_CDMA_FREQSAME_AS_PREV - BSPM_CDMA_Frequency_same_as_previous

indicator

BCMC flow information on another frequency indicator.

If the FLOW_INFO_ON_OTHER_FREQ field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if the CDMA channel number and band class where the BCMC Service Parameters Message containing information on this BCMC flow is transmitted is the same as the one for the previous BCMC flow listed in this message.

BSPM_BAND_CLASS - BSPM_band_class.

If the BSPM_CDMA_FREQSAME_AS_PREV field is not included or included and set to ‘1’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the CDMA band class where the BCMC Service Parameters Message containing information on this BCMC flow is transmitted.

BSPM_CDMA_FREQ - BSPM Frequency.

If the BSPM_CDMA_FREQSAME_AS_PREV field is not included or included and set to ‘1’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the CDMA channel number where the BCMC Service Parameters Message containing information on this BCMC flow is transmitted.

REGISTRATION_REQ_FLAG - Registration Required Flag.

If FLOW_INFO_ON_OTHER_FREQ is set to ‘1’ or REGISTRATION_REQ_FLAG_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if registration is required for this BCMC flow. Otherwise, the base station shall set this field to ‘0’.

AUTH_SIGNATURE_REQ_IND - Authorization signature required indicator.

If FLOW_INFO_ON_OTHER_FREQ is set to ‘1’ or the AUTH_SIGNATURE_REQUIRED field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if the mobile station is to include the authorization signature in the Registration Message, Origination Message, or Page Response Message for this BCMC flow; otherwise, the base station shall set this field to ‘0’.

FREQ_CHG_REG_REQ_IND - Frequency change BCMC registration required indication.
The base station shall set this field to ‘1’ to indicate that the mobile station is to send a Registration Message whenever mobile station changes frequency while monitoring this BCMC flow; otherwise, the base station shall set this field to ‘0’.

**BCMC_FLOW_ON_TRAFFIC_IND** - BCMC flow on traffic channel supported indicator.

If FLOW_INFO_ON_OTHER_FREQ is set to ‘1’ or BCMC_ON_TRAFFIC_SUP is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if this BCMC flow is available on traffic channel; otherwise, the base station shall set this field to ‘0’.

**NUM_LPM_ENTRIES** - Number of Logical-to-Physical Mapping Entries.

If the FLOW_INFO_ON_OTHER_FREQ field is set to ‘1’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the number of logical-to-physical mapping included for this BCMC flow.

**BCMC_FLOW_DISCRIMINATOR_HEADER_RECORD_RESERVED** - BCMC flow discriminator header record reserved bits.

The base station shall add reserved bits as needed in order to make the length of this BCMC flow discriminator header record equal to an integer number of octets. The base station shall set these bits to ‘0’.

The base station shall include NUM_LPM_ENTRIES occurrences of the following variable-length record:

**FSCH_ID** - Forward Broadcast Supplemental Channel Identifier. The base station shall set this field to the identifier corresponding to the Forward Broadcast Supplemental Channel on which the above BCMC flow is being transmitted. The Forward Supplemental Channel included first in this message is given the FSCH_ID of ‘0000000’, the second one listed is given the FSCH_ID of ‘0000001’, and so on.

**TDM_USED_IND** - TDM used indicator.

If the TDM_STRUCTURE_IND field for the Forward Supplemental Channel specified by this FSCH_ID is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if a time-division multiplexing structure (i.e., BCMC TDM Mode) is used on the Forward Supplemental Channel for this flow; otherwise, the base station shall set this field to ‘0’.

**TDM_MASK** - TDM mask.
If the TDM_USED_IND field is not included or is included and is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If FSCH_OUTERCODE_INCL field corresponding to FSCH_ID field included in this record is set to '1', the duration of a slot is 20 ms; otherwise, duration of a slot is indicated by TDM SLOT LENGTH. For each bit of this field, the base station set it to '1' if this flow is assigned to the corresponding slot. For each bit of this field, the base station shall set it to '0' if this flow is not assigned to the corresponding slot.

TDM_SUPER_PERIOD_MASK_INCL - TDM super period mask included indicator.

If the TDM_USED_IND field is not included or is included and is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station set it to ‘1’ if TDM_SUPER_PERIOD_MASK field is included in this message; otherwise, the base station shall set it to ‘0’.

TDM_SUPER_PERIOD_MASK - TDM super period mask.

If the TDM_SUPER_PERIOD_MASK_INCL field is not included or is included and is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If FSCH_OUTERCODE_INCL field corresponding to FSCH_ID field included in this record is set to '0', then number of bits included in this field is indicated by TDM_SUPER_PERIOD_MASK_LEN field. Otherwise, number of bits included in this field is set as specified in Table 3.7.2.3.2.38-3, based on FSCH_OUTERCODE_RATE field corresponding to FSCH_ID field included in this record.

Duration of super slot is 4 slots. For each bit of this field, the base station set it to ‘1’ if the TDM_MASK specified above applies to the corresponding super slot. For each bit of this field, the base station shall set it to ‘0’ if the TDM_MASK specified above does not apply to the corresponding super slot.

If FSCH_OUTERCODE_INCL field corresponding to FSCH_ID field included in this record is set to '1', the super period mask bits for parity frames (16 – bits included in this field) are not specified.

If TDM_SUPER_PERIOD_MASK is not included in this message, then it is considered equivalent to TDM_SUPER_PERIOD_MASK being implicitly included with all bits set to ‘1’.

TDM_MEGA_PERIOD_MASK_INCL - TDM mega period mask included indicator.
If the TDM_USED_IND field is not included or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station set it to ‘1’ if TDM_MEGA_PERIOD_MASK field is included in this message; otherwise, the base station shall set it to ‘0’.

**TDM_MEGA_PERIOD_MASK** - TDM mega period mask.

If the TDM_MEGA_PERIOD_MASK_INCL field is not included or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If FSCH_OUTERCODE_INCL field corresponding to FSCH_ID field included in this record is set to ‘1’, then number of bits included in this field is indicated by TDM_MEGA_PERIOD_MASK_LEN field. Otherwise, number of bits included in this field is set as specified in Table 3.7.2.3.2.38-6.

**Table 3.7.2.3.2.38-6. Length of TDM_MEGA_PERIOD_MASK**

<table>
<thead>
<tr>
<th>TDM_SUPER_PERIOD_MASK_INCL (binary)</th>
<th>Length of TDM_MEGA_PERIOD_MASK (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>8</td>
</tr>
<tr>
<td>1</td>
<td>4</td>
</tr>
</tbody>
</table>

If FSCH_OUTERCODE_INCL field corresponding to FSCH_ID field included in this record is set to ‘1’, duration of mega slot is 16 super slots. Otherwise, duration of mega slot is number of bits in TDM_SUPER_PERIOD_MASK times duration of super slot.

For each bit of this field, the base station set it to ‘1’ if the TDM_SUPER_PERIOD_MASK specified above applies to the corresponding mega slot. For each bit of this field, the base station shall set it to ‘0’ if the TDM_SUPER_PERIOD_MASK specified above does not apply to the corresponding mega slot.

**BSR_ID** - BCMC Service Reference Identifier.

The base station shall set this field to the BCMC Service Reference identifier corresponding to this BCMC flow on this Forward Broadcast Supplemental Channel. The base station shall not set this field to a value of 0.
NUM_NGHBR - Number of neighbor base stations.

If NUM_LPM_ENTIRES field is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the number of neighbor base stations included in this message for this logical-to-physical mapping entry.

The base station shall include NUM_NGHBR occurrences of the following variable length record.

NGHBR_RECORD_LEN - Neighbor record length.

The base station shall set this field to one minus the number of octets included in this neighbor record including this field.

NGHBR_PN - Neighbor pilot PN sequence offset index.

The base station shall set this field to the pilot PN sequence offset for this neighbor base station, in units of 64 PN chips.

NGHBR_BCMC_CONFIG - Neighbor BCMC Configuration.

The base station shall set this field as specified in Table 3.7.2.3.2.38-6 to indicate the configuration of this BCMC flow in this neighbor base station.
### Table 3.7.2.3.2.38-6. Neighbor BCMC Configuration Field

<table>
<thead>
<tr>

</tbody>
</table>

### NGHBR_BSR_ID - Neighbor BCMC Service Reference Identifier.

If the NGHBR_BCMC_CONFIG field is set to ‘000’, ‘010’, or ‘011’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to the BCMC Service Reference identifier corresponding to this BCMC flow in the neighbor base station.

The base station shall not set this field to a value of 0.

### NGHBR_FSCH_BAND_CLASS_INCL - Neighbor Forward Broadcast Supplemental Channel band class included indicator.

If the NGHBR_BCMC_CONFIG field is set to ‘000’ ‘010’, or ‘011’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

If this F-SCH in the neighbor base station resides in the same band class as in this base station, the base station shall set this field to ‘0’; otherwise, the base station shall set this field to ‘1’.
NGHBR_FSCH_BAND_CLASS - Band class of the Forward Broadcast Supplemental Channel in the neighbor base station.

If the NGHBR_FSCH_BAND_CLASS_INCL field is not included in this message or is included and is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the CDMA band class, as specified in [30], corresponding to the CDMA frequency assignment containing this Forward Broadcast Supplemental Channel in the neighbor base station.

NGHBR_FSCH_CDMA_FREQ_INCL - Neighbor frequency included indicator.

If the NGHBR_BCMC_CONFIG field is set to '000', '010', or '011', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If this F-SCH in the neighbor base station resides in the same frequency as in this base station, the base station shall set this field to '0'; otherwise, the base station shall set this field to '1'.

NGHBR_FSCH_CDMA_FREQ - Frequency assignment of the Forward Broadcast Supplemental Channel in the neighbor base station.

If the NGHBR_FSCH_CDMA_FREQ_INCL field is not included in this message or is included and is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the CDMA Channel number corresponding to the CDMA frequency assignment for the CDMA Channel containing this Forward Broadcast Supplemental Channel in this neighbor base station.

NGHBR_FSCH_CODE_CHAN_INCL - Neighbor pilot Forward Broadcast Supplemental Channel Code Channel Index Included Indicator.

If the NGHBR_BCMC_CONFIG field is set to ‘000’ or ‘011’ the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If this F-SCH in the neighbor base station uses the same code channel as in this base station, the base station shall set this field to '0'; otherwise, the base station shall set this field to '1'.

NGHBR_FSCH_CODE_CHAN - Neighbor pilot Forward Broadcast Supplemental Channel Code Channel Index.

If the NGHBR_FSCH_CODE_CHAN_INCL field is not included in this message or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.
The base station shall set this field to the code channel index that the mobile station is to use for this Forward Broadcast Supplemental Channel on this neighbor base station.

NGHBR_FSCH_PARMS_INCL - Neighbor Forward Broadcast Supplemental Channel Parameters Included Indicator.

If the NGHBR_BCMC_CONFIG field is set to ‘000’, ‘010’, or ‘011’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

If this F-SCH in the neighbor base station uses the same physical layer parameters as in this base station, the base station shall set this field to ‘0’; otherwise, the base station shall set this field to ‘1’.

NGHBR_FSCH_PLCM_IND - Neighbor Forward Broadcast Supplemental Channel Public Long Code Mask Scheme Indicator.

If the NGHBR_FSCH_PARMS_INCL field is not included in this message, or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

If the index to generate PLCM for this Forward Supplemental Channel is signaled in this message, the base station shall set this field to ‘1’; otherwise if the PLCM for this Forward Supplemental Channel is autonomously generated from BCMC_FLOW_ID and BSR_ID corresponding to a BCMC flow on this Forward Supplemental Channel as specified in 2.6.13.10.1, the base station shall set this field to ‘0’.

NGHBR_FSCH_PLCM_INDEX - Index to generate the Forward Supplemental Channel public long code mask.

If the NGHBR_FSCH_PLCM_IND field is not included or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include and set it as follows.

The base station shall set this field to the index from which the public long code mask for this Forward Supplemental Channel is generated as specified in 2.6.13.10.2.

NGHBR_FSCH_MUX_OPTION - Multiplex Option of the Forward Broadcast Supplemental Channel in the neighbor base station.

If the NGHBR_FSCH_PARMS_INCL field is not included in this message or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to the multiplex option of this Forward Broadcast Supplemental Channel in the neighbor base station as specified in [3].
NGHBR_FSCH_RC - Radio configuration of the Forward Broadcast Supplemental Channel in the Neighbor Base Station. If the NGHBR_FSCH_PARMS_INCL field is not included in this message or is included and is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows. The base station shall set this field to the radio configuration to be used by the mobile station for this Forward Broadcast Supplemental Channel in this neighbor base station as specified in [2].

NGHBR_FSCH_CODING - Coding type of the Forward Broadcast Supplemental Channel in this neighbor base station. If the NGHBR_FSCH_PARMS_INCL field is not included in this message or is included and is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows. The base station shall set this field to '1' if Convolutional Coding will be used when the number of channel bits per frame is less than 360 and Turbo Coding when the number of channel bits per frame is equal to or greater than 360. The base station shall set this field to '0' if Convolution Coding will be used for all block sizes.

NGHBR_FSCH_OUTERCODE_INCL - Forward Broadcast Supplemental Channel Outer Code included indicator for this neighbor base station. If the NGHBR_FSCH_PARMS_INCL field is not included in this message or is included and is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows. The base station shall set this field to ‘1’ if the Forward Broadcast Supplemental Channel outer code information for this neighbor base station is included in this message; otherwise, the base station shall set this field to ‘0’.

NGHBR_FSCH_OUTERCODE_RATE - Outer Code Rate of the Forward Broadcast Supplemental Channel in this neighbor base station. If the FSCH_OUTERCODE_INCL field is not included or is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows: The base station shall set this field to specify the outer code rate of the Forward Broadcast Supplemental Channel as specified in Table 3.7.2.3.2.38-3.
NGHBR_FSCH_OUTERCODE_OFFSET - Outer Coding Buffer Offset of the Forward Broadcast Supplemental Channel in this neighbor base station.

If the FSCH_OUTERCODE_INCL field is not included or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to specify the outer coding buffer offset of the Forward Broadcast Supplemental Channel in units of 20ms as specified in [2]. The base station shall set this field to a value between 0 and 63 inclusive.

NGHBR_FSCH_NUM_BITS_IDX - Number of Information bits index of the Forward Broadcast Supplemental Channel in the Neighbor Base Station.

If the NGHBR_FSCH_PARMS_INCL field is not included in this message or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field according to Table 3.7.3.3.2.37-4 to indicate the number of information bits per frame and the length of the CRC field for this Forward Broadcast Supplemental Channel in this neighbor base station.

NGHBR_FSCH_FRAME_40_USED - Forward Broadcast Supplemental Channel 40ms frame used indicator in the Neighbor Base Station.

If the NGHBR_FSCH_PARMS_INCL field is not included in this message or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if 40ms frame is used on this Forward Broadcast Supplemental Channel in this neighbor base station; otherwise, the base station shall set this field to ‘0’.

The base station shall not set both NGHBR_FSCH_FRAME_40_USED and NGHBR_FSCH_FRAME_80_USED fields to ‘1’.

NGHBR_FSCH_FRAME_80_USED - Forward Broadcast Supplemental Channel 80ms frame used indicator in the Neighbor Base Station.

If the NGHBR_FSCH_PARMS_INCL field is not included in this message or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.
The base station shall set this field to ‘1’ if 80ms frame is used on this Forward Supplemental Forward Broadcast Supplemental Channel in this neighbor base station; otherwise, the base station shall set this field to ‘0’.

The base station shall not set both NGHBR_FSCH_FRAME_40_USED and NGHBR_FSCH_FRAME_80_USED fields to ‘1’.

NGHBR_RECORD_RESERVED - Neighbor record reserved bits.

The base station shall add reserved bits as needed in order to make the length of this neighbor record equal to an integer number of octets. The base station shall set these bits to ‘0’.

BCMC_NUM_BCCH_NGHBR - Number of neighbor base stations that support Broadcast Control Channel.

The base station shall set this field to the number of neighbor base stations included in this message that support Primary Broadcast Control Channel and support BCMC on idle state.

BCMC_BCCH_NGHBR_PN - Neighbor Pilot PN sequence offset index.

The base station shall set this field to the pilot PN sequence offset for this neighbor base station, in units of 64 PN chips.

BCMC_SR1_BCCH_NON_TD_INCL - Common Channel in non TD mode on Spreading Rate 1 information included indicator.

The base station shall set this field to ‘1’ if the base station includes common channels (BCCH/F-CCCH/EACH) information in non TD mode; otherwise, the base station shall set this field to ‘0’.

BCMC_SR1_NON_TD_FREQ_INCL - Non Transmit Diversity frequency included indicator.

If BCMC_SR1_BCCH_NON_TD_INCL is not included, or is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to ‘1’ if BCMC_SR1_CDMA_FREQ_NON_TD is included in the message. Otherwise, base station shall set this field to ‘0’.

BCMC_SR1_CDMA_FREQ_NON_TD - Frequency assignment for non-transmit diversity operation.

If BCMC_SR1_NON_TD_FREQ_INCL is not included, or is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the CDMA Channel number corresponding to the CDMA frequency assignment for the CDMA Channel containing a Broadcast Control Channel that does not support the TD operation.

BCMC_SR1_BRAT_NON_TD - BCCH data rate in non-TD mode for Spreading Rate 1.
If BCMC_SR1_BCCH_NON_TD_INCL is not included, or is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the BRAT field value shown in Table 3.7.2.3.2.26-2 corresponding to the data rate used by the Primary Broadcast Control Channel in the system.

**BCMC_SR1_CRAT_NON_TD** – BCCH code rate in non Transmit Diversity mode for Spreading Rate 1.

If BCMC_SR1_BCCH_NON_TD_INCL is not included, or is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to ‘0’ if the BCCH Code Rate is 1/4 (see [2]). The base station shall set this field to ‘1’ if the BCCH code rate is 1/2 (see [2]).

**BCMC_SR1_BCCH_CODE_CHAN_NON_TD** – Walsh code for the Spreading Rate 1 BCCH in non Transmit Diversity mode.

If BCMC_SR1_BCCH_NON_TD_INCL is not included, or is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the Walsh code corresponding to the Spreading Rate 1 BCCH in non Transmit Diversity mode.

**BCMC_SR1_TD_INCL** - Spreading Rate 1 Transmit Diversity frequency information included indicator.

The base station shall set this field to ‘1’ if BCMC_SR1_CDMA_FREQ_TD, BCMC_SR1_BRAT_TD, BCMC_SR1_CRAT_TD, BCMC_SR1_TD_MODE, and BCMC_SR1_TD_POWER_LEVEL are included in the message; otherwise, the base station shall set this field to ‘0’.

**BCMC_SR1_CDMA_FREQ_TD** - Spreading Rate 1 frequency assignment for Transmit Diversity operation.

If BCMC_SR1_TD_INCL is not included, or is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the CDMA Channel number corresponding to the CDMA frequency assignment for the CDMA Channel containing a BCCH Channel that supports the TD operation.

**BCMC_SR1_BRAT_TD** - BCCH data rate in Transmit Diversity mode for Spreading Rate 1.

If BCMC_SR1_TD_INCL is not included, or is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:
The base station shall set this field to the BRAT field value shown in Table 3.7.2.3.2.26-2 corresponding to the data rate used by the Primary Broadcast Control Channel in the system.

**BCMC_SR1_CRAT_TD** — BCCH code rate in Transmit Diversity mode for Spreading Rate 1.

If BCMC_SR1_TD_INCL is not included, or is included and set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to '0' if the BCCH Code Rate is 1/4 [see [2]]. The base station shall set this field to '1' if the BCCH Code Rate is 1/2 [see [2]].

**BCMC_SR1_BCCH_CODE_CHAN_TD** — Walsh code for the Spreading Rate 1 BCCH in Transmit Diversity mode.

If BCMC_SR1_TD_INCL is not included, or is included and set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the Walsh code corresponding to the Spreading Rate 1 BCCH in Transmit Diversity mode.

**BCMC_SR1_TD_MODE** — Spreading Rate 1 Transmit Diversity Mode.

If BCMC_SR1_TD_INCL is not included, or is included and set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field corresponding to Table 3.7.2.3.2.26-3.

**BCMC_SR1_TD_POWER_LEVEL** — Spreading Rate 1 TD transmit power level.

If BCMC_SR1_TD_INCL is not included, or is included and set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the TD transmit power level relative to that of the Forward Pilot Channel, as specified in Table 3.7.2.3.2.26-4.
During Traffic Channel operation, the base station sends signaling messages to the mobile station using the f-dsch.
3.7.3.1 Reserved
1  3.7.3.2 Reserved
3.7.3.3 PDU Formats on the f-dsch

The signaling messages sent over the f-dsch are summarized in Table 3.7.3.3-1.

</tr>
<tr>
<td>CON_REF</td>
<td>0 or 8</td>
</tr>
</tbody>
</table>

**USE_TIME** - Use action time indicator.

This field indicates whether an explicit action time is specified in this order.

If an explicit action time can be specified for this order code, as shown in Table 3.7.4-1, the base station may set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**ACTION_TIME** - Action time.

If the USE_TIME field is set to ‘1’, the base station shall set this field to the System Time minus FRAME_OFFSETs × 1.25 ms, in units of 80 ms (modulo 64), at which the order is to take effect. If the USE_TIME field is set to ‘0’, the base station shall set this field to ‘000000’.

**ORDER** - Order code.

The base station shall set this field to the ORDER code for this type of Order Message (see 3.7.4).

**ADD_RECORD_LEN** - Additional record length.

The base station shall set this field to the number of octets in the order-specific fields included in this message.

**Order-specific fields** - Order-specific fields.

The base station shall include order-specific fields as specified in 3.7.4.

**CON_REF_INCL** - Connection reference included indicator.

If the order carried by this message is not a Call Control order
(see 3.6.8), the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if the connection reference field is included in this message; otherwise, it shall set this field to ‘0’.

**CON_REF** – Connection reference.

If the CON_REF_INCL field is not included or is included but is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and shall set it to the value of the connection reference assigned to the service option connection of the call, to which this message corresponds.
3.7.3.3.2.2 Authentication Challenge Message

MSG_TAG: AUCM

<table>

<td>1</td>
</tr>
</tbody>
</table>

RANDU - Random challenge data.

The base station shall set this field as specified in 2.3.12.1.4.

GEN_CMEAKEY - Generate CMEAKEY indicator.

The base station shall set this field to ‘1’ if it wants the MS to generate the CMEAKEY during the Unique Challenge-Response procedure (see 2.3.12.1.4); otherwise, the base station shall set this field to ‘0’.
3.7.3.3.2.3 Alert With Information Message

</tr>
</tbody>
</table>

The base station shall include occurrences of the following three-field record as specified in 3.7.5.

<table>
<thead>
<tr>
<th>RECORD_TYPE</th>
<th>Information record type.</th>
</tr>
</thead>
<tbody>
<tr>
<td>RECORD_LEN</td>
<td>Information record length.</td>
</tr>
<tr>
<td>Type-specific fields</td>
<td>Type-specific fields.</td>
</tr>
</tbody>
</table>

The base station shall set this field as specified in 3.7.5.

The base station shall set this field to the number of octets in the type-specific fields included in this record.

The base station shall include type-specific fields as specified in 3.7.5.
3.7.3.3.2.4 Data Burst Message

**MSG_TAG: DBM**

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>MSG_NUMBER</td>
<td>8</td>
</tr>
<tr>
<td>BURST_TYPE</td>
<td>6</td>
</tr>
<tr>
<td>NUM_MSGS</td>
<td>8</td>
</tr>
<tr>
<td>NUM_FIELDS</td>
<td>8</td>
</tr>
</tbody>
</table>

NUM_FIELDS occurrences of the following field:

```
{ (NUM_FIELDS)
  CHARi
} (NUM_FIELDS)
```

### Field Interpretation

- **MSG_NUMBER**: Message number.
  - The base station shall set this field to the number of this message within the data burst stream.

- **BURST_TYPE**: Data burst type.
  - The base station shall set the value of this field for the type of this data burst as defined in [30]. If the base station sets this field equal to ‘111110’, it shall set the first two CHARi fields of this message equal to the EXTENDED_BURST_TYPEINTERNATIONAL field as described in the definition of CHARi below. If the base station sets this field equal to ‘111111’, it shall set the first two CHARi fields of this message equal to the EXTENDED_BURST_TYPE as described in the definition of CHARi below.

- **NUM_MSGS**: Number of messages in the data burst stream.
  - The base station shall set this field to the number of messages in this data burst stream.

- **NUM_FIELDS**: Number of characters in this message.
  - The base station shall set this field to the number of occurrences of the CHARi field included in this message.

- **CHARi**: Character.
  - The base station shall include NUM_FIELDS occurrences of this field. The base station shall set these fields to the corresponding octet of the data burst stream.
If the BURST_TYPE field of this message is equal to ‘111110’, the first two CHARi octets shall represent a 16 bit EXTENDED_BURST_TYPE_INTERNATIONAL field, which is encoded as shown below. The first ten bits of this field contain a binary mapping of the Mobile Country Code (MCC) associated with the national standards organization administering the use of the remaining octets of the message. Encoding of the MCC shall be as specified in 2.3.1.3. The remaining six bits of the EXTENDED_BURST_TYPE_INTERNATIONAL field shall specify the COUNTRY_BURST_TYPE. The base station shall set the value of the COUNTRY_BURST_TYPE according to the type of this data burst as defined in standards governed by the country where this data burst type is to be used.

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mobile Country Code</td>
<td>10</td>
</tr>
<tr>
<td>COUNTRY_BURST_TYPE</td>
<td>6</td>
</tr>
<tr>
<td>Remaining CHARi fields</td>
<td>8 × (NUM_FIELDS – 2)</td>
</tr>
</tbody>
</table>

If the BURST_TYPE field of this message is equal to ‘111111’, the first two CHARi octets shall represent a single, 16 bit EXTENDED_BURST_TYPE field, as shown below. The base station shall set the value of the EXTENDED_BURST_TYPE field according to the type of this data burst as defined in [30].

<table>
<thead>
<tr>

<tr>
<td>CON_REF_INCL</td>
<td>1</td>
</tr>
<tr>
<td>CON_REF</td>
<td>0 or 8</td>
</tr>
</tbody>
</table>

**USE_TIME** - Use action time indicator. This field indicates whether an explicit action time is specified in this message. If an explicit action time is specified in this message, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

**ACTION_TIME** - Action time. If the USE_TIME field is set to ‘1’, the base station shall set this field to the System Time minus FRAME_OFFSET_s × 1.25 ms, in units of 80 ms (modulo 64), at which the handoff is to take effect. If the USE_TIME field is set to ‘0’, the base station shall set this field to ‘000000’.

**SID** - System identification of the analog system. The base station shall set this field to the system identification number for the analog system (see [6]).

**VMAC** - Voice mobile station attenuation code. This field indicates the mobile station’s power level associated with the designated voice channel. The base shall set this field to the MAC value shown in [12] corresponding to the nominal power for this mobile station.
ANALOG_CHAN - Analog voice channel number.
The base station shall set this field to the channel number of the analog voice channel, as specified in [12].

SCC - SAT color code.
This indicates the supervisory audio tone associated with the designated analog voice channel.
The base station shall set this field to the SAT value shown in [12].
If the assignment is to a narrow analog channel, the base station shall set this field to the two least significant bits of the DSCC.

MEM - Message encryption mode indicator.
To enable analog control message encryption on the assigned forward and reverse analog voice channels, the base station shall set this bit to ‘1’. To disable analog control message encryption, the base station shall set this bit to ‘0’.

AN_CHAN_TYPE - Analog voice channel type.
The base station shall set this field to the analog channel type as specified in Table 3.7.3.2.6.1. If the mobile station does not have narrow analog capability, the base station shall set this field to ‘00’.

### Table 3.7.3.3.2.6-1. Analog Channel Type

<table>
<thead>
<tr>
<th>Description</th>
<th>Analog Ch</th>
<th>AN_CHAN_TYPE (Binary)</th>

<td>NU</td>
<td>10</td>
</tr>
<tr>
<td>Narrow channel centered on ANALOG_CHAN</td>
<td>NM</td>
<td>11</td>
</tr>
</tbody>
</table>

DSCC_MSB - Digital supervisory audio tone color code most significant bit.
The base station shall set this field to ‘0’ when directing handoff to a wide analog channel. The base station shall set this field to the most significant bit of the DSCC when directing handoff to a narrow analog channel.

BAND_CLASS - Band class.
The base station shall set this field according to values defined in [30].
CON_REF_INCL – Connection reference included indicator.

The base station shall set this field to ‘1’ if the connection reference field is included in this message; otherwise, it shall set this field to ‘0’.

CON_REF – Connection reference.

If the CON_REF_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and shall set it to the value of the connection reference assigned to the service option connection of the call which is to be transferred to the analog system.

</table>

1. **SID** - System identification. The base station shall set this field to the system identification number for this wireless system (see 2.6.5.2).

2. **NID** - Network identification. This field serves as a sub-identifier of a system as defined by the owner of the SID.
The base station shall set this field to the network identification number for this network (see 2.6.5.2).

SRCH_WIN_A - Search window size for the Active Set and Candidate Set.

The base station shall set this field to the window size parameter shown in Table 2.6.6.2.1-1 corresponding to the number of PN chips that the mobile station is to search for pilots in the Active Set and Candidate Set.

SRCH_WIN_N - Search window size for the Neighbor Set.

The base station shall set this field to the window size parameter shown in Table 2.6.6.2.1-1 corresponding to the number of PN chips that the mobile station is to search for pilots in the Neighbor Set.

SRCH_WIN_R - Search window size for the Remaining Set.

The base station shall set this field to the window size parameter shown in Table 2.6.6.2.1-1 corresponding to the number of PN chips that the mobile station is to search for pilots in the Remaining Set.

T_ADD - Pilot detection threshold.

This value is used by the mobile station to trigger the transfer of a pilot from the Neighbor Set or Remaining Set to the Candidate Set (see 2.6.6.2.6) and to trigger the sending of the Pilot Strength Measurement Message or Extended Pilot Strength Measurement Message initiating the handoff process (see 2.6.6.2.5.2).

The base station shall set this field to the pilot detection threshold, expressed as an unsigned binary number equal to $\left\lfloor -2 \times 10 \times \log_{10} \frac{E_c}{I_o} \right\rfloor$.

T_DROP - Pilot drop threshold.

This value is used by the mobile station to start a handoff drop timer for pilots in the Active Set and the Candidate Set (see 2.6.6.2.3).

The base station shall set this field to the pilot drop threshold, expressed as an unsigned binary number equal to $\left\lfloor -2 \times 10 \times \log_{10} \frac{E_c}{I_o} \right\rfloor$.

T_COMP - Active Set versus Candidate Set comparison threshold.

The mobile station transmits a Pilot Strength Measurement Message or an Extended Pilot Strength Measurement Message when the strength of a pilot in the Candidate Set exceeds that of a pilot in the Active Set by this margin (see 2.6.6.2.5.2).

The base station shall set this field to the threshold Candidate Set pilot to Active Set pilot ratio, in units of 0.5 dB.

T_TDROP - Drop timer value.
Timer value after which an action is taken by the mobile station for a pilot that is a member of the Active Set or Candidate Set, and whose strength has not become greater than T_DROP. If the pilot is a member of the Active Set, a Pilot Strength Measurement Message or an Extended Pilot Strength Measurement Message is issued. If the pilot is a member of the Candidate Set, it will be moved to the Neighbor Set.

The base station shall set this field to the T_TDROP value shown in Table 2.6.6.2.3-1 corresponding to the drop timer value to be used by the mobile station.

NGHBR_MAX_AGE - Maximum age for retention of Neighbor Set members. The mobile station drops neighbor set members whose AGE count exceeds this field.

The base station shall set this field to the Neighbor Set maximum age retention value (see 2.6.6.2.6.3).

P_REV - Protocol revision level. The base station shall set this field to the base station protocol revision level.

SOFT_SLOPE - The slope in the inequality criterion for adding a pilot to the Active Set, or dropping a pilot from the Active Set (see 2.6.6.2.3 and 2.6.6.2.5.2).

The base station shall set this field as an unsigned binary number.

ADD_INTERCEPT - The intercept in the inequality criterion for adding a pilot to the Active Set (see 2.6.6.2.5.2).

The base station shall set this field as a two's complement signed binary number, in units of 0.5 dB.

DROP_INTERCEPT - The intercept in the inequality criterion for dropping a pilot from the Active Set (see 2.6.6.2.3).

The base station shall set this field as a two's complement signed binary number, in units of 0.5 dB.

PACKET_ZONE_ID - Packet data services zone identifier. If the base station supports a packet data service zone, the base station shall set this field to its non-zero packet data services zone identifier.

If the base station does not support a packet data service zone, the base station shall set this field to ‘00000000’.

EXTENSION - Indicator that extension fields are present. If Reverse Supplemental Code Channel or Reverse Supplemental Channel system parameters are included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

</tr>
</tbody>
</table>
This field consists of the subfields shown in Table 2.7.1.3.2.1-5.

If this field is included, the base station shall set the subfields as follows:

The base station shall set the CMEA subfield to ‘1’.

The base station shall set each other subfield to ‘1’ if the corresponding signaling algorithm is supported by the base station; otherwise, the base station shall set the subfield to ‘0’.

The base station shall set the RESERVED subfield to ‘00000’.

UI_ENCRYPT_SUP – User information Encryption supported indicator.

If ENC_SUPPORTED is equal to ‘1’, the base station shall include this field; otherwise, the base station shall omit this field. If this field is included, the base station shall set this field to indicate the supported user information encryption algorithms.

This field consists of the subfields shown in Table 2.7.1.3.2.4-9.

The base station shall set each subfield to ‘1’ if the corresponding user information encryption algorithm is supported by the base station; otherwise, the base station shall set the subfield to ‘0’.

CS_SUPPORTED - Concurrent Services supported indicator.

If the base station supports concurrent services, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

CHM_SUPPORTED – Control Hold Mode supported indicator.

The base station shall set this field to ‘1’ to indicate that the base station supports the Control Hold Mode; otherwise, the base station shall set this field to ‘0’.

CDMA_OFF_TIME_REP_SUP_IND – CDMA off time report supported indicator.

If the base station supports mobile station report for CDMA off time information using the CDMA Off Time Report Message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

CDMA_OFF_TIME_REP_THRESHOLD_UNIT – CDMA off time report threshold unit

If CDMA_OFF_TIME_REP_SUP_IND is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the time unit used in CDMA_OFF_TIME_REP_THRESHOLD, as specified in Table 3.7.2.3.2.13-5

CDMA_OFF_TIME_REP_THRESHOLD – CDMA off time report threshold
If CDMA_OFF_TIME_REP_SUP_IND is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the time in units of CDMA_OFF_TIME_REP_THRESHOLD_UNIT such that if the mobile station goes away from the CDMA traffic channel longer than this value, the mobile station is to send a CDMA Off Time Report Message.

T_TDROPT_RANGE_INCL - Drop timer range value included indicator.

The base station shall set this field to ‘1’ if the T_TDROPT_RANGE field is included in this message; otherwise, the base station shall set this field to ‘0’.

T_TDROPT_RANGE - Drop timer range value.

Timer range value to use in association with the T_TDROPT parameter when determining the drop timer expiration.

If T_TDROPT_RANGE_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field to the T_TDROPT_RANGE value shown in Table 2.6.6.2.3-2 corresponding to the timer expiration range value to be used by the mobile station.

FOR_PDCH_SUPPORTED - Forward Packet Data Channel supported indicator.

If the base station supports Forward Packet Data Channel, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

PDCH_CHM_SUPPORTED – PDCH Control Hold Mode supported indicator.

If FOR_PDCH_SUPPORTED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ to indicate that the base station supports the PDCH Control Hold Mode; otherwise, the base station shall set this field to ‘0’.

SDB_SUPPORTED - Short Data Burst supported indicator.

The base station shall set this field to ‘1’ if the mobile station is permitted to send a Short Data Burst; otherwise, the base station shall set this field to ‘0’.

MOB_QOS - Indicator granting permission to the mobile station to request QoS parameter settings in the Origination Message, Origination Continuation Message, or Enhanced Origination Message.

If CS_SUPPORTED is equal to ‘0’, the base station shall omit this field; otherwise the base station shall include this field and shall set it as follows:
The base station shall set this field to ‘1’, if the mobile station is allowed to include a QoS record in the *Origination Message*, *Origination Continuation Message*, or *Enhanced Origination Message*; otherwise, the base station shall set this field to ‘0’.

**MS_INIT_POS_LOC_SUP_IND** - Mobile station initiated position location determination supported indicator.

If the base station supports mobile station initiated position determination, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**PZ_HYST_PARMS_INCL** - Packet zone hysteresis parameters included indicator.

If the PACKET_ZONE_ID field is set to ‘00000000’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the packet zone hysteresis parameters are included, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**PZ_HYST_ENABLED** - Packet zone hysteresis enabled.

If the PACKET_ZONE_ID field is set to ‘00000000’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the packet zone hysteresis feature is to be enabled at the mobile station, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**PZ_HYST_INFO_INCL** - Packet zone hysteresis information included indicator.

If the PZ_HYST_ENABLED field is included and is set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

If the base includes the PZ_HYST_LIST_LEN, PZ_HYST_ACT_TIMER and packet zone hysteresis timer related fields, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**PZ_HYST_LIST_LEN** - Packet zone hysteresis list length.

If the PZ_HYST_INFO_INCL field is included and is set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to the length of the packet zone hysteresis list minus one. *This field shall be within the range ‘0001’ through ‘1111’, inclusive.*

**PZ_HYST_ACT_TIMER** - Packet zone hysteresis activation timer.

If the PZ_HYST_INFO_INCL field is included and is set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.
The base station shall set the field to the value of the packet zone hysteresis activation timer (in units of seconds). This field shall be within the range ‘00000001’ through ‘11111111’, inclusive.

**PZ_HYST_TIMER_MUL** - Packet zone hysteresis timer multiplier.

If the PZ_HYST_INFO_INCL field is included and is set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

The base station shall set the field to x, where $x \times 8^y$ seconds is the value of the hysteresis timer and y is the value indicated in the PZ_HYST_TIMER_EXP field. The base station shall set this field to a value that is between 1 and 7 inclusive. The value 0 is reserved.

**PZ_HYST_TIMER_EXP** - Packet zone hysteresis timer exponent.

If the PZ_HYST_INFO_INCL field is included and is set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

The base station shall set the field to y, where $x \times 8^y$ seconds is the value of the hysteresis timer and x is the value indicated in the PZ_HYST_TIMER_MUL field. The base station shall set this field to a value that is between 0 and 4 inclusive. All the other values are reserved.

**BCMC_ON_TRAFFIC_SUP** - BCMC on traffic channel supported indicator.

The base station shall set this field to ‘1’ to indicate that the BCMC feature is supported on traffic channel; otherwise, the base station shall set this field to ‘0’.

**AUTO_REQ_TRAF_ALLOWED_IND** - Autonomous BCMC request on traffic channel allowed indicator.

If the BCMC_ON_TRAFFIC_SUP field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ to indicate that the mobile station is allowed to request for a BCMC flow autonomously on traffic; otherwise, the base station shall set this field to ‘0’.

**REV_PDCH_SUPPORTED** - Reverse Packet Data Channel supported indicator.

If FOR_PDCH_SUPPORTED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

If the base station supports the Reverse Packet Data Channel (R-PDCH), the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**MAX_ADD_SERV_INSTANCE** - Maximum number of additional service reference identifiers allowed in origination
If the CS_SUPPORTED field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the maximum number of additional service reference identifiers that can be included in the Origination Message or Enhanced Origination Message.

USE_CH_CFG_RRM - Channel configuration request allowed indicator.

The base station shall set this field to ‘1’ to indicate that the mobile station is permitted to include the CH_IND and EXT_CH_IND fields in the Resource Request Message, and the Resource Request Mini Message; otherwise, the base station shall set this field to ‘0’.
3.7.3.3.2.8 Neighbor List Update Message

MSG_TAG: NLUM

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>PILOT_INC</td>
<td>4</td>
</tr>
</tbody>
</table>

One or more occurrences of the following field:

```
{  
  PILOT_INC - Pilot PN sequence offset index increment.  
  The mobile station searches for Remaining Set pilots at pilot  
  PN sequence offset index values that are multiples of this value.  
  The base station shall set this field to the pilot PN sequence  
  increment, in units of 64 PN chips, that the mobile station is  
  to use for searching the Remaining Set. The base station  
  should set this field to the largest increment such that the  
  pilot PN sequence offsets of all its neighbor base stations are  
  integer multiples of that increment.  
  NGHBR_PN - Neighbor pilot PN sequence offset index.  
  The base station shall include one occurrence of this field for  
  each pilot in its neighbor list. The base station shall set this  
  field to the pilot's PN sequence offset, in units of 64 PN chips.  
  The base station shall include no more than 20 occurrences of this field.  
  }
```
3.7.3.2.9 Send Burst DTMF Message

</tbody>
</table>

- **NUM_DIGITS** - Number of DTMF digits. The base station shall set this field to the number of DTMF digits included in this message.
- **DTMF_ON_LENGTH** - DTMF pulse width code. The base station shall set this field to the DTMF_ON_LENGTH value shown in Table 2.7.2.3.2.7-1 corresponding to the requested pulse width of the DTMF pulse to be generated by the mobile station.
- **DTMF_OFF_LENGTH** - DTMF interdigit interval code. The base station shall set this field to the DTMF_OFF_LENGTH value shown in Table 2.7.2.3.2.7-2 corresponding to the requested minimum interdigit interval between DTMF pulses to be generated by the mobile station.
- **DIGIT\_i** - DTMF digit. The base station shall include one occurrence of this field for each DTMF digit to be generated by the mobile station. The base station shall set each occurrence of this field to the code value shown in Table 2.7.1.3.2.4-4 corresponding to the dialed digit.
- **CON_REF_INCL** - Connection reference included indicator. The base station shall set this field to ‘1’ if the connection reference field is included in this message; otherwise, it shall set this field to ‘0’.
CON_REF – Connection reference.

If the CON_REF_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and shall set it to the value of the connection reference assigned to the service option connection of the call, to which this message corresponds.
3.7.3.3.2.10 Power Control Parameters Message

<td>1</td>
</tr>
<tr>
<td>PWR_REP_DELAY</td>
<td>5</td>
</tr>
</tbody>
</table>

PWR_REP_THRESH - Power control reporting threshold.
The base station shall set this field to the number of bad frames (see [2]) to be received in a measurement period on the channel which carries the Power Control Subchannel before the mobile station is to generate a Power Measurement Report Message (see 2.6.4.1.1). If the base station sets PWR_THRESH_ENABLE to ‘1’, it shall not set this field to ‘00000’.

PWR_REP_FRAMES - Power control reporting frame count.
The base station shall set this field to the value such that the number given by

\[ \left\lfloor 2\left(\frac{\text{PWR_REP_FRAMES}}{2}\right) \times 5 \right\rfloor \]

is the number of frames over which the mobile station is to count frame errors.

PWR_THRESH_ENABLE - Threshold report mode indicator.
If the mobile station is to generate threshold Power Measurement Report Messages, the base station shall set this field to ‘1’. If the mobile station is not to generate threshold Power Measurement Report Messages, the base station shall set this field to ‘0’.

PWR_PERIOD_ENABLE - Periodic report mode indicator.
If the mobile station is to generate periodic Power Measurement Report Messages, the base station shall set this field to ‘1’. If the mobile station is not to generate periodic Power Measurement Report Messages, the base station shall set this field to ‘0’.

PWR_REP_DELAY - Power report delay.
The period that the mobile station waits following a Power Measurement Report Message before restarting frame counting for power control purposes.
The base station shall set this field to the power report delay value, in units of 4 frames (see 2.6.4.1.1).
3.7.3.3.2.11 Retrieve Parameters Message

<table>

</table>

The base station shall include one occurrence of the following three-field record for each parameter to be set.

- **PARAMETER_ID** - Parameter identification.
  - The base station shall set this field to the identification shown in Table E-1 corresponding to the settable parameter to be set.

- **PARAMETER_LEN** - Parameter length.
  - The base station shall set this field to the length shown in Table E-1 corresponding to the parameter to be set.

- **PARAMETER** - Parameter value.
  - The base station shall set this field to the value of the parameter specified by the PARAMETER_ID field.
3.7.3.3.2.13 SSD Update Message

</tbody>
</table>

The base station shall include occurrences of the following three-field record as specified in 3.7.5.

- RECORD_TYPE - Information record type.
  The base station shall set this field as specified in 3.7.5.

- RECORD_LEN - Information record length.
  The base station shall set this field to the number of octets in the type-specific fields included in this record.

- Type-specific fields - Type-specific fields.
  The base station shall include type-specific fields as specified in 3.7.5.
3.7.3.3.2.15 Mobile Station Registered Message

<td>11</td>
</tr>
</tbody>
</table>

- **SID** - System identification. The base station shall set this field to the system identification number for this system.

- **NID** - Network identification. This field serves as a sub-identifier of a system as defined by the owner of the SID. The base station shall set this field to the network identification number for this network. The NID value of 65,535 is reserved.

- **REG_ZONE** - Registration zone. The base station shall set this field to its registration zone number (see 2.6.5.1.5).

- **TOTAL_ZONES** - Number of registration zones to be retained. The base station shall set this field to the number of registration zones the mobile station is to retain for purposes of zone-based registration (see 2.6.5.1.5). If zone-based registration is to be disabled, the base station shall set this field to ‘000’.

- **ZONE_TIMER** - Zone timer length. The base station shall set this field to the ZONE_TIMER value shown in Table 3.7.2.3.2.1-1 corresponding to the length of the zone registration timer to be used by mobile stations.
MULT_SIDS - Multiple SID storage indicator.
If mobile stations may store entries of SID_NID_LIST containing different SIDs, the base station shall set this field to '1'; otherwise the base station shall set this field to '0'.

MULT_NIDS - Multiple NID storage indicator.
If mobile stations may store multiple entries of SID_NID_LIST having the same SID (with different NIDs), the base station shall set this field to ‘1’; otherwise the base station shall set this field to ‘0’.

BASE_LAT - Base station latitude.
The base station shall set this field to its latitude in units of 0.25 second, expressed as a two’s complement signed number with positive numbers signifying North latitudes. The base station shall set this field to a value in the range -1296000 to 1296000 inclusive (corresponding to a range of -90° to +90°).

BASE_LONG - Base station longitude.
The base station shall set this field to its longitude in units of 0.25 second, expressed as a two’s complement signed number with positive numbers signifying East longitude. The base station shall set this field to a value in the range -2592000 to 2592000 inclusive (corresponding to a range of -180° to +180°).

REG_DIST - Registration distance.
If mobile stations are to perform distance-based registration, the base station shall set this field to the non-zero “distance” beyond which the mobile station is to re-register (see 2.6.5.1.4). If mobile stations are not to perform distance-based registration, the base station shall set this field to 0.
3.7.3.3.2.16 Status Request Message

</tr>
</tbody>
</table>

NUM_FIELDS occurrences of the following field:

```
{ (NUM_FIELDS)
  RECORD_TYPE
} (NUM_FIELDS)
```

QUAL_INFO_TYPE - Qualification information type.

The base station shall set this field to the value shown in Table 3.7.2.3.2.15-1 to show the inclusion of qualification information in the type-specific fields.

QUAL_INFO_LEN - Qualification information length.

The base station shall set this field to the number of octets included in the type-specific fields of the qualification information.

Type-specific fields - Type-specific fields.

The base station shall set these fields to the qualification information according to the QUAL_INFO_TYPE field.

If QUAL_INFO_TYPE is equal to ‘00000000’, the type-specific fields are omitted.

If QUAL_INFO_TYPE is equal to ‘00000001’, the base station shall use the following fixed-length format for the type-specific fields:

<table>
<thead>
<tr>
<th>Type-specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAND_CLASS</td>
<td>5</td>
</tr>
<tr>
<td>RESERVED</td>
<td>3</td>

<tbody>
<tr>
<td>BAND_CLASS</td>
<td>5</td>
</tr>
<tr>
<td>OP_MODE</td>
<td>8</td>
</tr>
<tr>
<td>RESERVED</td>
<td>3</td>
</tr>
</tbody>
</table>

1. **BAND_CLASS** - Band class.
   - The base station shall set this field to the CDMA band class, as specified in [30].

2. **OP_MODE** - Operating mode.
   - The base station shall set this field as shown in Table 3.7.2.3.2.15-3 to specify the operating mode qualification information.

3. **RESERVED** - Reserved bits.
   - The base station shall set this field to ‘000’.

4. **NUM_FIELDS** - Number of requested record fields in this message.
   - The base station shall set this field to the number of occurrences of RECORD_TYPE in this message.

The base station shall only request the status information records qualified by the included qualification information (see Table 2.7.4-1) in this message. The base station shall include one occurrence of the following field for each information record that is requested:

5. **RECORD_TYPE** - Information record type.
   - The base station shall set this field to the record type value shown in Table 2.7.4-1 corresponding to the information record requested.

One or more occurrences of the following record:

```markdown
/
PILOT\_PN                  9
PWR\_COMB\_IND             1
CODE\_CHAN                 8
/
```

2

**USE\_TIME** - Use action time indicator.

This field indicates whether an explicit action time is specified in this message.

If an explicit action time is specified in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

3

**ACTION\_TIME** - Action time.

If the USE\_TIME field is set to ‘1’, the base station shall set this field to the System Time minus FRAME\_OFFSET $s \times 1.25$ ms, in units of 80 ms (modulo 64), at which the handoff is to take effect. If the USE\_TIME field is set to ‘0’, the base station shall set this field to ‘000000’.

4

**HDM\_SEQ** - Extended Handoff Direction Message sequence number.

This field is used by the mobile station in the Power Measurement Report Message to identify the order in which the reported pilot strengths are sent.

The base station shall set this field as specified in 2.6.6.2.2.2.

5

**SEARCH\_INCLUDED** - Pilot search parameters included.

If the mobile station is to change its pilot search parameters, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

6

**SRCH\_WIN\_A** - Search window size for the Active Set and Candidate Set.

If SEARCH\_INCLUDED is set to ‘1’, the base station shall include the field SRCH\_WIN\_A and set this field to the window size parameter shown in Table 2.6.6.2.1-1 corresponding to the number of PN chips that the mobile station is to search for pilots in the Active Set and Candidate Set; otherwise, the base station shall omit this field.

7

**T\_ADD** - Pilot detection threshold.
This value is used by the mobile station to trigger the transfer of a pilot from the Neighbor Set or Remaining Set to the Candidate Set (see 2.6.6.2.6) and to trigger the sending of the *Pilot Strength Measurement Message* or *Extended Pilot Strength Measurement Message* initiating the handoff process (see 2.6.6.2.5.2).

If SEARCH_INCLUDED is set to ‘1’, the base station shall include the field T_ADD and set this field to the pilot detection threshold, expressed as an unsigned binary number equal to \[-2 \times 10 \times \log_{10} \frac{E_c}{I_o}\]; otherwise, the base station shall omit this field.

**T_DROP** - Pilot drop threshold.

This value is used by mobile stations to start a handoff drop timer for pilots in the Active Set and the Candidate Set (see 2.6.6.2.3).

If SEARCH_INCLUDED is set to ‘1’, the base station shall include the field T_DROP and set this field to the pilot drop threshold, expressed as an unsigned binary number equal to \[-2 \times 10 \times \log_{10} \frac{E_c}{I_o}\]; otherwise, the base station shall omit this field.

**T_COMP** - Active Set versus Candidate Set comparison threshold.

The mobile station transmits a *Pilot Strength Measurement Message* or an *Extended Pilot Strength Measurement Message* when the strength of a pilot in the Candidate Set exceeds that of a pilot in the Active Set by this margin (see 2.6.6.2.5.2).

If SEARCH_INCLUDED is set to ‘1’, the base station shall include the field T_COMP and set this field to the threshold Candidate Set pilot to Active Set pilot ratio, in units of 0.5 dB; otherwise, the base station shall omit this field.

**T_TDROP** - Drop timer value.

Timer value after which an action is taken by the mobile station for a pilot that is a member of the Active Set or Candidate Set, and whose strength has not become greater than T_DROP. If the pilot is a member of the Active Set, a *Pilot Strength Measurement Message* or an *Extended Pilot Strength Measurement Message* is issued. If the pilot is a member of the Candidate Set, it will be moved to the Neighbor Set.

If SEARCH_INCLUDED is set to ‘1’, the base station shall include the field T_TDROP and set this field to the T_TDROP value shown in Table 2.6.6.2.3-1 corresponding to the drop timer value to be used by the mobile station; otherwise, the base station shall omit this field.

**HARD_INCLUDED** - Hard handoff parameters included.
If the mobile station is to change FRAME_OFFSET, PRIVATE_LCM, ENCRYPT_MODE, SERV_NEG_TYPE, NOM_PWR_EXT, NUM_PREAMBLE, NOM_PWR, BAND_CLASS, or CDMA_FREQ, or the mobile station is to perform a reset of the acknowledgment procedures, or the mobile station is to reset Forward Traffic Channel power control counters, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

FRAME_OFFSET - Frame offset.
The Forward and Reverse Traffic Channel frames are delayed FRAME_OFFSET × 1.25 ms relative to system timing (see [2]). If HARD_INCLUDED is set to ‘1’, the base station shall include the field FRAME_OFFSET and set it to the Forward and Reverse Traffic Channel frame offset; otherwise, the base station shall omit this field.

PRIVATE_LCM - Private long code mask indicator.
This field is used to change the long code mask after a hard handoff. If HARD_INCLUDED is set to ‘1’, the base station shall include the field PRIVATE_LCM and set it as described below; otherwise, the base station shall omit this field.
If the private long code mask is to be used after the handoff, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

RESET_L2 - Reset acknowledgment procedures command.
This field is used to reset acknowledgment processing in the mobile station. If HARD_INCLUDED is set to ‘1’, the base station shall include the field RESET_L2 and set it as described below; otherwise, the base station shall omit this field.
If the field is included and the mobile station is to reset its acknowledgment procedures, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

RESET_FPC - Reset Forward Traffic Channel power control.
This field is used to reset the Forward Traffic Channel power control counters. If HARD_INCLUDED is set to ‘1’, the base station shall include the field RESET_FPC and set it as described below; otherwise, the base station shall omit this field.
The base station shall set this field to ‘0’ if the Forward Traffic Channel power control counters are to be maintained after completion of the handoff. If the counters are to be initialized as specified in 2.6.4.1.1.1, then the base station shall set this field to ‘1’.
SERV_NEG_TYPE - Service negotiation type.

If HARD_INCLUDED is set to ‘1’, the base station shall include the field SERV_NEG_TYPE and set it as described below; otherwise, the base station shall omit this field.

If the mobile station is to use service negotiation, the base station shall set this field to ‘1’. If the mobile station is to use service option negotiation, the base station shall set this field to ‘0’.

ENCRYPT_MODE - Message encryption mode.

If HARD_INCLUDED is set to ‘1’, the base station shall include the field ENCRYPT_MODE and set it to the ENCRYPT_MODE value shown in Table 3.7.2.3.2.8-2 corresponding to the encrypting mode that is to be used for messages sent on the Forward and Reverse Traffic Channels, as specified in 2.3.12.2; otherwise, the base station shall omit this field.

NOM_PWR_EXT - Extended nominal transmit power.

If HARD_INCLUDED is set to ‘1’, the base station shall include this field and set it as described below; otherwise, the base station shall omit this field.

If the mobile station is being handed off to a base station operating in Band Class 0 or Band Class 3, the base station shall set this field to ‘0’; otherwise, it shall set this field as follows:

If the correction factor to be used by the mobile station in the open loop power estimate is between –24 dB and –9 dB inclusive, the base station shall set this field to ‘1’; otherwise, the correction factor is in the range –8 dB to 7 dB inclusive, the base station shall set this field to ‘0’.

NOM_PWR - Nominal transmit power offset.

If HARD_INCLUDED is set to ‘1’, the base station shall include the field NOM_PWR and set it to the correction factor to be used by the mobile station in the open loop power estimate, expressed as a two’s complement value in units of 1 dB (see [2]); otherwise, the base station shall omit this field.

NUM_PREAMBLE - Traffic Channel preamble length.

If HARD_INCLUDED is set to ‘0’, the base station shall omit the NUM_PREAMBLE field; otherwise, the base station shall include this field and set it to the length of Traffic Channel preamble that the mobile station is to send when performing a handoff; as follows:
If, after the handoff, radio configuration 1 or radio configuration 2 is to be used, the base station shall set NUM_PREAMBLE to the Traffic Channel preamble length in 20 ms units; otherwise, the base station shall set NUM_PREAMBLE to the value shown in Table 3.7.3.2.17-1 corresponding to the Traffic Channel preamble length in 1.25 ms units.

<table>
<thead>
<tr>
<th>NUM_PREAMBLE or RESQ_NUM_PREAMBLE (binary)</th>
<th>Preamble Length in 1.25 ms Increments</th>
</tr>
</thead>
<tbody>
<tr>

<td>10</td>
</tr>
<tr>
<td>110</td>
<td>12</td>
</tr>
<tr>
<td>111</td>
<td>16</td>
</tr>
</tbody>
</table>

BAND_CLASS - Band class. If HARD_INCLUDED is set to ‘1’, the base station shall include the field BAND_CLASS and set it to the CDMA band class corresponding to the CDMA frequency assignment for the CDMA Channel as specified in [30]; otherwise, the base station shall omit this field.

CDMA_FREQ - Frequency assignment. If HARD_INCLUDED is set to ‘1’, the base station shall include the field CDMA_FREQ and set it to the CDMA Channel number, in the specified CDMA band class, corresponding to the CDMA frequency assignment for the CDMA Channel as specified in [2]; otherwise, the base station shall omit this field.

ADD_LENGTH - Number of octets in the additional fields. The base station shall set this field to the number of octets included in the Additional fields. If Additional fields are not included in this message, the base station shall set this field to ‘000’.

Additional fields - Additional fields. If the ADD_LENGTH field is not equal to ‘000’, the base station shall include the following fields as additional fields.
The base station shall set this field to the base station protocol revision level that the mobile station is to use after completion of the handoff.

The base station shall include one occurrence of the following three-field record for each member of the mobile station's new Active Set.

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>P_REV</td>
<td>8</td>
</tr>
</tbody>
</table>

- **P_REV** - Protocol revision level.

- **PILOT_PN** - Pilot PN sequence offset index.

- **PWR_COMB_IND** - Power control symbol combining indicator.

- **CODE_CHAN** - Code channel index.
3.7.3.3.2.18 Service Request Message

MSG_TAG: SRQM

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>0010</td>
<td>Indicates that the purpose of this message is to propose a service configuration.</td>
</tr>
</tbody>
</table>

All other REQ_PURPOSE codes are reserved.
RECORD_TYPE - Information record type.

If REQ_PURPOSE is set to '0010', the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to the record type value shown in Table 3.7.5-1 corresponding to the Service Configuration information record.

RECORD_LEN - Information record length.

If REQ_PURPOSE is set to '0010', the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to the number of octets included in the type-specific fields of the Service Configuration information record.

Type-specific fields - Type-specific fields.

If REQ_PURPOSE is set to '0010', the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

The base station shall set these fields as specified in 3.7.5.7 for the Service Configuration information record.
3.7.3.3.2.19 Service Response Message

</tr>
</tbody>
</table>

All other RESP_PURPOSE codes are reserved.
RECORD_TYPE - Information record type.

If RSP_PURPOSE is set to ‘0010’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to the record type value shown in Table 3.7.5-1 corresponding to the Service Configuration information record.

RECORD_LEN - Information record length.

If RSP_PURPOSE is set to ‘0010’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to the number of octets included in the type-specific fields of the Service Configuration information record.

Type-specific fields - Type-specific fields.

If RSP_PURPOSE is set to ‘0010’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

The base station shall set these fields as specified in 3.7.5.7 for the Service Configuration information record.

1. **USE_TIME** - Use action time indicator. This field indicates whether an explicit action time is specified in this message.
   
   If an explicit action time is specified in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

2. **ACTION_TIME** - Action time. If the USE_TIME field is set to ‘1’, the base station shall set this field to the System Time minus FRAME_OFFSET * 1.25 ms, in units of 80 ms (modulo 64), at which the specified service configuration is to take effect. If the USE_TIME field is set to ‘0’, the base station shall set this field to ‘000000’.

3. **SERV_CON_SEQ** - Connect sequence number. The base station shall set this field to the connect sequence number pertaining to this connect message as specified in 3.6.4.1.2.1.2.

4. **RESERVED** - Reserved bits. The base station shall set this field to ‘00’.

---

3-529
USE_OLD_SERV_CONFIG - Use stored service configuration indicator.

This field may be used by the base station to instruct the mobile station to use the stored service configuration (that is, both the Service Configuration information record and the Non-negotiable Service Configuration information record).

If MOB_P_REV is less than seven, the base station shall set this field to '00'.

If the base station had sent an Extended Channel Assignment Message with GRANTED_MODE set to '11' or a service configuration has been sent successfully to the mobile station upon entering the Traffic Channel Substate, the base station shall not set this field to '01' or '10'; otherwise, the base station shall set this field according to Table 3.7.3.3.2.20-1.
Table 3.7.3.20-1. USE_OLD_SERV_CONFIG values

<table>
<thead>
<tr>
<th>USE_OLD_SERV_CONFIG Field (binary)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Mobile Station is to use the SCR and NNSCR included in this message</td>
</tr>
<tr>
<td>01</td>
<td>Mobile Station is to use the stored service configuration, where all service option connections are to be restored.</td>
</tr>
<tr>
<td>10</td>
<td>Mobile Station is to use the stored service configuration but with the modifications specified by the SCR and NNSCR included in this message</td>
</tr>
<tr>
<td>11</td>
<td><strong>Mobile Station is to restore the service option connection record(s) indicated via the SR_ID or SR_ID_RESTORE_BITMAP field and release the service option connection record(s) indicated via the SR_ID_RELEASE_BITMAP. Mobile Station is to use the stored service configuration, where only the service option connection record(s) indicated via the SR_ID field are to be restored.</strong></td>
</tr>
</tbody>
</table>

2

SR_ID — Service reference identifier.

3

If the USE_OLD_SERV_CONFIG field is not set to ‘11’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
If the mobile station is to restore all remaining service option connections from the stored service configuration, the base station shall set this field to ‘111’; if the mobile station is to restore more than one but not all remaining service option connections from the stored service configuration, the base station shall set this field to ‘000’; otherwise, the base station shall set this field to the service reference identifier corresponding to the service option connection to be restored.

**SR_ID_RESTORE_BITMAP** – Bitmap of service reference identifiers to be restored.

If the SR_ID field is included and set to ‘000’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

This field consists of the subfields defined in Table 3.7.2.3.2.21-6. The base station shall set a subfield to ‘1’ to indicate that the mobile station is to restore the service option connection of the corresponding service reference identifier; otherwise, the base station shall set the subfield to ‘0’ to indicated that the service option connection of the corresponding service reference identifier is not affected.

**SYNC_ID_INCL** - Service Configuration synchronization identifier included indicator.

The base station shall set this field to ‘1’ if the SYNC_ID field is included in this message; otherwise, the base station shall set this field to ‘0’.

If MOB_P_REV is less than seven or if MOB_P_REV is less than 11 and USE_OLD_SERV_CONFIG field is set to ‘01’ or ‘11’, the base station shall set this field to ‘0’.

**SYNC_ID_LEN** - Service Configuration synchronization identifier length.

If the SYNC_ID_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
The base station shall set this field to the length (in octets) of the SYNC_ID field included in this message. The base station shall set this field to a value larger than zero.

**SYNC_ID** - Service Configuration synchronization identifier.

If the SYNC_ID_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the synchronization identifier corresponding to the service configuration conveyed by this message.

**RECORD_TYPE** - Information record type.

If USE_OLD_SERV_CONFIG is equal to ‘01’ or ‘11’, the base station shall omit this field; otherwise the base station shall include this field and set it as follows.

The base station shall set this field to the record type value shown in Table 3.7.5-1 corresponding to the Service Configuration information record.

**RECORD_LEN** - Information record length.

If USE_OLD_SERV_CONFIG is equal to ‘01’ or ‘11’, the base station shall omit this field; otherwise the base station shall include this field and set it as follows.

The base station shall set this field to the number of octets included in the type-specific fields of the Service Configuration information record.

**Type-specific fields** - Type-specific fields.

If USE_OLD_SERV_CONFIG is equal to ‘01’ or ‘11’, the base station shall omit this field; otherwise the base station shall include this field and set it as follows.

The base station shall set these fields as specified in 3.7.5.7 for the Service Configuration information record.

**RECORD_TYPE** - Information record type.

If USE_OLD_SERV_CONFIG is equal to ‘01’ or ‘11’, the base station shall omit this field; otherwise the base station shall include this field and set it as follows.

The base station shall set this field to the record type value shown in Table 3.7.5-1 corresponding to the Non-Negotiable Service Configuration information record.

**RECORD_LEN** - Information record length.
If USE_OLD_SERV_CONFIG is equal to ‘01’ or ‘11’, the base
station shall omit this field; otherwise the base station shall
include this field and set it as follows.

The base station shall set this field to the number of octets
included in the type-specific fields of the Non-Negotiable
Service Configuration information record.

Type-specific fields

If USE_OLD_SERV_CONFIG is equal to ‘01’ or ‘11’, the base
station shall omit this field; otherwise the base station shall
include this field and set it as follows.

The base station shall set these fields as specified in 3.7.5.20
for the Non-Negotiable Service Configuration information
record.

CC_INFO_INCL – Call Control information included indicator.

If the USE_OLD_SERV_CONFIG field is set to ‘01’, ‘10’, or ‘11’,
the base station shall omit this field; otherwise, the base
station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if Call Control related
parameters (to assign new call(s)) are included in this
message; otherwise, the base station shall set this field to ‘0’.

NUM_CALLS_ASSIGN – Number of call assignments.

If the CC_INFO_INCL field is not included or is included but is
set to ‘0’, the base station shall omit this field; otherwise, the
base station shall include this field and set it as follows:

The base station shall set this field to the number of new call
assignments included in this message.

The base station shall include NUM_CALLS_ASSIGN occurrences of the following variable
length record.

CON_REF – Connection reference.

The base station shall set this field to the connection
reference of the service option connection corresponding to
this call.

RESPONSE_IND – Response indicator.

The base station shall set this field to ‘1’ if this call
assignment is a response to an Enhanced Origination Message
from the mobile station; otherwise, the base station shall set
this field to ‘0’.

TAG – Transaction identifier.
If the RESPONSE_IND field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the value of the TAG field received in the Enhanced Origination Message to which this call assignment is the response.

**BYPASS_ALERT_ANSWER** - Bypass alert indicator.

If the RESPONSE_IND field is set to ‘1’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the mobile station is to bypass the Waiting for Order Substate and the Waiting for Mobile Station Answer Substate for this call, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**USE_TYPE0_PLCM** - Use TYPE0 PLCM indicator.

If the mobile station is to start using the PLCM defined by PLCM_TYPE of ‘0000’ when P_REV_IN_USE is less than 11 or ‘0100’ when P_REV_IN_USE is greater than or equal to 11 (see Table 3.7.2.3.2.21-5), the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**SYNC_ID_BS_INITIATED_IND** - SYNC_ID base station initiated indicator.

If the SYNC_ID_INCL field is set to ‘1’ and the USE_OLD_SERV_CONFIG field is included and is set to ‘10’, then the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

If the SYNC_ID included in this message is initiated by the base station and is to be used by mobile station to restore the stored configuration, then the base station shall set this field to ‘1’; otherwise the base station shall set this field to ‘0’.

**SR_ID_RELEASE_BITMAP_INCL** - SR_ID release bitmap included indicator.

If the USE_OLD_SERV_CONFIG field is not set to ‘11’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If SR_ID_RELEASE_BITMAP is included, base station shall set this field to ‘1’; otherwise, base station shall set this field to ‘0’.

**SR_ID_RELEASE_BITMAP** - SR_ID release bitmap.

If the SR_ID_RELEASE_BITMAP_INCL field is not included or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
This field consists of the subfields defined in Table 3.7.3.3.2.20-2. The base station shall set a subfield to ‘1’ to indicate that the mobile station is to release the service option connection of the corresponding service reference identifier; otherwise, the base station shall set the subfield to ‘0’ to indicate that the service option connection of the corresponding service reference identifier is not affected.

The base station shall not indicate the mobile station to restore and release the same SR_ID using this message.

**Table 3.7.3.3.2.20-2, SR_ID_RELEASE_BITMAP Subfields.**

</tr>
</tbody>
</table>

#### USE_TIME
- Use action time indicator.
- This field indicates whether an explicit action time is specified in this message.
- If an explicit action time is specified in this message, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

#### ACTION_TIME
- Action time.
- If the USE_TIME field is set to ‘1’, the base station shall set this field to the System Time minus $\text{FRAME\_OFFSET}_8 \times 1.25 \text{ ms}$, in units of 80 ms (modulo 64), at which the message is to take effect. If the USE_TIME field is set to ‘0’, the base station shall set this field to ‘000000’.

#### CON_REF
- Service option connection reference.
- The base station shall set this field to the reference for the service option connection.

#### SERVICE_OPTION
- Service option.
- The base station shall set this field to the service option in use with the service option connection.

#### CTL_REC_LEN
- Service option control record length.
- The base station shall set this field to the number of octets included in the type-specific fields of this service option control record.

#### Type-specific fields
- Type-specific fields.
- The base station shall set these fields as specified by the requirements for the service option, which are defined external to this specification. See relevant service option specification.
3.7.3.3.22 TMSI Assignment Message

MSG_TAG: TASM

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>

</tr>
<tr>
<td>TMSI_EXP_TIME</td>
<td>24</td>
</tr>
</tbody>
</table>

TMSI_ZONE_LEN - TMSI zone length.

The base station shall set this field to the number of octets included in the TMSI_ZONE. The base station shall set this field to a value in the range 1 to 8 inclusive.

TMSI_ZONE - TMSI zone.

The base station shall set this field to the TMSI zone number, as specified in [27].

TMSI_CODE - Temporary mobile station identity code.

The base station shall set this field to the 32-bit TMSI code assigned to the mobile station.

If the base station is to deassign the TMSI, the base station shall set all the bits in this field to ‘1’.

TMSI_EXP_TIME - TMSI expiration time.

The base station shall set this field to the System Time in the units of $80 \text{ ms} \times 2^{12}$ when the TMSI is to expire.
3.7.3.3.2.23 Service Redirection Message

Type-specific fields \(8 \times \text{RECORD\_LEN}\)
```

4. **RETURN_IF_FAIL** - Return if fail indicator.
   The base station shall set this field to ‘1’ if the mobile station is required to return to the system from which it is being redirected upon failure to obtain service using the redirection criteria specified in this message; otherwise, the base station shall set this field to ‘0’.

5. **DELETE_TMSI** - Delete TMSI indicator.
   The base station shall set this field to ‘1’ if the mobile station is required to delete the TMSI assigned to the mobile station; otherwise, the base station shall set this field to ‘0’.

6. **REDIRECT_TYPE** - Redirect indicator.
   The base station shall set this field to the REDIRECT_TYPE value shown in Table 3.7.2.3.2.16-1 corresponding to the redirection type.

7. The base station shall include one occurrence of the following record:

8. **RECORD_TYPE** - Redirection record type.
   The base station shall set this field to the RECORD_TYPE value shown in Table 3.7.2.3.2.16-2 corresponding to the type of redirection specified by this record.

9. **RECORD_LEN** - Redirection record length.
   If RECORD_TYPE equals to ‘00000000’, the base station shall set this field to ‘00000000’; otherwise, the base station shall set this field to the number of octets in the type-specific fields of this redirection record.
Type-specific fields - Redirect record type-specific fields. The base station shall include type-specific fields based on the RECORD_TYPE of this redirection record.

If RECORD_TYPE is equal to ‘00000000’, the base station shall not include the type-specific fields.

If RECORD_TYPE is equal to ‘00000001’, the base station shall include the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXPECTED_SID</td>
<td>15</td>
</tr>
<tr>
<td>IGNORE_CDMA</td>
<td>1</td>
</tr>
<tr>
<td>SYS.getOrder</td>
<td>3</td>
</tr>
<tr>
<td>RESERVED</td>
<td>5</td>
</tr>
</tbody>
</table>

EXPECTED_SID - Expected SID. If the base station is redirecting the mobile station to a specific system, the base station shall set this field to the SID of that system; otherwise, the base station shall set this field to 0.

IGNORE_CDMA - Ignore CDMA Available indicator. The base station shall set this field to ‘1’ to indicate that the mobile station is to ignore the CDMA Capability Message on the analog system to which it is being redirected. The base station shall set this field to ‘0’ to indicate that the mobile station may discontinue service on the system to which it is being redirected if the mobile station receives a CDMA Capability Message with CDMA_AVAIL equal to ‘1’, and the preferred mode of the mobile station is CDMA.

SYS_ORDERING - System ordering. The base station shall set this field to the SYS_ORDERING value shown in Table 3.7.2.3.2.16-3 corresponding to the order in which the mobile station is to attempt to obtain service on an analog system.

RESERVED - Reserved bits. The base station shall set this field to ‘00000’.

If RECORD_TYPE is equal to ‘00000010’, the base station shall include the following fields:
<table>
<thead>
<tr>
<th>Subfield</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAND_CLASS</td>
<td>5</td>
</tr>
<tr>
<td>EXPECTED_SID</td>
<td>15</td>
</tr>
<tr>
<td>EXPECTED_NID</td>
<td>16</td>
</tr>
<tr>
<td>RESERVED</td>
<td>4</td>
</tr>
<tr>
<td>NUM_CHANS</td>
<td>4</td>
</tr>
</tbody>
</table>

NUM_CHANS occurrences of the following field:

\[
\{ (NUM_CHANS) \\
CDMA_CHAN \quad \text{11} \\
\} (NUM_CHANS)
\]

<table>
<thead>
<tr>
<th>Subfield</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>RESERVED</td>
<td>0-7 (as needed)</td>
</tr>
</tbody>
</table>

1. BAND_CLASS - Band class. The base station shall set this field to the CDMA band class, as specified in [30].
2. EXPECTED_SID - Expected SID. If the base station is redirecting the mobile station to a specific system, the base station shall set this field to the SID of that system; otherwise, the base station shall set this field to 0.
3. EXPECTED_NID - Expected NID. If the base station is redirecting the mobile station to a specific network, the base station shall set this field to the NID of that network; otherwise, the base station shall set this field to 65535.
4. RESERVED - Reserved bits. The base station shall set this field to ‘0000’.
5. NUM_CHANS - Number of CDMA Channels. The base station shall set this field to the number of occurrences of the CDMA_CHAN field in this record.
6. CDMA_CHAN - CDMA Channel number. For each CDMA Channel on which the mobile station is to attempt to acquire a CDMA system, the base station shall include one occurrence of this field specifying the associated CDMA Channel number.
7. RESERVED - Reserved bits. The base station shall add reserved bits as needed in order to make the length of the entire record equal to an integer number of octets. The base station shall set these bits to ‘0’.

3-541
3.7.3.2.24 Supplemental Channel Assignment Message

MSG_TAG: SCAM

<table>
<thead>
<tr>

</tbody>
</table>

Include the following record only if REV_INCLUDED is set to ‘1’:

```
{ REV_DTX_DURATION 4
  EXPL_REV_START_TIME 1
  REV_START_TIME 0 or 6
  USE_REV_DURATION 1
  REV_DURATION 0 or 8
  USE_REV_HDM_SEQ 1
  REV_LINKED_HDM_SEQ 0 or 2
  NUM_REV_CODES 3
  USE_T_ADD_ABORT 1
  USE_SCRM_SEQ_NUM 1
  SCRM_SEQ_NUM 0 or 4
  REV_PARMS_INCLUDED 1
  T_MULCHAN 0 or 3
  BEGIN_PREAMBLE 0 or 3
  RESUME_PREAMBLE 0 or 3
}
```

FOR_INCLUDED 1

(continues on next page)
Field | Length (bits)
---|---
FOR_SUP_CONFIG | 2
EXPL_FOR_START_TIME | 0 or 1
FOR_START_TIME | 0 or 6
USE_FOR_DURATION | 1
FOR_DURATION | 0 or 8
USE_FOR_HDM_SEQ | 0 or 1
FOR_LINKED_HDM_SEQ | 0 or 2

Include the following record only if FOR_INCLUDED is set to ‘1’:

{ FOR_SUP_CONFIG
　EXPL_FOR_START_TIME 0 or 1
　FOR_START_TIME 0 or 6
　USE_FOR_DURATION 1
　FOR_DURATION 0 or 8
　USE_FOR_HDM_SEQ 0 or 1
　FOR_LINKED_HDM_SEQ 0 or 2
}

Include the following fields and records only if
FOR_INCLUDED is set to ‘1’ and
FOR_SUP_CONFIG is set to ‘10’ or ‘11’:

NUM_SUP_PILOTS | 3
NUM_FOR_SUP | 3

Include NUM_SUP_PILOTS occurrences of the following
record only if FOR_INCLUDED is set to ‘1’ and
FOR_SUP_CONFIG is set to ‘10’ or ‘11’:

{ (NUM_SUP_PILOTS)
　PILOT_PN | 9
　EXPL_CODE_CHAN | 1

If EXPL_CODE_CHAN is set to ‘1’, for each PILOT_PN
include NUM_FOR_SUP occurrences of the following field:

{ (NUM_FOR_SUP)
　SUP_CODE_CHAN | 0 or 8
}

If EXPL_CODE_CHAN is set to ‘0’, the following field is
included:

BASE_CODE_CHAN | 0 or 8

{ (NUM_SUP_PILOTS)
}

3 USE_RETRY_DELAY | Assign or Retry Indicator.
The base station shall set this field to ‘1’ to indicate that this message contains a retry delay time; otherwise, the base station shall set this field to ‘0’ to indicate that no RETRY_DELAY has been included.

RETRY_DELAY - Supplemental Channel Request Message retry delay.

If USE_RETRRY_DELAY is set to ‘1’, the base station shall include and set this field to the duration of the delay interval in units of 320 ms (4 frames) from the next 80 ms system time boundary during which the mobile station is not permitted to send a Supplemental Channel Request Message. The base station shall set RETRY_DELAY to ‘11111111’ to indicate that the mobile station is to refrain from sending Supplemental Channel Request Messages indefinitely.

REV_INCLUDED - Reverse Supplemental Code Channel configuration indicator.

The base station shall set this field to ‘1’ to indicate that this message contains assignment information for Reverse Supplemental Code Channels; otherwise, the base station shall set this field to ‘0’.

If REV_INCLUDED is set to ‘1’, then the base station shall include the following fields, otherwise the base station shall omit the following fields:

REV_DTX_DURATION - Reverse Discontinuous Transmission Duration.

The base station shall set this field to the maximum duration of time in units of 20 ms that the mobile station is allowed to stop transmission on a Reverse Supplemental Code Channel within the reverse assignment duration. The base station shall set this field to ‘0000’ if the mobile station is to stop using a Reverse Supplemental Code Channel once it has stopped transmitting on that Reverse Supplemental Code Channel. The base station shall set this field to ‘1111’ if the mobile station is allowed to resume transmission on a Reverse Supplemental Code Channel at any time within the reverse assignment duration.

EXPL_REV_START_TIME - Explicit Reverse Supplemental Code Channel assignment start time indicator.

This field indicates whether a start time for the specified Reverse Supplemental Code Channel Assignment is specified in this message. If a REV_START_TIME is specified in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’. If EXPL_REV_START_TIME is set to ‘1’, then the base station shall set USE_REV_HDM_SEQ to ‘0’.

REV_START_TIME - Explicit start time for Reverse Supplemental Code Channel assignment.
If EXPL_REV_START_TIME is included and set to ‘1’, the base
station shall include and set this field to the System Time, in
units of 80 ms (modulo 64), at which the mobile station may
start transmitting on the specified number of Reverse
Supplemental Code Channels. If EXPL_REV_START_TIME is
omitted or set to ‘0’, the base station shall omit this field.

USE_REV_DURATION - Use reverse duration indicator.

The base station shall set this field to ‘1’ if the
REV_DURATION field is included in the message; otherwise,
the base station shall set this field to ‘0’. If the mobile station
is granted permission to transmit on Reverse Supplemental
Code Channels (i.e., NUM_REV_CODES is not ‘000’) then a
value of ‘0’ for this field indicates an infinite Reverse
Supplemental Code Channel assignment duration (i.e., the
mobile station may transmit on Reverse Supplemental Code
Channels until it receives a subsequent Supplemental Channel
Assignment Message or a General Handoff Direction Message
that specifies an updated REV_DURATION or an updated
value of NUM_REV_CODES).

REV_DURATION - Duration of Reverse Supplemental Code Channel assignment.

The base station shall include this field only if the
USE_REV_DURATION field is included and set to ‘1’. If this
field is included, this field indicates the allocated duration, in
units of 80 ms, during which the mobile station may transmit
on Reverse Supplemental Code Channels.

USE_REV_HDM_SEQ - Use Reverse General Handoff Direction Message sequence
number indicator.

The base station shall set this field to ‘1’ to indicate that this
Reverse Supplemental Code Channel assignment shall take
effect at the same time as a corresponding General Handoff
Direction Message; otherwise, the base station shall set this
field to ‘0’. If USE_REV_HDM_SEQ is set to ‘1’, then the base
station shall set EXPL_REV_START_TIME to ‘0’.

REV_LINKED_HDM_SEQ - Sequence number of the reverse linked General Handoff
Direction Message.

If USE_REV_HDM_SEQ is included and set to ‘1’, then the
base station shall set this field to the sequence number of the
General Handoff Direction Message (HDM_SEQ) to which this
Reverse Supplemental Code Channel assignment is linked.

NUM_REV_CODES - Number of Reverse Supplemental Code Channels.

The base station shall set this field to the number of Reverse
Supplemental Code Channels that are assigned to the mobile
station.

USE_T_ADD_ABORT - Reverse use T_ADD abort indicator.
The base station shall set this field to ‘1’ to indicate that the mobile station is to utilize the T_ADD Reverse Supplemental Code Channel abort feature for this reverse assignment; otherwise, the base station shall set this field to ‘0’.

USE_SCRM_SEQ_NUM - Use Supplemental Channel Request Message sequence number indicator.

The base station shall set this field to ‘1’ if the SCRM_SEQ_NUM field is included in this message; otherwise, the base station shall set this field to ‘0’.

SCRM_SEQ_NUM - Supplemental Channel Request Message sequence number.

If USE_SCRM_SEQ_NUM is set to ‘1’, the base station shall set this field to the sequence number corresponding to the SCRM_SEQ_NUM field in a Supplemental Channel Request Message to which the mobile station is to match this message; otherwise, the base station shall omit this field.

REV_PARMS_INCLUDED - Reverse additional parameters included flag.

The base station shall set this field to ‘1’ if the following three fields (T_MULCHAN, BEGIN_PREAMBLE, and RESUME_PREAMBLE) are included in this message; otherwise, the base station shall set this field to ‘0’.

T_MULCHAN - Supplemental Channel Request Message pilot strength reporting offset.

If REV_PARMS_INCLUDED is set to ‘1’, the base station shall include this field and set this field to the threshold offset that the mobile station is to use when reporting neighbor pilot strength measurements in a Supplemental Channel Request Message. The mobile station is to interpret this field as an offset to T_ADD ranging from 0.5 dB (corresponding to T_MULCHAN = ‘000’) to 4.0 dB (corresponding to T_MULCHAN = ‘111’) in 0.5 dB increments.

BEGIN_PREAMBLE - Number of preamble frames on Reverse Supplemental Code Channels at the beginning of transmission on Reverse Supplemental Code Channel.

If REV_PARMS_INCLUDED is set to ‘1’, the base station shall include this field and set this field to the number of Reverse Supplemental Code Channel preamble frames that the mobile station is to send when beginning transmission on Reverse Supplemental Code Channels.

RESUME_PREAMBLE - Number of preamble frames on Reverse Supplemental Code Channels at the resumption of transmission.

If REV_PARMS_INCLUDED is set to ‘1’, the base station shall include this field and set this field to the number of Reverse Supplemental Code Channel preamble frames that the mobile station is to send when resuming transmission on a Reverse Supplemental Code Channel following an autonomous suspension of transmission on an allocated Supplemental Code Channel.
FOR_INCLUDED - Forward Supplemental Code Channel configuration indicator.
The base station shall set this field to ‘1’ to indicate that this message contains assignment information for Forward Supplemental Code Channels; otherwise, the base station shall set this field to ‘0’.

If FOR_INCLUDED is set to ‘1’, then the base station shall include the remaining fields in this message, otherwise the base station shall omit all of the following except for RESERVED.

FOR_SUP_CONFIG - Forward Supplemental Code Channel configuration indicator.
The base station shall set this field to ‘00’ to indicate that the mobile station is to stop processing the Forward Supplemental Code Channels at the implicit action time of the message.
The base station shall set this field to ‘01’ to indicate that the mobile station is to start processing the Forward Supplemental Code Channels in the Code Channel List at the implicit, explicit, or linked start time specified by this message (see 2.6.6.2.5.1).
The base station shall set this field to ‘10’ if the Forward Supplemental Code Channels are specified in the message and the mobile station is to update its Code Channel List and stop processing the Forward Supplemental Code Channels at the implicit action time of the message.
The base station shall set this field to ‘11’ if the Forward Supplemental Code Channels are specified in the message and the mobile station is to start processing the Forward Supplemental Code Channels at the implicit, explicit, or linked start time specified by this message (see 2.6.6.2.5.1).

EXPL_FOR_START_TIME - Explicit forward start time indicator.
This field indicates whether an explicit Forward Supplemental Code Channel start time is specified in this message.
The base station shall include this field only if FOR_SUP_CONFIG is set to ‘01’ or ‘11’. If a FOR_START_TIME is specified in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

If EXPL_FOR_START_TIME is set to ‘1’, then the base station shall set USE_FOR_HDM_SEQ to ‘0’.

The following field is included only if EXPL_FOR_START_TIME is included and set to ‘1’:

FOR_START_TIME - Start time of the Forward Supplemental Code Channel assignment.
The base station shall include this field only if FOR_SUP_CONFIG is set to ‘01’ or ‘11’. If the EXPL_FOR_START_TIME field is set to ‘1’, the base station shall set this field to the System Time, in units of 80 ms (modulo 64), at which the mobile station is to start processing the Forward Supplemental Code Channels. If EXPL_FOR_START_TIME is set to ‘0’, the base station shall omit this field.

USE_FOR_DURATI - Use forward duration indicator.

The base station shall set this field to ‘1’ if FOR_DURATION is included in the message; otherwise, the base station shall set this field to ‘0’.

If FOR_SUP_CONFIG is set to ‘01’ or ‘11’, then the base station may set this field to ‘0’ to indicate that the mobile station is to be assigned an infinite Forward Supplemental Code Channel assignment duration (i.e., the mobile station is to continue processing Forward Supplemental Code Channels until it receives a subsequent Supplemental Channel Assignment Message or a General Handoff Direction Message that specifies an updated FOR_DURATION). Otherwise, the base station may set this field to ‘1’ to indicate that the mobile station is to be given a Forward Supplemental Code Channel assignment for the duration specified by the FOR_DURATI field.

If FOR_SUP_CONFIG is set to ‘00’ or ‘10’, then the base station shall set USE_FOR_DURATI to ‘0’.

FOR_DURATI - Duration of Forward Supplemental Code Channel assignment.

The base station shall include this field only if USE_FOR_DURATI is included and set to ‘1’. If this field is included, this field indicates allocated duration, in units of 80 ms, during which the mobile station is to process the Forward Supplemental Code Channels.

USE_FOR_HDM_SEQ - Use Forward General Handoff Direction Message sequence number indicator.

This field indicates whether processing of the Forward Supplemental Code Channels shall take effect at the same time as a corresponding General Handoff Direction Message.

The base station shall include this field only if FOR_SUP_CONFIG is equal to ‘01’ or ‘11’. If this message is linked with a General Handoff Direction Message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’. If USE_FOR_HDM_SEQ is set to ‘1’, then the base station shall set EXPL_FOR_START_TIME to ‘0’.

FOR_LINKED_HDM_SEQ - Sequence number of the General Handoff Direction Message.
If the USE_FOR_HDM_SEQ field is included and set to ‘1’, the base station shall set this field to the sequence number of the General Handoff Direction Message (HDM_SEQ) to which this Forward Supplemental Code Channel assignment is linked; otherwise, if USE_FOR_HDM_SEQ is not included or is set to ‘0’, then base station shall omit this field.

NUM_SUP_PILOTS - Number of pilots in the Active Set which have at least one associated Supplemental Code Channel.

NUM_FOR_SUP - Number of Forward Supplemental Code Channels.

If FOR_SUP_CONFIG is included and is set to ‘10’ or ‘11’, the base station shall include this field and shall set this field to the number of pilots for which there is at least one associated Supplemental Code Channel. This field shall not be included if FOR_SUP_CONFIG is omitted or is set to ‘01’ or ‘00’.

If FOR_SUP_CONFIG is included and is set to ‘10’ or ‘11’, the base station shall include NUM_SUP_PILOTS occurrences of the following record, one for each pilot for which there is at least one associated Supplemental Code Channel:

PILOT_PN - Pilot PN sequence offset index.

EXPL_CODE_CHAN - Explicit code channel indicator

If EXPL_CODE_CHAN is set to ‘1’, then the base station shall include NUM_FOR_SUP occurrences of the following field, one for each pilot which has been included:

SUP_CODE_CHAN - Supplemental Code Channel index.
The base station shall set this field to the code channel index (see [2]) in the range 1 to 63 inclusive of the Supplemental Code Channel associated with this pilot.

If EXPL_CODE_CHAN is set to ‘0’, then the base station shall include the following field:

**BASE_CODE_CHAN** - Base code channel index.

If EXPL_CODE_CHAN is equal to ‘0’, the base station shall include this field and set it to the base code channel index (see [2]) in the range of 1 to \((63 - NUM_FOR_SUP + 1)\), inclusive, that the mobile station is to use as the first Forward Supplemental Code Channel associated with this pilot. The mobile station is to use NUM_FOR_SUP successive code channels beginning with index BASE_CODE_CHAN (i.e., BASE_CODE_CHAN through BASE_CODE_CHAN + NUM_FOR_SUP – 1) for the Forward Supplemental Code Channels associated with this pilot.

The base station shall not include this field if EXPL_CODE_CHAN is equal to ‘1’ or if EXPL_CODE_CHAN is not included.
### 3.7.3.2.25 Power Control Message

```

PWR_CNTL_STEP - Power control step size

The base station shall set this field to the closed loop power control step size parameter shown in Table 3.7.3.3.2.25-1 corresponding to the power control step size that the mobile station is to use for closed loop power control.
Table 3.7.3.3.25-1. Closed Loop Power Control

<td>0.25</td>
</tr>
</tbody>
</table>

All other PWR_CNTL_STEP values are reserved.

1 USE_TIME - Use action time indicator.

This field indicates whether an ACTION_TIME is specified in this message.

If an ACTION_TIME is specified in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

2 ACTION_TIME - Action time.

If the USE_TIME field is set to ‘1’, the base station shall set this field to the System Time minus $\text{FRAME_{OFFSET}} \times 1.25$ ms, in units of 80 ms (modulo 64), at which the message is to take effect. If the USE_TIME field is set to ‘0’, the base station shall omit this field.

3 FPC_INCL - Forward Link Power Control parameter included indicator.

If the forward power control related information is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

4 FPC_MODE - Forward Power Control Operation Mode Indicator

If FPC_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set the value to the forward power control operation mode (see [2]).

5 FPC_PRI_CHAN - Power Control Subchannel indicator.

If FPC_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to ‘0’ if the mobile station is to perform the primary inner loop estimation on the received Forward Fundamental Channel. The base station shall set this field to ‘1’ if the mobile station is to perform the primary inner loop estimation on the received Forward Dedicated Control Channel.

If only the Fundamental Channel is assigned, the base station shall set this field to ‘0’. If only the Dedicated Control Channel is assigned, the base station shall set this field to ‘1’.
If the F-CPCCH is assigned, the base station will multiplex the Power Control Subchannel on the F-CPCCH; otherwise:

If this field is set to ‘0’, the base station will multiplex the Power Control Subchannel on the Forward Fundamental Channel; otherwise, the base station will multiplex the Power Control Subchannel on the Forward Dedicated Control Channel.

**FPC_OLPC_FCH_INCL** - Fundamental Channel Outer Loop Power Control parameter included indicator.

If FPC_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

If the forward link fundamental channel outer loop power control parameters are included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**FPC_FCH_FER** - Fundamental channel target Frame Error Rate.

If FPC_OLPC_FCH_INCL is included and set to ‘1’, the base station shall set this field to the target Frame Error Rate on the Forward Fundamental Channel, as specified in Table 3.7.3.3.2.25-2; otherwise, the base station shall omit this field.

**Table 3.7.3.3.2.25-2. Target Frame Error Rate**

<table>
<thead>
<tr>
<th>FER (Binary)</th>
<th>Frame Error Rate</th>
</tr>
</thead>
<tbody>
<tr>
<td>00000</td>

<td>00001-10100</td>
<td>0.5% -10% (in units of 0.5%)</td>
</tr>
<tr>
<td>10101-11001</td>
<td>11% - 15% (in units of 1.0%)</td>
</tr>
<tr>
<td>11010-11110</td>
<td>18% - 30% (in units of 3.0%)</td>
</tr>
<tr>
<td>11111</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

**FPC_FCH_MIN_SETPT** - Minimum Fundamental Channel Outer Loop Eb/Nt setpoint

If FPC_OLPC_FCH_INCL is included and set to ‘1’, the base station shall set this field to minimum Fundamental Channel Outer Loop Eb/Nt setpoint, in units of 0.125 dB; otherwise, the base station shall omit this field.

The base station shall set this field to ‘11111111’, when it directs the mobile station to set this Eb/Nt **setpoint to the current setpoint used at the mobile station on this channel.**

**FPC_FCH_MAX_SETPT** - Maximum Fundamental Channel Outer Loop Eb/Nt setpoint

If FPC_OLPC_FCH_INCL is included and set to ‘1’, the base station shall set this field to maximum Fundamental Channel Outer Loop Eb/Nt setpoint, in units of 0.125 dB; otherwise, the base station shall omit this field.
The base station shall set this field to ‘11111111’, when it directs the mobile station to set this Eb/Nt Eb/No setpoint to the current setpoint used at the mobile station on this channel.

FPC_O LPC_DCCH_INCL - Dedicated Control Channel Outer Loop Power Control parameter included indicator.

If FPC_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

If the forward link Dedicated Control Channel outer loop power control parameters are included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

FPC_DCCH_FER - Dedicated Control Channel target Frame Error Rate.

If FPC_O LPC_DCCH_INCL is included and set to ‘1’, the base station shall set this field to the target Frame Error Rate on the Forward Dedicated Control Channel, as specified in Table 3.7.3.3.2.25-2; otherwise, the base station shall omit this field.

FPC_DCCH_MIN_SETPT - Minimum Dedicated Control Channel Outer Loop Eb/Nt setpoint.

If FPC_O LPC_DCCH_INCL is included and set to ‘1’, the base station shall set this field to minimum Dedicated Control Channel Outer Loop Eb/Nt setpoint, in units of 0.125 dB; otherwise, the base station shall omit this field.

The base station shall set this field to ‘11111111’, when it directs the mobile station to set this Eb/Nt Eb/No setpoint to the current setpoint used at the mobile station on this channel.

FPC_DCCH_MAX_SETPT - Maximum Dedicated Control Channel Outer Loop Eb/Nt setpoint.

If FPC_O LPC_DCCH_INCL is included and set to ‘1’, the base station shall set this field to maximum Dedicated Control Channel Outer Loop Eb/Nt setpoint, in units of 0.125 dB; otherwise, the base station shall omit this field.

The base station shall set this field to ‘11111111’, when it directs the mobile station to set this Eb/Nt Eb/No setpoint to the current setpoint used at the mobile station on this channel.

FPC_SEC_CHAN - Master Supplemental channel index.

If FPC_INCL is set to ‘1’ and FPC_MODE is set to ’001’, ’010’, ‘101’, or ‘110’, the base station shall set this field to the master Supplemental Channel index; otherwise, the base station shall omit this field.
NUM_SUP – Number of Supplemental Channels.

If FPC_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field to the total number of the Supplemental Channels.

The base station shall include NUM_SUP occurrences of the following record:

SCH_ID  - Supplemental channel index.

The base station shall set this field to the Supplemental Channel index.

FPC_SCH_FER  - Supplemental channel target Frame Error Rate.

The base station shall set this field to the target Frame Error Rate on the Supplemental Channel, as specified in Table 3.7.3.3.2.25-2.

FPC_MIN_SCH_MIN_SETPT  - Minimum Supplemental Channel outer loop Eb/Nt setpoint.

The base station shall set this field to minimum Supplemental Channel Outer Loop Eb/Nt setpoint, in units of 0.125 dB.

The base station shall set this field to ‘11111111’, when it directs the mobile station to set this Eb/Nt setpoint to the current setpoint used at the mobile station on this channel.

FPC_MAX_SCH_MAX_SETPT  - Maximum Supplemental Channel outer loop Eb/Nt setpoint.

The base station shall set this field to maximum Supplemental Channel Outer Loop Eb/Nt setpoint, in units of 0.125 dB.

The base station shall set this field to ‘11111111’, when it directs the mobile station to set this Eb/Nt setpoint to the current setpoint used at the mobile station on this channel.

FPC_THRESH_INCL  - Setpoint Report Threshold included indicator.

If FPC_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

If FPC_SETPT_THRESH is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

FPC_SETPT_THRESH  - Setpoint Report Threshold.

If FPC_THRESH_INCL is set to ‘1’, the base station shall set the value to FPC_SETPT_THRESH (in units of 0.125 dB) above which the outer loop report message will be sent by the mobile station; otherwise, the base station shall omit this field.

FPC_THRESH_SCH_INCL  - SCH Setpoint Report Threshold included indicator.

If FPC_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:
If FPC_SETPT_THRESH_SCH is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

FPC_SETPT_THRESH_SCH - SCH Setpoint Report Threshold.

If FPC_THRESH_SCH_INCL is set to ‘1’, the base station shall set the value to FPC_SETPT_THRESH_SCH (in units of 0.125 dB) above which the outer loop report message will be sent by the mobile station; otherwise, the base station shall omit this field.

RPC_INCL - Reverse Link Power Control parameter included indicator.

If the reverse power control related information is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

RPC_NUM_REC - Number of records for Reverse Link Power Control.

If RPC_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field to one less than the number of records included in this message.

If RPC_NUM_REC is included in this message, the base station shall include RPC_NUM_REC occurrences of the following record:

RPC_ADJ_REC_TYPE - Reverse Link Power Control adjustment record type.

The base station shall set this field to the value shown in Table 3.7.3.3.2.25-3 corresponding to the type of adjustment that is to be used.

Table 3.7.3.3.2.25-3. RPC_ADJ_REC_TYPE and RPC_ADJ_REC_LEN fields

All other values are reserved.

RPC_ADJ_REC_LEN - Reverse Link Power Control adjustment record length.
If RPC_ADJ_REC_TYPE is not equal to '0100', the base station shall set this field to the number of octets in the type-specific fields of this adjustment record as given in Table 3.7.3.3.2.25-3.

If RPC_ADJ_REC_TYPE is equal to '0100', the base station shall set this field to '0000'.

EXT_RPC_ADJ_REC_LEN - Reverse Link Power Control adjustment record length.

If RPC_ADJ_REC_TYPE is not equal to '0100', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

If RPC_ADJ_REC_TYPE is equal to '0100', the base station shall set this field to the number of octets in the type-specific fields of this adjustment record as given in Table 3.7.3.3.2.25-3.

Type-specific fields - Reverse Link Power Control adjustment record type-specific fields.

The base station shall include type-specific fields based on the RPC_ADJ_REC_TYPE of this adjustment record, as specified as below.
If RPC_ADJ_REC_TYPE is equal to ‘0000’, the base station shall set type-specific fields as specified in Table 3.7.3.3.2.25-4.

FCH_INCL - FCH channel adjustment gain included indicator.

If FCH_CHAN_ADJ_GAIN is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

FCH_CHAN_ADJ_GAIN - Channel adjustment gain for Reverse Fundamental Channel.

If FCH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set each field to the value of the gain adjustment that the mobile station is to make for the Reverse Fundamental Channel. The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB. The base station shall set the value in the range from –48 to 48 inclusive.

DCCH_INCL - DCCH channel adjustment gain included indicator.

If DCCH_CHAN_ADJ_GAIN is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

DCCH_CHAN_ADJ_GAIN - Channel adjustment gain for the Reverse Dedicated Control Channel.
If DCCH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set each field to the value of the gain adjustment that the mobile station is to make for the Reverse Dedicated Control Channel. The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB. The base station shall set the value in the range from −48 to 48 inclusive.

SCH0_INCL - SCH0 channel adjustment gain included indicator.

If SCH0_CHAN_ADJ_GAIN is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

SCH0_CHAN_ADJ_GAIN - Channel adjustment gain for Reverse Supplemental Channel 0.

If SCH0_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set each field to the value of the gain adjustment that the mobile station is to make for the Reverse Supplemental Channel 0. The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB. The base station shall set the value in the range from −48 to 48 inclusive.

SCH1_INCL - SCH1 channel adjustment gain included indicator.

If SCH1_CHAN_ADJ_GAIN is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

SCH1_CHAN_ADJ_GAIN - Channel adjustment gain for Reverse Supplemental Channel 1.

If SCH1_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set each field to the value of the gain adjustment that the mobile station is to make for the Supplemental Channel 1. The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB. The base station shall set the value in the range from −48 to 48 inclusive.

REV_ACKCH_INCL - Reverse Acknowledgment Channel channel adjustment gain included indicator.

If REV_ACKCH_CHAN_ADJ_GAIN is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

REV_ACKCH_CHAN_ADJ_GAIN - Channel adjustment gain for Reverse Acknowledgment Channel.
If REV_ACKCH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set each field to the value of the gain adjustment that the mobile station is to make for the Reverse Acknowledgment Channel. The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB. The base station shall set the value in the range from -24 to 24 inclusive.

REV_CQICH_INCL - Reverse Channel Quality Indicator Channel channel adjustment gain included indicator.

If REV_CQICH_CHAN_ADJ_GAIN is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

REV_CQICH_CHAN_ADJ_GAIN - Channel adjustment gain for Reverse Channel Quality Indicator Channel.

If REV_CQICH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set each field to the value of the gain adjustment that the mobile station is to make for the Reverse Channel Quality Indicator Channel. The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB. The base station shall set the value in the range from -16 to 16 inclusive.

RESERVED - Reserved bits.

The base station shall add reserved bits as needed in order to make the length of the entire record equal to an integer number of octets. The base station shall set these bits to ‘0’.

If RPC_ADJ_REC_TYPE is equal to ‘0001’, the base station shall set type-specific fields as specified in Table 3.7.3.3.2.25-5.
Table 3.7.3.3.25-5. Type Specific Fields for RECORD_TYPE = ‘0001’

</table>

**RL_ATT_ADJ_GAIN_TYPE** - Reverse Link Attribute Adjustment Gain value type indicator.

If the following fields are set to the nominal attribute gain adjustment values that the mobile station is to use for the transmission attributes (relative to Nominal_Attribute_Gain specified in [2]), the base station shall set this field to ‘0’. If the following fields are set to the pilot reference level adjustment values that the mobile station is to use for the transmission attributes (relative to Pilot_Reference_Level specified in [2]), the base station shall set this field to ‘1’.

**RC3_RC5_20MS_INCL** - Reverse Link Attribute Adjustment Gain for Radio Configuration 3 or 5 of 20 ms frame included indicator.

If Reverse Link Attribute adjustment Gain for Radio Configuration 3 or 5 of 20 ms frame is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**RL_ATT_ADJ_GAIN_1500** - Reverse Link Attribute Adjustment Gain for the transmission rate 1500 bits/s.

If RC3_RC5_20MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 1500 bits/s, convolutional code and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 1500 bits/s, convolutional code and 20ms frame.
The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

**RL_ATT_ADJ_GAIN_2700 -** Reverse Link Attribute Adjustment Gain for the transmission rate 2700 bits/s.

If RC3_RC5_20MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 2700 bits/s, convolutional code and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 2700 bits/s, convolutional code and 20ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

**RL_ATT_ADJ_GAIN_4800 -** Reverse Link Attribute Gain Adjustment for the transmission rate 4800 bits/s.

If RC3_RC5_20MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 4800 bits/s, convolutional code and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 4800 bits/s, convolutional code and 20ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

**RL_ATT_ADJ_GAIN_9600 -** Reverse Link Attribute Gain Adjustment for the transmission rate 9600 bits/s.

If RC3_RC5_20MS_INCL is set to ‘0’, the base station shall omit this field.
If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 9600 bits/s, convolutional code and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 9600 bits/s, convolutional code and 20ms frame.

The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

RC4_RC6_20MS_INCL - Reverse Link Attribute Adjustment Gain for Radio Configuration 4 or 6 of 20ms frame included indicator.

If Reverse Link Attribute Adjustment Gain for Radio Configuration 4 or 6 of 20ms frame is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

RL_ATT_ADJ_GAIN_1800 - Reverse Link Attribute Gain Adjustment for the transmission rate 1800 bits/s.

If RC4_RC6_20MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 1800 bits/s, convolutional code and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 1800 bits/s, convolutional code and 20ms frame.

The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_3600 - Reverse Link Attribute Adjustment Gain for the transmission rate 3600 bits/s.

If RC4_RC6_20MS_INCL is set to ‘0’, the base station shall omit this field.
If RC4_RC6_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 3600 bits/s, convolutional code and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 3600 bits/s, convolutional code and 20ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_7200 - Reverse Link Attribute Adjustment Gain for the transmission rate 7200 bits/s.

If RC4_RC6_20MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 7200 bits/s, convolutional code and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_20MS_INCL is set to ‘1’ and NORM_ATT_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 7200 bits/s, convolutional code and 20ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_14400- Reverse Link Attribute Adjustment Gain for the transmission rate 14400 bits/s.

If RC4_RC6_20MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 14400 bits/s, convolutional code and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.
If RC4_RC6_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 14400 bits/s, convolutional code and 20ms frame.

The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

5MS_INCL - 5ms frame Reverse Link Attribute Adjustment Gain included indicator.

If Reverse Link Attribute Adjustment Gain for 5ms frame is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

RL_ATT_ADJ_GAIN_9600_5MS - Reverse Link Attribute Adjustment Gain for the transmission rate 9600 bits/s with 5ms frame.

If 5MS_INCL is set to ‘0’, the base station shall omit this field.

If 5MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 9600 bits/s, convolutional code and 5ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If 5MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 9600 bits/s, convolutional code and 5ms frame. The base station shall set the correction factor expressed as a two's complement value in units of 0.125 dB.

RC3_RC5_40MS_INCL - Reverse Link Attribute Adjustment Gain for Radio Configuration 3 or 5 of 40 ms frame included indicator.

If Reverse Link Attribute adjustment Gain for Radio Configuration 3 or 5 of 40 ms frame is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

RL_ATT_ADJ_GAIN_1350_40MS - Reverse Link Attribute Adjustment Gain for the transmission rate 1350 bits/s.

If RC3_RC5_40MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 1350 bits/s, convolutional code and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.
If RC3_RC5_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 1350 bits/s, convolutional code and 40ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

**RL_ATT_ADJ_GAIN_2400_40MS** - Reverse Link Attribute Adjustment Gain for the transmission rate 2400 bits/s.

If RC3_RC5_40MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 2400 bits/s, convolutional code and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

**RL_ATT_ADJ_GAIN_4800_40MS** - Reverse Link Attribute Gain Adjustment for the transmission rate 4800 bits/s.

If RC3_RC5_40MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 4800 bits/s, convolutional code and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

**RL_ATT_ADJ_GAIN_9600_40MS** - Reverse Link Attribute Gain Adjustment for the transmission rate 9600 bits/s.
If $RC3\_RC5\_40MS\_INCL$ is set to ‘0’, the base station shall omit this field.

If $RC3\_RC5\_40MS\_INCL$ is set to ‘1’ and $RL\_ATT\_ADJ\_GAIN\_TYPE$ is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 9600 bits/s, convolutional code and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If $RC3\_RC5\_40MS\_INCL$ is set to ‘1’ and $RL\_ATT\_ADJ\_GAIN\_TYPE$ is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 9600 bits/s, convolutional code and 40ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

$RC4\_RC6\_40MS\_INCL$ - Reverse Link Attribute Adjustment Gain for Radio Configuration 4 or 6 of 40ms frame included indicator.

If Reverse Link Attribute Adjustment Gain for Radio Configuration 4 or 6 of 40ms frame is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

$RL\_ATT\_ADJ\_GAIN\_1800\_40MS$ - Reverse Link Attribute Gain Adjustment for the transmission rate 1800 bits/s.

If $RC4\_RC6\_40MS\_INCL$ is set to ‘0’, the base station shall omit this field.

If $RC4\_RC6\_40MS\_INCL$ is set to ‘1’ and $RL\_ATT\_ADJ\_GAIN\_TYPE$ is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 1800 bits/s, convolutional code and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If $RC4\_RC6\_40MS\_INCL$ is set to ‘1’ and $RL\_ATT\_ADJ\_GAIN\_TYPE$ is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 1800 bits/s, convolutional code and 40ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

$RL\_ATT\_ADJ\_GAIN\_3600\_40MS$ - Reverse Link Attribute Adjustment Gain for the transmission rate 3600 bits/s.

If $RC4\_RC6\_40MS\_INCL$ is set to ‘0’, the base station shall omit this field.
If RC4_RC6_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 3600 bits/s, convolutional code and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 3600 bits/s, convolutional code and 40ms frame.

The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_7200_40MS - Reverse Link Attribute Adjustment Gain for the transmission rate 7200 bits/s.

If RC4_RC6_40MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 7200 bits/s, convolutional code and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_40MS_INCL is set to ‘1’ and NORM_ATT_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 7200 bits/s, convolutional code and 40ms frame.

The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_14400_40MS - Reverse Link Attribute Adjustment Gain for the transmission rate 14400 bits/s.

If RC4_RC6_40MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 14400 bits/s, convolutional code and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.
If RC4_RC6_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 14400 bits/s, convolutional code and 40ms frame.

The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

RC3_RC5_80MS_INCL - Reverse Link Attribute Adjustment Gain for Radio Configuration 3 or 5 of 80 ms frame included indicator.

If Reverse Link Attribute adjustment Gain for Radio Configuration 3 or 5 of 80 ms frame is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

RL_ATT_ADJ_GAIN_1200_80MS - Reverse Link Attribute Adjustment Gain for the transmission rate 1200 bits/s.

If RC3_RC5_80MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 1200 bits/s, convolutional code and 80ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC3_RC5_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 1200 bits/s, convolutional code and 80ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_2400_80MS - Reverse Link Attribute Adjustment Gain for the transmission rate 2400 bits/s.

If RC3_RC5_80MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 2400 bits/s, convolutional code and 80ms frame. The base station shall set the value in the range from –48 to 48 inclusive.
If RC3_RC5_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 2400 bits/s, convolutional code and 80ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_4800_80MS - Reverse Link Attribute Gain Adjustment for the transmission rate 4800 bits/s.

If RC3_RC5_80MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 4800 bits/s, convolutional code and 80ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC3_RC5_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 4800 bits/s, convolutional code and 80ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_9600_80MS - Reverse Link Attribute Gain Adjustment for the transmission rate 9600 bits/s.

If RC3_RC5_80MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 9600 bits/s, convolutional code and 80ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC3_RC5_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 9600 bits/s, convolutional code and 80ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RC4_RC6_80MS_INCL - Reverse Link Attribute Adjustment Gain for Radio Configuration 4 or 6 of 80ms frame included indicator.
If Reverse Link Attribute Adjustment Gain for Radio Configuration 4 or 6 of 80ms frame is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**RL_ATT_ADJ_GAIN_1800_80MS** - Reverse Link Attribute Gain Adjustment for the transmission rate 1800 bits/s.

If RC4_RC6_80MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 1800 bits/s, convolutional code and 80ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 1800 bits/s, convolutional code and 80ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

**RL_ATT_ADJ_GAIN_3600_80MS** - Reverse Link Attribute Adjustment Gain for the transmission rate 3600 bits/s.

If RC4_RC6_80MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 3600 bits/s, convolutional code and 80ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 3600 bits/s, convolutional code and 80ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

**RL_ATT_ADJ_GAIN_7200_80MS** - Reverse Link Attribute Adjustment Gain for the transmission rate 7200 bits/s.

If RC4_RC6_80MS_INCL is set to ‘0’, the base station shall omit this field.
If RC4_RC6_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 7200 bits/s, convolutional code and 80ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_80MS_INCL is set to ‘1’ and NORM_ATT_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 7200 bits/s, convolutional code and 80ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

**RL_ATT_ADJ_GAIN_14400_80MS** - Reverse Link Attribute Adjustment Gain for the transmission rate 14400 bits/s.

If RC4_RC6_80MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 14400 bits/s, convolutional code and 80ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 14400 bits/s, convolutional code and 80ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

**RESERVED** - Reserved bits.

The base station shall add reserved bits as needed in order to make the length of the entire record equal to an integer number of octets. The base station shall set these bits to ‘0’.

If RPC_ADJ_REC_TYPE is equal to ‘0010’, the base station shall set type-specific fields as specified in Table 3.7.3.3.2.25-6.
Table 3.7.3.2.25-6. Type Specific Fields for
RECORD_TYPE = '0010'

1. **CODE_TYPE** - Coding type indicator.
   - If the following corresponding gain adjustment fields apply for the convolutional code, the base station shall set this field to '0'. If the following corresponding gain adjustment fields apply for the Turbo code, the base station shall set this field to '1'.

2. **RL_ATT_ADJ_GAIN_TYPE** - Reverse Link Attribute adjustment Gain value type indicator.
   - If the following corresponding gain adjustment fields are set to the value of the nominal attribute gain adjustment that the mobile station is to make for the corresponding transmission attributes (relative to Nominal_Attribute_Gain specified in [2]), the base station shall set this field to '0'. If the following corresponding gain adjustment fields are set to the value of the pilot reference level adjustment that the mobile station is to use for the corresponding transmission attributes (relative to Pilot_Reference_Level specified in [2]), the base station shall set this field to '1'.

3. **RC3_RC5_20MS_INCL** - Reverse Link Attribute Adjustment Gain for Radio Configuration 3 or 5 of 20ms frame included indicator.
   - If Reverse Link Attribute Adjustment Gain for Radio Configuration 3 or 5 of 20ms frame is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

4. **RL_ATT_ADJ_GAIN_19200** - Reverse Link Attribute Adjustment Gain for the transmission rate 19200 bits/s.
If RC3_RC5_20MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 19200 bits/s, and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 19200 bits/s and 20ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_38400 - Reverse Link Attribute Adjustment Gain for the transmission rate 38400 bits/s.

If RC3_RC5_20MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 38400 bits/s, and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC3_RC5_20MS_INCL is set to ‘1’ and NORM_ATT_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 38400 bits/s and 20ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_76800 - Reverse Link Attribute Adjustment Gain for the transmission rate 76800 bits/s.

If RC3_RC5_20MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 76800 bits/s, and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.
If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 76800 bits/s and 20ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_153600 - Reverse Link Attribute Adjustment Gain for the transmission rate 153600 bits/s.

If RC3_RC5_20MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_20MS_INCL is set to ‘1’ and NORM_ATT_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 153600 bits/s, and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC3_RC5_20MS_INCL is set to ‘1’ and NORM_ATT_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 153600 bits/s and 20ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_307200 - Reverse Link Attribute Adjustment Gain for the transmission rate 307200 bits/s.

If RC3_RC5_20MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 307200 bits/s, and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 307200 bits/s and 20ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_614400 - Reverse Link Attribute Adjustment Gain for the transmission rate 614400 bits/s.
If RC3_RC5_20MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 614400 bits/s, and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 614400 bits/s and 20ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

**RC4_RC6_20MS_INCL** - Reverse Link Attribute Adjustment Gain for Radio Configuration 4 or 6 of 20ms frame included indicator.

If Reverse Link Attribute Adjustment Gain for Radio Configuration 4 or 6 of 20ms frame is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**RL_ATT_ADJ_GAIN_28800** - Reverse Link Attribute Adjustment Gain for the transmission rate 28800 bits/s.

If RC4_RC6_20MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 28800 bits/s, and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_20MS_INCL is set to ‘1’ and NORM_ATT_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 28800 bits/s and 20ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

**RL_ATT_ADJ_GAIN_57600** - Reverse Link Attribute Adjustment Gain for the transmission rate 57600 bits/s.

If RC4_RC6_20MS_INCL is set to ‘0’, the base station shall omit this field.
If RC4_RC6_20MS_INCL is set to ‘1’ and NORM_ATT_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 57600 bits/s, and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_20MS_INCL is set to ‘1’ and NORM_ATT_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 57600 bits/s and 20ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_115200 - Reverse Link Attribute Adjustment Gain for the transmission rate 115200 bits/s.

If RC4_RC6_20MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 115200 bits/s, and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 115200 bits/s and 20ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_230400 - Reverse Link Attribute Adjustment Gain for the transmission rate 230400 bits/s.

If RC4_RC6_20MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 230400 bits/s, and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.
If $\text{RC4\_RC6\_20MS\_INCL}$ is set to ‘1’ and $\text{RL\_ATT\_ADJ\_GAIN\_TYPE}$ is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 230400 bits/s and 20ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

$\text{RL\_ATT\_ADJ\_GAIN\_460800}$ - Reverse Link Attribute Adjustment Gain for the transmission rate 460800 bits/s.

If $\text{RC4\_RC6\_20MS\_INCL}$ is set to ‘0’, the base station shall omit this field.

If $\text{RC4\_RC6\_20MS\_INCL}$ is set to ‘1’ and $\text{RL\_ATT\_ADJ\_GAIN\_TYPE}$ is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 460800 bits/s, and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

$\text{RL\_ATT\_ADJ\_GAIN\_1036800}$ - Reverse Link Attribute Adjustment Gain for the transmission rate 1036800 bits/s.

If $\text{RC4\_RC6\_20MS\_INCL}$ is set to ‘0’, the base station shall omit this field.

If $\text{RC4\_RC6\_20MS\_INCL}$ is set to ‘1’ and $\text{RL\_ATT\_ADJ\_GAIN\_TYPE}$ is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 1036800 bits/s, and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

$\text{RC3\_RC5\_40MS\_INCL}$ - Reverse Link Attribute Adjustment Gain for Radio Configuration 3 or 5 of 40ms frame included indicator.
If Reverse Link Attribute Adjustment Gain for Radio Configuration 3 or 5 of 40ms frame is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**RL_ATT_ADJ_GAIN_19200_40MS** - Reverse Link Attribute Adjustment Gain for the transmission rate 19200 bits/s.

If RC3_RC5_40MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 19200 bits/s, and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC3_RC5_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 19200 bits/s and 40ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

**RL_ATT_ADJ_GAIN_38400_40MS** - Reverse Link Attribute Adjustment Gain for the transmission rate 38400 bits/s.

If RC3_RC5_40MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 38400 bits/s, and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC3_RC5_40MS_INCL is set to ‘1’ and NORM_ATT_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 38400 bits/s and 40ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

**RL_ATT_ADJ_GAIN_76800_40MS** - Reverse Link Attribute Adjustment Gain for the transmission rate 76800 bits/s.

If RC3_RC5_40MS_INCL is set to ‘0’, the base station shall omit this field.
If RC3_RC5_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 76800 bits/s, and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC3_RC5_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 76800 bits/s and 40ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_153600_40MS - Reverse Link Attribute Adjustment Gain for the transmission rate 153600 bits/s.

If RC3_RC5_40MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_40MS_INCL is set to ‘1’ and NORM_ATT_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 153600 bits/s, and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC3_RC5_40MS_INCL is set to ‘1’ and NORM_ATT_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 153600 bits/s and 40ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_307200_40MS - Reverse Link Attribute Adjustment Gain for the transmission rate 307200 bits/s.

If RC3_RC5_40MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 307200 bits/s, and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.
If RC3_RC5_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 307200 bits/s and 40ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RC4_RC6_40MS_INCL - Reverse Link Attribute Adjustment Gain for Radio Configuration 4 or 6 of 40ms frame included indicator.

If Reverse Link Attribute Adjustment Gain for Radio Configuration 4 or 6 of 40ms frame is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

RL_ATT_ADJ_GAIN_28800_40MS - Reverse Link Attribute Adjustment Gain for the transmission rate 28800 bits/s.

If RC4_RC6_40MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 28800 bits/s, and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_40MS_INCL is set to ‘1’ and NORM_ATT_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 28800 bits/s and 40ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_57600_40MS - Reverse Link Attribute Adjustment Gain for the transmission rate 57600 bits/s.

If RC4_RC6_40MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_40MS_INCL is set to ‘1’ and NORM_ATT_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 57600 bits/s, and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.
If \( \text{RC4\_RC6\_40MS\_INCL} \) is set to ‘1’ and \( \text{NORM\_ATT\_GAIN\_TYPE} \) is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 57600 bits/s and 40ms frame.

The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

**RL\_ATT\_ADJ\_GAIN\_115200\_40MS** - Reverse Link Attribute Adjustment Gain for the transmission rate 115200 bits/s.

If \( \text{RC4\_RC6\_40MS\_INCL} \) is set to ‘0’, the base station shall omit this field.

If \( \text{RC4\_RC6\_40MS\_INCL} \) is set to ‘1’ and \( \text{RL\_ATT\_ADJ\_GAIN\_TYPE} \) is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 115200 bits/s, and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If \( \text{RC4\_RC6\_40MS\_INCL} \) is set to ‘1’ and \( \text{RL\_ATT\_ADJ\_GAIN\_TYPE} \) is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 115200 bits/s and 40ms frame.

**RL\_ATT\_ADJ\_GAIN\_230400\_40MS** - Reverse Link Attribute Adjustment Gain for the transmission rate 230400 bits/s.

If \( \text{RC4\_RC6\_40MS\_INCL} \) is set to ‘0’, the base station shall omit this field.

If \( \text{RC4\_RC6\_40MS\_INCL} \) is set to ‘1’ and \( \text{RL\_ATT\_ADJ\_GAIN\_TYPE} \) is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 230400 bits/s, and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If \( \text{RC4\_RC6\_40MS\_INCL} \) is set to ‘1’ and \( \text{RL\_ATT\_ADJ\_GAIN\_TYPE} \) is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 230400 bits/s and 40ms frame.

**RL\_ATT\_ADJ\_GAIN\_518400\_40MS** - Reverse Link Attribute Adjustment Gain for the transmission rate 518400 bits/s.
If RC4_RC6_40MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 518400 bits/s, and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 518400 bits/s and 40ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RC3_RC5_80MS_INCL - Reverse Link Attribute Adjustment Gain for Radio Configuration 3 or 5 of 80ms frame included indicator.

If Reverse Link Attribute Adjustment Gain for Radio Configuration 3 or 5 of 80ms frame is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

RL_ATT_ADJ_GAIN_19200_80MS - Reverse Link Attribute Adjustment Gain for the transmission rate 19200 bits/s.

If RC3_RC5_80MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 19200 bits/s, and 80ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC3_RC5_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 19200 bits/s and 80ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_38400_80MS - Reverse Link Attribute Adjustment Gain for the transmission rate 38400 bits/s.

If RC3_RC5_80MS_INCL is set to ‘0’, the base station shall omit this field.
If RC3_RC5_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 38400 bits/s, and 80ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC3_RC5_80MS_INCL is set to ‘1’ and NORM_ATT_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 38400 bits/s and 80ms frame.

The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_76800_80MS - Reverse Link Attribute Adjustment Gain for the transmission rate 76800 bits/s.

If RC3_RC5_80MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 76800 bits/s, and 80ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC3_RC5_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 76800 bits/s and 80ms frame.

The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_153600_80MS - Reverse Link Attribute Adjustment Gain for the transmission rate 153600 bits/s.

If RC3_RC5_80MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 153600 bits/s, and 80ms frame. The base station shall set the value in the range from –48 to 48 inclusive.
If RC3_RC5_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 153600 bits/s and 80ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

**RC4_RC6_80MS_INCL** - Reverse Link Attribute Adjustment Gain for Radio Configuration 4 or 6 of 80ms frame included indicator.

If Reverse Link Attribute Adjustment Gain for Radio Configuration 4 or 6 of 80ms frame is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**RL_ATT_ADJ_GAIN_28800_80MS** - Reverse Link Attribute Adjustment Gain for the transmission rate 28800 bits/s.

If RC4_RC6_80MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 28800 bits/s, and 80ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_80MS_INCL is set to ‘1’ and NORM_ATT_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 28800 bits/s and 80ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

**RL_ATT_ADJ_GAIN_57600_80MS** - Reverse Link Attribute Adjustment Gain for the transmission rate 57600 bits/s.

If RC4_RC6_80MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_80MS_INCL is set to ‘1’ and NORM_ATT_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 57600 bits/s, and 80ms frame. The base station shall set the value in the range from –48 to 48 inclusive.
If RC4_RC6_80MS_INCL is set to ‘1’ and NORM_ATT_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 57600 bits/s and 80ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_115200_80MS - Reverse Link Attribute Adjustment Gain for the transmission rate 115200 bits/s.

If RC4_RC6_80MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 115200 bits/s, and 80ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 115200 bits/s and 80ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_259200_80MS - Reverse Link Attribute Adjustment Gain for the transmission rate 259200 bits/s.

If RC4_RC6_80MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 259200 bits/s, and 80ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 259200 bits/s and 80ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RESERVED - Reserved bits.
The base station shall add reserved bits as needed in order to make the length of the entire record equal to an integer number of octets. The base station shall set these bits to '0'.

If RPC_ADJ_REC_TYPE is equal to '0011', the base station shall set type-specific fields as specified in Table 3.7.3.3.2.25-7.

Table 3.7.3.3.2.25-7. Type Specific Fields for RECORD_TYPE = '0011'

RL_CQICH_ATT_ADJ_GAIN_TYPE - Reverse Channel Quality Indicator Channel attribute adjustment gain value type indicator.

If the following fields are set to the nominal attribute gain adjustment values that the mobile station is to use for the transmission attributes (relative to Nominal_Attribute_Gain specified in [2]), the base station shall set this field to '0'. If the following fields are set to the pilot reference level adjustment values that the mobile station is to use for the transmission attributes (relative to Pilot_Reference Level specified in [2]), the base station shall set this field to '1'.

RL_CQICH_ATT_ADJ_GAIN_HIGH_INCL - Reverse Channel Quality Indicator Channel attribute adjustment gain for the high power level included indicator.

If the attribute adjustment gain for the high power level of Reverse Channel Quality Indicator Channel transmission is included in this message, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

RL_CQICH_ATT_ADJ_GAIN_HIGH - Attribute adjustment gain for Reverse Channel Quality Indicator Channel for the high Channel Quality Indicator gain power level.

If RL_CQICH_ATT_ADJ_GAIN_HIGH_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:
If RL_CQICH_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes for the high power level of R-CQICH. The base station shall set the value in the range from –40 to 16 inclusive.

If RL_CQICH_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes for the high power level of R-CQICH. The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_CQICH_ATT_ADJ_GAIN_LOW_INCL - Reverse Channel Quality Indicator Channel attribute adjustment gain for the low power level included indicator.

If the attribute adjustment gain for the low power level of Reverse Channel Quality Indicator Channel transmission is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

RL_CQICH_ATT_ADJ_GAIN_LOW - Attribute adjustment gain for Reverse Channel Quality Indicator Channel for the low Channel Quality Indicator gain power level.

If RL_CQICH_ATT_ADJ_GAIN_LOW_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

If RL_CQICH_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes for the low power level of R-CQICH. The base station shall set the value in the range from –16 to 16 inclusive.

If RL_CQICH_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes for the low power level of R-CQICH. The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

If RPC_ADJ_REC_TYPE is equal to ‘0100’, the base station shall set type-specific fields as specified in Table 3.7.3.3.2.25-8.

{ (2)
REV_REQCH_ADJ_INCL - Reverse Request Channel Adjustment included field.
If the attribute adjustment gains for the Reverse Request Channel are included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

REV_REQCH_ADJ_GAIN - Reverse Request Channel Adjustment Gain.
If REV_REQCH_ADJ_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes for the power level of R-REQCH. The base station shall set the value in the range from $-324$ to $540$ inclusive.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

REV_SPICH_ADJ_INCL - Reverse Secondary Pilot Channel Adjustment included field.
If the attribute adjustment gains for the Reverse Secondary Pilot Channel are included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

REV_SPICH_ADJ_GAIN - Reverse Secondary Pilot Channel Adjustment Gain.

If REV_SPICH_ADJ_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes for the power level of R-SPICH. The base station shall set the value in the range from $-2^{16}$ to $2^{16}$-inclusive.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

REV_SPICH_EP_SIZE - Minimum Encoder Packet Size for which the Reverse Secondary Pilot Channel is used.

If REV_SPICH_ADJ_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to the minimum encoder packet size for which the Reverse Secondary Pilot Channel is used (see [2] and [3]).

The base station shall set this field to a value in the range 0 to 10 inclusive, corresponding to the encoder packet sizes 192, 408, 792, 1560, 3096, 6168, 9240, 12312, 15384, and 18456 bits respectively.

REV_PDCCH_ADJ_INCL - Reverse Packet Data Control Channel Adjustment included field.

If the attribute adjustment gains for the Reverse Packet Data Control Channel are included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

REV_PDCCH_ADJ_GAIN - Reverse Packet Data Control Channel Adjustment Gain.

If REV_PDCCH_ADJ_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes for the power level of R-PDCCH. The base station shall set the value in the range from $-4^{32}$ to $4^{32}$-inclusive.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

REV_PDCCH_ATTRIBUTE_ADJ_INCL - Reverse Packet Data Control Channel Attribute Adjustment included field.
If the attribute adjustment gains for the Reverse Packet Data Control Channel are included per encoder packet size and per boost mode in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

REV_PDCCH_EP_SIZE_NUM - Number of occurrences of Reverse Packet Data Control Channel Attribute Adjustment Gains.

If REV_PDCCH_ATTRIBUTE_ADJ_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to one less than half the number of occurrences of the field included hereafter. The records are listed per encoder packet size, in the following ascending order: 192, 408, 792, 1560, 3096, 4632, 6168, 9240, 12312, 15384, 18456 bits.

If REV_PDCCH_ATTRIBUTE_ADJ_INCL is set to ‘1’, the base station shall include REV_PDCCH_EP_SIZE_NUM+1 occurrences of the following record:

The base station shall include 2 occurrences of the following field. The first occurrence of this field is for the non-boosted mode, while the second is for the boosted mode.

REV_PDCCH_ATTRIBUTE_ADJ_GAIN - Reverse Packet Data Control Channel Attribute Adjustment Gain.

The base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes for the power level of R-PDCCH, for the i-th encoder packet size, and for the non-boosted and boosted modes.

The base station shall set the value in the range from \(-2^{32}\) to \(2^{32}\)-inclusive.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

REV_PDCCH_BOOST_ADJ_INCL - Reverse Packet Data Control Channel Boost Adjustment included field.

If the attribute adjustment gains for the Reverse Packet Data Control Channel per boosted mode are included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

If REV_PDCCH_BOOST_ADJ_INCL is set to ‘1’, the base station shall include two occurrences of the following record:

REV_PDCCH_BOOST_ADJ_GAIN - Reverse Packet Data Control Channel Boost Adjustment Gains.
The base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes for the power level of R-PDCCH, for the appropriate mode. The base station shall set the value in the range from $-\frac{32}{32}$ to $\frac{32}{32}$ inclusive.

The first occurrence of this field is for the non-boosted mode, while the second is for the boosted mode. The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

REV_PDCCH_PAYLOAD_ADJ_INCL - Reverse Packet Data Control Channel Payload Attribute Adjustment inclusion field.

If the attribute adjustment gains for the Reverse Packet Data Control Channel are included per encoder packet size in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

REV_PDCCH_EP_SIZE_NUM_1 - Number of occurrences of Reverse Packet Data Control Channel Payload Attribute Adjustment Gain records. If REV_PDCCH_PAYLOAD_ADJ_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows. The base station shall set this field to one less than the number of occurrences of the field included hereafter. The fields are listed per encoder packet size, in the following ascending order: 192, 408, 792, 1560, 3096, 4632, 6168, 9240, 12312, 15384, 18456 bits.

If REV_PDCCH_PAYLOAD_ADJ_INCL is set to ‘1’, the base station shall include $(REV_PDCCH_EP_SIZE_NUM_1+1) \times 2$ occurrences of the following record:

REV_PDCCH_PAYLOAD_ADJ_GAIN - Reverse Packet Data Control Channel Payload Attribute Adjustment Gain.

The base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes for the power level of R-PDCCH, for the i-th encoder packet size, and for the non-boosted and boosted modes. In each set for the i-th encoder packet, the first occurrence of this field is for the non-boosted mode, while the second is for the boosted mode.

The base station shall set the value in the range from $-\frac{32}{32}$ to $\frac{32}{32}$ inclusive. The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

REV_PDCH_ADJ_INCL - Reverse Packet Data Channel Adjustment included field.

If the attribute adjustment gains for the Reverse Packet Data Channel are included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.
REVPDCH_ADJ_GAIN - Reverse Packet Data Channel Adjustment Gain.

If REVPDCH_ADJ_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes for the power level of R-PDCH. The base station shall set the value in the range from $-40$ to $656$, inclusive.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

REVPDCH_PAYLOAD_ADJ_INCL - Reverse Packet Data Channel Adjustment included field.

If the attribute adjustment gains for the Reverse Packet Data Channel are included per encoder packet size in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

REVPDCH_EP_SIZE_NUM - Number of occurrences of Reverse Packet Data Channel Payload Adjustment Gains.

If REVPDCH_PAYLOAD_ADJ_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to one less than the number of occurrences of the following field. The fields are listed per encoder packet size, in the following ascending order: 192, 408, 792, 1560, 3096, 4632, 6168, 9240, 12312, 15384, 18456 bits

If REVPDCH_PAYLOAD_ADJ_INCL is set to ‘1’, the base station shall include REVPDCH_EP_SIZE_NUM+1 occurrences of the following record:

REVPDCH_PAYLOAD_ADJ_GAIN - Reverse Packet Data Channel Payload Adjustment Gain.

The base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes for the power level of R-PDCH, for the i-th encoder packet size. The base station shall set the value in the range from $-40$ to $656$, inclusive.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

REVPDCH_BOOST_ADJ_INCL - Reverse Packet Data Channel Adjustment included field.

If the attribute adjustment gains for the Reverse Packet Data Channel are included per boosted mode in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.
If REV_PDCH_BOOST_ADJ_INCL is set to ‘1’, the base station shall include two occurrences of the following record. The first occurrence of this field-record is for the non-boosted mode, while the second is for the boosted mode.

REV_PDCH_BOOST_ADJ_GAIN - Reverse Packet Data Channel Boost-dependent Adjustment Gain.

The base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes for the power level of R-PDCH. The base station shall set the value in the range from $-40$ to $656$ inclusive.

The first occurrence of this field is for the non-boosted mode, while the second is for the boosted mode. The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

REV_PDCH_SUBPACKET_ADJ_INCL - Reverse Packet Data Channel Subpacket Adjustment included field.

If the attribute adjustment gains for the Reverse Packet Data Channel are included per subpacket transmission round in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

REV_PDCH_RETRX_NUM - Number of occurrences of the Reverse Packet Data Channel Subpacket Adjustment Gains.

If REV_PDCH_SUBPACKET_ADJ_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to one less than the number of occurrences of the following field.

If REV_PDCH_SUBPACKET_ADJ_INCL is set to ‘1’, the base station shall include $(REV_PDCH_RETRX_NUM+1)$ occurrences of the following record:

REV_PDCH_SUBPACKET_ADJ_GAIN - Reverse Packet Data Channel Subpacket Adjustment Gain.

The base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes for the power level of R-PDCH, on the i-th transmission round. The base station shall set the value in the range from $-40$ to $656$ inclusive.

The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

REV_PDCH_ATTRIBUTE_ADJ_INCL - Reverse Packet Data Channel Attribute Adjustment included field.

If the attribute adjustment gains for the Reverse Packet Data Channel are included per encoder packet size and per subpacket transmission round in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.
REV_PDCH_EP_SIZE_NUM_1 - Number of occurrences of the Reverse Packet Data Channel Attribute Adjustment Gains record.

If REV_PDCH_SUBPACKET_ADJ_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to one less than the number of occurrences of the following subrecord. The subrecords are listed per encoder packet size, in the following ascending order: 192, 408, 792, 1560, 3096, 4632, 6168, 9240, 12312, 15384, 18456 bits.

If REV_PDCH_ATTRIBUTE_ADJ_INCL REV_PDCH_SUBPACKET_ADJ_INCL is set to ‘1’, the base station shall include (REV_PDCH_EP_SIZE_NUM_1+1) occurrences of the following subrecord:

REV_PDCH_RETRX_NUM_1 - Number of occurrences of the Reverse Packet Data Channel Subpacket Adjustment Gains.

The base station shall set this field to one less than the number of occurrences of the Reverse Packet Data Channel Subpacket Adjustment Gains record.

The base station shall include (REV_PDCH_RETRX_NUM_1+1) occurrences of the following record:

The base station shall include 2 occurrences of the following field. The first occurrence of this field is for the non-boosted mode, while the second is for the boosted mode.

REV_PDCH_ATTRIBUTE_ADJ_GAIN - Reverse Packet Data Channel Attribute Adjustment Gain.

The base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes for the power level of R-PDCH, for the i-th encoder packet size on a j-th transmission round, using the non-boosted or boosted mode.

The base station shall set the value in the range from –40 to 56 inclusive. The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

REV_PDCH_PARMS_INCL - Reverse Packet Data Channel related parameters included indicator.

The base station shall set this field to ‘1’ if the R-PDCH parameters are included in this message; otherwise, the base station shall set this field to ‘0’.

REV_PDCH_NUM_ARQ_ROUNDS_NORMAL - Maximum number of allowed ARQ rounds on the Reverse PDCH in the non-boosted mode.
If REV_PDCH_PARMS_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to one less the maximum number of allowed ARQ rounds on the Reverse PDCH in the non-boosted mode. The base station shall set this field to 0, 1, or 2 corresponding to 1, 2, or 3 rounds respectively (See [3]).

REV_PDCH_NUM_ARQ_ROUNDS_BOOST - Maximum number of allowed HARQ retransmissions on the Reverse PDCH in the boosted mode.

If REV_PDCH_PARMS_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to one less the maximum number of allowed ARQ rounds on the Reverse PDCH in the boosted mode. The base station shall set this field to 0, 1, or 2 corresponding to 1, 2, or 3 rounds respectively (See [3]).

FPC_BCMC_CHAN - Channel used for secondary power control subchannel.

If FPC_INCL is set to ‘1’ and FPC_MODE is set to ‘001’, ‘010’, ‘101’, or ‘110’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

If F-FCH is associated with secondary power control subchannel, the base station shall set this field to ‘1’; otherwise, base station shall set this field to ‘0’ to indicate that FPC_SEC_CHAN points to the channel associated with secondary power control subchannel.

RESERVED - Reserved bits.

The base station shall add reserved bits as needed in order to make the length of the entire record equal to an integer number of octets. The base station shall set these bits to ‘0’.

```plaintext
{ (NUM_NGHBR)
  NGHBR_RESQ_CONFIGURED 1
} (NUM_NGHBR)
```

1. **PILOT_INC** - Pilot PN sequence offset index increment.
   A mobile station searches for Remaining Set pilots at pilot PN sequence index values that are multiples of this value.
   The base station shall set this field to the pilot PN sequence increment, in units of 64 PN chips, that mobile stations are to use for searching the Remaining Set. The base station should set this field to the largest increment such that the pilot PN sequence offsets of all its neighbor base stations are integer multiples of that increment.
   The base station shall set this field to a value in the range 1 to 15 inclusive.

2. **NGHBR_SRCH_MODE** - Search mode.
   The base station shall set this field to the value specified in Table 3.7.3.3.2.26-1 corresponding to the search mode.
Table 3.7.3.2.26-1. NGHBR_SRCH_MODE Field

</tbody>
</table>

SRCH_WIN_N - Default search window size for the Neighbor Set.

The base station shall set this field to the value specified in Table 2.6.6.2.1-1 corresponding to the default search window size to be used by the mobile station for its Neighbor Set. The mobile station uses the default search window size for all pilots in its Neighbor Set when the search window is not specified for each pilot individually (NGHBR_SRCH_MODE is set to a value other than ‘10’ and ‘11’).

USE_TIMING - Use timing indicator.

If base station timing information is included for neighbor base stations, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

GLOBAL_TIMING_INCL - Global timing included.

If USE_TIMING is set to ‘1’, the base station shall include the field GLOBAL_TIMING_INCL and set this field as described below; otherwise, the base station shall omit this field.

If base station timing information is included globally for all neighbor base stations with TIMING_INCL equal to ‘1’, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

GLOBAL_TX_DURATION - Global neighbor transmit time duration.

If GLOBAL_TIMING_INCL is included and is set to ‘1’, the base station shall include the field GLOBAL_TX_DURATION and shall set this field as described below; otherwise, the base station shall omit this field.

The base station shall set this field to the duration of the base station transmit window, during each period, in units of 80 ms. The base station should set this field to a value of 3 or greater.

GLOBAL_TX_PERIOD - Global neighbor transmit time period.

If GLOBAL_TIMING_INCL is included and is set to ‘1’, the base station shall include the field GLOBAL_TX_PERIOD and shall set this field as described below; otherwise, the base station shall omit this field.
The base station shall set this field to duration of the period, in units of 80 ms.

The base station shall set this field to the number of neighbors included in the message.

The base station shall include one occurrence of the following record for each pilot that a mobile station is to place in its Neighbor Set

**NUM_NGHB**R - Number of neighbor pilot PN sequences.

The base station shall include one occurrence of this field for each pilot in its neighbor list. The base station shall set this field to the pilot’s PN sequence offset, in units of 64 PN chips.

**SEARCH_PRIORITY** - Pilot Channel search priority.

If **NGHBR_SRCH_MODE** is set to ‘01’ or ‘11’, then the base station shall set this field to the search priority for this neighbor. The base station shall set the search priority as specified in Table 3.7.3.3.2.26-2. If **NGHBR_SRCH_MODE** is set to any other value, the base station shall omit this field.

<table>
<thead>
<tr>
<th>Value (binary)</th>
<th>Search Priority</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Low</td>
</tr>
<tr>
<td>01</td>
<td>Medium</td>
</tr>
<tr>
<td>10</td>
<td>High</td>
</tr>
<tr>
<td>11</td>
<td>Very High</td>
</tr>
</tbody>
</table>

**SRCH_WIN_NGHB**R - Neighbor pilot channel search window size.

If **NGHBR_SRCH_MODE** is set to ‘10’ or ‘11’, then the base station shall set this field to the value specified in Table 2.6.6.2.1-1 corresponding to the search window size to be used by the mobile stations for this neighbor. If **NGHBR_SRCH_MODE** is set to any other value, the base station shall omit this field.

**TIMING_INCL** - Timing included indicator.

If **USE_TIMING** is set to ‘1’, the base station shall include the field **TIMING_INCL** and set this field as described below; otherwise, the base station shall omit this field.

If base station timing information is included for this neighbor base station, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**NGHBR_TX_OFFSET** - Neighbor transmit time offset.
If TIMING_INCL is included and is set to ‘1’, the base station shall include the field NGHBR_TX_OFFSET and set this field as described below; otherwise, the base station shall omit this field.

The base station shall set this field to the time offset, in units of 80 ms, from the beginning of the neighbor timing period to the beginning of the first base station transmit window within the period. The beginning of the neighbor timing period occurs when \( \lceil t/4 \rceil \mod (16384) = 0 \).

NGHBR_TX_DURATION - Neighbor transmit time duration.

If TIMING_INCL is included and is set to ‘1’ and GLOBAL_TIMING_INCL is set to ‘0’, the base station shall include the field NGHBR_TX_DURATION and set this field as described below; otherwise, the base station shall omit this field.

The base station shall set this field to duration of the base station transmit window, during each period, in units of 80 ms. The base station should set this field to a value of 3 or greater.

NGHBR_TX_PERIOD - Neighbor transmit time period.

If TIMING_INCL is included and is set to ‘1’ and GLOBAL_TIMING_INCL is set to ‘0’, the base station shall include the field NGHBR_TX_PERIOD and set this field as described below; otherwise, the base station shall omit this field.

The base station shall set this field to duration of the period, in units of 80 ms.

SRCH_OFFSET_INCL - Neighbor pilot channel search window offset included.

If NGHBR_SRCH_MODE = ‘10’ or ‘11’ and if the SRCH_OFFSET_NGHB field is included in the following records, the base station shall set this bit to ‘1’; otherwise, the base station shall set this bit to ‘0’.

The base station shall include one occurrence of the following record for each pilot that a mobile station is to place in its Neighbor Set. The base station shall use the same order for the following record as is used for previous pilots which are listed in this message. Specifically, the \( i^{th} \) occurrence of the following record shall correspond the \( i^{th} \) pilot in this message.

ADD_PILOT_REC_INCL - Additional pilot information included indicator.

The base station shall set this field to ‘1’ if additional pilot information listed in NGHBR_PILOT_REC_TYPE and RECORD_LEN fields are included. The base station shall set this field to ‘0’ if the corresponding pilot is the common pilot and there is no additional pilot information included.

NGHBR_PILOT_REC_TYPE - Neighbor Pilot record type
If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall set this field to the NGHBR_PILOT_REC_TYPE value shown in Table 3.7.2.3.2.22-5 corresponding to the type of Pilot Record specified by this record.

If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.

RECORD_LEN - Pilot record length.

If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall set this field to the number of octets in the type-specific fields of this pilot record.

If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.

Type-specific fields - Pilot record type-specific fields.

If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall include type-specific fields based on the NGHBR_PILOT_REC_TYPE of this pilot record.

If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.

If NGHBR_PILOT_REC_TYPE is equal to ‘000’, the base station shall include the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>TD_POWER_LEVEL</td>
<td>2</td>
</tr>
<tr>
<td>TD_MODE</td>
<td>2</td>
</tr>
<tr>
<td>RESERVED</td>
<td>4</td>
</tr>
</tbody>
</table>

TD_POWER_LEVEL - TD Transmit Power Level.

The base station shall set this field to the TD transmit power level relative to that of the Forward Pilot Channel as specified in Table 3.7.2.3.2.26-4.

TD_MODE - Transmit Diversity mode.

The base station shall set this field to the Transmit Diversity mode, as specified in Table 3.7.2.3.2.26-3.

RESERVED - Reserved bits.

The base station shall set this field to ‘0000’.

If NGHBR_PILOT_REC_TYPE is equal to ‘001’, the base station shall include the following fields:
<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>QOF</td>
<td>2</td>
</tr>
<tr>
<td>WALSH_LENGTH</td>
<td>3</td>
</tr>
<tr>
<td>AUX_PILOT_WALSH</td>
<td>WALSH_LENGTH+6</td>
</tr>
<tr>
<td>RESERVED</td>
<td>0 to 7 (as needed)</td>
</tr>
</tbody>
</table>

1. QOF - Quasi-orthogonal function index. The base station shall set this field to the index of the Quasi-orthogonal function (see [2]).

2. WALSH_LENGTH - Length of the Walsh code. The base station shall set this field to the WALSH_LENGTH value shown in Table 3.7.2.3.2.22–6 corresponding to the length of the Walsh code for the pilot that is used in as the Auxiliary Pilot.

3. AUX_PILOT_WALSH - Walsh code for the Auxiliary Pilot. The base station shall set this field to the Walsh code corresponding to the Auxiliary Pilot.

4. RESERVED - Reserved bits. The base station shall set all the bits of this field to ‘0’ to make the entire record octet-aligned.

If NGHBR_PILOT_REC_TYPE is equal to ‘010’, the base station shall include the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>QOF</td>
<td>2</td>
</tr>
<tr>
<td>WALSH_LENGTH</td>
<td>3</td>
</tr>
<tr>
<td>AUX_WALSH</td>
<td>WALSH_LENGTH+6</td>
</tr>
<tr>
<td>AUX_TD_Power_Level</td>
<td>2</td>
</tr>
<tr>
<td>TD_MODE</td>
<td>2</td>
</tr>
<tr>
<td>RESERVED</td>
<td>0 to 7 (as needed)</td>
</tr>
</tbody>
</table>

5. QOF - Quasi-orthogonal function index for the Auxiliary Transmit Diversity Pilot. The base station shall set this field to the index of the Quasi-orthogonal function (see [2]).

6. WALSH_LENGTH - Length of the Walsh code.
The base station shall set this field to the WALSH_LENGTH value shown in 3.7.2.3.2.22-6 corresponding to the length of the Walsh code for the pilots that are used as Auxiliary pilot in the transmit diversity mode.

AUX_WALSH - Walsh code for the Auxiliary Pilot.

The base station shall set this field to the Walsh code corresponding to the Auxiliary Pilot.

AUX_TD_POWER_LEVEL - Auxiliary Transmit Diversity Pilot power level.

The base station shall set this field to the Auxiliary Transmit Diversity Pilot transmit power level relative to that of the Auxiliary Pilot as specified in Table 3.7.2.3.2.22-7.

TD_MODE - Transmit Diversity mode.

The base station shall set this field to the Transmit Diversity mode, as specified in Table 3.7.2.3.2.26-3.

RESERVED - Reserved bits.

The base station shall set all the bits of this field to ‘0’ to make the entire record octet-aligned.

If NGHBR_PILOT_REC_TYPE is equal to ‘011’, the base station shall include the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>SR3_PRIMARY_PILOT</td>
<td>2</td>
</tr>
<tr>
<td>SR3_PILOT_POWER1</td>
<td>3</td>
</tr>
<tr>
<td>SR3_PILOT_POWER2</td>
<td>3</td>
</tr>
</tbody>
</table>

SR3_PRIMARY_PILOT – Primary SR3 pilot.

The base station shall set this field to the value shown in Table 3.7.2.3.2.26-5 corresponding to the position of the primary SR3 pilot.

SR3_PILOT_POWER1 – The primary SR3 pilot power level relative to that of the pilot on the lower frequency of the two remaining SR3 frequencies.

The base station shall set this field to the value shown in Table 3.7.2.3.2.26-6 corresponding to the power level of the primary pilot with respect to the pilot on the lower frequency of the two remaining SR3 frequencies.

SR3_PILOT_POWER2 – The primary SR3 pilot power level relative to that of the pilot on the higher frequency of the two remaining SR3 frequencies.

The base station shall set this field to the value shown in Table 3.7.2.3.2.26-6 corresponding to the power level of the primary pilot with respect to the pilot on the higher frequency of the two remaining SR3 frequencies.
If **NGHBR_PILOT_REC_TYPE** is equal to ‘100’, the base station shall include the following fields:

<table>
<thead>
<tr>
<th><strong>Field</strong></th>
<th><strong>Length (bits)</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>SR3_PRIMARY_PILOT</td>
<td>2</td>
</tr>
<tr>
<td>SR3_PILOT_POWER1</td>
<td>3</td>
</tr>
<tr>
<td>SR3_PILOT_POWER2</td>
<td>3</td>
</tr>
<tr>
<td>QOF</td>
<td>2</td>
</tr>
<tr>
<td>WALSH_LENGTH</td>
<td>3</td>
</tr>
<tr>
<td>AUX_PILOT_WALSH</td>
<td>WALSH_LENGTH+6</td>
</tr>
<tr>
<td>ADD_INFO_INCL1</td>
<td>1</td>
</tr>
<tr>
<td>QOF1</td>
<td>0 or 2</td>
</tr>
<tr>
<td>WALSH_LENGTH1</td>
<td>0 or 3</td>
</tr>
<tr>
<td>AUX_PILOT_WALSH1</td>
<td>0 or WALSH_LENGTH1+6</td>
</tr>
<tr>
<td>ADD_INFO_INCL2</td>
<td>1</td>
</tr>
<tr>
<td>QOF2</td>
<td>0 or 2</td>
</tr>
<tr>
<td>WALSH_LENGTH2</td>
<td>0 or 3</td>
</tr>
<tr>
<td>AUX_PILOT_WALSH2</td>
<td>0 or WALSH_LENGTH2+6</td>
</tr>
<tr>
<td>RESERVED</td>
<td>0 – 7 (as needed)</td>
</tr>
</tbody>
</table>

**SR3_PRIMARY_PILOT** – Primary SR3 pilot.

The base station shall set this field to the value shown in Table 3.7.2.3.2.26-5 corresponding to the position of the primary SR3 pilot.

**SR3_PILOT_POWER1** – The primary SR3 pilot power level relative to that of the pilot on the lower frequency of the two remaining SR3 frequencies.

The base station shall set this field to the value shown in Table 3.7.2.3.2.26-6 corresponding to the power level of the primary pilot with respect to the pilot on the lower frequency of the two remaining SR3 frequencies.

**SR3_PILOT_POWER2** – The primary SR3 pilot power level relative to that of the pilot on the higher frequency of the two remaining SR3 frequencies.

The base station shall set this field to the value shown in Table 3.7.2.3.2.26-6 corresponding to the power level of the primary pilot with respect to the pilot on the higher frequency of the two remaining SR3 frequencies.

**QOF** – Quasi-orthogonal function index.
The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) on the frequency of the primary pilot.

**WALSH_LENGTH** - Length of the Walsh Code.

The base station shall set this field to the WALSH_LENGTH value shown in Table 3.7.2.3.2.22–6 corresponding to the length of the Walsh code for the pilot that is used as the Auxiliary pilot on the frequency of the primary pilot.

**AUX_PILOT_WALSH** - Walsh Code for the Auxiliary Pilot.

The base station shall set this field to the Walsh code corresponding to the Auxiliary pilot on the frequency of the primary pilot.

**ADD_INFO_INCL1** - Additional information included for the pilot on the lower frequency of the two remaining SR3 frequencies.

If the additional information for the pilot on the lower frequencies of the two remaining SR3 frequencies is the same as pilot on the primary frequency, the base station shall set this field to ‘0’; otherwise, the base station shall set this field to ‘1’.

**QOF1** - Quasi-orthogonal function index for the pilot on the lower frequency of the two remaining SR3 frequencies.

If ADD_INFO_INCL1 is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) on the lower frequency of the two remaining SR3 frequencies.

**WALSH_LENGTH1** - Length of the Walsh Code for the pilot on the lower frequency of the two remaining SR3 frequencies.

If ADD_INFO_INCL1 is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the WALSH_LENGTH value shown in Table 3.7.2.3.2.22–6 corresponding to the length of the Walsh code for the pilot that is used as the Auxiliary pilot on the lower frequency of the two remaining SR3 frequencies.

**AUX_PILOT_WALSH1** - Walsh Code for the Auxiliary Pilot on the lower frequency of the two remaining SR3 frequencies.

If ADD_INFO_INCL1 is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the Walsh code corresponding to the Auxiliary pilot on the lower frequency of the two remaining SR3 frequencies.
ADD_INFO_INCL2 - Additional information included for the pilot on the higher frequency of the two remaining SR3 frequencies.

If the additional information for the pilot on the higher frequencies of the two remaining SR3 frequencies is the same as pilot on the primary frequency, the base station shall set this field to ‘0’; otherwise, the base station shall set this field to ‘1’.

QOF2 - Quasi-orthogonal function index for the pilot on the higher frequency of the two remaining SR3 frequencies.

If ADD_INFO_INCL2 is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) on the higher frequency of the two remaining SR3 frequencies.

WALSH_LENGTH2 - Length of the Walsh Code for the pilot on the higher frequency of the two remaining SR3 frequencies.

If ADD_INFO_INCL2 is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the WALSH_LENGTH value shown in Table 3.7.2.3.2.22–6 corresponding to the length of the Walsh code for the pilot that is used as the Auxiliary pilot on the higher frequency of the two remaining SR3 frequencies.

AUX_PILOT_WALSH2 - Walsh Code for the Auxiliary Pilot on the higher frequency of the two remaining SR3 frequencies.

If ADD_INFO_INCL2 is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the Walsh code corresponding to the Auxiliary pilot on the higher frequency of the two remaining SR3 frequencies.

RESERVED - Reserved bits.

The base station shall set all the bits of this field to ‘0’ to make the entire record octet-aligned.

SRCH_OFFSET_NGHB - Neighbor pilot channel search window offset.

If SRCH_OFFSET_INCL equals to ‘1’, then the base station shall set this field to the value shown in Table 2.6.6.2.1-2 corresponding to the search window offset to be used by the mobile station for this neighbor; otherwise, the base station shall omit this field.

RESQ_ENABLED - Call rescue feature enabled indicator.
The base station shall set this field to ‘1’ if the call rescue feature is enabled and there is at least one occurrence of NGHBR_RESQ_CONFIGURED set to ‘1’ in this message; otherwise, the base station shall set this field to ‘0’.

**RESQ_DELAY_TIME** – Call rescue delay timer value.

If RESQ_ENABLED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the value of the call rescue delay timer to be used by the mobile station, in units of 80 ms.

**RESQ_ALLOWED_TIME** – Call rescue allowed timer value.

If RESQ_ENABLED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the value of the call rescue allowed timer to be used by the mobile station, in units of 80 ms.

**RESQ_ATTEMPT_TIME** – Call rescue attempt timer value.

If RESQ_ENABLED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the value of the call rescue attempt timer to be used by the mobile station, in units of 40 ms.

**RESQ_CODE_CHAN** – Code channel index for the Rescue Channel.

If RESQ_ENABLED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the code channel index (see [2]) that the mobile station is to use on the Forward Fundamental Channel when attempting Call Rescue Soft Handoff with the associated neighbor pilot.

If Radio Configuration 1, 2, 3, or 5 (see [2]) is used, the base station shall set this field in the range 1 to 63 inclusive. If Radio Configuration 4, 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

**RESQ_QOF** – Quasi-Orthogonal Function mask identifier for the Rescue Channel.

If RESQ_ENABLED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
The base station shall set this field to the quasi-orthogonal function mask identifier (see [2]) that the mobile station is to use on the Forward Fundamental Channel when attempting Call Rescue Soft Handoff with the associated neighbor pilot.

**RESQ_MIN_PERIOD_INCL** – Minimum time between consecutive rescues included indicator.

If RESQ_ENABLED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if the RESQ_MIN_PERIOD field is included in this message; otherwise, the base station shall set this field to ‘0’.

This field is set to ‘0’ if there is no minimum time restriction between consecutive rescues.

**RESQ_MIN_PERIOD** – Minimum time between consecutive rescues.

If RESQ_MIN_PERIOD_INCL is not included, or is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to one less than the minimum time after a successful call rescue (i.e. receipt of N3m good frames by the mobile station after the rescue attempt timer is enabled) before any subsequent call rescue attempts can be initiated, in units of 2 seconds.

**RESQ_NUM_TOT_TRANS_INCL** – The required number of transmissions before declaring L2 Acknowledgment Failure when Call Rescue is enabled included indicator.

If RESQ_ENABLED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the required number of transmissions of a regular PDU and mini PDU before declaring L2 Acknowledgment Failure when Call Rescue is enabled is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**RESQ_NUM_TOT_TRANS_20MS** – The required number of transmissions of a regular PDU before declaring L2 Acknowledgment Failure when Call Rescue is enabled.

If RESQ_NUM_TOT_TRANS_INCL field is not included or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the required number of transmissions of a regular PDU before declaring L2 Acknowledgment Failure when Call Rescue is enabled.

The base station shall not set this field to a value greater than N1m.
RESQ_NUM_TOT_TRANS_5MS - The required number of transmissions of a mini PDU before declaring L2 Acknowledgment Failure when Call Rescue is enabled.

If RESQ_NUM_TOT_TRANS_INCL field is not included or is included and is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the required number of transmissions of a mini PDU before declaring L2 Acknowledgment Failure when Call Rescue is enabled.

The base station shall not set this field to a value greater than $N_{15m}$.

RESQ_NUM_PREAMBLE - The Traffic Channel preamble Length for Call Rescue Soft Handoff.

If RESQ_ENABLED is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it to the length of Traffic Channel preamble that the mobile station is to send when performing a call rescue soft handoff, as follows:

If Radio configuration 1 or Radio configuration 2 is being used, the base station shall set this field to the Traffic Channel preamble length in 20 ms units; otherwise, the base station shall set this field to the value shown in Table 3.7.3.3.2.17-1 corresponding to the Traffic Channel preamble length in 1.25 ms units.

RESQ_POWER_DELTA - The power level adjustment to be applied to the last closed-loop power level when re-enabling the transmitter for call rescue soft handoff.

If RESQ_ENABLED is set to '0', the base station shall omit this field; otherwise, the base station shall set this field to a value by which mobile stations are to adjust the last closed-loop power level when re-enabling the transmitter for call rescue, expressed as a two's complement value in units of 1 dB.

The base station shall include NUM_NGHBR occurrences of the following one-field record if RESQ_ENABLED is set to '1'. The base station shall use the same order for the following field as is used for the NGHBR_PN fields listed in this message.

NGHBR_RESQ_CONFIGURED - Neighbor Rescue Channel configured indicator.

The base station shall set this field to '1' if a Rescue Channel is configured for this neighbor pilot; otherwise, the base station shall set this field to '0'.

The base station shall not set this field to a value greater than $N_{15m}$. 
3.7.3.2.27 Candidate Frequency Search Request Message

MSG_TAG: CFSRQM

<table>
<thead>

**USE_TIME** - Use action time indicator.

This field indicates whether an explicit action time is specified in this message. If an explicit action time is specified in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

If the base station requests the mobile station to perform an aligned search (see 2.6.6.2.8.3), the base station shall specify an explicit action time for the message.

**ACTION_TIME** - Action time.

If the USE_TIME field is set to ‘1’, the base station shall set this field to the System Time minus FRAME_OFFSET $\times 1.25$ ms, in units of 80 ms (modulo 64), at which the message is to take effect. If the USE_TIME field is set to ‘0’, the base station shall set this field to ‘000000’.

**RESERVED_1** - Reserved bits.

The base station shall set this field to ‘0000’.

**CFSRM_SEQ** - Candidate Frequency Search Request Message sequence number.
The base station shall set this field to the Candidate Frequency Search Request Message sequence number, as specified in 2.6.6.2.2.3.

SEARCH_TYPE - Search command.

The base station shall set this field to the appropriate SEARCH_TYPE code from Table 3.7.3.3.2.27-1 to indicate the purpose of the message.

<table>
<thead>
<tr>
<th>SEARCH_TYPE (binary)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>Directs the mobile station to stop any periodic search in progress (see 2.6.6.2.8.3.4 and 2.6.6.2.10.4)</td>
</tr>
<tr>
<td>01</td>
<td>Directs the mobile station to perform a single search (see 2.6.6.2.8.3.1 and 2.6.6.2.10.1).</td>
</tr>
<tr>

<td>Directs the mobile station to perform a periodic search (see 2.6.6.2.8.3.2 and 2.6.6.2.10.2).</td>
</tr>
<tr>
<td>10</td>
<td>Reserved.</td>
</tr>
</tbody>
</table>

SEARCH_PERIOD - Time between successive searches on the Candidate Frequency for periodic searches.

The base station shall set this field to the SEARCH_PERIOD value shown in Table 2.6.6.2.8.3.2-1 corresponding to the search period to be used by the mobile station, i.e., the time between the beginning of successive searches on the Candidate Frequency.

SEARCH_MODE - Search mode.

The base station shall set this field to the SEARCH_MODE value specified in Table 3.7.3.3.2.27-2 corresponding to the type of search specified by this message.
### Table 3.7.3.2.27-2. SEARCH_MODE Types

<table>

<tr>
<td>0011-1111</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

**MODE_SPECIFIC_LEN** - Length of mode-specific fields.

The base station shall set this field to the number of octets in the mode-specific fields of this message.

**Mode-specific fields** - Search mode-specific fields.

The base station shall include mode-specific fields based on the SEARCH_MODE field.

If SEARCH_MODE is equal to ‘0000’, the base station shall include the following fields:
<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>

</table>

NUM_PILOTS occurrences of the following record:

/ (0 or NUM_PILOTS)

| NGHBR_PN                   | 9             |
| SEARCH_SET                 | 1             |
| SEARCH_PRIORITY            | 0 or 2        |
| SRCH_WIN_NGHBR             | 0 or 4        |

/ (0 or NUM_PILOTS)

If PILOT_UPDATE is set to ‘1’, the base station shall include the following field:

NUM_PILOTS occurrences of the following record:

| CF_SRCH_OFFSET_INCL        | 1             |

(continues on next page)
If PILOT_UPDATE is set to ‘1’, the base station shall include NUM_PILOTS occurrences of the following record:

NUM_PILOTS occurrences of the following record:

Field | Length (bits)
--- | ---
ADD_PILOT_REC_INCL | 1
NGHBR_PILOT_REC_TYPE | 0 or 3
RECORD_LEN | 0 or 3
Type-specific fields | 0 or 8 × RECORD_LEN
SRCH_OFFSET_NGHBR | 0 or 3

RESERVED_3 | 0 - 7 (as needed)

<tr>
<td>CDMA_FREQ</td>
<td>Frequency assignment. The base station shall set this field to the CDMA frequency assignment for the Candidate Frequency.</td>
</tr>
</tbody>
</table>
| SF_TOTAL_EC_THRESH | Serving Frequency total pilot E_c threshold. If the mobile station is not to use the measurement of total E_c of the pilots in the Serving Frequency Active Set in the Candidate Frequency periodic search procedure, the base station shall set this field to ‘11111’; otherwise, the base station shall set this field to

\[
\left\lfloor \frac{10 \times \log_{10} (total\_ec\_thresh) + 120}{2} \right\rfloor
\]

where total_ec_thresh is defined by the following rule: The mobile station is not to visit the CDMA Candidate Frequency to search for pilots if the total E_c of the pilots in the Serving Frequency Active Set is greater than total_ec_thresh. |
| SF_TOTAL_EC_\(\Omega\)0_THRESH | Serving Frequency total pilot E_c/I_\(\Omega\)0 threshold. If the mobile station is not to use the measurement of total E_c/I_\(\Omega\)0 of the pilots in the Serving Frequency Active Set in the Candidate Frequency periodic search procedure, the base station shall set this field to ‘11111’; otherwise, the base station shall set this field to

\[
\left\lfloor -20 \times \log_{10} (total\_ec\_\Omega\_0\_thresh) \right\rfloor
\]
where $total_{ec\_io0\_thresh}$ is defined by the following rule: The mobile station is not to visit the CDMA Candidate Frequency to search for pilots if the total $E_c/I_{Io}$ of the pilots in the Serving Frequency Active Set is greater than $total_{ec\_io0\_thresh}$.

**DIFF_RX_PWR_THRESH** - Minimum difference in received power.

If this message is used for the Candidate Frequency single or periodic search procedure:

If the mobile station is to search for pilots on the CDMA Candidate Frequency irrespective of the received power on the Candidate Frequency, the base station shall set this field to '00000'; otherwise, the base station shall set this field to

$$\left\lceil \frac{(minimum\_power\_diff + 30)}{2} \right\rceil$$

where $minimum\_power\_diff$ is determined by the following rule: The mobile station is not to search for pilots on the CDMA Candidate Frequency if $(cand\_freq\_pwr - serving\_freq\_pwr)$ is less than $minimum\_power\_diff$ (in dB), where $cand\_freq\_pwr$ is the received power on the CDMA Candidate Frequency, in dBm / 1.23 MHz, and $serving\_freq\_pwr$ is the received power on the Serving Frequency, in dBm / 1.23 MHz.

If this message is used for the Hard Handoff with Return on Failure procedure:

If the mobile station is to continue hard handoff procedures irrespective of the received power on the Target Frequency, the base station shall set this field to ‘00000’; otherwise, the base station shall set this field to

$$\left\lceil \frac{(minimum\_power\_diff + 30)}{2} \right\rceil$$

where $minimum\_power\_diff$ is determined by the following rule: The mobile station is to declare the handoff attempt to be unsuccessful if $(target\_freq\_pwr - serving\_freq\_pwr)$ is less than $minimum\_power\_diff$ (in dB), where $target\_freq\_pwr$ is the received power on the CDMA Target Frequency, in dBm / 1.23 MHz, and $serving\_freq\_pwr$ is the received power on the Serving Frequency, in dBm / 1.23 MHz.

**MIN_TOTAL_PILOT_EC_IO0** - Minimum total pilot $E_c/ I_0$.

If this message is used for the Candidate Frequency periodic search procedure:

If the mobile station is to search for pilots on the CDMA Candidate Frequency irrespective of the strength of pilots in the Candidate Frequency Search Set, the base station shall set this field to ‘00000’; otherwise, the base station shall set this field to

$$\left\lfloor -20 \times \log_{10} total\_pilot\_threshold \right\rfloor$$
where total_pilot_threshold is defined by the following rule:
The mobile station is not to send the Candidate Frequency Search Report Message if the sum of $E_c/I_o$ of all pilots in the mobile station’s Candidate Frequency Search Set that measure above $CF_{T\_ADD}$ is less than total_pilot_threshold.

If this message is used for the Hard Handoff with Return on Failure procedure:

If the mobile station is to attempt to demodulate the Forward Traffic Channels irrespective of the strength of pilots in the Active Set, the base station shall set this field to ‘00000’; otherwise, the base station shall set this field to

$$\lceil -20 \times \log_{10} \text{total}_{\text{pilot}_\text{threshold}} \rceil$$

where total_pilot_threshold is defined by the following rule:
The mobile station is not to attempt to demodulate the Forward Traffic Channels if the sum of $E_c/I_o$ of all pilots in the mobile station’s Active Set is less than total_pilot_threshold.

**CF_T_ADD** - Pilot detection threshold for the CDMA Candidate Frequency.

This value is used by the mobile station to trigger the sending of the Candidate Frequency Search Report Message during a periodic search of the CDMA Candidate Frequency (see 2.6.6.2.8.3.2).

The base station shall set this field to the pilot detection threshold, expressed as an unsigned binary number equal to

$$\lceil -2 \times 10 \times \log_{10} E_c/I_o \rceil$$

**TF_WAIT_TIME** - The total maximum wait time on the CDMA Target Frequency.

The base station shall set this field to the maximum wait time, in units of 80 ms, that the mobile station is to spend waiting for a period of $(N_{11m} \times 20)$ ms with sufficient signal quality (e.g. good frames) on the CDMA Target Frequency.

**CF_PILOT_INC** - Pilot PN sequence offset index increment to be used on the CDMA Candidate Frequency after handoff.

The base station shall set this field to the pilot PN sequence increment, in units of 64 PN chips, that the mobile station is to use for searching the Remaining Set, after a handoff to the CDMA Candidate Frequency is successfully completed. The base station should set this field to the largest increment such that the pilot PN sequence offsets of all its neighbor base stations are integer multiples of that increment.

**CF_SRCH_WIN_N** - Default search window size for the Candidate Frequency Search Set.
The base station shall set this field to the value specified in Table 2.6.6.2.1-1 corresponding to the default search window size to be used by the mobile station for its Candidate Frequency Search Set. The mobile station uses the default search window size for all pilots in its Candidate Frequency Search Set when the search window has not been specified for each pilot individually.

**CF_SRCH_WIN_R** - Search window size for the Remaining Set on the CDMA Candidate Frequency.

The base station shall set this field to the window size parameter shown in Table 2.6.6.2.1-1 corresponding to the number of PN chips that the mobile station is to search for pilots in the Remaining Set on the CDMA Candidate Frequency after a handoff is successfully completed.

**RESERVED_2** - Reserved bits.

The base station shall set this field to ‘00000’.

**PILOT_UPDATE** - Pilot search parameter update indicator.

If the mobile station is to change its pilot search parameters, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**NUM_PILOTS** - Number of pilots included in the message.

If the PILOT_UPDATE field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the number of the CDMA Candidate Frequency pilots included in this message. The base station shall set this field to a value from 0 to $N_{8m}$ inclusive.

**CF_NGHBR_SRCH_MODE** - Search mode for Candidate Frequency Search Set.

If the PILOT_UPDATE field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the value shown in Table 3.7.3.3.2.27-3 corresponding to the search mode.

<table>
<thead>
<tr>
<th>Value (binary)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>No search priorities or search windows specified</td>
</tr>
<tr>
<td>01</td>
<td>Search priorities specified</td>
</tr>
<tr>
<td>10</td>
<td>Search windows specified</td>
</tr>
<tr>
<td>11</td>
<td>Search windows and search priorities specified</td>
</tr>
</tbody>
</table>
The base station shall include NUM_PILOTS occurrences of the following four-field record, one for each included CDMA Candidate Frequency pilot.

**NGHBR_PN** - Neighbor pilot PN sequence offset index.

The base station shall set this field to the pilot's PN sequence offset, in units of 64 PN chips.

**SEARCH_SET** - Flag to indicate if the corresponding pilot is to be searched.

The base station shall set this field to '1' if the mobile station should add the corresponding pilot to its Candidate Frequency Search Set; otherwise, the base station shall set this field to '0'.

**SEARCH_PRIORITY** - Pilot Channel search priority.

If CF_NGHBR_SRCH_MODE is set to '01' or '11', then the base station shall set this field to the search priority for this neighbor. The base station shall set the search priority as specified in Table 3.7.3.2.26-2. If CF_NGHBR_SRCH_MODE is set to any other value, the base station shall omit this field.

**SRCH_WIN_NGHBR** - Neighbor pilot channel search window size.

If CF_NGHBR_SRCH_MODE is set to '10' or '11', then the base station shall set this field to the value specified in Table 2.6.6.2.1-1 corresponding to the search window size to be used by mobile stations for this neighbor. If the CF_NGHBR_SRCH_MODE is set to any other value, the base station shall omit this field.

**CF_SRCH_OFFSET_INCL** - Neighbor pilot channel search window offset included.

If PILOT_UPDATE is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If CF_NGHBR_SRCH_MODE is set to '10' or '11' and if SRCH_OFFSET_NGHBR is included in the message, the base station shall set this bit to '1'; otherwise, the base station shall set this bit to '0'.

**ADD_PILOT_REC_INCL** - Additional pilot information included indicator.

The base station shall set this field to '1' if additional pilot information listed in NGHBR_PILOT_REC_TYPE and RECORD_LEN fields are included. The base station shall set this field to '0' if the corresponding pilot is the common pilot and there is no additional pilot information included.

**NGHBR_PILOT_REC_TYPE** - Neighbor Pilot record type

If ADD_PILOT_REC_INCL is set to '1', the base station shall set this field to the NGHBR_PILOT_REC_TYPE value shown in Table 3.7.2.3.2.22-5 corresponding to the type of Pilot Record specified by this record.
If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.

**RECORD_LEN** - Pilot record length.

If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall set this field to the number of octets in the type-specific fields of this pilot record.

If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.

**Type-specific fields** - Pilot record type-specific fields.

If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall include type-specific fields based on the NGHBR_PILOT_REC_TYPE of this pilot record.

If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.

If NGHBR_PILOT_REC_TYPE is equal to ‘000’, the base station shall include the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>TD_POWER_LEVEL</td>
<td>2</td>
</tr>
<tr>
<td>TD_MODE</td>
<td>2</td>
</tr>
<tr>
<td>RESERVED</td>
<td>4</td>
</tr>
</tbody>
</table>

- **TD_POWER_LEVEL** - TD Transmit Power Level.
  - The base station shall set this field to the TD transmit power level relative to that of the Forward Pilot Channel as specified in Table 3.7.2.3.2.26-4.

- **TD_MODE** - Transmit Diversity mode.
  - The base station shall set this field to the Transmit Diversity mode, as specified in Table 3.7.2.3.2.26-3.

- **reserved** - Reserved bits.
  - The base station shall set these bits to ‘0000’.

If NGHBR_PILOT_REC_TYPE is equal to ‘001’, the base station shall include the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>QOF</td>
<td>2</td>
</tr>
<tr>
<td>WALSH_LENGTH</td>
<td>3</td>
</tr>
<tr>
<td>AUX_PILOT_WALSH</td>
<td>WALSH_LENGTH+6</td>
</tr>
<tr>
<td>RESERVED</td>
<td>0 to 7 (as needed)</td>
</tr>
</tbody>
</table>

3-624
QOF - Quasi-orthogonal function index.
The base station shall set this field to the index of the Quasi-orthogonal function (see [2]).

WALSH_LENGTH - Length of the Walsh code.
The base station shall set this field to the WALSH_LENGTH value shown in Table 3.7.2.3.2.22–6 corresponding to the length of the Walsh code for the pilot that is used in as the Auxiliary pilot.

AUX_PILOT_WALSH - Walsh code for the Auxiliary Pilot.
The base station shall set this field to the Walsh code corresponding to the Auxiliary Pilot.

RESERVED - Reserved bits.
The base station shall set all the bits of this field to ‘0’ to make the entire record octet-aligned.

If NGHBR_PILOT_REC_TYPE is equal to ‘010’, the base station shall include the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>QOF</td>
<td>2</td>
</tr>
<tr>
<td>WALSH_LENGTH</td>
<td>3</td>

<tr>
<td>AUX_WALSH</td>
<td>WALSH_LENGTH+6</td>
</tr>
<tr>
<td>AUX_TD_POWER_LEVEL</td>
<td>2</td>
</tr>
<tr>
<td>TD_MODE</td>
<td>2</td>
</tr>
<tr>
<td>RESERVED</td>
<td>0 to 7 (as needed)</td>
</tr>
</tbody>
</table>

QOF - Quasi-orthogonal function index for the Auxiliary Transmit Diversity Pilot.
The base station shall set this field to the index of the Quasi-orthogonal function (see [2]).

WALSH_LENGTH - Length of the Walsh code.
The base station shall set this field to the WALSH_LENGTH value shown in 3.7.2.3.2.22-6 corresponding to the length of the Walsh code for the pilots that are used as Auxiliary pilot in the transmit diversity mode.

AUX_WALSH - Walsh code for the Auxiliary Pilot.
The base station shall set this field to the Walsh code corresponding to the Auxiliary Pilot.

AUX_TD_POWER_LEVEL - Auxiliary Transmit Diversity Pilot power level.
The base station shall set this field to the Auxiliary Transmit Diversity Pilot transmit power level relative to that of the Auxiliary Pilot as specified in Table 3.7.2.3.2.22-7.

**TD_MODE** - Transmit Diversity mode.

The base station shall set this field to the Transmit Diversity mode, as specified in Table 3.7.2.3.2.26-3.

**RESERVED** - Reserved bits.

The base station shall set all the bits of this field to ‘0’ to make the entire record octet-aligned.

If NGHBR_PILOT_REC_TYPE is equal to ‘011’, the base station shall include the following fields:

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>SR3_PRIMARY_PILOT</td>
<td>2</td>
</tr>
<tr>
<td>SR3_PILOT_POWER1</td>
<td>3</td>
</tr>
<tr>
<td>SR3_PILOT_POWER2</td>
<td>3</td>
</tr>
</tbody>
</table>

**SR3_PRIMARY_PILOT** – Primary SR3 pilot.

The base station shall set this field to the value shown in Table 3.7.2.3.2.26-5 corresponding to the position of the primary SR3 pilot.

**SR3_PILOT_POWER1** – The primary SR3 pilot power level relative to that of the pilot on the lower frequency of the two remaining SR3 frequencies.

The base station shall set this field to the value shown in Table 3.7.2.3.2.26-6 corresponding to the power level of the primary pilot with respect to the pilot on the lower frequency of the two remaining SR3 frequencies.

**SR3_PILOT_POWER2** – The primary SR3 pilot power level relative to that of the pilot on the higher frequency of the two remaining SR3 frequencies.

The base station shall set this field to the value shown in Table 3.7.2.3.2.26-6 corresponding to the power level of the primary pilot with respect to the pilot on the higher frequency of the two remaining SR3 frequencies.

If NGHBR_PILOT_REC_TYPE is equal to ‘100’, the base station shall include the following fields:
<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>SR3_PRIMARY_PILOT</td>
<td>2</td>

</tr>
<tr>
<td>RESERVED</td>
<td>0 – 7 (as needed)</td>
</tr>
</tbody>
</table>

1. **SR3_PRIMARY_PILOT** — Primary SR3 pilot.
   - The base station shall set this field to the value shown in Table 3.7.2.3.2.26-5 corresponding to the position of the primary SR3 pilot.

2. **SR3_PILOT_POWER1** — The primary SR3 pilot power level relative to that of the pilot on the lower frequency of the two remaining SR3 frequencies.
   - The base station shall set this field to the value shown in Table 3.7.2.3.2.26-6 corresponding to the power level of the primary pilot with respect to the pilot on the lower frequency of the two remaining SR3 frequencies.

3. **SR3_PILOT_POWER2** — The primary SR3 pilot power level relative to that of the pilot on the higher frequency of the two remaining SR3 frequencies.
   - The base station shall set this field to the value shown in Table 3.7.2.3.2.26-6 corresponding to the power level of the primary pilot with respect to the pilot on the higher frequency of the two remaining SR3 frequencies.

4. **QOF** — Quasi-orthogonal function index.
   - The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) on the frequency of the primary pilot.
WALSH_LENGTH - Length of the Walsh Code.

The base station shall set this field to the WALSH_LENGTH value shown in Table 3.7.2.3.2.22–6 corresponding to the length of the Walsh code for the pilot that is used as the Auxiliary pilot on the frequency of the primary pilot.

AUX_PILOT_WALSH - Walsh Code for the Auxiliary Pilot.

The base station shall set this field to the Walsh code corresponding to the Auxiliary pilot on the frequency of the primary pilot.

ADD_INFO_INCL1 - Additional information included for the pilot on the lower frequency of the two remaining SR3 frequencies.

If the additional information for the pilot on the lower frequencies of the two remaining SR3 frequencies is the same as pilot on the primary frequency, the base station shall set this field to ‘0’; otherwise, the base station shall set this field to ‘1’.

QOF1 - Quasi-orthogonal function index for the pilot on the lower frequency of the two remaining SR3 frequencies.

If ADD_INFO_INCL1 is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) on the lower frequency of the two remaining SR3 frequencies.

WALSH_LENGTH1 - Length of the Walsh Code for the pilot on the lower frequency of the two remaining SR3 frequencies.

If ADD_INFO_INCL1 is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the WALSH_LENGTH value shown in Table 3.7.2.3.2.22–6 corresponding to the length of the Walsh code for the pilot that is used as the Auxiliary pilot on the lower frequency of the two remaining SR3 frequencies.

AUX_PILOT_WALSH1 - Walsh Code for the Auxiliary Pilot on the lower frequency of the two remaining SR3 frequencies.

If ADD_INFO_INCL1 is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the Walsh code corresponding to the Auxiliary pilot on the lower frequency of the two remaining SR3 frequencies.

ADD_INFO_INCL2 - Additional information included for the pilot on the higher frequency of the two remaining SR3 frequencies.
If the additional information for the pilot on the higher frequencies of the two remaining SR3 frequencies is the same as pilot on the primary frequency, the base station shall set this field to ‘0’; otherwise, the base station shall set this field to ‘1’.

QOF2 - Quasi-orthogonal function index for the pilot on the higher frequency of the two remaining SR3 frequencies.

If ADD_INFO_INCL2 is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) on the higher frequency of the two remaining SR3 frequencies.

WALSH_LENGTH2 - Length of the Walsh Code for the pilot on the higher frequency of the two remaining SR3 frequencies.

If ADD_INFO_INCL2 is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the WALSH_LENGTH value shown in Table 3.7.2.3.2.22–6 corresponding to the length of the Walsh code for the pilot that is used as the Auxiliary pilot on the higher frequency of the two remaining SR3 frequencies.

AUX_PILOT_WALSH2 - Walsh Code for the Auxiliary Pilot on the higher frequency of the two remaining SR3 frequencies.

If ADD_INFO_INCL2 is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the Walsh code corresponding to the Auxiliary pilot on the higher frequency of the two remaining SR3 frequencies.

RESERVED - Reserved bits.

The base station shall set all the bits of this field to ‘0’ to make the entire record octet-aligned.

SRCH_OFFSET_NGHBR - Neighbor pilot channel search window offset.

If CF_SRCH_OFFSET_INCL is included and equals to ‘1’, then the base station shall set this field to the value specified in Table 2.6.6.2.1-2 corresponding to the search window offset to be used by the mobile station for this neighbor; otherwise, the base station shall omit this field.

RESERVED_3 - Reserved bits.

The base station shall add reserved bits as needed in order to make the length of the Mode-specific fields equal to an integer number of octets. The base station shall set these bits to ‘0’.

If SEARCH_MODE is equal to ‘0001’, the base station shall include the following fields:
<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAND_CLASS</td>
<td>5</td>
</tr>
<tr>
<td>SF_TOTAL_EC_THRESH</td>
<td>5</td>
</tr>
<tr>
<td>SF_TOTAL_EC_Io0_THRESH</td>
<td>5</td>
</tr>
<tr>
<td>RESERVED_4</td>
<td>6</td>
</tr>
<tr>
<td>NUM_ANALOG_FREQS</td>
<td>3</td>
</tr>
</tbody>
</table>

NUM_ANALOG_FREQS occurrences of the following record:

`{(NUM_ANALOG_FREQS)}

ANALOG_FREQ 11

{NUM_ANALOG_FREQS}

RESERVED_5 0-7

---

**BAND_CLASS** - Band class.

The base station shall set this field to the CDMA band class associated with the analog frequencies included in this message.

**SF_TOTAL_EC_THRESH** - Serving Frequency total pilot $E_c$ threshold.

If the mobile station is not to use the measurement of total $E_c$ of the pilots in the Serving Frequency Active Set in the Analog Frequencies periodic search procedure, the base station shall set this field to ‘11111’; otherwise, the base station shall set this field to

$$\left\lfloor \frac{(10 \times \log_{10}(total_{ec\_thresh}) + 120)}{2} \right\rfloor$$

where $total_{ec\_thresh}$ is defined by the following rule: The mobile station is not to visit any analog frequency if the total $E_c$ of the pilots in the Serving Frequency Active Set is greater than $total_{ec\_thresh}$.

**SF_TOTAL_EC_Io0_THRESH** - Serving Frequency total pilot $E_c/I_o0$ threshold.

If the mobile station is not to use the measurement of total $E_c/I_o0$ of the pilots in the Serving Frequency Active Set in the Analog Frequencies periodic search procedure, the base station shall set this field to ‘11111’; otherwise, the base station shall set this field to

$$\left\lfloor -20 \times \log_{10}(total_{ec\_io0\_thresh}) \right\rfloor$$

where $total_{ec\_io0\_thresh}$ is defined by the following rule: The mobile station is not to visit any analog frequency if the total $E_c/I_o0$ of the pilots in the Serving Frequency Active Set is greater than $total_{ec\_io0\_thresh}$.

**RESERVED_4** - Reserved bits.
The base station shall set this field to ‘000000’.

NUM_ANALOG_FREQS - Number of analog frequencies.

The base station shall set this field to the number of neighbors on the candidate frequency. The base station shall set this field to a value from 1 to 7, inclusive.

The message will include NUM_ANALOG_FREQS occurrences of the following one-field record, one for each neighbor on the candidate frequency.

ANALOG_FREQ - Analog frequency channel number.

The base station shall set this field to the analog frequency channel number to search.

RESERVED_5 - Reserved bits.

The base station shall add reserved bits as needed in order to make the length of the Mode-specific fields equal to an integer number of octets. The base station shall set these bits to ‘0’.

ALIGN_TIMING - Align timing indicator.

If the base station requests that the mobile station offset the start of the first search from the action time of this message (or of a subsequent Candidate Frequency Search Control Message that starts a search) by a delay specified by the SEARCH_OFFSET field, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

SEARCH_OFFSET - Search offset.

If the ALIGN_TIMING field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it to

\[
\min(63, \lceil \frac{\text{search_offset_time}}{0.00125} \rceil)
\]

where \( \text{search_offset_time} \) is the time offset, in seconds, of the start of the first search from the action time of this message (or of a subsequent Candidate Frequency Search Control Message that starts a search).
3.7.3.3.2.28 Candidate Frequency Search Control Message

**MSG_TAG:** CFSCNM

<table>
<thead>

</tbody>
</table>

**USE_TIME** - Use action time indicator.

This field indicates whether an explicit action time is specified in this message.

If an explicit action time is specified in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

If the base station requests the mobile station to perform an aligned search (see 2.6.6.2.8.3), the base station shall specify an explicit action time for the message.

**ACTION_TIME** - Action time.

If the USE_TIME field is set to ‘1’, the base station shall set this field to the System Time minus FRAME_OFFSETs × 1.25 ms, in units of 80 ms (modulo 64), at which the message is to take effect. If the USE_TIME field is set to ‘0’, the base station shall set this field to ‘000000’.

**CFSCM_SEQ** - Candidate Frequency Search Control Message sequence number.

The base station shall set this field to the Candidate Frequency Search Control Message sequence number, as specified in 3.6.6.2.2.5.

**SEARCH_TYPE** - Search command.

The base station shall set this field to the appropriate SEARCH_TYPE code from Table 3.7.3.3.2.27-1 to indicate the purpose of the message.

**ALIGN_TIMING** - Align timing indicator.
If the base station requests that the mobile station offset the start of the first search from the action time of this message by a delay specified by the SEARCH_OFFSET field of the last Candidate Frequency Search Request Message sent to the mobile station, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

USE_TIME - Use action time indicator.
The base station shall set this field to ‘1’.

ACTION_TIME - Action time.
The base station shall set this field to the System Time minus FRAME_OFFSETs × 1.25 ms, in units of 80 ms (modulo 64), used in calculating the start of the first PUF probe.

ACTION_TIME_FRAME - Action time frame.
The base station shall set this field to the number of frames after ACTION_TIME that the mobile station is to begin the first PUF probe.

PUF_SETUP_SIZE - Number of PUF setup power control groups.
The base station shall set this field to one less than the number of power control groups that the mobile station is to transmit at nominal power prior to transmitting a PUF pulse.
The base station shall set the values of PUF_SETUP_SIZE and PUF_PULSE_SIZE so that \([\text{PUF_SETUP_SIZE} + 1 + \text{PUF_PULSE_SIZE} + 1] \mod 16\) is not equal to 0.

PUF_PULSE_SIZE - Number of PUF pulse power control groups.
The base station shall set this field to one less than the number of power control groups that the mobile station is to transmit at elevated power level during the PUF pulse. The base station shall set the values of PUF_SETUP_SIZE and PUF_PULSE_SIZE so that \([\text{PUF_SETUP_SIZE} + 1 + \text{PUF_PULSE_SIZE} + 1]\) mod 16 is not equal to 0.

**PUF_INTERVAL** - PUF interval. The base station shall set this field to the number of frames between the start of each PUF probe.

**PUF_INIT_PWR** - Power increase of initial PUF pulse. The base station shall set this field to the amount (in dB) that the mobile station is to increase its mean output power for the first PUF pulse.

**PUF_PWR_STEP** - PUF power step. The base station shall set this field to the value (in dB) by which the mobile station is to increment the power of a PUF pulse above nominal power from one PUF pulse to the next.

**TOTAL_PUF_PROBES** - Total number of PUF probes. The base station shall set this field to one less than the maximum number of PUF probes the mobile station is to transmit in a PUF attempt.

**MAX_PWR_PUF** - Maximum number of PUF probes transmitted at full power. The base station shall set this field to one less than the number of PUF pulses that the mobile station is to transmit at maximum power level.

**PUF_FREQ_INCL** - Frequency included indicator. If the mobile station is to change PUF_BAND_CLASS or PUF_CDMA_FREQ, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

**PUF_BAND_CLASS** - Band class. If PUF_FREQ_INCL is set to ‘1’, the base station shall include this field and set it to the CDMA band class corresponding to the CDMA frequency assignment for the CDMA Channel as specified in [30]; otherwise, the base station shall omit this field.

**PUF_CDMA_FREQ** - Frequency assignment. If PUF_FREQ_INCL is set to ‘1’, the base station shall include this field and set it to the CDMA Channel number, in the specified CDMA band class, corresponding to the CDMA frequency for the CDMA Channel as specified in [2]; otherwise, the base station shall omit this field.

- **RESERVED** - Reserved bits.
  - The base station shall set these bits to '000000'.

- **LOC_IND** - Location indicator
  - If the base station is to include MS_LAT, MS_LONG, and MS_LOC_TSTAMP in this message, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

- **RESERVED_1** - Reserved bits.
  - If LOC_IND is equal to '1', the base station shall set these bits to '000'; otherwise, the base station shall not include this field.

- **MS_LAT** - Mobile station latitude.
  - If LOC_IND is equal to '1', the base station shall set this field to the mobile station’s latitude in units of 0.25 second, expressed as a two’s complement signed number with positive numbers signifying North latitudes. The base station shall set this field to a value in the range -1296000 to 1296000 inclusive (corresponding to a range of -90° to +90°).
  - Otherwise, the base station shall not include this field.

- **MS_LONG** - Mobile station longitude.
  - If LOC_IND is equal to '1', the base station shall set this field to the mobile station’s longitude in units of 0.25 second, expressed as a two’s complement signed number with positive numbers signifying East longitude. The base station shall set this field to a value in the range -2592000 to 2592000 inclusive (corresponding to a range of -180° to +180°).
  - Otherwise, the base station shall not include this field.

- **MS_LOC_TSTAMP** - Time stamp.
If LOC_IND is equal to ‘1’, the base station shall set this field to the time at which the mobile station’s location parameters were received; otherwise, the base station shall not include this field.

This field is formatted as shown below.

Note: All subfields contain two 4-bit BCD numbers giving the decimal value of the subfield. For example, if the minute is 53, the MINUTES subfield contains ‘01010011’.

- **HOURS** - Current hour (UTC).
  - The base station shall set this field to the current hour (UTC), in the range 0-23.

- **MINUTES** - Current minutes (UTC).
  - The base station shall set this field to the current minutes (UTC), in the range 0-59.

- **SECONDS** - Current seconds (UTC).
  - The base station shall set this field to the current seconds (UTC), in the range 0-59.

**USE_TIME** - Use action time indicator.

This field indicates whether an explicit action time is specified in this message.

If an explicit action time is specified in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**ACTION_TIME** - Action time.

If the USE_TIME field is set to ‘1’, the base station shall set this field to the System Time minus FRAME_OFFSET \(_s \times 1.25\) ms, in units of 80 ms (modulo 64), at which the handoff is to take effect. If the USE_TIME field is set to ‘0’, the base station shall omit this field.

**HDM_SEQ** - General Handoff Direction Message sequence number.

This field is used by the mobile station in the Power Measurement Report Message to identify the order in which the reported pilot strengths are sent. The base station shall set this field to the handoff message sequence number, as specified in 3.6.6.2.2.10.

**SEARCH_INCLUDED** - Pilot search parameters included.

If the mobile station is to change its pilot search parameters, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**SRCH_WIN_A** - Search window size for the Active Set and Candidate Set.

If SEARCH_INCLUDED is set to ‘1’, the base station shall include the field SRCH_WIN_A and set this field to the window size parameter shown in Table 2.6.6.2.1-1 corresponding to the number of PN chips that the mobile station is to search for pilots in the Active Set and the Candidate Set; otherwise, the base station shall omit this field.

**SRCH_WIN_N** - Search window size for the Neighbor Set.
If SEARCH_INCLUDED is set to ‘1’, the base station shall include the field SRCH_WIN_N and set this field to the window size parameter shown in Table 2.6.6.2.1-1 corresponding to the search window size to be used by mobile stations for the Neighbor Set after completion of the handoff; otherwise, the base station shall omit this field.

SRCH_WIN_R - Search window size for the Remaining Set.

If SEARCH_INCLUDED is set to ‘1’, the base station shall include the field SRCH_WIN_R and set this field to the window size parameter shown in Table 2.6.6.2.1-1 corresponding to the search window size to be used by mobile stations for the Remaining Set after completion of the handoff; otherwise, the base station shall omit this field.

T_ADD - Pilot detection threshold.

This value is used by the mobile station to trigger the transfer of a pilot from the Neighbor Set or Remaining Set to the Candidate Set (see 2.6.6.2.6) and to trigger the sending of the Pilot Strength Measurement Message or Extended Pilot Strength Measurement Message initiating the handoff process (see 2.6.6.2.5.2).

If SEARCH_INCLUDED is set to ‘1’, the base station shall include the field T_ADD and set this field to the pilot detection threshold, expressed as an unsigned binary number equal to $\left\lfloor -2 \times 10 \times \log_{10} \frac{E_c}{I_0} \right\rfloor$; otherwise, the base station shall omit this field.

T_DROP - Pilot drop threshold.

This value is used by mobile stations to start a handoff drop timer for pilots in the Active Set and the Candidate Set (see 2.6.6.2.3).

If SEARCH_INCLUDED is set to ‘1’, the base station shall include the field T_DROP and set this field to the pilot drop threshold, expressed as an unsigned binary number equal to $\left\lfloor -2 \times 10 \times \log_{10} \frac{E_c}{I_0} \right\rfloor$; otherwise, the base station shall omit this field.

T_COMP - Active Set versus Candidate Set comparison threshold.

The mobile station transmits a Pilot Strength Measurement Message or Extended Pilot Strength Measurement Message when the strength of a pilot in the Candidate Set exceeds that of a pilot in the Active Set by this margin (see 2.6.6.2.5.2).

If SEARCH_INCLUDED is set to ‘1’, the base station shall include the field T_COMP and set this field to the threshold Candidate Set pilot to Active Set pilot ratio, in units of 0.5 dB; otherwise, the base station shall omit this field.
T_TDROP - Drop timer value.  
Timer value after which an action is taken by the mobile station for a pilot that is a member of the Active Set or Candidate Set, and whose strength has not become greater than T_DROP. If the pilot is a member of the Active Set, a Pilot Strength Measurement Message or Extended Pilot Strength Measurement Message is issued. If the pilot is a member of the Candidate Set, it will be moved to the Neighbor Set.

If SEARCH_INCLUDED is set to ‘1’, the base station shall include the field T_TDROP and set this field to the T_TDROP value shown in Table 2.6.6.2.3-1 corresponding to the drop timer value to be used by the mobile station; otherwise, the base station shall omit this field.

SOFT_SLOPE - The slope in the inequality criterion for adding a pilot to the active set, or dropping a pilot from the active set (see 2.6.6.2.3 and 2.6.6.2.5.2).

If SEARCH_INCLUDED is set to ‘1’, the base station shall include the field SOFT_SLOPE in the additional fields and set this field as an unsigned binary number; otherwise, the base station shall omit this field.

ADD_INTERCEPT - The intercept in the inequality criterion for adding a pilot to the active set (see 2.6.6.2.5.2).

If SEARCH_INCLUDED is set to ‘1’, the base station shall include the field ADD_INTERCEPT in the additional fields and set this field as a two's complement signed binary number in units of 0.5 dB; otherwise, the base station shall omit this field.

DROP_INTERCEPT - The intercept in the inequality criterion for dropping a pilot from the active set (see 2.6.6.2.3).

If SEARCH_INCLUDED is set to ‘1’, the base station shall include the field DROP_INTERCEPT in the additional fields and set this field as a two's complement signed binary number in units of 0.5 dB; otherwise, the base station shall omit this field.

EXTRA_PARMS - Extra parameters included.

If the mobile station is to change FRAME_OFFSET, PRIVATE_LCM, ENCRYPT_MODE, NOM_PWR, BAND_CLASS, or CDMA_FREQ, or the mobile station is to perform a reset of the acknowledgment procedures, or the mobile station is to reset Forward Traffic Channel power control counters, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

P_REV - Protocol revision level.

If EXTRA_PARMS is set to ‘1’, the base station shall set this field to the base station protocol revision level that the mobile station is to use after completion of the handoff; otherwise, the base station shall omit this field.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PACKET_ZONE_ID</td>
<td>Packet data services zone identifier. If EXTRA_PARMS is set to ‘1’, the base station shall include the field PACKET_ZONE_ID and set this field as described below; otherwise, the base station shall omit this field. If the base station supports a packet data service zone, the base station shall set this field to the non-zero packet data services zone identifier that the mobile station is to use after completion of the handoff. If the base station does not support a packet data service zone, the base station shall set this field to ‘00000000’.</td>
</tr>
<tr>
<td>FRAME_OFFSET</td>
<td>Frame offset. The Forward and Reverse Traffic Channel frames are delayed FRAME_OFFSET × 1.25 ms relative to system timing (see [2]). If EXTRA_PARMS is set to ‘1’, the base station shall include the field FRAME_OFFSET and set this field to the Forward and Reverse Traffic Channel frame offset; otherwise, the base station shall omit this field.</td>
</tr>
<tr>
<td>PRIVATE_LCM</td>
<td>Private long code mask indicator. This field is used to change the long code mask after a hard handoff. If EXTRA_PARMS is set to ‘1’, the base station shall include the field PRIVATE_LCM and set this field as described below; otherwise, the base station shall omit this field. If the private long code mask is to be used after the handoff, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.</td>
</tr>
<tr>
<td>RESET_L2</td>
<td>Reset acknowledgment procedures command. This field is used to reset acknowledgment processing in the mobile station. If EXTRA_PARMS is set to ‘1’, the base station shall include the field RESET_L2 and set this field as described below; otherwise, the base station shall omit this field. If the field is included and the mobile station is to reset its acknowledgment procedures, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.</td>
</tr>
<tr>
<td>RESET_FPC</td>
<td>Reset Forward Traffic Channel power control. This field is used to reset the Forward Traffic Channel power control counters. If EXTRA_PARMS is set to ‘1’, the base station shall include the field RESET_FPC and set this field as described below; otherwise, the base station shall omit this field.</td>
</tr>
</tbody>
</table>
The base station shall set this field to ‘0’ if the Forward Traffic Channel power control counters are to be maintained after completion of the handoff. If the counters are to be initialized as specified in 2.6.1.1.1, then the base station shall set this field to ‘1’.

**SERV_NEG_TYPE** - Service negotiation type.

If EXTRA_PARMS is set to ‘1’, the base station shall include the field SERV_NEG_TYPE and set this field as described below; otherwise, the base station shall omit this field.

If the mobile station is to use service negotiation, the base station shall set this field to ‘1’. If the mobile station is to use service option negotiation, the base station shall set this field to ‘0’.

**ENCRYPT_MODE** - Message encryption mode.

If EXTRA_PARMS is set to ‘1’, the base station shall include the field ENCRYPT_MODE and set this field to the ENCRYPT_MODE value shown in Table 3.7.2.3.2.8-2 corresponding to the encryption mode that is to be used for messages sent on the Forward and Reverse Traffic Channels, as specified in 2.3.12.2; otherwise, the base station shall omit this field.

**NOM_PWR_EXT** - Extended nominal transmit power.

If EXTRA_PARMS is set to ‘1’, the base station shall include this field and set this field as described below; otherwise, the base station shall omit this field.

If the mobile station is being handed off to a base station operating in Band Class 0 or Band Class 3, the base station shall set this field to ‘0’; otherwise, the base station shall set it as follows:

If the correction factor to be used by the mobile station in the open loop power estimate is between -24 dB and -9 dB inclusive, the base station shall set this field to ‘1’; otherwise (the correction factor is in the range -8 dB to 7 dB inclusive), the base station shall set this field to ‘0’.

**NOM_PWR** - Nominal transmit power offset.

If EXTRA_PARMS is set to ‘1’, the base station shall include the field NOM_PWR and set this field to the correction factor to be used by the mobile station in the open loop power estimate, expressed as a two’s complement value in units of 1 dB (see [2]); otherwise, the base station shall omit this field.

**NUM_PREAMBLE** - Traffic Channel preamble length.

If EXTRA_PARMS is set to ‘0’, the base station shall omit the NUM_PREAMBLE field; otherwise, the base station shall include this field and set it to the length of Traffic Channel preamble that the mobile station is to send when performing a handoff; as follows:
If, after the handoff, radio configuration 1 or radio configuration 2 is to be used, the base station shall set NUM_PREAMBLE to the Traffic Channel preamble length in 20 ms units; otherwise, the base station shall set NUM_PREAMBLE to the value shown in Table 3.7.3.3.2.17-1 corresponding to the Traffic Channel preamble length in 1.25 ms units.

BAND_CLASS - Band class.

If EXTRA_PARMS is set to ‘1’, the base station shall include the field BAND_CLASS and set this field to the CDMA band class corresponding to the CDMA Channel as specified in [30]; otherwise, the base station shall omit this field.

CDMA_FREQ - Frequency assignment.

If EXTRA_PARMS is set to ‘1’, the base station shall include the field CDMA_FREQ and set this field to the CDMA Channel number, in the specified CDMA band class, corresponding to the CDMA frequency assignment for the CDMA Channel as specified in [2]; otherwise, the base station shall omit this field.

RETURN_IF_HANDOFF_FAIL - Return on failure flag.

If EXTRA_PARMS is set to ‘1’, the base station shall include the field RETURN_IF_HANDOFF_FAIL and set this field as described below; otherwise, the base station shall omit this field.

If the base station includes this field, it shall set this field to ‘1’ if the mobile station is to resume the use of the Active Set on the Serving Frequency following an unsuccessful hard handoff attempt, as specified in 2.6.6.2.8.2; otherwise, the base station shall set this field to ‘0’.

COMPLETE_SEARCH - Flag to complete search.

If RETURN_IF_HANDOFF_FAIL is included and is set to ‘1’, the base station shall include the field COMPLETE_SEARCH and set this field as described below; otherwise, the base station shall omit this field.

If the base station includes this field, it shall set this field to ‘1’ if the mobile station is to complete the search of the Candidate Frequency Search Set before resuming the use of the Active Set on the Serving Frequency when an inter-frequency handoff attempt is unsuccessful, as specified in 2.6.6.2.8.2; otherwise, the base station shall set this field to ‘0’.

PERIODIC_SEARCH - Flag to search the Candidate Frequency periodically.

If EXTRA_PARMS is set to ‘1’, the base station shall include the field PERIODIC_SEARCH and set this field as described below; otherwise, the base station shall omit this field.

RETURN_IF_HANDOFF_FAIL - Return on failure flag.

If EXTRA_PARMS is set to ‘1’, the base station shall include the field RETURN_IF_HANDOFF_FAIL and set this field as described below; otherwise, the base station shall omit this field.

If the base station includes this field, it shall set this field to ‘1’ if the mobile station is to resume the use of the Active Set on the Serving Frequency following an unsuccessful hard handoff attempt, as specified in 2.6.6.2.8.2; otherwise, the base station shall set this field to ‘0’.

COMPLETE_SEARCH - Flag to complete search.

If RETURN_IF_HANDOFF_FAIL is included and is set to ‘1’, the base station shall include the field COMPLETE_SEARCH and set this field as described below; otherwise, the base station shall omit this field.

If the base station includes this field, it shall set this field to ‘1’ if the mobile station is to complete the search of the Candidate Frequency Search Set before resuming the use of the Active Set on the Serving Frequency when an inter-frequency handoff attempt is unsuccessful, as specified in 2.6.6.2.8.2; otherwise, the base station shall set this field to ‘0’.

PERIODIC_SEARCH - Flag to search the Candidate Frequency periodically.

If EXTRA_PARMS is set to ‘1’, the base station shall include the field PERIODIC_SEARCH and set this field as described below; otherwise, the base station shall omit this field.
If the base station includes this field, it shall set this field to ‘1’ if the mobile station is to periodically search the Candidate Frequency, as specified in 2.6.6.2.8.3; otherwise, the base station shall set this field to ‘0’.

**SCR_INCLUDED** - Service Configuration Record included indicator.

If EXTRA_PARMS is set to ‘1’, the base station shall include the field SCR_INCLUDED and shall set this field as described below; otherwise, the base station shall omit this field.

The base station shall set this field to ‘1’ if it includes Service Configuration Record in the message; otherwise, the base station shall set this field to ‘0’.

**SERV_CON_SEQ** - Connect sequence number.

If SCR_INCLUDED is included and is set to ‘1’, the base station shall include the field SERV_CON_SEQ and shall set this field to the connect sequence number pertaining to this service configuration as specified in 3.6.4.1.2.1.2.

If SCR_INCLUDED is included and is set to ‘1’, the base station shall include one occurrence of the following three-field record to specify the service configuration.

**RECORD_TYPE** - Information record type.

If SCR_INCLUDED is included and is set to ‘1’, the base station shall include the field RECORD_TYPE and shall set this field to the record type value shown in Table 3.7.5-1 corresponding to the Service Configuration information record.

**RECORD_LEN** - Information record length.

If SCR_INCLUDED is included and is set to ‘1’, the base station shall include the field RECORD_LEN and shall set this field to the number of octets included in the type-specific fields of the Service Configuration information record.

**Type-specific fields** - Type-specific fields.

If SCR_INCLUDED is included and is set to ‘1’, the base station shall include the type specific fields and shall set these fields as specified in 3.7.5.7 for the Service Configuration information record.

**SUP_CHAN_PARMS_INCLUDED** - Supplemental code channel parameters included indicator.

The base station shall set this field to ‘1’ if the base station includes the FOR_INCLUDED, REV_INCLUDED, and REV_PARMS_INCLUDED fields in the message; otherwise, the base station shall set this field to ‘0’.

**FOR_INCLUDED** - Forward assignment information included indicator.

If SUP_CHAN_PARMS_INCLUDED is set to ‘1’, the base station shall include the field FOR_INCLUDED and set this field as described below; otherwise, the base station shall omit this field.
If the base station includes this field, it shall set this field to ‘1’ if Forward Supplemental Code Channel assignment information is included in the message; otherwise, the base station shall set this field to ‘0’.

FOR_SUP_CONFIG - Forward Supplemental Code Channel configuration indicator.

If FOR_INCLUDED is included and is set to ‘1’, the base station shall include the field FOR_SUP_CONFIG and set this field according to the following rules:

The base station shall set this field to ‘00’ if Forward Supplemental Code Channels are not specified in the message, and the mobile station is to stop processing all Forward Supplemental Code Channels.

The base station shall set this field to ‘01’ if Forward Supplemental Code Channels are not specified in the message, and the mobile station is to start processing the Forward Supplemental Code Channels previously stored in its Code Channel List, CODE_CHAN_LISTs.

The base station shall set this field to ‘10’ if the Forward Supplemental Code Channels are specified in the message, and the mobile station is to stop processing all Forward Supplemental Code Channels in CODE_CHAN_LISTs, and to update the CODE_CHAN_LISTs, according to the information contained in the message.

The base station shall set this field to ‘11’ if the Forward Supplemental Code Channels are specified in the message, and the mobile station is to update its Code Channel List, CODE_CHAN_LISTs, according to the information contained in the message and to start processing the Forward Supplemental Code Channels.

NUM_FOR_SUP - Number of Forward Supplemental Code Channels.

If FOR_SUP_CONFIG is included and is set to ‘10’ or ‘11’, the base station shall include the field NUM_FOR_SUP and set it to the number of Forward Supplemental Code Channels assigned to the mobile station; otherwise, the base station shall omit this field. NUM_FOR_SUP shall not exceed the maximum number of Forward Supplemental Code Channels for the negotiated multiplex option.

USE_FOR_DURATION - Use forward duration indicator.

If FOR_SUP_CONFIG is included and is set to ‘01’ or ‘11’, the base station shall include the field USE_FOR_DURATION and set this field as described below; otherwise the base station shall omit this field.

The base station shall set this field to ‘1’ if the FOR_DURATION field is included in the message and the mobile station is to process the Forward Supplemental Code Channels for a time duration indicated by FOR_DURATION.
The base station shall set this field to ‘0’ if the mobile station is to process the Forward Supplemental Code Channels for an indefinite duration (i.e., the mobile station is to continue processing Forward Supplemental Code Channels until it receives a subsequent Supplemental Channel Assignment Message or a General Handoff Direction Message that specifies a different Forward Supplemental Code Channel assignment.

FOR_DURATION - Duration of Forward Supplemental Code Channel assignment.

If USE_FOR_DURATION is included and is set to ‘1’, the base station shall include the field FOR_DURATION and set this field to the allocated duration, in units of 80 ms, for which the mobile station is to process the Forward Supplemental Code Channels; otherwise, the base station shall omit this field.

REV_INCLUDED - Reverse assignment information included indicator.

If SUP_CHAN_PARMS_INCLUDED is set to ‘1’, the base station shall include the field REV_INCLUDED and set this field as described below; otherwise, the base station shall omit this field.

If the base station includes this field, it shall set this field to ‘1’ if Reverse Supplemental Code Channel assignment information is included in the message; otherwise, the base station shall set this field to ‘0’.

REV_DTX_DURATION - Reverse Discontinuous Transmission Duration.

If REV_INCLUDED is included and is set to ‘1’, the base station shall include the field REV_DTX_DURATION; otherwise the base station shall omit this field.

If the base station includes this field, it shall set this field to the maximum duration of time in units of 20 ms that the mobile station is allowed to stop transmission on a Reverse Supplemental Code Channel within the reverse assignment duration. The base station shall set this field to ‘0000’ if the mobile station is to stop using a Reverse Supplemental Code Channel once it has stopped transmitting on that Reverse Supplemental Code Channel. The base station shall set this field to ‘1111’ if the mobile station is allowed to resume transmission on a Reverse Supplemental Code Channel at any time within the reverse assignment duration.

CLEAR_RETRY_DELAY - Clear retry delay indicator.

If REV_INCLUDED is included and is set to ‘1’, the base station shall include the field CLEAR_RETRY_DELAY and set this field as described below; otherwise the base station shall omit this field.

The base station shall set this field to ‘1’ to indicate that the mobile station is to clear any existing retry delay which it has stored (see 2.6.6.2.5.1); otherwise, the base station shall set this field to ‘0’.

3-650
USE_REV_DURATION - Use reverse duration indicator.

If REVINCLUDED is included and is set to ‘1’, the base station shall include the field USE_REV_DURATION and set this field as described below; otherwise the base station shall omit this field.

The base station shall set this field to ‘1’ if the REV_DURATION field is included in the message and the mobile station is allowed to transmit on the Reverse Supplemental Code Channels for a time duration indicated by REV_DURATION.

The base station shall set this field to ‘0’ if the mobile station is allowed to transmit on the Reverse Supplemental Code Channels for an indefinite duration (i.e., the mobile station may continue to transmit on the Reverse Supplemental Code Channels until it receives a subsequent Supplemental Channel Assignment Message or a General Handoff Direction Message that specifies a different Reverse Supplemental Code Channel assignment.

REV_DURATION - Duration of Reverse Supplemental Code Channel Assignment.

If USE_REV_DURATION is included and is set to ‘1’, the base station shall include the field REV_DURATION and set this field to the allocated duration, in units of 80 ms, for which the mobile station may transmit on Reverse Supplemental Code Channels; otherwise the base station shall omit this field.

NUM_REV_CODES - Number of Reverse Supplemental Code Channels.

If REVINCLUDED is included and is set to ‘1’, the base station shall include the field NUM_REV_CODES and set this field to the number of Reverse Supplemental Code Channels which are assigned to the mobile station; otherwise the base station shall omit this field.

USE_T_ADD_ABORT - Reverse use T_ADD abort indicator.

If REVINCLUDED is included and is set to ‘1’, the base station shall include the field USE_T_ADD_ABORT and set this field as described below; otherwise the base station shall omit this field.

The base station shall set this field to ‘1’ to indicate that the mobile station is to use the T_ADD Reverse Supplemental Code Channel abort feature for this reverse assignment; otherwise, the base station shall set this field to ‘0’.

REV_PARMS_INCLUDED - Reverse assignment parameters included indicator.

If SUP_CHAN_PARMS_INCLUDED is set to ‘1’, the base station shall include the field REV_PARMS_INCLUDED and set this field as described below; otherwise, the base station shall omit this field.

If the base station includes this field, it shall set this field to ‘1’ if the following three fields are included in the message; otherwise, the base station shall set this field to ‘0’.
T_MULCHAN - *Supplemental Channel Request Message* pilot strength reporting offset.

If REV_PARMS_INCLUDED is included and is set to ‘1’, the base station shall include the field T_MULCHAN and set this field as described below; otherwise the base station shall omit this field.

The base station shall set this field to the threshold offset that the mobile station is to use when reporting neighbor pilot strength measurements in a *Supplemental Channel Request Message*. The mobile station is to interpret this field as an offset to T_ADD ranging from 0.5 dB (corresponding to T_MULCHAN = ‘000’) to 4.0 dB (corresponding to T_MULCHAN = ‘111’), in 0.5 dB increments.

BEGIN_PREAMBLE - Number of preamble frames on Reverse Supplemental Code Channels at the beginning of transmission on Reverse Supplemental Code Channel.

If REV_PARMS_INCLUDED is included and is set to ‘1’, the base station shall include the field BEGIN_PREAMBLE and set this field to the number of Reverse Supplemental Code Channel preamble frames that the mobile station is to send when beginning transmission on Reverse Supplemental Code Channels; otherwise the base station shall omit this field.

RESUME_PREAMBLE - Number of preamble frames on Reverse Supplemental Code Channels at the resumption of transmission.

If REV_PARMS_INCLUDED is included and is set to ‘1’, the base station shall include the field RESUME_PREAMBLE and set this field to the number of Reverse Supplemental Code Channel preamble frames that the mobile station is to send when resuming transmission on a Reverse Supplemental Code Channel following an autonomous suspension of transmission on an allocated Supplemental Code Channel; otherwise the base station shall omit this field.

USE_PWR_CNTL_STEP - Power control step size indicator.

The base station shall set this field to ‘1’ if the field PWR_CNTL_STEP is included in the message.

PWR_CNTL_STEP - Power control step size.

If USE_PWR_CNTL_STEP is set to ‘1’, then the base station shall include the field PWR_CNTL_STEP and set this field to the step size that the mobile station is to use for closed loop power control, according to Table 3.7.3.3.2.25-1; otherwise, the base station shall omit this field.

NUM_PILOTS - Number of pilots included in the message.

The base station shall set this field to the number of pilots included in the message. The base station shall set this field to an integer that is equal to or greater than 1.
The base station shall include one occurrence of the following four-part record for each of the NUM_PILOTS pilots included in the message:

- **PILOT_PN** - Pilot PN sequence offset index. The base station shall set this field to the pilot PN sequence offset for this pilot in units of 64 PN chips.

- **PWR_COMB_IND** - Power control symbol combining indicator. If the Forward Traffic Channel associated with this pilot will carry the same closed-loop power control subchannel bits as that of the previous pilot in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’. The base station shall set this field to ‘0’ in the first record in the pilot list.

- **FOR_FUND_CODE_CHAN** - Forward Fundamental Channel. The base station shall set this field to the code channel index to be used for the Forward Fundamental Channel associated with this pilot.

- **FOR_SUP_INCLUDED** - Forward Supplemental Code Channel included. The base station shall include this field if FOR_SUP_CONFIG is included and is set to ‘10’ or ‘11’. If included, the base station shall set this field to ‘1’ if there are Supplemental Code Channels associated with this pilot.

- **FOR_SUP_CHAN_REC** - Forward Supplemental Code Channel record. If FOR_SUP_INCLUDED is set to ‘1’, the base station shall include the record FOR_SUP_CHAN_REC and set its fields as described below; otherwise, the base station shall omit this record.

  **FOR_SUP_CHAN_REC** contains information about Forward Supplemental Code Channels associated with this pilot, and consists of the field EXPL_CODE_CHAN, and either the BASE_CODE_CHAN field or NUM_FOR_SUP occurrences of the FOR_SUP_CODE_CHAN field, as shown below.

<table>
<thead>
<tr>
<th>EXPL_CODE_CHAN</th>
<th>1</th>
</tr>
</thead>
<tbody>
<tr>
<td>BASE_CODE_CHAN</td>
<td>0 or 8</td>
</tr>
</tbody>
</table>

If EXPL_CODE_CHAN is equal to ‘1’, NUM_FOR_SUP occurrences of the following field:

```
{ NUM_FOR_SUP }
```

```
FOR_SUP_CODE_CHAN 8
```

```
} (NUM_FOR_SUP)
```

- **EXPL_CODE_CHAN** - Explicit code channel indicator.
The base station shall set this field to ‘1’ to indicate explicit assignment of each Forward Supplemental Code Channel by means of the field FOR_SUP_CODE_CHAN. The base station shall set this field to ‘0’ if the mobile station is to use NUM_FOR_SUP adjacent code channels beginning with index BASE_CODE_CHAN (i.e., BASE_CODE_CHAN through BASE_CODE_CHAN + NUM_FOR_SUP - 1).

In both cases (i.e., the explicit code channel list format and range format), the order of the code channel indices is the same for all pilots specified in this message (i.e., for each pilot, the $i^{th}$ entry in the list indicates the code channel index to be used for the $i^{th}$ Forward Supplemental Code Channel associated with that pilot).

**BASE_CODE_CHAN** - Base code channel index.

If the EXPL_CODE_CHAN field is included and is set to ‘0’, the base station shall include the field BASE_CODE_CHAN and set this field as described below; otherwise the base station shall omit this field.

The base station shall set this field to the base code channel index (see [2]) in the range of 1 to (63 - NUM_FOR_SUP + 1), inclusive, that the mobile station is to use as the first Forward Supplemental Code Channel associated with this pilot. The mobile station is to use code channel index (BASE_CODE_CHAN + $i$ - 1), where $i$ ranges from 1 to NUM_FOR_SUP, for the $i^{th}$ Forward Supplemental Code Channel associated with this pilot.

**FOR_SUP_CODE_CHAN** - Forward Supplemental Code Channel.

If EXPL_CODE_CHAN is included and is set to ‘1’, the base station shall include NUM_FOR_SUP occurrences of the field FOR_SUP_CODE_CHAN and set this field as described below; otherwise the base station shall omit this field.

The base station shall set the $i^{th}$ occurrence of this field to the code channel index (see [2]), in the range 1 to 63 inclusive, that the mobile station is to use for the $i^{th}$ Forward Code Channel associated with this pilot.

**FPC_SUBCHAN_GAIN** - Forward power control subchannel relative gain.

The base station shall set FPC_SUBCHAN_GAIN equal to the power level of the forward link power control subchannel relative to that of 20 ms frames at a 9600 bps or 14400 bps rate on the Forward Fundamental Channel or the Forward Dedicated Control Channel indicated by FPC_PRI_CHAN. The base station shall set the value in units of 0.25 dB.

**USE_PC_TIME** - Use power control action time indicator.

This field indicates whether an explicit time [PC_ACTION_TIME] at which a new value for Power Control Subchannel to traffic ratio [FPC_SUBCHAN_GAIN] takes effect is specified in the message.
If an explicit action time is specified in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**PC_ACTION_TIME** - Power Control Subchannel gain action time.

If the USE_PC_TIME field is set to ‘1’, the base station shall set this field to the System Time minus FRAME_OFFSET \( \times 1.25 \) ms, in units of 80 ms (modulo 64), at which FPC_SUBCHAN_GAIN specified in this message is to take effect. If the USE_PC_TIME field is set to ‘0’, the base station shall omit this field.

**RLGAIN_TRAFFIC_PILOT** - Gain adjustment of the Reverse Traffic Channel relative to the Reverse Pilot Channel power for Radio Configurations greater than 2.

If EXTRA_PARMS is set to ‘1’, the base station shall include this field and set it to the correction factor to be used by mobile stations in setting the power of a code channel, expressed as a two’s complement value in units of 0.125 dB (see [2]); otherwise, the base station shall omit this field.

**DEFAULT_RLAG** - Default reverse link attribute gain used indicator.

If EXTRA_PARMS is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows.

If the mobile station is to use the default values for the reverse link attribute gain, as specified in [2] after completion of handoff, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**NNSCR_INCLUDED** - Non-negotiable Service Configuration Record included indicator.

The base station shall omit this field, if EXTRA_PARMS is set to ‘0’; otherwise, the base station shall include this field and set this field as described below:

The base station shall set this field to ‘1’, if the Non-negotiable Service Configuration record is included in this message; otherwise, the base station shall set this field to ‘0’.

If NNSCR_INCLUDED is included and is set to ‘1’, the base station shall include one occurrence of the following three-field record to specify the non-negotiable service configuration parameters.

**RECORD_TYPE** - Information record type.

If NNSCR_INCLUDED is included and is set to ‘1’, the base station shall include the field RECORD_TYPE and shall set this field to the record type value shown in Table 3.7.5-1 corresponding to the Non-Negotiable Service Configuration information record.

**RECORD_LEN** - Information record length.
If NNSCR_INCLUDED is included and is set to ‘1’, the base station shall include the field RECORD_LEN and shall set this field to the number of octets included in the type-specific fields of the Non-Negotiable Service Configuration information record.

Type-specific fields - Type-specific fields.

If NNSCR_INCLUDED is included and is set to ‘1’, the base station shall include the type specific fields and shall set these fields as specified in 3.7.5.20 for the Non-Negotiable Service Configuration information record.

REV_FCH_GATING_MODE - Reverse eighth gating mode indicator.

The base station shall set this field to ‘1’ if the mobile station is allowed to perform the reverse eighth gating mode after handoff; otherwise, the base station shall set this field to ‘0’.

REV_PWR_CNTL_DELAY_INCL - Reverse power control delay included indicator.

If REV_FCH_GATING_MODE is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if REV_PWR_CNTL_DELAY is included in this message; otherwise, the base station shall set this field to ‘0’.

REV_PWR_CNTL_DELAY - The reverse power control delay.

If REV_PWR_CNTL_DELAY_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the closed-loop reverse power control delay minus one (the closed-loop reverse power control delay is the time between the end of a gated-on reverse PCG and the beginning of the reverse PCG where the corresponding feedback is sent on the Forward Power Control Subchannel, (see [2]), in units of 1.25 ms.

D_SIG_ENCRYPT_MODE - Dedicated channel encryption mode indicator.

If ENCRYPT_MODE is included and is set to ‘11’, the base station shall include this field and shall set it to the dedicated channel signaling encryption mode, as shown in Table 3.7.4.5-1; otherwise the base station shall omit this field.

ENC_KEY_SIZE - Encryption key size indication.

If ENCRYPT_MODE is included and is set to ‘10’ or ‘11’, the base station shall include this field and set it to the encryption key size, as shown in Table 3.7.4.5-2; otherwise, the base station shall omit this field.
SYNC_ID_INCL - Service Configuration synchronization identifier included indicator.

If either the SCR_INCLUDED field is included and is set to ‘1’ or the NNSCR_INCLUDED field is included and is set to ‘1’, the base station shall include this field; otherwise, the base station shall omit this field. If included, the base station shall set this field as follows:

The base station shall set this field to ‘1’ if the SYNC_ID field is included in this message; otherwise, the base station shall set this field to ‘0’.

SYNC_ID_LEN - Service Configuration synchronization identifier length.

If the SYNC_ID_INCL field is not included or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the length (in octets) of the SYNC_ID field included in this message. The base station shall set this field to a value larger than zero.

SYNC_ID - Service Configuration synchronization identifier.

If the SYNC_ID_INCL field is not included or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the synchronization identifier corresponding to the service configuration conveyed by this message.

CS_SUPPORTED - Concurrent Services supported indicator.

If the base station supports concurrent services, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.
3.7.3.3.2.32 Resource Allocation Message

</tbody>
</table>

USE_TIME - Use action time indicator.
This field indicates whether an explicit action time is specified in this message.
If an explicit action time is specified in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

ACTION_TIME - Action time.
If the USE_TIME field is set to ‘1’, the base station shall set this field to the System Time minus FRAME_OFFSET \( \times 1.25 \) ms, in units of 80 ms (modulo 64), at which this message is to take effect. If the USE_TIME field is set to ‘0’, the base station shall omit this field.

FPC_PRI_CHAN - Power Control Subchannel indicator.
The base station shall set this field to ‘0’ if the mobile station is to perform the primary inner loop estimation on the received Forward Fundamental Channel. The base station shall set this field to ‘1’ if the mobile station is to perform the primary inner loop estimation on the received Forward Dedicated Control Channel.
If the F-CPCCH is assigned, the base station will multiplex the Power Control Subchannel on the F-CPCCH; otherwise:
If this field is set to ‘0’, the base station will multiplex the Power Control Subchannel on the Forward Fundamental Channel; otherwise, the base station will multiplex the Power Control Subchannel on the Forward Dedicated Control Channel.

USE_TIME - Use action time indicator.

This field indicates whether an explicit action time is specified in this message.

If an explicit action time is specified in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

ACTION_TIME - Action time.

If the USE_TIME field is set to ‘1’, the base station shall set this field to the System Time minus FRAME_OFFSET × 1.25 ms, in units of 80 ms (modulo 64), at which the message is to take effect. If the USE_TIME field is set to ‘0’, the base station shall omit this field.

CH_IND - Channel Indicator.

The base station shall set this field as shown in Table 3.7.3.3.2.34-1, to release physical resources.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

GATING_RATE_INCL - Reverse pilot gating rate included flag.

The base station shall set this field to ‘1’ if the PILOT_GATING_RATE field is included, otherwise it shall set this field to ‘0’.

PILOT_GATING_RATE - Actual Reverse Pilot gating Rate.
If the GATING_RATE_INCL field is set to ‘1’, then the base station shall set this field to the PILOT_GATING_RATE field shown in Table 3.7.3.2.34-2 corresponding to the actual gating rate on the Reverse Pilot Channel; otherwise, the base station shall omit this field.

Table 3.7.3.2.34-2. Actual Reverse Pilot Gating rate

</table>

USE_EXT_CH_IND - Use EXT_CH_IND to set channel configuration

The base station shall set this field to ‘1’ if the EXT_CH_IND field is included in this message and is used to set the channel configuration; otherwise, the base station shall set this field to ‘0’.

EXT_CH_IND - Extended Channel Indicator.

If the USE_EXT_CH_IND field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the desired channel configuration shown in Table 2.7.1.3.2.4-11.

PDCH_CONTROL_HOLD - Packet Data Channel Control Hold mode indication.

If the USE_EXT_CH_IND field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ to instruct the mobile station to transition to the Packet Data Channel Control Hold Mode.

If EXT_CH_IND signals the allocation of F-FCH, this field shall be set to ‘0’.

Table 3.7.3.2.34-3 shows the valid combinations of CH_IND, EXT_CH_IND, and PDCH_CONTROL_HOLD.

</table>
SWITCHING_PARMS_INCL - R-CQICH switching parameters included indicator.

If the USE_EXT_CH_IND or the GATING_RATE_INCL field is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to '1' if the parameters for R-CQICH soft and softer switching are included in this message; otherwise, the base station shall set this field to '0'.

NUM_SOFT_SWITCHING_FRAMES_CHM - Number of frames for R-CQICH soft switching while in Control Hold.

If SWITCHING_PARMS_INCL is not included or included and set to '0', then the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the duration of the cell switching period, in units of 20 ms, minus one, during which the mobile station, while in Control Hold, is to transmit the cell switch sequence on the R-CQICH when it switches between two pilots which are in different groups.

NUM.SOFTER_SWITCHING_FRAMES_CHM - Number of frames for R-CQICH softer switching while in Control Hold.

If SWITCHING_PARMS_INCL is not included or included and set to '0', then the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the duration of the cell switching period, in units of 20 ms, minus one, during which the mobile station, while in Control Hold, is to transmit the cell switch sequence on the R-CQICH when it switches between two pilots which are in the same group.

DIRECT_TO_IDLE_INFO_INCL - Direct to Idle information included.

If USE_EXT.CH_IND is equal to '0' and CH_IND is equal to '111' or the physical channels indicated by the two least significant bits of CH_IND includes all the physical channels (FCH, DCCH, or both) currently being processed by the mobile station, the base station shall set this field as follows:

• If DIRECT TO IDLE record is included, the base station shall set this field to '1'; otherwise base station shall set this field to '0'.

Otherwise the base station shall set this field to '0'.

RELEASE_TYPE - Release type.

If DIRECT_TO_IDLE_INFO_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and shall set it as follows:

The base station shall set this field as specified in Table 3.7.3.3.2.34-4.
### Table 3.7.3.2.34-4 Release Type

</tbody>
</table>

**SID** - System identification.

If RELEASE_TYPE field is not included or is included and equals '011', the base station shall omit this field; otherwise, the base station shall include this field and shall set it to the system identification number for the wireless system that the mobile station is being directed to (see 2.6.5.2).

**NID** - Network identification.

If RELEASE_TYPE field is not included or is included and equals '011', the base station shall omit this field; otherwise, the base station shall include this field and shall set it as follows:

This field serves as a sub-identifier of a system as defined by the owner of the SID.

The base station shall set this field to the network identification number for the network that the mobile station is being directed to (see 2.6.5.2).

**FREQ_INCL** - Frequency included indicator.

If RELEASE_TYPE field is not included or is included and equals '011', the base station shall omit this field; otherwise, the base station shall include this field and shall set it as follows:

If the CDMA_FREQ and BAND_CLASS fields are included, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**CDMA_FREQ** - Frequency assignment.
If the FREQ_INCL field is not included or is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field to the CDMA Channel number corresponding to the CDMA frequency assignment for the CDMA Channel containing the Paging Channel or Primary Broadcast Control Channel.

**BAND_CLASS** - Band class.

If the FREQ_INCL field is not included or is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field to the CDMA band class, as specified in [30], corresponding to the CDMA frequency assignment for the CDMA Channel containing the Paging Channel or Primary Broadcast Control Channel.

**PAGE_CH** - Paging Channel.

If RELEASE_TYPE field is included and equals ‘000’, the base station shall set this field to the Paging Channel number of the Paging Channel that the mobile station is being directed to; otherwise, the base station shall omit this field.

**PRAT** - Paging Channel data rate.

If RELEASE_TYPE field is included and equals ‘000’, the base station shall set this field to the PRAT field value shown in Table 3.7.2.3.2.26-1 corresponding to the data rate used by the Paging Channel that the mobile station is being directed to; otherwise, the base station shall omit this field.

**SR1_BCCH_CODE_CHAN_NON_TD** – Walsh code for the Spreading Rate 1 BCCH in non Transmit Diversity mode.

If RELEASE_TYPE field is not included or is included and is not equal to ‘001’, the base station shall omit this field; otherwise, the base station shall set this field to the Walsh code corresponding to the Spreading Rate 1 BCCH in non Transmit Diversity mode that the mobile station is being directed to.

**SR1_CRAT_NON_TD** – BCCH code rate in non Transmit Diversity mode for Spreading Rate 1.

If RELEASE_TYPE field is not included or is included and is not equal to ‘001’, the base station shall omit this field; otherwise the base station shall set this field as follows:

The base station shall set this field to ‘0’ if the BCCH Code Rate is 1/4 (see [2]). The base station shall set this field to ‘1’ if the BCCH code rate is 1/2 (see [2]).

**SR1_BRAT_NON_TD** - BCCH data rate in non Transmit Diversity mode for Spreading Rate 1.

If RELEASE_TYPE field is not included or is included and is not equal to ‘001’, the base station shall omit this field; otherwise, the base station shall set this field as follows:
The base station shall set this field to the BRAT field value shown in Table 3.7.2.3.2.26-2 corresponding to the data rate used by the Primary Broadcast Control Channel that the mobile station is being directed to.

SR1_TD_MODE - Spreading Rate 1 Transmit Diversity Mode.

If RELEASE_TYPE field is included and equals ‘010’, the base station shall set this field to the value shown in Table 3.7.2.3.2.26-3; otherwise, the base station shall omit this field.

SR1_BCCH_CODE_CHAN_TD - Walsh Code for Spreading Rate 1 BCCH in Transmit Diversity mode.

If RELEASE_TYPE field is included and equals ‘010’, the base station shall set this field to the Walsh Code corresponding to the Spreading Rate 1 BCCH in Transmit Diversity mode that the mobile station is being directed to; otherwise, the base station shall omit this field.

SR1_CRAT_TD - BCCH code rate in Transmit Diversity mode for Spreading Rate 1.

If RELEASE_TYPE field is not included or is included and is not equal to ‘010’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to ‘0’ if the BCCH Code Rate is ¼ (see [2]). The base station shall set this field to ‘1’ if the BCCH Code Rate is ½ (see [2]).

SR1_BRAT_TD - BCCH date rate in Transmit Diversity mode for Spreading Rate 1.

If RELEASE_TYPE field is included and equals ‘010’, the base station shall set this field to the BRAT field value shown in Table 3.7.2.3.2.26-2 corresponding to the data rate used by the Primary Broadcast Control Channel that the mobile station is being directed to; otherwise, the base station shall omit this field.

SR1_TD_POWER_LEVEL - Spreading Rate 1 TD transmit power level.

If RELEASE_TYPE field is not included or is included and is not equal to ‘010’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the TD transmit power level relative to that of the Forward Pilot Channel, as specified in Table 3.7.2.3.2.26-4.

NUM_PILOTS_D2I_INCL - Number of Pilots (Direct to Idle) Included Indicator.

If RELEASE_TYPE field is not included or is included and is equal to ‘011’, the base station shall omit this field; otherwise, the base station shall include this field and shall set it as follows:
The base station shall set this field to ‘0’ to indicate any pilot can be used for direct to idle transition; otherwise, the base station shall set this field to ‘1’.

NUM_PILOTS_D2I - Number of Pilots (Direct to Idle).

If NUM_PILOTS_D2I_INCL field is not included or is included and is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and shall set it as follows:

The base station shall set this field to ‘000’ to indicate any pilot in the active set can be used for direct to idle transition; otherwise, the base station shall set this field to number of pilots included in this DIRECT TO IDLE record.

If NUM_PILOTS_D2I field is included, the base station shall include NUM_PILOTS_D2I occurrences of the following record:

PILOT_PN - Pilot PN sequence offset index.

The base station shall set this field to the pilot PN sequence offset for this pilot in units of 64 PN chips.

RER_MODE_ENABLED - Radio environment reporting mode enabled indicator.

If USE_EXT_CH_IND is equal to ‘0’ and CH_IND is equal to ‘111’, or the physical channels indicated by the two least significant bits of CH_IND includes all the physical channels (FCH, DCCH, or both) currently being processed by the mobile station, the base station shall set this field as follows:

• If the radio environment reporting mode is enabled in this message, the base station shall set this field to ‘1’;
  otherwise, the base station shall set this field to ‘0’.

Otherwise, the base station shall set this field to ‘0’.

RER_MAX_NUM_MSG_IDX - Maximum number of Radio Environment Messages permitted while in radio environment reporting mode index.

If RER_MODE_ENABLED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the maximum number of Radio Environment Messages that the mobile station is allowed to transmit while in radio environment reporting mode, expressed as \(2^{\text{RER_MAX_NUM_MSG_IDX}}\) where \(0 \leq \text{RER_MAX_NUM_MSG_IDX} \leq 6\). If the mobile station is allowed to transmit an unlimited number of Radio Environment Message, then the base station shall set this field to ‘111’.

RER_TIME - Radio environment report timer value.

If RER_MODE_ENABLED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
The base station shall set this field to the value of the radio-environment report timer, expressed as $2^{\text{RER\_TIME}}$ where $0 \leq \text{RER\_TIME} \leq 6$ and in units of RER\_TIME\_UNIT. If the value of the radio-environment report timer is infinite, then the base station shall set this field to ‘111’.

RER\_TIME\_UNIT - Radio environment report timer value units.

If RER\_MODE\_ENABLED is set to ‘1’ and RER\_TIME is not set to ‘111’, the base station shall include this field and shall set it according to Table 3.7.3.2.34-5; otherwise, the base station shall omit this field.

**Table 3.7.3.2.34-5 RER\_TIME\_UNIT values**

<table>

</thead>
<tbody>
<tr>
<td>00</td>
<td>Seconds</td>
</tr>
<tr>
<td>01</td>
<td>Minutes</td>
</tr>
<tr>
<td>10</td>
<td>Hours</td>
</tr>
<tr>
<td>11</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

MAX\_RER\_PILOT\_LIST\_SIZE - Maximum number of pilots to maintain in RER\_PILOT\_LIST.

If RER\_MODE\_ENABLED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the maximum number of pilots that the mobile station is to maintain in RER\_PILOT\_LIST (see [4]). The base station shall set this field to a value in the range 1 to 6 inclusive.

RSC\_MODE\_SUPPORTED – Reduced slot cycle mode supported indicator.

If USE\_EXT\_CH\_IND is equal to ‘0’ and CH\_IND is equal to ‘111’, or the physical channels indicated by the two least significant bits of CH\_IND includes all the physical channels (FCH, DCCH, or both) currently being processed by the mobile station, the base station shall set this field as follows:

- If the fields related to reduced slot cycle mode are included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

Otherwise, the base station shall set this field to ‘0’.
MAX_RSC_END_TIME_UNIT – Maximum reduced slot cycle mode end time unit.

If RSC_MODE_SUPPORTED is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field according to Table 2.7.3.5-1 to indicate the units of the MAX_RSC_END_TIME_VALUE field.

MAX_RSC_END_TIME_VALUE – Maximum reduced slot cycle mode end time value.

If RSC_MODE_SUPPORTED is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the maximum system time \((\text{modulo } 16)\), in units of time specified by MAX_RSC_END_TIME_UNIT \((\text{modulo } 16)\), at which the mobile station is to exit the reduced slot cycle mode.

REQ_RSCI_INCL – REQ_RSCI included indicator.

If RSC_MODE_SUPPORTED is equal to ‘1’, the base station shall include this field and set it as specified below; otherwise, the base station shall omit this field.

If the base station is requesting the mobile station to operate in the reduced slot cycle mode following release of the traffic channel, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

REQ_RSCI – Requested reduced slot cycle index.

If REQ_RSCI_INCL is included and equal to ‘1’, the base station shall set this field as specified in Table 2.7.1.3.2.1-8 to the reduced slot cycle index value that it is requesting the mobile station to operate with; otherwise, the base station shall omit this field.

IGNORE_QPCH – Ignore QPCH indicators.

If RSC_MODE_SUPPORTED is equal to ‘1’, the base station shall include this field and set it as specified below; otherwise, the base station shall omit this field.

The base station shall set this field to ‘1’ to indicate to the mobile station that it is not to check its assigned paging indicators on the QPCH while operating in the reduced slot cycle mode if the reduced slot cycle index is -3 or -4; otherwise, the base station shall set this field to ‘0’.

TKZ_MODE_ENABLED - Tracking zone mode enabled indicator.

If USE_EXT_CH_IND is equal to ‘0’ and CH_IND is equal to ‘111’, or the physical channels indicated by the two least significant bits of CH_IND includes all the physical channels (FCH, DCCH, or both) currently being processed by the mobile station, the base station shall set this field as follows:

• If the tracking zone mode is enabled in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.
Otherwise, the base station shall set this field to ‘0’.

**TKZ_ID** - Tracking zone identifier.

If TKZ_MODE_ENABLED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field to its tracking zone identifier.

**TKZ_MAX_NUM_MSG_IDX** - Maximum number of *Radio Environment Messages* permitted while in tracking zone mode index.

If TKZ_MODE_ENABLED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the maximum number of *Radio Environment Messages* that the mobile station is allowed to transmit while in tracking zone mode, expressed as $2^{TKZ_MAX_NUM_MSG_IDX}$ where $0 \leq TKZ_MAX_NUM_MSG_IDX \leq 6$. If the mobile station is allowed to transmit an unlimited number of *Radio Environment Messages*, then the base station shall set this field to ‘111’.

**TKZ_UPDATE_PRD** - Tracking zone update period.

If TKZ_MODE_ENABLED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field such that the desired tracking zone update timer value is $2^{TKZ_UPDATE_PRD+6}$ seconds. If the value of the timer is infinite, then the base station shall set this field to ‘1111’.

**TKZ_LIST_LEN** - Tracking zone list length.

If TKZ_MODE_ENABLED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the length of the tracking zone list minus one.

**TKZ_TIMER** - Tracking zone timer.

If TKZ_MODE_ENABLED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the value of the tracking zone timer (in units of seconds) minus one.

**TBR_RAND_SUPPR_ENABLE** - Timer Based Registration Randomization Suppression enable indicator.

The base station shall set this field to ‘1’, if the mobile station is allowed to suppress timer-based registration randomization in order to eliminate unnecessary timer-based registrations (see 2.6.5.1.3.1); otherwise, the base station shall set this field to ‘0’.
TBR_RAND_WINDOW – Timer-based registration randomization window.

The base station shall set this field to the value shown in Table 2.6.5.1.3-1 corresponding to the randomization for timer-based registration (see 2.6.5.1.3).

BCMC_INFO_INCL - BCMC information Included Indicator

If RELEASE_TYPE field is not included or is included and is equal to ‘011’, the base station shall omit this field; otherwise, the base station shall include this field and shall set it as follows:

The base station shall set this field to ‘1’ if BCMC information is included in this message; otherwise, the base station shall set this field to ‘0’.

The BCMC information included in this message is applicable to all the pilots indicated by the DIRECT TO IDLE record in this message.

NUM_FSCH - Number of Forward Broadcast Supplemental Channel

If BCMC_INFO_INCL field is not included or is included and is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and shall set it as follows:

The base station shall set this field to the number of Forward Broadcast Supplemental Channels for which information is included in this message minus one.

NUM_BCMC_PROGRAMS - Number of BCMC Programs

If BCMC_INFO_INCL field is not included or is included and is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and shall set it as follows:

The base station shall set this field to the number of BCMC programs for which information is included in this message minus one.

If NUM_FSCH field is included, the base station shall include NUM_FSCH plus one occurrences of the following variable length record:

FSCH_RECORD_LEN - Forward Broadcast Supplemental Channel

The base station shall set this field to the number of octets included in this Forward Broadcast Supplemental Channel record including this field.
FSCH_CODE_CHAN - Code channel index of the Forward Broadcast Supplemental Channel.

The base station shall set this field to the code channel index of this Forward Broadcast Supplemental Channel as specified in [2].

FSCH_MUX_OPTION - Multiplex Option of the Forward Broadcast Supplemental Channel.

The base station shall set this field to the multiplex option of this Forward Broadcast Supplemental Channel as specified in [3].

FSCH_RC - Radio configuration of the Forward Broadcast Supplemental Channel.

The base station shall set this field to the radio configuration of this Forward Broadcast Supplemental Channel as specified in [2].

FSCH_CODING - Coding type of the Forward Broadcast Supplemental Channel.

The base station shall set this field to ‘1’ if Convolutional Coding will be used when the number of channel bits per frame is less than 360 and Turbo Coding when the number of channel bits per frame is equal to or greater than 360. The base station shall set this field to ‘0’ if Convolution Coding will be used for all block sizes.

FSCH_OUTERCODE_INCL - Forward Broadcast Supplemental Channel Outer Code included indicator.

The base station shall set this field to ‘1’ if the Forward Broadcast Supplemental Channel outer code information is included in this message; otherwise, the base station shall set this field to ‘0’.

FSCH_OUTERCODE_RATE - Outer Code Rate of the Forward Broadcast Supplemental Channel.

If the FSCH_OUTERCODE_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the outer code rate of the Forward Broadcast Supplemental Channel as specified in Table 3.7.2.3.2.38-3.[2].

FSCH_OUTERCODE_OFFSET - Outer Coding Buffer Offset of the Forward Broadcast Supplemental Channel.

If the FSCH_OUTERCODE_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the outer coding buffer offset of the Forward Broadcast Supplemental Channel in units of 20ms as specified in [2].
FSCH_RATE - Data Rate of the Forward Broadcast Supplemental Channel.

The base station shall set this field to the data rate of this Forward Broadcast Supplemental Channel as specified in [2].

FSCH_FRAME_40_USED - Forward Supplemental Channel 40ms frame used indicator.

The base station shall set this field to ‘1’ if 40ms frame is used on this Forward Supplemental Channel; otherwise, the base station shall set this field to ‘0’.

The base station shall not set both FSCH_FRAME_40_USED and FSCH_FRAME_80_USED fields to ‘1’.

FSCH_FRAME_80_USED - Forward Supplemental Channel 80ms frame used indicator.

The base station shall set this field to ‘1’ if 80ms frame is used on this Forward Supplemental Channel; otherwise, the base station shall set this field to ‘0’.

The base station shall not set both FSCH_FRAME_40_USED and FSCH_FRAME_80_USED fields to ‘1’.

FSCH_FRAME_SIZE - Frame Size of the Forward Broadcast Supplemental Channel.

The base station shall set this field to the frame size used on this Forward Broadcast Supplemental Channel as specified in [2].

FSCH_RECORD_RESERVED - Forward Broadcast Supplemental Channel record Reserved bits.

The base station shall add reserved bits as needed in order to make the length of this Forward Broadcast Supplemental Channel record equal to an integer number of octets. The base station shall set these bits to ‘0’.

If NUM_BCMC_PROGRAMS field is included, the base station shall include NUM_BCMC_PROGRAMS plus one occurrences of the following variable length record:

BCMC_PROGRAM_ID_LEN - Length of BCMC_PROGRAM_ID field

The base station shall set this field to one less than the length in bits of the BCMC_PROGRAM_ID of this program.

BCMC_PROGRAM_ID - BCMC program Identifier

The length of this field shall be one more than the value of BCMC_PROGRAM_ID_LEN bits.

The base station shall set this field to the BCMC program identifier of this program.

BCMC_FLOW_DISCRIMINATOR_LEN - Length of BCMC_FLOW_DISCRIMINATOR field

The base station shall set this field to the length in bits of the BCMC_FLOW_DISCRIMINATOR of this program.

NUM_FLOW_DISCRIMINATOR - Number of BCMC flow discriminators.
The length of this field shall be determined by the value of the
BCMC_FLOW_DISCRIMINATOR_LEN as follows: if
BCMC_FLOW_DISCRIMINATOR_LEN is set to '000', this field
is omitted; otherwise, the length of this field shall be
BCMC_FLOW_DISCRIMINATOR_LEN bits.

The base station shall set this field to the number of flow
discriminators included for this program minus one.

If NUM_FLOW_DISCRIMINATOR field is included, the base station shall include
NUM_FLOW_DISCRIMINATOR+1 occurrences of the following variable length record;
otherwise, the base station shall include 1 occurrence of the following variable length
record:

BCMC_FLOW_DISCRIMINATOR - BCMC flow discriminator

The length of this field shall be determined by the value of the
BCMC_FLOW_DISCRIMINATOR_LEN as follows: if
BCMC_FLOW_DISCRIMINATOR_LEN is set to '000', this field
is omitted; otherwise, the length of this field shall be
BCMC_FLOW_DISCRIMINATOR_LEN bits.

The base station shall set this field to the BCMC flow
discriminator of this flow.

NUM_LPM_ENTRIES - Number of Logical-to-Physical Mapping Entries

The base station shall set this field to one less than the
number of logical to physical mapping included for this BCMC
flow.

The base station shall include NUM_LPM_ENTRIES plus one occurrences of the following
variable-length record:

FSCH_ID - Forward Broadcast Supplemental Channel Identifier

The base station shall set this field to the identifier
corresponding to the Forward Broadcast Supplemental Channel on which the above
BCMC flow is being transmitted.

The F-SCH included first in this message is given the
FSCH_ID of '0000000', the second one listed is given the
FSCH_ID of '0000001', and so on.

BSR_ID_LEN_IND - BCMC Service Reference Identifier length indicator

The base station shall set this field to ‘1’ if the length of the
BCMC Service Reference Identifier is 3 bits; the base station
shall set this field to ‘0’ if the length of the BCMC Service Reference Identifier is 16 bits.

BSR_ID - BCMC Service Reference Identifier

The base station shall set this field to the BCMC Service
Reference identifier corresponding to this BCMC flow on this
Forward Broadcast Supplemental Channel.

The base station shall not set this field to a value of 0.

USE_TIME - Use action time indicator.

This field indicates whether an ACTION_TIME is specified in this message.

If an ACTION_TIME is specified in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

ACTION_TIME - Action time.

If the USE_TIME field is set to ‘1’, the base station shall set this field to the System Time minus FRAME_OFFSETs × 1.25 ms, in units of 80 ms (modulo 64), at which the message is to take effect. If the USE_TIME field is set to ‘0’, the base station shall omit this field.

CH_IND - Channel Indicator.

The base station shall set this field as shown in Table 3.7.3.3.2.34-1, to release physical resources.

GATING_RATE_INCL - Reverse pilot gating rate included flag.

The base station shall set this field to ‘1’ if the PILOT_GATING_RATE field is included, otherwise it shall set this field to ‘0’.

PILOT_GATING_RATE - Actual Reverse Pilot gating Rate.

If the GATING_RATE_INCL field is set to ‘1’, then the base station shall set this field to the PILOT_GATING_RATE field shown in Table 3.7.3.3.2.34-2 corresponding to the actual gating rate on the Reverse Pilot Channel; otherwise, the base station shall omit this field.

USE_EXT_CH_IND - Use EXT_CH_IND to set channel configuration
The base station shall set this field to ‘1’ if the EXT_CH_IND is included in this message and is used to set the channel configuration; otherwise, the base station shall set this field to ‘0’.

**EXT_CH_IND** - Extended Channel Indicator.

If the USE_EXT_CH_IND field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the desired channel configuration shown in Table 2.7.1.3.2.4-11.

**PDCH_CONTROL_HOLD** - Packet Data Channel Control Hold mode indication.

If the USE_EXT_CH_IND field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ to instruct the mobile station to transition to the Packet Data Channel Control Hold Mode.

If EXT_CH_IND signals the allocation of F-FCH, this field shall be set to ‘0’.

Table 3.7.3.3.2.34-3 shows the valid combinations of CH_IND, EXT_CH_IND, and PDCH_CONTROL_HOLD.

RESERVED 0 - 7 (as needed)

RESERVED 0 - 7 (as needed)

USE_TIME - Use action time indicator.

This field indicates whether an explicit action time is specified in this message.
If an explicit action time is specified in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**ACTION_TIME** - Action time.

If the USE_TIME field is set to ‘1’, the base station shall set this field to the System Time minus FRAME_OFFSET \times 1.25 ms, in units of 80 ms (modulo 64), at which the handoff is to take effect. If the USE_TIME field is set to ‘0’, the base station shall omit this field.

**HDM_SEQ** - *Universal Handoff Direction Message* sequence number.

This field is used by the mobile station in the *Power Measurement Report Message* to identify the order in which the reported pilot strengths are sent.

The base station shall set this field to the handoff message sequence number, as specified in 2.6.6.2.2.10.

**PARMS_INCL** - Parameters included indicator.

The base station shall set this field to ‘1’, if P_REV and SERV_NEG_TYPE are included; otherwise, the base station shall set this field ‘0’.

**P_REV** - Protocol revision level.

If PARMS_INCL is set to ‘1’, the base station shall set this field to the base station protocol revision level that the mobile station is to use after completion of the handoff; otherwise, the base station shall omit this field.

**SERV_NEG_TYPE** - Service negotiation type.

If PARMS_INCL is set to ‘1’, the base station shall include the field SERV_NEG_TYPE and set this field as described below; otherwise, the base station shall omit this field.

If the mobile station is to use service negotiation, the base station shall set this field to ‘1’. If the mobile station is to use service option negotiation, the base station shall set this field to ‘0’.

**SEARCH_INCLUDED** - Pilot search parameters included.

If the mobile station is to change its pilot search parameters, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**SRCH_WIN_A** - Search window size for the Active Set and Candidate Set.

If SEARCH_INCLUDED is set to ‘1’, the base station shall include the field SRCH_WIN_A and set this field to a window size parameter shown in Table 2.6.6.2.1-1 corresponding to the number of PN chips that the mobile station is to search for pilots in the Active Set and the Candidate Set; otherwise, the base station shall omit this field.

**SRCH_WIN_N** - Search window size for the Neighbor Set.
If SEARCH_INCLUDED is set to ‘1’, the base station shall include the field SRCH_WIN_N and set this field to the window size parameter shown in Table 2.6.6.2.1-1 corresponding to the search window size to be used by mobile stations for the Neighbor Set after completion of the handoff; otherwise, the base station shall omit this field.

SRCH_WIN_R - Search window size for the Remaining Set.

If SEARCH_INCLUDED is set to ‘1’, the base station shall include the field SRCH_WIN_R and set this field to the window size parameter shown in Table 2.6.6.2.1-1 corresponding to the search window size to be used by mobile stations for the Remaining Set after completion of the handoff; otherwise, the base station shall omit this field.

T_ADD - Pilot detection threshold.

This value is used by the mobile station to trigger the transfer of a pilot from the Neighbor Set or Remaining Set to the Candidate Set (see 2.6.6.2.6) and to trigger the sending of the Pilots Strength Measurement Message or Extended Pilot Strength Measurement Message initiating the handoff process (see 2.6.6.2.5.2).

If SEARCH_INCLUDED is set to ‘1’, the base station shall include the field T_ADD and set this field to the pilot detection threshold, expressed as an unsigned binary number equal to \(-2 \times 10 \times \log_{10} \frac{E_c/I_o}\); otherwise, the base station shall omit this field.

T_DROP - Pilot drop threshold.

This value is used by mobile stations to start a handoff drop timer for pilots in the Active Set and the Candidate Set (see 2.6.6.2.3).

If SEARCH_INCLUDED is set to ‘1’, the base station shall include the field T_DROP and set this field to the pilot drop threshold, expressed as an unsigned binary number equal to \(-2 \times 10 \times \log_{10} \frac{E_c/I_o}\); otherwise, the base station shall omit this field.

T_COMP - Active Set versus Candidate Set comparison threshold.

The mobile station transmits a Pilot Strength Measurement Message or Extended Pilot Strength Measurement Message when the strength of a pilot in the Candidate Set exceeds that of a pilot in the Active Set by this margin (see 2.6.6.2.5.2).

If SEARCH_INCLUDED is set to ‘1’, the base station shall include the field T_COMP and set this field to the threshold Candidate Set pilot to Active Set pilot ratio, in units of 0.5 dB; otherwise, the base station shall omit this field.
T_TDROP - Drop timer value. Timer value after which an action is taken by the mobile station for a pilot that is a member of the Active Set or Candidate Set, and whose strength has not become greater than T_DROP. If the pilot is a member of the Active Set, a Pilot Strength Measurement Message or Extended Pilot Strength Measurement Message is issued. If the pilot is a member of the Candidate Set, it will be moved to the Neighbor Set.

If SEARCH_INCLUDED is set to ‘1’, the base station shall include the field T_TDROP and set this field to the T_TDROP value shown in Table 2.6.6.2.3-1 corresponding to the drop timer value to be used by the mobile station; otherwise, the base station shall omit this field.

SOFT_SLOPE - The slope in the inequality criterion for adding a pilot to the Active Set, or dropping a pilot from the Active Set (see 2.6.6.2.3 and 2.6.6.2.5.2). If SEARCH_INCLUDED is set to ‘1’, the base station shall include the field SOFT_SLOPE in the additional fields and set this field as an unsigned binary number; otherwise, the base station shall omit this field.

ADD_INTERCEPT - The intercept in the inequality criterion for adding a pilot to the Active Set (see 2.6.6.2.5.2). If SEARCH_INCLUDED is set to ‘1’, the base station shall include the field ADD_INTERCEPT in the additional fields and set this field as a two’s complement signed binary number in units of 0.5 dB; otherwise, the base station shall omit this field.

DROP_INTERCEPT - The intercept in the inequality criterion for dropping a pilot from the Active Set (see 2.6.6.2.3). If SEARCH_INCLUDED is set to ‘1’, the base station shall include the field DROP_INTERCEPT in the additional fields and set this field as a two’s complement signed binary number in units of 0.5 dB; otherwise, the base station shall omit this field.

EXTRA_PARMS - Extra parameters included. If the base station includes the fields PACKET_ZONE_ID, FRAME_OFFSET, PRIVATE_LCM, RESET_L2, RESET_FPC, SERV_NEG_TYPE, ENCRYPT_MODE, NOM_PWR_EXT, NOM_PWR, RLGAIN_TRAFFIC_PILOT, DEFAULT_RLAG, NUM_PREAMBLE, BAND_CLASS, PERIODIC_SEARCH, or CDMA_FREQ in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

PACKET_ZONE_ID - Packet data services zone identifier. If EXTRA_PARMS is set to ‘1’, the base station shall include the field PACKET_ZONE_ID and set this field as described below; otherwise, the base station shall omit this field.
If the base station supports a packet data service zone, the base station shall set this field to the non-zero packet data services zone identifier that the mobile station is to use after completion of the handoff.

If the base station does not support a packet data service zone, the base station shall set this field to ‘00000000’.

**FRAME_OFFSET** - Frame offset.

The Forward and Reverse Traffic Channel frames are delayed FRAME_OFFSET \times 1.25 \text{ ms} relative to system timing (see [2]).

If EXTRA_PARMS is set to ‘1’, the base station shall include the field FRAME_OFFSET and set this field to the Forward and Reverse Traffic Channel frame offset (the frame offset does not apply to the F-PDCH); otherwise, the base station shall omit this field.

**PRIVATE_LCM** - Private long code mask indicator.

This field is used to change the long code mask after a hard handoff.

If EXTRA_PARMS is set to ‘1’, the base station shall include the field PRIVATE_LCM and set this field as described below; otherwise, the base station shall omit this field.

If the private long code mask is to be used after the handoff, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**RESET_L2** - Reset acknowledgment procedures command.

This field is used to reset acknowledgment processing in the mobile station.

If EXTRA_PARMS is set to ‘1’, the base station shall include the field RESET_L2 and set this field as described below; otherwise, the base station shall omit this field.

If the field is included and the mobile station is to reset its acknowledgment procedures, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**RESET_FPC** - Reset Forward Traffic Channel power control.

This field is used to reset the Forward Traffic Channel power control counters.

If EXTRA_PARMS is set to ‘1’, the base station shall include the field RESET_FPC and set this field as described below; otherwise, the base station shall omit this field.

The base station shall set this field to ‘0’ if the Forward Traffic Channel power control counters are to be maintained after completion of the handoff. If the counters are to be initialized as specified in 2.6.4.1.1.1, then the base station shall set this field to ‘1’.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENCRYPT_MODE</td>
<td>Message encryption mode. If EXTRA_PARMS is set to ‘1’, the base station shall include the field ENCRYPT_MODE and set this field to the ENCRYPT_MODE value shown in Table 3.7.2.3.2.8-2 corresponding to the encryption mode that is to be used for messages sent on the Forward and Reverse Traffic Channels, as specified in 2.3.12.2; otherwise, the base station shall omit this field.</td>
</tr>
<tr>
<td>NOM_PWR_EXT</td>
<td>Extended nominal transmit power. If EXTRA_PARMS is set to ‘1’, the base station shall include this field and set this field as described below; otherwise, the base station shall omit this field. If the mobile station is being handed off to a base station operating in Band Class 0 or Band Class 3, the base station shall set this field to ‘0’; otherwise, the base station shall set it as follows: If the correction factor to be used by the mobile station in the open loop power estimate is between -24 dB and -9 dB inclusive; otherwise (the correction factor is in the range -8 dB to 7 dB inclusive), the base station shall set this field to ‘0’.</td>
</tr>
<tr>
<td>NOM_PWR</td>
<td>Nominal transmit power offset. If EXTRA_PARMS is set to ‘1’, the base station shall include the field NOM_PWR and set this field to the correction factor to be used by the mobile station in the open loop power estimate, expressed as a two’s complement value in units of 1 dB (see [2]); otherwise, the base station shall omit this field.</td>
</tr>
<tr>
<td>RLGAIN_TRAFFIC_PILOT</td>
<td>Gain adjustment of the Reverse Traffic Channel relative to the Reverse Pilot Channel power for Radio configurations greater than 2. If EXTRA_PARMS is set to ‘1’, the base station shall include this field and set it to the correction factor to be used by mobile stations in setting the power of a reverse traffic channel, expressed as a two’s complement value in units of 0.125 dB (see [2]); otherwise, the base station shall omit this field.</td>
</tr>
<tr>
<td>DEFAULT_RLAG</td>
<td>Default reverse link attribute gain used indicator. If EXTRA_PARMS is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows: If the mobile station is to use the default values for the reverse link attribute gain, as specified in [2] after completion of handoff, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.</td>
</tr>
<tr>
<td>NUM_PREAMBLE</td>
<td>Number of Traffic Channel preamble.</td>
</tr>
</tbody>
</table>

3-709
If EXTRA_PARMS is set to ‘0’, the base station shall omit the NUM_PREAMBLE field; otherwise, the base station shall include this field and set it to the length of Traffic Channel preamble that the mobile station is to send when performing a handoff; as follows:

If, after the handoff, radio configuration 1 or radio configuration 2 is to be used, the base station shall set NUM_PREAMBLE to the Traffic Channel preamble length in 20 ms units; otherwise, the base station shall set NUM_PREAMBLE to the value shown in Table 3.7.3.3.2.17-1 corresponding to the Traffic Channel preamble length in 1.25 ms units.

**BAND_CLASS** - Band class.

If EXTRA_PARMS is set to ‘1’, the base station shall include the field BAND_CLASS and set this field to the CDMA band class corresponding to the CDMA frequency assignment for the CDMA Channel as specified in [30]; otherwise, the base station shall omit this field.

**CDMA_FREQ** - Frequency assignment.

If EXTRA_PARMS is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

If a Radio Configuration associated with Spreading Rate 1 is used, the base station shall set this field to the CDMA Channel number, in the specified CDMA band class, corresponding to the CDMA frequency assignment for the CDMA Channel as specified in [2]. If a Radio Configuration associated with Spreading Rate 3 is used, the base station shall include the field CDMA_FREQ and set this field to the CDMA Channel number, in the specified CDMA band class, corresponding to the CDMA center SR3 frequency assignment for the CDMA Channel.

**RETURN_IF_HANDOFF_FAIL** - Return on failure flag.

If EXTRA_PARMS is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

If the base station includes this field, it shall set this field to ‘1’ if the mobile station is to resume the use of the Active Set on the Serving Frequency following an unsuccessful hard handoff attempt, as specified in 2.6.6.2.8.2; otherwise, the base station shall set this field to ‘0’.

**COMPLETE_SEARCH** - Flag to complete search.

If RETURN_IF_HANDOFF_FAIL is included and is set to ‘1’, the base station shall include the field COMPLETE_SEARCH and set this field as described below; otherwise, the base station shall omit this field.
If the base station includes this field, it shall set this field to '1' if the mobile station is to complete the search of the Candidate Frequency Search Set before resuming the use of the Active Set on the Serving Frequency when an inter-frequency handoff attempt is unsuccessful, as specified in 2.6.6.2.8.2; otherwise, the base station shall set this field to '0'.

PERIODIC_SEARCH - Flag to search the Candidate Frequency periodically. If EXTRA_PARMS is set to '1', the base station shall include the field PERIODIC_SEARCH and set this field as described below; otherwise, the base station shall omit this field.

If the base station includes this field, it shall set this field to '1' if the mobile station is to periodically search the Candidate Frequency, as specified in 2.6.6.2.8.3; otherwise, the base station shall set this field to '0'.

SCR_INCLUDED - Service Configuration Record included indicator. If EXTRA_PARMS is set to '1', the base station shall include the field SCR_INCLUDED and shall set this field as described below; otherwise, the base station shall omit this field.

The base station shall set this field to '1' if it includes the Service Configuration Record in the message; otherwise, the base station shall set this field to '0'.

SERV_CON_SEQ - Connect sequence number. If SCR_INCLUDED is included and is set to '1', the base station shall include the field SERV_CON_SEQ and shall set this field to the connect sequence number pertaining to this service configuration as specified in 3.6.4.1.2.1.2.

If SCR_INCLUDED is included and is set to '1', the base station shall include one occurrence of the following three-field record to specify the service configuration.

RECORD_TYPE - Information record type. If SCR_INCLUDED is included and is set to '1', the base station shall include the field RECORD_TYPE and shall set this field to the record type value shown in Table 3.7.5-1 corresponding to the Service Configuration information record.

RECORD_LEN - Information record length. If SCR_INCLUDED is included and is set to '1', the base station shall include the field RECORD_LEN and shall set this field to the number of octets included in the type-specific fields of the Service Configuration information record.

Type-specific fields - Type-specific fields. If SCR_INCLUDED is included and is set to '1', the base station shall include the type specific fields and shall set these fields as specified in 3.7.5.7 for the Service Configuration information record.
NNSCR_INCLUDED - Non-negotiable Service Configuration Record Included indicator

The base station shall omit this field, if EXTRA_PARMS is set to '0'; otherwise, the base station shall include this field and set this field as described below:

The base station shall set this field to '1', if the Non-negotiable Service Configuration record is included in this message; otherwise, the base station shall set this field to '0'.

If NNSCR_INCLUDED is included and is set to ‘1’, the base station shall include one occurrence of the following three-field record to specify the non-negotiable service configuration.

RECORD_TYPE - Information record type.

If NNSCR_INCLUDED is included and is set to ‘1’, the base station shall include the field RECORD_TYPE and shall set this field to the record type value shown in Table 3.7.5-1 corresponding to the Non-Negotiable Service Configuration information record.

RECORD_LEN - Information record length.

If NNSCR_INCLUDED is included and is set to ‘1’, the base station shall include the field RECORD_LEN and shall set this field to the number of octets included in the type-specific fields of the Non-Negotiable Service Configuration information record.

Type-specific fields - Type-specific fields.

If NNSCR_INCLUDED is included and is set to ‘1’, the base station shall include the type specific fields and shall set these fields as specified in 3.7.5.20 for the Non-Negotiable Service Configuration information record.

USE_PWR_CNTL_STEP - Power control step size indicator.

The base station shall set this field to ‘1’ if the field PWR_CNTL_STEP is included in the message.

PWR_CNTL_STEP - Power control step size.

If USE_PWR_CNTL_STEP is set to ‘1’, then the base station shall include the field PWR_CNTL_STEP and set this field to the step size that the mobile station is to use for closed loop power control, according to Table 3.7.3.3.2.25-1; otherwise, the base station shall omit this field.

CLEAR_RETRY_DELAY - Clear retry delay indicator.

The base station shall set this field to ‘1’ if the mobile station is to clear any existing retry delay which it has stored (see 2.6.6.2.5.1); otherwise, the base station shall set this field to '0'.

SCH_INCL - Supplemental Channel related parameters included indicator.
The base station shall set this field to '1' if this message includes the NUM_FOR_ASSIGN, NUM_REV_ASSIGN, NUM_FOR_SCH, NUM_REV_SCH, and NUM_SCH fields. Otherwise, the base station shall set this field to '0'.

NUM_FOR_ASSIGN - Number of Forward Supplemental Channel assigned. If SCH_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field to the number of Forward Supplemental Channel assigned.

The base station shall include NUM_FOR_ASSIGN occurrences of the following five fields (FOR_SCH_ID, FOR_SCH_DURATION, FOR_SCH_START_TIME_INCL, FOR_SCH_START_TIME, and SCCL_INDEX).

FOR_SCH_ID - Forward Supplemental Channel identifier. The base station shall set this field to the Identifier of the Forward Supplemental Channel.

FOR_SCH_DURATION - Duration of Forward Supplemental Channel assignment. The base station shall set this field to the duration (see Table 3.7.3.2.37-3), starting at the start time of the message specified by FOR_SCH_START_TIME, during which the mobile station is to process the Forward Supplemental Channel.

The base station shall set this field to '0000' to indicate that the mobile station should stop processing the Forward Supplemental Channel starting at the explicit start time of the message specified by FOR_SCH_START_TIME or at the implicit start time if FOR_SCH_START_TIME_INCL is set to '0'.

The base station shall set this field to '1111' to indicate that the mobile station should process the Forward Supplemental Channel, starting at the start time of the message specified by FOR_SCH_START_TIME, until the start time specified by a subsequent Forward Supplemental Channel assignment corresponding to the same forward Supplemental Channel (see 2.6.6.2.5.1.1).

FOR_SCH_START_TIME_INCL - Start time included indicator.

If FOR_SCH_DURATION is not equal to '0000', the base station shall set this field to '1'. If FOR_SCH_DURATION is equal to '0000', the base station shall set this field as follows:

The base station shall set this field to '1' if FOR_SCH_START_TIME is included in this message; otherwise, the base station shall set this field to '0'.

FOR_SCH_START_TIME - Start time for Forward Supplemental Channel Assignment.
If FOR_SCH_START_TIME_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field to the System Time, in units of time specified by START_TIME_UNIT, (modulo 32) at which the mobile station is to start processing if FOR_SCH_DURATION is not equal to ‘0000’ or stop processing if FOR_SCH_DURATION is equal to ‘0000’ the Forward Supplemental Channel specified in this message. The explicit start time to start or stop for processing the Forward Supplemental Channels is the time for which

\[ \left\lfloor \frac{t}{(\text{START_TIME_UNIT}+1)} \right\rfloor - \text{FOR_SCH_START_TIME} \mod 32 = 0, \]

where \( t \) is the System Time in units of 20 ms.

**SCCL_INDEX** - Supplemental Channel Code list index.

The base station shall set this field to the index of the record in the Forward Supplemental Channel Code list corresponding to the FOR_SCH_ID. The base station shall include an SCCL_INDEX whose SCH Active Set is a subset of the Active Set of the Fundamental Channel, Dedicated Control Channel, or both.

**NUM_REV_ASSIGN** - Number of Reverse Supplemental Channel assigned.

If SCH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field to the number of Reverse Supplemental Channel assigned.

The base station shall include NUM_REV_ASSIGN occurrences of the following five fields (REV_SCH_ID, REV_SCH_DURATION, REV_SCH_START_TIME_INCL, REV_SCH_START_TIME, and REV_SCH_NUM_BITS_IDX).

**REV_SCH_ID** - Reverse Supplemental Channel Identifier.

The base station shall set this field to the identifier of the Reverse Supplemental Channel.

**REV_SCH_DURATION** - Duration of Reverse Supplemental Channel assignment.

The base station shall set this field to ‘0000’ to indicate that the mobile station is to stop transmitting on the Reverse Supplemental Channel specified by REV_SCH_ID at the explicit start time specified by REV_SCH_START_TIME or at the implicit start time if REV_SCH_START_TIME_INCL is set to ‘0’. The base station shall set this field to ‘1111’ to indicate that the mobile station may transmit on the Reverse Supplemental Channel specified by REV_SCH_ID, starting at the explicit start time specified by REV_SCH_START_TIME in this message, until the start time specified by a subsequent Reverse Supplemental Channel assignment corresponding to the same Supplemental Channel (see 2.6.6.2.5.1.1). The base station shall set this field to the duration according to Table 3.7.3.3.2.37-3, starting at the explicit start time specified by REV_SCH_START_TIME, during which the mobile station may transmit on the Reverse Supplemental Channel specified by REV_SCH_ID.
REV_SCH_START_TIME_INCL - Start time included indicator.

If REV_SCH_DURATION is not equal to ‘0000’, the base station shall set this field to ‘1’. If REV_SCH_DURATION is equal to ‘0000’, the base station shall set this field as follows:

The base station shall set this field to ‘1’ if REV_SCH_START_TIME is included in this message; otherwise, the base station shall set this field to ‘0’.

REV_SCH_START_TIME - Start time for Reverse Supplemental Channel Assignment.

If REV_SCH_START_TIME_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field to the System Time, in units of time specified by START_TIME_UNIT, (modulo 32) at which the mobile station may start transmitting or stop transmitting on the Reverse Supplemental Channel specified in this message. The explicit start time to start or stop transmitting on the Reverse Supplemental Channel is the time for which

\[
\left\lfloor \frac{t}{(\text{START\_TIME\_UNIT/s}+1)} \right\rfloor - \text{REV\_SCH\_START\_TIME} \mod 32 = 0,
\]

where t is the System Time in units of 20 ms.

REV_SCH_NUM_BITSIDX - Reverse Supplemental Channel number of bits per frame index granted by the base station.

If USE_FLEX_NUM_BITS is equal to ‘0’ or if USE_FLEX_NUM_BITS is equal to ‘1’ and RSCH_NBIT_TABLE_ID[REV_SCH_ID] is equal to ‘0000’, then the base station shall set this field according to Table 3.7.3.3.2.37-2 to indicate the Reverse Supplemental Channel number of information bits per frame and the number of CRC bits per frame, that the mobile station may transmit on the reverse Supplemental Channel identified by REV_SCH_ID.

If USE_FLEX_NUM_BITS is equal to ‘1’ and RSCH_NBIT_TABLE_ID[REV_SCH_ID] is not equal to ‘0000’, then the base station shall set this field to indicate the Reverse Supplemental Channel number of information bits per frame that the mobile station may transmit on the Reverse Supplemental Channel identified by REV_SCH_ID to be NUM_BITS[RSCH_NBIT_TABLE_ID[REV_SCH_ID]] [REV_SCH_NUM_BITSIDX] and the Reverse Supplemental Channel number of CRC bits per frame that the mobile station may transmit on the Reverse Supplemental Channel identified by REV_SCH_ID to be CRC_LEN_IDX[RSCH_NBIT_TABLE_ID[REV_SCH_ID]] [REV_SCH_NUM_BITSIDX].

FPC_SUBCHAN_GAIN - Forward power control subchannel relative gain.
The base station shall set FPC_SUBCHAN_GAIN equal to the power level of the forward link power control subchannel relative to that of 20 ms frames at a 9600 bps or 14400 bps rate on the Forward Fundamental Channel or the Forward Dedicated Control Channel indicated by FPC_PRI_CHANs. The base station shall set the value in units of 0.25 dB.

USE_PC_TIME - Use power control action time indicator.

This field indicates whether an explicit time [PC_ACTION_TIME] at which a new value for power control sub-channel to traffic ratio [FPC_SUBCHAN_GAIN] takes effect is specified in the message.

If an explicit action time is specified in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

PC_ACTION_TIME - Power Control Subchannel gain action time.

If the USE_PC_TIME field is set to ‘1’, the base station shall set this field to the System Time minus FRAME_OFFSETs × 1.25 ms, in units of 80 ms (modulo 64), at which FPC_SUBCHAN_GAIN specified in this message is to take effect. If the USE_PC_TIME field is set to ‘0’, the base station shall omit this field.

CH_IND - Channel Indicator.

The base station shall set this field as shown in Table 3.7.3.3.2.36-1.
### Table 3.7.3.3.2.36-1. Channel Indicator

<table>

</tbody>
</table>

**ACTIVE_SET_REC_LEN** - Active Set record length.

The base station shall set this field to the number of octets in the ACTIVE_SET_REC_FIELDS included in this message.

**ACTIVE_SET_REC_FIELDS** - Active Set record fields.

The Active Set record fields are determined by the value of CH_IND, as described below.

**REV_FCH_GATING_MODE** - Reverse eighth gating mode indicator.

If CH_IND is set to ‘010’ or ‘110’, or if EXT_CH_IND does not signal allocation of R-FCH, then the base station shall omit this field; otherwise, the base station include this field and set it as follows:

The base station shall set this field to ‘1’ if the mobile station is allowed to perform the reverse eighth gating mode after handoff; otherwise, the base station shall set this field to ‘0’.

**REV_PWR_CNTL_DELAY_INCL** - Reverse power control delay included indicator.

If REV_FCH_GATING_MODE is not included, or is included and set to ‘0’, then the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.
The base station shall set this field to ‘1’ if REV_PWR_CNTL_DELAY is included in this message; otherwise, the base station shall set this field to ‘0’.

REV_PWR_CNTL_DELAY - The reverse power control delay.

If REV_PWR_CNTL_DELAY_INCL is not included, or is included and set to ‘0’, then the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the closed-loop reverse power control delay minus one (the closed-loop reverse power control delay is the time between the end of a gated-on reverse PCG and the beginning of the reverse PCG where the corresponding feedback is sent on the Forward Power Control Subchannel, see [2]), in units of 1.25 ms.

D_SIG_ENCRYPT_MODE - Dedicated channel signaling encryption mode indicator.

If ENCRYPT_MODE is included and is set to ‘11’, the base station shall include this field and shall set it to the dedicated channel signaling encryption mode, as shown in Table 3.7.4.5-1; otherwise the base station shall omit this field.

ENC_KEY_SIZE - Encryption key size indication.

If ENCRYPT_MODE is included and is set to ‘10’ or ‘11’, the base station shall include this field and set it to the encryption key size, as shown in Table 3.7.4.5-2; otherwise, the base station shall omit this field.

3XFL_1XRL_INCL - 3X Forward Link and 1X Reverse Link indicator.

The base station shall set this field to ‘1’ if the base station is assigning 3X traffic channel on the Forward Link and 1X traffic channel on the Reverse Link; otherwise, the base station shall set this field to ‘0’.

1XRL_FREQ_OFFSET - 1X Reverse Link frequency offset.

If 3XFL_1XRL_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the value shown in Table 3.7.2.3.2.21-8 corresponding to the frequency offset of the 1X reverse link.
SYNC_ID_INCL - Service Configuration synchronization identifier included indicator.

If the SCR_INCLUDED field is included and is set to ‘1’ or the NNSCR_INCLUDED field is included and is set to ‘1’, or P_REV_IN_USE is equal or greater than 11, the base station shall include this field; otherwise, the base station shall omit this field. If included, the base station shall set this field as follows:

The base station shall set this field to ‘1’ if the SYNC_ID field is included in this message; otherwise, the base station shall set this field to ‘0’.

SYNC_ID_LEN - Service Configuration synchronization identifier length.

If the SYNC_ID_INCL field is not included or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the length (in octets) of the SYNC_ID field included in this message. The base station shall set this field to a value larger than zero.

SYNC_ID - Service Configuration synchronization identifier.

If the SYNC_ID_INCL field is not included or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the SCR_INCLUDED field is included and is set to ‘1’ or the NNSCR_INCLUDED field is included and is set to ‘1’, the base station shall set this field to the synchronization identifier corresponding to the service configuration conveyed by this message; otherwise, the base station shall set this field to the updated synchronization identifier corresponding to the current service configuration.

CC_INFO_INCL - Call Control information included indicator.

If the SCR_INCLUDED field is not included or is included but is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if Call Control related parameters (to assign new call(s)) are included in this message; otherwise, the base station shall set this field to ‘0’.
NUM_CALLS_ASSIGN - Number of call assignments.

If the CC_INFO_INCL field is not included or is included but is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the number of new call assignments included in this message.

The base station shall include NUM_CALLS_ASSIGN occurrences of the following variable length record (CON_REF, RESPONSE_IND, TAG, BYPASS_ALERT_ANSWER as per the following requirements).

CON_REF - Connection reference.

The base station shall set this field to the connection reference of the service option connection corresponding to this call.

RESPONSE_IND - Response indicator.

The base station shall set this field to '1' if this call assignment is a response to an Enhanced Origination Message from the mobile station; otherwise, the base station shall set this field to '0'.

TAG - Transaction identifier.

If the RESPONSE_IND field is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the value of the TAG field received in the Enhanced Origination Message to which this call assignment is the response.

BYPASS_ALERT_ANSWER - Bypass alert indicator.

If the RESPONSE_IND field is set to '1', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the mobile station is to bypass the Waiting for Order Substate and the Waiting for Mobile Station Answer Substate for this call, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

CS_SUPPORTED - Concurrent Services supported indicator.

If the base station supports concurrent services, the base
station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

3 CHM_SUPPORTED – Control Hold Mode supported indicator.

The base station shall set this field to ‘1’ to indicate that the base station supports the Control Hold Mode; otherwise, the base station shall set this field to ‘0’.

4 CDMA_OFF_TIME_REP_SUP_IND – CDMA off time report supported indicator.

If the base station supports mobile station report for CDMA off time information using the CDMA Off Time Report Message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

5 CDMA_OFF_TIME_REP_THRESHOLD_UNIT – CDMA off time report threshold unit

If CDMA_OFF_TIME_REP_SUP_IND is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the time unit used in CDMA_OFF_TIME_REP_THRESHOLD, as specified in Table 3.7.2.3.2.13-5

6 CDMA_OFF_TIME_REP_THRESHOLD – CDMA off time report threshold

If CDMA_OFF_TIME_REP_SUP_IND is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the time in units of CDMA_OFF_TIME_REP_THRESHOLD_UNIT such that if the mobile station goes away from the CDMA traffic channel longer than this value, the mobile station is to send a CDMA Off Time Report Message.

7 RELEASE_TO_IDLE_IND – Release to Idle State allowed indicator.

If the mobile station is allowed to return to the Mobile Station Idle State upon call release, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

8 MSG_INTEGRITY_SUP – Message integrity supported indicator.

If the base station supports message integrity, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

9 GEN_2G_KEY – Generate 2G encryption key indicator.

If the base station is to generate a new CMEAKEY from the current CK, the base station shall set this field to ‘1’ to order the mobile station to perform similar procedures; otherwise, the base station shall set this field to ‘0’.

10 REGISTER_IN_IDLE – Register in idle state indicator.
If the mobile station is to perform registration after transitioning back to the *Mobile Station Idle State*, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**PLCM_TYPE_INCL** - The Public Long Code Mask type Included Indicator.

If the mobile station is to change its public long code mask after handoff, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**PLCM_TYPE** - The Public Long Code Mask Type.

If **PLCM_TYPE_INCL** is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the Public Long Code Mask type to be used by the mobile station after the handoff as specified in Table 3.7.2.3.2.21-5.

**PLCM_TYPE ‘0010’** shall not be used when the mobile station is not in its home country (i.e., the MCC of the mobile station is different from the MCC of this base station).

**PLCM_TYPE ‘0011’** shall not be used when the mobile station is not in its home network (i.e., the MCC or MNC of the mobile station is different from the MCC or MNC of this base station).

**PLCM_39** - The 39 LSBs of the Public Long Code Mask.

If **PLCM_TYPE** is included and set to ‘0001’, the base station shall include this field and set it to the 39 least significant bits of the public long code mask to be used by the mobile station after the handoff as defined in Table 3.6.4.1.10; otherwise, the base station shall omit this field.

**T_TDROP_RANGE_INCL** - Drop timer range value included indicator.

If **SEARCH_INCLUDED** is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if the **T_TDROP_RANGE** field is included in this message; otherwise, the base station shall set this field to ‘0’.

**T_TDROP_RANGE** - Drop timer range value.

Timer range value to use in association with the **T_TDROP** parameter when determining the drop timer expiration.

If **T_TDROP_RANGE_INCL** is not included, or included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field to the **T_TDROP_RANGE** value shown in Table 2.6.6.2.3-2 corresponding to the timer expiration range value to be used by the mobile station.
FOR_PDCH_SUPPORTED - Forward Packet Data Channel supported indicator.
If the base station supports Forward Packet Data Channel, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

PDCH_CHM_SUPPORTED – PDCH Control Hold Mode supported indicator.
If FOR_PDCH_SUPPORTED is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
The base station shall set this field to '1' to indicate that the base station supports the PDCH Control Hold Mode; otherwise, the base station shall set this field to '0'.

PILOT_INFO_REQ_SUPPORTED - Pilot information request supported indicator.
If the base station supports mobile station request for pilot information using the “Pilot Information” record in the Base Station Status Request Message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

ENC_SUPPORTED – Encryption fields included.
The base station shall set this field to ‘1’ if the encryption related fields are included; otherwise, the base station shall set this field to ‘0’.

SIG_ENCRYPT_SUP – Signaling Encryption supported indicator.
If ENC_SUPPORTED is equal to ‘1’, the base station shall include this field; otherwise, the base station shall omit this field. If this field is included, this field indicates which signaling encryption algorithms are supported by the base station.
This field consists of the subfields shown in Table 2.7.1.3.2.1-5.
If this field is included, the base station shall set the subfields as follows:
The base station shall set the CMEA subfield to ‘1’.
The base station shall set each other subfield to ‘1’ if the corresponding signaling algorithm is supported by the base station; otherwise, the base station shall set the subfield to ‘0’.
The base station shall set the RESERVED subfield to ‘00000’.

UI_ENCRYPT_SUP – User information Encryption supported indicator.
If ENC_SUPPORTED is equal to ‘1’, the base station shall include this field; otherwise, the base station shall omit this field. If this field is included, the base station shall set this field to indicate the supported user information encryption algorithms.
This field consists of the subfields shown in Table 2.7.1.3.2.4-9.

The base station shall set each subfield to ‘1’ if the corresponding user information encryption algorithm is supported by the base station; otherwise, the base station shall set the subfield to ‘0’.

**USE_SYNC_ID** - Sync ID supported indicator.

The base station shall set this field to ‘1’ to indicate that the mobile station is permitted to include the SYNC_ID field in the Page Response Message, the Reconnect Message, the Origination Message, and the Enhanced Origination Message; otherwise, the base station shall set this field to ‘0’.

**SID_INCL** - SID included indicator.

If the SID field is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**SID** - System identification.

If the SID_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the system identification number for this wireless system (see 2.6.5.2).

**NID_INCL** - NID included indicator.

If the NID field is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**NID** - Network identification.

If the NID_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

This field serves as a sub-identifier of a system as defined by the owner of the SID.

The base station shall set this field to the network identification number for this network (see 2.6.5.2).

**SDB_SUPPORTED** - Short Data Burst supported indicator.

The base station shall set this field to ‘1’ if the mobile station is permitted to send a Short Data Burst; otherwise, the base station shall set this field to ‘0’.

**MOB_QOS** - Indicator granting permission to the mobile station to request QoS parameter settings in the Origination Message, Origination Continuation Message, or Enhanced Origination Message.
If CS_SUPPORTED is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and shall set it as follows:

The base station shall set this field to ‘1’, if the mobile station is allowed to include a QoS record in the Origination Message, Origination Continuation Message, or Enhanced Origination Message; otherwise, the base station shall set this field to ‘0’.

MS_INIT_POS_LOC_SUP_IND - Mobile station initiated position location determination supported indicator.

If the target base station supports mobile station initiated position determination, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

PZ_HYST_PARMS_INCL - Packet zone hysteresis parameters included indicator.

If the PACKET_ZONE_ID field is set to ‘00000000’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the packet zone hysteresis parameters are included, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

REV_PDCH_SUPPORTED - Reverse Packet Data Channel supported indicator.

If FOR_PDCH_SUPPORTED is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the base station supports the Reverse Packet Data Channel [R-PDCH], the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

PZ_HYST_ENABLED - Packet zone hysteresis enabled.

If the PACKET_ZONE_ID field is set to ‘00000000’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the packet zone hysteresis feature is to be enabled at the mobile station, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

If PZ_HYST_PARMS_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the packet zone hysteresis feature is to be enabled at the mobile station, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

PZ_HYST_INFO_INCL - Packet zone hysteresis information included indicator.

If the PZ_HYST_ENABLED field is included and is set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.
If the base includes the PZ_HYST_LIST_LEN, PZ_HYST_ACT_TIMER and packet zone hysteresis timer related fields, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

PZ_HYST_LIST_LEN - Packet zone hysteresis list length.

If the PZ_HYST_INFO_INCL field is included and is set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to the length of the packet zone hysteresis list minus one. This field shall be within the range ‘0001’ through ‘1111’, inclusive.

PZ_HYST_ACT_TIMER - Packet zone hysteresis activation timer.

If the PZ_HYST_INFO_INCL field is included and is set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

The base station shall set to the value of the packet zone hysteresis activation timer (in units of seconds). This field shall be within the range ‘00000001’ through ‘11111111’, inclusive.

PZ_HYST_TIMER_MUL - Packet zone hysteresis timer multiplier.

If the PZ_HYST_INFO_INCL field is included and is set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

The base station shall set the field to $x \times 8^y$ seconds is the value of the hysteresis timer and $y$ is the value indicated in the PZ_HYST_TIMER_EXP field. The base station shall set this field to a value that is between 1 and 7 inclusive. The value 0 is reserved.

PZ_HYST_TIMER_EXP - Packet zone hysteresis timer exponent.

If the PZ_HYST_INFO_INCL field is included and is set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

The base station shall set the field to $y$, where $x \times 8^y$ seconds is the value of the hysteresis timer and $x$ is the value indicated in the PZ_HYST_TIMER_MUL field. The base station shall set this field to a value that is between 0 and 4 inclusive. All the other values are reserved.

BCMC_ON_TRAFFIC_SUP - BCMC on traffic channel supported indicator.

The base station shall set this field to ‘1’ to indicate that the BCMC feature is supported on traffic channel; otherwise, the base station shall set this field to ‘0’.

AUTO_REQ_TRAF_ALLOWED_IND - Autonomous BCMC request on traffic channel allowed indicator.
If the BCMC_ON_TRAFFIC_SUP field is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ to indicate that the mobile station is allowed to request for a BCMC flow autonomously on traffic channel; otherwise, the base station shall set this field to ‘0’.

SCH_BCMC_IND – BCMC on supplemental channel Indicator.

If the BCMC_ON_TRAFFIC_SUP field is set to '0', or if NUM_FOR.Assign field is not included or is included and is set to '00', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the channel assignment in this message contains a Forward Supplemental Channel used for BCMC transmission, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

ADD_PLCM_FOR_SCH_INCL – Additional PLCM for forward SCH included indicator.

If the SCH_BCMC_IND field is not included or is included and is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the additional PLCM for forward SCH is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

ADD_PLCM_FOR_SCH_TYPE - The Additional Public Long Code Mask for forward SCH type indicator.

If ADD_PLCM_FOR_SCH_INCL is not included or is included and is set to '0', the base station shall omit this field; otherwise, the base station shall include this field to indicate PLCM specified by the base station. The field value ‘0’ is reserved.

The base station shall set this field to the Public Long Code Mask type ‘0001’ as specified in Table 3.7.2.3.2.21–5. The base station shall set this field to ‘1’ to indicate PLCM specified by the base station. The field value ‘0’ is reserved.

ADD_PLCM_FOR_SCH_LSB – The LSB bits of the additional Public Long Code Mask for forward SCH.

If ADD_PLCM_FOR_SCH_TYPE field is included and is set to ‘1’, the base station shall include this field and set it to the 395 least significant bits of the public long code mask used by the mobile station; otherwise, the base station shall omit this field.

If SCH_BCMC_IND field is included and is set to ‘1’, the base station shall include NUM_FOR.Assign occurrences of the following record:

USE_ADD_PLCM_FOR_SCH - Use additional PLCM indicator for forward SCH.
The base station shall set this field to ‘1’ if the additional PLCM included for forward SCH in this message is to be used for this Forward Supplemental Channel; otherwise, the base station shall set this field to ‘0’.

**FSCH_OUTERCODE_INCL** - Forward Supplemental Channel Outer Code included indicator.

The base station shall set this field to ‘1’ if the Forward Supplemental Channel outer code information is included in this message; otherwise, the base station shall set this field to ‘0’.

**FSCH_OUTERCODE_RATE** - Outer Code Rate of the Forward Supplemental Channel.

If the FSCH_OUTERCODE_INCL field is not included or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the outer code rate of the Forward Supplemental Channel as specified in Table 3.7.2.3.2.38-3.[2].

**FSCH_OUTERCODE_OFFSET** - Outer Coding Buffer Offset of the Forward Supplemental Channel.

If the FSCH_OUTERCODE_INCL field is not included or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the outer coding buffer offset of the Forward Supplemental Channel in units of 20ms as specified in [2].

**MAX_ADD_SERV_INSTANCE** - Maximum number of additional service reference identifiers allowed in origination

If the CS_SUPPORTED field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the maximum number of additional service reference identifiers that can be included in the Origination Message or Enhanced origination Message.

**USE_CH_CFG_RRM** - Channel configuration request allowed indicator.

The base station shall set this field to ‘1’ to indicate that the mobile station is permitted to include the CH_IND and EXT_CH_IND fields in the Resource Request Message, and the Resource Request Mini Message; otherwise, the base station shall set this field to ‘0’.

**TX_PWR_LIMIT_INCL** - Transmit Power Limit inclusion for the current base station
If TX_PWR_LIMIT_DEFAULT is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**TX_PWR_LIMIT_DEFAULT** - Use the Default Transmit Power Limit

If TX_PWR_LIMIT_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set to as follows.

The base station shall set this field to ‘1’ if the mobile station is to limit its transmission power in the 1915MHz – 1920MHz block of the PCS band to no more than the default value defined in [11]; otherwise, the base station shall set this field to ‘0’ if the mobile station is to limit its transmission power to no more than the value indicated by TX_PWR_LIMIT.

**TX_PWR_LIMIT** - Transmit Power Limit for the current base station

If TX_PWR_LIMIT_DEFAULT is omitted, or if it is included and set to ‘1’, the base station shall omit this field; otherwise, the base station shall include this field and set to as follows:

The base station shall set this field to thirty dB more than transmit power limit in dBm EIRP, in steps of 1 dB. This field can take the values 30 to 53 corresponding to maximum transmit power values 0 dBm to 23 dBm.

If the CH_IND field is set to ‘101’, the base station shall include the following fields:

**NUM_FOR_SCH** - Number of Forward Supplemental Channel records.

If SCH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the number of the Forward Supplemental Channel records need to be updated.

If NUM_FOR_SCH is included and not equal to ‘00000’, the base station shall include NUM_FOR_SCH occurrence of the following three fields:

**FOR_SCH_ID** - Forward Supplemental Channel identifier.

The base station shall set this field to the identifier of the Forward Supplemental Channel.

**SCCL_INDEX** - Supplemental Channel Code list index.

The base station shall set this field to the index of the record in the Supplemental Channel Code list.

**FOR_SCH_NUM_BITS_IDX** - Forward Supplemental Channel number of information bits index.

If USE_FLEX_NUM_BITS is equal to ‘0’ or if USE_FLEX_NUM_BITS is equal to ‘1’ and FSCH_NBIT_TABLE_ID for FOR_SCH_ID is equal to ‘0000’, then the base station shall set this field according to Table 3.7.3.3.2.37-4 to indicate the number of information bits per frame and the length of the CRC field for the Forward Supplemental Channel identified by FOR_SCH_ID corresponding to SCCL_INDEX.
If USE_FLEX_NUM_BITS is equal to '1' and FSCH_NBIT_TABLE_ID[FOR_SCH_ID] is not equal to '0000', then the base station shall set this field to indicate that the number of information bits per frame for the Forward Supplemental channel identified by FOR_SCH_ID to be NUM_BITS[FSCH_NBIT_TABLE_ID[FOR_SCH_ID]][FOR_SCH_NUM_BITS_IDX] and the number of CRC bits per frame for the Forward Supplemental channel identified by FOR_SCH_ID to be CRC_LEN_IDX[FSCH_NBIT_TABLE_ID[FOR_SCH_ID]][FOR_SCH_NUM_BITS_IDX].

NumbRevSCH - Number of Reverse Supplemental Channel records.

If SCH_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the number of the Reverse Supplemental Channels need to be updated.

If NUM_REV_SCH is included and not equal to '0000', the base station shall include NUM_REV_SCH occurrence of the following three fields:

REV_SCH_ID - Reverse Supplemental Channel identifier.

The base station shall set this field to the identifier of the Reverse Supplemental Channel.

REV_WALSH_ID - Reverse Supplemental Channel Walsh cover Identifier.

The base station shall set this field according to Table 3.7.3.3.2.37-1 to indicate the Walsh cover ID that the mobile station is to use when transmitting at the rate specified by REV_SCH_NUM_BITS_IDX on the Reverse Supplemental Channel specified by REV_SCH_ID. If only one reverse supplemental channel is assigned, the base station should set this field to the default value for the REV_WALSH_ID as specified in 2.6.4.2.

REV_SCH_NUM_BITS_IDX - Reverse Supplemental Channel number of bits per frame index.

If USE_FLEX_NUM_BITS is equal to '0' or if USE_FLEX_NUM_BITS is equal to '1' and RSCH_NBIT_TABLE_ID[REV_SCH_ID] is equal to '0000', then the base station shall set this field according to Table 3.7.3.3.2.37-2 to indicate the Reverse Supplemental Channel number of information bits per frame and the CRC bits per frame, corresponding to REV_WALSH_ID field.
If USE_FLEX_NUM_BITS is equal to ‘1’ and RSCH_NBIT_TABLE_ID[REV_SCH_ID] is not equal to ‘0000’, then the base station shall set this field to indicate the Reverse Supplemental Channel number of information bits per frame, corresponding to REV_WALSH_ID field to be NUM_BITS[RSCH_NBIT_TABLE_ID[REV_SCH_ID]] [REV_SCH_NUM_BITS_IDX] and the Reverse Supplemental Channel number of CRC bits per frame corresponding to REV_WALSH_ID field to be CRC_LEN_IDX[RSCH_NBIT_TABLE_ID[REV_SCH_ID]] [REV_SCH_NUM_BITS_IDX].

NUM_PILOTS - Number of pilots included in the message.

The base station shall set this field to the number of pilots included in the message. The base station shall set this field to an integer that is equal to or greater than 1.

SRCH_OFFSET_INCL - Target pilot channel search window offset included.

If the SRCH_OFFSET field is included in the following records, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

The base station shall include one occurrence of the following record for each of the NUM_PILOTS pilots included in the message:

PILOT_PN - Pilot PN sequence offset index.

The base station shall set this field to the pilot PN sequence offset for this pilot in units of 64 PN chips.

SRCH_OFFSET - Target pilot channel search window offset.

If SRCH_OFFSET_INCL equals to ‘1’, then the base station shall set this field to the value shown in Table 2.6.6.2.1-2 corresponding to the search window offset to be used by the mobile station for this target pilot. Otherwise, the base station shall omit this field.

ADD_PILOT_REC_INCL - Additional pilot information included indicator.

The base station shall set this field to ‘1’ if additional pilot information listed in PILOT_REC_TYPE and RECORD_LEN fields are included. The base station shall set this field to ‘0’ if the corresponding pilot is the common pilot and there is no additional pilot information included.

PILOT_REC_TYPE - Pilot record type.

If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall set this field to the PILOT_REC_TYPE value shown in Table 3.7.2.2.21-9 corresponding to the type of Pilot Record specified by this record.

If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.

RECORD_LEN - Pilot record length.
If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall set this field to the number of octets in the type-specific fields of this pilot record. If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.

Type-specific fields - Pilot record type-specific fields.

If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall include type-specific fields based on the PILOT_REC_TYPE of this pilot record as described in 3.7.6.1. If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.

PWR_COMB_IND - Power control symbol combining indicator.

If the Forward Traffic Channel associated with this pilot will carry the same closed-loop power control subchannel bits as that of the previous pilot in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’. The base station shall set this field to ‘0’ in the first record in the pilot list.

CODE_CHAN_FCH - Code channel on the Fundamental Channel.

If a Radio Configuration associated with Spreading Rate 1 is used, the base station shall set this field to the code channel index (see [2]) that the mobile station is to use on the Fundamental Channel of the Forward Traffic Channel. If a Radio Configuration associated with Spreading Rate 3 is used, the base station shall set this field to the code channel index that the mobile station is to use for the Fundamental Channel on the center SR3 frequency.

If Radio Configuration 1, 2, 3, or 5 (see [2]) is used, the base station shall set this field in the range 1 to 63 inclusive. If Radio Configuration 4, 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

QOF MASK ID FCH - Quasi-orthogonal function index on the Fundamental Channel.

If a Radio Configuration associated with Spreading Rate 1 is used, the base station shall set this field to the index of the Quasi-orthogonal function (see [2]). If a Radio Configuration associated with Spreading Rate 3 is used, the base station shall set this field to the index of the Quasi-orthogonal function on the center SR3 frequency.

NUM_SCH - Number of Supplemental Channel records.

If SCH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows: The base station shall set this field to the number of the Supplemental Channel records need to be updated.
If NUM_SCH is included and not equal to ‘00000’, the base station shall include NUM_SCH occurrence of the following five fields:

- **FOR_SCH_ID** - Forward Supplemental Channel identifier.
  - The base station shall set this field the identifier of the Forward Supplemental Channel pertaining to this record.

- **SCCL_INDEX** - Supplemental Channel Code list index.
  - The base station shall set this field to the index of the record in the Supplemental Channel Code list.

- **PILOT_INCL** - The corresponding pilot included in Supplemental Channel Active Set indicator.
  - The base station shall set this field to ‘1’ if the corresponding pilot is included in the Active Set of Supplemental Channel; otherwise, the base station shall set this field to ‘0’.

- **CODE_CHAN_SCH** - Code channel on the Supplemental Channel.
  - If PILOT_INCL is included and set to ‘1’, the base station shall set this field as follows; otherwise, the base station shall omit this field.
  - The base station shall set this field to the code channel index (see [2]) that the mobile station is to use on the Supplemental Channel of the Forward Traffic Channel indexed by SCCL_INDEX.

- **QOF_MASK_ID_SCH** - Quasi-orthogonal function index on the Supplemental Channel.
  - If PILOT_INCL is included and set to ‘1’, the base station shall set this field as follows; otherwise, the base station shall omit this field.
  - The base station shall set this field to the index of the Quasi-orthogonal function (see [2]).

- **3X_FCH_INFO_INCL** - 3X Fundamental Channel information included indicator.
  - If the 3X Fundamental Channel information is included, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.
  - The base station shall include NUM_PILOTS occurrences of the following record if 3X_FCH_INFO_INCL is set to ‘1’. The base station shall use the same order for the following fields as is used for the PILOT_PN fields listed in this message.

- **3X_FCH_LOW_INCL** - FCH code channel on the lowest SR3 frequency included indicator.
  - If the Fundamental Channel on the lowest SR3 frequencies has a different code channel than the Fundamental Channel on the center SR3 frequency, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

- **QOF_MASK_ID_FCH_LOW** - QOF index for the Fundamental Channel on the lowest SR3 frequency.
If 3X_FCH_LOW_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) corresponding to the QOF index for the Fundamental Channel on the lowest SR3 frequency.

**CODE_CHAN_FCH_LOW** - Code channel for the Fundamental Channel on the lowest SR3 frequency.

If 3X_FCH_LOW_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) corresponding to the QOF index for the Fundamental Channel on the lowest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

**3X_FCH_HIGH_INCL** - FCH code channel on the highest SR3 frequency included indicator.

If the Fundamental Channel on the highest SR3 frequencies has a different code channel than the Fundamental Channel on the center SR3 frequency, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

**QOF_MASK_ID_FCH_HIGH** - QOF index for the Fundamental Channel on the highest SR3 frequency.

If 3X_FCH_HIGH_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) corresponding to the QOF index for the Fundamental Channel on the highest SR3 frequency.

**CODE_CHAN_FCH_HIGH** - Code channel for the Fundamental Channel on the highest SR3 frequency.

If 3X_FCH_HIGH_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) corresponding to the QOF index for the Fundamental Channel on the highest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

**3X_SCH_INFO_INCL** - 3X Supplemental Channel information included indicator.

If SCH_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:
If the 3X Supplemental Channel information is included, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

The base station shall include NUM_SCH occurrences of the following seven fields record if 3X_SCH_INFO_INCL is included and set to ‘1’.

**FOR_SCH_ID** - Forward Supplemental Channel identifier.

The base station shall set this field the identifier of the Forward Supplemental Channel pertaining to this record.

**3X_SCH_LOW_INCL** - SCH code channel on the lowest SR3 frequency included indicator.

If the Supplemental Channel on the lowest SR3 frequencies has a different code channel than the Supplemental Channel on the center SR3 frequency, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**QOF_MASK_ID_SCH_LOW** - QOF index for the Supplemental Channel on the lowest SR3 frequency.

If 3X_SCH_LOW_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) corresponding to the QOF index for the Supplemental Channel on the lowest SR3 frequency.

**CODE_CHAN_SCH_LOW** - Code channel for the Supplemental Channel on the lowest SR3 frequency.

If 3X_SCH_LOW_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the code channel index (see [2]) that the mobile station is to use on the Supplemental Channel on the lowest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

**3X_SCH_HIGH_INCL** - SCH code channel on the highest SR3 frequency included indicator.

If the Supplemental Channel on the highest SR3 frequencies has a different code channel than the Supplemental Channel on the center SR3 frequency, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**QOF_MASK_ID_SCH_HIGH** - QOF index for the Supplemental Channel on the highest SR3 frequency.

If 3X_SCH_HIGH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:
The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) corresponding to the QOF index for the Supplemental Channel on the highest SR3 frequency.

**CODE_CHAN-_SCH_HIGH** – Code channel for the Supplemental Channel on the highest SR3 frequency.

If 3X_SCH_HIGH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the code channel index (see [2]) that the mobile station is to use on the Supplemental Channel on the highest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

**CCSH_INCLUDED** - Code Combining Soft Handoff information included indicator.

The base station shall set this field to ‘1’ if Code Combining Soft Handoff information is included in this message; otherwise, the base station shall set this field to ‘0’.

**USE_CCSH_ENCODER_TIME** - Use Code Combining Soft Handoff Turbo Encoder swapping action time indicator.

If the CCSH_INCLUDED field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

If an explicit action time at which Turbo Encoder types (CCSH_ENCODER_TYPE) included in this message takes effect is specified, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**CCSH_ENCODER_ACTION_TIME** - Code Combining Soft Handoff Turbo Encoder swapping action time.

If the USE_CCSH_ENCODER_TIME field is included and set to ‘1’, the base station shall set this field to the System Time minus FRAME_OFFSETS × 1.25 ms, in units of 80ms (modulo 64), at which Turbo Encoder types included in this message are to take effect; otherwise, the base station shall omit this field.

If the CCSH_INCLUDED field is set to ‘1’, the base station shall include one occurrence of the following one field for each of the Forward Supplemental Channel records (as specified by NUM_PILOTS and NUM_SCH) with PILOT_INCL field set to ‘1’. The base station shall use the same order for the following field as is used for the Forward Supplemental Channel records.

**CCSH_ENCODER_TYPE** - Code Combining Soft Handoff Turbo Encoder type.
The base station shall set this field to ‘0’ if the Turbo Encoder type to be used on the Forward Supplemental Channel identified by FOR_SCH_ID and SCCL_INDEX is the default encoder type. The base station shall set this field to ‘1’ if the Turbo Encoder to be used is the complementary type.

RESERVED - Reserved bits.

The base station shall add reserved bits as needed in order to make the length of the ACTIVE_SET_REC_FIELDS record equal to an integer number of octets. The base station shall set these bits to ‘0’.

If the CH_IND field is set to ‘010’ or ‘110’, the base station shall include the following fields:

NUM_FOR_SCH - Number of Forward Supplemental Channel records.

If SCH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the number of the Forward Supplemental Channel records need to be updated.

If NUM_FOR_SCH is included and not equal to ‘00000’, the base station shall include NUM_FOR_SCH occurrence of the following three fields:

FOR_SCH_ID - Forward Supplemental Channel identifier.

The base station shall set this field to identifier of the Forward Supplemental Channel.

SCCL_INDEX - Supplemental Channel Code list index.

The base station shall set this field to the index of the record in the Supplemental Channel Code list.

FOR_SCH_NUM_BITS_IDX - Forward Supplemental Channel number of information bits index.

If USE_FLEX_NUM_BITS is equal to ‘0’ or if USE_FLEX_NUM_BITS is equal to ‘1’ and FSCH_NBIT_TABLE_ID for FOR_SCH_ID is equal to ‘0000’, then the base station shall set this field according to Table 3.7.3.2.37-4 to indicate the number of information bits per frame and the length of the CRC field for the Forward Supplemental Channel identified by FOR_SCH_ID corresponding to SCCL_INDEX.

If USE_FLEX_NUM_BITS is equal to ‘1’ and FSCH_NBIT_TABLE_ID[FOR_SCH_ID] is not equal to ‘0000’, then the base station shall set this field to indicate that the number of information bits per frame for the Forward Supplemental channel identified by FOR_SCH_ID to be NUM_BITS[FSCH_NBIT_TABLE_ID][FOR_SCH_ID][FOR_SCH_NUM_BITS_IDX] and the number of CRC bits per frame for the Forward Supplemental channel identified by FOR_SCH_ID to be CRC_LEN_IDX[FSCH_NBIT_TABLE_ID][FOR_SCH_ID][FOR_SCH_NUM_BITS_IDX].
NUM_REV_SCH - Number of Reverse Supplemental Channel records.

If SCH_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the number of the Reverse Supplemental Channels need to be updated.

If NUM_REV_SCH is included and not equal to '00000', the base station shall include NUM_REV_SCH occurrence of the following three fields:

REV_SCH_ID - Reverse Supplemental Channel identifier.

The base station shall set this field to the identifier of the Reverse Supplemental Channel.

REV_WALSH_ID - Reverse Supplemental Channel Walsh cover Identifier.

The base station shall set this field according to Table 3.7.3.3.2.37-1 to indicate the Walsh cover ID that the mobile station is to use when transmitting at the rate specified by REV_SCH_NUM_BITS_IDX on the Reverse Supplemental Channel specified by REV_SCH_ID. If only one reverse supplemental channel is assigned, the base station should set this field to the default value for the REV_WALSH_ID as specified in 2.6.4.2.

REV_SCH_NUM_BITS_IDX - Reverse Supplemental Channel number of bits per frame index.

If USE_FLEX_NUM_BITS is equal to '0' or if USE_FLEX_NUM_BITS is equal to '1' and RSCH_NBIT_TABLE_ID[REV_SCH_ID] is equal to '0000', then the base station shall set this field according to Table 3.7.3.3.2.37-2 to indicate the Reverse Supplemental Channel number of information bits per frame and the number of CRC bits per frame, corresponding to REV_WALSH_ID field.

If USE_FLEX_NUM_BITS is equal to '1' and RSCH_NBIT_TABLE_ID[REV_SCH_ID] is not equal to '0000', then the base station shall set the REV_SCH_NUM_BITSIDX field to indicate the Reverse Supplemental Channel number of information bits per frame, corresponding to REV_WALSH_ID field to be NUM_BITS[RSCH_NBIT_TABLE_ID[REV_SCH_ID]] [REV_SCH_NUM_BITS_IDX] and the Reverse Supplemental Channel number of CRC bits per frame, corresponding to CRC_LEN_IDX[RSCH_NBIT_TABLE_ID[REV_SCH_ID]] [REV_SCH_NUM_BITS_IDX].

NUM_PILOTS - Number of pilots included in the message.

The base station shall set this field to the number of pilots included in the message. The base station shall set this field to an integer that is equal to or greater than 1.
- **SRCH_OFFSET_INCL** - Target pilot channel search window offset included.
  - If the SRCH_OFFSET field is included in the following records, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

- The base station shall include one occurrence of the following record for each of the NUM_PILOTS pilots included in the message:

- **PILOT_PN** - Pilot PN sequence offset index.
  - The base station shall set this field to the pilot PN sequence offset for this pilot in units of 64 PN chips.

- **SRCH_OFFSET** - Target pilot channel search window offset.
  - If SRCH_OFFSET_INCL equals to ‘1’, then the base station shall set this field to the value shown in Table 2.6.6.2.1-2 corresponding to the search window offset to be used by the mobile station for this target pilot. Otherwise, the base station shall omit this field.

- **ADD_PILOT_REC_INCL** - Additional pilot information included indicator.
  - The base station shall set this field to ‘1’ if additional pilot information listed in PILOT_REC_TYPE and RECORD_LEN fields are included. The base station shall set this field to ‘0’ if the corresponding pilot is the common pilot and there is no additional pilot information included.

- **PILOT_REC_TYPE** - Pilot record type.
  - If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall set this field to the PILOT_REC_TYPE value shown in Table 3.7.2.3.2.21-9 corresponding to the type of Pilot Record specified by this record.
  - If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.

- **RECORD_LEN** - Pilot record length.
  - If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall set this field to the number of octets in the type-specific fields of this pilot record.
  - If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.

- **Type-specific fields** - Pilot record type-specific fields.
  - If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall include type-specific fields based on the PILOT_REC_TYPE of this pilot record as described in 3.7.6.1.
  - If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.

- **PWR_COMB_IND** - Power control symbol combining indicator.
If this pilot will carry the same closed-loop power control subchannel bits as that of the previous pilot in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’. The base station shall set this field to ‘0’ in the first record in the pilot list.

**CODE_CHAN_DCCH** - Code channel on the Dedicated Control Channel.

If a Radio Configuration associated with Spreading Rate 1 is used, the base station shall set this field to the code channel index (see [2]), in the range of 1 to 127 inclusive, that the mobile station is to use on the Dedicated Control Channel of the Forward Traffic Channel. If a Radio Configuration associated with Spreading Rate 3, the base station shall set this field to the code channel index (see [2]), in the range of 1 to 255 inclusive, that the mobile station is to use for the Dedicated Control Channel on the center SR3 frequency.

If Radio Configuration 3 or 5 (see [2]) is used, the base station shall set this field in the range 1 to 63 inclusive. If Radio Configuration 4, 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

**QOF_MASK_ID_DCCH** - Quasi-orthogonal function index on the Dedicated Control Channel.

If a Radio Configuration associated with Spreading Rate 1 is used, the base station shall set this field to the index of the Quasi-orthogonal function (see [2]). If a Radio Configuration associated with Spreading Rate 3 is used, the base station shall set this field to the index of the Quasi-orthogonal function (see [2]).

**NUM_SCH** - Number of Supplemental Channel records.

If SCH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the number of the Supplemental Channel records need to be updated.

If NUM_SCH is included and not equal to ‘00000’, the base station shall include NUM_SCH occurrence of the following five fields:

**FOR_SCH_ID** - Forward Supplemental Channel identifier

The base station shall set this field to the identifier of the Forward Supplemental Channel pertaining to this record.

**SCCL_INDEX** - Supplemental Channel Code list index.

The base station shall set this field to the index of the record in the Supplemental Channel Code list.
PILOT_INCL - The corresponding pilot included in Supplemental Channel Active Set indicator. The base station shall set this field to ‘1’ if the corresponding pilot is included in the Active Set of Supplemental Channel; otherwise, the base station shall set this field to ‘0’.

CODE_CHAN_SCH - Code channel on the Supplemental Channel. The base station shall set this field to the code channel index (see [2]) that the mobile station is to use on the Supplemental Channel of the Forward Traffic Channel indexed by SCCL_INDEX.

QOF_MASK_ID_SCH - Quasi-orthogonal function index on the Supplemental Channel. If SCH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows: The base station shall set this field to the index of the Quasi-orthogonal function (see [2]).

3X_DCCH_INFO_INCL – 3X Dedicated Control Channel information included indicator. If the 3X Dedicated Control Channel information is included, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’. The base station shall include NUM_PILOTS occurrences of the following record if 3X_DCCH_INFO_INCL is set to ‘1’. The base station shall use the same order for the following fields as is used for the PILOT_PN fields listed in this message.

3X_DCCH_LOW_INCL – DCCH code channel on the lowest SR3 frequency included indicator. If the Dedicated Control Channel on the lowest SR3 frequencies has a different code channel than the Dedicated Control Channel on the center SR3 frequency, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

QOF_MASK_ID_DCCH_LOW – QOF index for the Dedicated Control Channel on the lowest SR3 frequency. If 3X_DCCH_LOW_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows: The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) corresponding to the QOF index for the Dedicated Control Channel on the lowest SR3 frequency.

CODE_CHAN_DCCH_LOW - Code channel for the Dedicated Control Channel on the lowest SR3 frequency. If 3X_DCCH_LOW_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:
The base station shall set this field to the code channel index (see [2]) that the mobile station is to use on the Dedicated Control Channel on the lowest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

3X_DCCH_HIGH_INCL – DCCH code channel on the highest SR3 frequency included indicator.

If the Dedicated Control Channel on the highest SR3 frequencies has a different code channel than the Dedicated Control Channel on the center SR3 frequency, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

QOF_MASK_ID_DCCH_HIGH – QOF index for the Dedicated Control Channel on the highest SR3 frequency.

If 3X_DCCH_HIGH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) corresponding to the QOF index for the Dedicated Control Channel on the highest SR3 frequency.

CODE_CHAN_DCCH_HIGH – Code channel for the Dedicated Control Channel on the highest SR3 frequency.

If 3X_DCCH_HIGH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the code channel index (see [2]) that the mobile station is to use on the Dedicated Control Channel on the highest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

3X_SCH_INFO_INCL – 3X Supplemental Channel information included indicator.

If SCH_INFO is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

If the 3X Supplemental Channel information is included, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

The base station shall include NUM_SCH occurrences of the following seven fields record if 3X_SCH_INFO_INCL is included and set to ‘1’.

FOR_SCH_ID – Forward Supplemental Channel identifier.

The base station shall set this field the identifier of the Forward Supplemental Channel pertaining to this record.
3X_SCH_LOW_INCL – SCH code channel on the lowest SR3 frequency included indicator.

If the Supplemental Channel on the lowest SR3 frequencies has a different code channel than the Supplemental Channel on the center SR3 frequency, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

QOF_MASK_ID_SCH_LOW – QOF index for the Supplemental Channel on the lowest SR3 frequency.

If 3X_SCH_LOW_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) corresponding to the QOF index for the Supplemental Channel on the lowest SR3 frequency.

CODE_CHAN_SCH_LOW – Code channel for the Supplemental Channel on the lowest SR3 frequency.

If 3X_SCH_LOW_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) corresponding to the QOF index for the Supplemental Channel on the lowest SR3 frequency.

CODE_CHAN_SCH_HIGH – Code channel for the Supplemental Channel on the highest SR3 frequency.

If 3X_SCH_HIGH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) corresponding to the QOF index for the Supplemental Channel on the highest SR3 frequency.

QOF_MASK_ID_SCH_HIGH – QOF index for the Supplemental Channel on the highest SR3 frequency.

If 3X_SCH_HIGH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) corresponding to the QOF index for the Supplemental Channel on the highest SR3 frequency.
The base station shall set this field to the code channel index (see [2]) that the mobile station is to use on the Supplemental Channel on the highest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

**CCSH_INCLUDED** - Code Combining Soft Handoff information included indicator.

The base station shall set this field to '1' if Code Combining Soft Handoff information is included in this message; otherwise, the base station shall set this field to '0'.

**USE_CCSH_ENCODER_TIME** - Use Code Combining Soft Handoff Turbo Encoder swapping action time indicator.

If the CCSH_INCLUDED field is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

If an explicit action time at which Turbo Encoder types (CCSH_ENCODER_TYPE) included in this message takes effect is specified, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

**CCSH_ENCODER_ACTION_TIME** - Code Combining Soft Handoff Turbo Encoder swapping action time.

If the USE_CCSH_ENCODER_TIME field is included and set to '1', the base station shall set this field to the System Time minus $\text{FRAME\_OFFSET}_s \times 1.25$ ms, in units of 80ms (modulo 64), at which Turbo Encoder types included in this message are to take effect; otherwise, the base station shall omit this field.

If the CCSH_INCLUDED field is set to '1', the base station shall include one occurrence of the following one field for each of the Forward Supplemental Channel records (as specified by NUM_PILOTS and NUM_SCH) with PILOT_INCL field set to '1'. The base station shall use the same order for the following field as is used for the Forward Supplemental Channel records.

**CCSH_ENCODER_TYPE** - Code Combining Soft Handoff Turbo Encoder type.

The base station shall set this field to '0' if the Turbo Encoder type to be used on the Forward Supplemental Channel identified by FOR_SCH_ID and SCCL_INDEX is the default encoder type. The base station shall set this field to '1' if the Turbo Encoder to be used is the complementary type.

**FUNDICATED_BCMC_IND** - BCMC on fundicated channel Indicator.

If the channel assignment in this message contains a Forward Fundicated Channel used for BCMC transmission, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

If FUNDICATED_BCMC_IND field is set to '1', the base station shall include NUM_PILOT occurrences of the following record:
FOR_CPCCH_WALSH - The Forward Common Power Control Channel Walsh code assignment. The base station shall set this field to the Walsh code assignment for the Forward Common Power Control Channel.

FOR_CPCSCH - The Forward Common Power Control Channel Subchannel. The base station shall set this field to the Forward Common Power Control Channel Subchannel associated with this base station.

RESERVED - Reserved bits. The base station shall add reserved bits as needed in order to make the length of the ACTIVE_SET_REC_FIELDS record equal to an integer number of octets. The base station shall set these bits to '0'.

If the CH_IND field is set to ‘111’, the base station shall include the following fields:

NUM_FOR_SCH - Number of Forward Supplemental Channel records. If SCH_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows: The base station shall set this field to the number of the Forward Supplemental Channel records need to be updated.

If NUM_FOR_SCH is included and not equal to ‘00000’, the base station shall include NUM_FOR_SCH occurrence of the following three fields:

FOR_SCH_ID - Forward Supplemental Channel identifier. The base station shall set this field to the identifier of the Forward Supplemental Channel.

SCCL_INDEX - Supplemental Channel Code list index. The base station shall set this field to the index of the record in the Supplemental Channel Code list.

FOR_SCH_NUM_BITS_IDX - Forward Supplemental Channel number of information bits index. If USE_FLEX_NUM_BITS is equal to '0' or if USE_FLEX_NUM_BITS is equal to '1' and FSCH_NBIT_TABLE_ID for FOR_SCH_ID is equal to '0000', then the base station shall set this field according to Table 3.7.3.2.37-4 to indicate the number of information bits per frame and the length of the CRC field for the Forward Supplemental Channel identified by FOR_SCH_ID corresponding to SCCL_INDEX.
If USE_FLEX_NUM_BITS is equal to ‘1’ and FSCH_NBIT_TABLE_ID[FOR_SCH_ID] is not equal to ‘0000’, then the base station shall set this field to indicate that the number of information bits per frame for the Forward Supplemental channel identified by FOR_SCH_ID to be NUM_BITS[FSCH_NBIT_TABLE_ID[FOR_SCH_ID]][FOR_SCH_NUM_BITS_IDX] and the number of CRC bits per frame for the Forward Supplemental channel identified by FOR_SCH_ID to be CRC_LEN_IDX[FSCH_NBIT_TABLE_ID[FOR_SCH_ID]][FOR_SCH_NUM_BITS_IDX].

NUM_REV_SCH - Number of Reverse Supplemental Channel records.

If SCH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the number of the Reverse Supplemental Channels need to be updated.

If NUM_REV_SCH is included and not equal to ‘0000’, the base station shall include NUM_REV_SCH occurrence of the following three fields:

REV_SCH_ID - Reverse Supplemental Channel identifier.

The base station shall set this field to the identifier of the Reverse Supplemental Channel.

REV_WALSH_ID - Reverse Supplemental Channel Walsh cover Identifier.

The base station shall set this field according to Table 3.7.3.3.2.37-1 to indicate the Walsh cover ID that the mobile station is to use when transmitting at the rate specified by REV_SCH_NUM_BITS_IDX on the Reverse Supplemental Channel specified by REV_SCH_ID. If only one reverse supplemental channel is assigned, the base station should set this field to the default value for the REV_WALSH_ID as specified in 2.6.4.2.

REV_SCH_NUM_BITS_IDX - Reverse Supplemental Channel number of bits per frame index.

If USE_FLEX_NUM_BITS is equal to ‘0’ or if USE_FLEX_NUM_BITS is equal to ‘1’ and RSCH_NBIT_TABLE_ID[REV_SCH_ID] is equal to ‘0000’, then the base station shall set this field according to Table 3.7.3.3.2.37-2 to indicate the Reverse Supplemental Channel number of information bits per frame and the number of CRC bits per frame, corresponding to REV_WALSH_ID field.
If USE_FLEX_NUM_BITS is equal to '1' and RSCH_NBIT_TABLE_ID[REV_SCH_ID] is not equal to '0000', then the base station shall set the REV_SCH_NUM_BITS_IDX field to indicate the Reverse Supplemental Channel number of information bits per frame, corresponding to REV_WALSH_ID field to be NUM_BITS[RSCH_NBIT_TABLE_ID[REV_SCH_ID]] [REV_SCH_NUM_BITS_IDX] and the Reverse Supplemental Channel number of information bits per frame, corresponding to REV_WALSH_ID field to be to be CRC_LEN_IDX[RSCH_NBIT_TABLE_ID[REV_SCH_ID]] [REV_SCH_NUM_BITS_IDX].

NUM_PILOTS - Number of pilots included in the message.
The base station shall set this field to the number of pilots included in the message. The base station shall set this field to an integer that is equal to or greater than 1.

SRCH_OFFSET_INCL - Target pilot channel search window offset included.
If the SRCH_OFFSET field is included in the following records, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

The base station shall include one occurrence of the following record for each of the NUM_PILOTS pilots included in the message:

PILOT_PN - Pilot PN sequence offset index.
The base station shall set this field to the pilot PN sequence offset for this pilot in units of 64 PN chips.

SRCH_OFFSET - Target pilot channel search window offset.
If SRCH_OFFSET_INCL equals to ‘1’, then the base station shall set this field to the value shown in Table 2.6.6.2.1-2 corresponding to the search window offset to be used by the mobile station for this target pilot. Otherwise, the base station shall omit this field.

ADD_PILOT_REC_INCL - Additional pilot information included indicator.
The base station shall set this field to ‘1’ if additional pilot information listed in PILOT_REC_TYPE and RECORD_LEN fields are included. The base station shall set this field to ‘0’ if the corresponding pilot is the common pilot and there is no additional pilot information included.

PILOT_REC_TYPE - Pilot record type.
If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall set this field to the PILOT_REC_TYPE value shown in Table 3.7.2.3.2.21-9 corresponding to the type of Pilot Record specified by this record.

If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.

RECORD_LEN - Pilot record length.
If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall set this field to the number of octets in the type-specific fields of this pilot record.

If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.

Type-specific fields - Pilot record type-specific fields.

If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall include type-specific fields based on the PILOT_REC_TYPE of this pilot record as described in 3.7.6.1.

If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.

PWR_COMB_IND - Power control symbol combining indicator.

If this pilot will carry the same closed-loop power control subchannel bits as that of the previous pilot in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’. The base station shall set this field to ‘0’ in the first record in the pilot list.

CODE_CHAN_FCH - Code Channel on the Fundamental Channel.

If a Radio Configuration associated with Spreading Rate 1 is used, the base station shall set this field to the code channel index (see [2]) that the mobile station is to use on the Fundamental Channel of the Forward Traffic Channel. If a Radio Configuration associated with Spreading Rate 3 is used, the base station shall set this field to the code channel index that the mobile station is to use for the Fundamental Channel on the center SR3 frequency.

If Radio Configuration 1, 2, 3, or 5 (see [2]) is used, the base station shall set this field in the range 1 to 63 inclusive. If Radio Configuration 4, 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

QOF_MASK_ID_FCH - Quasi-orthogonal function index on the Fundamental Channel.

If a Radio Configuration associated with Spreading Rate 1 is used, the base station shall set this field to the index of the Quasi-orthogonal function (see [2]). If a Radio Configuration associated with Spreading Rate 3 is used, the base station shall set this field to the index of the Quasi-orthogonal function on the center SR3 frequency.
CODE_CHAN_DCCH - Code channel on the Dedicated Control Channel. If a Radio Configuration associated with Spreading Rate 1 is used, the base station shall set this field to the code channel index (see [2]), in the range of 1 to 127 inclusive, that the mobile station is to use on the Dedicated Control Channel of the Forward Traffic Channel. If a Radio Configuration associated with Spreading Rate 3 is used, the base station shall set this field to the code channel index in the range of 1 to 255 inclusive, that the mobile station is to use for the Dedicated Control Channel on the center SR3 frequency.

If Radio Configuration 3 or 5 (see [2]) is used, the base station shall set this field in the range 1 to 63 inclusive. If Radio Configuration 4, 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

QOF_MASK_ID_DCCH - Quasi-orthogonal function index on the Dedicated Control Channel. If a Radio Configuration associated with Spreading Rate 1 is used, the base station shall set this field to the index of the Quasi-orthogonal function (see [2]). If a Radio Configuration associated with Spreading Rate 3 is used, the base station shall set this field on the center SR3 frequency. If Radio Configuration 3 or 5 (see [2]) is used, the base station shall set this field in the range 1 to 63 inclusive. If Radio Configuration 4, 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

NUM_SCH - Number of Supplemental Channel records. The base station shall set this field to the number of the Supplemental Channel records need to be updated. If NUM_SCH is included and not equal to ‘00000’, the base station shall include NUM_SCH occurrence of the following fields:

FOR_SCH_ID - Forward Supplemental Channel identifier. The base station shall set this field to the identifier of the Forward Supplemental Channel pertaining to this record.

SCCL_INDEX - Supplemental Channel Code list index. The base station shall set this field to the index of the record in the Supplemental Channel Code List Table.

PILOT_INCL - The corresponding pilot included in Supplemental Channel Active Set indicator. The base station shall set this field to ‘1’ if the corresponding pilot is included in the Active Set of Supplemental Channel; otherwise, the base station shall set this field to ‘0’.

CODE_CHAN_SCH - Code Channel on the Supplemental Channel. If SCH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:
The base station shall set this field to the code channel index (see [2]) that the mobile station is to use on the Supplemental Channel of the Forward Traffic Channel indexed by SCCL_INDEX.

**QOF_MASK_ID_SCH** - Quasi-orthogonal function index on the Supplemental Channel.

If SCH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]).

**3X_FCH_INFO_INCL** – 3X Fundamental Channel information included indicator.

If the 3X Fundamental Channel information is included, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**3X_DCCH_INFO_INCL** – 3X Dedicated Control Channel information included indicator.

If the 3X Dedicated Control Channel information is included, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

The base station shall include NUM_PILOTS occurrences of the following record if 3X_FCH_INFO_INCL or 3X_FCH_INFO_INCL is set to ‘1’. The base station shall use the same order for the following fields as is used for the PILOT_PN fields listed in this message.

**3X_FCH_LOW_INCL** – FCH code channel on the lowest SR3 frequency included indicator.

If 3X_FCH_INFO_INCL is set to ‘0’, the base station shall set omit this field; otherwise, the base station shall set this field as follows:

If the Fundamental Channel on the lowest SR3 frequencies has a different code channel than the Fundamental Channel on the center SR3 frequency, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**QOF_MASK_ID_FCH_LOW** – QOF index for the Fundamental Channel on the lowest SR3 frequency.

If 3X_FCH_LOW_INCL is included and set to ‘1’, the base station shall set this field as follows; otherwise, the base station shall omit this field:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) corresponding to the QOF index for the Fundamental Channel on the lowest SR3 frequency.

**CODE_CHAN_FCH_LOW** – Code channel for the Fundamental Channel on the lowest SR3 frequency.

If 3X_FCH_LOW_INCL is included and set to ‘1’, the base station shall set this field as follows; otherwise, the base station shall omit this field:
The base station shall set this field to the code channel index (see [2]) that the mobile station is to use on the Fundamental Channel on the lowest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

3X_FCH_HIGH_INCL – FCH code channel on the highest SR3 frequency included indicator.

If 3X_FCH_INFO_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

If the Fundamental Channel on the highest SR3 frequencies has a different code channel than the Fundamental Channel on the center SR3 frequency, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

QOF_MASK_ID_FCH_HIGH – QOF index for the Fundamental Channel on the highest SR3 frequency.

If 3X_FCH_HIGH_INCL is included and set to ‘1’, the base station shall set this field as follows; otherwise, the base station shall omit this field:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) corresponding to the QOF index for the Fundamental Channel on the highest SR3 frequency.

CODE_CHAN_FCH_HIGH – Code channel for the Fundamental Channel on the highest SR3 frequency.

If 3X_FCH_HIGH_INCL is included and set to ‘1’, the base station shall set this field as follows; otherwise, the base station shall omit this field:

The base station shall set this field to the code channel index (see [2]) that the mobile station is to use on the Fundamental Channel on the highest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

3X_DCCH_LOW_INCL – DCCH code channel on the lowest SR3 frequency included indicator.

If 3X_DCCH_INFO_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

If the Dedicated Control Channel on the lowest SR3 frequencies has a different code channel than the Dedicated Control Channel on the center SR3 frequency, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

QOF_MASK_ID_DCCH_LOW – QOF index for the Dedicated Control Channel on the lowest SR3 frequency.
If 3X_DCCH_LOW_INCL is included and set to ‘1’, the base station shall set this field as follows; otherwise, the base station shall omit this field:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) corresponding to the QOF index for the Dedicated Control Channel on the lowest SR3 frequency.

**CODE_CHAN_DCCH_LOW** - Code channel for the Dedicated Control Channel on the lowest SR3 frequency.

If 3X_DCCH_LOW_INCL is included and set to ‘1’, the base station shall set this field as follows; otherwise, the base station shall omit this field:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) corresponding to the QOF index for the Dedicated Control Channel on the lowest SR3 frequency.

**3X_DCCH_HIGH_INCL** - DCCH code channel on the highest SR3 frequency included indicator.

If 3X_DCCH_INFO_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

If the Dedicated Control Channel on the highest SR3 frequencies has a different code channel than the Dedicated Control Channel on the center SR3 frequency, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**QOF_MASK_ID_DCCH_HIGH** - QOF index for the Dedicated Control Channel on the highest SR3 frequency.

If 3X_DCCH_HIGH_INCL is included and set to ‘1’, the base station shall set this field as follows; otherwise, the base station shall omit this field:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) corresponding to the QOF index for the Dedicated Control Channel on the highest SR3 frequency.

**CODE_CHAN_DCCH_HIGH** - Code channel for the Dedicated Control Channel on the highest SR3 frequency.

If 3X_DCCH_HIGH_INCL is included and set to ‘1’, the base station shall set this field as follows; otherwise, the base station shall omit this field:
The base station shall set this field to the code channel index (see [2]) that the mobile station is to use on the Dedicated Control Channel on the highest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

3X_SCH_INFO_INCL – 3X Supplemental Channel information included indicator.

If SCH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

If the 3X Supplemental Channel information is included, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

The base station shall include NUM_SCH occurrences of the following seven fields record if 3X_SCH_INFO_INCL is included and set to ‘1’.

FOR_SCH_ID - Forward Supplemental Channel identifier.

The base station shall set this field the identifier of the Forward Supplemental Channel pertaining to this record.

3X_SCH_LOW_INCL – SCH code channel on the lowest SR3 frequency included indicator.

If the Supplemental Channel on the lowest SR3 frequencies has a different code channel than the Supplemental Channel on the center SR3 frequency, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

QOF_MASK_ID_SCH_LOW – QOF index for the Supplemental Channel on the lowest SR3 frequency.

If 3X_SCH_LOW_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) corresponding to the QOF index for the Supplemental Channel on the lowest SR3 frequency.

CODE_CHAN_SCH_LOW - Code channel for the Supplemental Channel on the lowest SR3 frequency.

If 3X_SCH_LOW_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the code channel index (see [2]) that the mobile station is to use on the Supplemental Channel on the lowest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

3X_SCH_HIGH_INCL – SCH code channel on the highest SR3 frequency included indicator.
If the Supplemental Channel on the highest SR3 frequencies has a different code channel than the Supplemental Channel on the center SR3 frequency, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**QOF_MASK_ID_SCH_HIGH** – QOF index for the Supplemental Channel on the highest SR3 frequency.

If 3X_SCH_HIGH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) corresponding to the QOF index for the Supplemental Channel on the highest SR3 frequency.

**CODE_CHAN_SCH_HIGH** – Code channel for the Supplemental Channel on the highest SR3 frequency.

If 3X_SCH_HIGH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the code channel index (see [2]) that the mobile station is to use on the Supplemental Channel on the highest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

**CCSH_INCLUDED** - Code Combining Soft Handoff information included indicator.

The base station shall set this field to ‘1’ if Code Combining Soft Handoff information is included in this message; otherwise, the base station shall set this field to ‘0’.

**USE_CCSH_ENCODER_TIME** - Use Code Combining Soft Handoff Turbo Encoder swapping action time indicator.

If the CCSH_INCLUDED field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

If an explicit action time at which Turbo Encoder types (CCSH_ENCODER_TYPE) included in this message takes effect is specified, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**CCSH_ENCODER_ACTION_TIME** - Code Combining Soft Handoff Turbo Encoder swapping action time.

If the USE_CCSH_ENCODER_TIME field is included and set to ‘1’, the base station shall set this field to the System Time minus FRAME_OFFSETₜ × 1.25 ms, in units of 80ms (modulo 64), at which Turbo Encoder types included in this message are to take effect; otherwise, the base station shall omit this field.

If the CCSH_INCLUDED field is set to ‘1’, the base station shall include one occurrence of
the following one field for each of the Forward Supplemental Channel records (as specified by NUM_PILOTS and NUM_SCH) with PILOT_INCL field set to ‘1’. The base station shall use the same order for the following field as is used for the Forward Supplemental Channel records.

CCSH_ENCODER_TYPE - Code Combining Soft Handoff Turbo Encoder type.

The base station shall set this field to ‘0’ if the Turbo Encoder type to be used on the Forward Supplemental Channel identified by FOR_SCH_ID and SCCL_INDEX is the default encoder type. The base station shall set this field to ‘1’ if the Turbo Encoder to be used is the complementary type.

FUNDICATED_BCMC_IND – BCMC on fundicated channel Indicator.

If the channel assignment in this message contains a Forward Fundicated Channel used for BCMC transmission, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

REV_FCH_ASSIGNED – Reverse FCH channel assigned indicator.

If the FUNDICATED_BCMC_IND field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the reverse FCH is assigned in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

ADD_PLCM_FOR_FCH_INCL – Additional PLCM for forward FCH included indicator.

If the FUNDICATED_BCMC_IND field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the additional PLCM for forward FCH is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

ADD_PLCM_FOR_FCH_TYPE - The Additional Public Long Code Mask for forward FCH type indicator.

If ADD_PLCM_FOR_FCH_INCL not included or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to ‘1’ to indicate PLCM specified by the base station. The field value ‘0’ is reserved.

ADD_PLCM_FOR_FCH_39 - The 39 LSB bits of the additional Public Long Code Mask for forward FCH.

If ADD_PLCM_FOR_FCH_TYPE field is included and is set to ‘1’, the base station shall include this field and set it to the 39 least significant bits of the public long code mask used by the mobile station; otherwise, the base station shall omit this field.
FOR_CPCCH_INFO_INCL – CPCCH information included indicator.

If the FUNDICATED_BCMC_IND field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the F-CPCCH information is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

If FOR_CPCCH_INFO_INCL field is included and is set to ‘1’, the base station shall include NUM_PILOT occurrences of the following record:

FOR_CPCCH_WALSH - The Forward Common Power Control Channel Walsh code assignment.

The base station shall set this field to the Walsh code assignment for the Forward Common Power Control Channel.

FOR_CPCSCH - The Forward Common Power Control Channel Subchannel.

The base station shall set this field to the Forward Common Power Control Channel Subchannel associated with this base station.

RESERVED - Reserved bits.

The base station shall add reserved bits as needed in order to make the length of the ACTIVE_SET_REC_FIELDS record equal to an integer number of octets. The base station shall set these bits to ‘0’.

If the CH_IND field is set to ‘000’, the base station shall include the following fields:

EXT_CH_IND - Extended Channel Indicator.

The base station shall set this field as shown in Table2.7.1.3.2.4-11.

RESERVED - Reserved bits for octet alignment.

Reserved bits to align the octets between ACTIVE_SET_REC_FIELDS and EXT_ACTIVE_SET_REC_FIELDS so that the latter has a length of ACTIVE_SET_REC_LEN-1 bytes.

EXT_ACTIVE_SET_REC_FIELDS - Extended Active Set record fields.

The Active Set record fields are determined by the value of EXT_CH_IND, as described below.

The EXT_ACTIVE_SET_REC_FIELDS shall be:

PDCH_CONTROL_HOLD - Packet Data Channel Control Hold mode indication.

The base station shall set this field to ‘1’ to instruct the mobile station to transition to the Packet Data Channel Control Hold Mode.

If EXT_CH_IND signals the allocation of a F-FCH this field shall be set to ‘0’.

FULL_CI_FEEDBACK_IND - Full C/I feedback rate indicator.
If the mobile station is to send full C/I feedback every 1.25 ms, the base station shall set this field to ‘1’. If the mobile station is to transmit full C/I feedback every 20 ms, the base station shall set this field to ‘0’.

**FOR_CPCCH_RATE** - The Forward Common Power Control Channel Rate.

If EXT_CH_IND equals ‘01000’, the base station shall include this field and shall set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to the rate of the Forward Common Power Control Channel as specified in Table 3.7.2.3.2.21-12. See [2].

**FOR_CPCCH_UPDATE_RATE** - Forward Common Power Control update rate.

If EXT_CH_IND equals ‘01000’, the base station shall include this field and shall set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to the update rate of the Forward Common Power Control as specified in Table 3.7.2.3.2.21-13. See [2].

**REV_CQICH_FRAME_OFFSET** - Reverse Channel Quality Indicator Channel Frame Offset.

The C/I feedback reports on the Reverse Channel Quality Indicator Channel are delayed REV_CQICH_FRAME_OFFSET × 1.25 ms relative to system timing (see [2]).

The base station shall set this field to the Reverse Channel Quality Indicator Channel frame offset.

**REV_CQICH_REPS** - Reverse Channel Quality Indicator Channel repetition factor.

The base station shall set this field according to Table 3.7.3.3.2.49-1.

**REV_ACKCH_REPS** - Reverse Acknowledgment Channel repetition factor.

The base station shall set this field according to Table 3.7.3.3.2.49-2.

**NUM_FOR_SCH** - Number of Forward Supplemental Channel records.

If EXT_CH_IND does not signal the allocation of neither a F-FCH nor a F-DCCH, or if SCH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and shall set it as follows:

The base station shall set this field to the number of Forward Supplemental Channel records that need to be updated.

If NUM_FOR_SCH is included and not equal to ‘00000’, the base station shall include NUM_FOR_SCH occurrence of the following three fields:

**FOR_SCH_ID** - Forward Supplemental Channel identifier.

The base station shall set this field to the identifier of the Forward Supplemental Channel.
SCCL_INDEX - Supplemental Channel Code list index. The base station shall set this field to the index of the record in the Supplemental Channel Code list.

FOR_SCH_NUM_BITS_IDX - Forward Supplemental Channel number of information bits index.
If USE_FLEX_NUM_BITS is equal to '0' or if USE_FLEX_NUM_BITS is equal to '1' and FSCH_NBIT_TABLE_ID for FOR_SCH_ID is equal to '0000', then the base station shall set this field according to Table 3.7.3.3.2.37-4 to indicate the number of information bits per frame and the length of the CRC field for the Forward Supplemental Channel identified by FOR_SCH_ID corresponding to SCCL_INDEX.
If USE_FLEX_NUM_BITS is equal to '1' and FSCH_NBIT_TABLE_ID[FOR_SCH_ID] is not equal to '0000', then the base station shall set this field to indicate that the number of information bits per frame for the Forward Supplemental channel identified by FOR_SCH_ID to be NUM_BITS[FSCH_NBIT_TABLE_ID[FOR_SCH_ID]][FOR_SCH_NUM_BITS_IDX] and the number of CRC bits per frame for the Forward Supplemental channel identified by FOR_SCH_ID to be CRC_LEN_IDX[FSCH_NBIT_TABLE_ID[FOR_SCH_ID]][FOR_SCH_NUM_BITS_IDX].

NUM_REV_SCH - Number of Reverse Supplemental Channel records.
If SCH_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and shall set it as follows:
The base station shall set this field to the number of the Reverse Supplemental Channels need to be updated.
If NUM_REV_SCH is included and not equal to '0000', the base station shall include NUM_REV_SCH occurrence of the following three fields:
REV_SCH_ID - Reverse Supplemental Channel identifier.
The base station shall set this field to the identifier of the Reverse Supplemental Channel.
REV_WALSH_ID - Reverse Supplemental Channel Walsh cover Identifier.
The base station shall set this field according to Table 3.7.3.3.2.37-1 to indicate the Walsh cover ID that the mobile station is to use when transmitting at the rate specified by REV_SCH_NUM_BITS_IDX on the Reverse Supplemental Channel specified by REV_SCH_ID. If only one reverse supplemental channel is assigned, the base station should set this field to the default value for the REV_WALSH_ID as specified in 2.6.4.2.
REV_SCH_NUM_BITS_IDX - Reverse Supplemental Channel number of bits per frame index.
If USE_FLEX_NUM_BITS is equal to '0' or if USE_FLEX_NUM_BITS is equal to '1' and RSCH_NBIT_TABLE_ID[REV_SCH_ID] is equal to '0000', then the base station shall set this field according to Table 3.7.3.3.2.37-2 to indicate the Reverse Supplemental Channel number of information bits per frame and the CRC bits per frame, corresponding to REV_WALSH_ID field.

If USE_FLEX_NUM_BITS is equal to '1' and RSCH_NBIT_TABLE_ID[REV_SCH_ID] is not equal to '0000', then the base station shall set this field to indicate the Reverse Supplemental Channel number of information bits per frame, corresponding to REV_WALSH_ID field to be NUM_BITS[RSCH_NBIT_TABLE_ID[REV_SCH_ID][REV_SCH_NUM_BITS_IDX] and the Reverse Supplemental Channel number of CRC bits per frame corresponding to REV_WALSH_ID field to be CRC_LEN_IDX[RSCH_NBIT_TABLE_ID[REV_SCH_ID][REV_SCH_NUM_BITS_IDX].

NUM_PILOTS - Number of pilots included in the message.

The base station shall set this field to the number of pilots included in the message. The base station shall set this field to an integer that is equal to or greater than 1.

SRCH_OFFSET_INCL - Target pilot channel search window offset included.

If the SRCH_OFFSET field is included in the following records, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

PDCH_GROUP_IND_INCL - Packet Data Channel Group Indicator included flag.

The base station shall set this field to '1' if the PDCH_GROUP_IND fields are included; otherwise, the base station shall set this field to '0'.

If this field is set to '0', the mobile station is to use PWR_COMB_IND to determine whether the softer or softer reselection parameters are used when re-pointing between pilots in its Active Set (see [3]).

FOR_PDCH_PARMS_INCL - Indicator of the inclusion of Forward Packet Data Channel configuration fields.

The base station shall set this field to '1' if the Forward Packet Data Channel configuration fields are included; otherwise, the base station shall set this field to '0'.

FOR_PDCH_RLGAIN_INCL - Forward Packet Data Channel parameters related to reverse link adjustment gains included indicator.

If FOR_PDCH_PARMS_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to '1' if the following F-PDCH gain related fields are included in this message; otherwise, the base station shall set this field to '0'.
RLGAIN_ACKCH_PILOT - Reverse Acknowledgment Channel to pilot adjustment gain.

If FOR_PDCH_RLGAIN_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows:

The base station shall set this field to the Reverse Acknowledgment Channel to pilot adjustment gain expressed as a two's complement value in units of 0.125 dB (see [2]).

RLGAIN_CQICH_PILOT - Reverse Channel Quality Indicator Channel to pilot adjustment gain.

If FOR_PDCH_RLGAIN_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows:

The base station shall set this field to the Reverse Channel Quality Indicator Channel to pilot adjustment gain expressed as a two's complement value in units of 0.125 dB (see [2]).

NUM_SOFT_SWITCHING_FRAMES - Number of frames for R-CQICH soft switching.

If FOR_PDCH_PARMS_INCL is equal to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the duration of the cell switching period, in units of 20 ms, minus one, during which the mobile station is to transmit the cell switch sequence on the R-CQICH channel when it switches between two pilots which are in different groups.

If PDCH_GROUP_IND_INCL is set to ‘1’, these groups are indicated by PDCH_GROUP_IND; otherwise, they are indicated by PWR_COMB_IND.

NUM_SOFTER-SWITCHING_FRAMES - Number of frames for R-CQICH softer switching.

If FOR_PDCH_PARMS_INCL is equal to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the duration of the cell switching period, in units of 20 ms, minus one, during which the mobile station is to transmit the cell switch sequence on the R-CQICH channel when it switches between two pilots which are in the same group.

If PDCH_GROUP_IND_INCL is set to ‘1’, these groups are indicated by PDCH_GROUP_IND; otherwise, they are indicated by PWR_COMB_IND.

NUM_SOFT_SWITCHING_SLOTS - Number of slots per frame for R-CQICH soft switching.

If FOR_PDCH_PARMS_INCL is equal to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
The base station shall set this field to the duration of the cell switching slots within a switching frame, in units of 1.25 ms as specified in Table 3.7.2.3.2.21-10, during which the mobile station is to transmit the cell switch indication by using Walsh cover of target on the R-CQICH when it switches between two pilots which are in different groups.

If PDCH_GROUP_IND_INCL is set to ‘1’, these groups are indicated by PDCH_GROUP_IND; otherwise, they are indicated by PWR_COMB_IND.

NUM_SOFTER_SWITCHING_SLOTS - Number of slots per frame for R-CQICH softer switching.

If FOR_PDCH_PARMS_INCL is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the duration of the cell switching slots within a switching frame, in units of 1.25 ms as specified in Table 3.7.2.3.2.21-10, during which the mobile station is to transmit the cell switch indication by using Walsh cover of target on the R-CQICH when it switches between two pilots which are in the same group.

If PDCH_GROUP_IND_INCL is set to ‘1’, these groups are indicated by PDCH_GROUP_IND; otherwise, they are indicated by PWR_COMB_IND.

CHM_SWITCHING_PARMS_INCL - Control Hold Mode fields included indicator.

If FOR_PDCH_PARMS_INCL is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if the switching parameters for Control Hold Mode are included; otherwise, the base station shall set this field to ‘0’.

NUM_SOFTER_SWITCHING_FRAMES_CHM - Number of frames for R-CQICH softer switching while in Control Hold.

If CHM_SWITCHING_PARMS_INCL is omitted or equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the duration of the cell switching period, in units of 20 ms, minus one, during which the mobile station, while in Control Hold, is to transmit the cell switch sequence on the R-CQICH when it switches between two pilots which are in different groups.

If PDCH_GROUP_IND_INCL is set to ‘1’, these groups are indicated by PDCH_GROUP_IND; otherwise, they are indicated by PWR_COMB_IND.

NUM_SOFTER_SWITCHING_FRAMES_CHM - Number of frames for R-CQICH softer switching while in Control Hold.
If CHM_SWITCHING_PARMS_INCL is omitted or equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the duration of the cell switching period, in units of 20 ms, minus one, during which the mobile station, while in Control Hold, is to transmit the cell switch sequence on the R-CQICH when it switches between two pilots which are in the same group.

If PDCH_GROUP_IND_INCL is set to ‘1’, these groups are indicated by PDCH_GROUP_IND; otherwise, they are indicated by PWR_COMB_IND.

NUM_SOFT_SWITCHING_SLOTS_CHM - Number of slots per frame for R-CQICH soft switching while in Control Hold.

If CHM_SWITCHING_PARMS_INCL is omitted or equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the duration of the cell switching slots within a switching frame, in units of 1.25 ms as specified in Table 3.7.2.3.2.21-10, during which the mobile station, while in Control Hold, is to transmit the cell switch indication by using Walsh cover of target on the R-CQICH when it switches between two pilots which are in different groups.

If PDCH_GROUP_IND_INCL is set to ‘1’, these groups are indicated by PDCH_GROUP_IND; otherwise, they are indicated by PWR_COMB_IND.

NUM_SOFTER_SWITCHING_SLOTS_CHM - Number of slots per frame for R-CQICH softer switching while in Control Hold.

If CHM_SWITCHING_PARMS_INCL is omitted or equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the duration of the cell switching slots within a switching frame, in units of 1.25 ms as specified in Table 3.7.2.3.2.21-10, during which the mobile station, while in Control Hold, is to transmit the cell switch indication by using Walsh cover of target on the R-CQICH when it switches between two pilots which are in the same group.

If PDCH_GROUP_IND_INCL is set to ‘1’, these groups are indicated by PDCH_GROUP_IND; otherwise, they are indicated by PWR_COMB_IND.

PDCH_SOFT_SWITCHING_DELAY - F-PDCH Soft Switching Delay.

If FOR_PDCH_PARMS_INCL is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
The base station shall set this field to the minimum interruption seen by the mobile station, in units of 10 ms, minus one, when the mobile station is to transmit the cell switch sequence on the R-CQICH when it switches between two pilots which are in different groups.

If PDCH_GROUP_IND_INCL is set to ‘1’, these groups are indicated by PDCH_GROUP_IND; otherwise, they are indicated by PWR_COMB_IND.

PDCH_SOFTER_SWITCHING_DELAY - F-PDCH Soft Switching Delay.

If FOR_PDCH_PARMS_INCL is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the minimum interruption seen by the mobile station, in units of 10 ms, minus one, when the mobile station is to transmit the cell switch sequence on the R-CQICH when it switches between two pilots which are in the same group.

If PDCH_GROUP_IND_INCL is set to ‘1’, these groups are indicated by PDCH_GROUP_IND; otherwise, they are indicated by PWR_COMB_IND.

FOR_PDCH_COMMON_PARMS - Common Forward Packet Data Channel configuration fields indicator.

If FOR_PDCH_PARMS_INCL is set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to ‘1’ if the following Forward Packet Data Channel configuration fields (WALSH_TABLE_ID, NUM_PDCCH, and FOR_PDCCH_WALSH) are common for all the pilots in the Active Set; otherwise, it shall be set to ‘0’.

WALSH_TABLE_ID - The index of the Walsh Table used.

If FOR_PDCH_PARMS_INCL is set to ‘1’, and FOR_PDCH_COMMON_PARMS is included and set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to the index of the Walsh Table being used by the Packet Data Channel. (See [3]).

TX_DISABLED_TIMER - Transmitted disabled timer.

If FOR_PDCH_PARMS_INCL is not included, or is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
The base station shall set this field to the maximum time, in units of 20ms, the mobile station’s transmitter can be disabled before the MAC Layer is to perform Forward Packet Data Channel initialization.

NUM_PDCCH - The number of Packet Data Control Channels supported.

If FOR_PDCH_PARMS_INCL is set to ‘1’, and FOR_PDCH_COMMON_PARMS is included and set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to ‘000’ if the pilot supports one Packet Data Control Channel. The base station shall set this field to ‘001’ if the pilot supports two Packet Data Control Channels. The base station shall not set this field to any other value.

The base station shall include NUM_PDCCH+1 occurrences of the following one-field record:

FOR_PDCCH_WALSH - Forward Packet Data Control Channel Walsh code assignment.

If FOR_PDCH_PARMS_INCL is set to ‘1’, and if FOR_PDCH_COMMON_PARMS is included and set to ‘1’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to the Walsh code assignment for the Forward Packet Data Control Channel.

If NUM_PDCCH is set to ‘001’, the Walsh code of PDCCH0 shall be included first, followed by the Walsh code for PDCCH1.

TX_DISABLED_TIMER_INCL - Transmitter disabled timer included flag.

The base station shall set this field to ‘1’ if the following TX_DISABLED_TIMER field is included; otherwise, the base station shall set this field to ‘0’.

TX_DISABLED_TIMER - Transmitter disabled timer.

If TX_DISABLED_TIMER_INCL is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the maximum time, in units of 20ms, the mobile station’s transmitter can be disabled before the MAC Layer is to perform Forward Packet Data Channel initialization (see [3]).

FOR_GCH_ASSIGNED - Forward Grant Channel assignment indicator.
If EXT_CH_IND signals the allocation of a R-PDCH, the base station shall include this field and shall set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to ‘1’ if the mobile station is to listen to grants on the Forward Grant Channel; otherwise, the base station shall set this field to ‘0’ (see [3]).

FOR_RCCH_ASSIGNED - Forward Rate Control Channel assignment indicator.

If EXT_CH_IND signals the allocation of a R-PDCH, the base station shall include this field and shall set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to ‘1’ if the mobile station is to follow rate control indicators on the Forward Rate Control Channel; otherwise, the base station shall set this field to ‘0’ (see [3]).

FOR_RCCH_DRC_MODE - Forward Rate Control Channel Dedicated Rate Control Mode Indicator.

If FOR_RCCH_ASSIGNED is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to ‘1’ if the dedicated rate control mode is being used on the Forward Rate Control Channel; otherwise, the base station shall set this field to ‘0’ if the common rate control mode is being used (see [3]).

FOR_RCCH_REPETITION - Forward Rate Control Subchannel repetition factor.

If FOR_RCCH_ASSIGNED is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to the subchannel repetition factor of the Rate Control Subchannel on all pilots as specified in Table 3.7.3.2.21-11 (see [2]).

FOR_RCCH_UPDATE_RATE - Forward Rate Control Subchannel update rate.

If FOR_RCCH_ASSIGNED is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to the update rate of the Rate Control Subchannel on all pilots as specified in Table 3.7.3.2.21-13. See [2].

FOR_ACKCH_ASSIGNED - Forward Acknowledgment Channel assignment indicator.

If EXT_CH_IND signals the allocation of a R-PDCH, the base station shall include this field and shall set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to ‘1’ if the mobile station is to listen to acknowledgments on the Forward Acknowledgment Channel; otherwise, the base station shall set this field to ‘0’ (see [2] and [3]).
FOR_ACKCH_MODE - Forward Acknowledgment Channel Mode.

If FOR_ACKCH_ASSIGNED is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to the Acknowledgment Channel mode identifier that governs how the Acknowledgment channel is demodulated. See [2] and [3] for the details.

The base station shall set this field to '00' if the mobile station is to attempt the reception of the Forward Acknowledgment Channel from all members of the reduced active set of the Forward Packet Data Channel.

The base station shall set this field to '01' if the mobile station is to attempt reception of the Forward Acknowledgment Channel from all members of the reduced active set, and is to combine the acknowledgments from all sectors in the same combining indicator set.

The base station shall set this field to '10' if the mobile station is to attempt reception of the Forward Acknowledgment Channel from the serving sector only.

The base station shall set this field to '11' if the mobile station is to combine the Forward Acknowledgment Channel from all sectors in the same combining indicator set as the serving sector.

FOR_ACKCH_COMB_SEL - Forward Acknowledgment Channel Combining method selector.

If FOR_ACKCH_ASSIGNED is omitted, or if it is included and set to '0', or if FOR_ACKCH_MODE is omitted, or if it is included and set to '00' or '10', or if PDCH_GROUP_IND_INCL is set to '0', the base station shall omit this field; otherwise, it shall include it and set it as follows.

The base station shall set this field to '0' if the mobile station is to use PWR_COMB_IND as a combining indicator when receiving the Forward Acknowledgment Channel; otherwise, it shall set it to '1' if the mobile station is to use PDCH_GROUP_IND as the indicator for combining sectors.

REV_PDCH_PARMS_INCL - Reverse Packet Data Channel related parameters included indicator.

If EXT_CH_IND signals the allocation of a R-PDCH, the base station shall include this field and shall set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to '1' if the following R-PDCH parameters are included in this message; otherwise, the base station shall set this field to '0'.

REV_PDCH_RLGAIN_INCL - Reverse Packet Data Channel parameters related to reverse link adjustment gains included indicator.
If REV_PDCH_PARMS_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows. The base station shall set this field to ‘1’ if the following R-PDCH gain related fields are included in this message; otherwise, the base station shall set this field to ‘0’.

RPGAIN_SPICH_PILOT - Reverse Secondary Pilot Channel to pilot adjustment gain.

If REV_PDCH_RLGAIN_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows. The base station shall set this field to the Reverse Secondary Pilot Channel to pilot adjustment gain expressed as a two’s complement value in units of 0.125 dB (see [2]).

RPGAIN_REQCH_PILOT - Reverse Request Channel to pilot adjustment gain.

If REV_PDCH_RLGAIN_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows. The base station shall set this field to the Reverse Request Channel to pilot adjustment gain expressed as a two’s complement value in units of 0.125 dB (see [2]).

RPGAIN_PDCCH_PILOT - Reverse Packet Data Control Channel to pilot adjustment gain.

If REV_PDCH_RLGAIN_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows. The base station shall set this field to the Reverse Packet Data Channel to pilot adjustment gain expressed as a two’s complement value in units of 0.125 dB (see [2]).

REV_PDCH_PARMS_1_INCL - Reverse Packet Data Channel parameters subset included indicator.

If REV_PDCH_PARMS_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows. The base station shall set this field to ‘1’ if the following R-PDCH parameters are included in this message; otherwise, the base station shall set this field to ‘0’.

REV_PDCH_TABLE_SEL - Reverse Packet Data Channel Table selector.

If REV_PDCH_PARMS_1_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows. The base station shall set this field to the Reverse Packet Data Channel Table selector (see [2]).

REV_PDCH_MAX_AUTO_TPR - Reverse Packet Data Channel maximum traffic to pilot ratio for autonomous transmission.
If REV_PDCH_PARMS_1_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to the maximum traffic to pilot ratio for autonomous transmission on the Reverse Packet Data Channel (see [2] and [3]).

The base station shall set this field to a value in the range 0 to 18 dB inclusive in units of 0.125 dB.

The base station shall include NUM_PILOTS occurrences of the following record:

- PILOT_PN - Pilot PN sequence offset index. The base station shall set this field to the pilot PN sequence offset for this pilot in units of 64 PN chips.
- SRCH_OFFSET - Target pilot channel search window offset. If SRCH_OFFSET_INCL equals to ‘1’, then the base station shall include this field and set it to the value shown in Table 2.6.6.2.1-2 corresponding to the search window offset to be used by the mobile station for this target pilot; otherwise, the base station shall omit this field.
- ADD_PILOT_REC_INCL - Additional pilot information included indicator. The base station shall set this field to ‘1’ if additional pilot information listed in PILOT_REC_TYPE and RECORD_LEN fields are included. The base station shall set this field to ‘0’ if the corresponding pilot is the common pilot and there is no additional pilot information included.
- PILOT_REC_TYPE - Pilot record type. If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall set this field to the PILOT_REC_TYPE value shown in Table 3.7.2.3.2.21-9 corresponding to the type of Pilot Record specified by this record. If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.
- RECORD_LEN - Pilot record length. If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall set this field to the number of octets in the type-specific fields of this pilot record. If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.
- Type-specific fields - Pilot record type-specific fields. If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall include type-specific fields based on the PILOT_REC_TYPE of this pilot record as described in 3.7.6.1. If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.
FOR_PDCH_INCL - Forward Packet Data Channel configuration field included indicator.

The base station shall set this field to ‘1’ if the MS is assigned resources on the PDCH channel; otherwise, the base station shall set this field to ‘0’. This field shall be set to ‘1’ for at least one of the pilots included in this message.

WALSH_TABLE_ID - The index of the Walsh Table used.

If FOR_PDCH_PARMS_INCL is set to ‘1’, FOR_PDCH_INCL is set to ‘1’, and if FOR_PDCH_COMMON_PARMS is included and set to ‘0’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to the index of the Walsh Table being used by the Packet Data Channel. (See [3]).

NUM_PDCCH - The number of Packet Data Control Channels supported.

If FOR_PDCH_PARMS_INCL is set to ‘1’, FOR_PDCH_INCL is set to ‘1’, and if FOR_PDCH_COMMON_PARMS is included and set to ‘0’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to ‘000’ if the pilot supports one Packet Data Control Channel. The base station shall set this field to ‘1’ if the pilot supports two Packet Data Control Channels. The base station shall not set this field to any other value.

The base station shall include NUM_PDCCH+1 occurrences of the following one-field record:

FOR_PDCCH_WALSH - Forward Packet Data Control Channel Walsh code assignment.

If FOR_PDCH_PARMS_INCL is set to ‘1’, FOR_PDCH_INCL is set to ‘1’, and if FOR_PDCH_COMMON_PARMS is included and set to ‘0’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to the Walsh code assignment for the Forward Packet Data Control Channel.

If NUM_PDCCH is set to ‘001’, the Walsh code of PDCCH0 shall be included first, followed by the Walsh code for PDCCH1.

MAC_ID - Medium Access Control index.

If FOR_PDCH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the MAC index assigned to the mobile station by this pilot.

The base station shall set this field to an integer value larger than 63.
REV_CQICH_COVER - Reverse Channel Quality Indicator Channel cover.

If FOR_PDCH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the index of the R-CQICH cover associated with this pilot.

If this pilot is a member of the mobile station’s current Active Set, the base station should assign the same value for the Walsh cover that is in the mobile station’s current Active Set.

If this pilot is not a member of the mobile station’s current Active Set, the base station should assign a value for the Walsh cover that was not recently assigned (See [2]).

FOR_CPCCH_WALSH - The Forward Common Power Control Channel Walsh code assignment.

If EXT_CH_IND signals the allocation of a F-CPCCH, and either of the following conditions is true:

- EXT_CH_IND signals the allocation of a F-FCH or a F-DCCH
- all of the following conditions are true:
  - FOR_PDCH_INCL is set to ‘1’
  - EXT_CH_IND does not signal allocation of a F-FCH
  - EXT_CH_IND does not signal allocation of a F-DCCH

the base station shall include this field and shall set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to the Walsh code assignment for the Forward Common Power Control Channel.

FOR_CPCSCH - The Forward Common Power Control Channel Subchannel.

If EXT_CH_IND signals the allocation of a F-CPCCH, and either of the following conditions is true:

- EXT_CH_IND signals the allocation of a F-FCH or a F-DCCH
- all of the following conditions are true:
  - FOR_PDCH_INCL is set to ‘1’
  - EXT_CH_IND does not signal allocation of a F-FCH
  - EXT_CH_IND does not signal allocation of a F-DCCH

The base station shall set this field to the rate of the Forward Common Power Control Channel as specified in Table 3.7.2.3.2.21-12.
the base station shall include this field and shall set it as
follows; otherwise, the base station shall omit this field.

The base station shall set this field to the Forward Common
Power Control Channel Subchannel associated with this base
station.

If FOR_CPCCH_RATE is omitted, or if it is included and set to
‘00’, the base station shall set this field to a value in the range
0 to 243 inclusive. If FOR_CPCCH_RATE is included and set
to ‘01’, the base station shall set this field to a value in the
range 0 to 487 inclusive. If FOR_CPCCH_RATE is included
and set to ‘10’, the base station shall set this field to a
value in the range 0 to 965 inclusive.

PWR_COMB_IND  - Power control symbol combining indicator.

If the Forward Traffic Channel or Forward Common Power
Control Channel associated with this pilot will carry the same
closed-loop power control subchannel bits as that of the
previous pilot in this message, the base station shall set this
field to ‘1’; otherwise, the base station shall set this field to ‘0’.
The base station shall set this field to ‘0’ in the first record in
the pilot list.

PDCH_GROUP_IND  - Packet Data Channel Group Indicator.

If PDCH_GROUP_IND_INCL is set to ‘1’, the base station shall
include this field and shall set it as follows; otherwise, the
base station shall omit this field.

If the mobile station is to use the softer reselection
parameters when re-pointing between this pilot and the
previous pilot in this message that has a F-PDCH assigned to
this mobile station (i.e. FOR_PDCH_INCL is set to ‘1’), the
base station shall set this field to ‘1’ (See [3]).

If the mobile station is to use the soft reselection parameters
when re-pointing between this pilot and the previous pilot in
this message that has a F-PDCH assigned to this mobile
station (i.e. FOR_PDCH_INCL is set to ‘1’), the base station
shall set this field to ‘0’ (See [3]).

The base station shall set this field to ‘0’ in the first record in
the pilot list that has a F-PDCH assigned to this mobile
station (i.e. FOR_PDCH_INCL is set to ‘1’).

CODE_CHAN_FCH  - Code channel on the Fundamental Channel.

If EXT_CH_IND signals the allocation of a F-FCH, the base
station shall include this field and shall set it as follows;
otherwise it shall be omitted.

The base station shall set this field to the code channel index
(see [2]) that the mobile station is to use on the Fundamental
Channel of the Forward Traffic Channel.
If Radio Configuration 1, 2, 3, or 5 (see [2]) is used, the base station shall set this field in the range 1 to 63 inclusive. If Radio Configuration 4 is used, the base station shall set this field in the range 1 to 127 inclusive.

QOF_MASK_ID_FCH - Quasi-orthogonal function index on the Fundamental Channel.

If EXT_CH_IND signals the allocation of a F-FCH, the base station shall include this field and shall set it as follows; otherwise it shall be omitted.

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]).

CODE_CHAN_DCCH - Code channel on the Dedicated Control Channel.

If EXT_CH_IND signals the allocation of a F-DCCH, the base station shall include this field and shall set it as follows; otherwise it shall be omitted.

The base station shall set this field to the code channel index (see [2]), in the range of 1 to 127 inclusive, that the mobile station is to use on the Dedicated Control Channel of the Forward Traffic Channel.

If Radio Configuration 3 or 5 (see [2]) is used, the base station shall set this field in the range 1 to 63 inclusive. If Radio Configuration 4 is used, the base station shall set this field in the range 1 to 127 inclusive.

QOF_MASK_ID_DCCH - Quasi-orthogonal function index on the Dedicated Control Channel.

If EXT_CH_IND signals the allocation of a F-DCCH, the base station shall include this field and shall set it as follows; otherwise it shall be omitted.

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]).

FOR_ACKCH_WALSH_INDEX - Walsh Code for the Forward Acknowledgment Channel.

If FOR_ACKCH_ASSIGNED is omitted, or if it is included and set to '0', or if FOR_PDCH_INCL is set to '0', or if EXT_CH_IND does not signal the allocation of a R-PDCH, the base station shall omit this field; otherwise, it shall include it and set it as follows.

The base station shall set this field to the Walsh code of the Forward Acknowledgment Channel (see [2]).

FOR_ACKSCH_INDEX - Forward Acknowledgment Subchannel Index.

If FOR_ACKCH_ASSIGNED is omitted, or if it is included and set to '0', or if FOR_PDCH_INCL is set to '0', or if EXT_CH_IND does not signal the allocation of a R-PDCH, the base station shall omit this field; otherwise, it shall include it and set it as follows.
The base station shall set this field to the subchannel index of the Forward Acknowledgment Channel (see [2]). The base station should not use FOR_ACKSCH_INDEX = 0, 1, 97, or 98.

FOR_RCCH_INCL - Forward Rate Control Subchannel included flag.

- If FOR_PDCH_INCL is set to '0', or if FOR_RCCH_ASSIGNED is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

- The base station shall set this field to ‘1’ if a Forward Rate Control Channel Subchannel is allocated on this pilot (see [2]); otherwise, the base station shall set this field to ‘0’.

- The base station shall set this field to a non zero value for at least one pilot in this message.

FOR_RCCH_WALSH_INDEX - Walsh Code for the Forward Rate Control Channel Subchannel.

- If FOR_RCCH_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

- The base station shall set this field to the Walsh code of the Forward Rate Control Channel Subchannel (see [2]).

FOR_RCSCH_INDEX - Forward Rate Control Subchannel.

- If FOR_RCCH_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

- The base station shall set this field to the subchannel index of the Rate Control Subchannel on this pilot (see [2]).

- If FOR_RCCH_REPETITION is set to '00' this field shall take values in the range 0 to 96. If FOR_RCCH_REPETITION is set to '01' this field shall take values in the range 0 to 48. If FOR_RCCH_REPETITION is set to '10' this field shall take values in the range 0 to 24.

NUM_FOR_GCH - Number of Forward Grant Channels

- If FOR_PDCH_INCL is set to '0', or if FOR_GCH_ASSIGNED is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

- The base station shall set this field to the number of assigned Forward Grant Channels on this pilot. The base station shall set this field to 0, 1, or 2.

- The base station shall set this field to a non zero value for at least one pilot in this message.

- If FOR_PDCH_INCL is set to ‘1’, and if FOR_GCH_ASSIGNED is included and set to ‘1’, the base station shall include NUM_FOR_GCH occurrences of the field FOR_GCH_WALSH_INDEX:
FOR_GCH_WALSH_INDEX - Walsh Code for the Forward Grant Channel.

The base station shall set this field to the Walsh code of the Forward Grant Channels (see [2]).

NUM_SCH - Number of Supplemental Channel records.

If SCH_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and shall set it as follows:

The base station shall set this field to the number of the Supplemental Channel records need to be updated.

If NUM_SCH is included and not equal to '00000', the base station shall include NUM_SCH occurrence of the following five fields:

FOR_SCH_ID - Forward Supplemental Channel identifier.

The base station shall set this field the identifier of the Forward Supplemental Channel pertaining to this record.

SCCL_INDEX - Supplemental Channel Code list index.

The base station shall set this field to the index of the record in the Supplemental Channel Code list.

PILOT_INCL - The corresponding pilot included in Supplemental Channel Active Set indicator.

The base station shall set this field to '1' if the corresponding pilot is included in the Active Set of Supplemental Channel; otherwise, the base station shall set this field to '0'.

CODE_CHAN_SCH - Code channel on the Supplemental Channel.

If PILOT_INCL is included and set to '1', the base station shall include this field and shall set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to the code channel index (see [2]) that the mobile station is to use on the Supplemental Channel of the Forward Traffic Channel indexed by SCCL_INDEX.

QOF_MASK_ID_SCH - Quasi-orthogonal function index on the Supplemental Channel.

If PILOT_INCL is included and set to '1', the base station shall include this field and shall set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]).

CCSH_INCLUDED - Code Combining Soft Handoff information included indicator.

The base station shall set this field to '1' if Code Combining Soft Handoff information is included in this message; otherwise, the base station shall set this field to '0'.

USE_CCSH_ENCODER_TIME - Use Code Combining Soft Handoff Turbo Encoder swapping action time indicator.
If the CCSH_INCLUDED field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

If an explicit action time at which Turbo Encoder types (CCSH_ENCODER_TYPE) included in this message takes effect is specified, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

CCSH_ENCODER_ACTION_TIME - Code Combining Soft Handoff Turbo Encoder swapping action time.

If the USE_CCSH_ENCODER_TIME field is included and set to ‘1’, the base station shall set this field to the System Time minus FRAME_OFFSET × 1.25 ms, in units of 80 ms (modulo 64), at which Turbo Encoder types included in this message are to take effect; otherwise, the base station shall omit this field.

If the CCSH_INCLUDED field is set to ‘1’, the base station shall include one occurrence of the following one field for each of the Forward Supplemental Channel records (as specified by NUM_PILOTS and NUM_SCH) with PILOT_INCL field set to ‘1’. The base station shall use the same order for the following field as is used for the Forward Supplemental Channel records.

CCSH_ENCODER_TYPE - Code Combining Soft Handoff Turbo Encoder type.

The base station shall set this field to ‘0’ if the Turbo Encoder type to be used on the Forward Supplemental Channel identified by FOR_SCH_ID and SCCL_INDEX is the default encoder type. The base station shall set this field to ‘1’ if the Turbo Encoder to be used is the complementary type.

FUNDICATED_BCMC_IND – BCMC on fundicated channel Indicator.

If the channel assignment in this message contains a Forward Fundicated Channel used for BCMC transmission, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

ADD_PLCM_FOR_FCH_INCL – Additional PLCM for forward FCH included indicator.

If the FUNDICATED_BCMC_IND field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the additional PLCM for forward FCH is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

ADD_PLCM_FOR_FCH_TYPE - The Additional Public Long Code Mask for forward FCH type indicator.

If ADD_PLCM_FOR_FCH_INCL not included or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.
The base station shall set this field to ‘1’ to indicate PLCM specified by the base station. The field value ‘0’ is reserved.

ADD_PLCM_FOR_FCH_39 - The 39 LSB bits of the additional Public Long Code Mask for forward FCH.

If ADD_PLCM_FOR_FCH_TYPE field is included and is set to ‘1’, the base station shall include this field and set it to the 39 least significant bits of the public long code mask used by the mobile station; otherwise, the base station shall omit this field.

MOB_QOS - Indicator granting permission to the mobile station to request QoS parameter settings in the Origination Message, Origination Continuation Message, or Enhanced Origination Message.

If CS_SUPPORTED is equal to ‘0’, the base station shall omit this field; otherwise the base station shall include this field and shall set it as follows:

The base station shall set this field to ‘1’, if the mobile station is allowed to include a QoS record in the Origination Message, Origination Continuation Message, or Enhanced Origination Message; otherwise, the base station shall set this field to ‘0’.

MS_INIT_POS_LOC_SUP_IND - Mobile station initiated position location determination supported indicator.

If the target base station supports mobile station initiated position determination, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

RESERVED - Reserved bits.

The base station shall add reserved bits as needed in order to make the length of the ACTIVE_SET_REC_FIELDS record equal to an integer number of octets. The base station shall set these bits to ‘0’.

</table>

FPC_BCMC_CHAN 0 or 1
START_TIME_UNIT - Unit for start time.
The base station shall set this field to indicate the units of start time included in Extended Supplemental Channel Assignment Message, Forward Supplemental Channel Assignment Mini Message, Reverse Supplemental Channel Assignment Mini Message, and Universal Handoff Direction Message. The base station shall set this field to one less than the number of 20 ms frames that determines the START_TIME_UNIT.

REV_SCH_DTX_DURATION - Discontinuous Transmission on Reverse Supplemental Channel.
The base station shall set this field to the maximum duration of time in units of 20 ms that the mobile station is allowed to stop transmission on a Reverse Supplemental Channel within the reverse assignment duration. The base station shall set this field to '0000' if the mobile station is to stop using a Reverse Supplemental Channel once it has stopped transmitting on that Reverse Supplemental Channel. The base shall set this field to '1111' if the mobile station is allowed to resume transmission on a Reverse Supplemental Channel at any time within the reverse assignment duration.

USE_T_ADD_ABORT - Reverse use T_ADD abort indicator.
The base station shall set this field to '1' to indicate that the mobile station is to utilize the T_ADD Reverse Supplemental Channel abort feature for this reverse assignment; otherwise, the base station shall set this field to '0'.

USE_SCRM_SEQ_NUM - Use Supplemental Channel Request Message sequence number indicator.
The base station shall set this field to '1' if the SCRM_SEQ_NUM field is included in this message; otherwise, the base station shall set this field to '0'.

SCRM_SEQ_NUM - Supplemental Channel Request Message sequence number.
If USE_SCRM_SEQ_NUM is set to '1', the base station shall set this field to the sequence number corresponding to the SCRM_SEQ_NUM field in a Supplemental Channel Request Message to which the mobile station is to match this message; otherwise, the base station shall omit this field.

ADD_INFO_INCL - Additional information included indicator.
If the message is to contain the FPC_PRI_CHAN field, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.
The base station shall set this field to ‘0’ if any of the following conditions holds:
The message does not contain any Supplemental Channel assignment.

- The mobile station is currently in the Active mode.

**FPC_PRI_CHAN**  -  Power Control Subchannel Indicator.

If the ADD_INFO_INCL field is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to '0' if the mobile station is to perform the primary inner loop estimation on the received Forward Fundamental Channel. The base station shall set this field to '1' if the mobile station is to perform the primary inner loop estimation on the received Forward Dedicated Control Channel. If the F-CPCCH is assigned, the base station shall multiplex the Power Control Subchannel on the F-CPCCH; otherwise:

If this field is set to '0', the base station shall multiplex the Power Control Subchannel on the Forward Fundamental Channel; otherwise, the base station shall multiplex the Power Control Subchannel on the Forward Dedicated Control Channel.

**REV_CFG_INCLUDED**  -  Reverse Supplemental Channel configuration included.

The base station shall set this field to '1' if this message contains a Reverse Supplemental Channel configuration. Otherwise, the base station shall set this field to '0'.

**NUM_REV_CFG_RECS**  -  Number of the Reverse Supplemental Channel configuration Records.

If REV_CFG_INCLUDED is set to ‘1’, the base station shall set this field to one less than the number of reverse supplemental channel configuration records consisting of the following three fields that are included in this message; otherwise, the base station shall omit this field.

The base station shall include NUM_REV_CFG_RECS+1 occurrences of the following three fields only if the REV_CFG_INCLUDED field is set to ‘1’.

**REV_SCH_ID**  -  Reverse Supplemental Channel Identifier.

The base station shall set this field to the identifier of the Reverse Supplemental Channel.

**REV_WALSH_ID**  -  Reverse Supplemental Channel Walsh cover Identifier.

The base station shall set this field according to Table 3.7.3.3.2.37-1 to indicate the Walsh cover ID that the mobile station is to use when transmitting number of bits per frame specified by REV_NUM_BITS_IDX on the Reverse Supplemental Channel specified by REV_SCH_ID. If only one reverse supplemental channel is assigned, the base station should set this field to the default value for the REV_WALSH_ID as specified in 2.6.4.2.
### Table 3.7.3.3.2.37-1. REV_WALSH_ID Field

</table>

### REVSCH_NUM_BITS_IDX - Reverse Supplemental Channel number of bits per frame index.

- If `USE_FLEX_NUM_BITS` is equal to '0' or if
- `USE_FLEX_NUM_BITS` is equal to '1' and
- `RSCH_NBIT_TABLE_ID[REV_SCH_ID]` is equal to '0000', then

  the base station shall set this field according to Table 3.7.3.3.2.37-2 to indicate the Reverse Supplemental Channel number of information bits per frame and the number of CRC bits per frame, corresponding to REV_WALSH_ID field.

- If `USE_FLEX_NUM_BITS` is equal to '1' and
- `RSCH_NBIT_TABLE_ID[REV_SCH_ID]` is not equal to '0000', then

  the base station shall set this field to indicate the Reverse Supplemental Channel number of information bits per frame, corresponding to REV_WALSH_ID field to be `NUM_BITS[RSCH_NBIT_TABLE_ID[REV_SCH_ID]][REV_SCH_NUM_BITS_IDX]` and the Reverse Supplemental Channel number of CRC bits per frame, corresponding to REV_WALSH_ID field to be `CRC_LEN_IDX[RSCH_NBIT_TABLE_ID[REV_SCH_ID]][REV_SCH_NUM_BITS_IDX]`.

</table>

NUM_REV_SCH - Number of Reverse Supplemental Channels assigned.

The base station shall set this field to the number of Reverse Supplemental Channel assigned. The base station shall set this field to '00' if the assignment of Supplemental Channel is not included.

The base station shall include NUM_REV_SCH occurrences of the following five fields (REV_SCH_ID, REV_SCH_DURATION, REV_SCH_START_TIME_INCL, REV_SCH_START_TIME, and REV_SCH_NUM_BITS_IDX).

REV_SCH_ID - Reverse Supplemental Channel Identifier.

The base station shall set this field to the identifier of the Reverse Supplemental Channel.

REV_SCH_DURATION - Duration of Reverse Supplemental Channel assignment

The base station shall set this field to '0000' to indicate that the mobile station is to stop transmitting on the Reverse Supplemental Channel specified by REV_SCH_ID at the explicit start time specified by REV_SCH_START_TIME or at the implicit start time if REV_SCH_START_TIME_INCL is set to '0'. The base station shall set this field to '1111' to indicate that the mobile station may transmit on the Reverse Supplemental Channel specified by REV_SCH_ID, starting at the explicit start time specified by REV_SCH_START_TIME in this message, until the start time specified by a subsequent Reverse Supplemental Channel assignment corresponding to the same Supplemental Channel (see 2.6.6.2.5.1.1). The base station shall set this field to the duration according to Table 3.7.3.3.2.37-3, starting at the start time specified by REV_SCH_START_TIME, during which the mobile station may transmit on the Reverse Supplemental Channel specified by REV_SCH_ID.

<table>
<thead>
<tr>
<th>FOR_SCH_DURATION REV_SCH_DURITION</th>
<th>Duration in 20 ms</th>
</tr>
</thead>
<tbody>
<tr>
<td>(binary)</td>
<td></td>
</tr>
<tr>
<td>0001</td>
<td>1</td>
</tr>
<tr>
<td>0010</td>
<td>2</td>
</tr>
</tbody>
</table>
REV_SCH_START_TIME_INCL - Start time included indicator.

If REV_SCH_DURATION is not equal to ‘0000’, the base station shall set this field to ‘1’. If REV_SCH_DURATION is equal to ‘0000’, the base station shall set this field as follows:

The base station shall set this field to ‘1’ if REV_SCH_START_TIME is included in this message; otherwise, the base station shall set this field to ‘0’.

REV_SCH_START_TIME - Start time for Reverse Supplemental Channel assignment.

If REV_SCH_START_TIME_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field to the System Time, in units of time specified by START_TIME_UNIT, (modulo 32) at which the mobile station may start transmitting (if REV_SCH_DURATION is not equal to ‘0000’) or stop transmitting (if REV_SCH_DURATION is equal to ‘0000’) on the Reverse Supplemental Channel specified in this message. The explicit start time to start or stop for transmitting on the Reverse Supplemental Channel is the time for which

\[
\lfloor \frac{t}{(\text{START\_TIME\_UNIT}s+1)} \rfloor - \text{REV\_SCH\_START\_TIME} \mod 32 = 0,
\]

where \(t\) is the System Time in units of 20 ms.

REV_SCH_NUM_BITS_IDX - Reverse Supplemental Channel number of bits per frame index.
If `USE_FLEX_NUM_BITS` is equal to '0' or if `USE_FLEX_NUM_BITS` is equal to '1' and `RSCH_NBIT_TABLE_ID[REV_SCH_ID]` is equal to '0000', then the base station shall set this field according to Table 3.7.3.2.37-2 to indicate the Reverse Supplemental Channel number of information bits per frame and the number of CRC bits per frame, corresponding to `REV_WALSH_ID` field.

If `USE_FLEX_NUM_BITS` is equal to '1' and `RSCH_NBIT_TABLE_ID[REV_SCH_ID]` is not equal to '0000', then the base station shall set this field to indicate the Reverse Supplemental Channel number of information bits per frame, corresponding to `REV_WALSH_ID` field to be `NUM_BITS[RSCH_NBIT_TABLE_ID[REV_SCH_ID]] [REV_SCH_NUM_BITS_IDX]` and the Reverse Supplemental Channel number of CRC bits per frame, corresponding to `REV_WALSH_ID` field to be `CRC_LEN_IDX[RSCH_NBIT_TABLE_ID[REV_SCH_ID]] [REV_SCH_NUM_BITS_IDX]`.

**FOR_CFG_INCLUDED** - Forward Supplemental Channel configuration included.

The base station shall set this field to '1' if this message contains a Forward Supplemental Channel configuration. Otherwise, the base station shall set this field to '0'.

**FOR_SCH_FER_REP** - Forward Supplemental Channel FER report indicator.

If `FOR_CFG_INCLUDED` is set to '0', the base station shall omit this field, otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to '1' if the mobile station is to report the Supplemental Channel frame counts (see 2.6.4.1.1); otherwise, the base station shall set this field to '0'.

**NUM_FOR_CFG_RECS** - Number of the Forward Supplemental Channel configuration Records.

If `FOR_CFG_INCLUDED` is set to '1', the base station shall set this field to one less than the number of forward supplemental channel configuration records consisting of the following fields that are included in this message; otherwise, the base station shall omit this field.

The base station shall include `NUM_FOR_CFG_RECS+1` occurrences of the following fields only if the `FOR_CFG_INCLUDED` field is set to '1'.

**FOR_SCH_ID** - Forward Supplemental Channel identifier

The base station shall set this field to the identifier of the Forward Supplemental Channel.

**SCCL_INDEX** - Supplemental Channel Code list index.

The base station shall set this field to the index of the record in the Supplemental Channel Code list.

**FOR_SCH_NUM_BITS_IDX** - Forward Supplemental Channel number of information bits index.
If \( \text{USE\_FLEX\_NUM\_BITS} \) is equal to '0' or if \( \text{USE\_FLEX\_NUM\_BITS} \) is equal to '1' and \( \text{FSCH\_NBIT\_TABLE\_ID} \) for \( \text{FOR\_SCH\_ID} \) is equal to '0000', then the base station shall set this field according to Table 3.7.3.2.37-4 to indicate the number of information bits per frame and the length of the CRC field for the Forward Supplemental Channel identified by \( \text{FOR\_SCH\_ID} \) corresponding to \( \text{SCCL\_INDEX} \).

If \( \text{USE\_FLEX\_NUM\_BITS} \) is equal to '1' and \( \text{FSCH\_NBIT\_TABLE\_ID}[\text{FOR\_SCH\_ID}] \) is not equal to '0000', then the base station shall set this field to indicate that the number of information bits per frame for the Forward Supplemental channel identified by \( \text{FOR\_SCH\_ID} \) to be \( \text{NUM\_BITS}[\text{FSCH\_NBIT\_TABLE\_ID}[\text{FOR\_SCH\_ID}]][\text{FOR\_SCH\_NUM\_BITS\_IDX}] \) that the number of CRC bits per frame for the Forward Supplemental channel identified by \( \text{FOR\_SCH\_ID} \) to be \( \text{CRC\_LEN\_IDX}[\text{FSCH\_NBIT\_TABLE\_ID}[\text{FOR\_SCH\_ID}]][\text{FOR\_SCH\_NUM\_BITS\_IDX}] \).

\( \text{NUM\_SUP\_SHO} \) - Number of Forward Supplemental Channels in Soft Handoff

The base station shall set this field to the size of the Forward Supplemental Channel Active Set minus one.

The base station shall include \( \text{NUM\_SUP\_SHO}+1 \) occurrences of the following fields for each Forward Supplemental channel corresponding to the \( \text{FOR\_SCH\_ID} \) and the
SCCL_INDEX whose frames may be soft-combined by the mobile station:

PILOT_PN - Pilot PN sequence offset index. The base station shall set this field to the pilot PN sequence offset for this pilot in units of 64 PN chips.

ADD_PILOT_REC_INCL - Additional pilot information included indicator. The base station shall set this field to ‘1’ if additional pilot information listed in PILOT_REC_TYPE and RECORD_LEN fields are included. The base station shall set this field to ‘0’ if the corresponding pilot is the common pilot and there is no additional pilot information included.

PILOT_REC_TYPE - Pilot record type
If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall set this field to the PILOT_REC_TYPE value shown in Table 3.7.2.3.2.21-9 corresponding to the type of Pilot Record specified by this record.
If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.

RECORD_LEN - Pilot record length.
If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall set this field to the number of octets in the type-specific fields of this pilot record.
If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.

Type-specific fields - Pilot record type-specific fields.
If ADD_PILOT_REC_INCL is set to ‘1’, the base station shall include type-specific fields based on the ACTIVE_PILOT_REC_TYPE of this pilot record as described in 3.7.6.1.
If ADD_PILOT_REC_INCL is set to ‘0’, the base station shall omit this field.

CODE_CHAN_SCH - Code channel on the Supplemental Channel.
The base station shall set this field to the code channel index (see [2]) that the mobile station is to use on the Supplemental Channel of the Forward Traffic Channel indexed by SCCL_INDEX.

QOF_MASK_ID_SCH - Quasi-orthogonal function index on the Supplemental Channel.
The base station shall set this field to the index of the Quasi-orthogonal function (see [2]).

NUM_FOR_SCH - Number of Forward Supplemental Channels assigned.
The base station shall set this field to the number of forward Supplemental Channel assigned. The base station shall set this field to ‘0’ if the assignment of Supplemental Channel is not included.

The base station shall include NUM_FOR_SCH occurrences of the following five fields (FOR_SCH_ID, FOR_SCH_DURATION, FOR_SCH_START_TIME_INCL, FOR_SCH_START_TIME, and SCCL_INDEX).

FOR_SCH_ID - Forward Supplemental Channel identifier.

The base station shall set this field to the identifier of the Forward Supplemental Channel pertaining to this record.

FOR_SCH_DURATION - Duration of Forward Supplemental Channel assignment.

The base station shall set this field to the duration (see Table 3.7.3.2.37-3), starting at the start time of the message specified by FOR_SCH_START_TIME, during which the mobile station is to process the Forward Supplemental Channel.

The base station shall set this field to ‘0000’ to indicate that the mobile station should stop processing the Forward Supplemental Channel starting at the explicit start time of the message specified by FOR_SCH_START_TIME or at the implicit start time if FOR_SCH_START_TIME_INCL is set to ‘0’.

The base station shall set this field to ‘1111’ to indicate that the mobile station should process the Forward Supplemental Channel, starting at the start time of the message specified by FOR_SCH_START_TIME, until the start time specified by a subsequent Forward Supplemental Channel assignment corresponding to the same Supplemental Channel (see 2.6.6.2.5.1.1).

FOR_SCH_START_TIME_INCL - Start time included indicator.

If FOR_SCH_DURATION is not equal to ‘0000’, the base station shall set this field to ‘1’. If FOR_SCH_DURATION is equal to ‘0000’, the base station shall set this field as follows:

The base station shall set this field to ‘1’ if FOR_SCH_START_TIME is included in this message; otherwise, the base station shall set this field to ‘0’.

FOR_SCH_START_TIME - Start time for Forward Supplemental Channel assignment.

If FOR_SCH_START_TIME_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field to the System Time, in units of time specified by START_TIME_UNIT, (modulo 32) at which the mobile station is to start processing (if FOR_SCH_DURATION is not equal to ‘0000’) or stop processing (if FOR_SCH_DURATION is equal to ‘0000’) the Forward Supplemental Channel specified in this message. The explicit start time to start or stop for processing the Forward Supplemental Channels is the time for which
\[ \left\lfloor \frac{t}{(\text{START\_TIME\_UNIT}+1)} \right\rfloor - \text{FOR\_SCH\_START\_TIME} \mod 32 = 0, \]

where \( t \) is the System Time in units of 20 ms.

- **SCCL\_INDEX** - Supplemental Channel Code list index.
  - The base station shall set this field to the index of the record in the Forward Supplemental Channel Code list corresponding to the \text{FOR\_SCH\_ID}. The base station shall include an SCCL\_INDEX whose SCH Active Set is a subset of the Active Set of the Fundamental Channel, Dedicated Control Channel, or both.

- **FPC\_INCL** - Forward Link Power Control parameter included indicator.
  - If the forward power control related information is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

- **FPC\_MODE\_SCH** - Forward Power Control operational mode indicator used during forward Supplemental Channel assignment interval.
  - If FPC\_INCL is set to ‘1’, the base station shall set the value to the forward power control operation mode (see [2]); otherwise, the base station shall omit this field.

- **FPC\_SCH\_INIT\_SETPT\_OP** - Initial Supplemental Channel Outer Loop Eb/Nt setpoint option.
  - If FPC\_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:
    - The base station shall set this field to ‘0’ to indicate that \text{FPC\_SCH\_INIT\_SETPT} contains the absolute value of the initial F-SCH Eb/Nt setpoint. The base station shall set this field to ‘1’ to indicate that \text{FPC\_SCH\_INIT\_SETPT} contains the offset value of the initial F-SCH Eb/Nt setpoint relative to the current value used in the mobile station for the channel carrying the Forward Power Control Subchannel.

- **FPC\_SEC\_CHAN** - Master Supplemental channel index.
  - If FPC\_INCL is set to ‘1’ and FPC\_MODE\_SCH is set to ‘001’, ‘010’, ‘101’, or ‘110’, the base station shall set this field to the master Supplemental Channel index; otherwise, the base station shall omit this field.

- **NUM\_SUP** - Number of Supplemental Channels.
  - If FPC\_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field to the total number of the Supplemental Channels.

The base station shall include \text{NUM\_SUP} occurrences of the following record:

- **SCH\_ID** - Supplemental Channel index.
  - The base station shall set this field to the Supplemental Channel index.

- **FPC\_SCH\_FER** - Supplemental Channel target Frame Error Rate.
FPC_SCH_INIT_SETPT - Initial Supplemental Channel Output Loop Eb/Nt setpoint
The base station shall set this field to initial Supplemental Channel Outer Loop Eb/Nt setpoint (absolute value or offset value as indicated by FPC_SCH_INIT_SETPT_OP) as follows:
- If FPC_SCH_INIT_SETPT_OP is set to '0', the unit is 0.125 dB;
- If FPC_SCH_INIT_SETPT_OP is set to '1', the unit is 0.125 dB and the offset is expressed as two's complement signed number.

FPC_SCH_MIN_SETPT - Minimum Supplemental Channel outer loop Eb/Nt setpoint.
The base station shall set this field to minimum Supplemental Channel Outer Loop Eb/Nt setpoint, in units of 0.125 dB.

FPC_SCH_MAX_SETPT - Maximum Supplemental Channel outer loop Eb/Nt setpoint.
The base station shall set this field to maximum Supplemental Channel Outer Loop Eb/Nt setpoint, in units of 0.125 dB.

FPC_THRESH_SCH_INCL - Supplemental Channel Setpoint Report Threshold Included Indicator.
If FPC_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set this field as follows:
- If Supplemental Channel setpoint report threshold is included in this message, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

FPC_SETPT_THRESH_SCH - Supplemental Channel Setpoint Report Threshold.
If FPC_THRESH_SCH_INCL is set to '1', the base station shall set this field to the value of the Supplemental Channel setpoint threshold (in units of 0.125 dB) above which the outer loop report message will be sent by the mobile station; otherwise, the base station shall omit this field.

RPC_INCL - Reverse Power Control parameter included indicator.
The base station shall set this field to '1' if RPC_NUM_SUP is included in this message; otherwise the base station shall set this field to '0'.

RPC_NUM_SUP - Number of Supplemental Channels.
If RPC_INCL is set to '1', the base station shall set this field to the total number of the Supplemental Channels minus one; otherwise, the base station shall omit this field.

The base station shall include RPC_NUM_SUP +1 occurrences of the following record:

SCH_ID - Supplemental Channel index.
The base station shall set this field to the Supplemental Channel index.

RLGAIN_SCH_PILOT - Supplemental Channel power offset adjustment relative to Reverse Pilot Channel power for radio configurations greater than 2.

The base station shall set this field to the correction factor to be used by mobile stations setting the power of a Supplemental Channel, expressed as a two’s complement value in units of 0.125 dB.

3X_SCH_INFO_INCL - 3X Supplemental Channel information included indicator.

If the 3X Supplemental Channel information is included, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

If FOR_CFG_INCLUDED is set to ‘0’, the base station shall set this field to ‘0’.

NUM_3X_CFG - Number of 3X Supplemental Channels to be configured

If 3X_SCH_INFO_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the number of 3X Forward Supplemental Channels to be configured. The base station shall set this field to ‘00’ if the configuration of Supplemental Channel is not included.

The base station shall include NUM_3X_CFG occurrences of the following record if 3X_SCH_INFO_INCL is included and set to ‘1’.

FOR_SCH_ID - Forward Supplemental Channel identifier.

The base station shall set this field the identifier of the Forward Supplemental Channel pertaining to this record.

NUM_3X_REC - Number of 3X records

The base station shall set this field to the number of instances of the following record minus one included in this message.

The base station shall include NUM_3X_REC+1 occurrences of the following variable-length record.

SCCL_INDEX - Supplemental Channel Code list index.

The base station shall set this field to the index of the record in the Supplemental Channel Code list.

The base station shall include NUM_SUP_SHO+1 occurrences of the following fields for each Forward Supplemental channel corresponding to the FOR_SCH_ID and the SCCL_INDEX whose frames may be soft-combined by the mobile station:

3X_SCH_LOW_INCL - SCH code channel on the lowest SR3 frequency included indicator.
If the Supplemental Channel on the lowest SR3 frequencies has a different code channel than the Supplemental Channel on the center SR3 frequency, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

QOF_MASK_ID_SCH_LOW – QOF index for the Supplemental Channel on the lowest SR3 frequency.

If 3X_SCH_LOW_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) corresponding to the QOF index for the Supplemental Channel on the lowest SR3 frequency.

CODE_CHAN_SCH_LOW – Code channel for the Supplemental Channel on the lowest SR3 frequency.

If 3X_SCH_LOW_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the code channel index (see [2]) that the mobile station is to use on the Supplemental Channel on the lowest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

3X_SCH_HIGH_INCL – SCH code channel on the highest SR3 frequency included indicator.

If the Supplemental Channel on the highest SR3 frequencies has a different code channel than the Supplemental Channel on the center SR3 frequency, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

QOF_MASK_ID_SCH_HIGH – QOF index for the Supplemental Channel on the highest SR3 frequency.

If 3X_SCH_HIGH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to the index of the Quasi-orthogonal function (see [2]) corresponding to the QOF index for the Supplemental Channel on the highest SR3 frequency.

CODE_CHAN_SCH_HIGH – Code channel for the Supplemental Channel on the highest SR3 frequency.

If 3X_SCH_HIGH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:
The base station shall set this field to the code channel index (see [2]) that the mobile station is to use on the Supplemental Channel on the highest SR3 frequency. If Radio Configuration 6 or 8 is used, the base station shall set this field in the range 1 to 127 inclusive. If Radio Configuration 7 or 9 is used, the base station shall set this field in the range 1 to 255 inclusive.

CCSH_INCLUDED - Code Combining Soft Handoff information included indicator.

The base station shall set this field to ‘1’ if Code Combining Soft Handoff information is included in this message; otherwise, the base station shall set this field to ‘0’.

If the CCSH_INCLUDED field is set to ‘1’, the base station shall include one occurrence of the following one field for each of the Forward Supplemental Channel records included in this message (as specified by NUM_FOR_CFG_RECS and NUM_SUP_SHO). The base station shall use the same order for the following field as is used for the Forward Supplemental Channel records.

CCSH_ENCODER_TYPE - Code Combining Soft Handoff Turbo Encoder type.

The base station shall set this field to ‘0’ if the Turbo Encoder type to be used on the Forward Supplemental Channel indexed by FOR_SCH_ID and SCCL_INDEX is the default encoder type. The base station shall set this field to ‘1’ if the Turbo Encoder to be used is the complementary type.

FOR_SCH_CC_INCL - Channel configuration for the Forward Supplemental Channel included indicator.

The base station shall set this field to ‘1’ if the channel configuration information for the Forward Supplemental Channel is included; otherwise, the base station shall set this field to ‘0’.

The base station shall set FOR_SCH_CC_INCL to ‘0’ if NUM_FOR_SCH is set to ‘00’ or if FOR_SCH_DURATION is set to ‘0000’.

If FOR_SCH_CC_INCL is set to ‘1’, the base station shall include NUM_FOR_SCH occurrences of the following three-field record.

FOR_SCH_ID - Forward Supplemental Channel Identifier.

The base station shall set this field to the identifier of the Forward Supplemental Channel pertaining to this record.

The base station shall set this field to the Supplemental Channel identifier, shown in Table 3.7.5.7-5.

FOR_SCH_MUX - Forward Supplemental Channel Multiplex Option.

The base station shall set this field to the Multiplex Option associated with the maximum data rate for this Forward Supplemental Channel (see [3]).

SCH_CC_Type-specific field - Supplemental Channel Configuration Information.

The base station shall set this field as defined in 3.7.5.7.1 for this Forward Supplemental Channel.
REV_SCH_CC_INCL - Channel configuration for the Reverse Supplemental Channel included indicator.

The base station shall set this field to ‘1’ if the channel configuration information for the Reverse Supplemental Channel is included; otherwise, the base station shall set this field to ‘0’.

The base station shall set REV_SCH_CC_INCL to ‘0’ if NUM_REV_SCH is set to ‘00’ or if REV_SCH_DURATION is set to ‘0000’.

If REV_SCH_CC_INCL is set to ‘1’, the base station shall include NUM_REV_SCH occurrences of the following three-field record.

REV_SCH_ID - Reverse Supplemental Channel Identifier.

The base station shall set this field to the identifier of the Reverse Supplemental Channel pertaining to this record.

The base station shall set this field to the Supplemental Channel identifier, shown in Table 3.7.5.7-5.

REV_SCH_MUX - Reverse Supplemental Channel Multiplex Option.

The base station shall set this field to the Multiplex Option associated with the maximum data rate for this Reverse Supplemental Channel (see [3]).

SCH_CC_Type-specific field - Supplemental Channel Configuration Information.

The base station shall set this field as defined in 3.7.5.7.1 for this Reverse Supplemental Channel.

SCH_BCMC_IND – BCMC on supplemental channel Indicator.

If NUM_FOR_SCH field is set to ‘00’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the channel assignment in this message contains a Forward Supplemental Channel used for BCMC transmission, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

ADD_PLCM_FOR_SCH_INCL – Additional PLCM for forward SCH included indicator.

If the SCH_BCMC_IND field is not included or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the additional PLCM for forward SCH is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

ADD_PLCM_FOR_SCH_TYPE - The Additional Public Long Code Mask for forward SCH type indicator.

If ADD_PLCM_FOR_SCH_INCL is not included or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.
The base station shall set this field to ‘1’ to indicate PLCM specified by the base station. The field value ‘0’ is reserved.

ADD_PLCM_FOR_SCH_395 - The 395 LSB bits of the additional Public Long Code Mask for forward SCH.

If ADD_PLCM_FOR_SCH_TYPE field is included and is set to ‘1’, the base station shall include this field and set it to the 395 least significant bits of the public long code mask used by the mobile station; otherwise, the base station shall omit this field.

If SCH_BCMC_IND field is included and is set to ‘1’, the base station shall include NUM_FOR_SCH occurrences of the following record:

USE_ADD_PLCM_FOR_SCH - Use additional PLCM for forward SCH indicator.

The base station shall set this field to ‘1’ if the additional PLCM for forward SCH included in this message is to be used for this Forward Supplemental Channel; otherwise, the base station shall set this field to ‘0’.

FSCH_OUTERCODE_INCL - Forward Supplemental Channel Outer Code included indicator.

The base station shall set this field to ‘1’ if the Forward Supplemental Channel outer code information is included in this message; otherwise, the base station shall set this field to ‘0’.

FSCH_OUTERCODE_RATE - Outer Code Rate of the Forward Supplemental Channel.

If the FSCH_OUTERCODE_INCL field is not included or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the outer code rate of the Forward Supplemental Channel as specified in Table 3.7.2.3.2.38-3.[2].

FSCH_OUTERCODE_OFFSET - Outer Coding Buffer Offset of the Forward Supplemental Channel.

If the FSCH_OUTERCODE_INCL field is not included or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the outer coding buffer offset of the Forward Supplemental Channel in units of 20ms as specified in [2].

FPC_BCMC_CHAN - Channel used for secondary power control subchannel.

If FPC_INCL is set to ‘1’ and FPC_MODE_SCH is set to ‘001’, ‘010’, ‘101’, or ‘110’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.
If F-FCH is associated with secondary power control subchannel, the base station shall set this field to ‘1’; otherwise, base station shall set this field to ‘0’ to indicate that FPC_SEC_CHAN points to the channel associated with secondary power control subchannel.
3.7.3.3.2.38 Forward Supplemental Channel Assignment Mini Message

MSG_TAG: FSCAMM

<table>

</table>
FOR_SCH_ID - Forward Supplemental Channel identifier.
The base station shall set this field to the identifier of the Forward Supplemental Channel.

FOR_SCH_DURATION - Duration of Forward Supplemental Channel assignment.
The base station shall set this field to the duration (see Table 3.7.3.3.2.37-3), starting at the start time of the message specified by FOR_SCH_START_TIME, during which the mobile station is to process the Forward Supplemental Channel.

The base station shall set this field to ‘0000’ to indicate that the mobile station should stop processing the Forward Supplemental Channel starting at the start time of the message specified by FOR_SCH_START_TIME.

The base station shall set this field to ‘1111’ to indicate that the mobile station should process the Forward Supplemental Channel, starting at the explicit start time of the message specified by FOR_SCH_START_TIME, until the start time of a subsequent Forward Supplemental Channel assignment corresponding to the same Forward Supplemental Channel (see 2.6.6.2.5.1.1).

FOR_SCH_START_TIME - Start time for Forward Supplemental Channel assignment.
The base station shall set this field to the System Time, in units of time specified by START_TIME_UNIT, (modulo 32) at which the mobile station is to start processing the Forward Supplemental Channel specified in this message. The start time for processing Forward Supplemental Channels is the time for which

\[
\left\lfloor \frac{t}{(\text{START\_TIME\_UNIT}+1)} \right\rfloor - \text{FOR\_SCH\_START\_TIME} \mod 32 = 0,
\]

where \( t \) is the System Time in units of 20 ms.

SCCL_INDEX - Supplemental Channel Code list index.
The base station shall set this field to the index of the record in the Forward Supplemental Channel Code list corresponding to the FOR_SCH_ID. The base station shall include an SCCL_INDEX whose SCH Active Set is a subset of the Active Set of the Fundamental Channel, Dedicated Control Channel, or both.

REV_SCH_ID - Reverse Supplemental Channel identifier.
The base station shall set this field to the identifier of the Reverse Supplemental Channel.

REV_SCH_DURATION - Duration of Reverse Supplemental Channel assignment.
The base station shall set this field to '0000' to indicate that the mobile station is to stop transmitting on the Reverse Supplemental Channel specified by REV_SCH_ID at the start time specified by START_TIME. The base station shall set this field to '1111' to indicate that the mobile station may transmit on the Reverse Supplemental Channel specified by REV_SCH_ID, starting at the start time specified by REV_SCH_START_TIME in this message, until the start time specified by a subsequent Reverse Supplemental Channel assignment corresponding to the same Supplemental Channel (see 2.6.6.2.5.1.1). The base station shall set this field to the duration according to Table 3.7.3.3.2.37-3, starting at the explicit start time specified by REV_SCH_START_TIME, during which the mobile station may transmit on the Reverse Supplemental Channel specified by REV_SCH_ID.

REV_SCH_START_TIME - Start time for Reverse Supplemental Channel Assignment Mini Message.
The base station shall set this field to the System Time, in units of time specified by START_TIME_UNIT, (modulo 32) at which the mobile station may start transmitting on the Reverse Supplemental Channel specified in this message. The explicit start time for transmitting on the Reverse Supplemental Channel is the time for which

\[ \left\lfloor \frac{t}{(\text{START\_TIME\_UNIT} + 1)} \right\rfloor - \text{REV\_SCH\_START\_TIME} \mod 32 = 0, \]

where t is the System Time in units of 20 ms.

REV_SCH_NUM_BITS_IDX - Reverse Supplemental Channel number of information bits per frame index.
If USE_FLEX_NUM_BITS is equal to '0' or if USE_FLEX_NUM_BITS is equal to '1' and RSCH_NBIT_TABLE_ID[REV_SCH_ID] is equal to '0000', then the base station shall set this field according to Table 3.7.3.3.2.37-2 to indicate the Reverse Supplemental Channel number of information bits per frame and the number of CRC bits per frame, that the mobile station may transmit on the reverse Supplemental Channel identified by REV_SCH_ID.

If USE_FLEX_NUM_BITS is equal to '1' and RSCH_NBIT_TABLE_ID[REV_SCH_ID] is not equal to '0000', then the base station shall set the REV_SCH_NUM_BITS_IDX field to indicate the Reverse Supplemental Channel number of
information bits per frame that the mobile station may transmit on the Reverse Supplemental Channel identified by

REV_SCH_ID to be

NUM_BITS[RSCH_NBIT_TABLE_ID[REV_SCH_ID]]

[REV_SCH_NUM_BITS_IDX] and the Reverse Supplemental Channel number of CRC bits per frame that the mobile station may transmit on the Reverse Supplemental Channel identified by

REV_SCH_ID to be

CRC_LEN_IDX[RSCH_NBIT_TABLE_ID[REV_SCH_ID]]

[REV_SCH_NUM_BITS_IDX].

</tr>
</tbody>
</table>

**ORDER_FLAG** - Order change reporting flag.

The base station shall set this field to ‘1’ to indicate that the mobile station is to send a Pilot Strength Measurement Mini Message to the base station whenever a received pilot strength measurement changes its relative order with respect to all other reported pilot strength measurements during supplemental channel burst operations; otherwise, the base station shall set this field to ‘0’.

If ORDER_FLAG is set to ‘1’, the base stations shall include the following two-field record:

**PS_MIN_DELTA** - Minimum power strength delta.
The base station shall set this field to one less than the minimum pilot strength measurement difference between two pilots (in units of 0.5 dB) that must be measured in order for the mobile station to send a Pilot Strength Measurement Mini Messages when the rank order mode is enabled. A difference in pilot strength of at least (PS_MIN_DELTA + 1), in units of 0.5 dB, must be measured for ORDER_INTERVAL successive 20 ms intervals before a rank order based Pilot Strength Measurement Mini Message is generated.

ORDER_INTERVAL - Order interval.

The base station shall set this field to the minimum interval (in 20 ms units) during which the indicated pilot strength measurement difference greater than or equal to (PS_MIN_DELTA + 1), in units of 0.5 dB, must be measured by the mobile station in order for the mobile station to send a Pilot Strength Measurement Mini Messages when the rank order mode is enabled.

PERIODIC_FLAG - Periodic report flag.

The base station shall set this field to ‘1’ to indicate that the mobile station is to send Pilot Strength Measurement Mini Messages periodically during supplemental channel burst operations; otherwise the base station shall set this field to ‘0’.

If PERIODIC_FLAG is set to ‘1’, the base station shall include the following two-field record:

NUM_PILOTS - Number of pilots.

The base station shall set this field to the number of pilots for which the mobile station is to send Pilot Strength Measurement Mini Messages when the periodic mode is enabled.

PERIODIC_INTERVAL - Periodic interval.

The base station shall set this field to the interval (in 20 ms units) between Pilot Strength Measurement Mini Messages when the periodic mode is enabled.

THRESHOLD_FLAG - Threshold reporting flag.

The base station shall set this field to ‘1’ to indicate that the mobile station is to send Pilot Strength Measurement Mini Messages whenever a measured pilot crosses below a lower bound or exceeds an upper bound during Supplemental channel burst operations; otherwise the base station shall set this field to ‘0’.

If THRESHOLD_FLAG is set to ‘1’, the base station shall include the following five-field record:

PS_FLOOR_HIGH - Lower bound reporting high water mark.

The base station shall set this field to the high water mark for the lower bound below which the mobile station is to send Pilot Strength Measurement Mini Messages when the threshold mode is enabled.
The base station shall set this field as an unsigned binary number equal to \(- 2 \times 10 \times \log_{10} \frac{E_c}{I_{0a}}\).

**PS_FLOOR_LOW** - Lower bound reporting low water mark.

The base station shall set this field to the low water mark for the lower bound below which the mobile station is to send *Pilot Strength Measurement Mini Messages* when the threshold mode is enabled.

The base station shall set this field as an unsigned binary number equal to \(- 2 \times 10 \times \log_{10} \frac{E_c}{I_{0a}}\).

**PS_CEILING_HIGH** - Upper bound reporting high water mark.

The base station shall set this field to the high water mark for the upper bound above which the mobile station is to send *Pilot Strength Measurement Mini Messages* when the threshold mode is enabled.

The base station shall set this field as an unsigned binary number equal to \(- 2 \times 10 \times \log_{10} \frac{E_c}{I_{0a}}\).

**PS_CEILING_LOW** - Upper bound reporting low water mark.

The base station shall set this field to the low water mark for the upper bound above which the mobile station is to send *Pilot Strength Measurement Mini Messages* when the threshold mode is enabled.

The base station shall set this field as an unsigned binary number equal to \(- 2 \times 10 \times \log_{10} \frac{E_c}{I_{0a}}\).

**THRESHOLD_INTERVAL** - Threshold reporting interval.

The base station shall set this field to the interval (in 20 ms units) between *Pilot Strength Measurement Mini Messages* when the threshold reporting mode is enabled.

REJECT_UZID - Rejected User Zone identifier.
The base station shall set this field to the User Zone identifier of the User Zone rejected by the base station.

REJECT_ACTION_INDI - Rejection action indicator.
The base station shall set this field to the value shown in Table 3.7.2.3.2.29-1 corresponding to the User Zone rejection action field to identify the mobile station action.

UZID.Assign_INCL - User Zone identifier assignment included indicator.
If assigned UZID information is included, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

ASSIGN_UZID - Assigned User Zone identifiers.
The base station shall set this field to the User Zone identifier of the User Zone assigned to the mobile station.

</table>
RESPONSE_IND – Response indicator.

The base station shall set this field to ‘1’ if this message is a response to an Enhanced Origination Message from the mobile station; otherwise, the base station shall set this field to ‘0’.

TAG – Transaction identifier.

If the RESPONSE_IND field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the value of the TAG or ADD_TAG field of the Enhanced Origination Message to which this message is the response.

ACCEPT_IND – Accepted indicator.

If the RESPONSE_IND field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and shall set it as follows:

If the base station accepts the call request from the mobile station, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

REJECT_PKTDATA_IND – Packet data service option rejection indicator.

If the ACCEPT_IND field is not included or is included and is set to ‘1’, the base station shall omit this field; otherwise, the base station shall include this field and shall set it as follows:

The base station shall set this field to ‘1’ to indicate rejection of the packet data service option requested by the mobile station; otherwise, the base station shall set this field to ‘0’.

BYPASS_ALERT_ANSWER – Bypass alert indicator.

If the RESPONSE_IND field is set to ‘1’, the base station shall omit this field; otherwise, the base station shall include this field and shall set it as follows:

If the mobile station is to bypass the Waiting for Order Substate and the Waiting for Mobile Station Answer Substate for this call, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

SO_INCL – Service option included indicator.

The base station shall set this field to ‘1’ if the SO field is included in this message; otherwise, it the base station shall set this field to ‘0’.

If the USE_OLD_SERV_CONFIG is included and is set to ‘1’, the base station shall set this field to ‘0’.

SO – Service option.

If the SO_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and shall set it to the value of the service option number (as specified in [30]) that the base station proposes for this call.
CON_REF_INCL – Connection reference included indicator.
If the ACCEPT_IND field is not included or is included but is
set to ‘1’, the base station shall set this field to ‘1’; otherwise,
the base station shall set this field to ‘0’.
If the USE_OLD_SERV_CONFIG is included and is set to ’1’,
the base station shall set this field to ‘0’.

CON_REF – Connection reference.
If the CON_REF_INCL field is set to ‘0’, the base station shall
omit this field; otherwise, the base station shall include this
field and shall set it to the value of the connection reference
that was/will be assigned to the service option connection
corresponding to this call.

USE_OLD_SERV_CONFIG - Use stored service option connection record(s) indicator.
This field may be used by the base station to instruct the
mobile station to use the stored service option connection record(s).
If the ACCEPT_IND field is included and is set to ‘0’, the base
station shall omit this field; otherwise, the base station shall
include this field and shall set it as follows:
If the mobile station is to restore one or more service option
connection record(s) from the stored service configuration, the
base station shall set this field to ‘1’; otherwise, the base
station shall set this field to ‘0’.

SR_ID - Service reference identifier.
If the USE_OLD_SERV_CONFIG field is not included or is
included and is set to ‘0’, the base station shall omit this field;
otherwise, the base station shall include this field and set it as follows.
If the mobile station is to restore all remaining service option
connections record from the stored service configuration, the
base station shall set this field to ‘111’; if the mobile station is
to restore more than one but not all remaining service option
connections from the stored service configuration, the base
station shall set this field to ‘000’; otherwise, the base station
shall set this field to the service reference identifier corresponding to the service option connection to be restored.

SR_ID_RESTORE_BITMAP – Bitmap of service reference identifiers to be restored.
If the SR_ID field is included and set to ‘000’, the base station
shall include this field and set it as follows; otherwise, the
base station shall omit this field.
This field consists of the subfields defined in Table 3.7.2.3.2.21-6. The base station shall set a subfield to ‘1’ to
indicate that the mobile station is to restore the service option
connection of the corresponding service reference identifier;
otherwise, the base station shall set the subfield to ‘0’.
ADD_CALL_INFO_INCLUDED – Additional call information included indicator.

If USE_OLD_SERV_CONFIG is not included, or is included and is set to ‘1’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

- If at least one occurrence of the additional call record is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

NUM_ADD_CALL_RECORDS – Number of additional call records included.

If ADD_CALL_INFO_INCLUDED is not included or is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it to one less than the number of occurrences of the call records included in this message.

If NUM_ADD_CALL_RECORDS is included, the base station shall include NUM_ADD_CALL_RECORDS + 1 occurrences of the following variable-field record:

ADD_TAG – Additional transaction identifier.

- If the RESPONSE_IND field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

  - The base station shall set this field to the value of the TAG or ADD_TAG field of the Enhanced Origination Message to which this message is the response.

ADD_ACCEPT_IND – Additional accepted indicator.

- If the RESPONSE_IND field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

  - If the base station accepts the call request from the mobile station, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

ADD_REJECT_PKTDATA_IND – Additional packet data service option rejection indicator.

- If the ADD_ACCEPT_IND field is not included or is included and is set to ‘1’, the base station shall omit this field; otherwise, the base station shall include this field and shall set it as follows:

  - The base station shall set this field to ‘1’ to indicate rejection of the packet data service option requested by the mobile station; otherwise, the base station shall set this field to ‘0’.

ADD_SO_INCL – Additional service option included indicator.

- The base station shall set this field to ‘1’ if the ADD_SO field is included in this message; otherwise, it the base station shall set this field to ‘0’.

ADD_SO – Additional service option.
If the ADD_SO_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and shall set it to the value of the service option number (as specified in [30]) that the base station proposes for this call.

ADD_CON_REF_INCL – Additional connection reference included indicator.

If the ACCEPT_IND field is not included or is included but is set to ‘1’, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

ADD_CON_REF – Connection reference.

If the ADD_CON_REF_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and shall set it to the value of the connection reference that was/will be assigned to the service option connection corresponding to this call.

**USE_TIME** - Use action time indicator.

This field indicates whether an ACTION_TIME is specified in this message.

If an ACTION_TIME is specified in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**ACTION_TIME** - Action time.

If the USE_TIME field is set to ‘1’, the base station shall set this field to the System Time minus FRAME_OFFSET_\S_ × 1.25 ms, in units of 80 ms (modulo 64), at which the message is to take effect. If the USE_TIME field is set to ‘0’, the base station shall omit this field.

**D_SIG_ENCRYPT_MODE** - Dedicated channel encryption mode indicator.

The base station shall set it to signaling encryption mode, as shown in Table 3.7.4.5-1.

**NUM_REC** - Number of user information encryption records.

The base station shall set this field to the number of user information encryption records included in this message.
The base station shall include NUM_REC occurrences of the following two-field record:

- **CON_REF** - Connection reference corresponding to the service option connection requesting for encryption.
  
  If this field is included, the base station shall set this field to the connection reference of the service option connection corresponding to this user information encryption.

- **UI_ENCRYPT_MODE** - Encryption mode indicator for user information privacy.
  
  The base station shall set this field to user information encryption mode for the service option connection identified by CON_REF as shown in Table 3.7.5.7-3.

- **ENC_KEY_SIZE** - Key Size used for user information and signaling encryption.
  
  If D_SIG_ENCRYPT_MODE is equal to ‘001’ or ‘010’, the base station shall include this field and set this field to the encryption key size as shown in Table 3.7.4.5-2; otherwise, the base station shall omit this field.

- **C_SIG_ENCRYPT_MODE_INCL** - Common channel signaling encryption mode included indicator.
  
  If C_SIG_ENCRYPT_MODE is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

- **C_SIG_ENCRYPT_MODE** - Common channel signaling encryption mode indicator.
  
  If C_SIG_ENCRYPT_MODE_INCL is set to ‘1’, the base station shall include this field and shall set it to the common channel signaling encryption mode, as shown in Table 3.7.4.5-1; otherwise, the base station shall omit this field.

- **MSG_INT_INFO_INCL** - Message integrity information included indicator.
  
  The base station shall set this field to ‘1’ if the base station supports message integrity; otherwise, the base station shall set this field to ‘0’.

- **CHANGE_KEYS** - Change keys indicator.
  
  If MSG_INT_INFO_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
  
  The base station shall set this field to ‘0’ to command the mobile station not to update the encryption key and integrity key. The base station shall set this field to ‘1’ to command the mobile station to update the encryption key and integrity key to the latest being generated.

- **USE_UAK** - Use UAK indicator.
  
  If MSG_INT_INFO_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
If the base station receives an authentication vector with a UAK, the base station shall set this field to ‘1’ to indicate that the mobile station is to use UMAC; otherwise, the base station shall set this field to ‘0’ to indicate that the mobile station is to use MAC-I.
3.7.3.3.2.47 Base Station Status Response Message

</table>

NUM_RECORDS occurrences of the following record:

\[
\begin{array}{ll}
\text{RECORD_TYPE} & 8 \\
\text{RECORD_LENGTH} & 8 \\
\text{Record type specific fields} & \text{variable} \\
\text{RESERVED} & 0-7 \text{ (as required)} \\
\end{array}
\]

QUAL_INFO_TYPE – Qualification information type.
The base station shall set this field to the QUAL_INFO_TYPE field in the corresponding Base Station Status Request Message.

QUAL_INFO_LEN – Qualification information length.
The base station shall set this field to the QUAL_INFO_LEN field in the corresponding Base Station Status Request Message.

Type-specific fields – Type-specific fields.
The base station shall set these fields to the qualification information in the corresponding Base Station Status Request Message.

NUM_RECORDS – Number of records included in this message.
The base station shall set this field to the number of occurrences of RECORD_TYPE field in this message.

The base station shall include one occurrence of the following variable-length record for each information record that is included:

RECORD_TYPE – Information record type.
The base station shall set this field to the record type value shown in Table 3.7.3.3.2.47-1 corresponding to the information record included.
### Table 3.7.3.3.2.47-1. Base Station Status Response Information Record

</table>

- **RECORD_LENGTH** - Information record length.
  - The base station shall set this field to the length, in octets, of the record type specific fields included in this record.

- **Record type specific fields** - Record type specific fields
  - The base station shall set this field to the type specific fields corresponding to this record type.
  - If the RECORD_TYPE field is set to ‘00000000’, the base station shall set the record type specific field as follows:
<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>NUM_PILOTS</td>
<td>4</td>
</tr>
<tr>
<td>SID_NID_IND</td>
<td>1</td>
</tr>
</tbody>
</table>

NUM_PILOTS occurrences of the following record:

```plaintext
{ NUM_PILOTS
  RECORD_LEN 4
  PILOT_PN 9
  BASE_ID 16
  SID_NID_INCL 0 or 1
  SID 0 or 15
  NID 0 or 16
  BASE_LAT_LONG_INCL 1
  BASE_LAT 0 or 22
  BASE_LONG 0 or 23
  RESERVED_1 0–7 (as required)
} NUM_PILOTS
```

- **NUM_PILOTS** - Number of Pilots reported.
  
  The base station shall set this field to the number of pilots whose information is reported in this message.

  The base station shall set this field to a number equal or greater than one.

- **SID_NID_IND** - SID, NID included indicator.
  
  The base station shall set this field to ‘1’ if SID, NID information is included in this message; otherwise, it shall set this field to ‘0’.

The base station shall include NUM_PILOTS occurrences of the following variable length record:
RECORD_LEN - Record Length.
The base station shall set this field to the length in octets of this record.

PILOT_PN - Pilot PN sequence offset index.
The base station shall set this field to the pilot PN sequence offset for this base station, in units of 64 PN chips.

BASE_ID - Base station identification.
The base station shall set this field to the Base Station identification number corresponding to this pilot.

SID_NID_INCL - SID, NID included indicator.
If the SID_NID_INCL field is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
If this is the first pilot included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field as follows:
If the SID and NID of this pilot are same as the SID and NID of the previous pilot, the base station shall set this field to ‘0’; otherwise, the base station shall set this field to ‘1’.

SID - System identification.
If the SID_NID_INCL field is not included or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
The base station shall set this field to the system identification number of the system corresponding to this pilot (see 2.6.5.2).

NID - Network identification.
If the SID_NID_INCL field is not included or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
The base station shall set this field to the network identification number of the network corresponding to this pilot (see 2.6.5.2).
BASE_LAT_LONG_INCL - Base station LAT/LONG included indicator.

The base station shall set this field to ‘1’ if the base station LAT/LONG fields are included in this message; otherwise, the base station shall set this field to ‘0’.

BASE_LAT - Base station latitude.

If the BASE_LAT_LONG_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to its latitude in units of 0.25 second, expressed as a two's complement signed number with positive numbers signifying North latitudes. The base station shall set this field to a value in the range -1296000 to 1296000 inclusive (corresponding to a range of -90° to +90°).

BASE_LONG - Base station longitude.

If the BASE_LAT_LONG_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to its longitude in units of 0.25 second, expressed as a two's complement signed number with positive numbers signifying East longitude. The base station shall set this field to a value in the range -2592000 to 2592000 inclusive (corresponding to a range of -180° to +180°).

RESERVED_1 - Reserved bits.

The base station shall add reserved bits as needed in order to make the length of the pilot specific record equal to an integer number of octets. The base station shall set these bits to ‘0’.

RESERVED - Reserved bits.

The base station shall add reserved bits as needed in order to make the length of the record equal to an integer number of octets. The base station shall set these bits to ‘0’.
3.7.3.2.48 Authentication Request Message

**MSG_TAG: AUREQM**

**RANDA** – The Random Challenge Number. The base station shall set this field to the value of the Random Challenge Number in the authentication vector.

**CON_SQN** – Concealed Sequence Number. The base station shall set this field to the value of the Concealed Sequence Number in the authentication vector.

**AMF** – Authentication Management Field. The base station shall set this field to the value of the Authentication Management Field in the authentication vector.

**MAC_A** – Message Authentication Code. The base station shall set this field to the value of the Message Authentication Code in the authentication vector.

</table>
USE_TIME - Use action time indicator.
This field indicates whether an explicit action time is specified in this order.
If an explicit action time is specified in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

ACTION_TIME - Action time.
If the USE_TIME field is set to ‘1’, the base station shall set this field to the System Time minus FRAME_OFFSET × 1.25 ms, in units of 80 ms (modulo 64), at which the rate change is to take effect. If the USE_TIME field is set to ‘0’, the base station shall set this field to ‘000000’.

REV_CQICH_RATE_CHANGE_INCL - Reverse Channel Quality Indicator Channel rate change included indicator.
If the base station determines to change the rate of R-CQICH, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

FULL_CI_FEEDBACK_IND - Full C/I feedback rate indicator.
If REV_CQICH_RATE_CHANGE_INCL is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:
If the mobile station is to send full C/I feedback every 1.25 ms, the base station shall set this field to ‘1’. If the mobile station is to transmit full C/I feedback every 20 ms, the base station shall set this field to ‘0’.

REV_CQICH_REPS - Reverse Channel Quality Indicator Channel repetition factor.
If REV_CQICH_RATE_CHANGE_INCL is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field according to the Table 3.7.3.3.2.49-1.

<table>
<thead>
<tr>

</table>

SWITCHING_PARMS_INCL - R-CQICH switching parameters included indicator.
If the REV_CQICH_RATE_CHANGE_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
The base station shall set this field to ‘1’ if the parameters for R-CQICH soft and softer switching are included in this message; otherwise, the base station shall set this field to ‘0’.

NUM_SOFT_SWITCHING_FRAMES - Number of frames for R-CQICH soft switching.

If SWITCHING_PARMS_INCL is not included or included and set to ‘0’, then the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the duration of the cell switching period, in units of 20 ms, minus one, during which the mobile station is to transmit the cell switch sequence on the R-CQICH channel when it switches between two pilots which are in different groups.

NUM_SOFTER_SWITCHING_FRAMES - Number of frames for R-CQICH softer switching.

If SWITCHING_PARMS_INCL is not included or included and set to ‘0’, then the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the duration of the cell switching period, in units of 20 ms, minus one, during which the mobile station is to transmit the cell switch sequence on the R-CQICH channel when it switches between two pilots which are in the same group.

CHM_SWITCHING_PARMS_INCL - Control Hold Mode fields included indicator.

If SWITCHING_PARMS_INCL is omitted or equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if the switching parameters for Control Hold Mode are included; otherwise, the base station shall set this field to ‘0’.

NUM_SOFT_SWITCHING_FRAMES_CHM - Number of frames for R-CQICH soft switching while in Control Hold.

If CHM_SWITCHING_PARMS_INCL is not included or included and set to ‘0’, then the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the duration of the cell switching period, in units of 20 ms, minus one, during which the mobile station, while in Control Hold, is to transmit the cell switch sequence on the R-CQICH when it switches between two pilots which are in different groups.

NUM_SOFTER_SWITCHING_FRAMES_CHM - Number of frames for R-CQICH softer switching while in Control Hold.
If CHM_SWITCHING_PARMS_INCL is not included or included and set to ‘0’, then the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the duration of the cell switching period, in units of 20 ms, minus one, during which the mobile station, while in Control Hold, is to transmit the cell switch sequence on the R-CQICH when it switches between two pilots which are in the same group.

**RL_CQICH_ATT_ADJ_GAIN_INCL** - Attribute adjustment gain for Reverse Channel Quality Indicator Channel included indicator.

If REV_CQICH_RATE_CHANGE_INCL is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

If the attribute adjustment gain for Reverse Channel Quality Indicator Channel is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**NUM_RECS** - Number of the records.

If RL_CQICH_ATT_ADJ_GAIN_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field.

Otherwise, the base station shall set this field to one less than the number of occurrences of the records included in this message.

If NUM_RECS is included in this message, the base station shall include NUM_RECS+1 occurrences of the following record:

**RL_CQICH_ATT_ADJ_GAIN_TYPE** - Reverse Channel Quality Indicator Channel attribute adjustment gain value type indicator

If the following fields are set to the nominal attribute gain adjustment values that the mobile station is to use for the transmission attributes (relative to Nominal_Attribute_Gain specified in [2]), the base station shall set this field to ‘0’. If the following fields are set to the pilot reference level adjustment values that the mobile station is to use for the transmission attributes (relative to Pilot_Reference_Level specified in [2]), the base station shall set this field to ‘1’.

**RL_CQICH_ATT_ADJ_GAIN_HIGH_INCL** - Attribute adjustment gain for the high power level of Reverse Channel Quality Indicator Channel transmission included indicator.

If the attribute adjustment gain for the high power level of Reverse Channel Quality Indicator Channel transmission is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**RL_CQICH_ATT_ADJ_GAIN_HIGH** - Attribute adjustment gain for the high power level of Reverse Channel Quality Indicator Channel transmission for the corresponding rate indicated in REV_CQICH_REPS.
If RL_CQICH_ATT_ADJ_GAIN_HIGH_INCL is not included or included but is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If RL_CQICH_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes for the high power level of R-CQICH. The base station shall set the value in the range from –40 to 16 inclusive.

If RL_CQICH_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes for the high power level of R-CQICH.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_CQICH_ATT_ADJ_GAIN_LOW_INCL - Attribute adjustment gain for Reverse Channel Quality Indicator Channel transmission Included Indicator.

If the attribute adjustment gain for the low power level of Reverse Channel Quality Indicator Channel transmission is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

RL_CQICH_ATT_ADJ_GAIN_LOW - Attribute adjustment gain for the low power level of Reverse Channel Quality Indicator Channel transmission for the corresponding rate indicated in REV_CQICH_REPS.

If RL_CQICH_ATT_ADJ_GAIN_LOW_INCL is not included or included but is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If RL_CQICH_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes for the low power level of R-CQICH. The base station shall set the value in the range from –16 to 16 inclusive.

If RL_CQICH_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes for the low power level of R-CQICH.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

REV_ACKCH_RATE_CHANGE_INCL - Reverse Acknowledgment Channel rate change included indicator

If the base station determines to change the rate of R-ACKCH, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.
If `REV_CQICH_RATE_CHANGE_INCL` is set to ‘0’, `REV_ACKCH_RATE_CHANGE_INCL` shall be set to ‘1’.

**REV_ACKCH_REPS** - Reverse Acknowledgment Channel repetition factor.

If `REV_ACKCH_RATE_CHANGE_INCL` is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it according to the Table 3.7.3.3.2.49-2.

<table>

**REV_PDCH_MAX_PARMS_INCL** - Reverse Packet Data Channel maximum traffic to pilot ratio included indicator.

The base station shall set this field to ‘1’ if the Reverse Packet Data Channel maximum traffic to pilot ratio for autonomous transmission is included; otherwise, the base station shall set this field to ‘0’.

**REV_PDCH_MAX_AUTO_TPR** - Reverse Packet Data Channel maximum traffic to pilot ratio for autonomous transmission.

If `REV_PDCH_MAX_PARMS_INCL` is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to the maximum traffic to pilot ratio for autonomous transmission on the Reverse Packet Data Channel (see [2] and [3]).

The base station shall set this field to values in the range 0 to 18 dB inclusive in units of 0.125 dB.

**REV_PDCH_MAX_SIZE_ALLOWED_ENCODER_PACKET** - Maximum Allowed Reverse PDCH encoder packet size.

If `REV_PDCH_MAX_PARMS_INCL` is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to the maximum size encoder packet that the mobile station is allowed to use. (see [2] and [3]).

The base station shall set this field to a value in the range 0 to 10 inclusive, corresponding to the encoder packet sizes 192, 408, 792, 1560, 3096, 4632, 6168, 9240, 12312, 15384, and 18456 bits respectively.
**REV_PDCH_PARMS_INCL** - Reverse Packet Data Channel related parameters included indicator.

The base station shall set this field to ‘1’ if the R-PDCH parameters are included in this message; otherwise, the base station shall set this field to ‘0’.

**REV_PDCH_NUM_ARQ_ROUNDS_NORMAL** - Maximum number of allowed ARQ rounds on the Reverse PDCH in the non-boosted mode.

If REV_PDCH_PARMS_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to one less the maximum number of allowed ARQ rounds on the Reverse PDCH in the non-boosted mode. The base station shall set this field to 0, 1, or 2 corresponding to 1, 2, or 3 rounds respectively (See [3]).

**REV_PDCH_NUM_ARQ_ROUNDS_BOOST** - Maximum number of allowed HARQ retransmissions on the Reverse PDCH in the boosted mode.

If REV_PDCH_PARMS_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to one less the maximum number of allowed ARQ rounds on the Reverse PDCH in the boosted mode. The base station shall set this field to 0, 1, or 2 corresponding to 1, 2, or 3 rounds respectively (See [3]).

3.7.3.3.2.50 AUTO_REQ_TRAF_ALLOWED_IND - Autonomous BCMC request on traffic channel allowed indicator.
The base station shall set this field to ‘1’ to indicate that the mobile station is allowed to request for a BCMC flow on traffic channel that is not included in this message; otherwise, the base station shall set this field to ‘0’.

BCMC_ON_IDLE_SUP - BCMC on idle state supported indicator.

The base station shall set this field to ‘1’ to indicate that the BCMC feature is supported on idle state; otherwise, the base station shall set this field to ‘0’.

BCMC_FLOWS_ON_TRAFFIC_ONLY_IND - BCMC flows on traffic channel only indicator.

If the BCMC_ON_IDLE_SUP_IND field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if this message contains information only about BCMC flows on traffic channel; otherwise, the base station shall set this field to ‘0’.

AUTH_SIGNATURE_REQUIRED - Authorization signature required indication.

The base station shall set this field to ‘1’ to indicate that the mobile station is to include the authorization signature in the Origination Message, Page Response Message and Enhanced Origination Message that include BCMC_FLOW_ID (see 2.6.13.11) for BCMC flows indicated in this message is included in that message; otherwise, the base station shall set this field to ‘0’.

NON_DEFAULT_VALUE_INCLUDED - Non-default values for Authorization signature included indicator.

If the AUTH_SIGNATURE_REQUIRED field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘0’ if default values are to be used to generate the Authorization signature; otherwise, the base station shall set this field to ‘1’.

ACH_TIME_STAMP_SHORT_LENGTH - Length of time stamp for use on r-csch.

If the NON_DEFAULT_VALUE_INCLUDED field is not included or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the length of the time stamp, in units of bits, included on the Origination Message, Page Response Message and Enhanced Origination Message.

TIME_STAMP_LONG_LENGTH - Length of time stamp.

If the NON_DEFAULT_VALUE_INCLUDED field is not included or is included and is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
The base station shall set this field to the length of the time stamp, in units of bits, used to generate the Authorization signature.

**TIME_STAMP_UNIT** - Unit for time stamp length.

If the `NON_DEFAULT_VALUE_INCLUDED` field is not included or is included and is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the unit of the time stamp length field as follows: the unit of the time stamp field shall be $2^{(\text{value of this field})}$.

**NUM_BCMC_PROGRAMS** - Number of BCMC Programs.

The base station shall set this field to the number of BCMC programs available in this base station in any one of the frequencies `minus one`.

The base station shall not set this field to '000000'.

The base station shall include `NUM_BCMC_PROGRAMS plus one` occurrences of the following variable length record:

**BCMC_PROGRAM_ID_LEN** - Length of BCMC_PROGRAM_ID field

The base station shall set this field to one less than the length in bits of the BCMC_PROGRAM_ID of this program.

**BCMC_PROGRAM_ID** - BCMC program Identifier

The length of this field shall be one more than the value of `BCMC_PROGRAM_ID_LEN` bits.

The base station shall set this field to the BCMC program identifier of this program.

**BCMC_FLOW_DISCRIMINATOR_LEN** - Length of BCMC_FLOW_DISCRIMINATOR field

The base station shall set this field to the length in bits of the BCMC_FLOW_DISCRIMINATOR of this program.

**NUM_FLOW_DISCRIMINATOR** - Number of BCMC flow discriminators

The length of this field shall be determined by the value of the `BCMC_FLOW_DISCRIMINATOR_LEN` as follows: if `BCMC_FLOW_DISCRIMINATOR_LEN` is set to '000', this field is omitted; otherwise, the length of this field shall be `BCMC_FLOW_DISCRIMINATOR_LEN` bits.

The base station shall set this field to the number of flow discriminators included for this program `minus one`.

If `NUM_FLOW_DISCRIMINATOR` field is included, the base station shall include `NUM_FLOW_DISCRIMINATOR+1` occurrences of the following variable length record; otherwise, the base station shall include 1 occurrence of the following variable length record:

**BCMC_FLOW_DISCRIMINATOR** - BCMC flow discriminator
The length of this field shall be determined by the value of the
BCMC_FLOW_DISCRIMINATOR_LEN as follows: if
BCMC_FLOW_DISCRIMINATOR_LEN is set to '000', this field
is omitted; otherwise, the length of this field shall be
BCMC_FLOW_DISCRIMINATOR_LEN bits.

The base station shall set this field to the BCMC flow
discriminator of this flow.

AUTH_SIGNATURE_REQ_IND - Authorization signature required indicator

If the AUTH_SIGNATURE_REQUIRED field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if the mobile station is to include the authorization signature in the Origination Message, Page Response Message, and Enhanced Origination Message for this BCMC flow; otherwise, the base station shall set this field to ‘0’.

BCMC_FLOW_ON_TRAFFIC_IDLE_IND - BCMC flow on traffic state or idle state supported indicator.

If the BCMC_FLOWS_ON_TRAFFIC_ONLY_IND field is not included or is included and set to ‘1’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field as specified in Table 3.7.3.3.2.50-1 to indicate the availability of this flow in the traffic state or idle state.

Table 3.7.3.3.2.50-1. BCMC Flow Availability

<table>

</tr>
<tr>
<td>11</td>
<td>Reserved</td>
</tr>
</tbody>
</table>
3.7.4 Orders

Order Messages are sent by the base station on the f-csch and the f-dsch. The general PDU format used on the f-csch is defined in 3.7.2.3.2.7, and the general PDU format used on the f-dsch is defined in 3.7.3.3.2.1. There are many specific types of Order Messages, as shown in Table 3.7.4-1.

The base station may send on the f-csch any type of order shown in Table 3.7.4-1 with a ‘Y’ in the first column, but shall not send on the f-csch any type of order with an ‘N’ in the first column. The base station may send on the f-dsch any type of order shown in Table 3.7.4-1 with a ‘Y’ in the second column, but shall not send on the f-dsch any type of order with an ‘N’ in the second column.

An order consists of a 6-bit order code and zero or more order-specific fields. The base station shall set the ORDER field in the Order Message to the order code shown in Table 3.7.4-1 corresponding to the type of order being sent.

If the order qualification code in the fourth column of Table 3.7.4-1 is ‘00000000’ and there are no other additional fields as shown by an ‘N’ in the sixth column, the base station shall include no order qualification code or other order-specific fields in the Order Message. The order qualification code of such a message is implicitly ‘00000000’.

If the order qualification code is not ‘00000000’ and there are no other additional fields as shown in Table 3.7.4-1 by an ‘N’ in the sixth column, the base station shall include the order qualification code as the only order specific field in the Order Message.

If there are other additional fields as shown in Table 3.7.4-1 by a ‘Y’ in the sixth column, the base station shall include order-specific fields as specified in the corresponding subsection of this section.

</tr>
<tr>
<td>RESERVED</td>
<td>0 – 7 (as needed)</td>
</tr>
</tbody>
</table>

**ORDQ** - Order qualification code.

If only ORDQ is included in the order, the base station shall set this field to ‘00000000’. If only ORDQ and ROAM_INDI are included in the order, the base station shall set this field to ‘00000101’. If ORDQ, ROAM_INDI, and the signaling encryption related fields are included in the order, the base station shall set this field to ‘00000111’.

**ROAM_INDI** - Roaming display indication.

If ORDQ is set to ‘00000000’, the base station shall omit this field.

If ORDQ is set to ‘00000101’ or ‘00000111’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field.

The base station shall set it to the appropriate ROAM_INDI code corresponding to the MS roaming condition. These values are defined in [30].

**C_SIG_ENCRYPT_MODE** - Common channel signaling encryption mode indicator.

If ORDQ is set to ‘00000111’, the base station shall include this field and shall set it as follows; otherwise, the base station shall omit this field.

The base station shall set it to the common channel signaling encryption mode, as shown in Table 3.7.4.5-1; otherwise the base station shall omit this field.
<table>
<thead>

<td>128 bits</td>
</tr>
<tr>
<td>011-111</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

MSG_INT_INFO_INCL – Message integrity information included indicator
If ORDQ is set to ‘00000111’, the base station shall include this field and shall set it as follows; otherwise, the base station shall omit this field.

The base station shall set this field to ‘1’ if the base station supports message integrity; otherwise, the base station shall set this field to ‘0’.

**CHANGE_KEYS** – Change keys indicator

If MSG_INT_INFO_INCL is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘0’ to command the mobile station not to update the encryption key and integrity key. The base station shall set this field to ‘1’ to command the mobile station to update the encryption key and integrity key to the latest being generated.

**USE_UAK** – Use UAK indicator

If MSG_INT_INFO_INCL is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the base station receives an authentication vector with a UAK, the base station shall set this field to ‘1’ to indicate that the mobile station is to use UMAC; otherwise, the base station shall set this field to ‘0’ to indicate that the mobile station is to use MAC-I.

**RESERVED** – Reserved bits.

The base station shall add reserved bits as needed in order to make the total length of the fields included in this order equal to an integer number of octets. The base station shall set these bits to ‘0’.
3.7.4.6 Periodic Pilot Measurement Request Order

The *Periodic Pilot Measurement Request Order* can be sent only on the f-dsch.

<table>

</table>

**ORDQ** - Order qualification code.

If INCL_SETPT equals ‘0’, the base station shall set this field to a report period, in units of 0.08 seconds, in the range of ‘00001010’ to ‘11111110’ inclusive; otherwise, the base station shall set this field to a report period, in units of 0.08 seconds, in the range of ‘00000001’ to ‘11111111’ inclusive. The base station shall set this field to ‘11111111’ to request a one time *Periodic Pilot Strength Measurement Message*.

**MIN_PILOT_PWR_THresh** - The threshold of the total received E\(_c\) of the pilots in the Active Set.

If the mobile station is to report pilot strength measurements periodically to the base station irrespective of the pilot power of the Active Set, the base station shall set this field to ‘11111’; otherwise, the base station shall set this field to the total E\(_c\) threshold, expressed as an unsigned binary number equal to:

\[
\left\lceil \frac{(10 \times \log_{10}(\text{pilot}_{\text{ec}}_{\text{thresh}}) + 120)}{2} \right\rceil
\]

where *pilot_ec_thresh* is the threshold of the mobile station received total E\(_c\) (in mW) of the pilots in the Active Set below which the mobile station is to send the pilot strength measurements periodically to the base station.

**MIN_PILOT_EC_Io_0_THresh** - Pilot Strength Threshold of Serving Frequency.

If the mobile station is to ignore this threshold, the base station shall set this field to ‘11111’; otherwise, the base station shall set this field to the total E\(_c\)/I\(_o\) threshold, expressed as an unsigned binary number equal to:

\[
\left\lfloor -20 \times \log_{10} \text{pilot}_{\text{streng}}_{\text{thresh}} \right\rfloor
\]
where `pilot_streng_thresh` is the threshold of the total received $E_{c}/I_{0}$ of the pilots in Active Set (see 2.6.6.2.2) below which the mobile station is to send the pilot strength measurements periodically to the base station.

<tr>
<td>6 to 0</td>
<td>Retry Delay interval</td>
</tr>
</tbody>
</table>

If RETRY_TYPE is set to ‘010’ or ‘011’, the base station shall set this field to the duration of the delay interval in units of 320 ms during which the mobile station is not permitted to send another Supplemental Channel Request (Mini) Message or Resource Request (Mini) Message. The base station shall set RETRY_DELAY to ‘00000000’ to indicate that there is no retry delay or to clear a previously set retry delay. The base station shall set RETRY_DELAY to ‘11111111’ to indicate that the mobile station is to refrain from sending the request indefinitely.

If RETRY_TYPE is set to ‘100’, the base station shall set this field to the duration of the delay interval, as shown in Table 3.7.4.7-2, during which the mobile station is not permitted to send a Short Data Burst (see [30], [42]). The base station shall set this field to ‘00000000’ to indicate that there is no retry delay or to clear a previously set retry delay.

If RETRY_TYPE is set to ‘101’, the base station shall set this field to the duration of the delay interval, as shown in Table 3.7.4.7-2, during which the mobile station is not permitted to send a Short Data Burst (see [30], [42]) and the mobile station is not permitted to send an Origination Message, Reconnect Message, or an Enhanced Origination Message with a Packet Data Service Option. The base station shall set this field to ‘00000000’ to indicate that there is no retry delay or to clear a previously set retry delay.

If RETRY_TYPE is set to ‘010’ or ‘011’, the base station shall set this field to the duration of the delay interval in units of 320 ms during which the mobile station is not permitted to send another Supplemental Channel Request (Mini) Message or Resource Request (Mini) Message. The base station shall set RETRY_DELAY to ‘00000000’ to indicate that there is no retry delay or to clear a previously set retry delay. The base station shall set RETRY_DELAY to ‘11111111’ to indicate that the mobile station is to refrain from sending the request indefinitely.

If RETRY_TYPE is set to ‘100’, the base station shall set this field to the duration of the delay interval, as shown in Table 3.7.4.7-2, during which the mobile station is not permitted to send a Short Data Burst (see [30], [42]). The base station shall set this field to ‘00000000’ to indicate that there is no retry delay or to clear a previously set retry delay.

If RETRY_TYPE is set to ‘101’, the base station shall set this field to the duration of the delay interval, as shown in Table 3.7.4.7-2, during which the mobile station is not permitted to send a Short Data Burst (see [30], [42]) and the mobile station is not permitted to send an Origination Message, Reconnect Message, or an Enhanced Origination Message with a Packet Data Service Option. The base station shall set this field to ‘00000000’ to indicate that there is no retry delay or to clear a previously set retry delay.

---

12 Packet data service option refers to SO 60, SO 61 or any service option in Service Option Group 4 and 5 in [30]
The base station shall set this field to ‘00000’.
1 3.7.4.8 Reserved.
3.7.4.9 Base Station Reject Order

The *Base Station Reject Order* can be sent on either the f-csch or on the f-dsch to indicate the base station does not accept a message from a mobile station due to encryption error, message integrity error, or both.

<table>
<thead>
<tr>

<td>Reserved</td>
<td>Reserved</td>
</tr>
</tbody>
</table>
REJECTED_MSG_TYPE - Message type of the rejected message.

The base station shall set this field to the value of the MSG_TYPE or the MSG_ID (see [4]) field of the message being rejected.

If the MSG_TYPE or the MSG_ID (see [4]) field is not 8 bits, the base station shall set the least significant bits of this field to the value of the MSG_TYPE field and set all the remaining bits to '0'.

REJECTED_MSG_SEQ - The Layer 2 message sequence number (see [4]) of the rejected message.

The base station shall set this field to the Layer 2 message sequence number (see [4]) of the rejected message.
3.7.4.10 BCMC Order

The BCMC Order is sent on f-csch or f-dsch to provide information on the requested BCMC flows.

<table>
<thead>
<tr>
<th>Order Specific Field</th>

<tr>
<td>BCMC_RETRY_DELAY</td>
<td>0 or 8</td>
</tr>
</tbody>
</table>

/ (NUM_FLOW_DISCRIMINATOR+1) or 1

/ (NUM_BCMC_PROGRAMS+1)

ORDQ - Order qualification code.

The base station shall set this field to ‘00000000’.
ALL_BCMC_FLOWS_IND – All BCMC flows indicator.

The base station shall set this field to ‘1’ to indicate the ALL_BCMC_REASON applies to all flows for which mobile station is expecting a response; otherwise the base station shall set this field to ‘0’.

CLEAR_ALL_RETRY_DELAY - Clear all retry delay indicator

If ALL_BCMC_FLOWS_IND is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ to indicate that the mobile station should clear all retry delays associated with each BCMC Flow; otherwise the base station shall set this field to ‘0’.

ALL_BCMC_REASON - All BCMC reason.

If ALL_BCMC_FLOWS_IND is set to ‘0’ or if CLEAR_ALL_RETRY_DELAY is set to ‘1’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field as specified in Table 3.7.4.10-1 to indicate the purpose of this order.

Table 3.7.4.10-1 BCMC Reason

<table>
<thead>
<tr>
<th>Value (binary)</th>
<th>BCMC_REASON/ALL_BCMC_REASON</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000</td>
<td>BCMC_FLOW_ID not available</td>

<tr>
<td>0011</td>
<td>BCMC Registration Accepted; requested BCMC flow will be transmitted at a later time</td>
</tr>
<tr>
<td>0100</td>
<td>Authorization failure</td>
</tr>
<tr>
<td>0101</td>
<td>Retry later</td>
</tr>
<tr>
<td>0110-1111</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

ALL_BCMC_RETRY_DELAY - All BCMC retry delay.
If the ALL_BCMC_FLOWS_IND is set to ‘0’ or if CLEAR_ALL_RETRY_DELAY is set to ‘1’ or if ALL_BCMC_REASON field is not included or is included and is not set to ‘0101’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the duration of the delay interval, as shown in Table 3.7.4.10-2, during which the mobile station is not permitted to request any BCMC flows. The base station shall not set this field to ‘00000000’.

Table 3.7.4.10-2 BCMC Retry Delay

<table>
<thead>
<tr>

</tbody>
</table>

NUM_BCMC_PROGRAMS – Number of BCMC programs included.

If ALL_BCMC_FLOWS_IND is set to ‘1’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to the number of BCMC programs included in this message minus one.

If the NUM_BCMC_PROGRAMS field is included, the base station shall include NUM_BCMC_PROGRAMS plus one occurrences of the following record:

BCMC_PROGRAM_ID_LEN - Length of BCMC_PROGRAM_ID field

The base station shall set this field to one less than the length in bits of the BCMC_PROGRAM_ID of this program.

BCMC_PROGRAM_ID - BCMC program Identifier

The length of this field shall be one more than the value of BCMC_PROGRAM_ID_LEN bits.

The base station shall set this field to the BCMC program identifier of this program.

BCMC_FLOW_DISCRIMINATOR_LEN - Length of BCMC_FLOW_DISCRIMINATOR field

The base station shall set this field to the length in bits of the BCMC_FLOW_DISCRIMINATOR of this program.
NUM_FLOW_DISCRIMINATOR - Number of BCMC flow discriminators.

The length of this field shall be determined by the value of the BCMC_FLOW_DISCRIMINATOR_LEN as follows: if BCMC_FLOW_DISCRIMINATOR_LEN is set to ‘000’, this field is omitted; otherwise, the length of this field shall be BCMC_FLOW_DISCRIMINATOR_LEN bits.

The base station shall set this field to the number of flow discriminators included for this program minus one.

If NUM_FLOW_DISCRIMINATOR field is included, the base station shall include NUM_FLOW_DISCRIMINATOR+1 occurrences of the following variable length record; otherwise, the base station shall include 1 occurrence of the following variable length record:

BCMC_FLOW_DISCRIMINATOR – BCMC Flow discriminator.

The length of this field shall be determined by the value of the BCMC_FLOW_DISCRIMINATOR_LEN as follows: if BCMC_FLOW_DISCRIMINATOR_LEN is set to ‘000’, this field is omitted; otherwise, the length of this field shall be BCMC_FLOW_DISCRIMINATOR_LEN bits.

The base station shall set this field to the discriminator of the BCMC flow.

SAME_AS_PREVIOUS_BCMC_FLOW – Same As Previous BCMC Flow Identifier.

If CLEAR_RETRY_DELAY, BCMC_REASON and BCMC_RETRY_DELAY are the same for this BCMC_FLOW_ID (see 2.6.13.11) as for the previous BCMC_FLOW_ID, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

CLEAR_RETRY_DELAY – Clear retry delay indicator

If SAME_AS_PREVIOUS_BCMC_FLOW is set to ‘1’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field to ‘1’ to indicate that the mobile station should clear retry delay associated with this BCMC Flow; otherwise the base station shall set this field to ‘0’.

BCMC_REASON – BCMC reason.

If SAME_AS_PREVIOUS_BCMC_FLOW is set to ‘1’ or if CLEAR_RETRY_DELAY is set to ‘1’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

The base station shall set this field as specified in Table 3.7.4.10-1 to indicate the purpose for this order.
### Table 3.7.4.10-1 BCMC-Reason

### BCMC_RETRY_DELAY

- BCMC retry delay.

If the **SAME_AS_PREVIOUS_BCMC_FLOW** is set to ‘1’ or if **BCMC_REASON** field is not included or is included and is not set to ‘0101’ or if **CLEAR_RETRY_DELAY** is set to ‘1’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the duration of the delay interval, as shown in Table 3.7.4.10-2, during which the mobile station is not permitted to request this **BCMC_FLOW_ID**. The base station shall not set this field to ‘00000000’.

</tr>
</tbody>
</table>

**ORDQ** - Order qualification code.

The base station shall set this field to the ORDQ value shown in Table 3.7.4-1.

**RSC_MODE_SUPPORTED** - Reduced slot cycle mode supported indicator.

The base station shall set this field to ‘1’ if it supports the reduced slot cycle mode; otherwise, the base station shall set this field to ‘0’.
MAX_RSC_END_TIME_UNIT – Maximum reduced slot cycle mode end time unit.

If RSC_MODE_SUPPORTED is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field according to Table 2.7.3.5-1 to indicate the units of the MAX_RSC_END_TIME_VALUE field.

MAX_RSC_END_TIME_VALUE – Maximum reduced slot cycle mode end time value.

If RSC_MODE_SUPPORTED is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the maximum system time (modulo 16), in units of time specified by MAX_RSC_END_TIME_UNIT (modulo 16), at which the mobile station is to exit the reduced slot cycle mode.

REQ_RSCI – Requested reduced slot cycle index.

If ORDQ is equal to ‘00000000’ and RSC_MODE_SUPPORTED is equal to ‘1’, the base station shall set this field as specified in Table 2.7.1.3.2.1-8 to the reduced slot cycle index value that it is requesting the mobile station to operate with; otherwise, the base station shall omit this field.

IGNORE_QPCH – Ignore QPCH indicators.

If RSC_MODE_SUPPORTED is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ to indicate to the mobile station that it is not to check its assigned paging indicators on the QPCH while operating in the reduced slot cycle mode if the reduced slot cycle index is -3 or -4; otherwise, the base station shall set this field to ‘0’.

RER_MODE_INCL – Radio environment reporting mode information included indicator.

If radio environment reporting mode related fields are included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

RER_MODE_ENABLED – Radio environment reporting mode enabled indicator.

If RER_MODE_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the radio environment reporting mode is enabled in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

RER_MAX_NUM_MSG_IDX – Maximum number of Radio Environment Messages permitted while in radio environment reporting mode index.
If RER_MODE_ENABLED is not included, or is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the maximum number of Radio Environment Messages that the mobile station is allowed to transmit while in radio environment reporting mode, expressed as $2^{\text{RER_MAX_NUM_MSG_IDX}}$ where $0 \leq \text{RER_MAX_NUM_MSG_IDX} \leq 6$. If the mobile station is allowed to transmit an unlimited number of Radio Environment Messages, then the base station shall set this field to ‘111’.

RER_TIME - Radio environment report timer value.

If RER_MODE_ENABLED is not included, or is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the value of the radio-environment report timer, expressed as $2^{\text{RER_TIME}}$ where $0 \leq \text{RER_TIME} \leq 6$ and in units of RER_TIME_UNIT. If the value of the radio-environment report timer is infinite, then the base station shall set this field to ‘111’.

RER_TIME_UNIT - Radio environment report timer value units.

If RER_MODE_ENABLED is included and set to ‘1’, and RER_TIME is not set to ‘111’, the base station shall include this field and shall set it according to Table 3.7.3.3.2.34-5; otherwise, the base station shall omit this field.

MAX_RER_PILOT_LIST_SIZE - Maximum number of pilots to maintain in RER_PILOT_LIST.

If RER_MODE_ENABLED is not included, or is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the maximum number of pilots that the mobile station is to maintain in RER_PILOT_LIST (see [4]). The base station shall set this field to a value in the range 1 to 6 inclusive.

TKZ_MODE_INCL - Tracking zone mode information included indicator.

If tracking zone mode related fields are included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

TKZ_MODE_ENABLED - Tracking zone mode enabled indicator.

If TKZ_MODE_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the tracking zone mode is enabled in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.
TKZ_MAX_NUM_MSG_IDX - Maximum number of Radio Environment Messages permitted while in tracking zone mode index.

If TKZ_MODE_ENABLED is not included, or is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the maximum number of Radio Environment Messages that the mobile station is allowed to transmit while in tracking zone mode, expressed as $2^{TKZ_MAX_NUM_MSG_IDX}$ where $0 \leq TKZ_MAX_NUM_MSG_IDX \leq 6$. If the mobile station is allowed to transmit an unlimited number of Radio Environment Messages, then the base station shall set this field to ‘111’.

TKZ_UPDATE_PRD - Tracking zone update period.

If TKZ_MODE_ENABLED is not included, or is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field such that the desired tracking zone update timer value is $2^{TKZ_UPDATE_PRD+6}$ seconds. If the value of the timer is infinite, then the base station shall set this field to ‘1111’.

TKZ_LIST_LEN - Tracking zone list length.

If TKZ_MODE_ENABLED is not included, or is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the length of the tracking zone list minus one.

TKZ_TIMER - Tracking zone timer.

If TKZ_MODE_ENABLED is not included, or is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the value of the tracking zone timer (in units of seconds) minus one.
3.7.4.12 Service Status Order

The *Service Status Order* can be sent on f-csch or f-dsch to indicate the status of the services requested by the mobile station.

<table>
<thead>
<tr>
<th>Order Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORDQ</td>
<td>8</td>
</tr>
<tr>
<td>SR_ID_BITMAP</td>
<td>6</td>
</tr>
</tbody>
</table>

**ORDQ** – Order qualification code. The base station shall set this field to ‘00000000’.

**SR_ID_BITMAP** – Service Reference Identifier Bitmap. This field consists of the subfields defined in Table 3.7.4.12-1. The base station shall set a subfield to ‘1’ to indicate that the service status information corresponding to the service reference identifier is included in this message; otherwise, the base station shall set the subfield to ‘0’.

**Table 3.7.4.12-1. SR_ID_BITMAP Subfields.**

<table>
<thead>
<tr>
<th>Subfield</th>
<th>Length (bits)</th>
<th>Subfield Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SR_ID_1</td>
<td>1</td>
<td>SR_ID 1 service status included indicator</td>
</tr>
<tr>
<td>SR_ID_2</td>
<td>1</td>
<td>SR_ID 2 service status included indicator</td>
</tr>
<tr>
<td>SR_ID_3</td>
<td>1</td>
<td>SR_ID 3 service status included indicator</td>
</tr>
<tr>
<td>SR_ID_4</td>
<td>1</td>
<td>SR_ID 4 service status included indicator</td>
</tr>
<tr>
<td>SR_ID_5</td>
<td>1</td>
<td>SR_ID 5 service status included indicator</td>
</tr>
<tr>
<td>SR_ID_6</td>
<td>1</td>
<td>SR_ID 6 service status included indicator</td>
</tr>
</tbody>
</table>

The base station shall include the following subrecord for each bit set to ‘1’ in **SR_ID_BITMAP**:

**SERVICE_STATUS** – Service Status. The base station shall set this field to the **SERVICE_STATUS** value shown in Table 3.7.4.12-2 indicating the service status corresponding to this service reference identifier.
Table 3.7.4.12-2. Service Status Values

<table>
<thead>
<tr>
<th>SERVICE_STATUS Value (binary)</th>
<th>Service Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>000</td>
<td>Service request accepted</td>
</tr>
<tr>
<td>001</td>
<td>Service request rejected</td>
</tr>
<tr>
<td></td>
<td>All other values are reserved.</td>
</tr>
</tbody>
</table>

RESERVED - Reserved bits.

The base station shall add reserved bits as needed in order to make the total length of the fields included in this order equal to an integer number of octets. The base station shall set these bits to ‘0’.
3.7.4.13 Location Services Order

<table>
<thead>
<tr>
<th>Order Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORDQ</td>
<td>8</td>
</tr>
<tr>
<td>REGULATORY_IND_INCL</td>
<td>1</td>
</tr>
<tr>
<td>REGULATORY_IND</td>
<td>0 or 2</td>
</tr>
</tbody>
</table>

ORDQ - Order qualification code.

The base station shall set this field to the ORDQ value shown in Table 3.7.4-1.

REGULATORY_IND_INCL - Regulatory indicator included.

The base station shall set this field to ‘0’ to indicate that the mobile station is to release all current location sessions associated with *Data Burst Message* transport; the base station shall set this field to ‘1’ to indicate that the mobile station is to release the current location session that is associated with *Data Burst Message* transport corresponding to the regulatory type specified by this message.

REGULATORY_IND - Regulatory indication.

If the REGULATORY_IND_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to indicate the regulatory type, as specified in [43], of the position location session that the mobile station is to release.
3.7.5 Information Records

On the f-csch, information records may be included in the Feature Notification Message. On the f-dsch, information records may be included in the Alert with Information Message, the Flash with Information Message, the Extended Alert with Information Message, the Extended Flash with Information Message, the Service Request Message, the Service Response Message, the Service Connect Message, the General Handoff Direction Message, and the Universal Handoff Direction Message. Table 3.7.5-1 lists the information record type values that may be used with each message type. The following sections describe the contents of each of the record types in detail.
Table 3.7.5-1. Information Record Types (Part 1 of 3)

All other record type values are reserved.

“AWI” refers to either the *Alert With Information Message* or the *Extended Alert With Information Message*.

“FWI” refers to either the *Flash With Information Message* or the *Extended Flash With Information Message*. 
3.7.5.1 Display

This information record allows the network to supply display information that may be displayed by the mobile station.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHARi</td>
<td>8</td>
</tr>
</tbody>
</table>

One or more occurrences of the following field:

`CHARi`

CHARi - Character.

The base station shall include one occurrence of this field for each character to be displayed. The base station shall set each occurrence of this field to the ASCII representation corresponding to the character entered, as specified in [9], with the most significant bit set to ‘0’.
3.7.5.2 Called Party Number

This information record identifies the called party’s number.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>NUMBER_TYPE</td>
<td>3</td>
</tr>
<tr>
<td>NUMBER_PLAN</td>
<td>4</td>
</tr>
</tbody>
</table>

Zero or more occurrences of the following field:

/ 

CHARi 8

/ 

RESERVED 1

5  NUMBER_TYPE - Type of number.

The base station shall set this field to the NUMBER_TYPE value shown in Table 2.7.1.3.2.4-2 corresponding to the type of the called number, as defined in [7], Section 4.5.9.

9  NUMBER_PLAN - Numbering plan.

The base station shall set this field to the NUMBER_PLAN value shown in Table 2.7.1.3.2.4-3 corresponding to the numbering plan used for the called number, as defined in [7], Section 4.5.9.

14  CHARi - Character.

The base station shall include one occurrence of this field for each character in the called number. The base station shall set each occurrence of this field to the ASCII representation corresponding to the character, as specified in [9], with the most significant bit set to ‘0’.

20  RESERVED - Reserved bits.

The base station shall set this field to ‘0’.
3.7.5.3 Calling Party Number

This information record identifies the calling party’s number.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>NUMBER_TYPE</td>
<td>3</td>
</tr>

<tr>
<td>SI</td>
<td>2</td>
</tr>
</tbody>
</table>

Zero or more occurrences of the following field:

/C/

CHARi 8

/}

RESERVED 5

NUMBER_TYPE - Type of number.

The base station shall set this field to the NUMBER_TYPE value shown in Table 2.7.1.3.2.4-2 corresponding to the type of the calling number, as defined in [7], Section 4.5.9.

NUMBER_PLAN - Numbering plan.

The base station shall set this field to the NUMBER_PLAN value shown in Table 2.7.1.3.2.4-3 corresponding to the numbering plan used for the calling number, as defined in [7], Section 4.5.9.

PI - Presentation indicator.

This field indicates whether or not the calling number should be displayed.

The base station shall set this field to the PI value shown in Table 2.7.4.4-1 corresponding to the presentation indicator, as defined in [7], Section 4.5.9.

SI - Screening indicator.

This field indicates how the calling number was screened.

The base station shall set this field to the SI value shown in Table 2.7.4.4-2 corresponding to the screening indicator value, as defined in [7], Section 4.5.9.
<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Zero or more occurrences of the following field:

| CHARi               | 8             |

RESERVED 5

**NUMBER_TYPE** - Type of number.

The base station shall set this field to the NUMBER_TYPE value shown in Table 2.7.1.3.2.4-2 corresponding to the type of the connected number, as defined in [7], Section 4.5.9.

**NUMBER_PLAN** - Numbering plan.

The base station shall set this field to the NUMBER_PLAN value shown in Table 2.7.1.3.2.4-3 corresponding to the numbering plan used for the connected number, as defined in [7], Section 4.5.9.

**PI** - Presentation indicator.

This field indicates whether or not the connected number should be displayed.

The base station shall set this field to the PI value shown in Table 2.7.4.4-1 corresponding to the presentation indicator, as defined in [7], Section 4.5.9.

**SI** - Screening indicator.

This field indicates how the connected number was screened.

The base station shall set this field to the SI value shown in Table 2.7.4.4-2 corresponding to the screening indicator value, as defined in [7], Section 4.5.9.
CHARi - Character.

The base station shall include one occurrence of this field for each character in the connected number. The base station shall set each occurrence of this field to the ASCII representation corresponding to the character, as specified in [9], with the most significant bit set to '0'.

RESERVED - Reserved bits.

The base station shall set this field to ‘00000’.
3.7.5.5 Signal

This information record allows the network to convey information to a user by means of tones and other alerting signals.

The Standard Alert is defined as SIGNALTYPE = ‘10’, ALERT_PITCH = ‘00’ and SIGNAL = ‘000001’.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>IS-54B Alerting</td>
<td>10</td>
</tr>
<tr>
<td>Reserved</td>
<td>11</td>
</tr>
</tbody>
</table>

**ALERT_PITCH** - Pitch of the alerting signal.

This field is ignored by the mobile station unless SIGNALTYPE is ‘10’, IS-54B Alerting.

If SIGNALTYPE is ‘10’, the base station shall set this field to the alert pitch shown in Table 3.7.5.5-2; otherwise, the base station shall set this field to ‘00’.
Table 3.7.5.5-2. Alert Pitch

</tr>
</tbody>
</table>

SIGNAL  -  Signal code.

The base station shall set this field to the specific signal desired. If SIGNAL_TYPE is ‘00’, the base station shall set this field as described in Table 3.7.5.5-3. If SIGNAL_TYPE is ‘01’, the base station shall set this field as described in Table 3.7.5.5-4. If SIGNAL_TYPE is ‘10’, the base station shall set this field as described in Table 3.7.5.5-5.

All other SIGNAL values are reserved

RESERVED - Reserved bits.

The base station shall set this field to ‘000000’.

3-888
3.7.5.6 Message Waiting

This information record conveys to the user the number of messages waiting.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>MSG_COUNT</td>
<td>8</td>
</tr>
</tbody>
</table>

MSG_COUNT  -  Number of waiting messages.

The base station shall set this field to the number of messages waiting.
3.7.5.7 Service Configuration

For the mobile station, this record is included in a Status Response Message to return the current service configuration, and in a Service Request Message and a Service Response Message to propose a service configuration.

For a base station, this record is included in a Service Request Message and a Service Response Message to propose a service configuration. It is included in a Service Connect Message to specify an actual service configuration to be used. It can be included in a General Handoff Direction Message and Universal Handoff Direction Message to specify an actual service configuration to be used.

FOR_MUX_OPTION - Forward multiplex option.

If P_REV_IN_USEs is less than eight, the mobile station shall set this field as follows:
For a *Status Response Message*, the mobile station shall set this field to the number of the multiplex option for the Forward Fundamental Channel, Forward Dedicated Control Channel, or both, if both are present (e.g., 1 corresponds to Multiplex Option 1).

For a *Service Request Message* and a *Service Response Message*, the mobile station shall set this field to the number of the multiplex option for the Forward Fundamental Channel, Forward Dedicated Control Channel, or both, if both are present.

If $P_{REV\_IN\_USE_s}$ is greater than or equal to eight, the mobile station shall set this field as follows:

For a *Status Response Message*, the mobile station shall set this field to the number of the multiplex option for the Forward Fundamental Channel, Forward Dedicated Control Channel, or both (e.g., 1 corresponds to Multiplex Option 1), according to the value as specified by $FCH\_DCCH\_MUX\_OPTION\_IND$.

For a *Service Request Message* and a *Service Response Message*, the mobile station shall set this field to the number of the multiplex option for the Forward Fundamental Channel, Forward Dedicated Control Channel, or both, according to the value as specified by $FCH\_DCCH\_MUX\_OPTION\_IND$.

If neither the Forward Fundamental Channel nor Forward Dedicated Control Channel configuration is assigned, then the mobile station shall set this field to 0.

If $MOB\_P\_REV$ is less than eight, the base station shall set this field as follows:

For a *Service Request Message* and a *Service Response Message*, the base station shall set this field to the number of the multiplex option for the Forward Fundamental Channel, Forward Dedicated Control Channel, or both, if both are present.

For a *Service Connect Message*, *General Handoff Direction Message*, and a *Universal Handoff Direction Message*, the base station shall set this field to the number of the multiplex option for the Forward Fundamental Channel, Forward Dedicated Control Channel, or both, if both are present.

If $MOB\_P\_REV$ is greater than or equal to eight, the base station shall set this field as follows:
For a *Service Request Message* and a *Service Response Message*, the base station shall set this field to the number of the multiplex option for the Forward Fundamental Channel, Forward Dedicated Control Channel, or both, according to the value as specified by FCH_DCCH_MUX_OPTION_IND.

For a *Service Connect Message, General Handoff Direction Message,* and a *Universal Handoff Direction Message*, the base station shall set this field to the number of the multiplex option for the Forward Fundamental Channel, Forward Dedicated Control Channel, or both, according to the value as specified by FCH_DCCH_MUX_OPTION_IND.

If neither the Forward Fundamental Channel nor Forward Dedicated Control Channel configuration is assigned, the base station shall set this field to 0.

**REV_MUX_OPTION** - Reverse multiplex option.

If P_REV_IN_USE₈ is less than eight, the mobile station shall set this field as follows:

For a *Status Response Message*, the mobile station shall set this field to the number of the multiplex option for the Reverse Fundamental Channel, Reverse Dedicated Control Channel, or both, if both are present (e.g., 1 corresponds to Multiplex Option 1).

For a *Service Request Message* and a *Service Response Message*, the mobile station shall set this field to the number of the multiplex option for the Reverse Fundamental Channel, Reverse Dedicated Control Channel, or both, if both are present.

If P_REV_IN_USE₈ is greater than or equal to eight, the mobile station shall set this field as follows:

For a *Status Response Message*, the mobile station shall set this field to the number of the multiplex option for the Reverse Fundamental Channel, Reverse Dedicated Control Channel, or both [e.g., 1 corresponds to Multiplex Option 1], according to the value as specified by FCH_DCCH_MUX_OPTION_IND.

For a *Service Request Message* and a *Service Response Message*, the mobile station shall set this field to the number of the multiplex option for the Reverse Fundamental Channel, Reverse Dedicated Control Channel, or both, according to the value as specified by FCH_DCCH_MUX_OPTION_IND.

If neither the Reverse Fundamental Channel nor Reverse Dedicated Control Channel configuration is assigned, the mobile station shall set this field to 0.
If MOB_P_REVP is less than eight, the base station shall set this field as follows:

For a *Service Request Message* and a *Service Response Message*, the base station shall set this field to the number of the multiplex option for the Reverse Fundamental Channel, Reverse Dedicated Control Channel, or both, if both are present.

For a *Service Connect Message, General Handoff Direction Message*, and a *Universal Handoff Direction Message*, the base station shall set this field to the number of the multiplex option for the Reverse Fundamental Channel, Reverse Dedicated Control Channel, or both, if both are present.

If MOB_P_REVP is greater than or equal to eight, the base station shall set this field as follows:

For a *Service Request Message* and a *Service Response Message*, the base station shall set this field to the number of the multiplex option for the Reverse Fundamental Channel, Reverse Dedicated Control Channel, or both, according to the value as specified by FCH_DCCH_MUX_OPTION_IND.

For a *Service Connect Message, General Handoff Direction Message*, and a *Universal Handoff Direction Message*, the base station shall set this field to the number of the multiplex option for the Reverse Fundamental Channel, Reverse Dedicated Control Channel, or both, according to the value as specified by FCH_DCCH_MUX_OPTION_IND.

**FOR_NUM_BITS** - Set of number of bits per frame of the Forward Fundamental Channel.

The mobile station shall set this field as follows:

The mobile station shall use the Forward Fundamental Channel transmission set of number of bits per frame specified in 2.7.4.28 for the specified Forward Traffic Channel multiplex option.

For a *Status Response Message*, the mobile station shall set the subfields corresponding to the Forward Traffic Channel transmission set of number of bits per frame of the current service configuration to ‘1’, and shall set the remaining subfields to ‘0’. If FOR_MUX_OPTION is equal to 1 or 2, the mobile station shall set RESERVED to ‘0000’. If the Forward Fundamental Channel configuration is not specified in this record, then the mobile station shall set this field to 0.
For a *Service Request Message* and a *Service Response Message*, the mobile station shall set the subfields corresponding to the Forward Traffic Channel transmission set of number of bits per frame of the proposed service configuration to ‘1’, and shall set the remaining subfields to ‘0’. If FOR_MUX_OPTION is equal to 1 or 2, the mobile station shall set RESERVED to ‘0000’. If the Forward Fundamental Channel configuration is not specified in this record, then the mobile station shall set this field to 0.

The base station shall set this field as follows:

The base station shall set this field to the Forward Fundamental Channel transmission set of number of bits per frame specified in 2.7.4.28 for the specified Forward Traffic Channel multiplex option.

For a *Service Request Message* or a *Service Response Message*, the base station shall set the subfields corresponding to the Forward Fundamental Channel transmission set of number of bits per frame of the proposed service configuration to ‘1’, and shall set the remaining subfields to ‘0’. If FOR_MUX_OPTION is equal to 1 or 2, the base station shall set RESERVED to ‘0000’. If the Forward Fundamental Channel configuration is not specified in this record, then the base station shall set this field to 0.

For a *Service Connect Message, General Handoff Direction Message*, and a *Universal Handoff Direction Message*, the base station shall set the subfields corresponding to the Forward Fundamental Channel transmission set of number of bits per frame of the actual service configuration to be used to ‘1’, and shall set the remaining subfields to ‘0’. If FOR_MUX_OPTION is equal to 1 or 2, the base station shall set RESERVED to ‘0000’. If the Forward Fundamental Channel configuration is not specified in this record, then the base station shall set this field to 0.

**REV_NUM_BITS** - Set of number of bits per frame of the Reverse Fundamental Channel.

The mobile station shall set this field as follows:

The mobile station shall use the Reverse Fundamental Channel transmission set of number of bits per frame specified in 2.7.4.28 for the specified Reverse Traffic Channel multiplex option.
For a *Status Response Message*, the mobile station shall set the subfields corresponding to the Reverse Traffic Channel transmission set of number of bits per frame of the current service configuration to ‘1’, and shall set the remaining subfields to ‘0’. If REV_MUX_OPTION is equal to 1 or 2, the mobile station shall set RESERVED to ‘0000’.

For a *Service Request Message* and a *Service Response Message*, the mobile station shall set the subfields corresponding to the Reverse Traffic Channel transmission set of number of bits per frame of the current service configuration to ‘1’, and shall set the remaining subfields to ‘0’. If REV_MUX_OPTION is equal to 1 or 2, the mobile station shall set RESERVED to ‘0000’.

The base station shall set this field as follows:

The base station shall set this field to the Reverse Fundamental Channel transmission set of number of bits per frame specified in 2.7.4.28 for the specified Reverse Traffic Channel multiplex option.

For a *Service Request Message* or a *Service Response Message*, the base station shall set the subfields corresponding to the Reverse Fundamental Channel transmission set of number of bits per frame of the proposed service configuration to ‘1’, and shall set the remaining subfields to ‘0’. If REV_MUX_OPTION is equal to 1 or 2, the base station shall set RESERVED to ‘0000’.

For a *Service Connect Message*, *General Handoff Direction Message*, and a *Universal Handoff Direction Message*, the base station shall set the subfields corresponding to the Reverse Fundamental Channel transmission set of number of bits per frame of the proposed service configuration to be used to ‘1’, and shall set the remaining subfields to ‘0’. If REV_MUX_OPTION is equal to 1 or 2, the base station shall set RESERVED to ‘0000’.

**NUM_CON_REC** - Number of service option connection records.

The mobile station shall set this field as follows:

The mobile station shall set this field to the number of service option connection records included in the message.

The base station shall set this field as follows:

The base station shall set this field to the number of service option connection records included in the message.

For a *Status Response Message*, the mobile station shall include one occurrence of the
following variable-length record for each service option connection of the current service configuration. For a Service Request Message and a Service Response Message, the mobile station shall include one occurrence of the following variable-length record for each service option connection of the proposed service configuration.

For a Service Request Message or a Service Response Message, the base station shall include one occurrence of the following variable-length record for each service option connection of the proposed service configuration.

For a Service Connect Message, a General Handoff Direction Message, or a Universal Handoff Direction Message, the base station shall include one occurrence of the following variable-length record for each service option connection of the actual service configuration to be used.

RECORD_LEN - Service option connection record length.

The mobile station shall set this field as follows:

The mobile station shall set this field to the number of octets included in this service option connection record including this field.

The base station shall set this field as follows:

The base station shall set this field to the number of octets included in this service option connection record including this field.

CON_REF - Service option connection reference.

The mobile station shall set this field as follows:

For a Status Response Message, the mobile station shall set this field to the service option connection reference.

For a Service Request Message and a Service Response Message, if the service option connection is part of the current service configuration, the mobile station shall set this field to the service option connection reference; otherwise, the mobile station shall set this field to ‘00000000’.

The base station shall set this field as follows:

For a Service Request Message or a Service Response Message: if the service option connection is part of the current service configuration, the base station shall set this field to the service option connection reference; otherwise, the base station shall set this field to ‘00000000’.
For a *Service Connect Message*, *General Handoff Direction Message*, and a *Universal Handoff Direction Message*, the base station shall set this field to the service option connection reference assigned to the service option connection.

**SERVICE_OPTION** - Service option.

The mobile station shall set this field as follows:

For a *Status Response Message*, the mobile station shall set this field to the service option in use with the service option connection.

For a *Service Request Message* and a *Service Response Message*, the mobile station shall set this field to the service option to be used with the service option connection.

The base station shall set this field as follows:

The base station shall set this field to the service option to be used with the service option connection.

**FOR_TRAFFIC** - Forward Traffic Channel traffic type.

The mobile station shall set this field as follows:

For a *Status Response Message*, the mobile station shall set this field to the FOR_TRAFFIC code shown in Table 3.7.5.7-1 corresponding to the Forward Traffic Channel traffic type in use with the service option connection.

For a *Service Request Message* and a *Service Response Message*, the mobile station shall set this field to the FOR_TRAFFIC code shown in Table 3.7.5.7-1 corresponding to the Forward Traffic Channel traffic type to be used with the service option connection.

The base station shall set this field as follows:

The base station shall set this field to the FOR_TRAFFIC code shown in Table 3.7.5.7-1 corresponding to the Forward Traffic Channel traffic type to be used with the service option connection.
**Table 3.7.5.7-1. FOR_TRAFFIC Codes**

<table>
<thead>

</tr>
</tbody>
</table>

All other FOR_TRAFFIC codes are reserved.

**REV_TRAFFIC** - Reverse Traffic Channel traffic type.

The mobile station shall set this field as follows:

For a *Status Response Message*, the mobile station shall set this field to the REV_TRAFFIC code shown in Table 3.7.5.7-2 corresponding to the Reverse Traffic Channel traffic type in use with the service option connection.

For a *Service Request Message* and a *Service Response Message*, the mobile station shall set this field to the REV_TRAFFIC code shown in Table 3.7.5.7-2 corresponding to the Reverse Traffic Channel traffic type to be used with the service option connection.

The base station shall set this field as follows:

The base station shall set this field to the REV_TRAFFIC code shown in Table 3.7.5.7-2 corresponding to the Reverse Traffic Channel traffic type to be used with the service option connection.
Table 3.7.5.7-2. REV_TRAFFIC Codes

</tbody>
</table>

All other REV_TRAFFIC codes are reserved.

UI_ENCRYPT_MODE - Encryption mode indicator for user information privacy.

The mobile station shall set this field as follows:

For a Status Response Message, the mobile station shall set this field to indicate the current user information encryption mode as shown in Table 3.7.5.7-3.

For a Service Request Message and a Service Response Message, the mobile station shall set this field to indicate the proposed user information encryption mode as shown in Table 3.7.5.7-3.

The base station shall set this field as follows:

For a Service Request Message or a Service Response Message: the base station shall set this field to the proposed user information encryption mode, as shown in Table 3.7.5.7-3.

For a Service Connect Message, General Handoff Direction Message, and a Universal Handoff Direction Message, the base station shall set this field to the assigned user information encryption mode, as shown in Table 3.7.5.7-3.
Table 3.7.5.7-3. User information Encryption Modes

| 010                           | If P_REV_IN_USE is less than nine, this value indicates that User information Encryption uses the Rijndael encryption algorithm. Encryption procedures defined in 2.3.12.4.2.1 shall be performed.  
If P_REV_IN_USE is greater than or equal to nine, this value indicates that User information Encryption uses the Rijndael encryption algorithm. Encryption procedures defined in the corresponding service option specification shall be performed. (Encryption of voice service option is defined in this document). |
| 011-111                       | Reserved                                                                                                                                              |

SR_ID — Service reference identifier.

The mobile station shall set this field as follows:

For a Status Response Message, the mobile station shall set this field to the service reference identifier in use.

For a Service Request Message and a Service Response Message, the mobile station shall set this field as follows:
If the service option connection is a part of the current service configuration, the mobile station shall set this field to the service reference identifier in use.

If the service option connection is not a part of the current service configuration, the mobile station shall perform the following:

- If this service option connection request is initiated by the base station, the mobile station shall set this field to the value sent by the base station.

- If this service option connection request is initiated by the mobile station, the mobile station shall perform the following: if the service instance provides a service reference identifier, the mobile station shall set this field to the service reference identifier specified by the service instance; otherwise, the mobile station shall set this field to the smallest unused service reference identifier value between 1 and 6 inclusive.

The base station shall set this field as follows:

For a Service Request Message, a Service Response Message, a Service Connect Message, a General Handoff Direction Message, or a Universal Handoff Direction Message, the base station shall set this field as follows:

If the service option connection is a part of the current service configuration, the base station shall set this field to the service reference identifier in use.

If the service option connection is not a part of the current service configuration, the base station shall perform the following:

- If this service option connection request is initiated by the mobile station, the base station shall set this field to the value sent by the mobile station.

- If this service option connection request is initiated by the base station, the base station shall perform the following: if the service instance provides a service reference identifier, the base station shall set this field to the service reference identifier specified by the service instance; otherwise, the base station shall set this field to the highest unused service reference identifier value between 1 and 6 inclusive.

RLP_INFO_INCL - RLP information included indicator.

The mobile station shall set this field as follows:

The mobile station shall set this field to ‘1’ if the RLP_BLOB field is included in this record; otherwise, it shall set this field to ‘0’.
The base station shall set this field as follows:

The base station shall set this field to ‘1’ if the RLP_BLOB field is included in this record; otherwise, it shall set this field to ‘0’.

**RLP_BLOB_LEN** - RLP information block of bits length.

The mobile station shall set this field as follows:

If the RLP_INFO_INCL field is set to ‘0’, the mobile station shall omit this field; otherwise, it shall include this field and set it as follows:

The mobile station shall set this field to the size of the RLP_BLOB field in integer number of octets.

The base station shall set this field as follows:

If the RLP_INFO_INCL field is set to ‘0’, the base station shall omit this field; otherwise, it shall include this field and set it as follows:

The base station shall set this field to the size of the RLP_BLOB field in integer number of octets.

The mobile station shall set this field as follows:

If the RLP_INFO_INCL field is set to ‘0’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

For a *Status Response Message*, the mobile station shall set this field to the Radio Link Protocol block of bits for this service option connection.

For a *Service Request Message* or *Service Response Message*, the mobile station shall set this field to the proposed Radio Link Protocol block of bits for this service option connection, and shall add ‘0’ bits to the end of the field as needed in order to make the length of this field equal to an integer number of octets.

The base station shall set this field as follows:
If the RLP_INFO_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the Radio Link Protocol block of bits for this service option connection, and shall add ‘0’ bits to the end of the field as needed in order to make the length of this field equal to an integer number of octets.

**QOS_PARMS_INCL** - Presence indicator for the QoS parameters.

The mobile station shall set this field as follows:

The mobile station shall set this field to ‘1’, if QOS_PARMS field is included in the record; otherwise the base station shall set this field to ‘0’.

The base station shall set this field as follows:

The base station shall set this field to ‘1’, if QOS_PARMS field is included in the record; otherwise, the base station shall set this field to ‘0’.

**QOS_PARMS_LEN** - Length of the block of QoS parameters.

The mobile station shall set this field as follows:

If QOS_PARMS_INCL is set to ‘1’, the mobile station shall set this field to the combined length in octets, of the QOS_PARMS field and the immediately following QOS_RESERVED field; otherwise, the mobile station shall omit this field.

The base station shall set this field as follows:

If QOS_PARMS_INCL is set to ‘1’, the base station shall set this field to the combined length in octets, of the QOS_PARMS field and the immediately following QOS_RESERVED field; otherwise, the base station shall omit this field.

**QOS_PARMS** - QoS parameters block.

The mobile station shall set this field as follows:

If QOS_PARMS_INCL is set to ‘1’, the mobile station shall include this field in the record as follows:

For a *Status Response Message*, the mobile station shall set this field to the set of QoS parameters configured for this service option connection.
For a *Service Request Message* or *Service Response Message*, the mobile station shall set this field to the set of QoS parameters requested for the respective connection.

The base station shall set this field as follows:

If QOS_PARMS_INCL is set to ‘1’, the base station shall include this field in the record and set it to the set of QoS parameters requested or required for the respective connection.

**QOS_RESERVED** - Padding bits.

The mobile station shall set this field as follows:

If QOS_PARMS_INCL is set to ‘1’, the mobile station shall include the minimum number of ‘0’ bits necessary to ensure that the combined length of the QOS_PARMS field and of this field is an integer number of octets; otherwise, the mobile station shall omit this field.

The base station shall set this field as follows:

If QOS_PARMS_INCL is set to ‘1’, the base station shall include the minimum number of ‘0’ bits necessary to ensure that the combined length of the QOS_PARMS field and of this field is an integer number of octets; otherwise, the base station shall omit this field.

**RESERVED** - Reserved bits.

The mobile station shall set this field as follows:

The mobile station shall add reserved bits as needed in order to make the length of the entire record equal to an integer number of octets. The mobile station shall set these bits to ‘0’.

The base station shall set this field as follows:

The base station shall add reserved bits as needed in order to make the length of this record equal to an integer number of octets. The base station shall set these bits to ‘0’.

**FCH_CC_INCL** - Channel configuration for the Fundamental Channel included indicator.

The mobile station shall set this field as follows:
The mobile station shall set this field to ‘1’, if Fundamental Channel Configuration information is included in the record; otherwise, the mobile station shall set this field to ‘0’ to indicate the current values of Channel configuration for the Fundamental Channel are to be used.

The base station shall set this field as follows:

The base station shall set this field to ‘1’, if the channel configuration information for the Fundamental Channel is included in this Service Configuration Record; otherwise, the base station shall set this field to ‘0’ to indicate the current values of Channel configuration for the Fundamental Channel are to be used.

**FCH_FRAME_SIZE** - Fundamental Channel frame size supported indicator.

The mobile station shall set this field as follows:

If FCH_CC_INCL field is set to ‘1’, the mobile station shall include this field and set it as described below; otherwise, the mobile station shall omit this field.

For a *Status Response Message*, the mobile station shall set this field to ‘1’, if the 5ms frame size is used in the Forward Fundamental Channel (if specified in this record) and Reverse Fundamental Channel, in addition to the 20ms frame size, for the current service configuration; otherwise, the mobile station shall set this field to ‘0’.

For a *Service Request Message* or a *Service Response Message*, the mobile station shall set this field to ‘1’ if the 5ms frame size is used in the Forward Fundamental Channel (if specified in this record) and Reverse Fundamental Channel, in addition to the 20ms frame size, for the proposed service configuration; otherwise the mobile station shall set this field to ‘0’.

The base station shall set this field as follows:

If the FCH_CC_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if the service configuration includes the use of 5 ms frame size in addition to 20ms frame size for the Forward Fundamental Channel (if specified in this record) and Reverse Fundamental Channel; otherwise, the base station shall set this field to ‘0’.

**FOR_FCH_RC** - Forward Fundamental Channel Radio Configuration.

The mobile station shall set this field as follows:
If FCH_CC_INCL field is set to ‘1’, the mobile station shall include this field and set it as described below; otherwise, the mobile station shall omit this field.

For a *Status Response Message*, the mobile station shall set this field to the Forward Fundamental Channel Radio Configuration (see [2]) for the current service configuration. If the Forward Fundamental Channel configuration is not specified in this record, then the mobile station shall set this field to 0.

For a *Service Request Message* or *Service Response Message*, the mobile station shall set this field to the Forward Fundamental Channel Radio Configuration for the proposed service configuration. If the Forward Fundamental Channel configuration is not specified in this record, then the mobile station shall set this field to 0.

The base station shall set this field as follows:

If the FCH_CC_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

For a *Service Request Message* or a *Service Response Message*, the base station shall set this field to the Forward Fundamental Channel Radio Configuration in the proposed service configuration. If the Forward Fundamental Channel configuration is not specified in this record, then the base station shall set this field to 0.

For a *Service Connect Message*, a *General Handoff Direction Message*, or a *Universal Handoff Direction Message*, the base station shall set this field to the actual Forward Fundamental Channel Radio Configuration to be used. If the Forward Fundamental Channel configuration is not specified in this record, then the base station shall set this field to 0.

---

**REV_FCH_RC** - Reverse Fundamental Channel Radio Configuration.

The mobile station shall set this field as follows:

If FCH_CC_INCL field is set to ‘1’, the mobile station shall include this field and set it as described below; otherwise, the mobile station shall omit this field.

For a *Status Response Message*, the mobile station shall set field to the Reverse Fundamental Channel Radio Configuration (see [2]) for the current service configuration.

For a *Service Request Message* or a *Service Response Message*, the mobile station shall set this field to the Reverse Fundamental Channel Radio Configuration for the proposed service configuration.
The base station shall set this field as follows:

If the FCH_CC_INCL field is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

For a *Service Request Message* or a *Service Response Message*, the base station shall set this field to the Reverse Fundamental Channel Radio Configuration (see [2]) in the proposed service configuration.

For a *Service Connect Message*, a *General Handoff Direction Message*, or a *Universal Handoff Direction Message*, the base station shall set this field to the actual Reverse Fundamental Channel Radio Configuration to be used.

**DCCH_CC_INCL** - Channel configuration for the Dedicated Control Channel included indicator.

The mobile station shall set this field as follows:

The mobile station shall set this field to ‘1’, if DCCH channel configuration information is included in this record; otherwise, the mobile station shall set this field to ‘0’ to indicate the current values of Channel configuration for the Dedicated Control Channel are to be used.

The base station shall set this field as follows:

The base station shall set this field to ‘1’, if channel configuration information for the Dedicated Control Channel is included in this Service Configuration Record; otherwise, the base station shall set this field to ‘0’ to indicate the current values of Channel configuration for the Dedicated Control Channel are to be used.

**DCCH_FRAME_SIZE** - Dedicated Control Channel frame size.

The mobile station shall set this field as follows:

If DCCH_CC_INCL field is set to ‘1’, the mobile station shall include this field and set it as described below; otherwise, the mobile station shall omit this field.

For a *Status Response Message*, the mobile station shall set this field to the frame size, as defined in Table 3.7.5.7-4, for the current service configuration.

For a *Service Request Message* or a *Service Response Message*, the mobile station shall set this field to the frame size, as defined in Table 3.7.5.7-4, for the proposed service configuration.

The base station shall set this field as follows:
If the DCCH_CC_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it according to the Table 3.7.5.7-4 as follows:

For a **Service Connect Message**, a **General Handoff Direction Message**, or a **Universal Handoff Direction Message**, the base station shall set this field to the Dedicated Control Channel frame size(s) for the actual service configuration.

For a **Service Request Message** or a **Service Response Message**, the base station shall set this field to the Dedicated Control Channel frame size(s) for the proposed service configuration.

**FOR_DCCH_RC** - Forward Dedicated Control Channel Radio Configuration.

The mobile station shall set this field as follows:

If DCCH_CC_INCL field is set to ‘1’, the mobile station shall include this field and set it as described below; otherwise, the mobile station shall omit this field.

For a **Status Response Message**, the mobile station shall set this field to the Forward Dedicated Control Channel Radio Configuration (see [2]) for the current service configuration. If the Forward Dedicated Control Channel configuration is not specified in this record, then the mobile station shall set this field to 0.

For a **Service Request Message** or a **Service Response Message**, the mobile station shall set this field to the Forward Dedicated Control Channel Radio Configuration for the proposed service configuration. If the Forward Dedicated Control Channel configuration is not specified in this record, then the mobile station shall set this field to 0.

The base station shall set this field as follows:
If the DCCH_CC_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

For a Service Connect Message, a General Handoff Direction Message, or a Universal Handoff Direction Message, the base station shall set this field to the actual Forward Dedicated Control Channel Radio Configuration to be used (see [2]). If the Forward Dedicated Control Channel configuration is not specified in this record, then the mobile station shall set this field to 0.

For a Service Request Message or a Service Response Message, the base station shall set this field to the Forward Dedicated Control Channel Radio Configuration in the proposed service configuration. If the Forward Dedicated Control Channel configuration is not specified in this record, then the base station shall set this field to 0.

REV_DCCH_RC - Reverse Dedicated Control Channel Radio Configuration.

The mobile station shall set this field as follows:

If DCCH_CC_INCL field is set to ‘1’, the mobile station shall include this field and set it as described below; otherwise, the mobile station shall omit this field.

For a Status Response Message, the mobile station shall set this field to the Reverse Dedicated Control Channel Radio Configuration (see [2]) for the current service configuration.

For a Service Request Message or a Service Response Message, the mobile station shall set this field to the Reverse Dedicated Control Channel Radio Configuration for the proposed service configuration.

The base station shall set this field as follows:

If the DCCH_CC_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

For a Service Connect Message, a General Handoff Direction Message, or a Universal Handoff Direction Message, the base station shall set this field to the actual Reverse Dedicated Control Channel Radio Configuration to be used (see [2]).

For a Service Request Message or a Service Response Message, the base station shall set this field to the Reverse Dedicated Control Channel Radio Configuration for the proposed service configuration.

FOR_SCH_CC_INCL - Channel configuration for the Forward Supplemental Channel included indicator.
The mobile station shall set this field as follows:

The mobile station shall set this field to ‘1’, if the Forward Supplemental Channel Configuration information is included; otherwise, the mobile station shall set this field to ‘0’ to indicate the current values of Channel configuration for the Forward Supplemental Channel are to be used.

The base station shall set this field as follows:

The base station shall set this field to ‘1’, if the channel configuration information for the Forward Supplemental Channel is included in this Service Configuration Record; otherwise, the base station shall set this field to ‘0’ to indicate the current values of Channel configuration for the Forward Supplemental Channel are to be used.

NUM_FOR_SCH - Number of Forward Supplemental Channels.

The mobile station shall set this field as follows:

If FOR_SCH_CC_INCL field is set to ‘1’, the mobile station shall include this field and set it as describe below; otherwise, the mobile station shall omit this field.

For a Status Response Message, the mobile station shall set this field to the number of Forward Supplemental Channels for the current service configuration and include one occurrence of the following three-field SCH record for each Supplemental Channel Configuration.

For a Service Request Message or a Service Response Message, the mobile station shall set this field to the number of Forward Supplemental Channels for the proposed service configuration and include one occurrence of the following three-field SCH record for each Supplemental Channel Configuration.

The base station shall set this field as follows:

If the FOR_SCH_CC_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field to the number of Forward Supplemental Channels associated with this service configuration.

If the FOR_SCH_CC_INCL field is set to ‘1’, the base station shall not set this field to ‘00’.

If the NUM_FOR_SCH field is present, the base station shall include one occurrence of the following three-field record for each Forward Supplemental Channel included in this record:

FOR_SCH_ID - Forward Supplemental Channel Identification

The mobile station shall set this field as follows:
The mobile station shall set this field to the identification of the Supplemental Channel included in this Forward Supplemental Channel Configuration record.

The mobile station shall set this field to the Supplemental Channel identifier, shown in Table 3.7.5.7-5.

Table 3.7.5.7-5. SCH Identifier

<table>
<thead>
<tr>
<th>FOR_SCH_ID</th>

<tr>
<td>10-11</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

The base station shall set this field as follows:

The base station shall set this field as defined in 3.7.5.7.1 for this Forward Supplemental Channel.

FOR_SCH_MUX - Forward Supplemental Channel Multiplex Option.

The mobile station shall set this field as follows:

The mobile station shall set this field to the identifier of the Forward Supplemental Channel pertaining to this record.

The base station shall set this field to the Supplemental Channel identifier, shown in Table 3.7.5.7-5.

FOR_SCH_MUX - Forward Supplemental Channel Multiplex Option.

The mobile station shall set this field as follows:

The mobile station shall set this field to the Multiplex Option associated with the maximum data rate for this Forward Supplemental Channel (see [3]).

The base station shall set this field as follows:

The base station shall set this field to the Multiplex Option associated with the maximum data rate for this Forward Supplemental Channel (see [3]).

SCH_CC_Type-specific field - Supplemental Channel Configuration Information.

The mobile station shall set this field as follows:

The mobile station shall set this field to the subfields of the Channel Configuration record defined in 3.7.5.7.1, for this Forward Supplemental Channel included in the service configuration.

The base station shall set this field as follows:

The base station shall set this field as defined in 3.7.5.7.1 for this Forward Supplemental Channel.
REV_SCH_CC_INCL - Channel configuration for the Reverse Supplemental Channel included indicator.

The mobile station shall set this field as follows:

The mobile station shall set this field to ‘1’, if the Reverse Supplemental Channel Configuration information is included; otherwise, the mobile station shall set this field to ‘0’ to indicate the current values of Channel configuration for the Reverse Supplemental Channel are to be used.

The base station shall set this field as follows:

The base station shall set this field to ‘1’ if the channel configuration information for the Reverse Supplemental Channel is included in this service configuration record; otherwise, the base station shall set this field to ‘0’ to indicate the current values of Channel configuration for the Reverse Supplemental Channel are to be used.

NUM_REV_SCH - Number of Reverse Supplemental Channels.

The mobile station shall set this field as follows:

If REV_SCH_CC_INCL field is set to ‘1’, the mobile station shall include this field and set it as described below; otherwise, the mobile station shall omit this field.

For a Status Response Message, the mobile station shall set this field to the number of Reverse Supplemental Channels for the current service configuration and include one occurrence of the following three-field record for each reverse Supplemental Channel Configuration.

For a Service Request Message or a Service Response Message, the mobile station shall set this field to the number of Reverse Supplemental Channels for the proposed service configuration and include one occurrence of the following three-field record for each reverse Supplemental Channel Configuration.

The base station shall set this field as follows:

If the REV_SCH_CC_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field to the number of Reverse Supplemental Channels associated with this service configuration.

If the REV_SCH_CC_INCL field is set to ‘1’, the base station shall not set this field to ‘00’.

If the NUM_REV_SCH field is present, the base station shall include one occurrence of the following three-field record for each Reverse Supplemental Channel included in this record:

REV_SCH_ID - Reverse Supplemental Channel Identification
The mobile station shall set this field as follows:

The mobile station shall set this field to the identifier of the Supplemental Channel included in this Reverse Supplemental Channel Configuration record.

The mobile station shall set this field to the Supplemental Channel identifier, shown in Table 3.7.5.7-5.

The base station shall set this field as follows:

The base station shall set this field to the identifier of the Reverse Supplemental Channel pertaining to this record.

The base station shall set this field to the Supplemental Channel identifier, shown in Table 3.7.5.7-5.

REV_SCH_MUX - Reverse Supplemental Channel Multiplex Option

The mobile station shall set this field as follows:

The mobile station shall set this field to the Multiplex Option associated with the maximum data rate for this Reverse Supplemental Channel (see [3]).

The base station shall set this field as follows:

The base station shall set this field to the identifier of the Reverse Supplemental Channel pertaining to this record.

The base station shall set this field to the Supplemental Channel identifier, shown in Table 3.7.5.7-5.

SCH_CC_Type-specific field - Supplemental Channel Configuration Information.

The mobile station shall set this field as follows:

The mobile station shall set this field to the subfields of the Channel Configuration record defined in 3.7.5.7.1, for this Reverse Supplemental Channel included in the service configuration.

The base station shall set this field as follows:

The base station shall set this field as defined in 3.7.5.7.1 for this Reverse Supplemental Channel.

FCH_DCCH_MUX_OPTION_IND - FCH and DCCH Multiplex Option Indicator

The mobile station shall set this field according to Table 3.7.5.7-6.

The base station shall set this field according to Table 3.7.5.7-6.
Table 3.7.5-7-6. FCH_DCCH_MUX_OPTION_IND USAGE

<table>
<thead>
<tr>
<th>FCH_DCCH_MUX_OPTION_IND</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>00</td>
<td>FOR_MUX_OPTION applies to both the Forward Fundamental Channel and the Forward Dedicated Control Channel (if specified in this record), and REV_MUX_OPTION applies to both the Reverse Fundamental Channel and the Reverse Dedicated Control Channel.</td>
</tr>
<tr>
<td>01</td>
<td>FOR_MUX_OPTION applies only to the Forward Fundamental Channel (if specified in this record), and REV_MUX_OPTION applies only to the Reverse Fundamental Channel.</td>
</tr>
<tr>
<td>10</td>
<td>FOR_MUX_OPTION applies only to the Forward Dedicated Control Channel (if specified in this record), and REV_MUX_OPTION applies only to the Reverse Dedicated Control Channel.</td>
</tr>
<tr>
<td>11</td>
<td>FOR_MUX_OPTION applies only to the Forward Fundamental Channel, and REV_MUX_OPTION applies only to the Reverse Fundamental Channel. FOR_DCCH_MUX_OPTION is included for the Forward Dedicated Control Channel (if specified in this record), and REV_DCCH_MUX_OPTION is included for the Reverse Dedicated Control Channel.</td>
</tr>
</tbody>
</table>

FOR_DCCH_MUX_OPTION — Forward DCCH Multiplex Option.

If FCH_DCCH_MUX_OPTION_IND is set to a value other than ‘11’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set as follows:

For a Status Response Message, the mobile station shall set this field to the number of the multiplex option for the Forward Dedicated Control Channel (e.g., 1 corresponds to Multiplex Option 1). If the Forward Dedicated Control Channel configuration is not specified in this record, then the mobile station shall set this field to 0.

For a Service Request Message and a Service Response Message, the mobile station shall set this field to the number of the multiplex option for the Forward Dedicated Control Channel. If the Forward Dedicated Control Channel configuration is not specified in this record, then the mobile station shall set this field to 0.

If FCH_DCCH_MUX_OPTION_IND is set to a value other than ‘11’, the base station shall omit this field; otherwise, the base station shall include this field and set as follows:
For a *Service Request Message* and a *Service Response Message*, the base station shall set this field to the number of the multiplex option for the Forward Dedicated Control Channel. If the Forward Dedicated Control Channel configuration is not specified in this record, then the mobile station shall set this field to 0.

For a *Service Connect Message*, *General Handoff Direction Message*, and a *Universal Handoff Direction Message*, the base station shall set this field to the number of the multiplex option for the Forward Dedicated Control Channel. If the Forward Dedicated Control Channel configuration is not specified in this record, then the base station shall set this field to 0.

**REV_DCCH_MUX_OPTION** – Reverse DCCH Multiplex Option.

If FCH_DCCH_MUX_OPTION_IND is set to a value other than ‘11’, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set as follows:

For a *Status Response Message*, the mobile station shall set this field to the number of the multiplex option for the Reverse Dedicated Control Channel (e.g., 1 corresponds to Multiplex Option 1).

For a *Service Request Message* and a *Service Response Message*, the mobile station shall set this field to the number of the multiplex option for the Reverse Dedicated Control Channel.

If DCCH_MUX_OPTION_INCL is set to a value other than ‘11’, the base station shall omit this field; otherwise, the base station shall include this field and set as follows:

For a *Service Request Message* and a *Service Response Message*, the base station shall set this field to the number of the multiplex option for the Reverse Dedicated Control Channel.

For a *Service Connect Message*, *General Handoff Direction Message*, and a *Universal Handoff Direction Message*, the base station shall set this field to the number of the multiplex option for the Reverse Dedicated Control Channel.

**FOR_PDCH_CC_INCL** – Channel configuration for the Forward Packet Data Channel included indicator.

The mobile station shall set this field as follows:

The mobile station shall set this field to ‘1’, if channel configuration information for the Forward Packet Data Channel is included in this Service Configuration Record; otherwise, the mobile station shall set this field to ‘0’ to indicate the current values of Channel configuration for the Forward Packet Data Channel are to be used.
The base station shall set this field as follows:

The base station shall set this field to ‘1’, if channel configuration information for the Forward Packet Data Channel is included in this Service Configuration Record; otherwise, the base station shall set this field to ‘0’ to indicate the current values of Channel configuration for the Forward Packet Data Channel are to be used.

FOR_PDCH_MUX_OPTION - Forward Packet Data Channel Multiplex Option.

The mobile station shall set this field as follows:

If FOR_PDCH_CC_INCL is set to ‘0’, then the mobile station shall omit this field; otherwise, the mobile station shall set this field to the Multiplex Option associated with the Forward Packet Data Channel (see [3]).

The base station shall set this field as follows:

If FOR_PDCH_CC_INCL is set to ‘0’, then the base station shall omit this field; otherwise, the base station shall set this field to the Multiplex Option associated with the Forward Packet Data Channel (see [3]).

FOR_PDCH_RC - Forward Packet Data Channel Radio Configuration.

The mobile station shall set this field as follows:

If FOR_PDCH_CC_INCL is set to ‘0’, then the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

For a Status Response Message, the mobile station shall set this field to the Forward Packet Data Channel Radio Configuration (see [2]) for the current service configuration.

For a Service Request Message or a Service Response Message, the mobile station shall set this field to the Forward Packet Data Channel Radio Configuration (see [2]) for the proposed service configuration.

The base station shall set this field as follows:

If FOR_PDCH_CC_INCL field is set to ‘0’, then the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

For a Service Connect Message, a General Handoff Direction Message, or a Universal Handoff Direction Message, the base station shall set this field to the actual Forward Packet Data Channel Radio Configuration to be used (see [2]).
For a Service Request Message or a Service Response Message, the base station shall set this field to the Forward Packet Data Channel Radio Configuration (see [2]) for the proposed service configuration.

REV_PDCH_CC_INCL - Channel configuration for the Reverse Packet Data Channel included indicator.

The mobile station shall set this field as follows:

The mobile station shall set this field to ‘1’, if channel configuration information for the Reverse Packet Data Channel is included in this Service Configuration Record; otherwise, the mobile station shall set this field to ‘0’ to indicate the current values of Channel configuration for the Reverse Packet Data Channel are to be used.

The base station shall set this field as follows:

The base station shall set this field to ‘1’, if channel configuration information for the Reverse Packet Data Channel is included in this Service Configuration Record; otherwise, the base station shall set this field to ‘0’ to indicate the current values of Channel configuration for the Reverse Packet Data Channel are to be used.

REV_PDCH_MUX_OPTION_HIGH_RATE - Reverse Packet Data Channel Multiplex Option for Higher Data Rates.

The mobile station shall set this field as follows:

If REV_PDCH_CC_INCL is set to ‘0’, then the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

For a Status Response Message, the mobile station shall set this field to the Multiplex Option for Higher Data Rates associated with the Reverse Packet Data Channel (see [3]) for the current service configuration.

For a Service Request Message or a Service Response Message, the mobile station shall set this field to the Multiplex Option for Higher Data Rates associated with the Reverse Packet Data Channel (see [3]) for the proposed service configuration.

The base station shall set this field as follows:

If REV_PDCH_CC_INCL field is set to ‘0’, then the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

For a Service Connect Message, a General Handoff Direction Message, or a Universal Handoff Direction Message, the base station shall set this field to the actual Multiplex Option for Higher Data Rates associated with the Reverse Packet Data Channel to be used (see [3]).
For a Service Request Message or a Service Response Message, the base station shall set this field to the Multiplex Option for Higher Data Rates associated with the Reverse Packet Data Channel (see [3]) for the proposed service configuration.

REV_PDCH_MUX_OPTION_LOW_RATE - Reverse PDCH Mux Option for Lower Data Rates

The mobile station shall set this field as follows:

If REV_PDCH_CC_INCL is set to '0', then the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:

This field shall be set to 0x1, 0x1301, or 0x1305.

For a Status Response Message, the mobile station shall set this field to the Multiplex Option for Lower Data Rates associated with the Reverse Packet Data Channel (see [3]) for the current service configuration.

For a Service Request Message or a Service Response Message, the mobile station shall set this field to the Multiplex Option for Lower Data Rates associated with the Reverse Packet Data Channel (see [3]) for the proposed service configuration.

The base station shall set this field as follows:

If REV_PDCH_CC_INCL field is set to '0', then the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

For a Service Connect Message, a General Handoff Direction Message, or a Universal Handoff Direction Message, the base station shall set this field to the actual Multiplex Option for Lower Data Rates associated with the Reverse Packet Data Channel to be used (see [3]).

For a Service Request Message or a Service Response Message, the base station shall set this field to the Multiplex Option for Lower Data Rates associated with the Reverse Packet Data Channel (see [3]) for the proposed service configuration.

REV_PDCH_RC - Reverse Packet Data Channel Radio Configuration.

The mobile station shall set this field as follows:

If REV_PDCH_CC_INCL is set to ‘0’, then the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows:
For a Status Response Message, the mobile station shall set this field to the Reverse Packet Data Channel Radio Configuration (see [2]) for the current service configuration.

For a Service Request Message or a Service Response Message, the mobile station shall set this field to the Reverse Packet Data Channel Radio Configuration (see [2]) for the proposed service configuration.

The base station shall set this field as follows:

If REV_PDCH_CC_INCL field is set to ‘0’, then the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

For a Service Connect Message, a General Handoff Direction Message, or a Universal Handoff Direction Message, the base station shall set this field to the actual Reverse Packet Data Channel Radio Configuration to be used (see [2]).

For a Service Request Message or a Service Response Message, the base station shall set this field to the Reverse Packet Data Channel Radio Configuration (see [2]) for the proposed service configuration.

RESERVED - Reserved bits.

The mobile station shall set this field as follows:

The mobile station shall add reserved bits as needed in order to make the length of the entire information record equal to an integer number of octets. The mobile station shall set these bits to ‘0’.

The base station shall set this field as follows:

The base station shall add reserved bits as needed in order to make the length of the entire message equal to an integer number of octets. The base station shall set these bits to ‘0’.

RESERVED - Reserved bits.
3.7.5.7.1 Channel Configuration for the Supplemental Channel

The channel configuration information for the Supplemental Channel consists of the following subfields:

<table>
<thead>
<tr>
<th>Subfields</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCH_REC_LEN</td>
<td>4</td>
</tr>
<tr>
<td>SCH_RC</td>
<td>5</td>
</tr>
<tr>
<td>CODING</td>
<td>1</td>
</tr>
<tr>
<td>FRAME_40_USED</td>
<td>1</td>
</tr>
<tr>
<td>FRAME_80_USED</td>
<td>1</td>
</tr>
<tr>
<td>MAX_RATE</td>
<td>4</td>
</tr>
</tbody>
</table>

SCH_REC_LEN - Supplemental Channel channel configuration record length. The mobile station or base station shall set this field to the number of octets included in this Supplemental Channel channel configuration record including this SCH_REC_LEN field.

SCH_RC - Supplemental Channel Radio Configuration. The mobile station or base station shall set this field to the Radio Configuration for this Supplemental Channel. Radio Configurations are defined in [2].

CODING - Coding type. The mobile station or base station shall set this field to ‘1’ if the mobile station or the base station is to use Convolutional Coding when the number of channel bits per frame is less than 360 and Turbo Coding when the number of channel bits per frame is equal to or greater than 360. The mobile station or base station shall set this field to ‘0’ if the mobile station or the base station uses Convolution Coding for all block sizes.

FRAME_40_USED - 40ms frame used indicator. The mobile station or base station shall set this field to ‘1’ if 40ms frame is used; otherwise, the mobile station or base station shall set this field to ‘0’.

If a f-dtch logical channel corresponding to the same sr_id is mapped to both forward Supplemental Channels 0 and 1, then the mobile station or base station shall specify the same frame length for both forward Supplemental Channels 0 and 1.
If a r-dtch logical channel corresponding to the same sr_id is mapped to both reverse Supplemental Channels 0 and 1, then the mobile station or base station shall specify the same frame length for both forward Supplemental Channels 0 and 1.

The base station shall not set both FRAME_40_USED and FRAME_80_USED fields set to ‘1’.

FRAME_80_USED - 80ms frame used indicator.

The mobile station or base station shall set this field to ‘1’ if 80ms frame is to be used; otherwise, the mobile station or base station shall set this field to ‘0’.

If a f-dtch logical channel corresponding to the same sr_id is mapped to both forward Supplemental Channels 0 and 1, then the mobile station or base station shall specify the same frame length for both forward Supplemental Channels 0 and 1.

Then the base station shall not set both FRAME_40_USED and FRAME_80_USED fields set to ‘1’.

MAX_RATE - Maximum supplemental channel rate

The mobile station or base station shall set this field according to Table 2.7.4.27.3-2 to indicate the maximum forward or reverse supplemental channel data rate supported.
3.7.5.8 Called Party Subaddress

This information record identifies the called party subaddress.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXTENSION_BIT</td>
<td>1</td>
</tr>
<tr>
<td>SUBADDRESS_TYPE</td>
<td>3</td>
</tr>
<tr>
<td>ODD/EVEN_INDICATOR</td>
<td>1</td>
</tr>
<tr>
<td>RESERVED</td>
<td>3</td>
</tr>
</tbody>
</table>

Zero or more occurrences of the following field:

```
/ CHARi 8 /
```

5  EXTENSION_BIT - The extension bit.

The base station shall set this field to ‘1’.

7  SUBADDRESS_TYPE - Type of subaddress.

The base station shall set this field to the SUBADDRESS_TYPE value shown in Table 2.7.4.19-1 corresponding to the type of the subaddress, as defined in [7], Section 4.5.8.

12 ODD/EVEN_INDICATOR - The indicator of odd/even bits.

The base station shall set this field to the ODD/EVEN_INDICATOR value shown in Table 2.7.4.19-2 corresponding to the indicator of even/odd bits, as defined in [7], Section 4.5.8. It is only used when the type of subaddress is “User specified” and the coding is BCD.

18  RESERVED - Reserved bits.

The base station shall set this field to ‘000’.

20  CHARi - Character.

The base station shall include one occurrence of this field for each character in the called party subaddress.

When the SUBADDRESS_TYPE field is equal to ‘000’, the NSAP address shall be encoded using the preferred binary encoding specified in [35].

When the SUBADDRESS_TYPE field is set to ‘010’, user-specified subaddress field is encoded according to the user specification, subject to a maximum length of 20 octets. When interworking with [36] networks, BCD coding should be applied.
3.7.5.9 Calling Party Subaddress

This information record identifies the calling party subaddress.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXTENSION_BIT</td>
<td>1</td>
</tr>
<tr>
<td>SUBADDRESS_TYPE</td>
<td>3</td>
</tr>
<tr>
<td>ODD/EVEN_INDICATOR</td>
<td>1</td>
</tr>
<tr>
<td>RESERVED</td>
<td>3</td>
</tr>
</tbody>
</table>

Zero or more occurrences of the following field:

```
CHARi
```

EXTENSION_BIT - The extension bit.

The base station shall set this field to ‘1’.

SUBADDRESS_TYPE - Type of subaddress.

The base station shall set this field to the SUBADDRESS_TYPE value shown in Table 2.7.4.19-1 corresponding to the type of the subaddress, as defined in [7], Section 4.5.10.

ODD/EVEN INDICATOR - The indicator of odd/even bits.

The base station shall set this field to the ODD/EVEN_INDICATOR value shown in Table 2.7.4.19-2 corresponding to the indicator of even/odd bits, as defined in [7], Section 4.5.10. It is only used when the type of subaddress is “User specified” and the coding is BCD.

RESERVED - Reserved bits.

The base station shall set this field to ‘000’.

CHARi - Character.

The base station shall include one occurrence of this field for each character in the calling party subaddress.

When the SUBADDRESS_TYPE field is equal to ’000’, the NSAP address shall be encoded using the preferred binary encoding specified in [35].

When the SUBADDRESS_TYPE field is set to ’010’, user-specified subaddress field is encoded according to the user specification, subject to a maximum length of 20 octets.

When interworking with [36] networks, BCD coding should be applied.
3.7.5.10 Connected Subaddress

This information record identifies the subaddress of the responding party.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXTENSION_BIT</td>
<td>1</td>
</tr>
<tr>
<td>SUBADDRESS_TYPE</td>

<tr>
<td>ODD/EVEN_INDICATOR</td>
<td>1</td>
</tr>
<tr>
<td>RESERVED</td>
<td>3</td>
</tr>
</tbody>
</table>

Zero or more occurrences of the following field:

```
{ CHARi 8 }
```

EXTENSION_BIT - The extension bit.

The base station shall set this field to ‘1’.

SUBADDRESS_TYPE - Type of subaddress.

The base station shall set this field to the SUBADDRESS_TYPE value shown in Table 2.7.4.19-1 corresponding to the type of the subaddress, as defined in [7], Section 4.5.14.

ODD/EVEN_INDICATOR - The indicator of odd/even bits.

The base station shall set this field to the ODD/EVEN_INDICATOR value shown in Table 2.7.4.19-2 corresponding to the indicator of even/odd bits, as defined in [7], Section 4.5.14. It is only used when the type of subaddress is “User specified” and the coding is BCD.

RESERVED - Reserved bits.

The base station shall set this field to ‘000’.

CHARi - Character.

The base station shall include one occurrence of this field for each character in the connected subaddress.

When the SUBADDRESS_TYPE field is equal to ‘000’, the NSAP address shall be encoded using the preferred binary encoding specified in [35].

When the SUBADDRESS_TYPE field is set to ‘010’, user-specified subaddress field is encoded according to the user specification, subject to a maximum length of 20 octets.

When interworking with [36] networks, BCD coding should be applied.
3.7.5.11 Redirecting Number

This information record identifies the Redirecting Number.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>

<td>0 or 3</td>
</tr>
<tr>
<td>REDIRECTION_REASON</td>
<td>0 or 4</td>
</tr>
</tbody>
</table>

Zero or more occurrences of the following field:

```
CHARI
```

EXTENSION_BIT_1 - The extension bit.

If the PI and SI are included in this record, the base station shall set this field to ‘0’; otherwise, the base station shall set this field to ‘1’.

NUMBER_TYPE - Type of number.

The base station shall set this field to the NUMBER_TYPE value shown in Table 2.7.1.3.2.4-2 corresponding to the type of the redirecting number, as defined in [34].

NUMBER_PLAN - Numbering plan.

The base station shall set this field to the NUMBER_PLAN value shown in Table 2.7.1.3.2.4-3 corresponding to the numbering plan used for the redirecting number, as defined in [34].

EXTENSION_BIT_2 - The extension bit.
If the EXTENSION_BIT_1 is set to ‘0’ and REDIRECTION_REASON is included in this record, the base station shall set this field to ‘0’. If the EXTENSION_BIT_1 is set to ‘0’ and REDIRECTION_REASON is not included in this record, the base station shall set this field to ‘1’. If the EXTENSION_BIT_1 is set to ‘1’, the base station shall omit this field.

**PI** - Presentation indicator.

This field indicates whether or not the redirecting number should be displayed.

if the EXTENSION_BIT_1 is set to ‘0’, the base station shall set this field to the PI value shown in Table 2.7.4.4-1 corresponding to the presentation indicator, as defined in [34]; otherwise, the base station shall omit this field.

**RESERVED** - Reserved bits.

If the EXTENSION_BIT_1 is set to ‘0’, the base station shall set this field to ‘000’; otherwise, the base station shall omit this field.

**SI** - Screening indicator.

This field indicates how the redirecting number was screened.

If the EXTENSION_BIT_1 is set to ‘0’, the base station shall set this field to the SI value shown in Table 2.7.4.4-2 corresponding to the screening indicator value, as defined in [34]; otherwise, the base station shall omit this field.

**EXTENSION_BIT_3** - The extension bit.

If the EXTENSION_BIT_2 is set to ‘0’, the base station shall set this field to ‘1’; otherwise, the base station shall omit this field.

**RESERVED** - Reserved bits.

If the EXTENSION_BIT_2 is set to ‘0’, the base station shall set this field to ‘000’; otherwise, the base station shall omit this field.

**REDIRECTION_REASON** - The reason for redirection.

If the EXTENSION_BIT_2 is set to ‘0’, the base station shall set this field to the REDIRECTION_REASON value shown in Table 3.7.5.5.11-1 corresponding to the redirection reason, as defined in [34]; otherwise, the base station shall omit this field.
### Table 3.7.5.11-1. Redirection Reason

<table>

<td>others</td>
</tr>
</tbody>
</table>

**CHARi** - Character.

The base stations shall include one occurrence of this field for each character in the Redirecting Number. The base station shall set each occurrence of this field to the ASCII representation corresponding to the character, as specified in [9], with the most significant bit set to ‘0’.
3.7.5.12 Redirecting Subaddress

This information record identifies the subaddress of the responding party.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXTENSION_BIT</td>
<td>1</td>
</tr>
<tr>
<td>SUBADDRESS_TYPE</td>

<td>1</td>
</tr>
<tr>
<td>RESERVED</td>
<td>3</td>
</tr>
</tbody>
</table>

Zero or more occurrences of the following field:

```
/
```

```
CHARi  8
```

EXTENSION_BIT - The extension bit.
The base station shall set this field to ‘1’.

SUBADDRESS_TYPE - Type of subaddress.
The base station shall set this field to the SUBADDRESS_TYPE value shown in Table 2.7.4.19-1 corresponding to the type of the subaddress, as defined in [34].

ODD/EVEN_INDICATOR - The indicator of odd /even bits.
The base station shall set this field to the ODD/EVEN_INDICATOR value shown in Table 2.7.4.19-2 corresponding to the indicator of even/odd bits, as defined in [34]. It is only used when the type of subaddress is “User specified” and the coding is BCD.

RESERVED - Reserved bits.
The base station shall set this field to ‘000’.

CHARi - Character.
The base station shall include one occurrence of this field for each character in the redirecting subaddress.

When the SUBADDRESS_TYPE field is equal to ‘000’, the NSAP address shall be encoded using the preferred binary encoding specified in [35].

When the SUBADDRESS_TYPE field is set to ‘010’, user-specified subaddress field is encoded according to the user specification, subject to a maximum length of 20 octets.

When interworking with [36] networks, BCD coding should be applied.
3.7.5.13 Meter Pulses

This information record identifies the number of meter pulses and frequency of the alert tone.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>PULSE_FREQUENCY</td>
<td>11</td>
</tr>
<tr>
<td>PULSE_ON_TIME</td>
<td>8</td>
</tr>
<tr>
<td>PULSE_OFF_TIME</td>
<td>8</td>
</tr>
<tr>
<td>PULSE_COUNT</td>
<td>4</td>
</tr>
<tr>
<td>RESERVED</td>
<td>1</td>
</tr>
</tbody>
</table>

- **PULSE_FREQUENCY** - Pulse frequency. The base station shall set this field to the frequency of the alert signals in units of 10 Hz or to zero to indicate that line polarity control is to be used. If this field is set to zero, the PULSE_ON_TIME and PULSE_OFF_TIME shall be the period of line polarity reversal and normal line polarity, respectively.

- **PULSE_ON_TIME** - Pulse on time. The base station shall set this field to the period of the meter pulses in units of 5 ms.

- **PULSE_OFF_TIME** - Pulse off time. The base station shall set this field to the period of the inter-pulse spacing in units of 5 ms.

- **PULSE_COUNT** - Pulse count. The base station shall set this field to the number of meter pulses.

- **RESERVED** - Reserved bits. The base station shall set this field to ‘0’.
3.7.5.14 Parametric Alerting

This information record allows the network to convey information to a user by means of programmable alerting signals.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>CADENCE_COUNT</td>
<td>8</td>
</tr>
<tr>
<td>NUM_GROUPS</td>
<td>4</td>
</tr>
</tbody>
</table>

NUM_GROUPS occurrences of the following record:

```
/ (NUM_GROUPS)

<table>
<thead>
<tr>
<th>Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMPLITUDE</td>
<td>8</td>
</tr>
<tr>
<td>FREQ_1</td>
<td>10</td>
</tr>
<tr>
<td>FREQ_2</td>
<td>10</td>
</tr>
<tr>
<td>ON_TIME</td>
<td>8</td>
</tr>
<tr>
<td>OFF_TIME</td>
<td>8</td>
</tr>
<tr>
<td>REPEAT</td>
<td>4</td>
</tr>
<tr>
<td>DELAY</td>
<td>8</td>
</tr>
</tbody>
</table>

/ (NUM_GROUPS)
```

CADENCE_COUNT - Cadence count.

The base station shall set this field to the number of times the cadence of tone groups will be generated between 0x01 and 0xFE. The base station shall set this field to 0x00 to indicate that the mobile station should end alert tone generation. The base station shall set this field to 0xFF to indicate that the cadence will repeat indefinitely.

NUM_GROUPS - Number of groups.

The base station shall set this field to the number of groups.

AMPLITUDE - Amplitude.

The base station shall set this field to the amplitude level of the tone group in units of -1 dBm.

FREQ_1 - Tone frequency 1.

The base station shall set this field to the first frequency of the tone group in units of 5 Hz.

FREQ_2 - Tone frequency 2.
The base station shall set this field to the second frequency of the tone group in units of 5 Hz. Setting this field to zero creates a single frequency tone.

ON_TIME - On time.

The base station shall set this field to the duration of the tone group in units of 50 ms.

OFF_TIME - Off time.

The base station shall set this field to the duration of the spacing between tones in units of 50 ms.

REPEAT - Repeat.

The base station shall set this field to the number of times the tone group should repeat. The base station shall set this field to 0xFF to indicate that the tone group will repeat indefinitely.

DELAY - Delay.

The base station shall set this field to the length of time before the next tone group begins in units of 50 ms.

CADENCE_TYPE - Parametric Alerting cadence type.

The base station shall set this field to indicate that the alert should be conveyed to the user as specified in Table 3.7.5.14.

Table 3.7.5.14. Cadence Types

<table>
<thead>
<tr>
<th>CADENCE_TYPE</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>01</td>
<td>Acoustic earpiece or similar device</td>
</tr>
<tr>
<td>10</td>
<td>Device other than acoustic earpiece or similar device (Eg. Ringer)</td>
</tr>
<tr>
<td>11</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

RESERVED - Reserved bits.

The base station shall set this field to ‘00’.
3.7.5.15 Line Control

This information record allows the network to convey line control information.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>POLARITY_INCLUDED</td>
<td>1</td>
</tr>
<tr>
<td>TOGGLE_MODE</td>
<td>0 or 1</td>

<tr>
<td>REVERSE_POLARITY</td>
<td>0 or 1</td>
</tr>
<tr>
<td>POWER_DENIAL_TIME</td>
<td>8</td>
</tr>
<tr>
<td>RESERVED</td>
<td>0 - 7 (as needed)</td>
</tr>
</tbody>
</table>

POLARITY_INCLUDED - Polarity parameter included.

If the mobile station is to change the line polarity, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

TOGGLE_MODE - If POLARITY_INCLUDED is set to ‘1’, the base station shall include this field and set it to ‘1’ to toggle the line polarity or to ‘0’ to set the polarity to the absolute value indicated in the REVERSE_POLARITY field.

REVERSE_POLARITY - Reverse polarity.

If POLARITY_INCLUDED is set to ‘1’ and TOGGLE_MODE is set to ‘1’, the base station shall include this field and set it to ‘0’; otherwise, the base station shall omit this field.

POWER_DENIAL_TIME - Power denial timeout.

The base station shall include this field and set it to the duration of the power denial in increments of 5 ms.

RESERVED - Reserved bits.

The base station shall add reserved bits as needed in order to make the length of the entire message equal to an integer number of octets. The base station shall set these bits to ‘0’.
3.7.5.16 Extended Display

This information record allows the network to supply supplementary service display information that may be displayed by the mobile station.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXT_DISPLAY_IND</td>

</tbody>
</table>
DISPLAY_LEN - The display length.
The base station shall set this field to the number of octets of display text. See [8] Annex D.

CHARi - Character.
The base station shall include DISPLAY_LEN occurrences of this field, one for each character to be displayed, except for blank and skip. The base station shall set each occurrence of this field to the ASCII representation corresponding to the character entered, as specified in [9], with the most significant bit set to ‘0’.
3.7.5.17 Extended Record Type - International

The use of this record type is country-specific. The first ten bits of the type-specific fields shall include the Mobile Country Code (MCC) associated with the national standards organization administering the use of the record type. Encoding of the MCC shall be as specified in 2.3.1.3. The remaining six bits of the first two octets of the type-specific fields shall be used to specify the country-specific record type.
1  3.7.5.18 Reserved
1  3.7.5.19 Reserved
3.7.5.20 Non-Negotiable Service Configuration

This record is included in a Service Connect Message to specify the non-negotiable service configuration parameters to be used by the mobile station. This record can be included in a General Handoff Direction Message or a Universal Handoff Direction Message to specify the non-negotiable service configuration parameters to be used by the mobile station.

**RESERVED** | 0-7 (as needed)

**FPC_INCL** - Forward power control information included indicator.

The base station shall set this field to ‘1’ if the forward power control information parameters are included in this record; otherwise, it shall set this field to ‘0’.

**FPC_PRI_CHAN** - Power Control Subchannel indicator.

If the FPC_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘0’ if the mobile station is to perform the primary inner loop estimation on the received Forward Fundamental Channel; the base station shall set this field to ‘1’ if the mobile station is to perform the primary inner loop estimation on the received Forward Dedicated Control Channel.
If only Fundamental Channel is assigned, the base station shall set this field to ‘0’. If only the Dedicated Control Channel is assigned, the base station shall set this field to ‘1’.

If the F-CPCH is assigned, the base station will multiplex the Power Control Subchannel on the F-CPCH; otherwise:

If this field is set to ‘0’, the base station will multiplex the Power Control Subchannel on the Forward Fundamental Channel; otherwise, the base station will multiplex the Power Control Subchannel on the Forward Dedicated Control Channel.

FPC_MODE - Forward Power Control operation mode indicator.

If the FPC_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the value of the forward power control operation mode (see [2]).

FPC_OLPC_FCH_INCL - Fundamental Channel Outer Loop Power Control parameter included indicator.

If the FPC_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

If the forward link Fundamental Channel outer loop power control parameters are included in this record, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

FPC_FCH_FER - Fundamental Channel target Frame Error Rate.

If FPC_OLPC_FCH_INCL is included and set to ‘1’, the base station shall set this field to the target Frame Error Rate on the Forward Fundamental Channel, as specified in Table 3.7.3.3.2.25-2; otherwise, the base station shall omit this field.

FPC_FCH_MIN_SETPT - Minimum Fundamental Channel Outer Loop Eb/Nt setpoint.

If FPC_OLPC_FCH_INCL is included and set to ‘1’, the base station shall set this field to minimum Fundamental Channel Outer Loop Eb/Nt setpoint, in units of 0.125dB; otherwise, the base station shall omit this field.

FPC_FCH_MAX_SETPT - Maximum Fundamental Channel Outer Loop Eb/Nt setpoint.

If FPC_OLPC_FCH_INCL is set to ‘1’, the base station shall set this field to maximum Fundamental Channel Outer Loop Eb/Nt setpoint, in units of 0.125dB; otherwise, the base station shall omit this field.

FPC_OLPC_DCCH_INCL - Dedicated Control Channel Outer Loop Power Control parameter included indicator.

If the FPC_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
If the forward link Dedicated Control Channel outer loop power control parameters are included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**FPC_DCCH_FER** - Dedicated Control Channel target Frame Error Rate.

If FPC_O LPC_DCCH_INCL is included and set to ‘1’, the base station shall set this field to the target Frame Error Rate on the Forward Dedicated Control Channel, as specified in Table 3.7.3.3.2.25-2; otherwise, the base station shall omit this field.

**FPC_DCCH_MIN_SETPT** - Minimum Dedicated Control Channel Outer Loop Eb/Nt setpoint.

If FPC_O LPC_DCCH_INCL is included and set to ‘1’, the base station shall set this field to minimum Dedicated Control Channel Outer Loop Eb/Nt setpoint, in units of 0.125dB; otherwise, the base station shall omit this field.

**FPC_DCCH_MAX_SETPT** - Maximum Dedicated Control Channel Outer Loop Eb/Nt setpoint.

If FPC_O LPC_DCCH_INCL is included and set to ‘1’, the base station shall set this field to maximum Dedicated Control Channel Outer Loop Eb/Nt setpoint, in units of 0.125dB; otherwise, the base station shall omit this field.

**GATING_RATE_INCL** - Reverse Pilot Channel Gating rate included flag.

The base station shall set this field to ‘1’ if the PILOT_GATING_RATE field is included; otherwise, it shall set this field to ‘0’.

**PILOT_GATING_RATE** - Reverse Pilot Channel Gating rate.

If the GATING_RATE_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows: The base station shall set this field to the PILOT_GATING_RATE field shown in Table 3.7.5.20-1 corresponding to the gating rate on the Reverse Pilot Channel.

<table>
<thead>
<tr>
<th>PILOT_GATING_RATE field (binary)</th>

</tr>
</tbody>
</table>

**FOR_SCH_INCL** - Forward Supplemental Channel information included indicator.
The base station shall set this field to ‘1’, if the forward Supplemental Channel information is included; otherwise, the base station shall set this field to ‘0’.

NUM_FOR_SCH - Number of Forward Supplemental Channels.

If the FOR_SCH_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field to the number of Forward Supplemental Channels associated with this service configuration.

If the NUM_FOR_SCH field is present and is set to any value other than ‘00’, the base station shall include one occurrence of the following two-field record for each Forward Supplemental Channel included in this record:

FOR_SCH_ID - Forward Supplemental Channel Identification.

The base station shall set this field to the identifier of the Forward Supplemental Channel pertaining to this record.

FOR_SCH_FRAME_OFFSET - Forward Supplemental Channel multiple frame offset.

The base station shall set this field to the multiple frame offset of this Forward Supplemental Channel. The frames of this Forward Supplemental Channel are delayed by

\[(FRAME_{OFFSET} \times 1.25 + FOR\_SCH\_FRAME\_OFFSET \times 20)\] ms relative to system timing (see [2]).

REV_SCH_INCL - Reverse Supplemental Channel information included indicator.

The base station shall set this field to ‘1’ if the reverse Supplemental Channel information is included; otherwise, the base station shall set this field to ‘0’.

NUM_REV_SCH - Number of Reverse Supplemental Channels.

If the REV_SCH_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field to the number of Reverse Supplemental Channels associated with this service configuration.

If the NUM_REV_SCH field is present and is set to any value other than ‘00’, the base station shall include one occurrence of the following two-field record for each Reverse Supplemental Channel included in this record:

REV_SCH_ID - Reverse Supplemental Channel Identification.

The base station shall set this field to the identifier of the Reverse Supplemental Channel pertaining to this record.

REV_SCH_FRAME_OFFSET - Reverse Supplemental Channel multiple frame offset.

The base station shall set this field to the multiple frame offset with this Reverse Supplemental Channel. The frames of this Reverse Supplemental Channel are delayed by

\[(FRAME_{OFFSET} \times 1.25 + REV\_SCH\_FRAME\_OFFSET \times 20)\] ms relative to system timing (see [2]).

LPM_IND - Logical to Physical Mapping indicator.
The base station shall set this field to the LPM_IND field value shown in Table 3.7.5.20-2 corresponding to the Logical to Physical Mapping indicator.

The base station shall not set this field to ‘00’ if there is more than one service option connection in the current Service Configuration information record.

### Table 3.7.5.20-2. Logical to Physical Mapping indicator

<table>
<thead>
<tr>
<th>LPM_IND Field (binary)</th>

<td>Reserved</td>
</tr>
</tbody>
</table>

**NUM_LPM_ENTRIES - Number of Logical-to-Physical Mapping entries.**

If the LPM_IND field is set to ‘01’, the base station shall include this field and set it as follows; otherwise, the base station shall omit this field:

The base station shall set this field to the number of Logical-to-Physical Mapping entries that are included in this record.

If the NUM_LPM_ENTRIES field is included and is not equal to ‘0000’, the base station shall include NUM_LPM_ENTRIES occurrences of the following six-field record for each Logical-to-Physical Mapping entry:

**SR_ID - Service reference identifier.**

The base station shall set this field to the identifier of the service reference to which this Logical to Physical Mapping entry applies.

For the signaling service, the base station shall set this field to ‘000’.

**LOGICAL_RESOURCE - Logical resource identifier.**

The base station shall set this field to the logical resource identifier shown in Table 3.7.5.20-3 which is to be mapped by this Logical to Physical Mapping entry.
Table 3.7.5.20-3. Logical Resource Identifier.

<table>
<thead>
<tr>

<td>Reserved</td>
</tr>
</tbody>
</table>

PHYSICAL_RESOURCE - Physical resource identifier.

The base station shall set this field to the physical resource identifier shown in Table 3.7.5.20-4 to which the logical channel specified in this Logical to Physical Mapping entry is to be mapped.

If the LOGICAL_RESOURCE field of this record is set to ‘0001’, then the base station shall not set this field to ‘0010’ or ‘0011’.

Table 3.7.5.20-4. Physical Resource Identifier.

</tr>
</tbody>
</table>

FORWARD_FLAG - Forward mapping indicator.

The base station shall set this field to ‘1’ if the logical to physical channel mapping specified in this record applies to forward logical channels; otherwise, the base station shall set this field to ‘0’.

REVERSE_FLAG - Reverse mapping indicator.

The base station shall set this field to ‘1’ if the logical to physical channel mapping specified in this record applies to reverse logical channels; otherwise, the base station shall set this field to ‘0’.

PRIORITY - Multiplexing priority.

The base station shall set this field to ‘0000’.

NUM_REC - Number of service-specific records.

3-958
The base station shall set this field to the number of the following variable-length records included in the message.

The base station shall include one occurrence of the following variable-length record for each service option connection for which this record needs to be specified.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RECORD_LEN</td>

</tr>
<tr>
<td>SDB_SO_OMIT</td>
<td>Short Data Burst service option number omitted indicator. The base station shall set this field to ‘1’ if the mobile station is required to omit the service option number when sending Short Data Burst (see IS-707-A-2) for this service option connection; otherwise, the base station shall set this field to ‘0’.</td>
</tr>
<tr>
<td>RESERVED</td>
<td>Reserved bits. The base station shall add reserved bits as needed in order to make the length of this record equal to an integer number of octets. The base station shall set these bits to ‘0’.</td>
</tr>
<tr>
<td>USE_FLEX_NUM_BITS</td>
<td>Use flexible (non-default) number of bits per frame indicator. The base station shall set this field to ‘0’ to indicate that the mapping between the number of information bits per frame [NUM_BITS], and a four-bit index field [NUM_BITS_IDX], shall follow the default mapping identified in Table 3.7.3.3.2.37-2 and Table 3.7.3.3.2.37-4. The base station shall set this field to ‘1’ to indicate a non-default mapping between the number of information bits per frame, [NUM_BITS], and a four-bit index field [NUM_BITS_IDX] is used for at least a forward or reverse traffic channel.</td>
</tr>
<tr>
<td>NUM_BITS_TABLES_INCL</td>
<td>Flexible Rate Tables included indicator. If the USE_FLEX_NUM_BITS field is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set this field as follows: If the Flexible Rate Tables are included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.</td>
</tr>
<tr>
<td>NUM_BITS_TABLES_COUNT</td>
<td>Number of instances of the Flexible Rate Table included in this message.</td>
</tr>
</tbody>
</table>
If the NUM_BITS_TABLES_INCL field is included and is equal to ‘1’, the base station shall include this field and set this field to one less than the number of instances of the Flexible Rate Table included in this message; otherwise, the base station shall omit this field.

If NUM_TABLES_INCL is included and is equal to ‘1’, the base station shall include NUM_BITS_TABLES_COUNT+1 instances of the Flexible Rate Table.

NUM_BITS_TABLE_ID - Flexible Rate Table ID.

The base station shall set this field to the ID of the Flexible Rate Table that follows. The base station shall not set this field to ‘0000’.

NUM_RECS - Number of records in the Flexible Rate Table.

The base station shall set this field to one less than the number of three-field records that follows.

The base station shall include NUM_RECS+1 instances of the following three-field record:

NUM_BITS_IDX - Index to the number of bits array.

The base station shall set this field to the index to the array that identifies the number of bits per frame.

NUM_BITS - Number of bits array.

The base station shall set this field to the number of information bits per frame corresponding to the index specified by NUM_BITS_IDX. The base station shall set the number of information bits per frame specified by the service option numbers included in the service configuration record.

CRC_LEN_IDX - Array of Number of CRC bits.

The base station shall set this field to specify the number of CRC bits per frame corresponding to the index specified by NUM_BITS_IDX according to Table 3.7.5.20-5. The base station shall not specify more than one value of the CRC length for the same number of bits per frame for a specific channel (i.e., for a given channel, the number of information bits per frame uniquely specifies the length of the CRC field).

</table>

1. **USE_VAR_RATE** - Use variable rate on supplemental channels indicator.

   The base station shall set this field to ‘1’ to indicate that at least one of the forward or reverse supplemental channels is to operate in the variable rate mode (i.e., the rate of the supplemental channel can be picked from a pre-determined set of rates autonomously).

   The base station shall set this bit to ‘0’ to indicate that variable rate on supplemental channels are not allowed.

2. **VAR_TABLES_INCL** - Variable Rate Tables included indicator.

   If the USE_VAR_RATE field is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set this field as follows:

   If the Variable Rate Tables are included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

3. **VAR_RATE_TABLES_COUNT** - Number of instances of the Variable Rate Mask table included in this message.

   If VAR_TABLES_INCL is included and is equal to ‘1’, the base station shall include this field and set this field to one less than the number of instances of the Variable Rate Mask table included in this message as follows; otherwise, the base station shall omit this field:

   If VAR_TABLES_INCL is included and is equal to ‘1’, the base station shall include VAR_RATE_TABLES_COUNT +1 instances of the Variable Rate Mask table.

4. **VAR_RATE_TABLE_ID** - Variable Rate Mask table ID.

   The base station shall set this field to the ID of the Variable Rate Mask table that follows. The base station shall not set this field to ‘000’.

5. **NUM_RECS** - Number of records in the Variable Rate Mask table.
The base station shall set this field to one less than the number of two-field records that follows.

The base station shall include NUM_RECS+1 instances of the following two fields:

**NUM_BITS_IDX** - Index to the number of bits array.

The base station shall set this field to the index to the array that identifies the number of bits per supplemental channel frame.

**MASK** - Number of bits array.

The base station shall set this field to a mask that identifies the other members of the Variable Rate Set. The base station shall set the \( i \)th LSB bit (\( i=1, \ldots, \text{NUM_BITS_IDX} \)) of this field to ‘1’ to indicate that the number of bits per frame specified by the index NUM_BITS_IDX-i is to be included in the Supplemental Variable Rate Set.

**USE_OLD_FLEX_MAPPING** - Use the previously downloaded mapping between the channels and Flexible Rate Tables.

If the USE_FLEX_NUM_BITS field is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set this field as follows:

The base station shall set this field to ‘1’ to indicate that the mobile station is to use the previously downloaded mapping between the channels and Flexible Rate Tables. The base station shall set this field to ‘0’, if the following eight fields are included in this message.

**FSCH0_NBIT_TABLE_ID** - Forward Supplemental Channel 0 Flexible Rate Table ID.

If the USE_OLD_FLEX_MAPPING field is included and is equal to ‘0’, the base station shall include this field and set this field as follows; otherwise, the base station shall omit this field:

The base station shall set this field to the ID of the Flexible Rate Table corresponding to Forward Supplemental Channel 0. The base station shall set this field to ‘0000’ to indicate that the Flexible Rate feature is not used for Forward Supplemental 0 and the default table specified in 3.7.3.3.2.37-4 shall be used.

**RSCH0_NBIT_TABLE_ID** - Reverse Supplemental Channel 0 Flexible Rate Table ID.

If the USE_OLD_FLEX_MAPPING field is included and is equal to ‘0’, the base station shall include this field and set this field as follows; otherwise, the base station shall omit this field:

The base station shall set this field to the ID of the Flexible Rate Table corresponding to Reverse Supplemental Channel 0. The base station shall set this field to ‘0000’ to indicate that the Flexible Rate feature is not used for Reverse Supplemental 0 and the default table specified in 3.7.3.3.2.37-2 shall be used.

**FSCH1_NBIT_TABLE_ID** - Forward Supplemental Channel 1 Flexible Rate Table ID.
If the USE_OLD_FLEX_MAPPING field is included and is equal to ‘0’, the base station shall include this field and set this field as follows; otherwise, the base station shall omit this field:

The base station shall set this field to the ID of the Flexible Rate Table corresponding to Forward Supplemental Channel 1. The base station shall set this field to ‘0000’ to indicate that the Flexible Rate feature is not used for Forward Supplemental 1 and the default table specified in 3.7.3.2.37-4 shall be used.

**RSCH1_NBIT_TABLE_ID** - Reverse Supplemental Channel 1 Flexible Rate Table ID.

If the USE_OLD_FLEX_MAPPING field is included and is equal to ‘0’, the base station shall include this field and set this field as follows; otherwise, the base station shall omit this field:

The base station shall set this field to the ID of the Flexible Rate Table corresponding to Reverse Supplemental Channel 1. The base station shall set this field to ‘0000’ to indicate that the Flexible Rate feature is not used for Reverse Supplemental 1 and the default table specified in 3.7.3.2.37-2 shall be used.

**FFCH_NBIT_TABLE_ID** - Forward Fundamental Channel Flexible Rate Table ID.

If the USE_OLD_FLEX_MAPPING field is included and is equal to ‘0’, the base station shall include this field and set this field as follows; otherwise, the base station shall omit this field:

The base station shall set this field to the ID of the Flexible Rate Table corresponding to the Forward Fundamental Channel. The base station shall set this field to ‘0000’ to indicate that the Flexible Rate feature is not used for the Forward Fundamental Channel.

**RFCH_NBIT_TABLE_ID** - Reverse Fundamental Channel Flexible Rate Table ID.

If the USE_OLD_FLEX_MAPPING field is included and is equal to ‘0’, the base station shall include this field and set this field as follows; otherwise, the base station shall omit this field:

The base station shall set this field to the ID of the Flexible Rate Table corresponding to the Reverse Fundamental Channel. The base station shall set this field to ‘0000’ to indicate that the Flexible Rate feature is not used for the Reverse Fundamental Channel.

**FDCCH_NBIT_TABLE_ID** - Forward Dedicated Control Channel Flexible Rate Table ID.

If the USE_OLD_FLEX_MAPPING field is included and is equal to ‘0’, the base station shall include this field and set this field as follows; otherwise, the base station shall omit this field:

The base station shall set this field to the ID of the Flexible Rate Table corresponding to the Forward Dedicated Control Channel. The base station shall set this field to ‘0000’ to indicate that the Flexible Rate feature is not used for the Forward Dedicated Control Channel.
FDCCH_NBITS_IDX - Forward Dedicated Control Channel number of information bits per frame index.

If the FDCCH_NBIT_TABLE_ID field is included and is not equal to '0000', the base station shall include this field and set this field to indicate the number of information bits per Forward Dedicated Control Channel frame; otherwise, the base station shall omit this field.

The number of information bits per frame is specified by the Flexible Rate Table associated with Forward Dedicated Control Channel and FDCCH_NBITS_IDX as the index to the table (i.e., NUM_BITSs[FDCCH_NBIT_TABLE_IDr][FDCCH_NBITS_IDX].

RDCCH_NBIT_TABLE_ID - Reverse Dedicated Control Channel Flexible Rate Table ID.

If the USE_OLD_FLEX_MAPPING field is included and is equal to '0', the base station shall include this field and set this field as follows; otherwise, the base station shall omit this field:

The base station shall set this field to the ID of the Flexible Rate Table corresponding to the Reverse Dedicated Control Channel. The base station shall set this field to '0000' to indicate that the Flexible Rate feature is not used for the Reverse Dedicated Control Channel.

RDCCH_NBITS_IDX - Reverse Dedicated Control Channel number of information bits per frame index.

If the RDCCH_NBIT_TABLE_ID field is included and is not equal to '0000', the base station shall include this field and set this field to indicate the number of information bits per Reverse Dedicated Control Channel frame; otherwise, the base station shall omit this field.

The number of information bits per frame is specified by the Flexible Rate Table associated with Reverse Dedicated Control Channel and RDCCH_NBITS_IDX as the index to the table (i.e., NUM_BITSs[RDCCH_NBIT_TABLE_IDr][RDCCH_NBITS_IDX].

USE_OLD_VAR_MAPPING - Use the previously downloaded mapping between the channels and Variable Rate Mask Tables.

If the USE_VAR_RATE field is equal to '0', the base station shall omit this field; otherwise, the base station shall include this field and set this field as follows:

The base station shall set this field to '1' to indicate that the mobile station is to use the previously downloaded mapping between the channels and Variable Rate Mask Tables. The base station shall set this field to '0', if the following four fields are included in this message.
FSCH0_VAR_TABLE_ID  - Forward Supplemental Channel 0 Variable Rate Mask Table ID.  

If the USE_OLD_VAR_MAPPING field is included and is equal to '0', the base station shall include this field and set this field as follows; otherwise, the base station shall omit this field:

The base station shall set this field to the ID of the Variable Rate Mask Table corresponding to Forward Supplemental Channel 0. The base station shall set this field to '000' to indicate that no variable rate operation is performed on the F-SCH0.

RSCH0_VAR_TABLE_ID  - Reverse Supplemental Channel 0 Variable Rate Mask Table ID.  

If the USE_OLD_VAR_MAPPING field is included and is equal to '0', the base station shall include this field and set this field as follows; otherwise, the base station shall omit this field:

The base station shall set this field to the ID of the Variable Rate Mask Table corresponding to Reverse Supplemental Channel 0. The base station shall set this field to '000' to indicate that the mobile station is not to autonomously change the rate of the R-SCH0.

FSCH1_VAR_TABLE_ID  - Forward Supplemental Channel 1 Variable Rate Mask Table ID.  

If the USE_OLD_VAR_MAPPING field is included and is equal to '0', the base station shall include this field and set this field as follows; otherwise, the base station shall omit this field:

The base station shall set this field to the ID of the Variable Rate Mask Table corresponding to Forward Supplemental Channel 1. The base station shall set this field to '000' to indicate that no variable rate operation is performed on the F-SCH1.

RSCH1_VAR_TABLE_ID  - Reverse Supplemental Channel 1 Variable Rate Mask Table ID.  

If the USE_OLD_VAR_MAPPING field is included and is equal to '0', the base station shall include this field and set this field as follows; otherwise, the base station shall omit this field:

The base station shall set this field to the ID of the Variable Rate Mask Table corresponding to Reverse Supplemental Channel 1. The base station shall set this field to '000' to indicate that the mobile station is not to autonomously change the rate of the R-SCH1.

R_INC_RATE_ALLOWED  - Reverse increase rate within Variable Rate Set Allowed indicator.  

If the USE_VAR_RATE field is included and is equal to ‘1’, the base station shall include this field and set this field as follows; otherwise, the base station shall omit this field:
The base station shall set this field to ‘1’ to indicate that the mobile station is allowed to switch between any of the rates (i.e., number of bits per frame) in the Variable Rate Set for the Reverse Supplemental channels. The base station shall set this field to ‘0’ to indicate that only a downward transition in rate within the rates (i.e., number of bits per frame) in the Variable Rate Set for the Reverse Supplemental channels is allowed.

**F_INC_RATE_ALLOWED** - Forward increase rate within Variable Rate Set Allowed indicator.

If the USE_VAR_RATE field is included and is equal to ‘1’, the base station shall include this field and set this field as follows; otherwise, the base station shall omit this field:

The base station shall set this field to ‘1’ to indicate that the base station is allowed to switch between any of the rates (i.e., number of bits per frame) in the Variable Rate Set for the Forward Supplemental channels. The base station shall set this field to ‘0’ to indicate that only a downward transition in rate within the rates (i.e., number of bits per frame) in the Variable Rate Set for the Forward Supplemental channels is possible.

**LTU_INFO_INCL** - LTU Tables included indicator.

The base station shall set this field to ‘1’ if the base station includes LTU related information in this message; otherwise, the base station shall set this field to ‘0’.

The base station shall set this field to ‘0’ if the mobile station indicates that it does not support downloadable LTU Table in the capability information (i.e., the \texttt{F\_SCH\_LTU\_TAB\_SUPPORTED} and \texttt{R\_SCH\_LTU\_TAB\_SUPPORTED} fields in the capability information are equal to ‘0’).

**LTU_TABLES_INCL** - LTU Tables included indicator.

If the LTU_INFO_INCL field is equal to ‘0’, the base station shall omit this field; otherwise, the base stations shall include this field and set this field as follows:

If the LTU Tables are included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

If LTU_TABLES_INCL is included and is equal to ‘1’, the base station shall include the following fields related to the LTU Table information:

**NUM_LTU_TABLES** - Number of LTU tables included.

The base station shall set this field to the number of LTU Tables minus one included in this message.

If LTU_TABLES_INCL is included and is equal to ‘1’, then the base station shall include \texttt{NUM_LTU_TABLES} + 1 occurrences of the following fields:
LTU_TABLE_ID - LTU Table ID.
The base station shall set this field to the ID of the LTU Table that follows. The base station shall not set this field to ‘000’.

NUM_ROWS - Number of configurations associated with the LTU Table identified by LTU_TABLE_ID.
The base station shall set this field to one less than the number of rows of the LTU Table identified by LTU_TABLE_ID.

If LTU_TABLES_INCL is included and is equal to ‘1’, then the base station shall include the NUM_ROWS + 1 occurrences of the following fields:

NBITS_IDX - Number of bits per frame index.
The base station shall set this field to the 4-bit index that specified the number of information bits per supplemental channel frame.

NUM_LTUS - Number of LTUs per physical layer supplemental channel frame.
The base station shall specify the number of LTUs per physical layer supplemental channel frame corresponding to the number of information bits per supplemental channel frame specified by NBITS_IDX according to Table 3.7.5.20-6. The base station shall set this field to ‘0000’ to indicate that no LTUs are supported for the number of information bits per frame specified by NBITS_IDX.

Table 3.7.5.20-6. NUM_LTUS

USE_OLD_LTU_MAPPING - Use the previously downloaded mapping between the channels and LTU Tables.

If the LTU_INFO_INCL field is equal to ‘0’, the base station
shall omit this field; otherwise, the base station shall include this field and set this field as follows:

The base station shall set this field to ‘1’ to indicate that the mobile station is to use the previously downloaded mapping between the channels and LTU Tables. The base station shall set this field to ‘0’ if the following four fields are included in this message.

**FSCH0_LTU_TAB_ID** - Forward Supplemental Channel LTU Table ID.

If USE_OLD_LTU_MAPPING is included and is equal to ‘0’, the base station shall include this field and set this field as follows; otherwise, the base station shall omit this field:

The base station shall set this field to the LTU Table ID to be used for the Forward Supplemental Channel 0. The base station shall set this field to ‘000’ to indicate that the default number of LTUs are to be used (see [3]). The base station shall set this field to ‘000’ if MuxPDU Type 5 is not used on this channel (see [3]).

**RSCH0_LTU_TAB_ID** - Reverse Supplemental Channel LTU Table ID.

If USE_OLD_LTU_MAPPING is included and is equal to ‘0’, the base station shall include this field and set this field as follows; otherwise, the base station shall omit this field:

The base station shall set this field to the LTU Table ID to be used for the Reverse Supplemental Channel 0. The base station shall set this field to ‘000’ to indicate that the default number of LTUs are to be used (see [3]). The base station shall set this field to ‘000’ if MuxPDU Type 5 is not used on this channel (see [3]).

**FSCH1_LTU_TAB_ID** - Forward Supplemental Channel LTU Table ID.

If USE_OLD_LTU_MAPPING is included and is equal to ‘0’, the base station shall include this field and set this field as follows; otherwise, the base station shall omit this field:

The base station shall set this field to the LTU Table ID to be used for the Forward Supplemental Channel 1. The base station shall set this field to ‘000’ to indicate that the default number of LTUs are to be used (see [3]). The base station shall set this field to ‘000’ if MuxPDU Type 5 is not used on this channel (see [3]).

**RSCH1_LTU_TAB_ID** - Reverse Supplemental Channel LTU Table ID.

If USE_OLD_LTU_MAPPING is included and is equal to ‘0’, the base station shall include this field and set this field as follows; otherwise, the base station shall omit this field:

The base station shall set this field to the LTU Table ID to be used for the Reverse Supplemental Channel 1. The base station shall set this field to ‘000’ to indicate that the default number of LTUs are to be used (see [3]). The base station shall set this field to ‘000’ if MuxPDU Type 5 is not used on this channel (see [3]).
PARTITION_TABLES_INFO_INCL - Partition Tables information included indicator.

If USE_FLEX_NUM_BITS is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set this field as follows:

If Partition Tables information is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

PARTITION_TABLES_INCL - Partition Tables included indicator.

If PARTITION_TABLES_INFO_INCL is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set this field as follows:

If the Partition Tables are included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

If PARTITION_TABLES_INCL is included and is equal to ‘1’, then the base station shall include the following fields

NUM_PARTITION_TABLES - Number of partition tables.

The base station shall set this field to one less than the number of Partition Tables corresponding to an FCH or DCCH included in this message.

If PARTITION_TABLES_INCL is included and is equal to ‘1’, then the base station shall include the NUM_PARTITION_TABLES + 1 occurrences of the following fields:

PARTITION_TABLE_ID - Partition Table ID.

The base station shall set this field to the ID of the Partition Table that follows. The base station shall not set this field to ‘000’.

NUM_ROWS - Number of configurations associated with the Partition Table identified by PARTITION_TABLE_ID.

The base station shall set this field to one less than the number of rows of the Partition Table identified by PARTITION_TABLE_ID.

If PARTITION_TABLES_INCL is included and is equal to ‘1’, then the base station shall include NUM_ROWS + 1 occurrences of the following fields:

CATEGORY - Category number.

The base station shall set this field to the category number of the entry of the Partition Table identified by number of bits per each service as specified below. The base station shall not set this field to ‘00001’ or ‘00010’. The base station shall place rows of the Partition Table corresponding to the same number of total information bits per frame consecutively. See [3].

MUX_HEADER_LEN - Multiplex Sublayer Header Length.
The base station shall set this field to the length of the multiplex sublayer header corresponding to the entry of the Partition Table identified by number of bits per each service as specified below.

**MUX_HEADER** - Multiplex Sublayer Header.

The base station shall set this field to the multiplex sublayer header corresponding to the entry of the Partition Table identified by number of bits per each service as specified below.\(^\text{14}\)

**NUM_PARTITIONS** - Number of partitions.

The base station shall set this field to one less than the number of partitions corresponding to each service (including signaling) included in the entry of the Partition Table identified by CATEGORY.

If **PARTITION_TABLES_INCL** is included and is equal to ‘1’, then the base station shall include **NUM_PARTITIONS + 1** occurrences of the following fields:

**SR_ID** - Service Reference ID.

The base station shall set this field to the sr_id of the service (sr_id = ‘000’ for signaling) present in this category.

**SRV_NUM_BITS** - Number of bits allocated to the service.

The base station shall set this field to the number of bits allocated to the service (including signaling) identified by **SR_ID**.

**USE_OLD_PART_MAPPING** - Use the previously downloaded mapping between the channels and Partition Tables.

If **PARTITION_TABLES_INFO_INCL** is equal to ‘1’, the base station shall include this field and set this field as follows; otherwise, the base station shall omit this field:

The base station shall set this field to ‘1’ to indicate that the mobile station is to use the previously downloaded mapping between the channels and Partition Tables. The base station shall set this field to ‘0’, if the following four fields are included in this message.

**FFCH_PART_TAB_ID** - Forward Fundamental Channel Partition Table ID.

---

\(^{14}\) The values of the **MUX_HEADER** corresponding to a specific number of bits per frame, shall be encoded using prefix-free codes. Prefix-free code is defined to be a code constructed so that any partial code word, beginning at the start of a code word but terminating prior to the end of that code word, is not a valid code word.
If USE_OLD_PART_MAPPING is included and is equal to ‘0’, the base station shall include this field and set this field as follows; otherwise, the base station shall omit this field:

The base station shall set this field to the Partition Table ID to be used for the Forward Fundamental Channel. The base station shall set this field to ‘000’ to indicate that the default number of bits per service is to be used (see MuxPDU Type 1 and 2 Categories and Formats for the FCH and DCCH in [3]). The base station shall set this field to a value other than ‘000’ if the FFCH_NBIT_TABLE_ID field is included in this message and is not set to ‘0000’.

**RFCH_PART_TAB_ID** - Reverse Fundamental Channel Partition Table ID.

If USE_OLD_PART_MAPPING is included and is equal to ‘0’, the base station shall include this field and set this field as follows; otherwise, the base station shall omit this field:

The base station shall set this field to the Partition Table ID to be used for the Reverse Fundamental Channel. The base station shall set this field to ‘000’ to indicate that the default number of bits per service is to be used (see MuxPDU Type 1 and 2 Categories and Formats for the FCH and DCCH in [3]). The base station shall set this field to a value other than ‘000’ if the RFCH_NBIT_TABLE_ID is included in this message and field is not set to ‘0000’.

**FDCCH_PART_TAB_ID** - Forward Dedicated Control Channel Partition Table ID.

If USE_OLD_PART_MAPPING is included and is equal to ‘0’, the base station shall include this field and set this field as follows; otherwise, the base station shall omit this field:

The base station shall set this field to the Partition Table ID to be used for the Forward Dedicated Control Channel. The base station shall set this field to ‘000’ to indicate that the default number of bits per service is to be used (see MuxPDU Type 1 and 2 Categories and Formats for the FCH and DCCH in [3]). The base station shall set this field to a value other than ‘000’ if the FDCCH_NBIT_TABLE_ID field is included in this message and is not set to ‘0000’.

**RDCCH_PART_TAB_ID** - Reverse Dedicated Control Channel Partition Table ID.

If USE_OLD_PART_MAPPING is included and is equal to ‘0’, the base station shall include this field and set this field as follows; otherwise, the base station shall omit this field:

The base station shall set this field to the Partition Table ID to be used for the Reverse Dedicated Control Channel. The base station shall set this field to ‘000’ to indicate that the default number of bits per service is to be used (see MuxPDU Type 1
and 2 Categories and Formats for the FCH and DCCH in [3]).  
The base station shall set this field to a value other than ‘000’  
if the RDCCH_NBIT_TABLE_ID field is included in this  
message and is not set to ‘0000’.

USE_ERAM - Use the Enhanced Rate Adaptation Mode indicator.

The base station shall include this field only if  
USE_FLEX_NUM_BITS or USE_VAR_RATE is equal to ‘1’. If  
included, the base station shall set this field to ‘1’ if the base  
station is to use lower rate turbo codes for RC4 and RC5  
Forward Supplemental Channel and the mobile station is to  
use lower rate turbo codes for RC4 Reverse Supplemental  
Channel to match the desired channel interleaver block size  
instead of pure code symbol repetition; otherwise, the base  
station shall set this field to ‘0’.

SWITCHING_PARMS_INCL - R-CQICH switching parameters included indicator.

If the GATING_RATE_INCL field is set to ‘0’, the base station  
shall omit this field; otherwise, the base station shall include  
this field and set it as follows:

The base station shall set this field to ‘1’ if the parameters for  
R-CQICH soft and softer switching are included in this  
message; otherwise, the base station shall set this field to ‘0’.

NUM_SOFT_SWITCHING_FRAMES_CHM - Number of frames for R-CQICH soft  
switching while in Control Hold.

If SWITCHING_PARMS_INCL is not included or included and  
set to ‘0’, then the base station shall omit this field; otherwise,  
the base station shall include this field and set it as follows:

The base station shall set this field to the duration of the cell  
switching period, in units of 20 ms, minus one, during which  
the mobile station, while in Control Hold, is to transmit the  
cell switch sequence on the R-CQICH when it switches  
between two pilots which are in different groups.

NUM_SOFTER_SWITCHING_FRAMES_CHM - Number of frames for R-CQICH softer  
switching while in Control Hold.

If SWITCHING_PARMS_INCL is not included or included and  
set to ‘0’, then the base station shall omit this field; otherwise,  
the base station shall include this field and set it as follows:

The base station shall set this field to the duration of the cell  
switching period, in units of 20 ms, minus one, during which  
the mobile station, while in Control Hold, is to transmit the  
cell switch sequence on the R-CQICH when it switches  
between two pilots which are in the same group.

RPC_INCL - Reverse Link Power Control parameter included indicator.

If the reverse power control related information is included in  
this message, the base station shall set this field to ‘1’;  
otherwise, the base station shall set this field to ‘0’.

RPC_NUM_REC - Number of records for Reverse Link Power Control.
If RPC_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field to one less than the number of records included in this message.

If RPC_NUM_REC is included in this message, the base station shall include RPC_NUM_REC occurrences of the following record:

RPC_ADJ_REC_TYPE - Reverse Link Power Control adjustment record type.

The base station shall set this field to the value shown in Table 3.7.3.3.2.25-3 corresponding to the type of adjustment that is to be used.

RPC_ADJ_REC_LEN - Reverse Link Power Control adjustment record length.

If RPC_ADJ_REC_TYPE is not equal to ‘0100’, the base station shall set this field to the number of octets in the type-specific fields of this adjustment record as given in Table 3.7.3.3.2.25-3.

If RPC_ADJ_REC_TYPE is equal to ‘0100’, the base station shall set this field to ‘0000’.

EXT_RPC_ADJ_REC_LEN - Reverse Link Power Control adjustment record length.

If RPC_ADJ_REC_TYPE is not equal to ‘0100’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

If RPC_ADJ_REC_TYPE is equal to ‘0100’, the base station shall set this field to the number of octets in the type-specific fields of this adjustment record as given in Table 3.7.3.3.2.25-3.

Type-specific fields - Reverse Link Power Control adjustment record type-specific fields.

The base station shall include type-specific fields based on the RPC_ADJ_REC_TYPE of this adjustment record, as specified as below.

If RPC_ADJ_REC_TYPE is equal to ‘0000’, the base station shall set type-specific fields as specified in Table 3.7.5.20-4.
Table 3.7.5.20-4. Type Specific Fields for RECORD_TYPE

FCH_INCL - FCH channel adjustment gain included indicator.

If FCH_CHAN_ADJ_GAIN is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

FCH_CHAN_ADJ_GAIN - Channel adjustment gain for Reverse Fundamental Channel.

If FCH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set each field to the value of the gain adjustment that the mobile station is to make for the Reverse Fundamental Channel. The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB. The base station shall set the value in the range from –48 to 48 inclusive.

DCCH_INCL - DCCH channel adjustment gain included indicator.

If DCCH_CHAN_ADJ_GAIN is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

DCCH_CHAN_ADJ_GAIN - Channel adjustment gain for the Reverse Dedicated Control Channel.
If DCCH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set each field to the value of the gain adjustment that the mobile station is to make for the Reverse Dedicated Control Channel. The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB. The base station shall set the value in the range from –48 to 48 inclusive.

SCH0_INCL - SCH0 channel adjustment gain included indicator.

If SCH0_CHAN_ADJ_GAIN is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

SCH0_CHAN_ADJ_GAIN - Channel adjustment gain for Reverse Supplemental Channel 0.

If SCH0_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set each field to the value of the gain adjustment that the mobile station is to make for the Reverse Supplemental Channel 0. The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB. The base station shall set the value in the range from –48 to 48 inclusive.

SCH1_INCL - SCH1 channel adjustment gain included indicator.

If SCH1_CHAN_ADJ_GAIN is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

SCH1_CHAN_ADJ_GAIN - Channel adjustment gain for Reverse Supplemental Channel 1.

If SCH1_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set each field to the value of the gain adjustment that the mobile station is to make for the Supplemental Channel 1. The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB. The base station shall set the value in the range from –48 to 48 inclusive.

REV_ACKCH_INCL - Reverse Acknowledgment Channel channel adjustment gain included indicator.

If REV_ACKCH_CHAN_ADJ_GAIN is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

REV_ACKCH_CHAN_ADJ_GAIN - Channel adjustment gain for Reverse Acknowledgment Channel.
If REV_ACKCH_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall set each field to the value of the gain adjustment that the mobile station is to make for the Reverse Acknowledgment Channel. The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB. The base station shall set the value in the range from -24 to 24 inclusive.

REV_CQICH_INCL - Reverse Channel Quality Indicator Channel channel adjustment gain included indicator.

If REV_CQICH_CHAN_ADJ_GAIN is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

REV_CQICH_CHAN_ADJ_GAIN - Channel adjustment gain for Reverse Channel Quality Indicator Channel.

If REV_CQICH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set each field to the value of the gain adjustment that the mobile station is to make for the Reverse Channel Quality Indicator Channel. The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB. The base station shall set the value in the range from -16 to 16 inclusive.

RESERVED - Reserved bits.

The base station shall add reserved bits as needed in order to make the length of the entire record equal to an integer number of octets. The base station shall set these bits to ‘0’.

If RPC_ADJ_REC_TYPE is equal to ‘0001’, the base station shall set type-specific fields as specified in Table 3.7.5.20-5.

| RESERVED                          | 0-7 (if needed) |

1. **RL_ATT_ADJ_GAIN_TYPE** - Reverse Link Attribute Adjustment Gain value type indicator. If the following fields are set to the nominal attribute gain adjustment values that the mobile station is to use for the transmission attributes (relative to Nominal_Attribute_Gain specified in [2]), the base station shall set this field to ‘0’. If the following fields are set to the pilot reference level adjustment values that the mobile station is to use for the transmission attributes (relative to Pilot_Reference_Level specified in [2]), the base station shall set this field to ‘1’.

2. **RC3_RC5_20MS_INCL** - Reverse Link Attribute Adjustment Gain for Radio Configuration 3 or 5 of 20 ms frame included indicator. If Reverse Link Attribute adjustment Gain for Radio Configuration 3 or 5 of 20 ms frame is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

3. **RL_ATT_ADJ_GAIN_1500** - Reverse Link Attribute Adjustment Gain for the transmission rate 1500 bits/s. If RC3_RC5_20MS_INCL is set to ‘0’, the base station shall omit this field. If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 1500 bits/s, convolutional code and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive. If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 1500 bits/s, convolutional code and 20ms frame.
The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

- **RL_ATT_ADJ_GAIN_2700** - Reverse Link Attribute Adjustment Gain for the transmission rate 2700 bits/s.

  If RC3_RC5_20MS_INCL is set to ‘0’, the base station shall omit this field.

  If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 2700 bits/s, convolutional code and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

  If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 2700 bits/s, convolutional code and 20ms frame.

  The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

- **RL_ATT_ADJ_GAIN_4800** - Reverse Link Attribute Gain Adjustment for the transmission rate 4800 bits/s.

  If RC3_RC5_20MS_INCL is set to ‘0’, the base station shall omit this field.

  If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 4800 bits/s, convolutional code and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

  If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 4800 bits/s, convolutional code and 20ms frame.

  The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

- **RL_ATT_ADJ_GAIN_9600** - Reverse Link Attribute Gain Adjustment for the transmission rate 9600 bits/s.

  If RC3_RC5_20MS_INCL is set to ‘0’, the base station shall omit this field.
If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 9600 bits/s, convolutional code and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 9600 bits/s, convolutional code and 20ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RC4_RC6_20MS_INCL - Reverse Link Attribute Adjustment Gain for Radio Configuration 4 or 6 of 20ms frame included indicator.

If Reverse Link Attribute Adjustment Gain for Radio Configuration 4 or 6 of 20ms frame is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

RL_ATT_ADJ_GAIN_1800 - Reverse Link Attribute Gain Adjustment for the transmission rate 1800 bits/s.

If RC4_RC6_20MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 1800 bits/s, convolutional code and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 1800 bits/s, convolutional code and 20ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_3600 - Reverse Link Attribute Adjustment Gain for the transmission rate 3600 bits/s.

If RC4_RC6_20MS_INCL is set to ‘0’, the base station shall omit this field.
If RC4_RC6_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 3600 bits/s, convolutional code and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 3600 bits/s, convolutional code and 20ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_7200 - Reverse Link Attribute Adjustment Gain for the transmission rate 7200 bits/s.

If RC4_RC6_20MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 7200 bits/s, convolutional code and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_20MS_INCL is set to ‘1’ and NORM_ATT_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 7200 bits/s, convolutional code and 20ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_14400 - Reverse Link Attribute Adjustment Gain for the transmission rate 14400 bits/s.

If RC4_RC6_20MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 14400 bits/s, convolutional code and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.
If RC4_RC6_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 14400 bits/s, convolutional code and 20ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

5MS_INCL    - 5ms frame Reverse Link Attribute Adjustment Gain included indicator.

If Reverse Link Attribute Adjustment Gain for 5ms frame is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

RL_ATT_ADJ_GAIN_9600_5MS    - Reverse Link Attribute Adjustment Gain for the transmission rate 9600 bits/s with 5ms frame.

If 5MS_INCL is set to ‘0’, the base station shall omit this field.

If 5MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 9600 bits/s, convolutional code and 5ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If 5MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 9600 bits/s, convolutional code and 5ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RC3_RC5_40MS_INCL    - Reverse Link Attribute Adjustment Gain for Radio Configuration 3 or 5 of 40 ms frame included indicator.

If Reverse Link Attribute adjustment Gain for Radio Configuration 3 or 5 of 40 ms frame is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

RL_ATT_ADJ_GAIN_1350_40MS    - Reverse Link Attribute Adjustment Gain for the transmission rate 1350 bits/s.

If RC3_RC5_40MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 1350 bits/s, convolutional code and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.
If RC3_RC5_40MS_INCL is set to '1' and RL_ATT_ADJ_GAIN_TYPE is set to '1', the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 1350 bits/s, convolutional code and 40ms frame.

The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

**RL_ATT_ADJ_GAIN_2400_40MS** - Reverse Link Attribute Adjustment Gain for the transmission rate 2400 bits/s.

If RC3_RC5_40MS_INCL is set to '0', the base station shall omit this field.

If RC3_RC5_40MS_INCL is set to '1' and RL_ATT_ADJ_GAIN_TYPE is set to '0', the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 2400 bits/s, convolutional code and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

**RL_ATT_ADJ_GAIN_4800_40MS** - Reverse Link Attribute Gain Adjustment for the transmission rate 4800 bits/s.

If RC3_RC5_40MS_INCL is set to '0', the base station shall omit this field.

If RC3_RC5_40MS_INCL is set to '1' and RL_ATT_ADJ_GAIN_TYPE is set to '0', the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 4800 bits/s, convolutional code and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

**RL_ATT_ADJ_GAIN_9600_40MS** - Reverse Link Attribute Gain Adjustment for the transmission rate 9600 bits/s.
If RC3_RC5_40MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 9600 bits/s, convolutional code and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC3_RC5_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 9600 bits/s, convolutional code and 40ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RC4_RC6_40MS_INCL - Reverse Link Attribute Adjustment Gain for Radio Configuration 4 or 6 of 40ms frame included indicator.

If Reverse Link Attribute Adjustment Gain for Radio Configuration 4 or 6 of 40ms frame is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

RL_ATT_ADJ_GAIN_1800_40MS - Reverse Link Attribute Gain Adjustment for the transmission rate 1800 bits/s.

If RC4_RC6_40MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 1800 bits/s, convolutional code and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 1800 bits/s, convolutional code and 40ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_3600_40MS - Reverse Link Attribute Adjustment Gain for the transmission rate 3600 bits/s.

If RC4_RC6_40MS_INCL is set to ‘0’, the base station shall omit this field.
If RC4_RC6_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 3600 bits/s, convolutional code and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 3600 bits/s, convolutional code and 40ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_7200_40MS - Reverse Link Attribute Adjustment Gain for the transmission rate 7200 bits/s.

If RC4_RC6_40MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 7200 bits/s, convolutional code and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_40MS_INCL is set to ‘1’ and NORM_ATT_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 7200 bits/s, convolutional code and 40ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_14400_40MS - Reverse Link Attribute Adjustment Gain for the transmission rate 14400 bits/s.

If RC4_RC6_40MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 14400 bits/s, convolutional code and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.
If RC4_RC6_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 14400 bits/s, convolutional code and 40ms frame.

The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

RC3_RC5_80MS_INCL - Reverse Link Attribute Adjustment Gain for Radio Configuration 3 or 5 of 80 ms frame included indicator.

If Reverse Link Attribute adjustment Gain for Radio Configuration 3 or 5 of 80 ms frame is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

RL_ATT_ADJ_GAIN_1200_80MS - Reverse Link Attribute Adjustment Gain for the transmission rate 1200 bits/s.

If RC3_RC5_80MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 1200 bits/s, convolutional code and 80ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_2400_80MS - Reverse Link Attribute Adjustment Gain for the transmission rate 2400 bits/s.

If RC3_RC5_80MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 2400 bits/s, convolutional code and 80ms frame. The base station shall set the value in the range from –48 to 48 inclusive.
If RC3_RC5_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 2400 bits/s, convolutional code and 80ms frame.

The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

**RL_ATT_ADJ_GAIN_4800_80MS** - Reverse Link Attribute Gain Adjustment for the transmission rate 4800 bits/s.

If RC3_RC5_80MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 4800 bits/s, convolutional code and 80ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

**RL_ATT_ADJ_GAIN_9600_80MS** - Reverse Link Attribute Gain Adjustment for the transmission rate 9600 bits/s.

If RC3_RC5_80MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 9600 bits/s, convolutional code and 80ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

**RC4_RC6_80MS_INCL** - Reverse Link Attribute Adjustment Gain for Radio Configuration 4 or 6 of 80ms frame included indicator.
If Reverse Link Attribute Adjustment Gain for Radio Configuration 4 or 6 of 80ms frame is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

RL_ATT_ADJ_GAIN_1800_80MS - Reverse Link Attribute Gain Adjustment for the transmission rate 1800 bits/s.

If RC4_RC6_80MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 1800 bits/s, convolutional code and 80ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 1800 bits/s, convolutional code and 80ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_3600_80MS - Reverse Link Attribute Adjustment Gain for the transmission rate 3600 bits/s.

If RC4_RC6_80MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 3600 bits/s, convolutional code and 80ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 3600 bits/s, convolutional code and 80ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_7200_80MS - Reverse Link Attribute Adjustment Gain for the transmission rate 7200 bits/s.

If RC4_RC6_80MS_INCL is set to ‘0’, the base station shall omit this field.
If RC4_RC6_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 7200 bits/s, convolutional code and 80ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_80MS_INCL is set to ‘1’ and NORM_ATT_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 7200 bits/s, convolutional code and 80ms frame.

The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_14400_80MS - Reverse Link Attribute Adjustment Gain for the transmission rate 14400 bits/s.

If RC4_RC6_80MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 14400 bits/s, convolutional code and 80ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 14400 bits/s, convolutional code and 80ms frame.

The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

RESERVED - Reserved bits.

The base station shall add reserved bits as needed in order to make the length of the entire record equal to an integer number of octets. The base station shall set these bits to ‘0’.

If RPC_ADJ_REC_TYPE is equal to ‘0010’, the base station shall set type-specific fields as specified in Table 3.7.5.20-6.

| RESERVED                          | 0-7 (if needed) |

1 CODE_TYPE - Coding type indicator.

If the following corresponding gain adjustment fields apply for the convolutional code, the base station shall set this field to '0'. If the following corresponding gain adjustment fields apply for the Turbo code, the base station shall set this field to '1'.

8 RL_ATT_ADJ_GAIN_TYPE - Reverse Link Attribute adjustment Gain value type indicator.

If the following corresponding gain adjustment fields are set to the value of the nominal attribute gain adjustment that the mobile station is to make for the corresponding transmission attributes (relative to Nominal_Attribute_Gain specified in [2]), the base station shall set this field to '0'. If the following corresponding gain adjustment fields are set to the value of the pilot reference level adjustment that the mobile station is to use for the corresponding transmission attributes (relative to Pilot_Reference_Level specified in [2]), the base station shall set this field to '1'.

19 RC3_RC5_20MS_INCL - Reverse Link Attribute Adjustment Gain for Radio Configuration 3 or 5 of 20ms frame included indicator.

If Reverse Link Attribute Adjustment Gain for Radio Configuration 3 or 5 of 20ms frame is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

25 RL_ATT_ADJ_GAIN_19200 - Reverse Link Attribute Adjustment Gain for the transmission rate 19200 bits/s.
If RC3_RC5_20MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 19200 bits/s, and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 19200 bits/s and 20ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_38400 - Reverse Link Attribute Adjustment Gain for the transmission rate 38400 bits/s.

If RC3_RC5_20MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 38400 bits/s, and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC3_RC5_20MS_INCL is set to ‘1’ and NORM_ATT_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 38400 bits/s and 20ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_76800 - Reverse Link Attribute Adjustment Gain for the transmission rate 76800 bits/s.

If RC3_RC5_20MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 76800 bits/s, and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.
If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 76800 bits/s and 20ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_153600 - Reverse Link Attribute Adjustment Gain for the transmission rate 153600 bits/s.

If RC3_RC5_20MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_20MS_INCL is set to ‘1’ and NORM_ATT_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 153600 bits/s, and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC3_RC5_20MS_INCL is set to ‘1’ and NORM_ATT_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 153600 bits/s and 20ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_307200 - Reverse Link Attribute Adjustment Gain for the transmission rate 307200 bits/s.

If RC3_RC5_20MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 307200 bits/s, and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 307200 bits/s and 20ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_614400 - Reverse Link Attribute Adjustment Gain for the transmission rate 614400 bits/s.
If RC3_RC5_20MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 614400 bits/s and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC3_RC5_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 614400 bits/s and 20ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RC4_RC6_20MS_INCL - Reverse Link Attribute Adjustment Gain for Radio Configuration 4 or 6 of 20ms frame included indicator.

If Reverse Link Attribute Adjustment Gain for Radio Configuration 4 or 6 of 20ms frame is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

RL_ATT_ADJ_GAIN_28800 - Reverse Link Attribute Adjustment Gain for the transmission rate 28800 bits/s.

If RC4_RC6_20MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 28800 bits/s and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_20MS_INCL is set to ‘1’ and NORM_ATT_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 28800 bits/s and 20ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_57600 - Reverse Link Attribute Adjustment Gain for the transmission rate 57600 bits/s.

If RC4_RC6_20MS_INCL is set to ‘0’, the base station shall omit this field.
If RC4_RC6_20MS_INCL is set to ‘1’ and NORM_ATT_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 57600 bits/s, and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_20MS_INCL is set to ‘1’ and NORM_ATT_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 57600 bits/s and 20ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

**RL_ATT_ADJ_GAIN_115200** - Reverse Link Attribute Adjustment Gain for the transmission rate 115200 bits/s.

If RC4_RC6_20MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 115200 bits/s, and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 115200 bits/s and 20ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

**RL_ATT_ADJ_GAIN_230400** - Reverse Link Attribute Adjustment Gain for the transmission rate 230400 bits/s.

If RC4_RC6_20MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 230400 bits/s, and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.
If RC4_RC6_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 230400 bits/s and 20ms frame.

The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_460800 - Reverse Link Attribute Adjustment Gain for the transmission rate 460800 bits/s.

If RC4_RC6_20MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 460800 bits/s, and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_1036800 - Reverse Link Attribute Adjustment Gain for the transmission rate 1036800 bits/s.

If RC4_RC6_20MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_20MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 1036800 bits/s, and 20ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

RC3_RC5_40MS_INCL - Reverse Link Attribute Adjustment Gain for Radio Configuration 3 or 5 of 40ms frame included indicator.
If Reverse Link Attribute Adjustment Gain for Radio Configuration 3 or 5 of 40ms frame is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**RL_ATT_ADJ_GAIN_19200_40MS** - Reverse Link Attribute Adjustment Gain for the transmission rate 19200 bits/s.

If **RC3_RC5_40MS_INCL** is set to ‘0’, the base station shall omit this field.

If **RC3_RC5_40MS_INCL** is set to ‘1’ and **RL_ATT_ADJ_GAIN_TYPE** is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 19200 bits/s, and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If **RC3_RC5_40MS_INCL** is set to ‘1’ and **RL_ATT_ADJ_GAIN_TYPE** is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 19200 bits/s and 40ms frame.

The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

**RL_ATT_ADJ_GAIN_38400_40MS** - Reverse Link Attribute Adjustment Gain for the transmission rate 38400 bits/s.

If **RC3_RC5_40MS_INCL** is set to ‘0’, the base station shall omit this field.

If **RC3_RC5_40MS_INCL** is set to ‘1’ and **RL_ATT_ADJ_GAIN_TYPE** is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 38400 bits/s, and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If **RC3_RC5_40MS_INCL** is set to ‘1’ and **NORM_ATT_GAIN_TYPE** is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 38400 bits/s and 40ms frame.

The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

**RL_ATT_ADJ_GAIN_76800_40MS** - Reverse Link Attribute Adjustment Gain for the transmission rate 76800 bits/s.

If **RC3_RC5_40MS_INCL** is set to ‘0’, the base station shall omit this field.
If `RC3_RC5_40MS_INCL` is set to ‘1’ and `RL_ATT_ADJ_GAIN_TYPE` is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 76800 bits/s, and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If `RC3_RC5_40MS_INCL` is set to ‘1’ and `RL_ATT_ADJ_GAIN_TYPE` is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 76800 bits/s and 40ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

`RL_ATT_ADJ_GAIN_153600_40MS` - Reverse Link Attribute Adjustment Gain for the transmission rate 153600 bits/s.

If `RC3_RC5_40MS_INCL` is set to ‘0’, the base station shall omit this field.

If `RC3_RC5_40MS_INCL` is set to ‘1’ and `NORM_ATT_GAIN_TYPE` is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 153600 bits/s, and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If `RC3_RC5_40MS_INCL` is set to ‘1’ and `NORM_ATT_GAIN_TYPE` is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 153600 bits/s and 40ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

`RL_ATT_ADJ_GAIN_307200_40MS` - Reverse Link Attribute Adjustment Gain for the transmission rate 307200 bits/s.

If `RC3_RC5_40MS_INCL` is set to ‘0’, the base station shall omit this field.

If `RC3_RC5_40MS_INCL` is set to ‘1’ and `RL_ATT_ADJ_GAIN_TYPE` is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 307200 bits/s, and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.
If RC3_RC5_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 307200 bits/s and 40ms frame.

The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

RC4_RC6_40MS_INCL - Reverse Link Attribute Adjustment Gain for Radio Configuration 4 or 6 of 40ms frame included indicator.

If Reverse Link Attribute Adjustment Gain for Radio Configuration 4 or 6 of 40ms frame is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

RL_ATT_ADJ_GAIN_28800_40MS - Reverse Link Attribute Adjustment Gain for the transmission rate 28800 bits/s.

If RC4_RC6_40MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 28800 bits/s, and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_40MS_INCL is set to ‘1’ and NORM_ATT_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 28800 bits/s and 40ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_57600_40MS - Reverse Link Attribute Adjustment Gain for the transmission rate 57600 bits/s.

If RC4_RC6_40MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_40MS_INCL is set to ‘1’ and NORM_ATT_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 57600 bits/s, and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.
If RC4_RC6_40MS_INCL is set to ‘1’ and NORM_ATT_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 57600 bits/s and 40ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_115200_40MS - Reverse Link Attribute Adjustment Gain for the transmission rate 115200 bits/s.

If RC4_RC6_40MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 115200 bits/s, and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 115200 bits/s and 40ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_230400_40MS - Reverse Link Attribute Adjustment Gain for the transmission rate 230400 bits/s.

If RC4_RC6_40MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 230400 bits/s, and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_40MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 230400 bits/s and 40ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_518400_40MS - Reverse Link Attribute Adjustment Gain for the transmission rate 518400 bits/s.
If RC4_RC6_40MS_INCL is set to '0', the base station shall omit this field.

If RC4_RC6_40MS_INCL is set to '1' and RL_ATT_ADJ_GAIN_TYPE is set to '0', the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 518400 bits/s, and 40ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_40MS_INCL is set to '1' and RL_ATT_ADJ_GAIN_TYPE is set to '1', the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 518400 bits/s and 40ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RC3_RC5_80MS_INCL - Reverse Link Attribute Adjustment Gain for Radio Configuration 3 or 5 of 80ms frame included indicator.

If Reverse Link Attribute Adjustment Gain for Radio Configuration 3 or 5 of 80ms frame is included in this message, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

RL_ATT_ADJ_GAIN_19200_80MS - Reverse Link Attribute Adjustment Gain for the transmission rate 19200 bits/s.

If RC3_RC5_80MS_INCL is set to '0', the base station shall omit this field.

If RC3_RC5_80MS_INCL is set to '1' and RL_ATT_ADJ_GAIN_TYPE is set to '0', the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 19200 bits/s, and 80ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC3_RC5_80MS_INCL is set to '1' and RL_ATT_ADJ_GAIN_TYPE is set to '1', the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 19200 bits/s and 80ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_38400_80MS - Reverse Link Attribute Adjustment Gain for the transmission rate 38400 bits/s.

If RC3_RC5_80MS_INCL is set to '0', the base station shall omit this field.
If RC3_RC5_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 38400 bits/s, and 80ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC3_RC5_80MS_INCL is set to ‘1’ and NORM_ATT_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 38400 bits/s and 80ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_76800_80MS - Reverse Link Attribute Adjustment Gain for the transmission rate 76800 bits/s.

If RC3_RC5_80MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 76800 bits/s, and 80ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC3_RC5_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 76800 bits/s and 80ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_153600_80MS - Reverse Link Attribute Adjustment Gain for the transmission rate 153600 bits/s.

If RC3_RC5_80MS_INCL is set to ‘0’, the base station shall omit this field.

If RC3_RC5_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 153600 bits/s, and 80ms frame. The base station shall set the value in the range from –48 to 48 inclusive.
If `RC3_RC5_80MS_INCL` is set to ‘1’ and `RL_ATT_ADJ_GAIN_TYPE` is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 153600 bits/s and 80ms frame.

The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

**RC4_RC6_80MS_INCL** - Reverse Link Attribute Adjustment Gain for Radio Configuration 4 or 6 of 80ms frame included indicator.

If Reverse Link Attribute Adjustment Gain for Radio Configuration 4 or 6 of 80ms frame is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**RL_ATT_ADJ_GAIN_28800_80MS** - Reverse Link Attribute Adjustment Gain for the transmission rate 28800 bits/s.

If `RC4_RC6_80MS_INCL` is set to ‘0’, the base station shall omit this field.

If `RC4_RC6_80MS_INCL` is set to ‘1’ and `RL_ATT_ADJ_GAIN_TYPE` is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 28800 bits/s, and 80ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If `RC4_RC6_80MS_INCL` is set to ‘1’ and `NORM_ATT_GAIN_TYPE` is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 28800 bits/s and 80ms frame.

The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

**RL_ATT_ADJ_GAIN_57600_80MS** - Reverse Link Attribute Adjustment Gain for the transmission rate 57600 bits/s.

If `RC4_RC6_80MS_INCL` is set to ‘0’, the base station shall omit this field.

If `RC4_RC6_80MS_INCL` is set to ‘1’ and `NORM_ATT_GAIN_TYPE` is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 57600 bits/s, and 80ms frame. The base station shall set the value in the range from –48 to 48 inclusive.
If RC4_RC6_80MS_INCL is set to ‘1’ and NORM_ATT_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 57600 bits/s and 80ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_115200_80MS - Reverse Link Attribute Adjustment Gain for the transmission rate 115200 bits/s.

If RC4_RC6_80MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 115200 bits/s, and 80ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 115200 bits/s and 80ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_ATT_ADJ_GAIN_259200_80MS - Reverse Link Attribute Adjustment Gain for the transmission rate 259200 bits/s.

If RC4_RC6_80MS_INCL is set to ‘0’, the base station shall omit this field.

If RC4_RC6_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes with transmission rate 259200 bits/s, and 80ms frame. The base station shall set the value in the range from –48 to 48 inclusive.

If RC4_RC6_80MS_INCL is set to ‘1’ and RL_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes with transmission rate 259200 bits/s and 80ms frame.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RESERVED - Reserved bits.
The base station shall add reserved bits as needed in order to make the length of the entire record equal to an integer number of octets. The base station shall set these bits to '0'.

If RPC_ADJ_REC_TYPE is equal to '0011', the base station shall set type-specific fields as specified in Table 3.7.5.20-7.

**Table 3.7.5.20-7. Type Specific Fields for RECORD_TYPE = ‘0011’**

RL_CQICH_ATT_ADJ_GAIN_TYPE - Reverse Channel Quality Indicator Channel attribute adjustment gain value type indicator

If the following fields are set to the nominal attribute gain adjustment values that the mobile station is to use for the transmission attributes (relative to Nominal_Attribute_Gain specified in [2]), the base station shall set this field to ‘0’. If the following fields are set to the pilot reference level adjustment values that the mobile station is to use for the transmission attributes (relative to Pilot_Reference Level specified in [2]), the base station shall set this field to ‘1’.

RL_CQICH_ATT_ADJ_GAIN_HIGH_INCL - Reverse Channel Quality Indicator Channel attribute adjustment gain for the high power level included indicator.

If the attribute adjustment gain for the high power level of Reverse Channel Quality Indicator Channel transmission is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

RL_CQICH_ATT_ADJ_GAIN_HIGH - Attribute adjustment gain for Reverse Channel Quality Indicator Channel for the high Channel Quality Indicator gain power level.

If RL_CQICH_ATT_ADJ_GAIN_HIGH_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:
If RL_CQICH_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes for the high power level of R-CQICH. The base station shall set the value in the range from –40 to 16 inclusive.

If RL_CQICH_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes for the high power level of R-CQICH.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RL_CQICH_ATT_ADJ_GAIN_LOW_INCL - Reverse Channel Quality Indicator Channel attribute adjustment gain for the low power level included indicator.

If the attribute adjustment gain for the low power level of Reverse Channel Quality Indicator Channel transmission is included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

RL_CQICH_ATT_ADJ_GAIN_LOW - Attribute adjustment gain for Reverse Channel Quality Indicator Channel for the low Channel Quality Indicator gain power level.

If RL_CQICH_ATT_ADJ_GAIN_LOW_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall set this field as follows:

If RL_CQICH_ATT_ADJ_GAIN_TYPE is set to ‘0’, the base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes for the low power level of R-CQICH. The base station shall set the value in the range from –16 to 16 inclusive.

If RL_CQICH_ATT_ADJ_GAIN_TYPE is set to ‘1’, the base station shall set this field to the value of the pilot reference level adjustment that the mobile station is to make for the transmission attributes for the low power level of R-CQICH.

The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.
If RPC_ADJ_REC_TYPE is equal to ‘0100’, the base station shall set type-specific fields as specified in Table 3.7.5.20-8.

Table 3.7.5.20-8. Type Specific Fields for RECORD_TYPE = ‘0100’

1. REV_REQCH_ADJ_INCL - Reverse Request Channel Adjustment included field.
2. If the attribute adjustment gains for the Reverse Request Channel are included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.
3. REV_REQCH_ADJ_GAIN - Reverse Request Channel Adjustment Gain.
If REV_REQCH_ADJ_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes for the power level of R-REQCH.

The base station shall set the value in the range from $-324$ to $540$ inclusive. The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

**REV_SPICH_ADJ_INCL** - Reverse Secondary Pilot Channel Adjustment included field.

If the attribute adjustment gains for the Reverse Secondary Pilot Channel are included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

**REV_SPICH_ADJ_GAIN** - Reverse Secondary Pilot Channel Adjustment Gain.

If REV_SPICH_ADJ_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes for the power level of R-SPICH.

The base station shall set the value in the range from $-216$ to $648$ inclusive. The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

**REV_SPICH_EP_SIZE** - Minimum Encoder Packet Size for which the Reverse Secondary Pilot Channel is used.

If REV_SPICH_ADJ_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to the minimum encoder packet size for which the Reverse Secondary Pilot Channel is used (see [2] and [3]).

This field shall take the values 0 to 10 corresponding to the encoder packet sizes 192, 408, 792, 1560, 3096, 4632, 6168, 9240, 12312, 15384, 18456 bits.

**REV_PDCCH_ADJ_INCL** - Reverse Packet Data Control Channel Adjustment included field.

If the attribute adjustment gains for the Reverse Packet Data Control Channel are included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.
REV_PDCCH_ADJ_GAIN - Reverse Packet Data Control Channel Adjustment Gain.

If REV_PDCCH_ADJ_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes for the power level of R-PDCCH.

The base station shall set the value in the range from \(-432\) to \(432\) inclusive. The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

REV_PDCCH_ATTRIBUTE_ADJ_INCL - Reverse Packet Data Control Channel Attribute Adjustment included field.

If the attribute adjustment gains for the Reverse Packet Data Control Channel are included per encoder packet size and per boost mode in this message, the base station shall set this field to '1'; otherwise, the base station shall set this field to '0'.

REV_PDCCH_EP_SIZE_NUM - Number of occurrences of Reverse Packet Data Control Channel Attribute Adjustment Gains.

If REV_PDCCH_ATTRIBUTE_ADJ_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to one less than half the number of occurrences of the field included hereafter. The records are listed per encoder packet size, in the following ascending order: 192, 408, 792, 1560, 3096, 4632, 6168, 9240, 12312, 15384, 18456 bits.

If REV_PDCCH_ATTRIBUTE_ADJ_INCL is set to ‘1’, the base station shall include REV_PDCCH_EP_SIZE_NUM+1 occurrences of the following record:

The base station shall include 2 occurrences of the following field. The first occurrence of this field is for the non-boosted mode, while the second is for the boosted mode.

REV_PDCCH_ATTRIBUTE_ADJ_GAIN - Reverse Packet Data Control Channel Attribute Adjustment Gain.

The base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes for the power level of R-PDCCH, for the i-th encoder packet size, and for the non-boosted and boosted modes.

The base station shall set the value in the range from \(-432\) to \(432\) inclusive. The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.
REV_PDCCH_BOOST_ADJ_INCL - Reverse Packet Data Control Channel Boost

Adjustment included field.

If the attribute adjustment gains for the Reverse Packet Data Control Channel per boosted mode are included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

If REV_PDCCH_BOOST_ADJ_INCL is set to ‘1’, the base station shall include two occurrences of the following record:

REV_PDCCH_BOOST_ADJ_GAIN - Reverse Packet Data Control Channel Boost Adjustment Gains.

The base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes for the power level of R-PDCCH, for the appropriate mode.

The base station shall set the value in the range from $-\frac{1}{4}$ to $\frac{1}{4}$-inclusive.

The first occurrence of this field is for the non-boosted mode, while the second is for the boosted mode. The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

REV_PDCCH_PAYLOAD_ADJ_INCL - Reverse Packet Data Control Channel Payload Attribute Adjustment included field.

If the attribute adjustment gains for the Reverse Packet Data Control Channel are included per encoder packet size in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

REV_PDCCH_EP_SIZE_NUM_1 - Number of occurrences of Reverse Packet Data Control Channel Payload Attribute Adjustment Gain records.

If REV_PDCCH_PAYLOAD_ADJ_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to one less than the number of occurrences of the field included hereafter. The fields are listed per encoder packet size, in the following ascending order: 192, 408, 792, 1560, 3096, 4632, 6168, 9240, 12312, 15384, 18456 bits.

If REV_PDCCH_PAYLOAD_ADJ_INCL is set to ‘1’, the base station shall include $(REV_PDCCH_EP_SIZE_NUM_1+1)\times2$ occurrences of the following record:
REV_PDCCH_PAYLOAD_ADJ_GAIN  -  Reverse Packet Data Control Channel Payload Attribute Adjustment Gain.

The base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes for the power level of R-PDCCH, for the i-th encoder packet size, and for the non-boosted and boosted modes. In each set for the i-th encoder packet, the first occurrence of this field is for the non-boosted mode, while the second is for the boosted mode.

The base station shall set the value in the range from $-\frac{432}{40}$ to $\frac{432}{40}$ inclusive. The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

REV_PDCH_ADJ_INCL  -  Reverse Packet Data Channel Adjustment included field.

If the attribute adjustment gains for the Reverse Packet Data Channel are included in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

REV_PDCH_ADJ_GAIN  -  Reverse Packet Data Channel Adjustment Gain.

If REV_PDCH_ADJ_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes for the power level of R-PDCH.

The base station shall set the value in the range from $-\frac{440}{656}$ to $\frac{440}{656}$ inclusive. The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

REV_PDCH_PAYLOAD_ADJ_INCL  -  Reverse Packet Data Channel Adjustment included field.

If the attribute adjustment gains for the Reverse Packet Data Channel are included per encoder packet size in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

REV_PDCH_EP_SIZE_NUM  -  Number of occurrences of Reverse Packet Data Channel Payload Adjustment Gains.

If REV_PDCH_PAYLOAD_ADJ_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to one less than the number of occurrences of the following field. The fields are listed per encoder packet size, in the following ascending order: 192, 408, 792, 1560, 3096, 4632, 6168, 9240, 12312, 15384, 18456 bits.

If REV_PDCH_PAYLOAD_ADJ_INCL is set to ‘1’, the base station shall include
REV_PDCH_EP_SIZE_NUM+1 occurrences of the following record:

REV_PDCH_PAYLOAD_ADJ_GAIN  - Reverse Packet Data Channel Payload Adjustment Gain. 
The base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes for the power level of R-PDCH, for the i-th encoder packet size.

The base station shall set the value in the range from $-440$ to $656$–inclusive. The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

REV_PDCH_BOOST_ADJ_INCL  - Reverse Packet Data Channel Adjustment included field. 

If the attribute adjustment gains for the Reverse Packet Data Channel are included per boosted mode in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

If REV_PDCH_BOOST_ADJ_INCL is set to ‘1’, the base station shall include two occurrences of the following record. The first occurrence of this field is for the non-boosted mode, while the second is for the boosted mode.

REV_PDCH_BOOST_ADJ_GAIN  - Reverse Packet Data Channel Boost-dependent Adjustment Gain. 
The base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes for the power level of R-PDCH.

The base station shall set the value in the range from $-440$ to $656$–inclusive. The first occurrence of this field is for the non-boosted mode, while the second is for the boosted mode. The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

REV_PDCH_SUBPACKET_ADJ_INCL  - Reverse Packet Data Channel Subpacket Adjustment included field. 

If the attribute adjustment gains for the Reverse Packet Data Channel are included per subpacket transmission round in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

REV_PDCH_RETRX_NUM  - Number of occurrences of the Reverse Packet Data Channel Subpacket Adjustment Gains. 

If REV_PDCH_SUBPACKET_ADJ_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to one less than the number of occurrences of the following field.

If REV_PDCH_SUBPACKET_ADJ_INCL is set to ‘1’, the base station shall include
(REV_PDCH_RETRX_NUM+1) occurrences of the following record:

REV_PDCH_SUBPACKET_ADJ_GAIN  - Reverse Packet Data Channel Subpacket Adjustment Gain.

The base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes for the power level of R-PDCH on the i-th transmission round.

The base station shall set the value in the range from \(-40\) to \(46\) inclusive. The base station shall set this field to the correction factor expressed as a two's complement value in units of 0.125 dB.

REV_PDCH_ATTRIBUTE_ADJ_INCL  - Reverse Packet Data Channel Attribute Adjustment included field.

If the attribute adjustment gains for the Reverse Packet Data Channel are included per encoder packet size and per subpacket transmission round in this message, the base station shall set this field to ‘1’; otherwise, the base station shall set this field to ‘0’.

REV_PDCH_EP_SIZE_NUM_1  - Number of occurrences of the Reverse Packet Data Channel Attribute Adjustment Gains record.

If REV_PDCH_ATTRIBUTE_ADJ_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

The base station shall set this field to one less than the number of occurrences of the following subrecord. The subrecords are listed per encoder packet size, in the following ascending order: 192, 408, 792, 1560, 3096, 4632, 6168, 9240, 12312, 15384, 18456 bits.

If REV_PDCH_ATTRIBUTE_ADJ_INCL REV_PDCH_SUBPACKET_ADJ_INCL is set to ‘1’, the base station shall include (REV_PDCH_EP_SIZE_NUM_1+1) occurrences of the following subrecord:

REV_PDCH_RETRX_NUM_1  - Number of occurrences of the Reverse Packet Data Channel Subpacket Adjustment Gains.

The base station shall set this field to one less than the number of occurrences of the following field.

The base station shall include (REV_PDCH_RETRX_NUM_1+1) occurrences of the following record:

The base station shall include 2 occurrences of the following field. The first occurrence of this field is for the non-boosted mode, while the second is for the boosted mode.
REV_PDCH_ATTRIBUTE_ADJ_GAIN - Reverse Packet Data Channel Attribute

Adjustment Gain.

The base station shall set this field to the value of the nominal attribute gain adjustment that the mobile station is to make for the transmission attributes for the power level of R-PDCH, for the i-th encoder packet size on a j-th transmission round, using the non-boosted or boosted mode.

The base station shall set the value in the range from \(-440\) to \(656\) inclusive. The base station shall set this field to the correction factor expressed as a two’s complement value in units of 0.125 dB.

RESERVED - Reserved bits.

The base station shall add reserved bits as needed in order to make the length of the entire record equal to an integer number of octets. The base station shall set these bits to '0'.

BCMC_LPM_INCL - BCMC Logical to Physical Mapping included indicator.

The base station shall set this field to ‘1’ if BCMC Logical to Physical Mapping is included in this message; otherwise, the base station shall set this field to ‘0’.

BCMC_LPM_IND - BCMC Logical to Physical Mapping indicator.

If the BCMC_LPM_INCL field is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘01’ or ‘10’ as shown in Table 3.7.5.20-2 corresponding to the Logical to Physical Mapping indicator.

NUM_BCMC_PROGRAMS - Number of BCMC Programs

If the BCMC_LPM_IND field is not included or is included and is not set to ‘01’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the number of BCMC programs included in this LPM record minus 1.

The base station shall include NUM_BCMC_PROGRAMS+1 occurrences of the following variable length record:

BCMC_PROGRAM_ID_LEN - Length of BCMC_PROGRAM_ID field

The base station shall set this field to one less than the length, in bits, of the BCMC_PROGRAM_ID of this program.

BCMC_PROGRAM_ID - BCMC program Identifier

The length of this field shall be one more than the value of BCMC_PROGRAM_ID_LEN bits.
The base station shall set this field to the identifier of the BCMC program to which this Logical to Physical Mapping entry applies.

**BCMC_FLOW_DISCRIMINATOR_LEN** - Length of BCMC_FLOW_DISCRIMINATOR field

The base station shall set this field to the length, in bits, of the BCMC_FLOW_DISCRIMINATOR of this program.

**NUM_FLOW_DISCRIMINATOR** - Number of flow discriminators

The length of this field shall be determined by the value of the BCMC_FLOW_DISCRIMINATOR_LEN as follows: if BCMC_FLOW_DISCRIMINATOR_LEN is set to '000', this field is omitted; otherwise, the length of this field shall be BCMC_FLOW_DISCRIMINATOR_LEN bits.

The base station shall set this field to the number of flow discriminators included for this program.

If **NUM_FLOW_DISCRIMINATOR** field is included, the base station shall include NUM_FLOW_DISCRIMINATOR+1 occurrences of the following variable length record; otherwise, the base station shall include 1 occurrence of the following variable length record:

**BCMC_FLOW_DISCRIMINATOR** – BCMC Flow discriminator.

The length of this field shall be determined by the value of the BCMC_FLOW_DISCRIMINATOR_LEN as follows: if BCMC_FLOW_DISCRIMINATOR_LEN is set to '000', this field is omitted; otherwise, the length of this field shall be BCMC_FLOW_DISCRIMINATOR_LEN bits.

The base station shall set this field to the number of flow discriminators included for this program.

The base station shall set this field to the BCMC flow discriminator to which this Logical to Physical Mapping entry applies.

**BCMC_FLOW_ID_LEN_IND** – BCMC Flow Identifier Length Indicator

If the BCMC_LPM_IND field is not included or is included and is not set to ‘01’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The mobile station shall set this field to indicate the length of the BCMC flow identifier as specified in Table 3.7.2.3.2.38-1.

**BCMC_NUM_LPM_ENTRIES** – Number of BCMC Logical-to-Physical Mapping entries

If the BCMC_LPM_IND field is not included or is included and is not set to ‘01’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the number of Logical-to-Physical Mapping entries that are included in this record.
If the BCMC_NUM_LPM_ENTRIES field is included and is not equal to ‘0000’, the base
station shall include BCMC_NUM_LPM_ENTRIES occurrences of the following record for
each BCMC Logical-to-Physical Mapping entry:

BCMC_FLOW_ID – BCMC Flow Identifier.

The base station shall set this field to the identifier of the
BCMC flow to which this Logical to Physical Mapping entry applies.

PHYSICAL_RESOURCE - Physical resource identifier.

The base station shall set this field to the physical resource
identifier ‘0000’, ‘0001’, ‘0010’, ‘0011’ as shown in Table
3.7.5.20-4 to which the logical BCMC traffic channel
corresponding to BCMC_FLOW_ID specified in this BCMC
Logical to Physical Mapping entry is to be mapped.

FORWARD_FLAG - Forward mapping indicator.

The base station shall set this field to ‘1’ if the logical to
physical channel mapping specified in this record applies to
forward logical channels; otherwise, the base station shall set
this field to ‘0’.

REVERSE_FLAG - Reverse mapping indicator.

The base station shall set this field to ‘1’ if the logical to
physical channel mapping specified in this record applies to
reverse logical channels; otherwise, the base station shall set
this field to ‘0’.

BSR_ID_INCL - BSR_ID included indicator.

The base station shall set this field to ‘1’ if BSR_ID_LEN_IND,
BSR_ID fields are included in this message; otherwise, the
base station shall set this field to ‘0’ and include
FOR_TRAFFIC, REV_TRAFFIC fields in this message.

BSR_ID_LEN_IND – BCMC Service Reference Identifier length indicator

If the BSR_ID_INCL field is set to ‘0’, the base station shall
omit this field; otherwise, the base station shall include this
field and set it as follows:

The base station shall set this field to ‘1’ if the length of the
BCMC Service Reference Identifier is 3 bits; the base station
shall set this field to ‘0’ if the length of the BCMC Service
Reference Identifier is 16 bits.

BSR_ID - BCMC Service Reference Identifier

If the BSR_ID_INCL field is set to ‘0’, the base station shall
omit this field; otherwise, the base station shall include this
field and set it as follows:

The base station shall set this field to the BCMC Service
Reference identifier corresponding to this BCMC flow to which
this Logical to Physical Mapping entry applies.
The base station shall not set this field to a value of 0.

FOR_TRAFFIC - Forward Traffic Channel traffic type.

If the BSR_ID_INCL field is set to ‘1’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the FOR_TRAFFIC code shown in Table 3.7.5.20-5 corresponding to the Forward Traffic Channel traffic type to be used with the BCMC flow to which this Logical to Physical Mapping entry applies.

Table 3.7.5.20-5. FOR_TRAFFIC Codes

All other FOR_TRAFFIC codes are reserved.

REV_TRAFFIC - Reverse Traffic Channel traffic type.

If the BSR_ID_INCL field is set to ‘1’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to the REV_TRAFFIC code shown in Table 3.7.5.20-6 corresponding to the Reverse Traffic Channel traffic type to be used with the BCMC flow to which this Logical to Physical Mapping entry applies.
### Table 3.7.5.20-6. REV_TRAFFIC Codes

All other REV_TRAFFIC codes are reserved.

---

2. REV_PDCH_PARMS_INCL - Reverse PDCH Parameters Included indicator.

   The base station shall set this field to ‘1’ if the reverse Packet Data Channel parameters are included; otherwise, the base station shall set this field to ‘0’.

3. REV_PDCH_PARMS_1_INCL - Reverse Packet Data Channel parameters subset included indicator.

   If REV_PDCH_PARMS_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field, and set it as follows.

   The base station shall set this field to ‘1’ if the following R-PDCH parameters are included in this message; otherwise, the base station shall set this field to ‘0’.

4. REV_PDCH_MAX_AUTO_TPR - Reverse Packet Data Channel maximum traffic to pilot ratio for autonomous transmission.

   If REV_PDCH_PARMS_1_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

   The base station shall set this field to the maximum traffic to pilot ratio for autonomous transmission on the Reverse Packet Data Channel (see [2] and [3]).

   The base station shall set this field to a value in the range 0 to 18 dB inclusive in units of 0.125 dB.

5. REV_PDCH_NUM_ARQ_ROUNDS_NORMAL - Maximum number of allowed ARQ rounds on the Reverse PDCH in the non-boosted mode.

   If REV_PDCH_PARMS_1_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.
The base station shall set this field to one less the maximum number of allowed ARQ rounds on the Reverse PDCH in the non-boosted mode. The base station shall set this field to 0, 1, or 2 corresponding to 1, 2, or 3 rounds respectively (See [3]).

**REV_PDCH_OPER_PARMS_INCL** - Reverse Packet Data Channel operational parameters included indicator.

If REV_PDCH_PARMS_INCL is set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to '1' if the following PDCH operational parameters are included in this message; otherwise, the base station shall set this field to '0'.

**REV_PDCH_MAX_SIZE_ALLOWED_ENCODER_PACKET** - Maximum Allowed Reverse PDCH encoder packet size.

If REV_PDCH_OPER_PARMS_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to the maximum size encoder packet that the mobile station is allowed to use. (see [2] and [3]).

The base station shall set this field to a value in the range 0 to 10 inclusive, corresponding to the encoder packet sizes 192, 408, 792, 1560, 3096, 6168, 9240, 12312, 15384, and 18456 bits respectively.

**REV_PDCH_DEFAULT_PERSISTENCE** - Reverse Packet Data Channel default initial persistence.

If REV_PDCH_OPER_PARMS_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to '1' if the mobile station is to be persistent at the call setup; otherwise, the base station shall set this field to '0' (See [3]).

**REV_PDCH_RESET_PERSISTENCE** - Reverse Packet Data Channel reset persistence indicator.

If REV_PDCH_OPER_PARMS_INCL is omitted, or if it is included and set to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to '1' if, at the end of a persistent grant, the mobile station shall reset its persistent indicator to persistent; otherwise, the base station shall set this field to '0' if the mobile station shall reset its persistent indicator to non-persistent (See [3]).

**REV_PDCH_GRANT_PRECEDENCE** - Reverse Packet Data Channel Grant Precedence Indicator.
If REV_PDCH_OPER_PARMS_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if unicast Forward Grant Channel messages have precedence over Rate Control commands; otherwise, the base station shall set this field to ‘0’ to indicate that Rate Control down commands from non-serving sectors have precedence over Forward Grant Channel messages (see [3]).

REV_PDCH_MSIB_SUPPORTED - Reverse Packet Data Channel MSIB usage indicator.

If REV_PDCH_OPER_PARMS_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if the mobile station is to use the MSIB bit on the Reverse Packet Data Control Channel; otherwise, the base station shall set this field to ‘0’ (See [3]).

REV_PDCH_ALWAYS_ACK_FINAL_ROUND - Reverse Packet Data Channel Final Round Always Acknowledged

If REV_PDCH_OPER_PARMS_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if all of the following conditions are true:

- The Forward Acknowledgment Channel is assigned to the mobile station,
- The base station does not send an acknowledgment on the assigned Forward Acknowledgment Channel whenever a Reverse Packet Data Channel transmission is not successfully decoded on the last ARQ round, and
- The base station sends an acknowledgment on the assigned Forward Acknowledgment Channel to the mobile station whenever a Reverse Packet Data Channel transmission is successfully decoded on the last ARQ round,

Otherwise, the base station shall set this field to ‘0’.

REV_PDCH_MSIB_SUPPORTED - Reverse PDC-H MSIB usage indicator.

If REV_PDCH_OPER_PARMS_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:
The base station shall set this field to ‘1’ if the mobile station is to use the MSIB bit on the Reverse Packet Data Control Channel; otherwise, the base station shall set this field to ‘0’.

REV_PDCH_SOFT_HANDBOFF_RESET_IND - Reverse Packet Data Channel soft handoff reset indicator.

If REV_PDCH_OPER_PARMS_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if the mobile station is to initialize RPDCHCF when soft selection occurs in the FPDCHCF; otherwise, the base station shall set this field to ‘0’ (see [3]).

REV_PDCH_BOOST_PARMS_INCL - Reverse Packet Data Channel boosted mode parameters included indicator.

If REV_PDCH_PARMS_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to ‘1’ if the Reverse Packet Data Channel boosted mode parameters are included; otherwise, the base station shall set this field to ‘0’.

REV_PDCH_NUM_ARQ_ROUNDS_BOOST - Maximum number of allowed ARQ rounds on the Reverse PDCH in the boosted mode.

If REV_PDCH_BOOST_PARMS_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to one less the maximum number of allowed ARQ rounds on the Reverse PDCH in the boosted mode. The base station shall set this field to 0, 1, or 2 corresponding to 1, 2, or 3 rounds respectively (See [3]).

REV_PDCH_BOOST_OVERSHOOT - Reverse Packet Data Channel Boost Overshoot.

If REV_PDCH_BOOST_PARMS_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to the boosted QoS parameter that defines the overshoot allowed by boosted QoS on the Reverse Packet Data Channel (see [3]).

The base station shall set this field to a value in the range 0 to 3.875 dB inclusive in units of 0.125 dB.

REV_REQCH_ENABLED - Reverse Request Channel Enabled.

If REV_PDCH_PARMS_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.
The base station shall set this field to ‘1’ if the mobile station
is to enable the Reverse Request Channel; otherwise, the base
station shall set this field to ‘0’.

**REV_REQCH_PARMS_INCL** - Reverse Request Channel Parameters Included Indicator.

If **REV_REQCH_ENABLED** or **REV_PDCH_PARMS_INCL** is
omitted, or if it is included and is set to ‘0’, the base station
shall omit this field; otherwise, the base station shall include
this field and set it as follows.

The base station shall set this field to ‘1’ if the Reverse
Request Channel Parameters are included hereafter;
otherwise, the base station shall set this field to ‘0’.

**REV_REQCH_QUICK_REPEAT_ALLOWED** - Reverse Request Channel Quick Repeat
Allowed indicator.

If **REV_REQCH_PARMS_INCL** is omitted, or if it is included
and set to ‘0’, the base station shall omit this field; otherwise,
the base station shall include this field and set it as follows.

The base station shall set this field to ‘1’ if quick repeats are
allowed on the Reverse Request Channel; otherwise, the base
station shall set this field to ‘0’ (see [3]).

**REV_REQCH_POWER_REPORTS_PARMS_INCL** - Reverse Request Channel Power
Parameters Included indicator.

If **REV_REQCH_PARMS_INCL** is omitted, or if it is included
and set to ‘0’, the base station shall omit this field; otherwise,
the base station shall include this field and set it as follows.

The base station shall set this field to ‘1’ if the parameters
needed for power status reports are included hereafter;
otherwise, the base station shall set this field to ‘0’.

**REV_REQCH_POWER_HEADROOM_INCREASE** - Reverse Request Channel Power
headroom increase delta to trigger power report.

If **REV_REQ_CH_POWER_REPORTS_PARMS_INCL** is omitted,
or if it is included and set to ‘0’, the base station shall omit
this field; otherwise, the base station shall include this field
and set it as follows.

The base station shall set this field to the power headroom
increase delta that triggers a power report (see [3]).

The base station shall set this field to a value in the range 0 to
18 dB inclusive in units of 1 dB, or to 31 which means plus
infinity.

**REV_REQCH_POWER_HEADROOM_DECREASE** - Reverse Request Channel Power
headroom decrease delta to trigger power report.

If **REV_REQCH POWER REPORTS_PARMS_INCL** is omitted,
or if it is included and set to ‘0’, the base station shall omit
this field; otherwise, the base station shall include this field
and set it as follows.

The base station shall set this field to the power headroom
decrease delta that triggers a power report (see [3]).
The base station shall set this field to a value in the range 0 to 18 dB inclusive in units of 1 dB, or to 31 which means plus infinity.

REV_REQCH_HEADROOM_DURATION - Reverse Request Channel minimum power headroom update trigger interval.

If REV_REQCH_POWER_REPORTS_PARMS_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to the minimum power headroom update trigger interval (see [3]).

The base station shall set this field to a value in the range 0 to 5.10 seconds inclusive in units of 20 ms.

REV_REQCH_MAX_POWER_UPDATE_DURATION - Reverse Request Channel maximum power headroom update trigger interval.

If REV_REQCH_POWER_REPORTS_PARMS_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to the maximum power headroom update trigger interval (see [3]).

The base station shall set this field to a value in the range 0.02 to 5.10 seconds inclusive in units of 20 ms, or to 0 which means plus infinity.

REV_PDCH_CRC_PARMS_INCL - Reverse Packet Data Channel Common Rate Control Parameters Included Indicator.

If REV_PDCH_PARMS_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to ‘1’ if Reverse Packet Data Channel Common Rate Control Parameters are included hereafter; otherwise, the base station shall set this field to ‘0’.

REV_PDCH_INIT_TARGET_TPR - Reverse Packet Data Channel initial target traffic to pilot ratio.

If REV_PDCH_CRC_PARMS_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to the initial target traffic to pilot ratio on the Reverse Packet Data Channel (see [3]).

The base station shall set this field to a value in the range 0 to 18 dB inclusive in units of 0.125 dB.

REV_PDCH_MAX_TARGET_TPR - Reverse Packet Data Channel maximum target traffic to pilot ratio.
If REV_PDCH_CRC_PARMS_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to the maximum target traffic to pilot ratio on the Reverse Packet Data Channel (see [3]).

The base station shall set this field to a value in the range 0 to 18 dB inclusive in units of 0.125 dB.

**REV_PDCH_QUICK_START_THRESH** - Reverse Packet Data Channel quick start threshold.

If REV_PDCH_CRC_PARMS_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to the quick start threshold on the Reverse Packet Data Channel (see [3]).

The base station shall set this field to a value in the range 0 to 9 dB inclusive in units of 0.125 dB.

If REV_PDCH_CRC_PARMS_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to ‘0’ (the only length of the Encoder Packet size map length supported is 11 bits; the base station shall set this field to ‘0’; otherwise, the base station shall set this field to ‘1’ if the length of the Encoder Packet size map is 22 bits).

**REV_PDCH_EP_MAP** - Number of Reverse PDCH Encoder Packet sizes.

If REV_PDCH_CRC_PARMS_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set the i-th bit to ‘1’ for each encoder packet size for which a subrecord is included hereafter. The first 11 bits correspond to the following encoder packet sizes: 192, 408, 792, 1560, 3096, 4632, 6168, 9240, 12312, 15384, 18456 bits.

If REV_PDCH_CRC_PARMS_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit the following subrecord; otherwise, the base station shall include the following subrecord for each bit set to ‘1’ in REV_PDCH_EP_MAP:

**REV_PDCH_STEP_UP** - Reverse Packet Data Channel Step “up” for rate control.
The base station shall set this field to the step “up” value of the rate control on the Reverse Packet Data Channel for the i-th encoder packet size signaled in REV_PDCH_EP_MAP (see [3]).

The base station shall set this field to a value in the range 0 to 7.96875 dB inclusive in units of 0.03125 dB.

REV_PDCH_STEP_DOWN - Reverse Packet Data Channel Step “down” for rate control.

The base station shall set this field to the step “down” value of rate control on the Reverse Packet Data Channel for the i-th encoder packet size signaled in REV_PDCH_EP_MAP (see [3]).

The base station shall set this field to a value in the range 0 to 7.96875 dB inclusive in units of 0.03125 dB.

REV_PDCH_SR_ID_MAP - Number of Reverse PDCH Encoder Packet sizes.

If REV_PDCH_PARMS_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set the i-th bit to ‘1’ for each SR_ID associated with the Reverse Packet Data Channel. The LSB corresponds to SR_ID 0. The MSB corresponds to SR_ID 6.

The base station shall include the following subrecord for each bit set to ‘1’ in REV_PDCH_SR_ID_MAP:

REV_PDCH_BOOST_ALLOWED - Reverse PDCH TPR Boost Allowed indicator.

If REV_PDCH_PARMS_INCL is omitted or is included and is set to ‘0’, then the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if TPR (traffic to pilot ratio) power boost on the Reverse PDCH is allowed; otherwise, the base station shall set this field to ‘0’.

REV_PDCH_AUTO_ALLOWED - Reverse PDCH Autonomous Transmission Allowed indicator.

If REV_PDCH_PARMS_INCL is set to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows:

The base station shall set this field to ‘1’ if autonomous transmission on the Reverse PDCH is allowed; otherwise, the base station shall set this field to ‘0’.

If REV_REQCH_PARMS_INCL, is not included or is included and is set to ‘0’, the base station shall omit the following fields; otherwise, the base station shall include the following subrecord as described hereafter:

• The base station shall include an occurrence of the following subrecord for each bit set to ‘1’ in REV_PDCH_SR_ID_MAP:

• Additionally, the base station shall include an additional subrecord for the aggregate traffic across all SR_ID’s, and...
The base station shall set REV_REQCH_USE_POWER_REPORTS,
REV_REQCH_USE_BUFFER_REPORTS, or REV_REQCH_USE_WATERMARKS to ‘1’
in at least one of these subrecords.

REV_REQCH_MIN_DURATIoN - Reverse Request Channel Minimum Duration.
The base station shall set this field to the minimum duration,
which is the minimum duration between REQCH messages for this sr_id[see [3]].
The base station shall set this field to a value in the range 0 to
5.10 seconds inclusive in units of 20 ms.

REV_REQCH_USE_POWER_REPORTS - Reverse Request Channel Use of Power Status
Reports indicator.
If REV_REQCH_POWER_REPORTS_PARMS_INCL is omitted, or if it is included and set to ‘0’, the base station shall omit
this field; otherwise, the base station shall include this field
and set it as follows.
The base station shall set this field to the value ‘1’ if power status
reports are allowed; otherwise, the base station shall set this
field to ‘0’.

REV_REQCH_USE_BUFFER_REPORTS - Reverse Request Channel Use of Buffer Status
Reports indicator.
The base station shall set this field to the value ‘1’ if buffer status
reports are allowed; otherwise, the base station shall set this
field to ‘0’.

REV_REQCH_USE_WATERMARKS - Reverse Request Channel Use of Watermark Reports
indicator.
The base station shall set this field to the value ‘1’ if watermark reports
are allowed; otherwise, the base station shall set this
field to ‘0’.

REV_REQCH_USE_DEFAULT_TAB - Reverse Packet Data Channel use default buffer
size table indicator.
If REV_REQCH_USE_POWER_REPORTS is included and set
to ‘1’, or if REV_REQCH_USE_BUFFER_REPORTS is set
to ‘1’, or if REV_REQCH_USE_WATERMARKS is set to ‘1’, the
base station shall include this field and set it according to
Table 3.7.5.20.7; otherwise, the base station shall omit this
field.

REV_REQCH_BUF_QUANT_PARM_1 - Reverse Request Channel First Buffer Quantization Parameter.

If REV_REQCH_USE_DEFAULT_TAB is omitted, or if it is included and not set to '000', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to the first Reverse Packet Data Channel buffer size quantization parameter.

The base station shall not set this field to '0000000' if REV_REQCH_BUF_QUANT_PARM_2 is equal to '00000000' (see [3]).

REV_REQCH_BUF_QUANT_PARM_2 - Reverse Request Channel Second Buffer Quantization Parameter.

If REV_REQCH_USE_DEFAULT_TAB is omitted, or if it is included and not set to '000', the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to the second Reverse Packet Data Channel buffer size quantization parameter.

The base station shall not set this field to '0000000' if REV_REQCH_BUF_QUANT_PARM_1 is equal to '00000000' (see [3]).

REV_REQCH_USE_WATERMARKS - Reverse Request Channel Use of Watermark Reports indicator.

The base station shall set this field to the '1' if watermark reports are allowed; otherwise, the base station shall set this field to '0'.

REV_REQCH_HIGH_WATERMARK_1 - Reverse Request Channel First High Watermark Parameter.

If REV_REQCH_USE_WATERMARKS is equal to '0', the base station shall omit this field; otherwise, the base station shall include this field and set it to the first high watermark parameter (for high priority reports) for this sr_id:

REV_REQCH_HIGH_WATERMARK_2 - Reverse Request Channel Second High Watermark Parameter.
If REV_REQCH_USE_WATERMARKS is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it to the second high watermark parameter (for high priority report) for this sr_id.

**REV_REQCH_LOW_WATERMARK_1** - Reverse Request Channel First Low Watermark Parameter.

If REV_REQCH_USE_WATERMARKS is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it to the first low watermark parameter (for high priority reports) for this sr_id.

**REV_REQCH_LOW_WATERMARK_2** - Reverse Request Channel Second Low Watermark Parameter.

If REV_REQCH_USE_WATERMARKS is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it to the second low watermark parameter for this sr_id.

**REV_REQCH_CEILING_1** - Reverse Request Channel Ceiling first parameter.

If REV_REQCH_USE_WATERMARKS is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it to the first high ceiling level parameter for this sr_id.

**REV_REQCH_CEILING_2** - Reverse Request Channel Ceiling second parameter.

If REV_REQCH_USE_WATERMARKS is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it to the second high ceiling level parameter for this sr_id.

**REV_REQCH_FLOOR_1** - Reverse Request Channel Floor first parameter.

If REV_REQCH_USE_WATERMARKS is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it to the first low floor level parameters for this sr_id.

**REV_REQCH_FLOOR_2** - Reverse Request Channel Floor second parameter.

If REV_REQCH_USE_WATERMARKS is equal to ‘0’, the base station shall omit this field; otherwise, the base station shall include this field and set it to the second low floor level parameter for this sr_id.

**RESERVED** - Reserved bits.

The base station shall add reserved bits as needed in order to make the length of the entire record equal to an integer number of octets. The base station shall set these bits to ‘0’.
3.7.5.21 Multiple Character Extended Display

If P_REV_IN_USE is equal to or greater than nine, the base station shall not transmit this information record to the mobile station.

This information record allows the network to supply supplementary service multiple character display information that may be displayed by the mobile station.

<table>

| RESERVED               | 0 - 7 (as needed) |

7

MC_EXT_DISPLAY_IND - The indicator of Multiple Character Extended Display information record. The base station shall set this field to ‘1’.

DISPLAY_TYPE - The type of display. The base station shall set this field to the DISPLAY_TYPE value shown in Table 3.7.5.16-1 corresponding to the type of display, as defined in [8] Annex D.

DISPLAY_TAG - The indicator of the display information. There are three types of display tags: mandatory control tags (Blank and Skip), display text tags, and optional control tags, see [8] Annex D.
The base station shall set this field to the DISPLAY_TAG value shown in Table 3.7.5.16-2 corresponding to the type of information contained in the following CHARi field, as defined in [8] Annex D.

**NUM_RECORD** - The number of records displaying.

The base station shall set this field to the number of records of display text.

If the DISPLAY_TAG field is equal to ‘10000000’ or ‘10000001’, the base station shall set this field to ‘00000000’.

The base station shall include NUM_RECORD occurrences of the following record.

**DISPLAY_ENCODING** - Display encoding.

If the DISPLAY_TAG field is not equal to ‘10000000’ or ‘10000001’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The three most significant bits of this field shall be set to ‘000’ and the five least significant bit of this field shall be set to a value as specified in [30] to indicate the display encoding type used.

Support of an encoding method does not imply that the entire encodable character set must be supported. In general, once the supported character set is determined, various subsets of the character set can be supported. If a message is comprised entirely of characters from a supported subset of a character set, it can be displayed. If a message contains an unsupported character of a character set, it can be discarded.

**NUM_FIELDS** - Number of occurrences of the CHARi field.

If the DISPLAY_TAG field is not equal to ‘10000000’ or ‘10000001’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to the number of characters included in this record.

**CHARi** - Character.

The base station shall include NUM_FIELDS occurrences of this field, one for each character to be displayed, except for blank and skip.

**RESERVED** - Reserved bits.

The base station shall add reserved bits as needed in order to make the length of the entire record equal to an integer number of octets. The base station shall set these bits to ‘0’.
3.7.5.22 Call Waiting Indicator

This information record allows the base station to inform the mobile station that a call waiting call is available. This indicator may be used to suppress the generation of the local dial tone in mobile stations that provide locally generated dial tone.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALL_WAITING_INDICATOR</td>
<td>1</td>
</tr>
<tr>
<td>RESERVED</td>
<td>7</td>
</tr>
</tbody>
</table>

CALL_WAITING_INDICATOR - Call waiting indicator.

The base station shall set this field to a ‘1’ to indicate to the mobile station that a call is waiting. The base station shall set this field to a ‘0’ if the call waiting call is not answered by the mobile station and the call waiting call goes away.

RESERVED - Reserved bits.

The base station shall set this field to ‘0000000’.
3.7.5.23 Enhanced Multiple Character Extended Display

This information record allows the network to supply supplementary service multiple character display information that may be displayed by the mobile station.

<table>
<thead>
<tr>
<th>Type-Specific Field</th>
<th>Length (bits)</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISPLAY_TYPE</td>

</tr>
<tr>
<td>NUM_DISPLAYS</td>
<td>8</td>
</tr>
</tbody>
</table>

NUM_DISPLAYS+1 occurrences of the following variable length record:

{ (NUM_DISPLAYS)+1
  
  | DISPLAY_TAG | 8 |
  | NUM_RECORD  | 8 |

NUM_RECORD occurrences of the following record

{ (NUM_RECORD)
  
  | RECORD_LENGTH  | 8 |
  | DISPLAY_ENCODING | 8 |
  | NUM_FIELDS      | 8 |

NUM_FIELDS occurrences of the following field:

{ (NUM_FIELDS)
  
  | CHARi          | Variable |

{ (NUM_FIELDS)
  
  | RESERVED       | 0 - 7 (as needed) |

{ (NUM_RECORD)
  
  | RESERVED_1     | 0 - 7 (as needed) |

5  DISPLAY_TYPE - The type of display.

The base station shall set this field to the DISPLAY_TYPE value shown in Table 3.7.5.16-1 corresponding to the type of display, as defined in [8] Annex D.

9  NUM_DISPLAYS - The number of occurrences of display text included.

The base station shall set this field to one less than the number of occurrences of display text included.

13  DISPLAY_TAG - The indicator of the display information.

The base station shall include NUM_DISPLAYS + 1 occurrences of the following variable-field record:
There are three types of display tags: mandatory control tags (Blank and Skip), display text tags, and optional control tags, see [8] Annex D.

The base station shall set this field to the DISPLAY_TAG value shown in Table 3.7.5.16-2 corresponding to the type of information contained in the following CHARi field, as defined in [8] Annex D.

**NUM_RECORD** - The number of records displaying.

The base station shall set this field to the number of records of display text.

**RECORD_LENGTH** - Display text record length.

If the DISPLAY_TAG field is not equal to ‘10000000’ or ‘10000001’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The base station shall set this field to the number of octets included in this display text record, of specified encoding, including this field.

**DISPLAY_ENCODING** - Display encoding.

If the DISPLAY_TAG field is not equal to ‘10000000’ or ‘10000001’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows.

The three most significant bits of this field shall be set to ‘000’ and the five least significant bit of this field shall be set to a value as specified in [30] to indicate the display encoding type used.

Support of an encoding method does not imply that the entire encodable character set must be supported. In general, once the supported character set is determined, various subsets of the character set can be supported. If a message is comprised entirely of characters from a supported subset of a character set, it can be displayed. If a message contains an unsupported character of a character set, it can be discarded.

**NUM_FIELDS** - Number of occurrences of the CHARi field.

If the DISPLAY_TAG field is not equal to ‘10000000’ or ‘10000001’, the base station shall omit this field; otherwise, the base station shall include this field and set it as follows. The base station shall set this field to the number of characters included in this record.

**CHARi** - Character.
The base station shall include NUM_FIELDS occurrences of this field, one for each character to be displayed, except for blank and skip.

**RESERVED** - Reserved bits.

The base station shall add reserved bits as needed in order to make the length of the entire record, of specified encoding, equal to an integer number of octets. The base station shall set these bits to '0'.

**RESERVED_1** - Reserved bits for octet alignment.

The mobile station shall add the minimum number of bits necessary to make the record length in bits an integral multiple of 8. The mobile station shall set these bits to ‘0’.
3.7.6 Information Elements

3.7.6.1 Pilot Record Type Specific Fields

If PILOT_REC_TYPE is equal to ‘000’, the Pilot Record Type Specific fields include the following fields:

</tbody>
</table>

QOF - Quasi-orthogonal function index for the Auxiliary Transmit Diversity Pilot.

The base station or mobile station shall set this field to the index of the Quasi-orthogonal function (see [2]).

WALSH_LENGTH - Length of the Walsh code.

The base station or mobile station shall set this field to the WALSH_LENGTH value shown in 3.7.6.1-3 corresponding to the length of the Walsh code for the pilots that are used as Auxiliary pilot in the transmit diversity mode.

AUX_WALSH - Walsh Code for the Auxiliary Pilot.
The base station or mobile station shall set this field to the Walsh code corresponding to the Auxiliary Pilot.

AUX_TDPOWERLEVEL - Auxiliary Transmit Diversity Pilot Power Level.

The base station or mobile station shall set this field to the Auxiliary Transmit Diversity Pilot transmit power level relative to that of the Auxiliary Pilot as specified in Table 3.7.6.1-4.

Table 3.7.6.1-4. Auxiliary Transmit Diversity Pilot Transmit Power Level

<table>
<thead>
<tr>

</tbody>
</table>

SR3_PRIMARY_PILOT – Primary SR3 pilot.

The base station or mobile station shall set this field to the value shown in Table 3.7.6.1-5 corresponding to the position of the primary SR3 pilot.

SR3_PILOT_POWER1 – The primary SR3 pilot power level relative to that of the pilot on the lower frequency of the two remaining SR3 frequencies.

The base station or mobile station shall set this field to the value shown in Table 3.7.6.1-6 corresponding to the power level of the primary pilot with respect to the pilot on the lower frequency of the two remaining SR3 frequencies.
The primary SR3 pilot power level relative to that of the pilot on the higher frequency of the two remaining SR3 frequencies.

The base station or mobile station shall set this field to the value shown in Table 3.7.6.1-6 corresponding to the power level of the primary pilot with respect to the pilot on the higher frequency of the two remaining SR3 frequencies.

Quasi-orthogonal function index.

The base station or mobile station shall set this field to the index of the Quasi-orthogonal function (see [2]) on the frequency of the primary pilot.

Length of the Walsh Code.

The base station or mobile station shall set this field to the WALSH_LENGTH value shown in Table 3.7.6.1-3 corresponding to the length of the Walsh code for the pilot that is used as the Auxiliary pilot on the frequency of the primary pilot.

Walsh Code for the Auxiliary Pilot.

The base station or mobile station shall set this field to the Walsh code corresponding to the Auxiliary pilot on the frequency of the primary pilot.

Additional information included for the pilot on the lower frequency of the two remaining SR3 frequencies.

If the additional information for the pilot on the lower frequencies of the two remaining SR3 frequencies is the same as pilot on the primary frequency, the base station or mobile station shall set this field to '0'; otherwise, the base station or mobile station shall set this field to ‘1’.

Quasi-orthogonal function index for the pilot on the lower frequency of the two remaining SR3 frequencies.

If ADD_INFO_INCL1 is set to ‘0’, the base station or mobile station shall omit this field; otherwise, the base station or mobile station shall set this field as follows:

The base station or mobile station shall set this field to the index of the Quasi-orthogonal function (see [2]) on the lower frequency of the two remaining SR3 frequencies.

Length of the Walsh Code for the pilot on the lower frequency of the two remaining SR3 frequencies.

If ADD_INFO_INCL1 is set to ‘0’, the base station or mobile station shall omit this field; otherwise, the base station or mobile station shall set this field as follows:

The base station or mobile station shall set this field to the WALSH_LENGTH value shown in Table 3.7.6.1-3 corresponding to the length of the Walsh code for the pilot that is used as the Auxiliary pilot on the lower frequency of the two remaining SR3 frequencies.

ANNEX B CDMA CALL FLOW EXAMPLES

This is an informative annex which contains examples of call flow. The diagrams follow these conventions:

- All messages are received without error
- Receipt of messages is not shown except in the handoff examples
- Acknowledgments are not shown
- Optional authentication procedures are not shown
- Optional private long code transitions are not shown

For the call flow diagrams B-22 through B-31, the following conventions hold:

- The following message acronyms are defined:
  
  - ERRM: Extended Release Response Message
  - ERRMM: Extended Release Response Mini Message
  - RRM: Resource Request Message
  - RRMM: Resource Request Mini Message
  - RRRM: Resource Release Request Message
  - RRRMM: Resource Release Request Mini Message
  - SreqM: Service Request Message
  - SCRM: Supplemental Channel Request Message
  - SCRMM: Supplemental Channel Request Mini Message
  - ERM: Extended Release Message
  - ERMM: Extended Release Mini Message
  - RAM: Resource Allocation Message
  - RAMM: Resource Allocation Mini Message
  - SCM: Service Connect Message
  - GHDM: General Handoff Direction Message
  - UHDM: Universal Handoff Direction Message
  - ESCAM: Extended Supplemental Channel Assignment Message
  - FSCAMM: Forward Supplemental Channel Assignment Mini Message
RSCAMM: Reverse Supplemental Channel Assignment Mini Message

HCM: (Extended) Handoff Complete Message

**Mobile Station**
- Detects user-initiated call.
- Sends *Origination Message*.
- Sends *Origination Continuation Message*.
- Sets up Traffic Channel.
- Receives $N_{5m}$ consecutive valid frames.
- Begins sending the Traffic Channel preamble.
- Begins transmitting null Traffic Channel data.
- Begins processing primary traffic in accordance with Service Option 1.

**Base Station**
- Sets up Traffic Channel.
- Begins sending null Traffic Channel data.
- Sends *Channel Assignment Message*.
- Acquires the Reverse Traffic Channel.
- Sends *Base Station Acknowledgment Order*.

Optional
- Sends *Service Option Response Order*.
- Sends *Alert With Information Message* (ring back tone).

Optional
- Sends *Alert With Information Message* (tones off).

**Figure B-6. Simple Call Flow, Call-Waiting Example**

Figure B-7 illustrates call processing operations during a soft handoff from base station A to base station B. Figure B-8 illustrates call processing operations during a sequential soft handoff in which the mobile station is transferred from a pair of base stations A and B through a pair of base stations B and C to base station C.
### Mobile Station

*User conversation using A*
- Pilot B strength exceeds T_ADD.
- Sends *Pilot Strength Measurement Message.*

- Receives *Extended Handoff Direction Message.*
- Acquires B; begins using Active Set \{A, B\}.
- Sends *Handoff Completion Message.*

- Handoff drop timer of pilot A expires.
- Sends *Pilot Strength Measurement Message.*
- Receives *Extended Handoff Direction Message.*
- Stops diversity combining; begins using Active Set \{B\}.
- Sends *Handoff Completion Message.*

*User conversation using B*

### Base Station

*User conversation using A*
- A receives *Pilot Strength Measurement Message.*
- B begins transmitting traffic on the Forward Traffic Channel and acquires the Reverse Traffic Channel.
- A sends *Extended Handoff Direction Message* to use A and B.

- A and B receive *Handoff Completion Message.*
- A and B receive *Pilot Strength Measurement Message.*
- A and B send *Extended Handoff Direction Message* to use B only.

- A and B receive *Handoff Completion Message.*
- A stops transmitting on the Forward Traffic Channel and receiving on the Reverse Traffic Channel.

*User conversation using B*

---

**Figure B-7. Call Processing During Soft Handoff**
### Mobile Station

(User conversation using A and B)

- Handoff drop timer of pilot A expires and pilot C strength exceeds $T_{ADD}$.
- Sends *Pilot Strength Measurement Message*.
- Receives *Extended Handoff Direction Message*.
- Stops diversity combining A and B; starts diversity combining B and C.
- Sends *Handoff Completion Message*.

(Continued on next page)

### Base Station

(User conversation using A and B)

- A and B receive *Pilot Strength Measurement Message*, determine that new Active Set should contain B and C.
- C begins transmitting traffic on the Forward Traffic Channel and acquires the Reverse Traffic Channel.
- A and B send *Extended Handoff Direction Message* to use B and C.
- A, B, and C receive *Handoff Completion Message*.
- A stops transmitting on the Forward Traffic Channel and receiving on the Reverse Traffic Channel.
- B and C receive *Pilot Strength Measurement Message*.

**Figure B-8. Call Processing During Sequential Soft Handoff (Part 2 of 2)**
### Mobile Station

- User initiates priority call.
- Sends *Origination Message*.
- Indicates to user that priority call has been queued as a PACA call, and indicates queue position. Uses non-slotted mode operation while waiting for channel assignment.
- Indicates updated queue position to user.
- Sends *Origination Message* again.
- Indicates to user that PACA call is proceeding, sets up Traffic Channel.
- Receives $N_{5m}$ consecutive valid frames.
- Begins sending Traffic Channel preamble.
- Begins transmitting null Traffic Channel data.
- Begins processing primary traffic in accordance with Service Option 1.
- Sends *Service Connect Completion Message*.

### Base Station

- Determines that no Traffic Channels are available and that call is a priority call.
- Sends *PACA Message* to inform user that priority call has been queued as a PACA call, and to indicate queue position.
- Sends *PACA Message* periodically to update PACA call queue position.
- Sends *PACA Message* to instruct mobile station to re-originate PACA call.
- Sets up Traffic Channel.
- Sends *Channel Assignment Message*.
- Acquires the Reverse Traffic Channel.
- Sends *Base Station Acknowledgment Order*.
- Sends *Service Connect Message*.

**Figure B-9. PACA Call Processing (Part 2 of 2)**

Figure B-10 illustrates call processing operations for failure recovery for hard handoff on the same frequency. Figure B-11 illustrates call flow for failure recovery for inter-frequency handoff when the mobile station does not search the Candidate Frequency. Figures B-12 and B-13 show the call flow for mobile-assisted inter-frequency handoff (handoff preceded by searching of the Candidate Frequency Search Set by the mobile station), where the search is started by using the *Candidate Frequency Search Control Message*. Figures B-14 and B-15 illustrate call flow for inter-frequency handoff when failure recovery also includes searching the Candidate Frequency Search Set. In the periodic search examples (Figures B-13 and B-15), it is assumed that the mobile station performs a search of the Candidate Frequency Search Set in a single visit to the Candidate Frequency. Figures B-16 and B-17 illustrate the interaction of inter-frequency handoff operations with an ongoing periodic search of the Candidate Frequency Search Set.
**Figure B-10. Call Flow for Same Frequency Hard Handoff Failure Recovery**

**Mobile Station**

(Serving Frequency = F1)

- Receives General Handoff Direction Message.
  Saves current configuration. Discontinues use of serving Active Set.

- Attempts to hand off to target Active Set.
  *(Handoff attempt fails)*

- Restores old configuration. Resumes use of serving Active Set.

- Sends Candidate Frequency Search Report Message reporting pilots in target Active Set.

*(Continues communication using serving Active Set)*

**Base Station**

(Serving Frequency = F1)

(Decides to hand off mobile station to new Active Set)

(Starts transmitting on Forward Traffic Channel corresponding to target Active Set)

- Sends General Handoff Direction Message
  (target Active Set disjoint from serving Active Set; RETURN_IF_HO_FAIL = ‘1’; Target Frequency = F1).

*(Maintains Forward and Reverse Traffic Channels corresponding to serving Active Set)*

*(Discontinues use of target Active Set)*

*(Continues communication using serving Active Set)*

**Figure B-11. Call Flow for Inter-Frequency Hard Handoff Failure Recovery without Search**
### Mobile Station

(Serving Frequency = F1)
- Receives Candidate Frequency Search Request Message.
- Computes search time for Candidate Frequency Search Set.
  Sends Candidate Frequency Search Response Message.
- Receives Candidate Frequency Search Control Message.
- Saves current configuration. Discontinues use of serving Active Set.
- Tunes to F2.
- Searches pilots in Candidate Frequency Search Set.
- Re-tunes to F1.
  Restores old configuration.
  Resumes use of serving Active Set.
- Sends Candidate Frequency Search Report Message reporting pilots in Candidate Frequency Search Set above CF_T_ADD.

(Continues communication on F1)

(Continued on next page)

### Base Station

(Serving Frequency = F1)
- Sends Candidate Frequency Search Request Message (non-empty Search Set; Candidate Frequency = F2).
- Receives Candidate Frequency Search Response Message.
  (Decides to initiate single search)
- Sends Candidate Frequency Search Control Message (perform single search; Candidate Frequency = F2).

(Continues communication on F1)

(Continued on next page)
Mobile Station

(Continued from previous page)

- Receives General Handoff Direction Message. Saves current configuration. Discontinues use of serving Active Set.
- Tunes to F2. Attempts to hand off to target Active Set. (Handoff attempt succeeds) (Starts transmitting on Reverse Traffic Channel on F2)
- Sends Handoff Completion Message.

(Continues communication on F2)

Base Station

(Continued from previous page)

(Decides to hand off mobile station to Active Set on F2) (Starts transmitting on Forward Traffic Channel on F2)
- Sends General Handoff Direction Message (RETURN_IF_HO_FAIL = ‘1’; Target Frequency = F2). (Maintains Forward and Reverse Traffic Channels on F1)
- Receives Handoff Completion Message.
- Discontinues use of Active Set on F1
- Continues communication on F2

Figure B-12. Call Flow for Inter-Frequency Handoff (Single Search Using Candidate Frequency Search Control Message) (Part 2 of 2)
**Figure B-13. Call Flow for Inter-Frequency Handoff (Periodic Search Using Candidate Frequency Search Control Message) (Part 1 of 3)**
Mobile Station

(Continued from previous page)

- Re-tunes to F1.
  Restores old configuration.
  Resumes use of serving Active Set.

- Sends Candidate Frequency Search Report Message reporting pilots in Candidate Frequency Search Set above CF_T_ADD.

(Continues communication on F1)

(Periodic search timer expires)

- Initializes and enables periodic search timer.

(Continues periodic search on F2 by repeating the search described above, once every search period)

(Continued on next page)

Base Station

2. **BS** sends **ECAM** (ASSIGN_MODE=101, EXT_CH_IND = 01000)

3. **BS** assigns F/R-PDCH only

4. **MS** acquires FL, transmits preamble, starts CQI reporting & starts monitoring

5. **MS** monitors F-PDCCH/F-PDCH

6. **BS** acquires RL & detects CQI reports

7. **BS** sends BS Ack Order

8. **MS** sends R-ACKCH: ACK

9. **BS** sends Service Connect Msg (SCR+NNSCR)

10. **MS** sends Service Conn Compl Msg

11. **BS** sends User Traffic

C.2.6 Call setup with bypass two good frames

Figure C-2.6 Call setup with bypass two good frames
C-2.7 Call setup with fixed duration preamble transmission

-MS/user decides to initiate a call
-Sets up Traffic Channel.
-Receive a BS Ack Order within T80m

After TCH_INIT_NUM_PREAMBLE, MS starts transmitting data.

-MS receives a BS Ack Order within T80m

-BS Ack Order
-MS Ack Order

Figure C-2.7 Call setup with fixed duration preamble transmission
C.2.8 Call setup with bypass two good frames + fixed duration preamble transmission

- MS/user decides to initiate a call
- Sets up Traffic Channel and starts waiting for the Forward Traffic Channel.
  - Begins sending the Traffic Channel preamble
- Receives N5m consecutive valid frames.
- After TCH_INIT_NUM_PREAMBLE, MS starts transmitting data.
- MS receives BS Ack Order

- BS
  - Sets up Traffic Channel
  - Starts waiting for the Reverse Traffic Channel
  - Acquires the reverse link at some point
  - Might miss some RL data.
  - Receives MS Ack Order and Null Traffic
  - Stops sending BS Ack orders
Figure C-2. 8 Call setup with bypass two good frames + fixed duration preamble transmission

C-6.7 Concurrent BCMC flows monitoring

Traffic channel initialization

f-dsch: UHDM
(ADD_PLCM_FOR_SCH_INCL=1,
SCR/NNSCR with
BCMC_FLOW_ID=1, F-SCH=0,
BSR_ID=1 and other required BCMC
information)

F-SCH=0 with
(BCMC_FLOW_ID=1,
BSR_ID=1)
**Figure C-6. 7 Concurrent BCMC flows monitoring**

- **MS**
  - r-csch: ORM
    - (BCMC_INCL=1, BCMC_FLOW_ID=1)
  - f-csch: ECAM

- **BS**
  - BS starts transmitting BCMC_FLOW_ID 1 on shared F-SCH 0 with the specified PLCM
  - F-SCH=0 with
    - (BCMC_FLOW_ID=1, BSR_ID=1)
  - f-dsch: UHDM
    - (ADD_PLCM_FOR_SCH_INCL=1, SCR/NNSCR with
      - BCMC_FLOW_ID=1, F-SCH=0, BSR_ID=1 and other required BCMC information)

MS begins to use the PLCM received in UHDM to decode the channel
Figure C-6. 8 Concurrent BCMC and Point-to-Point call
ANNEX D CDMA CONSTANTS

Annex D is a normative annex which contains tables that give specific values for the constant identifiers. These identifiers take the forms such as $T_{20m}$ and $N_{5m}$. The subscripted numbers vary to identify the particular constant. Typically the subscripted letter “m” refers to the mobile station and the subscripted letter “b” refers to the base station. The following tables provide values for identifiers given in the text:

Table D-1. Time Limits

Table D-2. Other Constants (Part 2 of 2)

| \(N_{11m}\) | The duration, of sufficient signal quality (e.g. good frames), in units of 20ms, received on the Forward Traffic Channel before a mobile station re-enables its transmitter after disabling its transmitter during a CDMA-to-CDMA Hard Handoff | 1 | 2.6.6.2.8 |
| \(N_{12m}\) | Number of frames over which the mobile station maintains a running average of the total received power | 10 | 2.6.6.2.8.3 |
| \(N_{13m}\) | Maximum number of pilots reported in an Access Channel message | 6 | 2.6.3.1.7 2.7.1.3.1.3 |
| \(N_{16m}\) | The duration of insufficient signal quality, in units of 1.25ms, received on the Forward Common Power Control Subchannels assigned to this mobile station, before a mobile station must disable its transmitter. | 384 (if F-CPCCH rate is 800 bps) 576 (if F-CPCCH rate is 400 bps) 768 (if F-CPCCH rate is 200 bps) | 2.6.4.1.8.2 |
| \(N_{17m}\) | The duration of sufficient signal quality, in units of 1.25 ms, received on the Forward Common Power Control Subchannels assigned to this mobile station, before a mobile station is allowed to re-enable its transmitter after disabling its transmitter | 64 (if F-CPCCH rate is 800 bps) 128 (if F-CPCCH rate is 400 bps) 160 (if F-CPCCH rate is 200 bps) | 2.6.4.1.8.2 |
| \(N_{18m}\) | The duration of sufficient signal quality, in units of 1.25 ms, received on the Forward Common Power Control Subchannels assigned to this mobile station, before a mobile station is allowed to enable its transmitter after entering the Traffic Channel Initialization Substate of the Mobile Station Control on the Traffic Channel State | 32 (if F-CPCCH rate is 800 bps) 64 (if F-CPCCH rate is 400 bps) 64 (if F-CPCCH rate is 200 bps) | 2.6.4.2 |
| \(N_{19m}\) | The duration, of sufficient signal quality, in units of 1.25 ms, received on the Forward Common Power Control Subchannels assigned to this mobile station, before a mobile station re-enables its transmitter after disabling its transmitter during a CDMA-to-CDMA Hard Handoff | 16 (if F-CPCCH rate is 800 bps) 32 (if F-CPCCH rate is 400 bps) 32 (if F-CPCCH rate is 200 bps) | 2.6.6.2.8 |
ANNEX E CDMA RETRIEVABLE AND SETTABLE PARAMETERS

This is a normative annex which describes the parameters that can be retrieved and set in the mobile station using the Retrieve Parameters Message, the Parameters Response Message, and the Set Parameters Message.

PARAMETER_ID values from 0 through 32767 are reserved for definition by this standard and shall not be defined by mobile station manufacturers. PARAMETER_ID values from 32768 through 65535 may be defined by mobile station manufacturers.

ANNEX F MOBILE STATION DATABASE

F.1 Introduction

This is an informative annex which lists the numeric indicators that are described by this document and stored in the mobile station's permanent or semi-permanent memory. Some of these indicators are required; other indicators are optional and are so noted.

The indicators are organized in this annex according to two categories:

• Mobile station indicators These indicators are global to the mobile station and independent of the mobile station’s NAMs.

• NAM indicators These indicators specify parameters associated with the mobile station’s NAM.

The description of each indicator below includes the indicator’s name, the number of bits it contains, and the section in this document where it is defined. Permanent indicators are denoted by the “p” subscript; semi-permanent indicators are denoted by the “s-p” subscript.
F.2 Mobile Station Indicators

Mobile station indicators are organized into permanent mobile station indicators and semi-permanent mobile station indicators.

F.2.1 Permanent Mobile Station Indicators

Permanent mobile station indicators specify physical station configuration and attributes, independent of NAM. The indicators are listed in Table F.2.1-1.

Table F.2.1-1. Permanent Mobile Station Indicators

<table>

</table>

For each band class supported:

| MOB_P_REV<sub>p</sub> | 8 | 2.3.14 |
F.2.2 Semi-permanent Mobile Station Indicators

Semi-permanent mobile station indicators are retained when the mobile station power is turned off. These indicators are associated with mobile station registration and lock. They are independent of the NAM in use. CDMA indicators are listed in Table F.2.2-1.

Table F.2.2-1. CDMA Semi-permanent Mobile Station Indicators

ANNEX G CDMA EXTENDED ENCRYPTION CALL FLOW EXAMPLES

This is an informative annex, which contains examples of extended encryption call flow. The diagrams follow these conventions:

- All messages are received without error
- Acknowledgments are not shown

For all the call flow diagrams, the following conventions hold:

- The following message acronyms are defined:
  - RGM: Registration Message
  - ORM: Origination Message
  - CAM: Channel Assignment Message
  - ECAM: Extended Channel Assignment Message
  - SMCM: Security Mode Command Message

- The following short forms are defined:
  - enc.k1: encrypt the message with key k1
  - csch_enc_req: C_SIG_ENCRYPT_REQ
  - dsch_enc_req: D_SIG_ENCRYPT_REQs
  - csch_enc: C_SIG_ENCRYPT_MODE
  - dsch_enc: D_SIG_ENCRYPT_MODE
  - A <- B: assign value B to variable A
Upon power-up:
\[ C_{SIG\_ENCRYPT\_MODEs} \leftarrow '000' \]
\[ ENC\_KEY \leftarrow NULL \]

\[ ENC\_KEY = \text{null} \]

Registration Msg (csch_enc_req = on)

Reg. Accepted Order (csch_enc = on)

\[ \text{enc.k1[Some Msg]} \]

\[ \text{enc.k1[ORM(dialed digits, dsch_enc_req = on)]} \]

\[ \text{enc.k1[CAM/ECAM(dsch_enc = on)]} \]

\[ ENC\_KEY \leftarrow k1 \]

ON

\[ \text{enc.k2[Release Order]} \]

\[ \text{enc.k2[Release Order]} \]

\[ ENC\_KEY \leftarrow k2 \]

Upon power-up:
\[ C_{SIG\_ENCRYPT\_MODEs} \leftarrow '000' \]
\[ ENC\_KEY \leftarrow NULL \]

\[ ENC\_KEY \leftarrow \text{null} \]

Figure G-1. Power-Up Registration, Origination, and Call Release (BS waits for the new CMEAKEY before sending CAM/ECAM)

\[ C_{SIG\_ENCRYPT\_MODEs} \]

D_{SIG\_ENCRYPT\_MODEs} Initial value set by CAM/ECAM

CMEAKEY obtained from VLR or AuC

= successful key exchange
= unsuccessful key exchange
\( k \) = CMEAKEY generated in MS
CAM/ECAM specifies that dsch_enc = '000' meaning the BS is waiting for the new key. MS just continues with the current encryption mode.

**Figure G-2. Quick Channel Assignment (BS does not wait for the new key before sending CAM/ECAM)**
Figure G-3. MS Initiates Call Origination During the Registration Access Substate
Figure G-4. Implicit Registration (MS crosses a SID/NID boundary during MS Idle State. MS originates before registering)
Figure G-5. BS Lost the Stored Key (A rare out-of-sync case)
Figure G-6. MS Fails to Decrypt Messages (MS recovers by re-synchronizing the crypto-sync)
Figure G-7. MS Fails to Decrypt Messages (MS recovers by re-registering after failing to re-sync the crypto-sync)
BS can not decrypt msg 1

Security Mode Request Msg (24-bit crypto-sync, csch_enc_req/dsch_enc_req = on)

Security Mode Command Msg (csch_enc/dsch_enc = on)

Can decrypt now.

Figure G-8. BS Fails to Decrypt Messages (BS recovers by re-synchronizing the crypto-sync)
Figure G-9. BS Fails to Decrypt Messages (BS recovers by forcing the MS to re-register after failing to re-synchronize the crypto-sync)
