

3GPP2 C.S0005-E

Version 3.0

June 2011

**3RD GENERATION
PARTNERSHIP
PROJECT 2
"3GPP2"**

***Upper Layer (Layer 3) Signaling Standard for
cdma2000 Spread Spectrum Systems***

Revision History

Revision	Description of Changes	Date
1.0	Initial publication	September 2009
2.0	Bug fix	June 2010
3.0	Bug fix	June 2011

CONTENTS

1	FOREWORD AND SCOPE.....	xlvi
2	NOTES	xlviii
3	REFERENCES.....	1
4	1 GENERAL.....	1-1
5	1.1 Terms and Numeric Information	1-1
6	1.1.1 Terms.....	1-1
7	1.1.2 Numeric Information	1-28
8	1.1.2.1 Reserved.....	1-28
9	1.1.2.2 CDMA Numeric Information	1-28
10	1.2 Signaling Architecture.....	1-61
11	1.3 Signaling and Functionality	1-61
12	1.3.1 General Architecture	1-61
13	1.3.2 Interface to Layer 2	1-61
14	1.3.2.1 Message Control and Status Block (MCSB).....	1-61
15	1.3.2.2 Interface Primitives.....	1-62
16	1.3.3 Reserved	1-63
17	1.3.4 Functional Description.....	1-63
18	1.3.5 PDU Transmission and Reception	1-63
19	2 REQUIREMENTS FOR MOBILE STATION CDMA OPERATION	2-1
20	2.1 Reserved	2-1
21	2.2 Reserved	2-1
22	2.3 Security and Identification	2-1
23	2.3.1 Mobile Station Identification Number	2-1
24	2.3.1.1 Encoding of IMSI_M_S and IMSI_T_S.....	2-3
25	2.3.1.2 Encoding of IMSI_M_11_12 and IMSI_T_11_12	2-5
26	2.3.1.3 Encoding of the MCC_M and MCC_T	2-5
27	2.3.1.4 Mobile Directory Number.....	2-5
28	2.3.2 Electronic Serial Number (ESN), R-UIM Identifier (UIM_ID), and Mobile	
29	Equipment Identifier (MEID).....	2-5
30	2.3.2.1 Electronic Serial Number (ESN)	2-6
31	2.3.2.2 Mobile Equipment Identifier (MEID).....	2-6
32	2.3.2.2.1 Pseudo-ESN.....	2-6

CONTENTS

1	2.3.2.3 R-UIM Identifier (UIM_ID, EXT_UIM_ID)	2-6
2	2.3.3 Station Class Mark.....	2-6
3	2.3.4 Registration Memory	2-7
4	2.3.5 Access Overload Class.....	2-8
5	2.3.6 Public Long Code Mask and Private Long Code Mask	2-9
6	2.3.6.1 Public Long Code Mask Formats.....	2-9
7	2.3.6.1.1 Public Long Code Mask PLCM_42, ADD_PLCM_FOR_FCH_42 and	
8	ADD_PLCM_FOR_SCH_42.....	2-11
9	2.3.6.2 Private Long Code Mask PVTLCM_42.....	2-12
10	2.3.7 Reserved	2-13
11	2.3.8 Home System and Network Identification	2-13
12	2.3.9 Local Control Option	2-13
13	2.3.10 Preferred Operation Selection.....	2-13
14	2.3.10.1 Preferred System	2-13
15	2.3.10.2 Reserved.....	2-13
16	2.3.11 Discontinuous Reception.....	2-13
17	2.3.12 Authentication, Encryption of Signaling Information/User Data and Voice	
18	Privacy	2-13
19	2.3.12.1 Authentication.....	2-13
20	2.3.12.1.1 Shared Secret Data (SSD)	2-14
21	2.3.12.1.2 Random Challenge Memory (RAND)	2-14
22	2.3.12.1.3 Call History Parameter (COUNT _{s-p}).....	2-14
23	2.3.12.1.4 Unique Challenge-Response Procedure	2-14
24	2.3.12.1.5 Updating the Shared Secret Data (SSD)	2-16
25	2.3.12.2 Signaling Message Encryption	2-19
26	2.3.12.2.1 Encrypted Messages on the f-dsch	2-20
27	2.3.12.2.2 Encrypted Messages on the r-dsch.....	2-23
28	2.3.12.3 Voice Privacy	2-25
29	2.3.12.4 Extended Encryption for Signaling Message and User Information	2-26
30	2.3.12.4.1 Extended Encryption for Signaling Messages	2-26
31	2.3.12.4.1.1 Extended Encryption for Signaling on f/r-csch.....	2-26
32	2.3.12.4.1.2 Extended Encryption for Signaling on f/r-dsch.....	2-27
33	2.3.12.4.1.3 Signaling Encryption/Decryption Procedures	2-27

CONTENTS

1	2.3.12.4.1.4 Computation of the 8-bit Layer 3 PDU CRC Field	2-29
2	2.3.12.4.1.5 Duplicate Detection of Security Sequence Number	2-30
3	2.3.12.4.2 Extended Encryption for User Information	2-31
4	2.3.12.4.2.1 User Information Encryption/Decryption Procedures	2-32
5	2.3.12.4.3 Interface to the Encryption Algorithms.....	2-32
6	2.3.12.4.4 Encryption Negotiation	2-35
7	2.3.12.4.5 Computation of NEW_SSEQ_H_SIG	2-36
8	2.3.12.5 Authentication and Key Set-up Procedures when P_REV_IN_USE _s >=	
9	10	2-36
10	2.3.12.5.1 2G Authentication when P_REV_IN_USE _s >= 10	2-38
11	2.3.12.5.2 3G Authentication (AKA) when P_REV_IN_USE _s >= 10.....	2-39
12	2.3.12.5.3 Restoring (IK, CK) upon power on	2-44
13	2.3.12.5.4 Key Strength Reduction Algorithm	2-44
14	2.3.12.5.5 Message Integrity Check Negotiation and Other Requirements.....	2-45
15	2.3.13 Lock and Maintenance Required Orders.....	2-46
16	2.3.14 Mobile Station Revision Identification.....	2-46
17	2.3.15 Temporary Mobile Subscriber Identity.....	2-46
18	2.3.15.1 Overview.....	2-46
19	2.3.15.2 TMSI Assignment Memory	2-48
20	2.4 Accumulated Statistics	2-48
21	2.4.1 Monitored Quantities and Statistics	2-48
22	2.4.2 Accumulated Paging, Broadcast, and Forward Common Control Channel	
23	Statistics.....	2-48
24	2.5 Reserved	2-50
25	2.6 Layer 3 Processing.....	2-50
26	2.6.1 Mobile Station Initialization State.....	2-52
27	2.6.1.1 System Determination Substate	2-54
28	2.6.1.1.1 Custom System Selection Process	2-60
29	2.6.1.1.2 System Selection Using Current Redirection Criteria.....	2-60
30	2.6.1.1.2.1 System Selection Using Current Redirection Record.....	2-61
31	2.6.1.1.3 System Selection Using System Reselection Criteria.....	2-62
32	2.6.1.1.4 Acquiring the Selected System	2-62

CONTENTS

1	2.6.1.2	Pilot Channel Acquisition Substate.....	2-63
2	2.6.1.3	Sync Channel Acquisition Substate.....	2-63
3	2.6.1.4	Timing Change Substate.....	2-66
4	2.6.2	Mobile Station Idle State.....	2-69
5	2.6.2.1	Idle Procedures.....	2-72
6	2.6.2.1.1	Forward Channel Monitoring Procedures.....	2-72
7	2.6.2.1.1.1	General Overview.....	2-72
8	2.6.2.1.1.1.1	General Overview for Individually Addressed Messages.....	2-73
9	2.6.2.1.1.1.1.1	Overview of Stopping Monitoring via the General Page	
10		Message.....	2-75
11	2.6.2.1.1.1.1.2	Overview of Stopping Monitoring via the Universal Page	
12		Message.....	2-77
13	2.6.2.1.1.1.2	Overview of Broadcast Messages on Paging Channel.....	2-77
14	2.6.2.1.1.1.2.1	Method 1: Multi-Slot Broadcast Message Transmission....	2-77
15	2.6.2.1.1.1.2.2	Method 2: Periodic Broadcast Paging.....	2-78
16	2.6.2.1.1.1.3	Overview of Broadcast Messages on Broadcast Control	
17		Channel.....	2-79
18	2.6.2.1.1.1.3.1	Method 1: Multi-Slot Enhanced Broadcast Paging.....	2-79
19	2.6.2.1.1.1.3.2	Method 2: Periodic Enhanced Broadcast Paging.....	2-80
20	2.6.2.1.1.1.4	Overview of Broadcast Messages on Forward Common	
21		Control Channel.....	2-80
22	2.6.2.1.1.1.4.1	Method 1: Multi-Slot Broadcast Message Transmission....	2-81
23	2.6.2.1.1.1.4.2	Method 2: Periodic Enhanced Broadcast Paging.....	2-81
24	2.6.2.1.1.2	Non-Slotted Mode Requirements.....	2-81
25	2.6.2.1.1.3	Slotted Mode Requirements.....	2-82
26	2.6.2.1.1.3.1	Monitoring Assigned Slots.....	2-82
27	2.6.2.1.1.3.2	Determination of the Slot Cycle Index.....	2-85
28	2.6.2.1.1.3.3	Slot Cycles for Broadcast Message Transmission.....	2-85
29	2.6.2.1.1.3.3.1	Slot Cycles for Broadcast Message Transmission on the	
30		Paging Channel.....	2-85
31	2.6.2.1.1.3.3.2	Slot Cycles for Broadcast Message Transmission on the	
32		Forward Common Control Channel.....	2-86
33	2.6.2.1.1.3.4	Monitoring Paging Channel Broadcasts.....	2-86

CONTENTS

1	2.6.2.1.1.3.5	Support of Broadcast Delivery Options on the Paging Channel.....	2-88
2			
3	2.6.2.1.1.3.6	Monitoring the Forward Common Control Channel for the Enhanced Broadcast Page	2-88
4			
5	2.6.2.1.1.3.7	Support of Broadcast Delivery Options on the Forward Common Control Channel/Broadcast Control Channel when NUM_BCCH_BCAST _S does not equal '000'.....	2-90
6			
7			
8	2.6.2.1.1.3.7.1	Support of Broadcast Delivery Options on the Forward Common Control Channel when NUM_BCCH_BCAST _S equals '000'.....	2-90
9			
10			
11	2.6.2.1.1.3.8	Slot Cycles for BSPM Transmission	2-90
12	2.6.2.1.1.3.8.1	BSPM Slot Cycle on the Paging Channel.....	2-90
13	2.6.2.1.1.3.8.2	BSPM Slot Cycle on the Primary Broadcast Control Channel	2-91
14			
15	2.6.2.1.1.4	Common Channel Supervision	2-91
16	2.6.2.1.2	Quick Paging Channel Monitoring Procedures.....	2-91
17	2.6.2.1.2.1	Overview	2-91
18	2.6.2.1.2.2	Requirements.....	2-94
19	2.6.2.1.3	Registration	2-96
20	2.6.2.1.4	Idle Handoff.....	2-96
21	2.6.2.1.4.1	Pilot Search.....	2-96
22	2.6.2.1.4.2	Idle Handoff Procedures	2-99
23	2.6.2.1.5	Primary Broadcast Control Channel Monitoring.....	2-109
24	2.6.2.1.5.1	General Overview	2-109
25	2.6.2.1.5.2	Requirements.....	2-109
26	2.6.2.1.6	System Reselection Procedures	2-110
27	2.6.2.1.7	Slotted Timer Expiration	2-110
28	2.6.2.1.8	Exiting the Reduced Slot Cycle Mode	2-110
29	2.6.2.1.9	Radio Environment Report Timer Expiration.....	2-110
30	2.6.2.2	Response to Overhead Information Operation.....	2-110
31	2.6.2.2.1	System Parameters Message	2-117
32	2.6.2.2.1.1	Stored Parameters.....	2-117
33	2.6.2.2.1.2	Paging Channel Assignment Change	2-122
34	2.6.2.2.1.3	RESCAN Parameter	2-122

CONTENTS

1	2.6.2.2.1.4	Roaming Status.....	2-122
2	2.6.2.2.1.5	Registration.....	2-122
3	2.6.2.2.1.6	Slot Cycle Index	2-123
4	2.6.2.2.1.7	PACA Disable for SID Change.....	2-123
5	2.6.2.2.1.8	Retry Delay Disable for Packet Zone ID or SID/NID Change	2-123
6	2.6.2.2.1.9	Encryption key reset for SID/NID Change	2-123
7	2.6.2.2.2	Access Parameters Message	2-124
8	2.6.2.2.3	Neighbor List Message	2-126
9	2.6.2.2.4	CDMA Channel List Message	2-127
10	2.6.2.2.5	Extended System Parameters Message.....	2-128
11	2.6.2.2.6	Global Service Redirection Message	2-137
12	2.6.2.2.7	Extended Neighbor List Message	2-138
13	2.6.2.2.8	General Neighbor List Message	2-140
14	2.6.2.2.9	User Zone Identification Message	2-145
15	2.6.2.2.10	Private Neighbor List Message.....	2-146
16	2.6.2.2.11	Extended Global Service Redirection Message	2-147
17	2.6.2.2.12	Extended CDMA Channel List Message Overview.....	2-148
18	2.6.2.2.12.1	Extended CDMA Channel List Message on Paging Channel	2-148
19	2.6.2.2.12.2	Extended CDMA Channel List Message on Primary Broadcast	
20		Control Channel.....	2-153
21	2.6.2.2.13	ANSI-41 System Parameters Message	2-158
22	2.6.2.2.13.1	Stored Parameters.....	2-158
23	2.6.2.2.13.2	Roaming Status.....	2-162
24	2.6.2.2.13.3	Registration.....	2-162
25	2.6.2.2.13.4	PACA Disable for SID Change.....	2-162
26	2.6.2.2.14	MC-RR Parameters Message	2-162
27	2.6.2.2.14.1	Stored Parameters.....	2-163
28	2.6.2.2.14.2	Slot Cycle Index	2-172
29	2.6.2.2.14.3	Forward Common Control Channel Assignment Change	2-172
30	2.6.2.2.14.4	RESCAN Parameter	2-172
31	2.6.2.2.15	Enhanced Access Parameters Message	2-172
32	2.6.2.2.16	ANSI-41 RAND Message.....	2-178

CONTENTS

1	2.6.2.2.17 Universal Neighbor List Message	2-178
2	2.6.2.2.18 BCMC Service Parameters Message	2-183
3	2.6.2.2.19 Access Point Pilot Information Message.....	2-194
4	2.6.2.2.20 Access Point Identification Message	2-195
5	2.6.2.2.21 Access Point Identification Text Message.....	2-197
6	2.6.2.2.22 General <i>Overhead</i> Information Message	2-197
7	2.6.2.2.23 Flex Duplex CDMA Channel List Message Overview	2-198
8	2.6.2.2.23.1 Flex Duplex CDMA Channel List Message on Paging Channel ...	2-201
9	2.6.2.2.23.2 Flex Duplex CDMA Channel List Message on Primary	
10	Broadcast Control Channel.....	2-204
11	2.6.2.2.24 Alternative Technologies Information Message	2-208
12	2.6.2.2.25 Frequent General Overhead Information Message	2-209
13	2.6.2.3 Mobile Station Page Match Operation	2-210
14	2.6.2.4 Mobile Station Order and Message Processing Operation.....	2-212
15	2.6.2.5 Mobile Station Origination Operation.....	2-222
16	2.6.2.6 Mobile Station Message Transmission Operation	2-222
17	2.6.2.7 Mobile Station Power-Down Operation.....	2-223
18	2.6.2.8 Mobile Station PACA Cancel Operation	2-223
19	2.6.3 System Access State.....	2-223
20	2.6.3.1 Access Procedures	2-224
21	2.6.3.1.1 Access Attempts.....	2-224
22	2.6.3.1.2 Reserved	2-225
23	2.6.3.1.3 Handoffs	2-225
24	2.6.3.1.3.1 Pilot Search.....	2-226
25	2.6.3.1.3.2 Access Handoff.....	2-227
26	2.6.3.1.3.3 Access Probe Handoff.....	2-228
27	2.6.3.1.4 System Access State Exit Procedures	2-230
28	2.6.3.1.5 Reserved	2-230
29	2.6.3.1.6 Full-TMSI Timer.....	2-230
30	2.6.3.1.7 Monitoring Pilots.....	2-230
31	2.6.3.1.7.1 Generation of the Initial Access Handoff List	2-230
32	2.6.3.1.7.2 Update of the Access Handoff List	2-231

CONTENTS

1	2.6.3.1.7.3	Generation of the Other Reported List	2-231
2	2.6.3.1.7.4	Update of OTHER_REPORTED_LIST	2-232
3	2.6.3.1.8	Paging Channel and Forward Common Control Channel/ Primary	
4		Broadcast Control Channel Monitoring	2-232
5	2.6.3.2	Update Overhead Information Substate	2-233
6	2.6.3.3	Page Response Substate	2-238
7	2.6.3.4	Mobile Station Order/Message Response Substate	2-279
8	2.6.3.5	Mobile Station Origination Attempt Substate	2-283
9	2.6.3.6	Registration Access Substate	2-327
10	2.6.3.7	Mobile Station Message Transmission Substate	2-333
11	2.6.3.8	PACA Cancel Substate	2-340
12	2.6.4	Mobile Station Control on the Traffic Channel State	2-344
13	2.6.4.1	Special Functions and Actions	2-346
14	2.6.4.1.1	Forward Traffic Channel Power Control	2-346
15	2.6.4.1.1.1	Forward Traffic Channel Power Control Initialization	2-349
16	2.6.4.1.1.2	Processing the Power Control Parameters Message	2-349
17	2.6.4.1.1.3	Processing the Power Control Message	2-350
18	2.6.4.1.1.4	Processing the Rate Change Message	2-352
19	2.6.4.1.2	Service Configuration and Negotiation	2-354
20	2.6.4.1.2.1	Use of Variables	2-359
21	2.6.4.1.2.1.1	Maintaining the Service Request Sequence Number	2-359
22	2.6.4.1.2.1.2	Maintaining the Service Negotiation Indicator Variable	2-359
23	2.6.4.1.2.1.3	Maintaining the Service Option Request Number	2-359
24	2.6.4.1.2.1.4	Stored Service Configuration and Reconnection	2-359
25	2.6.4.1.2.2	Service Subfunctions	2-360
26	2.6.4.1.2.2.1	Normal Service Subfunction	2-363
27	2.6.4.1.2.2.2	Waiting for Service Request Message Subfunction	2-365
28	2.6.4.1.2.2.3	Waiting for Service Response Message Subfunction	2-368
29	2.6.4.1.2.2.4	Waiting for Service Connect Message Subfunction	2-371
30	2.6.4.1.2.2.5	Waiting for Service Action Time Subfunction	2-374
31	2.6.4.1.2.2.5.1	Storing a Service Configuration with SYNC_ID	2-380
32	2.6.4.1.2.2.5.2	Restoring a stored Service Configuration based on	
33		SYNC_ID	2-381

CONTENTS

1	2.6.4.1.2.2.6 SO Negotiation Subfunction.....	2-381
2	2.6.4.1.3 Ordering of Messages.....	2-384
3	2.6.4.1.4 Processing the In-Traffic System Parameters Message.....	2-384
4	2.6.4.1.5 Message Action Times.....	2-386
5	2.6.4.1.6 Long Code Transition Request Processing.....	2-387
6	2.6.4.1.7 Power Up Function (PUF).....	2-387
7	2.6.4.1.7.1 Processing the Power Up Function Message.....	2-389
8	2.6.4.1.7.2 Power Up Function Procedures.....	2-390
9	2.6.4.1.7.2.1 PUF Probe On Serving Frequency.....	2-390
10	2.6.4.1.7.2.2 PUF Probe On PUF Target Frequency.....	2-390
11	2.6.4.1.7.3 Processing the Power Up Function Completion Message.....	2-392
12	2.6.4.1.8 Forward Traffic Channel Supervision.....	2-392
13	2.6.4.1.8.1 Forward Traffic Channel Supervision when a Forward Common	
14	Power Control Channel is not assigned.....	2-392
15	2.6.4.1.8.1.1 Triggers.....	2-393
16	2.6.4.1.8.2 Forward Traffic Channel Supervision when a Forward Common	
17	Power Control Channel is assigned.....	2-394
18	2.6.4.1.9 Processing the Extended Release Message and the Extended	
19	Release Mini Message.....	2-395
20	2.6.4.1.10 Processing the Resource Allocation Message and Resource	
21	Allocation Mini Message.....	2-398
22	2.6.4.1.11 Reserved.....	2-398
23	2.6.4.1.12 Processing the Service Configuration Record.....	2-398
24	2.6.4.1.13 Processing the Non-Negotiable Service Configuration Record.....	2-402
25	2.6.4.1.14 Processing the Security Mode Command Message.....	2-417
26	2.6.4.1.15 Processing the Handoff Supplementary Information Solicit Message	2-419
27	2.6.4.2 Traffic Channel Initialization Substate.....	2-419
28	2.6.4.2.1 Return to Traffic Channel Initialization Substate with Initialization	
29	Failure Indication.....	2-443
30	2.6.4.2.2 Exiting the Traffic Channel Initialization Substate.....	2-445
31	2.6.4.3 Traffic Channel Substate.....	2-447
32	2.6.4.4 Release Substate.....	2-473
33	2.6.4.4.1 Procedures for Exiting the Release Substate.....	2-482

CONTENTS

1	2.6.5	Registration.....	2-487
2	2.6.5.1	Forms of Registration	2-487
3	2.6.5.1.1	Power-Up Registration	2-488
4	2.6.5.1.2	Power-Down Registration	2-489
5	2.6.5.1.3	Timer-Based Registration.....	2-489
6	2.6.5.1.3.1	Timer-Based Registration based on Frequency of Implicit	
7		Registrations.....	2-490
8	2.6.5.1.4	Distance-Based Registration	2-491
9	2.6.5.1.5	Zone-Based Registration	2-491
10	2.6.5.1.6	Parameter-Change Registration.....	2-494
11	2.6.5.1.7	Ordered Registration.....	2-494
12	2.6.5.1.8	Implicit Registration.....	2-495
13	2.6.5.1.9	Traffic Channel Registration.....	2-495
14	2.6.5.1.10	User Zone Registration.....	2-495
15	2.6.5.1.11	Encryption/Message Integrity Re-sync Required Registration	2-495
16	2.6.5.1.12	BCMC Registration	2-495
17	2.6.5.2	Systems and Networks	2-495
18	2.6.5.3	Roaming.....	2-496
19	2.6.5.4	Registration Timers and Indicators	2-498
20	2.6.5.5	Registration Procedures.....	2-498
21	2.6.5.5.1	Actions in the Mobile Station Initialization State	2-498
22	2.6.5.5.1.1	Power-Up or Change to a Different Operating Mode, Band

FOREWORD AND SCOPE

(This foreword and scope are not part of this specification)

This Specification was prepared by Technical Specification Group C of the Third Generation Partnership Project 2 (3GPP2). This Specification contains the Layer 3 layer of the IMT-2000 CDMA Multi-Carrier Mode, IMT-2000 CDMA MC, also known as cdma2000^{®1}. It provides a specification for land mobile wireless systems based upon cellular principles. This Specification includes the capabilities of Telecommunications Industry Association Standard TIA/EIA-95-B.

This Specification provides the Layer 3 Upper Layer signaling protocol architecture and functionality. Other specifications are required to complete the air interface and the rest of the system. Some of these specifications are listed in the References section.

1. General. This section defines the terms and numeric indications used in this document. This section also describes the general signaling architecture.

2. Requirements for Mobile Station CDMA Operation. This section describes the requirements for mobile stations operating in the CDMA mode. A mobile station complying with these requirements will be able to operate with CDMA base stations complying with this document.

3. Requirements for Base Station CDMA Operation. This section describes the requirements for CDMA base stations. A base station complying with these requirements will be able to operate in the CDMA mode with mobile stations complying with this document.

Annex A. Reserved.

Annex B. CDMA Call Flow Examples. This informative annex provides examples of simple call flows in the CDMA system.

Annex C. Additional CDMA Call Flows. This informative annex provides examples of additional simple call flows in the CDMA system.

Annex D. CDMA Constants. This normative annex contains tables that give specific values for the constant identifiers found in Section 2 and Section 3.

Annex E. CDMA Retrievable and Settable Parameters. This normative annex describes the mobile station parameters that the base station can set and retrieve.

¹cdma2000[®] is the trademark for the technical nomenclature for certain specifications and standards of the Organizational Partners (OPs) of 3GPP2. Geographically (and as of the date of publication), cdma2000[®] is a registered trademark of the Telecommunications Industry Association (TIA-USA) in the United States.

1 **Annex F. Mobile Station Database.** This informative annex describes a database model
2 that can be used for mobile stations complying with this document.

3 **Annex G. Encryption Call Flows.** This informative annex provides examples of extended
4 encryption call flows in the CDMA system.

31

32

1. Compatibility, as used in connection with cdma2000^{®2}, is understood to mean: any cdma2000 mobile station is able to place and receive calls in cdma2000 and IS-95 systems. Conversely, any cdma2000 system is able to place and receive calls for cdma2000 and IS-95 mobile stations.
2. Reserved.
3. This compatibility specification is based upon spectrum allocations that have been defined by various governmental administrations.
4. Each mobile station is assigned either a single unique 32-bit binary serial number (ESN) or a single unique 56-bit binary serial number (MEID) that cannot be changed by the subscriber without rendering the mobile station inoperative (see 2.3.2).
5. “Base station” refers to the functions performed in the fixed network. These functions typically distributed among cells, sectors, and mobile switching centers.
6. This standard uses the following verbal forms: “Shall” and “shall not” identify requirements strictly to be followed in order to conform with the standard and from which no deviation is permitted. “Should” and “should not” indicate that one of several possibilities is recommended as particularly suitable, without mentioning or excluding others; that a certain course of action is preferred but not necessarily required; or that (in the negative form) a certain possibility or course of action is discouraged but not prohibited. “May” and “need not” indicate a course of action permissible within the limits of the standard. “Can” and “cannot” are used for statements of possibility and capability, whether material, physical, or causal.
7. Footnotes appear at various points in this specification to elaborate and further clarify items discussed in the body of the specification.
8. Unless indicated otherwise, this document presents numbers in decimal form. Binary numbers are distinguished in the text by the use of single quotation marks.
9. The following operators define mathematical operations:
 - × indicates multiplication.
 - $\lfloor x \rfloor$ indicates the largest integer less than or equal to x : $\lfloor 1.1 \rfloor = 1$, $\lfloor 1.0 \rfloor = 1$.
 - $\lceil x \rceil$ indicates the smallest integer greater or equal to x : $\lceil 1.1 \rceil = 2$, $\lceil 2.0 \rceil = 2$.
 - $|x|$ indicates the absolute value of x : $|-17| = 17$, $|17| = 17$.
 - \oplus indicates exclusive OR (modulo-2 addition).

² “cdma2000[®] is the trademark for the technical nomenclature for certain specifications and standards of the Organizational Partners (OPs) of 3GPP2. Geographically (and as of the date of publication), cdma2000[®] is a registered trademark of the Telecommunications Industry Association (TIA-USA) in the United States.”

- 1 $\min(x, y)$ indicates the minimum of x and y .
2 $\max(x, y)$ indicates the maximum of x and y .
3 $x \bmod y$ indicates the remainder after dividing x by y : $x \bmod y = x - (y \times \lfloor x/y \rfloor)$.
4 $\text{weight}(x)$ indicates the number of '1's in the binary representation of x .
5 \gg indicates binary right shift operation.
6 \ll indicates binary left shift operation.

7 10. While communication between Layer 3 and Layer 2 is specified, there is no
8 requirement to implement layering.

1 GENERAL

This section defines the terms and numeric indications used in this document. This section also describes the general signaling architecture.

1.1 Terms and Numeric Information

1.1.1 Terms

Abbreviated Alert. An abbreviated alert is used to remind the mobile station user that previously selected alternative routing features are still active.

AC. See Authentication Center.

Access Attempt. The entire process of sending one message and receiving (or failing to receive) an acknowledgment for that message, consisting of one or more access sub-attempts. See also Access Probe, Access Probe Sequence, and Access Sub-attempt.

Access Channel. A Reverse CDMA Channel used by mobile stations for communicating to the base station. The Access Channel is used for short signaling message exchanges such as call originations, responses to pages, and registrations. The Access Channel is a slotted random access channel.

Access Channel Message. The information part of an access probe consisting of the message body, length field, and CRC.

Access Channel Message Capsule. An Access Channel message plus the padding.

Access Channel Preamble. The preamble of an access probe consisting of a sequence of all-zero frames that are sent at the 4800 bps rate.

Access Channel Request Message. An Access Channel message that is autonomously generated by the mobile station. See also Access Channel Response Message.

Access Channel Response Message. A message on the Access Channel generated to reply to a message received from the base station.

Access Channel Slot. The assigned time interval for an access probe. An Access Channel slot consists of an integer number of frames. The transmission of an access probe is performed within the boundaries of an Access Channel slot.

Access Entry Handoff. The act of transferring reception of the Paging Channel from one base station to another, when the mobile station is transitioning from the *Mobile Station Idle State* to the *System Access State*.

Access Handoff. The act of transferring reception of the Paging Channel from one base station to another, when the mobile station is in the *System Access State* after an Access Attempt.

Access Overload Class. See Overload Class.

Access Probe. One Access Channel transmission consisting of a preamble and a message. The transmission is an integer number of frames in length and transmits one Access Channel message. See also Access Probe Sequence, Access Sub-attempt, and Access Attempt.

- 1 **Access Probe Handoff.** A handoff that occurs while the mobile station is performing an
2 Access Attempt in the *System Access State*.
- 3 **Access Probe Sequence.** A sequence of one or more access probes on the Access Channel.
4 Other than the reported pilot information, the same Access Channel message content is
5 transmitted in every access probe of an access sub-attempt. See also Access Probe, Access
6 Sub-attempt, and Access Attempt.
- 7 **Access Sub-attempt.** A sequence of one or more access probe sequences on the Access
8 Channel transmitted to one pilot, containing the same message content other than the
9 reported pilot information. See also Access Probe, Access Probe Sequence, and Access
10 Attempt.
- 11 **Acknowledgment.** A Layer 2 response by the mobile station or the base station confirming
12 that a signaling message was received correctly.
- 13 **Action Time.** The time at which the action implied by a message should take effect.
- 14 **Active Set.** The set of pilots associated with the CDMA Channels containing Forward
15 Traffic Channels assigned to a particular mobile station.
- 16 **Active User Zone.** A user zone in which the mobile station makes its presence known via
17 an explicit registration in order to activate tiered service features. See also CDMA Tiered
18 Services, User Zone, and Passive User Zone.
- 19 **Aging.** A mechanism through which the mobile station maintains in its Neighbor Set the
20 pilots that have been recently sent to it from the base station and the pilots whose handoff
21 drop timers have recently expired.
- 22 **AKA.** Authentication and Key Agreement. An authentication procedure that allows mutual
23 authentication of the mobile station and base station.
- 24 **A-key.** A secret, 64-bit pattern stored in the mobile station and HLR/AC. It is used to
25 generate/update the mobile station's Shared Secret Data.
- 26 **Alternate Interleaver Pattern.** An interleaver pattern used for convolutional coded frames
27 for code combining soft handoff for Radio Configuration 12. The alternate interleaver
28 pattern is used by some base stations in the mobile station active set to increase the
29 probability of frame early termination.
- 30 **ARQ.** Automatic Repeat Request. The ARQ is an automatic retransmission protocol that
31 ensures the delivery of encoder packets from the sender to the receiver by retransmission
32 of portions of a turbo encoded packet based on the feedback from the receiver that
33 indicates if the encoder packets have been received and decoded successfully (ACK) or not
34 (NAK).
- 35 **Assured Mode.** Mode of delivery that guarantees that a PDU will be delivered to the peer.
36 A PDU sent in assured mode is retransmitted by the LAC sublayer, up to a maximum
37 number of retransmissions, until the LAC entity at the sender receives an acknowledgment
38 for the PDU. See also Confirmation of Delivery.
- 39 **Authentication.** A procedure used by a base station to validate a mobile station's identity.

- 1 **Authentication Center (AC).** An entity that manages the authentication information
2 related to the mobile station.
- 3 **Authentication Response (AUTHR).** An 18-bit output of the authentication algorithm. It
4 is used, for example, to validate mobile station registrations, originations and terminations.
- 5 **Autonomous Registration.** A method of registration in which the mobile station registers
6 without an explicit command from the base station.
- 7 **Auxiliary Pilot Channel.** A non-data-bearing, direct-sequence spread spectrum signal
8 optionally transmitted by a CDMA base station.
- 9 **Auxiliary Transmit Diversity Pilot Channel.** A pilot channel, counterpart to an Auxiliary
10 Pilot Channel, that is transmitted by a CDMA base station from the non-primary antenna
11 when orthogonal transmit diversity is employed.
- 12 **AV.** Authentication Vector used by AKA.
- 13 **Bad Frames.** Frames classified as insufficient frame quality or as 9600 bps primary traffic
14 only, with bit errors. See also Good Frames.
- 15 **Band Class.** A set of CDMA frequency assignments and a numbering scheme for these
16 channels. See also CDMA Frequency Assignment.
- 17 **Base Station.** A fixed station used for communicating with mobile stations. Depending
18 upon the context, the term base station may refer to a cell, a sector within a cell, an MSC,
19 or other part of the wireless system. See also MSC.
- 20 **Base Station Authentication Response (AUTHBS).** An 18-bit pattern generated by the
21 authentication algorithm. AUTHBS is used to confirm the validity of base station orders to
22 update the Shared Secret Data.
- 23 **Base Station Random Variable (RANDBS).** A 32-bit random number generated by the
24 mobile station for authenticating base station orders to update the Shared Secret Data.
- 25 **BCMC Service Layer.** The functional components residing above the signaling layer (Layer
26 3) that provide BCMC services.
- 27 **BCMC TDM Mode.** A mode of operation where a time-division multiplexing (TDM)
28 structure is used on a Forward Supplemental Channel (F-SCH) for BCMC content
29 transmission to mobile stations in *Mobile Station Idle State*.
- 30 **Blank-and-Burst.** The preemption of an entire Traffic Channel frame's primary traffic by
31 signaling traffic or secondary traffic. Blank-and-burst is performed on a frame-by-frame
32 basis.
- 33 **BLOB.** Block of Bits.
- 34 **bps.** Bits per second.
- 35 **Boosted Mode.** Mode of operation of Reverse Packet Data Channel where selected data
36 packets are transmitted by the mobile station at a higher power to increase the probability
37 of being received by the base station.

1 **Broadcast Control Channel.** A code channel in a Forward CDMA Channel used for
2 transmission of control information or broadcast messages from a base station to a mobile
3 station.

4 **Broadcast Control Channel Number (BCN).** A number that identifies the Broadcast
5 Control Channel. BCN number 1 corresponds to the Primary Broadcast Control Channel.
6 BCN numbers 2 through 7 correspond to other Broadcast Control Channels (if any).

7 **Broadcast User Zone.** A user zone that is identified to the mobile station by means of
8 broadcast messages. It corresponds to the RF coverage area of a particular set of cells and
9 sectors. See also CDMA Tiered Services and Mobile-Specific User Zone.

10 **Call Disconnect.** The process that releases the resources handling a particular call. The
11 disconnect process begins either when the mobile station user indicates the end of the call
12 by generating an on-hook condition or other call-release mechanism, or when the base
13 station initiates a release.

14 **Call History Parameter (COUNT).** A modulo-64 event counter maintained by the mobile
15 station and Authentication Center that is used for clone detection.

16 **Call Rescue Soft Handoff.** The ability for a mobile station to autonomously add one or
17 more strong pilots to its Active Set in order to minimize the probability of dropped calls.

18 **Candidate Frequency.** The frequency, for which the base station specifies a search set,
19 using a *Candidate Frequency Search Request Message*.

20 **Candidate Set.** The set of pilots that have been received with sufficient strength by the
21 mobile station to be successfully demodulated, but have not been placed in the Active Set
22 by the base station. See also Active Set, Neighbor Set, and Remaining Set.

23 **CCK.** An encryption key derived from the CMEA key. A 128-bit pattern that is the 64-bit
24 CMEA key concatenated with a copy of itself.

25 **CCSH.** See Code Combining Soft Handoff.

26 **CDMA.** See Code Division Multiple Access.

27 **CDMA Candidate Frequency.** The Candidate Frequency specified for a search of CDMA
28 pilots.

29 **CDMA Channel.** The set of channels transmitted between the base station and the mobile
30 stations within a given CDMA Frequency Assignment. See also Forward CDMA Channel
31 and Reverse CDMA Channel.

32 **CDMA Channel Number.** An 11-bit number that identifies a CDMA Frequency
33 Assignment.

34 **CDMA Frequency Assignment.** A 1.23 or 3.69 MHz segment of spectrum. The center of a
35 CDMA frequency assignment is given by a CDMA Channel Number.

36 **CDMA Preferred Set.** The set of CDMA channel numbers in a CDMA system
37 corresponding to Frequency Assignments that a mobile station will normally search to
38 acquire a CDMA Pilot Channel. For CDMA cellular systems, the primary and secondary
39 channels comprise the CDMA Preferred Set.

- 1 **CDMA Tiered Services.** System features and services that are based on location,
2 potentially including private networks. User zones establish the availability of services. See
3 also User Zone, Broadcast User Zone, Mobile-Specific User Zone, Active User Zone, and
4 Passive User Zone.
- 5 **Center SR3 Frequency.** The Spreading Rate 3 frequency that has the center frequency
6 assignment.
- 7 **Chip.** See PN Chip.
- 8 **CIK.** An integrity key derived from the CMEA key. A 128-bit pattern that is the 64-bit
9 CMEA key concatenated with a copy of itself.
- 10 **CK.** Cipher Key. A 128-bit pattern produced by AKA that is used for encryption.
- 11 **CMEA.** Cellular Message Encryption Algorithm.
- 12 **Code Channel.** A subchannel of a Forward CDMA Channel or Reverse CDMA Channel.
13 Each subchannel uses an orthogonal Walsh function or quasi-orthogonal function.
- 14 **Code Combining Soft Handoff (CCSH).** A Soft Handoff method for Fundamental
15 Channels on the forward link in Radio Configuration 12 and Supplemental Channels on
16 the forward link in Radio Configurations 4, 5, and 12. For Supplemental Channels using
17 Turbo codes in this mode, certain base stations encode and transmit the data with the
18 default Turbo Encoder, whereas others use the complementary Turbo Encoder. Mobile
19 stations in soft handoff can then combine both codes to achieve lower code rate. For
20 Fundamental Channels and Supplemental Channels using Convolutional codes in this
21 mode certain base stations transmit using the default interleaver pattern, whereas others
22 use an alternate interleaver pattern. Mobile stations in handoff combine transmissions
23 from both base stations to decode the frames earlier.
- 24 **Code Division Multiple Access (CDMA).** A technique for spread-spectrum multiple-
25 access digital communications that creates channels through the use of unique code
26 sequences.
- 27 **Code Symbol.** The output of an error-correcting encoder. Information bits are input to
28 the encoder and code symbols are output from the encoder. See Convolutional Code.
- 29 **Configuration Change Indicator.** A one-bit datum, sent on the Quick Paging Channel.
30 Appearance of the Configuration Change Indicator in the Quick Paging Channel serves to
31 alert a slotted mode mobile station, operating in the idle state, that, after performing an idle
32 handoff, it should monitor the Paging Channel, the Forward Common Control Channel, or
33 the Primary Broadcast Control Channel in order to determine if it should update its stored
34 parameters.
- 35 **Confirmation of Delivery.** A notification sent by the LAC sublayer to Layer 3 at the
36 sender, when the LAC entity at the sender receives the acknowledgment for a specific PDU
37 sent in assured mode.
- 38 **Convolutional Code.** A type of error-correcting code. A code symbol can be considered as
39 modulo 2 the convolution of the input data sequence with the impulse response of a
40 generator function.

1 **CRC.** See Cyclic Redundancy Code.

2 **Cyclic Redundancy Code (CRC).** A class of linear error detecting codes that generate
3 parity check bits by finding the remainder of a polynomial division. See also Frame Quality
4 Indicator.

5 **dBm.** A measure of power expressed in terms of its ratio (in dB) to one milliwatt.

6 **dBm/Hz.** A measure of power spectral density. The ratio, dBm/Hz, is the power in one
7 Hertz of bandwidth, where power is expressed in units of dBm.

8 **dBW.** A measure of power expressed in terms of its ratio (in dB) to one Watt.

9 **Dedicated Control Channel.** A portion of a Traffic Channel (Forward or Reverse) that
10 carries a combination of user data, signaling, and power control information.

11 **Deinterleaving.** The process of unpermuting the symbols that were permuted by the
12 interleaver. Deinterleaving is performed on received symbols prior to decoding.

13 **Direct Channel Assignment.** A MS-terminated call set-up procedure where the channel
14 assignment can be sent directly to a mobile station without receiving a page response
15 message from the mobile station.

16 **Discontinuous Transmission (DTX).** A mode of operation in which a base station or a
17 mobile station switches its transmitter on and off on a particular code channel
18 autonomously. For the case of DTX operation on the Forward Dedicated Control Channel,
19 the Forward Power Control Subchannel is still transmitted.

20 **Distance-Based Registration.** An autonomous registration method in which the mobile
21 station registers whenever it enters a cell whose distance from the cell in which the mobile
22 station last registered exceeds a given threshold.

23 **DTMF.** See Dual-Tone Multifrequency.

24 **Dual-Tone Multifrequency (DTMF).** Signaling by the simultaneous transmission of two
25 tones, one from a group of low frequencies and another from a group of high frequencies.
26 Each group of frequencies consists of four frequencies.

27 **E_b .** A measure of the energy in a signal, at some point in a communication system, per
28 information bit conveyed by that signal, or an average value of such energies. Its relevance
29 to system performance is most often expressed by its ratio to additive noise and
30 interference, such as in E_b/N_0 or E_b/I_0 . Such ratios are dimensionless, and are usually
31 expressed in dB units.

32 **E_c/I_0 .** A notation used to represent a dimensionless ratio of the average power of some
33 code-distinguished CDMA signal channel, typically a pilot, to the total power comprised of
34 signal plus interference, within the signal bandwidth. It is usually expressed in dB units.

35 **Effective Radiated Power (ERP).** The product of the power supplied to the antenna and
36 its gain relative to a half-wave dipole in a given direction.

37 **EIRP.** See Equivalent Isotropic Radiated Power.

38 **Electronic Serial Number (ESN).** A 32-bit number assigned by the mobile station
39 manufacturer, uniquely identifying the mobile station equipment.

1 **Encoder Tail Bits.** A fixed sequence of bits added to the end of a block of data to reset the
2 convolutional encoder to a known state.

3 **Enhanced Access Channel.** A reverse channel used by mobile station for communicating
4 to the base station. The Enhanced Access Channel operates in the Basic Access Mode, and
5 Reservation Access Mode. It is used for transmission of short messages, such as signaling,
6 MAC messages, response to pages, and call originations. It can also be used to transmit
7 moderate-sized data packets.

8 **Enhanced Access Channel Preamble.** A non-data bearing portion of the Enhanced
9 Access probe sent by the mobile station to assist the base station in initial acquisition and
10 channel estimation.

11 **Enhanced Access Channel Slot.** The assigned time interval for an enhanced access
12 probe. The transmission of an enhanced access probe is performed within the boundaries
13 of an Enhanced Access Channel slot.

14 **Enhanced Access Data.** The data transmitted while in the Basic Access Mode on the
15 Enhanced Access Channel or while in the Reservation Access Mode on a Reverse Common
16 Control Channel.

17 **Enhanced Access Header.** A frame containing access origination information transmitted
18 immediately after the Enhanced Access Channel Preamble while in the Reservation Access
19 Mode.

20 **Enhanced Access Probe.** One Enhanced Access Channel transmission consisting of an
21 Enhanced Access Channel preamble, optionally an Enhanced Access header, and
22 optionally Enhanced Access data. See also Enhanced Access Probe Sequence.

23 **Enhanced Access Probe Sequence.** A sequence of one or more Enhanced Access probes
24 on the Enhanced Access Channel. See also Enhanced Access Probe.

25 **Enhanced Rate Adaptation Mode (ERAM).** A flexible and variable data rate mode for the
26 Supplemental Channel operation with turbo codes. ERAM is defined on forward link for
27 Radio Configurations 4 and 5, and on the reverse link for Radio Configuration 4. In this
28 mode, lower rate turbo codes are used to match the desired channel interleaver block size
29 instead of pure code symbol repetitions.

30 **Equivalent Isotropically Radiated Power (EIRP).** The product of the power supplied to
31 the antenna and the antenna gain in a direction relative to an isotropic antenna.

32 **ERAM.** See Enhanced Rate Adaptation Mode.

33 **Erasur e Indicator Bit.** See [2].

34 **ERP.** See Effective Radiated Power.

35 **ESN.** See Electronic Serial Number.

36 **ESN ME.** ESN associated with the mobile equipment. See Electronic Serial Number (ESN)
37 and ME.

38 **EXT_SSEQ.** Security sequence number. A 32-bit crypto-sync that is used for encryption,
39 message integrity, or both.

- 1 **EXT_UIM_ID.** An extended (length more than 32-bits) electronic identification (ID) number
2 that is unique to the R-UIM. See [40]. EXT_UIM_ID can be either SF_EUIMID or
3 LF_EUIMID. The mobile station uses SF_EUIMID in place of MEID, with the exception of
4 the MEID_ME information record, when configured with a R-UIM which indicates that
5 SF_EUIMID is to be used in place of MEID (see [40]).
- 6 **F-ACKCH.** Forward Acknowledgment Channel. A channel used by the base station to
7 acknowledge the successful receipt and decoding of the encoder packets (ACK) sent by the
8 mobile station on Reverse Packet Data Channel or the failure to do so (NAK).
- 9 **f-csch.** Forward common signaling logical channel.
- 10 **f-dsch.** Forward dedicated signaling logical channel.
- 11 **F-GCH.** Forward Grant Channel. A channel used by the base station to assign or “grant”
12 the mobile station a certain data rate on the Reverse Packet Data Channel.
- 13 **F-RCCH.** Forward Rate Control Channel. A channel used by the base station to modify the
14 transmission data rate used on the Reverse Packet Data Channel by the mobile station.
15 The data rates possible are allocated in advance.
- 16 **Fade Timer.** A timer kept by the mobile station as a measure of Forward Traffic Channel
17 continuity. If the fade timer expires, the mobile station drops the call.
- 18 **Fast Call Setup Mode.** Any operational mode of a mobile station in the *Mobile Station Idle*
19 *State* that can improve setup time for call originations or terminations. See Radio
20 Environment Reporting Mode, Reduced Slot Cycle Mode, and Tracking Zone Mode.
- 21 **Flash.** An indication sent on the Reverse CDMA Channel indicating that the user directed
22 the mobile station to invoke special processing.
- 23 **Foreign NID Roamer.** A mobile station operating in the same system (SID) but in a
24 different network (NID) from the one in which service was subscribed. See also Foreign SID
25 Roamer and Roamer.
- 26 **Foreign SID Roamer.** A mobile station operating in a system (SID) other than the one
27 from which service was subscribed. See also Foreign NID Roamer and Roamer.
- 28 **Forward CDMA Channel.** A CDMA Channel from a base station to mobile stations. The
29 Forward CDMA Channel contains one or more code channels that are transmitted on a
30 CDMA Frequency Assignment using a particular pilot PN offset. The code channels are
31 associated with the Pilot Channel, Sync Channel, Paging Channels, Broadcast Control
32 Channel, Forward Common Control Channels, and Traffic Channels. The Forward CDMA
33 Channel always carries a Pilot Channel and may also carry up to one Sync Channel, up to
34 seven Paging Channels, up to seven Broadcast Control Channels, up to seven Forward
35 Common Control Channels and up to the maximum number of channels allowed for the
36 assigned Radio Configuration minus one Traffic Channels, as long as the total number of
37 channels, including the Pilot Channel, is no greater than the maximum number of
38 channels allowed for the assigned Radio Configuration (see [2] section 3.1.3.1.13).
- 39 **Forward Acknowledgment Channel.** A portion of a Forward CDMA Channel used for the
40 transmission of acknowledgments from a base station to multiple mobile stations in

1 response to the data received on the Reverse Packet Data Channel or the Reverse
2 Fundamental Channel.

3 **Forward Common Acknowledgment Channel.** A portion of the Forward CDMA Channel
4 used for the transmission of Acknowledgments from a base station to multiple mobile
5 stations in response to the Reverse Supplemental Channel from mobile stations operating
6 with reverse link Radio Configuration 8. The Forward Common Acknowledgment Channel
7 is used by the base station to early terminate Reverse Supplemental Channel frames.

8 **Forward Common Acknowledgment Subchannel.** A subchannel on the Forward Common
9 Acknowledgment Channel used by the base station to early terminate the Reverse
10 Supplemental Channel from a mobile station operating with Radio Configuration 8.

11 **Forward Common Control Channel.** A control channel used for the transmission of
12 digital control information from a base station to one or more mobile stations.

13 **Forward Dedicated Control Channel.** A Dedicated Control Channel that is transmitted
14 on the Forward CDMA Channel.

15 **Forward Fundamental Channel.** A Fundamental Channel that is transmitted on the
16 Forward CDMA Channel.

17 **Forward Packet Data Channel.** A portion of a Forward Link channel with Spreading Rate
18 1 used for the transmission of higher-level data from a base station to a mobile station.

19 **Forward Packet Data Control Channel.** A portion of a Forward Link channel with
20 Spreading Rate 1 used for the transmission of the control information for the subpacket
21 being transmitted on the Forward Packet Data Channel.

22 **Forward Pilot Channel.** A non-data-bearing direct-sequence spread spectrum signal
23 transmitted continuously by each CDMA base station. The Forward Pilot Channel allows a
24 mobile station to acquire the timing of the Forward CDMA Channel, provides a phase
25 reference for coherent demodulation, and provides a means for signal strength
26 comparisons between base stations for determining when to handoff. Different base
27 stations are identified by different pilot PN sequence time phases. See also Pilot PN
28 Sequence, Pilot PN Sequence Offset.

29 **Forward Supplemental Channel.** A Supplemental Channel that is transmitted on the
30 Forward CDMA Channel.

31 **Forward Supplemental Code Channel.** A Supplemental Code Channel that is transmitted
32 on the Forward CDMA Channel.

33 **Forward Traffic Channel.** One or more code channels used to transport user and
34 signaling traffic from the base station to the mobile station. See Forward Fundamental
35 Channel, Forward Dedicated Control Channel, Forward Packet Data Channel, Forward
36 Supplemental Channel, and Forward Supplemental Code Channel.³

³ The Forward Traffic Channel does not include F-PDCCH, F-CPCCH.

1 **Forward Transmit Diversity Pilot Channel.** A pilot channel transmitted by a CDMA base
2 station from the non-primary antenna when orthogonal transmit diversity is employed.

3 **Frame.** A basic timing interval in the system. For the Sync Channel, a frame is 26.666...
4 ms long. For the Access Channel, the Paging Channel, the Forward Supplemental Code
5 Channel, and the Reverse Supplemental Code Channel, a frame is 20 ms long. For the
6 Forward Supplemental Channel and the Reverse Supplemental Channel, a frame is 20, 40,
7 or 80 ms long. For the Enhanced Access Channel, the Forward Common Control Channel,
8 and the Reverse Common Control Channel, a frame is 5, 10, or 20 ms long. For the
9 Forward Fundamental Channel, Forward Dedicated Control Channel, Reverse
10 Fundamental Channel, and Reverse Dedicated Control Channel, a frame is 5 or 20 ms
11 long. For the Common Assignment Channel, a frame is 5 ms long. For the Broadcast
12 Control Channel, a frame is 40 ms long; the frame may be transmitted once, twice, or four
13 times. For the Forward Packet Data Control Channel and the Forward Packet Data
14 Channel, a frame could be 1.25, 2.5, or 5 ms long. For the Reverse Acknowledgment
15 Channel and the Reverse Channel Quality Indicator Channel, a frame is 1.25 ms long. For
16 the Reverse Packet Data Channel, the Reverse Packet Data Control Channel, the Reverse
17 Request Channel, the Forward Indicator Control Channel, the Forward Grant Channel, and
18 the Forward Acknowledgment Channel, a frame is 10 ms long.

19 **Frame Category.** A classification of a received Traffic Channel frame based upon
20 transmission data rate, the frame contents (primary traffic, secondary traffic, or signaling
21 traffic), and whether there are detected errors in the frame.

22 **Frame Early Termination.** A method used to terminate transmission of a frame earlier
23 than the nominal length of the frame (20 ms) if the receiver has successfully received the
24 frame. The receiver transmits an acknowledgment to the transmitter following successful
25 reception of the frame.

26 **Frame Number.** CDMA System Time, in integer multiples of 20 ms.

27 **Frame Offset.** A time skewing of Traffic Channel frames from System Time in integer
28 multiples of 1.25 ms. The maximum frame offset is 18.75 ms.

29 **Frame Quality Indicator.** See [2].

30 **Full TMSI.** The combination of TMSI_ZONE and TMSI_CODE. The full TMSI is a globally
31 unique address for the mobile station.

32 **Fundamental Channel.** A portion of a Traffic Channel that can carry a combination of
33 primary data, secondary data, signaling, and power control information.

34 **Fundicated Channel.** Fundamental Channel, Dedicated Control Channel, or both.

35 **Gating Rate Set.** This specifies the set of supported reverse pilot gating rates. The base
36 station and the mobile station may support one or more gating rates.

37 **GHz.** Gigahertz (10^9 Hertz).

38 **Global Positioning System (GPS).** A US government satellite system that provides
39 location and time information to users. See Navstar GPS Space Segment / Navigation User
40 Interfaces ICD-GPS-200 for specifications.

- 1 **Good Frames.** Frames not classified as bad frames. See also Bad Frames.
- 2 **GPS.** See Global Positioning System.
- 3 **Handoff.** The act of transferring communication with a mobile station from one base
4 station to another.
- 5 **Hard Handoff.** A handoff characterized by a temporary disconnection of the Traffic
6 Channel. Hard handoffs occur when the mobile station is transferred between disjoint
7 Active Sets, when the CDMA Frequency Assignment changes, or when the frame offset
8 changes. See also Soft Handoff.
- 9 **Hash Function.** A function used by the mobile station to select one out of N available
10 resources. The hash function distributes the available resources uniformly among a
11 random sample of mobile stations.
- 12 **HARQ.** Hybrid ARQ (Automatic Repeat Request). A “hybrid ARQ” is a combination of an
13 ARQ with an error correction mechanism to repair some errors in the encoder packet.
- 14 **Highest SR3 Frequency.** The SR3 frequency that has the highest frequency assignment.
- 15 **HLR.** See Home Location Register.
- 16 **Home Location Register (HLR).** The location register to which a MIN/IMSI is assigned for
17 record purposes such as subscriber information.
- 18 **Home System.** The wireless system in which the mobile station subscribes for service.
- 19 **Hopping Pilot Beacon.** A pilot beacon that changes CDMA Frequency periodically to
20 simulate multiple base stations operating on different frequencies. The transmission of the
21 hopping pilot beacon is discontinuous on any CDMA Channel.
- 22 **Idle Handoff.** The act of transferring reception of the Paging Channel, Broadcast Control
23 Channel or the Forward Common Control Channel from one base station to another, when
24 the mobile station is in the *Mobile Station Idle State*.
- 25 **IK.** Integrity Key. A 128-bit pattern produced by AKA that is used for integrity protection.
- 26 **Implicit Registration.** A registration achieved by a successful transmission of an
27 origination or page response on the r-csch.
- 28 **IMSI.** See International Mobile Subscriber Identity.
- 29 **IMSI_M.** MIN-based IMSI using the lower 10 digits to store the MIN.
- 30 **IMSI_O.** Operational value of IMSI used by the mobile station for operation with the base
31 station.
- 32 **IMSI_T.** True IMSI not associated with MIN. This could be 15 digits or fewer.
- 33 **Interleaving.** The process of permuting a sequence of symbols.
- 34 **International Mobile Subscriber Identity (IMSI).** A method of identifying stations in the
35 land mobile service as specified in [18].
- 36 **kHz.** Kilohertz (10^3 Hertz).

1 **ksps.** Kilo-symbols per second (10^3 symbols per second).

2 **LAC.** See Link Access Control.

3 **Layering.** A method of organization for communication protocols in which the transmitted
4 or received information is transferred in pipeline fashion, within each station, in well-
5 defined encapsulated data units between otherwise decoupled processing entities (“layers”).
6 A layer is defined in terms of its communication protocol to a peer layer in another entity
7 and the services it offers to the next higher layer in its own entity.

8 **Layer 1.** Layer 1 provides for the transmission and reception of radio signals between the
9 base station and the mobile station. Also see Physical Layer.

10 **Layer 2.** Layer 2 provides for the correct transmission and reception of signaling
11 messages, including partial duplicate detection. Layer 2 makes use of the services
12 provided by Layer 1. See also Layering and Layer 3.

13 **Layer 3.** Layer 3 provides the control messaging for the wireless telephone system. Layer
14 3 originates and terminates signaling messages according to the semantics and timing of
15 the communication protocol between the base station and the mobile station. Layer 3
16 makes use of the services provided by Layer 2. See also Layering and Layer 2.

17 **Link Access Control.** See LAC. The LAC Sublayer is the upper sublayer of Layer 2. It
18 implements a data link protocol that provides for the correct transport and delivery of
19 signaling messages generated by Layer 3. The LAC Sublayer makes use of the services
20 provided by the Lower Layers (Layer 1 and the MAC Sublayer).

21 **Local Control.** An optional mobile station feature used to perform manufacturer-specific
22 functions.

23 **Logical Channel.** A communication path between the mobile station and the base station,
24 described in terms of the intended use of, and access to, the transferred data, and direction
25 of transfer. A logical channel can be “mapped” to and from one or more physical channels.

26 **Logical-to-physical Mapping.** The technique for forming associations between logical and
27 physical channels.

28 **Long Code.** A PN sequence with period $2^{42} - 1$ that is used for scrambling on the Forward
29 CDMA Channel and spreading on the Reverse CDMA Channel. The long code uniquely
30 identifies a mobile station on both the Reverse Traffic Channel and the Forward Traffic
31 Channel. The long code provides limited privacy. The long code also separates multiple
32 Access Channels and Enhanced Access Channels on the same CDMA Channel. See also
33 Public Long Code and Private Long Code.

34 **Long Code Mask.** A 42-bit binary number that creates the unique identity of the long
35 code. See also Public Long Code, Private Long Code, Public Long Code Mask, and Private
36 Long Code Mask.

37 **Lowest SR3 Frequency.** The SR3 frequency that has the lowest frequency assignment.

38 **LSB.** Least significant bit.

39 **LTU.** Logical Transmission Unit. One of more Type 3 MuxPDUs with a 16-bit CRC.

- 1 **MAC.** See Medium Access Control.
- 2 **MAC-I.** Message Authentication Code for message integrity. The 32-bit output of the
3 message integrity algorithm that allows the receiver to authenticate the message.
- 4 **MACI.** A 32-bit LAC Layer field that carries either the MAC-I or the UMAC of a signaling
5 message.
- 6 **Maximal Length Sequence (m-Sequence).** A binary sequence of period $2^n - 1$, n being a
7 positive integer, with no internal periodicities. A maximal length sequence can be
8 generated by a tapped n -bit shift register with linear feedback.
- 9 **MC System.** Multi Carrier CDMA System (1x and 3x).
- 10 **MCC.** See Mobile Country Code.
- 11 **Mcps.** Megachips per second (10^6 chips per second).
- 12 **MCSB.** See Message Control and Status Block.
- 13 **ME.** Mobile Equipment. The part of a mobile station that does not include the UIM.
- 14 **Mean Input Power.** The total received calorimetric power measured in a specified
15 bandwidth at the antenna connector, including all internal and external signal and noise
16 sources.
- 17 **Mean Output Power.** The total transmitted calorimetric power measured in a specified
18 bandwidth at the antenna connector when the transmitter is active.
- 19 **Medium Access Control.** See MAC. The MAC Sublayer is the lower sublayer of Layer 2.
20 It implements the medium access protocol and is responsible for transport of LAC protocol
21 data units using the services provided by Layer 1.
- 22 **MEID.** See Mobile Equipment Identifier.
- 23 **MEID_ME.** MEID associated with the mobile equipment. See Mobile Equipment Identifier
24 (MEID) and ME.
- 25 **Message.** A data structure that conveys control information or application information. A
26 message consists of a length field (MSG_LENGTH), a message body (the part conveying the
27 information), and a CRC.
- 28 **Message Body.** The part of the message contained between the length field
29 (MSG_LENGTH) and the CRC field.
- 30 **Message Capsule.** A sequence of bits comprising a single message and padding. The
31 padding always follows the message and may be of zero length.
- 32 **Message Control and Status Block.** In this document, a parameter block representing
33 the PCI being transferred between Layer 3 and Layer 2.
- 34 **Message CRC.** The CRC check associated with a message. See also Cyclic Redundancy
35 Code.
- 36 **Message Field.** A basic named element in a message. A message field may consist of zero
37 or more bits.

- 1 **Message Record.** An entry in a message consisting of one or more fields that repeats in
2 the message.
- 3 **MHz.** Megahertz (10^6 Hertz).
- 4 **MIN.** See Mobile Identification Number.
- 5 **MNC.** See Mobile Network Code.
- 6 **Mobile Country Code (MCC).** A part of the E.212 IMSI identifying the home country. See
7 [18].
- 8 **Mobile Directory Number.** A dialable directory number that is not necessarily the same
9 as the mobile station's air interface identification, i.e., MIN, IMSI_M or IMSI_T.
- 10 **Mobile Equipment Identifier (MEID).** A 56-bit number assigned by the mobile station
11 manufacturer, uniquely identifying the mobile station equipment.
- 12 **Mobile Identification Number (MIN).** The 34-bit number that is a digital representation
13 of the 10-digit number assigned to a mobile station.
- 14 **Mobile Network Code (MNC).** A part of the E.212 IMSI identifying the home network
15 within the home country. See [18].
- 16 **Mobile Protocol Capability Indicator (MPCI).** A 2-bit field used to indicate the mobile
17 station's capabilities.
- 18 **Mobile-Specific User Zone.** A user zone that is identified by the mobile station. The
19 mobile station may consider parameters such as the identity of the serving system, cell,
20 and sector, and the geographic location of that station in making the determination. See
21 also CDMA Tiered Services, User Zone, Broadcast User Zone, Active User Zone, and Passive
22 User Zone.
- 23 **Mobile Station.** A station in the Public Wireless Radio Telecommunications Service
24 intended to be used while in motion or during halts at unspecified points. Mobile stations
25 include portable units (e.g., hand-held personal units) and units installed in vehicles. A
26 mobile station consists of two parts – ME and UIM.
- 27 **Mobile Station Class.** A classification of mobile stations based on characteristics such as
28 slotted operation and transmission power. See [12] and Table 2.3.3-1 of this document.
- 29 **Mobile Station Identification Number (MSIN).** A part of the E.212 IMSI identifying the
30 mobile station within its home network. See [18].
- 31 **Mobile Station Originated Call.** A call originating from a mobile station.
- 32 **Mobile Station Terminated Call.** A call received by a mobile station (not to be confused
33 with a disconnect or call release).
- 34 **ms.** Millisecond (10^{-3} second).
- 35 **MSB.** Most significant bit.
- 36 **MSC.** See Mobile Switching Center.
- 37 **MSIN.** See Mobile Subscriber Identification Number.

- 1 **Multiplex Option.** The ability of the multiplex sublayer and lower layers to be tailored to
2 provide special capabilities. A multiplex option defines such characteristics as the frame
3 format, the maximum number of Supplemental Code Channels supported, and the rate
4 decision rules. See also Multiplex Sublayer.
- 5 **Multiplex Sublayer.** One of the conceptual layers of the system that multiplexes and
6 demultiplexes primary traffic, secondary traffic, and signaling traffic.
- 7 **NAM.** See Number Assignment Module.
- 8 **National Mobile Subscriber Identity (NMSI).** A part of the E.212 IMSI identifying the
9 mobile station within its home country. The NMSI consists of the MNC and the MSIN. See
10 [18].
- 11 **NDSS.** See Network Directed System Selection.
- 12 **Neighbor Set.** The set of pilots associated with the CDMA Channels that are probable
13 candidates for handoff. Normally, the Neighbor Set consists of the pilots associated with
14 CDMA Channels that cover geographical areas near the mobile station. See also Active Set,
15 Candidate Set, Remaining Set, and Private Neighbor Set.
- 16 **Network.** A network is a subset of a wireless system, such as an area-wide cellular
17 network, a private group of base stations, or a group of base stations set up to handle a
18 special requirement. A network can be as small or as large as needed, as long as it is fully
19 contained within a system. See also System.
- 20 **Network Directed System Selection (NDSS).** A feature that allows the mobile station to
21 automatically register with a preferred system while roaming, or to be automatically
22 directed by a service provider, typically the home service provider, to a suggested system,
23 regardless of the frequency band class, cellular band, or PCS frequency block.
- 24 **Network Identification (NID).** A number that uniquely identifies a network within a
25 wireless system. See also System Identification.
- 26 **NEW_KEY_ID.** In *ROP*, this is the index of the pending (CIK, CCK) and NEW_SSEQ_H
27 associated with AUTHR. In *Authentication Response Message*, this is the index of the
28 pending (IK, CK) and NEW_SSEQ_H associated with the (RANDA, AUTHN).
- 29 **NEW_SSEQ_H.** The pending 24-bit security sequence number used for encryption and/or
30 integrity protection.
- 31 **NEW_SSEQ_H_SIG.** An 8-bit digital signature of NEW_SSEQ_H computed by RAND_S,
32 SSD_A, and NEW_SSEQ_H.
- 33 **NID.** See Network Identification.
- 34 **NMSI.** See National Mobile Subscriber Identity.
- 35 **Non-Autonomous Registration.** A registration method in which the base station initiates
36 registration. See also Autonomous Registration.
- 37 **Non-Slotted Mode.** An operation mode of the mobile station in which the mobile station
38 continuously monitors the Paging Channel, or the Forward Common Control Channel/
39 Broadcast Control Channel.

- 1 **ns.** Nanosecond (10^{-9} second).
- 2 **NULL.** Any value that is not in the specified range of a field.
- 3 **Null Traffic Channel Data.** One or more frames of a specified data sequence sent at the
4 lowest agreed-upon rate of the negotiated radio configuration. Null Traffic Channel data
5 may be sent when there is no primary, secondary, or signaling traffic available. Null Traffic
6 Channel data serves to maintain the connectivity between the mobile station and the base
7 station.
- 8 **Number Assignment Module (NAM).** A set of MIN/IMSI-related parameters stored in the
9 mobile station.
- 10 **Numeric Information.** Numeric information consists of parameters that appear as
11 numeric fields in messages exchanged by the base station and the mobile station and
12 information used to describe the operation of the mobile station.
- 13 **Optional Field.** A field defined within a message structure that is optionally transmitted
14 to the message recipient.
- 15 **Order.** A type of message that contains control codes for either the mobile station or the
16 base station.
- 17 **Ordered Registration.** A registration method in which the base station orders the mobile
18 station to send registration related parameters.
- 19 **Orthogonal Transmit Diversity (OTD).** An optional method of transmission of the
20 Forward CDMA Channel that uses two antennas, each transmitting a fraction of the code
21 symbols. It can be used to enhance performance in the presence of multipath fading radio
22 propagation.
- 23 **OTD.** See Orthogonal Transmit Diversity
- 24 **Overhead Message.** A message sent by the base station on the Paging Channel or the
25 Primary Broadcast Control Channel to communicate base-station-specific and system-wide
26 information to mobile stations.
- 27 **Overload Class (OLC).** The means used to control system access by mobile stations,
28 typically in emergency or other overloaded conditions. Mobile stations are assigned one (or
29 more) of sixteen overload classes. Access to the CDMA system can then be controlled on a
30 per class basis by persistence values transmitted by the base station.
- 31 **PACA.** Priority Access and Channel Assignment. See PACA Call.
- 32 **PACA Call.** A priority mobile station originated call for which no traffic channel or voice
33 channel was immediately available, and which has been queued for a priority access
34 channel assignment.
- 35 **Packet.** The unit of information exchanged between the service option applications of the
36 base station and the mobile station.
- 37 **Padding.** A sequence of bits used to fill from the end of a message to the end of a message
38 capsule, typically to the end of the frame or half frame. All bits in the padding are '0'.

- 1 **Paging.** The act of seeking a mobile station when a call has been placed to that mobile
2 station.
- 3 **Paging Channel.** A code channel in a Forward CDMA Channel used for transmission of
4 control information and pages from a base station to a mobile station.
- 5 **Paging Channel Slot.** An 80 ms interval on the Paging Channel. Mobile stations
6 operating in the slotted mode are assigned specific slots in which they monitor messages
7 from the base station.
- 8 **Paging Indicator.** A one-bit datum, sent on the Quick Paging Channel. Quick paging
9 indicators are associated with mobile stations, in pairs, via a hashing algorithm.
10 Appearance of both of its indicators in its assigned Quick Paging Channel slot serves to
11 alert a slotted mode mobile station, operating in the idle state, that it should monitor the
12 Paging Channel or the Forward Common Control Channel starting in the next slot. See
13 also Quick Paging Channel.
- 14 **Parameter-Change Registration.** A registration method in which the mobile station
15 registers when certain of its stored parameters change.
- 16 **Parity Check Bits.** Bits added to a sequence of information bits to provide error detection,
17 correction, or both.
- 18 **Passive User Zone.** A user zone in which the implicit registration that takes place at call
19 set-up is sufficient to trigger a change in tiered service features. See also CDMA Tiered
20 Services, User Zone, and Active User Zone.
- 21 **PCI.** See Protocol Control Information.
- 22 **PCS.** See Personal Communications Services.
- 23 **PCSC.** See Personal Communications Switching Center.
- 24 **PCS System.** See Personal Communications Services System.
- 25 **PDU.** See Protocol Data Unit.
- 26 **Personal Communications Services System.** A configuration of equipment that provides
27 PCS radiotelephone services.
- 28 **Personal Communications Services (PCS).** A family of mobile and portable radio
29 communications services for individuals and businesses that may be integrated with a
30 variety of competing networks. Broadcasting is prohibited and fixed operations are to be
31 ancillary to mobile operations.
- 32 **Personal Communications Switching Center (PCSC).** See Mobile Switching Center
33 (MSC).
- 34 **Physical Channel.** A communication path between stations, described in terms of the RF
35 characteristics such as coding, power control policies, etc.
- 36 **Physical Layer.** The part of the communication protocol between the mobile station and
37 the base station that is responsible for the transmission and reception of data. The
38 physical layer in the transmitting station is presented a frame by the multiplex sublayer
39 and transforms it into an over-the-air waveform. The physical layer in the receiving station

1 transforms the waveform back into a frame and presents it to the multiplex sublayer above
2 it.

3 **Pilot Beacon.** A transmit-only base station that broadcasts a Pilot Channel, a Sync
4 Channel, optionally a Paging Channel or a Primary Broadcast Control Channel, but no
5 Forward Common Control Channels and Forward Traffic Channels. The mobile station
6 measures the pilot beacon to assist in CDMA hard handoffs and inter-frequency idle-mode
7 handoffs.

8 **Pilot Channel.** A non-data-bearing signal transmitted by a CDMA station. See Forward
9 Pilot Channel, Transmit Diversity Pilot Channel, Auxiliary Pilot Channel, Auxiliary
10 Transmit Diversity Pilot Channel, and Reverse Pilot Channel.

11 **Pilot PN Chip.** One bit, or bit pair, of a pilot PN sequence, or the time interval
12 corresponding thereto.

13 **Pilot PN Sequence.** A pair of modified maximal length PN sequences used to spread the
14 quadrature components of a CDMA Channel.

15 **Pilot PN Sequence Offset.** The time offset of a Forward Pilot Channel from CDMA System
16 time, as transmitted by the base station, expressed modulo the pilot period.

17 **Pilot PN Sequence Offset Index.** The pilot PN sequence offset in units of 64 PN chips of a
18 Forward Pilot Channel, relative to the zero offset pilot PN sequence.

19 **Pilot Strength.** The ratio of pilot power to total power in the signal bandwidth of a CDMA
20 Forward or Reverse Channel. See also E_c/I_0 .

21 **Plus Code Dialing.** Plus code dialing relieves the user of the need to dial an international
22 access prefix, which may vary between countries and carriers. This capability allows
23 telephony addresses to be entered, received, displayed, stored and transmitted in an
24 international format (full ITU-T E.164 number, including country code). When addresses
25 are entered by a user, the MS user interface can provide an input aid, such as a key
26 marked with a "+" sign, to indicate that the address is international. When displayed by the
27 MS, they can be identified by a visual device, such as a "+" prefix. When received,
28 transmitted, or stored, an international indicator can be included with the address digits. It
29 will be the responsibility of the network to ignore the international indicator when attached
30 to a national number. This allows users to store and dial all phone numbers in a consistent
31 format, which is particularly useful for international travelers. See [39].

32 **PN.** Pseudonoise.

33 **PN Chip.** One bit in a PN sequence, or the time duration of such a bit. It corresponds to
34 the smallest modulation interval in a CDMA system.

35 **PN Sequence.** Pseudonoise sequence. A deterministic, periodic binary sequence having
36 limited statistical similarity to a Bernoulli (coin-tossing).

37 **Power Control Bit.** A bit sent on the Forward Power Control Subchannel or Reverse Power
38 Control Subchannel to signal the mobile station or base station to increase or decrease its
39 transmit power.

- 1 **Power Control Group.** A 1.25 ms interval on the Forward Traffic Channel and the Reverse
2 Traffic Channel. See also Power Control Bit.
- 3 **Power-Down Registration.** An autonomous registration method in which the mobile
4 station registers on power-down.
- 5 **Power Up Function.** A method by which the mobile station increases its output power to
6 support location services.
- 7 **Power-Up Registration.** An autonomous registration method in which the mobile station
8 registers on power-up.
- 9 **PPM.** Parts per million.
- 10 **Preamble.** See Access Channel Preamble and Traffic Channel Preamble.
- 11 **Primary CDMA Channel.** A pre-assigned channel in a CDMA Cellular System used by the
12 mobile station for initial acquisition. See also Secondary CDMA Channel.
- 13 **Primary Paging Channel (CDMA).** The default code channel (code channel 1) assigned for
14 paging on a CDMA Channel.
- 15 **Primary Pilot.** One of the three pilots on the Spreading Rate 3 Forward Channels. The
16 primary pilot may be on any one of the SR3 frequencies and may have a higher
17 transmission power comparing to the pilots on the other two SR3 frequencies.
- 18 **Primary Traffic.** The main traffic stream carried between the mobile station and the base
19 station on the Traffic Channel. See also Secondary Traffic and Signaling Traffic.
- 20 **Primitive.** An atomic, well-defined method of transferring data and control information
21 between two adjacent layers and sublayers. Conventionally represented as a function
22 invocation with the data and/or control information as parameters.
- 23 **Private Long Code.** The long code characterized by the private long code mask. See also
24 Long Code.
- 25 **Private Long Code Mask.** The long code mask used to form the private long code. See
26 also Public Long Code Mask and Long Code.
- 27 **Private Neighbor Set.** The set of pilots associated with the private system base stations
28 that are probable candidates for idle handoff. See also Active Set, Neighbor Set, Remaining
29 Set, and CDMA Tiered Services.
- 30 **Protocol Control Information (PCI).** Data passed between adjacent layers in the protocol
31 stack, together with the SDU, to assist a layer to properly encapsulate/decapsulate the
32 SDU. Examples of PCI in this document are the MCSB and the PCSB.
- 33 **Protocol Data Unit.** Encapsulated data communicated between peer layers on the mobile
34 station and base station. Unless specified otherwise, in this document PDU refers to the
35 Layer 3 protocol data unit transferred at the interface between Layer 3 and Layer 2.
- 36 **Protocol Stack.** Conceptual model of the layered architecture for communication
37 protocols (see Layering) in which layers within a station are represented in the order of
38 their numeric designation and requiring that transferred data be processed sequentially by

1 each layer, in the order of their representation. Graphically, the “stack” is drawn vertically,
2 with the layer having the lowest numeric designation at the base.

3 **Pseudo-ESN.** A 32 bit number derived from MEID and used in place of ESN.

4 **Public Long Code.** The long code characterized by the public long code mask.

5 **Public Long Code Mask.** The long code mask used to form the public long code. The
6 mask can contain a permutation of the mobile station’s ESN, or the particular mask
7 specified by the base station. The mask also includes the channel number when used for a
8 Supplemental Code Channel. See also Private Long Code Mask and Long Code.

9 **PUF.** See Power Up Function.

10 **PUF Attempt.** A sequence of PUF probes sent by the mobile station in response to a *Power*
11 *Up Function Message*.

12 **PUF Probe.** One or more consecutive frames on the Reverse Traffic Channel within which
13 the mobile station transmits the PUF pulse.

14 **PUF Pulse.** Portion of PUF probe that may be transmitted at elevated output power.

15 **PUF Target Frequency.** The CDMA frequency assignment to which the base station
16 directs a mobile station for transmitting the PUF probe.

17 **Punctured Code.** An error-correcting code generated from another error-correcting code
18 by deleting (i.e., puncturing) code symbols from the coder output.

19 **QoS.** See Quality of Service.

20 **Quality of Service.** Set of parameters and procedures associated with a service and/or
21 user, indicating some of the capabilities and constraints related to the delivery of the
22 service to the user.

23 **Quick Paging.** A feature that permits mobile stations to further conserve battery power
24 beyond the savings achieved by slotted mode operation. See also Paging Indicator and
25 Configuration Change Indicator.

26 **Quick Paging Channel.** An uncoded, on-off-keyed (OOK) spread spectrum signal sent by
27 base stations to inform slotted mode mobile stations, operating in the idle state, whether to
28 monitor the Paging Channel or the Forward Common Control Channel. See also Quick
29 Paging, Paging Indicator, and Configuration Change Indicator.

30 **Quick Paging Channel Slot.** An 80 ms interval on the Quick Paging Channel. See also
31 Paging Indicator and Configuration Change Indicator.

32 **Quick Repeats.** Additional transmissions of identical copies of a message within a short
33 interval to increase the probability that the message is received correctly.

34 **r-csch.** Reverse common signaling logical channel.

35 **r-dsch.** Reverse dedicated signaling logical channel.

36 **R-PDCCH.** Reverse Packet Data Control Channel. A control channel used for the
37 transmission of control information for the subpacket being transmitted on the Reverse
38 Packet Data Channel and the Mobile Status Indicator Bit.

- 1 **R-PDCH. Reverse** Packet Data Channel. A portion of a Radio Configuration 7 Reverse
2 Traffic Channel which carries higher-level data and control information from a mobile
3 station to a base station.
- 4 **R-REQCH. Reverse** Request Channel. A control channel used by the mobile station to
5 report available power headroom and buffer status.
- 6 **R-SPICH.** Reverse Secondary Pilot Channel. An unmodulated, direct-sequence spread
7 spectrum signal transmitted by a CDMA mobile station in conjunction with certain
8 transmissions on the Reverse Packet Data Channel. The secondary pilot channel provides
9 additional phase reference for the Reverse Packet Data Channel for coherent demodulation
10 and may provide a means for signal strength measurement.
- 11 **Radio Configuration.** A set of Forward Traffic Channel and Reverse Traffic Channel
12 transmission formats that are characterized by physical layer parameters such as
13 transmission rates, modulation characteristics and spreading rate. See [2].
- 14 **Radio Configuration Class.** A group of Radio Configurations. All Radio Configurations,
15 for the Forward Traffic Channel and the Reverse Traffic Channel, are divided into three
16 classes by the types of pre-spreading symbols (BPSK and QPSK) and spreading rates. RC
17 Class 1 consists of RC 1 and RC 2 for the Forward Traffic Channel and the Reverse Traffic
18 Channel. RC Class 2 consists of RC 3, RC 4, and RC 8 of the Reverse Traffic Channel, and
19 RC 3, RC 4, RC 5, RC 11, and RC12 of the Forward Traffic Channel. RC Class 3 consists of
20 RC 5 and RC 6 of the Reverse Traffic Channel, and RC 6, RC 7, RC 8, and RC 9 of the
21 Forward Traffic Channel.
- 22 **Radio Environment Reporting Mode.** A fast call setup mode of the mobile station in the
23 *Mobile Station Idle State*, in which *Radio Environment Messages* are triggered based on a
24 radio environment report pilot list (RER_PILOT_LIST). This mode may be used to assist the
25 base station with direct channel assignment. See also Direct Channel Assignment.
- 26 **RANDA.** The random challenge number contained in an AV.
- 27 **RC.** See Radio Configuration.
- 28 **Reduced Slot Cycle Mode.** A fast call setup mode of the mobile station in which the
29 mobile station operates in the slotted mode with a shorter slot cycle than the registered slot
30 cycle or in the non-slotted mode for the negotiated duration of time. See also Slotted Mode
31 and Non-Slotted Mode.
- 32 **RES.** A *Registration Accepted Order*, *Extended Channel Assignment Message*, or *Security*
33 *Mode Command Message*.
- 34 **Registration.** The process by which a mobile station identifies its location and parameters
35 to a base station.
- 36 **Registration Zone.** A collection of one or more base stations treated as a unit when
37 determining whether a mobile station should perform zone-based registration. See also
38 User Zone, with which it should not be confused.
- 39 **Release.** A process that the mobile station and base station use to inform each other of
40 call disconnect.

- 1 **Remaining Set.** The set of all allowable pilot offsets as determined by PILOT_INC,
2 excluding the pilot offsets of the pilots in the Active Set, Candidate Set, and Neighbor Set.
3 See also Active Set, Candidate Set, and Neighbor Set.
- 4 **Replay Attack.** An attempt by a third party to record an over-the-air message and send it
5 later in time so as to mislead the receiver.
- 6 **Request.** A Layer 3 message generated by either the mobile station or the base station to
7 retrieve information, ask for service, or command an action.
- 8 **Rescue Channel.** A Fundamental Channel used for call rescue soft handoff. The Walsh
9 Code is pre-allocated and advertised to the mobile station. In the event that the mobile
10 station loses the Forward Traffic Channel or declares an acknowledgment failure,
11 communication with a new base station can be established on the Rescue Channel.
- 12 **Response.** A Layer 3 message generated as a result of another message, typically a
13 request.
- 14 **Reverse Acknowledgment Channel.** A portion of Reverse CDMA Channel used for the
15 transmission of acknowledgments from the mobile station to the base station in response
16 to the data transmitted on the Forward Packet Data Channel, the Forward Packet Data
17 Control Channel, the Forward Fundamental Channel and the Forward Supplemental
18 Channel.
- 19 **Reverse Channel Quality Indicator Channel.** A portion of Reverse CDMA Channel used
20 by the mobile station to indicate to the base station the quality of the Forward Link Pilot
21 Channel received at the mobile station.
- 22 **Reverse CDMA Channel.** The CDMA Channel from the mobile station to the base station.
23 From the base station's perspective, the Reverse CDMA Channel is the sum of all mobile
24 station transmissions on a CDMA Frequency Assignment.
- 25 **Reverse Dedicated Control Channel.** A Dedicated Control Channel that is transmitted on
26 the Reverse CDMA Channel.
- 27 **Reverse Fundamental Channel.** A Fundamental Channel that is transmitted on the
28 Reverse CDMA Channel.
- 29 **Reverse Pilot Channel.** A non-data-bearing direct-sequence spread spectrum signal
30 transmitted by each CDMA mobile station whenever the Enhanced Access Channel,
31 Reverse Common Control Channel, or Reverse Traffic Channel is enabled. The Reverse
32 Pilot Channel allows a base station to acquire the timing of the Reverse CDMA Channel and
33 provides a phase reference for coherent demodulation. The Reverse Pilot Channel may be
34 transmitted either continuously or in gated mode.
- 35 **Reverse Supplemental Channel.** A Supplemental Channel that is transmitted on the
36 Reverse CDMA Channel.
- 37 **Reverse Supplemental Code Channel.** A Supplemental Code Channel that is transmitted
38 on the Reverse CDMA Channel.
- 39 **Reverse Traffic Channel.** A Traffic Channel on which data and signaling are transmitted
40 from a mobile station to a base station. The Reverse Traffic Channel is composed of zero or

1 one Reverse Fundamental Channel, zero to seven Reverse Supplemental Code Channels,
 2 zero to two Reverse Supplemental Channels, and zero or one Reverse Dedicated Control
 3 Channel.⁴

4 **ROP.** *A Registration Message, Origination Message, or Page Response Message.*

5 **Roamer.** A mobile station operating in a wireless system (or network) other than the one
 6 from which service was subscribed. See also Foreign NID Roamer and Foreign SID
 7 Roamer.

8 **R-UIM.** Removable UIM.

9 **SAP.** See Service Access Point.

10 **SCI.** See Synchronized Capsule Indicator Bit.

11 **SDU.** See Service Data Unit.

12 **Search Window.** The range of PN sequence offsets that a mobile station searches for a
 13 pilot.

14 **Search Window Offset.** PN sequence offset used by the mobile station to position the
 15 search window when searching for a pilot.

16 **Secondary CDMA Channel.** A pre-assigned channel in a CDMA Cellular System used by
 17 the mobile station for initial acquisition. See also Primary CDMA Channel.

18 **Secondary Traffic.** An additional traffic stream that can be carried between the mobile
 19 station and the base station on the Traffic Channel. See also Primary Traffic and Signaling
 20 Traffic.

21 **Service Access Point.** Conceptual point at the interface between two adjacent layers
 22 where services are provided to the upper layer and data and protocol information is
 23 exchanged between layers.

24 **Service Configuration.** The common attributes used by the mobile station and the base
 25 station to build and interpret Traffic Channel frames. Service configuration corresponds to
 26 the parameters contained in the Service Configuration information record and the Non-
 27 negotiable Service Configuration information record. Examples of such parameters include
 28 Forward and Reverse Traffic Channel multiplex options, Forward and Reverse Traffic
 29 Channel transmission rates, service option connections, and reverse pilot gating rate.

30 **Service Configuration Synchronization Identifier (SYNC_ID).** An identifier assigned by
 31 the base station that identifies a specific Service Configuration information record and Non-
 32 negotiable Service Configuration information record.

33 **Service Data Unit.** Data transferred between adjacent layers in the protocol stack.
 34 Unless specified otherwise in this document SDU refers to the Layer 3 service data unit
 35 being transferred to/from Layer 2.

⁴ The Reverse Traffic Channel does not include R-CQICH, R-ACKCH.

- 1 **Service Negotiation.** The procedures used by the mobile station and base station to
2 establish a service configuration. See also Service Option Negotiation.
- 3 **Service Option.** A service capability of the system. Service options may be applications
4 such as voice, data, or facsimile. See [30].
- 5 **Service Option Connection.** A particular instance or session in which the service defined
6 by a service option is used. Associated with a service option connection are a reference,
7 which is used for uniquely identifying the service option connection, a service option, which
8 specifies the particular type of service in use, a Forward Traffic Channel traffic type, which
9 specifies what type of Forward Traffic Channel traffic is used to support the service option
10 connection, and a Reverse Traffic Channel traffic type, which specifies what type of Reverse
11 Traffic Channel traffic is used by the service option connection.
- 12 **Service Option Connection Reference.** A designator used by the base station and mobile
13 station to uniquely identify a particular service option connection.
- 14 **Service Option Negotiation.** The procedures used by the mobile station and base station
15 to establish a service configuration. Service option negotiation is similar to service
16 negotiation, but allows less flexibility for specifying the attributes of the service
17 configuration. See also Service Negotiation.
- 18 **Service Redirection.** The process by which the base station alters the system selection
19 made by a mobile station. It can be used temporarily during maintenance and testing to
20 divert subscribers to an alternate system.
- 21 **Serving Frequency.** The CDMA frequency on which a mobile station is currently
22 communicating with one or more base stations.
- 23 **Shared Secret Data (SSD).** A 128-bit pattern stored in the mobile station (in semi-
24 permanent memory) and known by the base station. SSD is a concatenation of two 64-bit
25 subsets: SSD_A, which is used to support the authentication procedures, and SSD_B,
26 which serves as one of the inputs to the process generating the encryption mask and
27 private long code.
- 28 **Short Message Services (SMS).** A suite of services such as SMS Text Delivery, Digital
29 Paging (i.e., Call Back Number - CBN), and Voice Mail Notification (VMN).
- 30 **SID.** See System Identification.
- 31 **Signaling Traffic.** Control messages that are carried between the mobile station and the
32 base station on the Traffic Channel. See also Primary Traffic and Secondary Traffic.
- 33 **Silent Re-origination.** An autonomous attempt to re-originate a call after the mobile
34 station Layer 3 receives an access attempt failure indication from Layer 2 following a user-
35 initiated origination or a re-origination. Silent re-origination does not apply to any user-
36 programmable capabilities or services, e.g. user-programmable automatic redial.
- 37 **Slotted Mode.** An operation mode of the mobile station in which the mobile station
38 monitors only selected slots on the Paging Channel or the Forward Common Control
39 Channel when in the *Mobile Station Idle State*.

1 **Soft Handoff.** A handoff occurring while the mobile station is in the *Mobile Station Control*
2 *on the Traffic Channel State*. This handoff is characterized by commencing communications
3 with a new base station on the same CDMA Frequency Assignment before terminating
4 communications with an old base station. See also Hard Handoff.

5 **SOM.** Start-of-Message bit.

6 **Space Time Spreading (STS).** A forward link transmission method which transmits all
7 forward link channel symbols on multiple antennas and spreads the symbols with
8 complementary Walsh or quasi-orthogonal functions.

9 **Spreading Rate.** The PN chip rate of the system, defined as a multiple of 1.2288 Mcps.

10 **Spreading Rate 1.** A 1.2288 Mcps chip rate-based system using a direct-spread single
11 carrier.

12 **Spreading Rate 3.** A 3.6864 Mcps chip rate-based system using three 1.2288 Mcps
13 carriers on the Forward CDMA Channel. The Reverse CDMA Channel uses a 3.6864 Mcps
14 direct-spread carrier.

15 **sps.** Symbols per second.

16 **SR.** See Spreading Rate.

17 **SR1.** See Spreading Rate 1.

18 **SR3.** See Spreading Rate 3.

19 **SR3 Frequencies.** CDMA frequencies for the three 1.2288 Mcps carriers on the Forward
20 CDMA Channel. SR3 frequencies include the lowest SR3 frequency, the center SR3
21 frequency, and the highest SR3 frequency.

22 **SR3 Primary Pilot.** See Primary Pilot.

23 **SSD.** See Shared Secret Data.

24 **SSEQ.** Security sequence number. The 8 LSB of the EXT_SSEQ used for an input to
25 encryption functions and as an input to MACI calculations.

26 **Station Class Mark (SCM).** An identification of certain characteristics of a mobile station.
27 Classes are defined in [12] and Table 6.3.3-1 of this document.

28 **Subscriber Authentication Key.** A secret, 128-bit pattern stored in the mobile station
29 and AC. It is used to generate/update the mobile station's IK, CK and UAK during AKA
30 procedure.

31 **Supplemental Channel.** An optional portion of a Traffic Channel (Forward or Reverse
32 Radio Configurations 3 and above) that operates in conjunction with a Fundamental
33 Channel in that Traffic Channel, and (optionally) with other Supplemental Channels to
34 provide higher data rate services.

35 **Supplemental Code Channel.** An optional portion of a Traffic Channel (Forward or
36 Reverse Radio Configurations 1 and 2) that operates in conjunction with a Fundamental
37 Channel in that Traffic Channel, and (optionally) with other Supplemental Code Channels

1 to provide higher data rate services. On this channel a combination of primary data,
2 secondary data, or both (but never signaling information) are transmitted.

3 **Symbol.** See Code Symbol and Modulation Symbol.

4 **Sync Channel.** Code channel 32 in the Forward CDMA Channel which transports the
5 synchronization message to the mobile station.

6 **Sync Channel Superframe.** An 80 ms interval consisting of three Sync Channel frames
7 (each 26.666... ms in length).

8 **System.** A system is a wireless communications service that covers a geographic area
9 such as a city, metropolitan region, county, or group of counties. See also Network.

10 **System Identification (SID).** A number uniquely identifying a wireless system.

11 **System Time.** The time reference used by the system. System Time is synchronous to
12 UTC time (except for leap seconds) and uses the same time origin as GPS time. All base
13 stations use the same System Time (within a small error). Mobile stations use the same
14 System Time, offset by the propagation delay from the base station to the mobile station.
15 See also Universal Coordinated Time.

16 **Target Frequency.** The CDMA frequency assignment to which the base station directs a
17 mobile station in a handoff using an *Extended Handoff Direction Message*, a *General*
18 *Handoff Direction Message*, or a *Universal Handoff Direction Message*.

19 **TD.** See Transmit Diversity.

20 **Temporary Mobile Subscriber Identity (TMSI).** A temporary mobile station identification
21 assigned by the base station.

22 **Tracking Zone Mode.** A fast call setup mode of the mobile station in the *Mobile Station*
23 *Idle State*, in which *Radio Environment Messages* are triggered based on the tracking zone
24 identifier (TKZ_ID) broadcast by the base station and hysteresis criteria. This mode may be
25 used to assist the base station with direct channel assignment. See also Direct Channel
26 Assignment.

27 **Timer-Based Registration.** A registration method in which the mobile station registers
28 whenever a counter reaches a predetermined value. The counter is incremented an
29 average of once per 80 ms period.

30 **Time Reference.** A reference established by the mobile station that is synchronous with
31 the earliest arriving multipath component used for demodulation.

32 **TMSI.** See Temporary Mobile Subscriber Identity.

33 **TMSI Zone.** The administrative zone that allows the TMSI to be reused. The TMSI_CODE
34 has to be unique within a TMSI zone but may be reused in a different TMSI zone. The
35 TMSI zone is identified by the field TMSI_ZONE.

36 **Traffic Channel.** A communication path between a mobile station and a base station used
37 for user and signaling traffic. The term Traffic Channel implies a Forward Traffic Channel
38 and Reverse Traffic Channel pair. See also Forward Traffic Channel and Reverse Traffic
39 Channel.

1 **Traffic Channel Preamble.** For RC1 and RC2, a sequence of all-zero frames that is sent by
2 the mobile station on the Reverse Traffic Channel as an aid to Traffic Channel acquisition.
3 For RC3 to RC6 inclusive, the traffic preamble is the ungated transmission of the Reverse
4 Pilot.

5 **Transmit Diversity.** See Orthogonal Transmit Diversity and Space Time Spreading.

6 **UAK.** UIM Authentication Key. A 128-bit pattern produced by AKA that is used for
7 authentication of the R-UIM.

8 **UIM.** User Identity Module.

9 **UIM_ID.** A 32-bit electronic identification (ID) number that is unique to the R-UIM. The
10 mobile station uses UIM_ID in place of ESN, with the exception of the ESN_ME information
11 record, when configured with a R-UIM which indicates that UIM ID is to be used (see [40]).

12 **UMAC.** A 32-bit output of the UMAC algorithm computed by UIM based on MAC-I.

13 **Unassured Mode.** Mode of delivery that does not guarantee that a PDU will be delivered to
14 the peer. The LAC entity at the receiver does not acknowledge a PDU sent in unassured
15 mode.

16 **Unique Challenge-Response Procedure.** An exchange of information between a mobile
17 station and a base station for the purpose of confirming the mobile station's identity. The
18 procedure is initiated by the base station and is characterized by the use of a challenge-
19 specific random number (i.e., RANDU) instead of the random variable broadcast globally
20 (RAND).

21 **Unique Random Variable (RANDU).** A 24-bit random number generated by the base
22 station in support of the Unique Challenge-Response procedure.

23 **Universal Coordinated Time (UTC).** An internationally agreed-upon time scale
24 maintained by the Bureau International de l'Heure (BIH) used as the time reference by
25 nearly all commonly available time and frequency distribution systems i.e., WWV, WWVH,
26 LORAN-C, Transit, Omega, and GPS.

27 **User Zone.** An area within which CDMA Tiered Services may be provided. It may
28 correspond to an RF coverage area, or it may be established independent of RF topology.
29 User Zones are classified as broadcast versus mobile-specific, and as active versus passive.
30 See Broadcast User Zone, Mobile-Specific User Zone, Active User Zone, and Passive User
31 Zone. See also Registration Zone, with which it should not be confused.

32 **User Zone Registration.** An autonomous registration method in which the mobile station
33 registers when it selects an active user zone while in the Idle State. See also Zone-Based
34 Registration, with which it should not be confused.

35 **Upper Layers.** General reference to Layer 3 and the layers above it.

36 **User Zone Exit parameter.** A parameter used by the mobile station to determine if it
37 should exit a User Zone.

38 **UTC.** Universal Temps Coordiné. See Universal Coordinated Time.

1 **Voice Privacy.** The process by which user voice transmitted over a CDMA Traffic Channel
2 is afforded a modest degree of protection against eavesdropping over the air.

3 **Walsh Chip.** See [2].

4 **Walsh Function.** One of 2^N time orthogonal binary functions (note that the functions are
5 orthogonal after mapping '0' to 1 and '1' to -1).

6 **Wireless Local Loop.** Wireless alternative access mechanism to provide standard
7 telecommunication services using standard wireline terminal via a radio link between the
8 network and customer premises equipment.

9 **WLL.** See Wireless Local Loop.

10 **Zone-Based Registration.** An autonomous registration method in which the mobile
11 station registers whenever it enters a zone that is not in the mobile station's zone list. See
12 also User Zone Registration, with which it should not be confused.

13 **Zone Timer.** A timer used by the mobile station to remove outdated entries from its list of
14 zones in which it has previously registered.

15 **μs.** Microsecond (10^{-6} second).

16 1.1.2 Numeric Information

17 Numeric information is used to describe the operation of the mobile station. The following
18 subscripts are used to clarify the use of the numeric information:

- 19 • "s" indicates a value stored in a mobile station's temporary memory.
- 20 • "sv" indicates a stored value that varies as a mobile station processes various tasks.
- 21 • "sl" indicates the stored limits on values that vary.
- 22 • "r" indicates a value received by a mobile station over a CDMA Forward Channel.
- 23 • "p" indicates a value set in a mobile station's permanent security and identification
24 memory.
- 25 • "s-p" indicates a value stored in a mobile station's semi-permanent security and
26 identification memory.

27 1.1.2.1 Reserved

28 1.1.2.2 CDMA Numeric Information

29 The following are internal values that are stored by the mobile station in temporary
30 memory that are not sent over the air. See Annex F for values stored by the mobile station
31 in permanent and semi-permanent memory.

32 **1XRL_FREQ_OFFSET_s** – Frequency offset of the 1X reverse link.

33 **A41_SYS_PAR_MSG_SEQ_s** – ANSI-41 System Parameters Message sequence number.

34 **ACC_CHAN_s** – Number of Access Channels supported by the current Paging Channel.

35 **ACC_ENT_HO_ORDER_s** – Access entry handoff permitted from the *Mobile Station Order and*
36 *Message Processing Operation of the Mobile Station Idle State.*

- 1 **ACCESS_ENTRY_HO_s** – Idle handoff permitted when entering the *System Access State*.
- 2 **ACCESS_HO_s** – Handoff permitted after performing an access attempt while the mobile
3 station is in the *System Access State*.
- 4 **ACCESS_HO_ALLOWED_s** – Handoff permitted to the corresponding neighbor base station
5 while in the *System Access State*.
- 6 **ACCESS_HO_LIST** – List of pilots to which access handoff or access probe handoff is
7 permitted.
- 8 **ACC_HO_LIST_UPD_s** – Access handoff list update permitted indicator.
- 9 **ACCESS_HO_MSG_RSP_s** – Access handoff permitted in the *System Access State* between
10 the time that the mobile station receives a message and responds to that message.
- 11 **ACCESS_PROBE_HO_s** – Access probe handoff permitted during an access attempt in the
12 *Mobile Station Origination Attempt Substate* or the *Page Response Substate*.
- 13 **ACC_MSG_SEQ_s** – Last received *Access Parameters Message* or *Enhanced Access*
14 *Parameters Message* sequence number.
- 15 **ACC_PROBE_HO_OTHER_MSG_s** – Access probe handoff permitted for Access Channel
16 messages other than the *Origination Message*, *Reconnect Message*, and the *Page Response*
17 *Message*.
- 18 **ACCT_INCL_EMG_s** – Access Control based on Call Type (ACCT) applies to emergency calls
19 indicator.
- 20 **ACCT_SO_GRP_LIST** – List of service option groups that have Access Control based on Call
21 Type (ACCT) enabled.
- 22 **ACCT_SO_LIST** – List of individual service options that have Access Control based on Call
23 Type (ACCT) enabled.
- 24 **ACH_ACC_TMO_s** – Access Channel acknowledgment timeout, in units of 80 ms.
- 25 **ACK_WAITING_s[i]** – Acknowledgment status indicator for message sequence number i. Set
26 to YES if an acknowledgment is pending for the message; otherwise, set to NO.
- 27 **ADD_INTERCEPT_s** – The intercept in the inequality criterion for adding a pilot to the Active
28 Set.
- 29 **ADD_PLCM_FOR_FCH_39_s** – The 39 least significant bits of the additional Public Long
30 Code Mask for the forward Fundamental Channel.
- 31 **ADD_PLCM_FOR_FCH_TYPE_s** – Additional Public Long Code Mask for forward
32 Fundamental Channel type indicator.
- 33 **AGE_s** – Neighbor list age. For each pilot in the Neighbor Set, the mobile station increments
34 this counter each time a *Neighbor List Update Message* or an *Extended Neighbor List Update*
35 *Message* is received. When AGE_s exceeds NGBHR_MAX_AGE, the pilot is deleted from the
36 Neighbor Set.

- 1 **ALIGN_TIMING_USED_s** – Indicates whether the mobile station aligns the times of visits
 2 away from the Serving Frequency, as requested by the base station, in the periodic search
 3 procedures.
- 4 **ASSIGNED_QPAGECH_s** – Assigned Quick Paging Channel number.
- 5 **AUTH_s** – Current authentication mode.
- 6 **AUTO_FCSO_ALLOWED_s** – Base station support of autonomous *Fast Call Setup Order*
 7 indicator.
- 8 **AUTO_MSG_INTERVAL** – Autonomous message interval.
- 9 **AUTO_MSG_SUPPORTED** – Autonomous message supported indicator.
- 10 **BAD_FRAMES_s** – Forward Fundamental Channel bad frames count. The number of
 11 received bad Forward Fundamental Channel frames.
- 12 **BAND_SUBCLASS_IND_REC** – Band subclass indicator record. This record specifies the
 13 band subclasses that the base station requires the mobile station to report whether it
 14 supports.
- 15 **BASE_CLASS_s** – Base station class of the current base station.
- 16 **BASE_ID_s** – Base station identification of the current base station.
- 17 **BASE_LAT_s** – Latitude of the current base station, in units of 0.25 seconds.
- 18 **BASE_LONG_s** – Longitude of the current base station, in units of 0.25 seconds.
- 19 **BCMC_FLOW_LIST_s[i]** – BCMC Flow Information. This is an array that contains
 20 information corresponding to each BCMC flow being transmitted by the base station in this
 21 sector:
- 22 • **BCMC_FLOW_ID** - BCMC flow identifier.
 - 23 • **REGISTRATION_REQ_FLAG** – Registration required flag.
 - 24 • **AUTH_SIGNATURE_REQ_IND** – Authorization signature required indication.
 - 25 • **BCMC_FLOW_ON_TRAFFIC_IND** – BCMC flow on traffic channel supported
 26 indicator.
 - 27 • **BCMC_FLOW_ON_IND** – BCMC flow On indicator.
 - 28 • **LPM_INFO[j]** - For each **BCMC_FLOW_ID**, one or more Logical-to-Physical Mapping
 29 entries:
 - 30 - **FSCH_ID** - Forward Broadcast Supplemental Channel identifier.
 - 31 - **TDM_USED_IND** - TDM used indicator.
 - 32 - **TDM_MASK** - TDM mask.

- 1 - TDM_SUPER_PERIOD_MASK - TDM super period mask.
- 2 - TDM_MEGA_PERIOD_MASK - TDM mega period mask.
- 3 - BSR_ID - BCMC Service Reference identifier.
- 4 - NGHBR_INFO[k] - For each Logical-to-Physical Mapping entries, information on
- 5 one or more neighbor base stations:
- 6 + NGHBR_PN - Neighbor pilot PN sequence offset index.
- 7 + NGHBR_BCMC_CONFIG - Neighbor BCMC Configuration.
- 8 + NGHBR_FSCH_BAND_CLASS - Neighbor band class of the Forward
- 9 Broadcast Supplemental Channel.
- 10 + NGHBR_FSCH_CDMA_FREQ - Neighbor Frequency assignment of the
- 11 Forward Broadcast Supplemental Channel.
- 12 + NGHBR_FSCH_CODE_CHAN - Neighbor Forward Broadcast Supplemental
- 13 Channel Code Channel Index.
- 14 + NGHBR_FSCH_PLCM - Neighbor Public Long Code Mask of the Forward
- 15 Broadcast Supplemental Channel.
- 16 + NGHBR_FSCH_MUX_OPTION - Neighbor Multiplex Option of the Forward
- 17 Broadcast Supplemental Channel.
- 18 + NGHBR_FSCH_RC - Neighbor Radio configuration of the Forward Broadcast
- 19 Supplemental Channel.
- 20 + NGHBR_FSCH_CODING - Neighbor Coding Type of the Forward Broadcast
- 21 Supplemental Channel.
- 22 + NGHBR_FSCH_OUTERCODE_RATE - Neighbor outer code rate of the
- 23 Forward Broadcast Supplemental Channel.
- 24 + NGHBR_FSCH_OUTERCODE_OFFSET - Neighbor outer coding buffer offset
- 25 of the Forward Broadcast Supplemental Channel.
- 26 + NGHBR_FSCH_NUM_BITS_IDX - Neighbor number of information bits index
- 27 of the Forward Broadcast Supplemental Channel.
- 28 + NGHBR_FSCH_FRAME_40_USED - Neighbor Forward Broadcast
- 29 Supplemental Channel 40ms frame used indicator.
- 30 + NGHBR_FSCH_FRAME_80_USED - Neighbor Forward Broadcast
- 31 Supplemental Channel 80ms frame used indicator.

- 1 **BCMC_RETRY_DELAY_LISTs[j]** – BCMC Retry Delay List. This is an array that contains
 2 retry time corresponding to each BCMC flow rejected with BCMC Reason indicating
 3 **RETRY_LATER**:
- 4 • **BCMC_FLOW_ID** - BCMC flow identifier.
 - 5 • **RETRY_DELAY** – Retry time for this BCMC flow.
- 6 **BEGIN_PREAMBLE_s** – A stored variable in the mobile station that contains the size of the
 7 preamble that shall be transmitted on a Reverse Supplemental Code Channel at the
 8 beginning of a Reverse Supplemental Code Channel transmission.
- 9 **BKOFF_s** – Access Channel probe sequence backoff range.
- 10 **BRAT_s** – Data rate of the Primary Broadcast Control Channel.
- 11 **BSPM_MSG_SEQ_s** – *BCMC Service Parameters Message* sequence number.
- 12 **BSPM_WAIT_TIME** – The maximum duration the mobile station waits to receive a BCMC
 13 Service Parameters Message after sending a Registration Message requesting a BCMC flow.
- 14 **BYPASS_ALERT_ANSWER_s** – Mobile station termination bypass indicator. This is set to ‘1’
 15 if the mobile station is to bypass the *Waiting for Order Substate* and the *Waiting for Mobile*
 16 *Station Answer Substate*, and proceed directly to the *Conversation Substate* when Layer 3
 17 receives a *forward dedicated channel-acquired* indication from Layer 2.
- 18 **CAND_BAND_CLASS_REC** – Candidate band class record. This record specifies the band
 19 classes that the base station requires the mobile station to report whether it supports.
- 20 **CCSH_ENCODER_ACTION_TIME_s** - Specifies the time at which Code Combining Soft
 21 Handoff Turbo Encoder swapping takes effect.
- 22 **CDMABAND_s**. CDMA band class. The CDMA band class currently used by the mobile
 23 station.
- 24 **CDMACH_s** – CDMA Channel number. The CDMA Channel number currently used by the
 25 mobile station.
- 26 **CDMA_OFF_TIME_REP_SUP_IND_s** – CDMA off time report supported indicator.
- 27 **CDMA_OFF_TIME_REP_THRESHOLD_s** – CDMA off time report threshold.
- 28 **CF_CDMABAND_s** – Candidate Frequency CDMA band class. The CDMA band class
 29 specified in the *Candidate Frequency Search Request Message*.
- 30 **CF_CDMACH_s** – Candidate Frequency CDMA Channel number. The CDMA Channel
 31 number specified in the *Candidate Frequency Search Request Message*.
- 32 **CF_PILOT_INC_s** – PILOT_INC to be used by the mobile station after an inter-frequency
 33 hard handoff to the CDMA Candidate Frequency is successfully completed.
- 34 **CF_SEARCH_PRIORITY_INCL_s** – Candidate Frequency neighbor pilots’ search priority
 35 included indicator.
- 36 **CF_SRCH_OFFSET_INCL_s** – Candidate Frequency neighbor pilot search window offset
 37 included indicator.

- 1 **CF_SRCH_WIN_NGHR_INCL_s** – Candidate Frequency neighbor pilots’ search window
2 included indicator.
- 3 **CF_SRCH_WIN_N_s** – Search window size for the Candidate Frequency Search Set.
- 4 **CF_SRCH_WIN_R_s** – Search window size to be used for the Remaining Set after an inter-
5 frequency hard handoff to the CDMA Candidate Frequency is successfully completed.
- 6 **CF_T_ADD_s** – Pilot detection threshold to be used on the CDMA Candidate Frequency. The
7 stored value is a positive value in units of 0.5 dB.
- 8 **CH_IND_s** – A two-bit physical channel indicator, based on the currently established
9 physical channels. The least significant bit denotes the Fundamental Channel, and the
10 most significant bit denotes the Dedicated Control Channel.
- 11 **CHAN_LST_MSG_SEQ_s** – *CDMA Channel List Message* sequence number.
- 12 **CHM_SUPPORTED_s** – Indicates whether the base station supports Control Hold Mode
13 operation.
- 14 **CODE_CHAN_LIST** – Code Channel List. A descriptive structure used to manage the
15 Forward Fundamental Channel, and Forward Supplemental Code Channels, if any,
16 associated with the mobile station’s Active Set.
- 17 **COMPLETE_PUF_FRAME_s** – Number of power control groups required to make the PUF
18 probe an integer number of frames.
- 19 **COMPLETE_SEARCH_s** – Flag to indicate if the mobile station is to complete the search of
20 the Candidate Frequency Search Set after it has determined that the inter-frequency
21 handoff attempt to the CDMA Candidate Frequency is unsuccessful.
- 22 **CONFIG_MSG_SEQ_s** – Current message sequence number for the *System Parameters*
23 *Message*, *Neighbor List Message*, *Extended Neighbor List Message*, *General Neighbor List*
24 *Message*, *CDMA Channel List Message*, *Extended System Parameters Message*, *Global*
25 *Service Redirection Message*, *Private Neighbor List Message*, *User Zone Identification*
26 *Message*, *Extended CDMA Channel List Message*, *Extended Global Service Redirection*
27 *Message*, *MC-RR Parameters Message*, *ANSI-41 System Parameters Message*.
- 28 **COUNTER_ENABLED_s** – Timer-based registration indicator. Set to YES if timer-based
29 registration is enabled; otherwise, set to NO.
- 30 **C_SIG_ENCRYPT_MODE_s** – Common Channel signaling message encryption mode.
- 31 **CS_SUPPORTED_s** – Base station Concurrent Services supported indicator. This 1-bit field
32 is set to ‘1’ if the base station supports concurrent connection of at least two services that
33 use either Primary or Secondary traffic type.
- 34 **CURR_ACC_MSG_SEQ** – Current *Access Parameters Message* or *Enhanced Access*
35 *Parameters Message* sequence number.
- 36 **CURRENT_ACTIVE_PILOT_s** – Identifies the current pilot in the Active Set during an access
37 attempt.
- 38 **CURRENT_PUF_PROBE_s** – Number of the next PUF probe to be transmitted within the PUF
39 attempt.

- 1 **DAYLT_s** – Daylight Savings Time indicator.
- 2 **DCCH_BAD_FRAMES_s** – Forward Dedicated Control Channel bad frames count. The
3 number of received bad Forward Dedicated Control Channel frames.
- 4 **DCCH_TOT_FRAMES_s** – Total Forward Dedicated Control Channel frames received. The
5 total number of received Forward Dedicated Control Channel frames, counted for Forward
6 Traffic Channel power control.
- 7 **DECORR** – Hashing function input used to decorrelate hashing function applications for
8 the same mobile station.
- 9 **DEFAULT_CONFIG_s** – Mobile station current default configuration.
- 10 **DELETE_FOR_TMSI_s** – A storage variable in the mobile station that indicates whether the
11 mobile station should delete its current TMSI if the TMSI was assigned in a different TMSI
12 zone.
- 13 **DIFF_RX_PWR_THRESH_s** – Threshold for the difference between the received power on the
14 Serving Frequency and the received power on the CDMA Candidate Frequency for the
15 mobile station to search for pilots on the CDMA Candidate Frequency.
- 16 **DIRECT_CH_ASSIGN_RECOVER_IND_s** – Direct Channel Assignment Recover Indicator.
- 17 **DISTANCE** – Distance from registered base station to current base station, used for
18 distance-based registration.
- 19 **DROP_INTERCEPT_s** – The intercept in the inequality criterion for dropping a pilot from the
20 Active Set.
- 21 **D_SIG_ENCRYPT_MODE_s** – Dedicated Channel signaling message encryption mode.
- 22 **EACH_ACC_TMO_s** – Enhanced Access Channel acknowledgment timeout, in units of 20
23 ms.
- 24 **EACH_SLOT_s** – See [2].
- 25 **EACH_SLOT_OFFSET1_s** – See [2].
- 26 **EACH_SLOT_OFFSET2_s** – See [2].
- 27 **EARLY_RL_TRANSMIT_IND_s** – The early reverse link transmission flag indicates whether,
28 upon channel assignment, the mobile station is allowed to enable its transmitter and
29 transmit the preamble prior to receiving sufficient energy on the forward link.
- 30 **EC_IO_THRESH_s** – Pilot E_c/I_0 threshold used for system reselection.
- 31 **EC_THRESH_s** – Pilot power threshold used for system reselection.
- 32 **ENC_KEY_SIZE_s** – The key size used for signaling and user information encryption on
33 common channel and dedicated channel.

- 1 **ENC_KEY[j]** – An array of encryption keys for signaling and user information encryption on
 2 common channel and dedicated channel, where *j* is the key identifier that ranges from ‘00’
 3 to ‘11’.
- 4 **SSEQ⁵** – An 8-bit temporary variable for encryption/decryption and message integrity.
- 5 **ENCRYPT_MODE_s** – Current message encryption mode.
- 6 **EXCL_P_REV_MS** – Exclude from redirection by MOB_P_REV indicator.
- 7 **EXT_CHAN_LST_s** – *Extended CDMA Channel List Message* sent indicator.
- 8 **EXT_CHAN_LST_MSG_SEQ_s** – *Extended CDMA Channel List Message* sequence number.
- 9 **EXT_NGHR_LST_MSG_SEQ_s** – *Extended Neighbor List Message* sequence number.
- 10 **EXT_PREF_MSID_TYPE_s** – Extended preferred mobile station identifier field type.
- 11 **RX_EXT_SSEQ[i][j]⁶** – An array of 32-bit crypto-sync counters used for encryption and
 12 message integrity, where *i* = 0 is for unassured messages and *i* = 1 is for assured messages,
 13 where *j* is the key identifier that ranges from ‘00’ to ‘11’.
- 14 **TX_EXT_SSEQ[i][j]⁷** – An array of 32-bit crypto-sync counters used for encryption and
 15 message integrity, where *i* = 0 is for unassured messages and *i* = 1 is for assured messages,
 16 where *j* is the key identifier that ranges from ‘00’ to ‘11’.
- 17 **EXT_SSEQ⁸** – A 32-bit temporary variable for encryption and message integrity.
- 18 **INT_KEY[j]** – An array of 128-bit integrity keys for message integrity, where *j* is the key
 19 identifier that ranges from ‘00’ to ‘11’.
- 20 **KEY_ID** – A 2-bit index of INT_KEY[.], ENC_KEY[.], TX_EXT_SSEQ[.][.], and
 21 RX_EXT_SSEQ[.][.] that are “in use”. The values ‘00’ to ‘01’ are used to index 2G keys and
 22 security sequence numbers. The values ‘10’ to ‘11’ are used to index 3G keys and security
 23 sequence numbers.
- 24 **EXT_GLOBAL_REDIRECT_s** – *Extended Global Service Redirection Message* sent indicator.
- 25 **EXT_GLOB_SERV_REDIR_MSG_SEQ_s** – *Extended Global Service Redirection Message*
 26 sequence number.
- 27 **EXT_SYS_PARAMETER_s** – *Extended System Parameters Message* sent indicator.
- 28 **EXT_SYS_PAR_MSG_SEQ_s** – *Extended System Parameters Message* sequence number.

⁵ Formerly called ENC_SEQ.

⁶ Formerly called EXT_DECRYPT_SEQ[i].

⁷ Formerly called EXT_ENCRYPT_SEQ[i].

⁸ Formerly called EXT_ENC_SEQ[i].

1 **FSCH_LIST_s[i]** – Forward Broadcast Supplemental Channel information. This is an array
 2 that contains information corresponding to each Forward Supplemental Channel
 3 transmitted by the base station:

- 4 • FSCH_ID - Forward Broadcast Supplemental Channel identifier.
- 5 • FSCH_BAND_CLASS - Band class of the Forward Broadcast Supplemental Channel.
- 6 • FSCH_FREQ - Frequency assignment of the Forward Broadcast Supplemental
 7 Channel.
- 8 • FSCH_CODE_CHAN - Code Channel index of the Forward Broadcast Supplemental
 9 Channel.
- 10 • FSCH_PLCM – Public Long Code Mask of the Forward Broadcast Supplemental
 11 Channel
- 12 • FSCH_MUX_OPTION - Multiplex Option of the Forward Broadcast Supplemental
 13 Channel
- 14 • FSCH_RC - Radio configuration of the Forward Broadcast Supplemental Channel.
- 15 • FSCH_CODING - Coding Type of the Forward Broadcast Supplemental Channel.
- 16 • FSCH_OUTERCODE_RATE - Outer code rate of the Forward Broadcast
 17 Supplemental Channel.
- 18 • FSCH_OUTERCODE_OFFSET - Outer coding buffer offset of the Forward Broadcast
 19 Supplemental Channel.
- 20 • FSCH_NUM_BITS_IDX - Number of information bits index of the Forward Broadcast
 21 Supplemental Channel.
- 22 • FSCH_FRAME_40_USED - Forward Broadcast Supplemental Channel 40ms frame
 23 used indicator.
- 24 • FSCH_FRAME_80_USED - Forward Broadcast Supplemental Channel 80ms frame
 25 used indicator.
- 26 • TDM_STRUCTURE_IND - Forward Broadcast Supplemental Channel TDM structure
 27 used indicator.
- 28 • TDM_SLOT_LENGTH - Forward Broadcast Supplemental Channel TDM slot length
- 29 • TDM_SUPER_PERIOD_MASK_LEN - TDM super period mask length indicator.
- 30 • TDM_MEGA_PERIOD_MASK_LEN - TDM mega period mask length indicator.

31 **FCCCH_s** – Current Forward Common Control Channel number.

- 1 **FIRST_ACTIVE_PILOT_s** – While the mobile station is in the *System Access State*, identifies
2 the pilot to which the first access probe was transmitted, upon entering the *System Access*
3 *State*.
- 4 **FIXED_NUM_PREAMBLE_s** – Traffic Channel preamble length for fixed preamble
5 transmission.
- 6 **FIXED_PREAMBLE_TRANSMIT_IND_s** – The fixed preamble transmission flag indicates
7 whether the mobile station is allowed to enter the *Traffic Channel Substate* of the *Mobile*
8 *Station Control on the Traffic Channel State*, after sending the number of preambles specified
9 in *Extended Channel Assignment Message*.
- 10 **FOR_ACKCH_ASSIGNED_s** – Forward Acknowledgment Channel assignment
11 indicator.
- 12 **FOR_ACKCH_COMB_SEL_s** – Forward Acknowledgment Channel combining method
13 selector.
- 14 **FOR_ACKCH_MODE_s** – Forward Acknowledgment Channel Mode.
- 15 **FOR_ACKCH_WALSH_INDEX_s** – Forward Acknowledgment Channel Walsh Code index.
- 16 **FOR_ACKSCH_INDEX_s** – Forward Acknowledgment Channel subchannel index.
- 17 **FOR_CPCCH_RATE_s** – Forward Common Power Control Channel Rate.
- 18 **FOR_DCCH_MUX_OPTION_s** – Forward Dedicated Control Channel Multiplex Option.
- 19 **FOR_DURATION_s** – A stored variable in the mobile station that contains the duration (in
20 units of 80 ms) of a forward Supplemental Code Channel transmission that begins at time
21 FOR_START_TIME_s.
- 22 **FOR_FCH_MUX_OPTION_s** – Forward Fundamental Channel Multiplex Option.
- 23 **FOR_FCH_RC_s** – Forward Fundamental Channel Radio Configuration.
- 24 **FOR_FRAME_40_MAX_RATE_s** – The maximum data rate for the mobile station's
25 transmission at 40 ms frame length on the Forward Supplemental Channel.
- 26 **FOR_FRAME_80_MAX_RATE_s** – The maximum data rate for the mobile station's
27 transmission at 80 ms frame length on the Forward Supplemental Channel.
- 28 **FOR_GCH_ASSIGNED_s** – Forward Grant Channel assigned indicator.
- 29 **FOR_GCH_WALSH_INDEX_s** – Forward Grant Channel Walsh Index. The Walsh index of
30 the Forward Grant Channel assigned to a mobile station.
- 31 **FOR_LINKED_HDM_SEQ_s** – Storage variable containing the most recent forward sequence
32 number of the *General Handoff Direction Message* to which a *Supplemental Channel*
33 *Assignment Message* forward assignment was linked.
- 34 **FOR_NID_REG_s** – Foreign NID roamer autonomous registration enable.
- 35 **FOR_RCCH_ASSIGNED_s** – Assigned Forward Rate Control Channel. An on or off indicator
36 used to determine if Forward Rate Control Channel is assigned or not.
- 37 **FOR_RCCH_MODE_s** – Forward Rate Control Channel mode.

- 1 **FOR_RCCH_REPETITION_s** – Forward Rate Control Channel Subchannel repetition factor.
- 2 **FOR_RCCH_WALSH_INDEX_s** – Forward Rate Control Channel Walsh code.
- 3 **FOR_RCSCH_INDEX_s** – Forward Rate Control Channel subchannel index.
- 4 **FOR_PDCH_SUPPORTED_s** – Forward Packet Data Channel supported indicator.
- 5 **FOR_PDCH_INCL_s** – Forward Packet Data Channel assigned indicator for each pilot in the
- 6 active set.
- 7 **FOR_RC_s** – Forward Channel Radio Configuration.
- 8 **FOR_SCH_CC_INDEX_s** – Supplemental code channel index used on the Supplemental
- 9 Channel.
- 10 **FOR_SCH_DURATION_s** – A stored variable in the mobile station, which contains the
- 11 duration of a forward Supplemental Channel transmission, which begins at time
- 12 FOR_SCH_START_TIME_s.
- 13 **FOR_SCH_FRAME_LENGTH_s** – The Forward Supplemental Channel frame length.
- 14 **FOR_SCH_RATE_s** – The rate of the Forward Supplemental Channel.
- 15 **FOR_SCH_START_TIME_s** – A stored variable in the mobile station which contains the
- 16 System Time, in units of time specified by START_TIME_UNIT_s, (modulo 32) at which the
- 17 mobile station shall start (or resume) processing Forward Supplemental Channels.
- 18 **FOR_SID_REG_s** – Foreign SID roamer autonomous registration enable.
- 19 **FOR_START_TIME_s** – A stored variable in the mobile station that contains the System
- 20 Time, in units of 80 ms, (modulo 64) at which the mobile station shall start (or resume)
- 21 processing Forward Supplemental Code Channels.
- 22 **FPC_DCCH_CURR_SETPT_s** – Current power control subchannel outer loop setpoint for the
- 23 Forward Dedicated Control Channel.
- 24 **FPC_DCCH_FER_s** – Target frame error rate for the Forward Dedicated Control Channel.
- 25 **FPC_DCCH_MAX_SETPT_s** – Maximum value of the power control subchannel outer loop
- 26 setpoint for the Forward Dedicated Control Channel.
- 27 **FPC_DCCH_MIN_SETPT_s** – Minimum value of the power control subchannel outer loop
- 28 setpoint for the Forward Dedicated Control Channel.
- 29 **FPC_DELTA_SCH_SETPT_s** – The difference between the Fundamental Channel current
- 30 power control subchannel outer loop setpoint and the Supplemental Channel current
- 31 power control subchannel outer loop setpoint.
- 32 **FPC_DELTA_SETPT_s** – The difference between the Fundamental Channel current power
- 33 control subchannel outer loop setpoint and the Dedicated Control Channel current power
- 34 control subchannel outer loop setpoint.
- 35 **FPC_FCH_CURR_SETPT_s** – Current power control subchannel outer loop setpoint for the
- 36 Forward Fundamental Channel.
- 37 **FPC_FCH_FER_s** – Target frame error rate for the Forward Fundamental Channel.

- 1 **FPC_FCH_MAX_SETPT_s** – Maximum value of the power control subchannel outer loop
2 setpoint for the Forward Fundamental Channel.
- 3 **FPC_FCH_MIN_SETPT_s** – Minimum value of the power control subchannel outer loop
4 setpoint for the Forward Fundamental Channel.
- 5 **FPC_MODE_s** – Forward power control operating mode.
- 6 **FPC_MODE_NO_SCH_s** – Forward power control operating mode except during the forward
7 Supplemental Channel assignment interval.
- 8 **FPC_MODE_SCH_s** – Forward power control operating mode during the forward
9 Supplemental Channel assignment interval.
- 10 **FPC_PRI_CHAN_s** – Primary power control subchannel measured channel.
- 11 **FPC_SEC_CHAN_s** – Index of Forward Supplemental Channel to be measured by the
12 secondary power control subchannel.
- 13 **FPC_SCH_CURR_SETPT_s[i]** – Current power control subchannel outer loop setpoint for
14 Forward Supplemental Channel i.
- 15 **FPC_SCH_FER_s[i]** – Target frame error rate for Forward Supplemental Channel i.
- 16 **FPC_SCH_MAX_SETPT_s[i]** – Maximum value of the power control subchannel outer loop
17 setpoint for Forward Supplemental Channel i.
- 18 **FPC_SCH_MIN_SETPT_s[i]** – Minimum value of the power control subchannel outer loop
19 setpoint for Forward Supplemental Channel i.
- 20 **FPC_SETPT_THRESH_s** – Power control subchannel outer loop setpoint report threshold for
21 the Dedicated Control Channel.
- 22 **FPC_SETPT_THRESH_SCH_s** – Power control subchannel outer loop setpoint report
23 threshold for the Supplemental Channel.
- 24 **FRAME_OFFSET_s** – Current Traffic Channel frame offset, in units of 1.25 ms.
- 25 **FULL_BSPM_IND** – Indicates whether mobile station had the complete BSPM information
26 at the time it received the last Full or Differential *BCMC Service Parameters Message*.
- 27 **FUNDICATED_BCMC_IND_s** – Broadcast-Multicast services on Fundicated Channel
28 Indicator.
- 29 **GEN_NGHBR_LST_MSG_SEQ_s** – General Neighbor List Message sequence number.
- 30 **GLOBAL_REDIRECT_s** – *Global Service Redirection Message* sent indicator.
- 31 **GLOB_SERV_REDIR_MSG_SEQ_s** – Global Service Redirection Message sequence number.
- 32 **GRANTED_MODE_s** – Mobile station current granted mode.
- 33 **HASH_KEY** – Hashing function input that determines the return value. Derived from
34 IMSI_O.
- 35 **HDM_SEQ_s** – Last received *Extended Handoff Direction Message*, *General Handoff Direction*
36 *Message*, or *Universal Handoff Direction Message* sequence number.

- 1 **HOME_REG_s** – Home (non-roaming) autonomous registration enable.
- 2 **IGNORE_ESCAM_s** – Identifies whether a mobile station will process the reverse
3 supplemental channel assignment portion of the subsequent *Supplemental Channel*
4 *Assignment Message* or *Reverse Supplemental Channel Assignment Mini Message*.
- 5 **IGNORE_QPCH_s** – Ignore QPCH indicators flag. Indicates whether the mobile station is to
6 ignore its assigned paging indicators on the QPCH while operating in the reduced slot cycle
7 mode if the reduced slot cycle index is -3 or -4.
- 8 **IGNORE_SCAM_s** – Identifies whether a mobile station will process the reverse
9 supplemental code channel assignment portion of the subsequent *Supplemental Channel*
10 *Assignment Message*.
- 11 **IMSI_10_s** – The least significant digit of MNC when the MNC is 3-digit.
- 12 **IMSI_11_12_s** – The 11th and 12th digits of the IMSI used for address matching.
- 13 **IMSI_O_ADDR_NUM_s** – The number of digits in the NMSI of the Operational IMSI (IMSI_O)
14 minus four.
- 15 **IMSI_O_S_s** – The last 10-digits of Operational IMSI (IMSI_O).
- 16 **IMSI_O_11_12_s** – The 11th and 12th digits of the Operational IMSI (IMSI_O).
- 17 **INIT_PWR_s** – Initial power offset for Access Channel probes.
- 18 **LC_STATE_s** – Long code state obtained from the *Sync Channel Message*.
- 19 **LOGICAL_TO_PHYSICAL_MAPPING_TABLE** – This table contains the logical to physical
20 mapping for signaling and user traffic.
- 21 **LP_SEC_s** – Leap seconds count (offset of CDMA system time from UTC).
- 22 **LTM_OFF_s** – Local time offset from UTC, in units of 30 minutes.
- 23 **MAX_ADD_SERV_INSTANCE_s** – Maximum number of additional service reference
24 identifiers allowed in origination.
- 25 **MAX_CAP_SZ_s** – Maximum number of Access Channel frames in an Access Channel
26 message capsule, less 3.
- 27 **MAX_NUM_ALT_SO_s** – The maximum number of alternative service option numbers that
28 the mobile station is allowed to include in the *Origination Message* or in the *Page Response*
29 *Message*.
- 30 **MAX_NUM_PROBE_HO_s** – The maximum number of times that a mobile station is
31 permitted to perform an access probe handoff.
- 32 **MAX_PWR_PUF_s** – Maximum number of PUF probes to be transmitted at maximum mobile
33 station output power during a PUF attempt.
- 34 **MAX_REQ_SEQ_s** – Maximum number of access probe sequences for an Access Channel or
35 Enhanced Access Channel request.
- 36 **MAX_RER_PILOT_LIST_SIZE_s** – Maximum number of pilots to be maintained in the radio
37 environment report pilot list while in the radio environment reporting mode.

- 1 **MAX_RSP_SEQ_s** – Maximum number of access probe sequences for an Access Channel or
 2 Enhanced Access Channel response.
- 3 **MAX_SLOT_CYCLE_INDEX_s** – Maximum value of the slot cycle index allowed by the
 4 current base station. This parameter can take values between 0 and 7, inclusive.
- 5 **MCC_s** – The Mobile Country Code used for address matching.
- 6 **MCC_O_s** – The Mobile Country Code of IMSI_O.
- 7 **MC_RR_PAR_MSG_SEQ_s** – *MC-RR Parameters Message* sequence number.
- 8 **MIN_PILOT_EC_IO_THRESH_s** – Threshold for total E_c/I_o of pilots in the Serving Frequency
 9 Active Set used in the Periodic Serving Frequency Pilot Report Procedure.
- 10 **MIN_PILOT_PWR_THRESH_s** – Threshold for total E_c of pilots in the Serving Frequency
 11 Active Set used in the Periodic Serving Frequency Pilot Report Procedure.
- 12 **MIN_P_REV_s** – Minimum mobile station protocol revision level required for access to the
 13 CDMA system.
- 14 **MIN_SLOT_CYCLE_INDEX** – Minimum value of the slot cycle index allowed by the current
 15 base station. This parameter can take the values -4 or 0.
- 16 **MIN_TOTAL_PILOT_EC_IO_s** – Total pilot strength threshold for the mobile station to
 17 attempt to demodulate the Forward Traffic Channel on the CDMA Candidate Frequency.
- 18 **MOB_QOS_s** – Indicator of whether the mobile station is allowed to request QoS settings in
 19 the *Origination Message*, *Origination Continuation Message*, or *Enhanced Origination*
 20 *Message*.
- 21 **MOB_TERM_s** – Mobile station termination indicator. Set to ‘1’ if the mobile station will
 22 accept mobile station terminated calls in its current roaming status.
- 23 **MSG_PERSIST_s** – Persistence modifier for Access Channel message and Enhanced Access
 24 data transmissions.
- 25 **MS_LAT_s** – The latitude of the mobile station as estimated by the base station.
- 26 **MS_LOC_TSTAMP_s** – The time corresponding to the estimate of mobile station’s latitude
 27 and longitude.
- 28 **MS_LONG_s** – The longitude of the mobile station as estimated by the base station.
- 29 **MS_INIT_POS_LOC_SUP_IND_s** – Mobile station initiated position location determination
 30 supported indicator.
- 31 **MULT_NIDS_s** – Multiple NID storage indicator. Set to ‘1’ if the mobile station may store
 32 more than one entry in SID_NID_LIST_s for each SID.
- 33 **MULT_SIDS_s** – Multiple SID storage indicator. Set to ‘1’ if the mobile station may store
 34 entries in SID_NID_LIST_s having different SIDs.
- 35 **NDSS_ORIG_s** – NDSS Origination Indicator. Indicator used when the mobile station is
 36 NDSS-redirected while originating a call.

- 1 **NEW_BAND_RECORD** – Record carrying information pertaining to a channel on a new
2 band to which the mobile station has hashed. The record includes the following fields:
- 3 • **NEW_BAND_CLASS** – The new band class.
 - 4 • **NEW_FREQ** – The new frequency in the new band class.
- 5 **NGHBR_BAND_s** – Neighbor band class.
- 6 **NGHBR_CONFIG_s** – Neighbor base station channel allocation configuration.
- 7 **NGHBR_FREQ_s** – Neighbor CDMA channel number.
- 8 **NGHBR_LST_MSG_SEQ_s** – *Neighbor List Message* sequence number.
- 9 **NGHBR_MAX_AGE_s** – Neighbor set maximum age for retention in the set.
- 10 **NGHBR_PN_s** – Neighbor base station Pilot Channel PN sequence offset in units of 64 PN
11 chips.
- 12 **NGHBR_REC** – Record containing information about a neighbor base station (see also
13 **NGHBR_REC_LIST**).
- 14 **NGHBR_REC_LIST** – Neighbor base station record list. A descriptive structure used to
15 manage the base station’s information records about neighbor base stations (see also
16 **NGHBR_REC**).
- 17 **NGHBR_SET_ACCESS_INFO_s** – Neighbor Set access handoff or access probe handoff
18 information included indicator.
- 19 **NGHBR_SET_ENTRY_INFO_s** – Neighbor Set access entry handoff information included
20 indicator.
- 21 **NGHBR_SET_SIZE_s** – Size of the Neighbor Set.
- 22 **NGHBR_TIMING_INCL_s** – Indicates that hopping pilot beacon timing information is
23 included.
- 24 **NGHBR_TX_DURATION_s** – Hopping pilot beacon transmit time duration.
- 25 **NGHBR_TX_OFFSET_s** – Hopping pilot beacon transmit time offset.
- 26 **NGHBR_TX_PERIOD_s** – Hopping pilot beacon transmit time period.
- 27 **NID_s** – Network identification. A network is a subset of the base stations within a wireless
28 system.
- 29 **NOM_PWR_s** – Nominal transmit power offset. A correction factor to be used by mobile
30 stations in the open loop power estimate.
- 31 **NUM_FCCCH_s** – Number of Forward Common Control Channels supported on the current
32 CDMA channel.
- 33 **NUM_PREAMBLE_s** – Traffic Channel preamble length for hard handoff.
- 34 **NUM_QPCH_s** – Number of Quick Paging Channels supported on the current CDMA
35 channel.

- 1 **NUM_REV_CODES_s** – A storage variable in the mobile station that contains the number of
 2 Reverse Supplemental Code Channels that will be utilized in the next Reverse
 3 Supplemental Code Channel transmission beginning at time REV_START_TIME_s. A value
 4 of 0 indicates no Reverse Supplemental Code Channel transmission will be permitted (i.e.,
 5 there is no pending Reverse Supplemental Code Channel transmission).
- 6 **NUM_SOFT_SWITCHING_FRAMES_s** – Number of frames for R-CQICH soft switching. The
 7 duration of the cell switching period, during which the mobile station is to transmit the cell
 8 switch sequence on the R-CQICH channel when it switches between two pilots which are in
 9 different groups.
- 10 **NUM_SOFT_SWITCHING_FRAMES_CHM_s** – Number of frames for R-CQICH soft switching
 11 while in Control Hold. The duration of the cell switching period, during which the mobile
 12 station, while in Control Hold, is to transmit the cell switch sequence on the R-CQICH
 13 channel when it switches between two pilots which are in different groups.
- 14 **NUM_SOFT_SWITCHING_SLOTS_s** – Number of slots per frame for R-CQICH soft switching.
 15 The duration of the cell switching slots within a switching frame, during which the mobile
 16 station is to transmit the cell switch indication by using Walsh cover of target on the R-
 17 CQICH channel when it switches between two pilots which are in different groups.
- 18 **NUM_SOFT_SWITCHING_SLOTS_CHM_s** – Number of slots per frame for R-CQICH soft
 19 switching while in Control Hold. The duration of the cell switching slots within a switching
 20 frame, during which the mobile station, while in Control Hold, is to transmit the cell switch
 21 indication by using Walsh cover of target on the R-CQICH channel when it switches
 22 between two pilots which are in different groups.
- 23 **NUM_SOFTER_SWITCHING_FRAMES_s** – Number of frames for R-CQICH softer switching.
 24 The duration of the cell switching period, during which the mobile station is to transmit the
 25 cell switch sequence on the R-CQICH channel when it switches between two pilots which
 26 are in the same group.
- 27 **NUM_SOFTER_SWITCHING_FRAMES_CHM_s** – Number of frames for R-CQICH softer
 28 switching while in Control Hold. The duration of the cell switching period, during which the
 29 mobile station, while in Control Hold, is to transmit the cell switch sequence on the R-
 30 CQICH channel when it switches between two pilots which are in the same group.
- 31 **NUM_SOFTER_SWITCHING_SLOTS_s** – Number of slots per frame for R-CQICH softer
 32 switching. The duration of the cell switching slots within a switching frame. During this
 33 time the mobile station is to transmit the cell switch indication by using the Walsh cover of
 34 the target sector in the cell switch sequence on the R-CQICH channel when it switches
 35 between two pilots which are in the same group.
- 36 **NUM_SOFTER_SWITCHING_SLOTS_CHM_s** – Number of slots per frame for R-CQICH softer
 37 switching while in Control Hold. The duration of the cell switching slots within a switching
 38 frame. During this time the mobile station, while in Control Hold, is to transmit the cell
 39 switch indication by using the Walsh cover of the target sector in the cell switch sequence
 40 on the R-CQICH channel when it switches between two pilots which are in the same group.
- 41 **NUM_STEP_s** – Number of access probes or enhanced access probes in a single access
 42 probe sequence or enhanced access probe sequence.

- 1 **NUM_SYNC_ID_SUPPORTED** – Number of SYNC_IDs supported by the mobile station.
- 2 **OTHER_REPORTED_LIST** – List of other pilots that have pilot strengths exceeding T_ADD
3 and that are not included in ACCESS_HO_LIST.
- 4 **PACA_s** – PACA call indicator. Set to enabled to indicate that the mobile station is waiting
5 for a priority access channel assignment; otherwise, set to disabled. In Sections 2 and 3,
6 PACA_s = 0 is equivalent to setting PACA_s to disabled and PACA_s = 1 is equivalent to setting
7 PACA_s to enabled.
- 8 **PACA_CANCEL** – PACA call cancel indicator. Set to ‘1’ when the mobile station is directed
9 by the user to cancel the PACA call; otherwise, set to ‘0’.
- 10 **PACA_SID_s** – PACA system identifier. Equal to the SID of the system on which the mobile
11 station originated a PACA call.
- 12 **PACA_TIMEOUT_s** – PACA state timer duration. Specifies how long the mobile station
13 should wait for a *PACA Message* from the base station.
- 14 **PACKET_ZONE_ID_s** – Packet data services zone identifier of the base station.
- 15 **PAGECH_s** – Current CDMA Paging Channel number.
- 16 **PAGED** – Indicator for a page match detected while the mobile station is in the *System*
17 *Access State*.
- 18 **PAGE_CHAN_s** – Number of Paging Channels supported on the current CDMA channel.
- 19 **PAM_SZ_s** – Number of frames in the Access Channel or Enhanced Access Channel
20 preamble, less 1.
- 21 **PARAMETER_REG_s** – Parameter-change registration enable.
- 22 **PDCH_CHM_SUPPORTED_s** – Indicates whether the base station supports PDCH Control
23 Hold Mode operation.
- 24 **PDCH_GROUP_IDENTIFIER_s** – A three-bit Packet Data Channel group identifier. It is used
25 to determine whether the mobile station should use the softer or soft reselection
26 parameters when repointing between pilots in its Active Set (See [3]).
- 27 **PDCH_SOFT_SWITCHING_DELAY_s** – PDCH soft switching delay. The minimum
28 interruption seen by the mobile station when the mobile station is to transmit the cell
29 switch sequence on the R-CQICH channel when it switches between two pilots which are in
30 different groups.
- 31 **PDCH_SOFTSWITCHING_DELAY_s** – PDCH softer switching delay. The minimum
32 interruption seen by the mobile station when the mobile station is to transmit the cell
33 switch sequence on the R-CQICH channel when it switches between two pilots which are in
34 the same group.
- 35 **PERIODIC_SEARCH_s** – Flag to indicate if the mobile station is to perform a periodic search
36 on the Candidate Frequency.
- 37 **PGSLOT** – Value obtained from the hashing function, used to determine the mobile
38 station’s assigned Paging Channel slots.

- 1 **PILOT_ARRIVAL** – Time of occurrence, as measured at the mobile station antenna
2 connector, of the earliest arriving usable multipath component of the pilot. The arrival time
3 is measured relative to the mobile station's time reference.
- 4 **PILOT_INFO_REQ_SUPPORTED_s** – Pilot information request supported indicator.
- 5 **PILOT_GATING_RATE_s** – Reverse pilot gating rate on the Reverse Pilot Channel.
- 6 **PILOT_GATING_USE_RATE** – Reverse pilot gating rate enable indicator. It indicates
7 whether or not the Reverse Pilot Channel is gated.
- 8 **PILOT_INC_s** – Pilot PN sequence offset index increment. The interval between pilots, in
9 units of 64 PN chips, for base stations in a system.
- 10 **PILOT_PN_s** – Pilot Channel PN sequence offset, in units of 64 PN chips, for a base station.
- 11 **PILOT_PN_PHASE** – Calculated Pilot Channel PN phase, in chips, including the PN
12 sequence offset and the arrival time relative to the mobile station's time reference.
- 13 **PILOT_REPORT_s** – Pilot reporting indicator.
- 14 **PLCM_TYPE_s** – Public long code mask type. Indicates the long code mask generation
15 algorithm when Public Long Code Mask is in use. See 2.3.6.
- 16 **POTENTIAL_CDMACH_s** – The CDMA Channel number that could potentially be used by
17 the mobile station.
- 18 **POWER_DOWN_REG_s** – Power down registration enable indicator.
- 19 **POWER_UP_REG_s** – Power up registration enable indicator.
- 20 **PPSMM_PERIOD_s** – The period used in the Periodic Serving Frequency Pilot Report
21 Procedure.
- 22 **PRAT_s** – Data rate of the Paging Channels.
- 23 **P_REV_s** – Protocol revision level supported by a base station.
- 24 **P_REV_IN_USE_s** – Protocol revision level currently in use by a mobile station.
- 25 **PREF_MSID_TYPE_s** – Preferred mobile station identifier field type.
- 26 **PREVIOUS_ACTIVE_PILOT_s** – Identifies the pilot, if any, which was in the Active Set
27 immediately prior to the current pilot in the Active Set, during the current access attempt.
- 28 **PRI_NGHBR_LST_s** – *Private Neighbor List Message* sent indicator.
- 29 **PRI_NGHBR_PN** – Private Neighbor base station Pilot Channel PN sequence offset in units
30 of 64 PN chips.
- 31 **PRI_NGHBR_REC** – Record containing information about a private neighbor base station
32 (see also PRI_NGHBR_REC_LIST).
- 33 **PRI_NGHBR_REC_LIST** – Private neighbor base station record list. A descriptive structure
34 used to manage the base station's information records about private neighbor base stations
35 (see also PRI_NGHBR_REC).
- 36 **PRI_NGHBR_LST_MSG_SEQ_s** – Private Neighbor List Message sequence number.

- 1 **PROBE_BKOFF_s** – Access Channel probe backoff range, in slots.
- 2 **PROBE_PN_RAN_s** – Range for hashing function selection of the delay prior to transmission
3 of Access Channel probes. Value is $\log_2(\text{range} + 1)$.
- 4 **PSIST_s** – Persistence value for the mobile station's overload class.
- 5 **PUF_FREQ_INCL_s** – Flag to indicate whether the mobile station is to transmit a PUF probe
6 on the serving frequency or on a target frequency.
- 7 **PUF_INIT_PWR_s** – Power increase (in dB) of the first PUF pulse in a PUF attempt.
- 8 **PUF_INTERVAL_s** – Number of frames between the start of each PUF probe.
- 9 **PUF_PULSE_SIZE_s** – Duration of a PUF pulse in power control groups.
- 10 **PUF_PWR_STEP_s** – Amount (in dB) by which the mobile station is to increment the power
11 of a PUF pulse above nominal power from one PUF pulse to the next.
- 12 **PUF_SETUP_SIZE_s** – Number of power control groups within a PUF probe before the
13 transmission of the PUF pulse.
- 14 **PUF_SF_CDMABAND_s** – Serving Frequency CDMA band class.
- 15 **PUF_SF_CDMACH_s** – Serving Frequency CDMA Channel number.
- 16 **PUF_TF_CDMABAND_s** – Target Frequency CDMA band class.
- 17 **PUF_TF_CDMACH_s** – Target Frequency CDMA Channel number.
- 18 **PUF_TX_PWR_s** – Mobile station's output power for the PUF pulse.
- 19 **PWR_CNTL_STEP_s** – Power control step size assigned by the base station that the mobile
20 station is to use for closed loop power control.
- 21 **PWR_PERIOD_ENABLE_s** – Forward power control periodic reporting enabled indicator.
- 22 **PWR_REP_DELAY_s** – Power report delay. The period that the mobile station waits following
23 an autonomous *Power Measurement Report* before restarting frame counting for power
24 control purposes.
- 25 **PWR_REP_FRAMES_s** – Power control reporting frame count. The number of frames over
26 which the mobile station is to count frame errors. Value is $2 \times \log_2(\text{frames} / 5)$.
- 27 **PWR_REP_THRESH_s** – Power control reporting threshold. The number of bad frames to be
28 received in a measurement period before the mobile station is to generate a *Power*
29 *Measurement Report Message*.
- 30 **PWR_STEP_s** – Power increment for successive access probes, in units of 1.0 dB.
- 31 **PWR_THRESH_ENABLE_s** – Forward power control threshold reporting enabled indicator.
- 32 **QOF_ID_s** – Quasi-orthogonal function index on the Supplemental Channel.
- 33 **QoF Set** – QoF Set is a set of Quasi-orthogonal functions generated by applying the same
34 quasi-orthogonal masking function to the set of all Walsh functions.
- 35 **QPAGECH_s** – Current Quick Paging Channel number.

- 1 **QPCH_CCI_SUPPORTED_s** – Flag to indicate if configuration change indicators are
2 supported on the Quick Paging Channel.
- 3 **QPCH_POWER_LEVEL_PAGE_s** – Relative power level of the transmitted Quick Paging
4 Channel Paging Indicator modulation symbols, relative to the Forward Pilot Channel.
- 5 **QPCH_POWER_LEVEL_CONFIG_s** – Relative power level of the transmitted Quick Paging
6 Channel Configuration Change Indicator modulation symbols, relative to the Forward Pilot
7 Channel.
- 8 **QPCH_RATE_s** – Indicator rate of the current Quick Paging Channel(s).
- 9 **QPCH_SUPPORTED_s** – Flag to indicate if the Quick Paging Channel is supported by the
10 base station.
- 11 **RA** – Random access channel number. The Access Channel number generated (pseudo-
12 randomly) by the mobile station.
- 13 **RAND_s** – Authentication random challenge value.
- 14 **RANDC** – The eight most-significant bits of the random challenge value used by the mobile
15 station.
- 16 **RANDOM_TIME** – Random time. A portion of SYS_TIME used to seed the random number
17 generator.
- 18 **RC_CAP_REQUESTED_s** – Radio Configuration Capability indicator. When set to “1” the
19 mobile station shall include the Radio Configuration capabilities that it supports in the
20 *Origination Message and Page Response Message*.
- 21 **RCCCH_SLOT_s** – See [2].
- 22 **RCCCH_SLOT_OFFSET1_s** – See [2].
- 23 **RCCCH_SLOT_OFFSET2_s** – See [2].
- 24 **REDIRECTION_s** – Service redirection indicator. Set to enabled to indicate that service
25 redirection is currently in effect; otherwise, set to disabled.
- 26 **REDIRECT_REC_s** – Holds the service redirection criteria specified in the redirection record
27 of the most recently received *Extended Global Service Redirection Message, Global Service*
28 *Redirection Message* or *Service Redirection Message*.
- 29 **REDIRECT_REC_LIST** – An array of redirection records selected from the most recently
30 received *Extended Global Service Redirection Message*. Each redirection record in this array
31 specifies a redirection criteria. See REDIRECT_REC_s.
- 32 **REG_COUNT_s** – The timer-based registration counter.
- 33 **REG_COUNT_MAX_s** – Timer-based registration count limit. The timer-based registration
34 counter expiration value computed from REG_PRD_r.
- 35 **REG_DIST_s** – Registration distance. Distance from last registration that causes a distance-
36 based registration to occur.
- 37 **REG_ENABLED_s** – Autonomous registrations enabled indicator.

- 1 **REG_NID_s** – Network identification corresponding to the base station where the mobile
2 station is considered registered upon receiving confirmation of delivery of *Registration*
3 *Message*, *Origination Message*, *Page Response Message*, or *Reconnect Message*.
- 4 **REG_REG_ZONE_s** – Registration zone number corresponding to the base station where the
5 mobile station is considered registered upon receiving confirmation of delivery of
6 *Registration Message*, *Origination Message*, *Page Response Message*, or *Reconnect Message*.
- 7 **REG_SECURITY_RESYNC** – Security re-sync required registration indicator.
- 8 **REG_SID_s** – System identification corresponding to the base station where the mobile
9 station is considered registered upon receiving confirmation of delivery of *Registration*
10 *Message*, *Origination Message*, *Page Response Message*, or *Reconnect Message*.
- 11 **REGISTERED_s** – Mobile station registered indicator.
- 12 **REG_PRD_s** – Registration period. The time interval between timer-based registrations.
13 Value is $4 \times \log_2(\text{time} / 0.08 \text{ s})$.
- 14 **REG_PERSIST_s** – Persistence modifier for registration accesses (except ordered registrations).
- 15 **REG_ZONE_s** – Registration zone number of the base station.
- 16 **REG_ZONE_TIMER_s** – Zone timer length corresponding to the base station where the
17 mobile station is considered registered upon receiving confirmation of delivery of
18 *Registration Message*, *Origination Message*, *Page Response Message*, or *Reconnect Message*.
- 19 **REJECT_UZID_s** – User Zone identifier of the User Zone rejected by the base station.
- 20 **RELEASE_TO_IDLE_IND_s** – Indicator of whether the mobile station is allowed to transition
21 directly to the *Mobile Station Idle State* upon releasing all the dedicated channels.
- 22 **RER_MAX_NUM_MSG_s** – The maximum number of Radio Environment Messages that the
23 mobile station is permitted to transmit while in the radio environment reporting mode.
- 24 **RER_MODE_ENABLED** – Flag that indicates whether the radio environment reporting
25 mode is currently enabled at the mobile station.
- 26 **RER_PILOT_LIST** – Radio environment report pilot list used while in the radio environment
27 reporting mode.
- 28 **RER_MODE_SUPPORTED_s** – Base station support of radio environment reporting mode
29 indicator.
- 30 **RESELECT_INCLUDED_s** – System reselection information included indicator. When this is
31 set to ‘1’, the system reselection procedure is enabled.
- 32 **RESPOND_IND_s** – Respond Requested Indicator. Indicates if the mobile station is to
33 acknowledge direct channel assignment by sending a page response message or a
34 reconnect message in unassured mode.
- 35 **RESQ_ENABLED_s** – Call rescue feature enabled indicator. Flag to indicate if the call
36 rescue feature is enabled in the network.

1 **RESQ_ALLOWED_TIME_s** – Call rescue allowed timer. Specifies the maximum interval that
 2 the mobile station has to begin a call rescue soft handoff attempt, after the call rescue
 3 delay timer expires.

4 **RESQ_ATTEMPT_TIME_s** – Call rescue attempt timer. Specifies the maximum time a
 5 mobile station is allowed to keep its transmitter re-enabled while waiting to receive N_{3m}
 6 consecutive good frames during a call rescue soft handoff attempt.

7 **RESQ_CODE_CHAN_s** – The code channel index of the Rescue Channel for neighbor base
 8 stations that are configured with a Rescue Channel.

9 **RESQ_DELAY_TIME_s** – Call rescue delay timer. Specifies the minimum delay before the
 10 mobile station can attempt call rescue soft handoff, after the mobile station disables its
 11 transmitter due to receiving N_{2m} consecutive bad frames or declaring an acknowledgment
 12 failure.

13 **RESQ_MIN_PERIOD_s** – Minimum time between consecutive call rescues. Specifies the
 14 minimum time after a successful call rescue (i.e. receipt of N_{3m} consecutive good frames
 15 by the mobile station after the rescue attempt timer is enabled) before any subsequent call
 16 rescue attempts can be initiated.

17 **RESQ_NUM_PREAMBLE_RC1_RC2_s** – The Traffic Channel preamble length for Call Rescue
 18 Soft Handoff when operating in Radio Configuration 1 or 2.

19 **RESQ_NUM_PREAMBLE_s** – The Traffic Channel preamble length for Call Rescue Soft
 20 Handoff when operating in Radio Configuration greater than 2.

21 **RESQ_NUM_TOT_TRANS_20MS_s** – The required number of transmissions of a regular
 22 PDU before declaring a L2 Acknowledgment Failure when Call Rescue is enabled.

23 **RESQ_NUM_TOT_TRANS_5MS_s** – The required number of transmissions of a mini PDU
 24 before declaring a L2 Acknowledgment Failure when Call Rescue is enabled.

25 **RESQ_POWER_DELTA_s** – The power level adjustment to be applied to the last closed-loop
 26 power level when re-enabling the transmitter for call rescue soft handoff.

27 **RESQ_QOF_s** – The Quasi-Orthogonal Function mask identifier of the Rescue Channel for
 28 neighbor base stations that are configured with a Rescue Channel.

29 **RESUME_PREAMBLE_s** – A storage variable in the mobile station that contains the size of
 30 the preamble that shall be transmitted on a Reverse Supplemental Code Channel at the
 31 beginning of transmission on a Reverse Supplemental Code Channel when resuming
 32 transmission following an interruption when discontinuous transmission is occurring.

33 **RETRY_DELAY_s[i]** – A storage variable in the mobile station that contains the system time
 34 before which the mobile station may not transmit a specific message. The type of message
 35 that cannot be transmitted is specified by **RETRY_TYPE**, represented here by *i*. A
 36 **RETRY_DELAY_s[i]** value of 0 indicates no retry delay is in effect, and a value of ‘1111111’
 37 indicates an infinite retry delay.

38 **RETRY_DELAY_UNIT_s** – The units for the value of **RETRY_DELAY_s**. Possible values are
 39 1000ms and 60000ms.

40 **RETRY_DELAY_VALUE_s** – The unitless value of the retry delay.

- 1 **RETRY_TYPE_s** – The retry delay type. It specifies the type of message to which the retry
2 delay value applies. If set to a value of 0, it indicates that all retry delay values should be
3 cleared.
- 4 **RETURN_CAUSE_s** – Reason for the mobile station registering or accessing the system.
- 5 **RETURN_IF_FAIL_s** – Return if fail indicator. Set to ‘1’ to indicate that mobile station is to
6 return to the system from which it was redirected if it fails to acquire service on a system
7 using specified redirection criteria. Otherwise, set to ‘0’.
- 8 **RETURN_IF_HANDOFF_FAIL_s** – Return if handoff fail indicator. Indicates if the mobile
9 station is to resume using the Active Set on the Serving Frequency following an
10 unsuccessful hard handoff attempt.
- 11 **REV_DCCH_MUX_OPTION_s** – Reverse Dedicated Control Channel Multiplex Option.
- 12 **REV_DTX_DURATION_s** – Maximum duration of time in units of 20 ms that the mobile
13 station is allowed to stop transmitting on a Reverse Supplemental Code Channel within the
14 reverse assignment duration.
- 15 **REV_DURATION_s** – A stored variable in the mobile station that contains the duration (in
16 units of 80 ms) of the Reverse Supplemental Code Channel transmission that will begin at
17 time REV_START_TIME_s.
- 18 **REV_FCH_GATING_MODE_s** – The reverse Fundamental Traffic Channel gating mode in
19 Radio Configurations 3, 4, 5, and 6 where 50% of the PCGs in the 1500 bps and 1800 bps
20 frames are gated off (see [2]). Set to ‘1’ if the mobile station is operating in the reverse
21 fundamental channel gating mode.
- 22 **REV_FCH_MUX_OPTION_s** – Reverse Fundamental Channel Multiplex Option.
- 23 **REV_FCH_RC_s** – Reverse Fundamental Channel Radio Configuration.
- 24 **REV_FRAME_40_MAX_RATE_s** – The maximum data rate for the mobile station's
25 transmission at 40 ms frame length on the Reverse Supplemental Channel.
- 26 **REV_FRAME_80_MAX_RATE_s** – The maximum data rate for the mobile station's
27 transmission at 80 ms frame length on the Reverse Supplemental Channel.
- 28 **REV_LINKED_HDM_SEQ_s** – Storage variable containing the most recent reverse sequence
29 number of the *General Handoff Direction Message* to which a *Supplemental Channel*
30 *Assignment Message* reverse assignment was linked.
- 31 **REV_PDCH_AUTO_ALLOWED_s[i]** – Reverse Packet Data Channel Autonomous
32 Transmission allowed indicator. An on or off indicator used to identify whether
33 autonomous transmission is allowed or not allowed for each SR_ID.
- 34 **REV_PDCH_BOOST_ALLOWED_s[i]** – Reverse Packet Data Channel boost allowed indicator.
35 An on or off indicator that identifies whether traffic to pilot ratio boosting is allowed or not
36 allowed for each SR_ID.
- 37 **REV_PDCH_BOOST_OVERSHOOT_s** – Reverse Packet Data Channel Boost Overshoot.
- 38 **REV_PDCH_BUFFER_SIZE_s[i]** – Reverse Packet Data Buffer size. An array of buffer sizes
39 that correspond to the buffer status.

- 1 **REV_PDCH_DEFAULT_PERSISTENCE_s** – Reverse Packet Data Default Persistence. The
2 initial default persistence value.
- 3 **REV_PDCH_GRANT_PRECEDENCE_s** – Reverse Packet Data Channel Grant
4 Precedence Indicator.
- 5 **REV_PDCH_INIT_TARGET_TPR_s** – Reverse Packet Data Channel Initial Target for Traffic
6 to pilot ratio. The initial target traffic to pilot ratio.
- 7 **REV_PDCH_MAX_AUTO_TPR_s** – The maximum traffic to pilot ratio for autonomous
8 transmission.
- 9 **REV_PDCH_MAX_SIZE_ALLOWED_ENCODER_PACKET_s** – Maximum Allowed Reverse
10 Packet Data Channel encoder packet size.
- 11 **REV_PDCH_MAX_SIZE_SUPPORTED_ENCODER_PACKET** – Maximum supported
12 Reverse Packet Data Channel encoder packet size by the mobile station.
- 13 **REV_PDCH_MAX_TARGET_TPR_s** – Reverse Packet Data Maximum Target Traffic to Pilot
14 Ratio. The maximum target traffic to pilot ratio that is allowed.
- 15 **REV_PDCH_MSIB_SUPPORTED_s** – Reverse Packet Data Channel Mobile Station Indicator
16 Supported Bit.
- 17 **REV_PDCH_MUX_OPTION_HIGH_RATE_s** – Reverse Packet Data Channel Multiplex
18 Option for higher data rates indicator.
- 19 **REV_PDCH_MUX_OPTION_LOW_RATE_s** – Reverse Packet Data Channel Multiplex Option
20 for lower data rates indicator.
- 21 **REV_PDCH_NUM_ARQ_ROUNDS_BOOST_s** – The maximum number of ARQ rounds for
22 boosted transmission that can be performed on the Reverse Packet Data Channel.
- 23 **REV_PDCH_NUM_ARQ_ROUNDS_NORMAL_s** – The maximum number of ARQ rounds for
24 non-boosted transmission that can be performed on the Reverse Packet Data Channel.
- 25 **REV_PDCH_QUICK_START_THRESH_s** – Reverse Packet Data Quick Start Threshold. The
26 Quick start threshold for the Reverse Packet Data Control Channel.
- 27 **REV_PDCH_RC** – Reverse Packet Data Channel radio configuration.
- 28 **REV_PDCH_RESET_PERSISTENCE_s** – Reverse Packet Data Channel Reset Persistence.
29 Determines the value of current persistence [3] at the end of a non-persistent grant for the
30 Reverse Packet Data Channel.
- 31 **REV_PDCH_REQCH_TRIGGER_s[i]** – Reverse Packet Data Request Channel Trigger. The
32 following parameters are contained in this array and will be triggered for the REQCH.
- 33 • REV_REQCH_MIN_DURATION – Minimum duration between REQCH messages for
34 this SR_ID.
 - 35 • REV_REQCH_USE_BUFFER_REPORTS – An on or off indicator used to allow buffer
36 reports.

- 1 • REV_REQCH_USE_POWER_REPORTS – An on or off indicator used to allow power
2 status reports.
- 3 • REV_REQCH_USE_WATERMARKS – An on or off indicator used to allow watermark
4 reports.
- 5 • REV_REQCH_HIGH_WATERMARK – The high watermark level, in octets.
- 6 • REV_REQCH_LOW_WATERMARK – The low watermark level, in octets.
- 7 • REV_REQCH_CEILING – The high ceiling level, in octets, used for high priority
8 reporting.
- 9 • REV_REQCH_FLOOR – The low floor level, in octets, used for high priority reporting.
- 10 **REV_PDCH_SOFT_HANDOFF_RESET_IND_s** – Reverse Packet Data Channel Soft Handoff
11 Reset Indicator. An indicator used to determine whether the Reverse Packet Data Channel
12 control function must be initialized when soft selection is to occur or not.
- 13 **REV_PDCH_STEP_DOWN_s[i]** – Reverse Packet Data Channel Step “down” for rate
14 control.
- 15 **REV_PDCH_STEP_UP_s[i]** – Reverse Packet Data Channel Step “up” for rate
16 control.
- 17 **REV_PDCH_TABLE_SEL_s** – Reverse Packet Data Channel Table selector.
- 18 **REV_PDCH_TPR_BOOSTED_s[i]** – Reverse Packet Data Traffic to Pilot Ratio Boosted. An
19 array indicating the traffic to pilot ratio for boosted traffic.
- 20 **REV_PDCH_TPR_NORMAL_s[i]** – Reverse Packet Data Channel Traffic to Pilot Normal. An
21 array indicating the traffic to pilot ratio for non-boosted traffic.
- 22 **REV_PWR_CNTL_DELAY_s** – The reverse link power control delay for the reverse
23 fundamental channel gating mode in Radio Configurations 3, 4, 5, and 6 and the gated
24 preamble transmission on the Enhanced Access Channel or the Reverse Common Control
25 Channel. The delay is the time between the end of the reverse link PCG and the beginning
26 of the forward link PCG minus one, when the round trip delay is zero.
- 27 **REV_RC_s** – Reverse Channel Radio Configuration.
- 28 **REV_REQCH_ADJ_GAIN_s** – Reverse Request Channel Adjustment Gain.
- 29 **REV_REQCH_HEADROOM_DURATION_s** – Reverse Request Channel minimum power
30 headroom update trigger interval.
- 31 **REV_REQCH_MAX_POWER_UPDATE_DURATION_s** – Reverse Request Channel
32 maximum power headroom update trigger interval.
- 33 **REV_REQCH_POWER_HEADROOM_DECREASE_s** – Reverse Request Channel Power
34 headroom decrease delta to trigger power report.
- 35 **REV_REQCH_POWER_HEADROOM_INCREASE_s** – Reverse Request Channel Power
36 headroom increase delta to trigger power report.

- 1 **REV_REQCH_QUICK_REPEAT_ALLOWED_s** – Reverse Request Channel Quick Repeat
2 Allowed indicator.
- 3 **REV_SCH_DTX_DURATION_s** – Maximum duration of time in units of 20 ms that the
4 mobile station is allowed to stop transmitting on a Reverse Supplemental Channel within
5 the reverse assignment duration.
- 6 **REV_SCH_DURATION_s** – A stored variable in the mobile station which contains the
7 duration of the Reverse Supplemental Channel transmission which will begin at time
8 REV_SCH_START_TIME_s.
- 9 **REV_SCH_FRAME_LENGTH_s** – The Reverse Supplemental Channel frame length.
- 10 **REV_SCH_RATE_s** – The rate of the Reverse Supplemental Channel.
- 11 **REV_SCH_START_TIME_s** – A stored variable in the mobile station which contains the
12 System Time, in units of time specified by START_TIME_UNIT_s, (modulo 32) at which the
13 mobile station shall start (or resume) processing Reverse Supplemental Channels.
- 14 **REV_SPICH_ADJ_GAIN_s** – Reverse Secondary Pilot Channel Adjustment Gain.
- 15 **REV_SPICH_EP_SIZE_s** – Minimum Encoder Packet Size for which the Reverse
16 Secondary Pilot Channel is used.
- 17 **REV_START_TIME_s** – A stored variable in the mobile station that contains the next 80 ms
18 frame boundary (modulo 64) on which the mobile station is assigned to start Reverse
19 Supplemental Code Channel transmission.
- 20 **REV_WALSH_ID_s** – Reverse Supplemental Channel Walsh cover Identifier.
- 21 **RLGAIN_ACKCH_PILOT_s** – Reverse Acknowledgment Channel to pilot adjustment
22 gain.
- 23 **RLGAIN_CQICH_PILOT_s** – Reverse Channel Quality Indicator Channel to pilot
24 adjustment gain.
- 25 **RLGAIN_PDCCH_PILOT_s** – Reverse Packet Data Channel to pilot adjustment gain.
- 26 **RLGAIN_REQCH_PILOT_s** – Reverse Request Channel to pilot adjustment gain.
- 27 **RLGAIN_SPICH_PILOT_s** – Reverse Secondary Pilot Channel to pilot adjustment
28 gain.
- 29 **RN_HASH_KEY_s** – Name of an internal variable having the same value as the mobile
30 station's ESN. This variable is used by procedures defined in [3].
- 31 **ROAM_INDI_s** – Enhanced roaming indicator used for mobile station roaming condition
32 display.
- 33 **RS** – Inter-probe sequence backoff. The delay in slots generated (pseudorandomly) by the
34 mobile station following an unsuccessful access probe sequence or prior to the first access
35 probe in a response attempt.
- 36 **RSC_END_TIME** – Reduced slot cycle mode end time. The system time at which a mobile
37 station operating in the reduced slot cycle mode will exit the mode.

- 1 **RSC_MODE_ENABLED** – Mobile Station flag that indicates whether reduced slot cycle
2 mode is enabled.
- 3 **RSCI_s** – Reduced slot cycle index.
- 4 **RT** – Inter-probe backoff. The delay in slots generated (pseudorandomly) by the mobile
5 station following an unacknowledged access probe.
- 6 **RTC_NOM_PWR_s** – Reverse Traffic Channel Nominal Power. The nominal power to be used
7 by the mobile station for its initial transmission on the Reverse Traffic Channel when Direct
8 Channel Assignment is used.
- 9 **RTC_NOM_PWR_USE_IND** – Reverse Traffic Channel Nominal Power Used Indicator.
10 Indicates if the mobile station uses RTC_NOM_PWR_s. See RTC_NOM_PWR_s.
- 11 **SCAM_FOR_DURATION_MODE_s** – Indicator for a specific or an indefinite Forward
12 Supplemental Code Channel assignment duration.
- 13 **SCAM_FOR_ORDER_s** – The stop or start command set by a *Supplemental Channel*
14 *Assignment Message* that is linked to a *General Handoff Direction Message*.
- 15 **SCAM_REV_DURATION_MODE_s** – Indicator for a specific or an indefinite Reverse
16 Supplemental Code Channel assignment duration.
- 17 **SCH_BAD_FRAMES_s** – Forward Supplemental Channel bad frames count. The number of
18 received bad Forward Supplemental Channel frames.
- 19 **SCH_TOT_FRAMES_s** – Total Forward Supplemental Channel frames received. The total
20 number of received Forward Supplemental Channel frames, counted for Forward Traffic
21 Channel power control.
- 22 **SCRM_SEQ_NUM_s** – Storage variable containing the most recently transmitted
23 *Supplemental Channel Request Message* sequence number.
- 24 **SEARCH_MODE_s** – Search mode to be used in a search on the Candidate Frequency.
- 25 **SEARCH_OFFSET_s** – Time offset of the start of the first search from the action time of the
26 *Candidate Frequency Search Request Message* or the *Candidate Frequency Search Control*
27 *Message* that starts a search.
- 28 **SEARCH_PERIOD_s** – Period for search on the Candidate Frequency.
- 29 **SEARCH_PRIORITY_s** – Neighbor Pilot Channel search priority.
- 30 **SEARCH_PRIORITY_INCL_s** – Search priorities included indicator.
- 31 **SEARCH_TIME_RESOLUTION_s** – Unit of delay used in the *Candidate Frequency Search*
32 *Report Message* to report the total and maximum times away from the Serving Frequency.
- 33 **SENDING_BSPM_s** – *BCMC Service Parameters Message* is being transmitted indicator.
- 34 **SENDING_RAND_s** – *ANSI-41 RAND Message* sent indicator.
- 35 **SERV_NEG_s** – Service negotiation indicator. Indicates whether the mobile station is to use
36 service negotiation or service option negotiation.

- 1 **SERV_REQ_NUM_s** – Service request sequence number. Sequence number to use when
2 requesting a new service configuration.
- 3 **SERVSYS_s** – Selected serving system indicator for Band Class 0. Set to SYS_A if the mobile
4 station operates in system A; otherwise, set to SYS_B.
- 5 **SETTING_SEARCH_WIN** – SRCH_WIN_NGHBR Setting flag. Set to ‘1’ if the mobile station
6 shall set the SRCH_WIN_NGHBR field of each NGHBR_REC to SEARCH_WIN_N_s for all
7 NGHBR_SET_SIZE_s entries upon receiving the *System Parameters Message*.
- 8 **SF_ADD_INTERCEPT_s** – Intercept of the handoff add criterion for the Serving Frequency,
9 stored during hard handoff.
- 10 **SF_CDMABAND_s** – Serving Frequency CDMA band class, stored during hard handoff.
- 11 **SF_CDMACH_s** – Serving Frequency CDMA Channel number, stored during hard handoff.
- 12 **SF_CODE_CHAN_LIST_s** – Serving Frequency Code Channel List, stored during hard
13 handoff.
- 14 **SF_DROP_INTERCEPT_s** – Intercept of the handoff drop criterion for the Serving Frequency,
15 stored during hard handoff.
- 16 **SF_ENCRYPT_MODE_s** – Message encryption indicator for the Serving Frequency, stored
17 during hard handoff.
- 18 **SF_FRAME_OFFSET_s** – Traffic Channel frame offset used on the Serving Frequency, stored
19 during hard handoff.
- 20 **SF_NOM_PWR_s** – Nominal transmit power offset used on the Serving Frequency, stored
21 during hard handoff.
- 22 **SF_NOM_PWR_EXT_s** – Extended nominal transmit power offset indicator for the Serving
23 Frequency, stored during hard handoff.
- 24 **SF_P_REV_s** – Protocol revision level supported by the base station on the Serving
25 Frequency.
- 26 **SF_P_REV_IN_USE_s** – Protocol revision level currently used by the mobile station on the
27 Serving Frequency.
- 28 **SF_PLCM_TYPE_s** – Public long code mask type for the Serving Frequency, stored during
29 hard handoff.
- 30 **SF_PLCM_39_s** – 39-bit public long code mask specified by the base station for the Serving
31 Frequency, stored during hard handoff.
- 32 **SF_PRIVATE_LCM_s** – Private long code mask indicator for the Serving Frequency, stored
33 during hard handoff.
- 34 **SF_PVTLCM_42_s** – Private long code mask for the Serving Frequency, stored during hard
35 handoff.
- 36 **SF_SERV_NEG_s** – Service negotiation indicator for the Serving Frequency, stored during
37 hard handoff.

- 1 **SF_SERVICE_CONFIG_s** – Service configuration (service configuration record and non-
2 negotiable service configuration record) for the Serving Frequency.
- 3 **SF_SOFT_SLOPE_s** – Slope of the handoff add/drop criterion for the Serving Frequency,
4 stored during hard handoff.
- 5 **SF_SRCH_WIN_A_s** – Search window size for the Active Set and Candidate Set used on the
6 Serving Frequency, stored during hard handoff.
- 7 **SF_SRCH_WIN_N_s** – Search window size for the Neighbor Set used on the Serving
8 Frequency, stored during hard handoff.
- 9 **SF_SRCH_WIN_R_s** – Search window size for the Remaining Set used on the Serving
10 Frequency, stored during hard handoff.
- 11 **SF_T_ADD_s** – Pilot detection threshold used on the Serving Frequency, stored during hard
12 handoff.
- 13 **SF_T_COMP_s** – Active Set versus Candidate Set comparison threshold used on the Serving
14 Frequency, stored during hard handoff.
- 15 **SF_T_DROP_s** – Pilot drop threshold used on the Serving Frequency, stored during hard
16 handoff.
- 17 **SF_T_TDROPS_s** – Pilot drop timer value used on the Serving Frequency, stored during hard
18 handoff.
- 19 **SF_T_TDROPS_RANGE_s** – Pilot drop timer range value used on the Serving Frequency,
20 stored during hard handoff.
- 21 **SF_TOTAL_EC_THRESH_s** – Threshold for total E_c of pilots in the Serving Frequency Active
22 Set used in the Candidate Frequency periodic search procedures.
- 23 **SF_TOTAL_EC_IO_THRESH_s** – Threshold for total E_c/I_o of pilots in the Serving Frequency
24 Active Set used in the Candidate Frequency periodic search procedures.
- 25 **SID_s** – System identifier.
- 26 **SID_NID_LIST_s** – Registration SID, NID list. The SID, NID pairs in which the mobile
27 station has registered.
- 28 **SLOT_CYCLE_INDEX_s** – Slot cycle index. This is a signed parameter that can take values
29 between -4 and +7, inclusive. It is computed from the SLOT_CYCLE_INDEX_REG, and
30 bounded by the minimum and maximum slot cycle indices allowed by the current base
31 station.
- 32 **SLOT_CYCLE_INDEX_REG** – Slot cycle index registered. This is a signed parameter that
33 can take values between -4 and +7, inclusive. It is computed based on the slot cycle index
34 value included in the last registration attempt.
- 35 **SLOT_NUM** – Paging Channel or Forward Common Control Channel slot number.
- 36 **SOFT_SLOPE_s** – The slope in the inequality criterion for adding a pilot to the Active Set, or
37 dropping a pilot from the Active Set.

- 1 **SO_REQ_s** – Service option request number. The number of the service option requested by
 2 the mobile station during service option negotiation.
- 3 **SR1_BRAT_NON_TD_s** – Spreading Rate 1 Primary Broadcast Control Channel data rate
 4 with no transmit diversity.
- 5 **SR1_BRAT_TD_s** – Spreading Rate 1 Primary Broadcast Control Channel data rate with
 6 transmit diversity.
- 7 **SR1_CRAT_NON_TD_s** – Spreading Rate 1 coding rate with no transmit diversity.
- 8 **SR1_CRAT_TD_s** – Spreading Rate 1 coding rate with transmit diversity.
- 9 **SR1_TD_MODE_s** – Spreading Rate 1 transmit diversity mode in support of OTD or STS.
- 10 **SR1_TD_LEVEL_s** – Spreading Rate 1 transmit diversity power level.
- 11 **SR3_BRAT_s** – Data rate of the Broadcast Control Channel on SR3 frequencies.
- 12 **SR3_PRIMARY_PILOT_s** – Frequency offset of the primary SR3 pilot.
- 13 **SR3_PILOT_POWER1_s** – The power level of the primary pilot with respect to the pilot on
 14 the lower frequency of the two remaining SR3 frequencies.
- 15 **SR3_PILOT_POWER2_s** – The power level of the primary pilot with respect to the pilot on
 16 the higher frequency of the two remaining SR3 frequencies.
- 17 **SRCH_OFFSET_INCL_s** – Neighbor pilot search window offset included indicator.
- 18 **SRCH_OFFSET_NGHBR_s** – Neighbor pilot search window offset.
- 19 **SRCH_WIN_A_s** – Search window size for the Active Set and Candidate Set.
- 20 **SRCH_WIN_NGHBR_s** – Neighbor Pilot Channel search window size.
- 21 **SRCH_WIN_NGHBR_INCL_s** – Neighbor Pilot Channel search window size included
 22 indicator.
- 23 **SRCH_WIN_N_s** – Search window size for the Neighbor Set.
- 24 **SRCH_WIN_R_s** – Search window size for the Remaining Set.
- 25 **START_TIME_UNIT_s** – A stored variable in the mobile station which contains the time unit
 26 used for determining FOR_SCH_START_TIME and REV_SCH_START_TIME on
 27 Supplemental Channels.
- 28 **SYNC_ID_s** – Service Configuration Synchronization Identifier identifying the service
 29 configuration currently in use (i.e. Service Configuration information record and Non-
 30 negotiable Service Configuration information record).
- 31 **SYS_PAR_MSG_SEQ_s** – *System Parameters Message* sequence number.
- 32 **SYS_TIME_s** – Current value of CDMA system time as received in the *Sync Channel*
 33 *Message*.
- 34 **TA** – Acknowledgment response timeout.
- 35 **T_ADD_s** – Pilot detection threshold. The stored value is a positive value in units of 0.5 dB.

- 1 **T_COMP_s** – Active Set versus Candidate Set comparison threshold. The stored value is a
2 positive value in units of 0.5 dB.
- 3 **T_DROP_s** – Pilot drop threshold. The stored value is a positive value in units of 0.5 dB.
- 4 **T_TDROP_RANGE_s** – Pilot drop timer range value.
- 5 **T_SLOTTED_s** – Slotted timer, used for the slotted timer feature.
- 6 **TAG_s** – Transaction identifier. This is a 4-bit parameter maintained by the mobile station
7 which is used to uniquely identify a new call origination (via an *Enhanced Origination*
8 *Message*) by the mobile station. When the mobile station is to send an *Enhanced*
9 *Origination Message*, the mobile station increments the stored value of TAG and includes it
10 in the message.
- 11 **TAG_OUTSTANDING_LIST** – List of outstanding TAG values. This corresponds to those
12 values of TAG sent in the *Enhanced Origination Message* which have neither been accepted
13 by the base station (by assigning the requested call) nor rejected by the base station.
- 14 **TBR_RAND_SUPPR_ENABLE_s** – Flag to indicate if suppression of timer-based registration
15 randomization based upon frequent implicit registrations is enabled.
- 16 **TBR_RAND_WINDOW_s** – Indicates the window over which the next timer-based registration
17 following call release is randomized.
- 18 **TEMP_SUB_s** – User Zone temporary subscription flag.
- 19 **TF_CDMABAND_s** – Target Frequency CDMA band class. The CDMA band class specified in
20 the *Extended Handoff Direction Message* or the *General Handoff Direction Message*.
- 21 **TF_CDMACH_s** – Target Frequency CDMA Channel number. The CDMA Channel number
22 specified in the *Extended Handoff Direction Message* or the *General Handoff Direction*
23 *Message*.
- 24 **TF_RESET_FPC_s** – Flag to initialize the Forward Traffic Channel power control counters on
25 the Target Frequency.
- 26 **TF_RESET_L2_s** – Flag to reset acknowledgment procedures on the Target Frequency.
- 27 **TF_T_ADD_s** – Pilot detection threshold to be used on the Target Frequency. The stored
28 value is a positive value in units of 0.5 dB.
- 29 **TF_WAIT_TIME_s** – Maximum time that the mobile station may wait to receive a period of
30 $(N_{11m} \times 20)$ ms with sufficient signal quality on the CDMA Target Frequency.
- 31 **TKZ_ID_s** – Tracking zone identifier used while in tracking zone mode.
- 32 **TKZ_LIST_LEN_s** – Number of tracking zone identifiers to be maintained in the tracking
33 zone list while in tracking zone mode.
- 34 **TKZ_MAX_NUM_MSG_s** – The maximum number of *Radio Environment Messages* that the
35 mobile station is permitted to transmit while in the tracking zone mode.
- 36 **TKZ_MODE_ENABLED** – Flag that indicates whether the tracking zone mode is currently
37 enabled at the mobile station.

- 1 **TKZ_MODE_PENDING** – Flag that indicates whether the tracking zone mode is currently
2 pending at the mobile station. If the tracking zone mode is pending, then it becomes
3 enabled when the radio environment reporting mode is disabled.
- 4 **TKZ_MODE_SUPPORTED_s** – Base station support of tracking zone mode indicator.
- 5 **TKZ_LIST** – Tracking zone list. A list of most recent TKZ_IDs that the mobile station has
6 received while in the tracking zone mode.
- 7 **TMSI_ZONE_s** – TMSI zone number of the base station.
- 8 **TMSI_ZONE_LEN_s** – The number of octets in TMSI zone.
- 9 **T_MULCHAN_s** – The threshold offset that the mobile station is to use when reporting
10 neighbor pilot strength measurements in a *Supplemental Channel Request Message*. The
11 stored value is a positive value in units of 0.5 dB.
- 12 **TOTAL_PUF_PROBES_s** – Maximum number of PUF probes transmitted in a PUF attempt.
- 13 **TOTAL_ZONES_s** – Number of registration zones to be retained in ZONE_LIST_s.
- 14 **TOT_FRAMES_s** – Total Forward Fundamental Channel frames received. The total number
15 of received Forward Fundamental Channel frames, counted for Forward Traffic Channel
16 power control.
- 17 **TX_PWR_LIMIT_s** – Transmit Power Limit. If the mobile station is operating in the 1915MHz
18 – 1920MHz block of the PCS band, the mobile station is to limit its transmission power to
19 no more than the value indicated by this field.
- 20 **T_TDROPS_s** – Pilot drop timer value.
- 21 **USE_ERAM_s** – Use ERAM indicator. Indicates whether ERAM is to be used on the flexible
22 and variable data rate Supplemental Channel with turbo codes in RC4 and RC5 Forward
23 Link and RC4 Reverse Link.
- 24 **USE_FOR_HDM_SEQ_s** – Storage variable containing a flag indicating a pending
25 *Supplemental Channel Assignment Message* forward assignment that is linked to a *General*
26 *Handoff Direction Message*.
- 27 **USE_REV_HDM_SEQ_s** – Storage variable containing a flag indicating a pending
28 *Supplemental Channel Assignment Message* reverse assignment that is linked to a *General*
29 *Handoff Direction Message*.
- 30 **USE_T_ADD_ABORT_s** – A storage variable in the mobile station that contains the Reverse
31 Supplement Code Channel assignment T_ADD abort indicator.
- 32 **USE_TMSI_s** – Base station's preference of the use of TMSI.
- 33 **USER_ZONE_ID_s** – *User Zone Identification Message* sent indicator.
- 34 **USER_ZONE_ID_MSG_SEQ_s** – *User Zone Identification Message* sequence number.
- 35 **UZ_EXIT_IN_USE_s** – The User Zone Exit parameter that the mobile station received from
36 the *User Zone Identification Message* broadcast by the last base station of the old user zone.
- 37 **UZ_EXIT_RCVD_s** – The User Zone Exit parameter that the mobile station just received from
38 the *User Zone Identification Message* broadcast by the currently serving base station.

- 1 **UZID_s** – User Zone identifier.
- 2 **UZ_REC** – Record containing information about a User Zone broadcast by the base station
3 (see also UZ_REC_LIST).
- 4 **UZ_REC_LIST** – Broadcast User Zone record list. A descriptive structure used to manage
5 the base station’s information records about broadcast User Zones (see also UZ_REC).
- 6 **UZ_REV_s** – User Zone update revision number.
- 7 **ZONE_LIST_s** – Registration zone list. List of zones in which the mobile station has
8 registered.
- 9 **ZONE_TIMER_s** – Zone timer length.

10

1.2 Signaling Architecture

Layer 3 signaling for cdma2000 is modeled as follows:

- Protocol Layer.** Layer 3 generates Layer 3 PDUs and passes these PDUs to Lower Layers, where proper encapsulation into Lower Layer PDUs is performed. On the receiving end, Lower Layer PDUs are decapsulated and the resulting SDUs are sent from Lower Layers to Layer 3 for processing.
- Service Access Points.** SAPs and corresponding communication primitives are defined between the Layer 3 and Lower Layers over the data plane. No SAPs are defined for communications through the control plane.

1.3 Signaling and Functionality

1.3.1 General Architecture

The general architecture is presented in Figure 1.3.1-1.

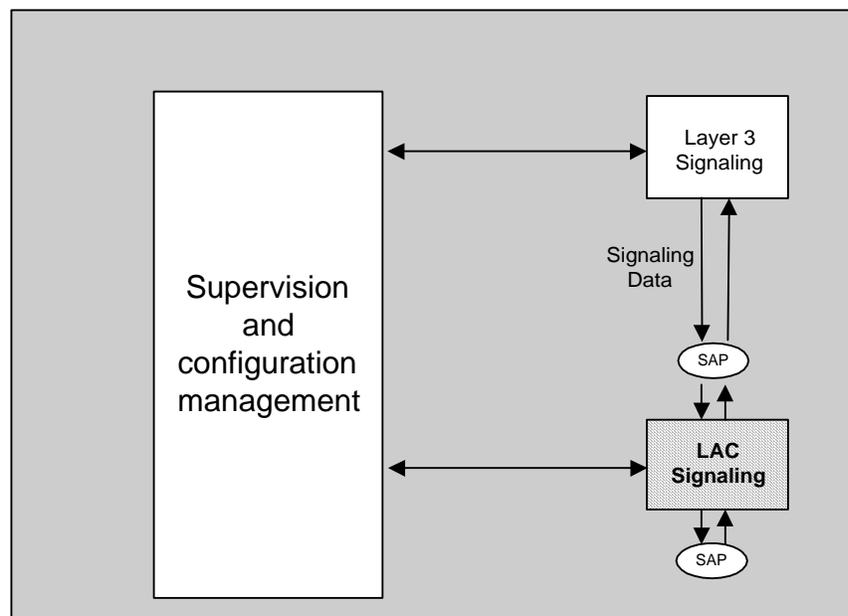

Figure 1.3.1-1. cdma2000 Signaling – General Architecture

1.3.2 Interface to Layer 2

The interface between Layer 3 and Layer 2 is a Service Access Point (SAP). At the SAP, Layer 3 and Layer 2 exchange Service Data Units (SDU) and interface control information in the form of Message Control and Status Blocks (MCSB) using a set of primitives.

1.3.2.1 Message Control and Status Block (MCSB)

The MCSB is a parameter block for the defined primitives, containing relevant information about an individual Layer 3 message (PDU), as well as instructions on how the message may be handled or how it is to be (for transmission), or was (for reception), processed by Layer 2. The MCSB is a conceptual construct and is not subject to detailed specification in this document; see [4] for more information on the content of the MCSB.

1 1.3.2.2 Interface Primitives

2 The following primitives are defined for communication between the Layer 3 and Layer 2:

3

4 Name: **L2-Data.Request**

5 Type: Request

6 Direction: Layer 3 to Layer 2

7 Parameters: PDU, MCSB

8 Action: The PDU is handed to Layer 2 for delivery across the radio interface.

9

10 Name: **L2-Data.Confirm**

11 Type: Confirm

12 Direction: Layer 2 to Layer 3

13 Parameters: MCSB

14 Action: Reception of the specified (in the MCSB) transmitted PDU was acknowledged
15 at Layer 2 by the addressee.

16

17 Name: **L2-Data.Indication**

18 Type: Indication

19 Direction: Layer 2 to Layer 3

20 Parameters: PDU, MCSB

21 Action: The received PDU is handed to Layer 3.

22

23 Name: **L2-Condition.Notification**

24 Type: Indication

25 Direction: Layer 2 to Layer 3

26 Parameters: MCSB

27 Action: Layer 3 is notified of a relevant event (e.g. abnormal condition) detected at
28 Layer 2. Details are indicated via the MCSB.

29

30 Name: **L2-Supervision.Request**

31 Type: Request

32 Direction: Layer 3 to Layer 2

33 Parameters: MCSB

1 Action: Layer 2 executes a control command as directed by Layer 3. This could be,
2 for example, an order to abandon retransmission of a message or an order
3 for local reset for the message sequence number, acknowledgment sequence
4 number and duplicate detection.

5 1.3.3 Reserved

7 1.3.4 Functional Description

8 In the Data Plane, Layer 3 originates and terminates signaling data units according to the
9 semantic and timing of the communication protocol between the base station and the
10 mobile station. From a semantic point of view the signaling data units are referred to as
11 “messages” (or “orders”). From a protocol point of view, the signaling data units are PDUs.
12 In general, the language of this specification does not explicitly distinguish between the
13 terms “PDU” and “Message”. It is considered that the context provides enough information
14 to allow the reader to make the appropriate distinctions.

15 1.3.5 PDU Transmission and Reception

16 Layer 3 employs the services offered at the interface with Layer 2 to transfer PDUs to and
17 from the Layer 3 entity.

18 When requesting the transmission of a PDU, Layer 3 will typically specify whether the
19 transfer will be performed in *assured mode* or in *unassured mode* (for example, by setting
20 the proper parameters in the MCSB argument of the L2-Data.Request primitive). For
21 transmission in assured mode, Layer 3 may specify if *confirmation of delivery* of the PDU is
22 required.

23 Layer 2 guarantees that an assured mode PDU received from the transmitting Layer 3
24 entity is delivered to the receiving Layer 3 entity. Each assured mode PDU is delivered to
25 the receiving Layer 3 entity only once and without errors. Additionally, if the transmitting
26 Layer 3 entity requests confirmation of delivery of an assured mode PDU, Layer 2 will send
27 an indication to the transmitting Layer 3 entity (for example by using the L2-Data.Confirm
28 primitive) when Layer 2 receives an acknowledgment for that PDU. If Layer 2 is not able to
29 deliver an assured mode PDU, it sends an indication of the failure to Layer 3 which can
30 then take corrective action.

31 Layer 2 does not guarantee that an unassured mode PDU received from the transmitting
32 Layer 3 entity is delivered to the receiving Layer 3 entity. Thus, Layer 2 acknowledgments
33 may not be required for unassured mode PDUs. To increase the probability of delivery of
34 unassured mode PDUs, Layer 3 may request Layer 2 to send those PDUs multiple times in
35 quick repeat sequence and rely on the duplicate detection capabilities of the receiver to
36 achieve uniqueness of delivery.

37 Layer 3 can also request Layer 2 to perform a reset of the Layer 2 ARQ procedures (for
38 example, by using the L2-Supervision.Request primitive).

39

2 REQUIREMENTS FOR MOBILE STATION CDMA OPERATION

This section defines requirements that are specific to CDMA mobile station equipment and operation. A CDMA mobile station may support operation in one or more band classes.

2.1 Reserved

2.2 Reserved

2.3 Security and Identification

2.3.1 Mobile Station Identification Number

Mobile stations operating in the CDMA mode are identified by the International Mobile Subscriber Identity (IMSI).⁹ Mobile Stations shall have two different identifiers, IMSI_T and IMSI_M. The IMSI consists of up to 15 numerical characters (0-9). The first three digits of the IMSI are the Mobile Country Code (MCC), and the remaining digits are the National Mobile Subscriber Identity (NMSI). The NMSI consists of the Mobile Network Code (MNC) and the Mobile Station Identification Number (MSIN). The IMSI structure is shown in Figure 2.3.1-1.

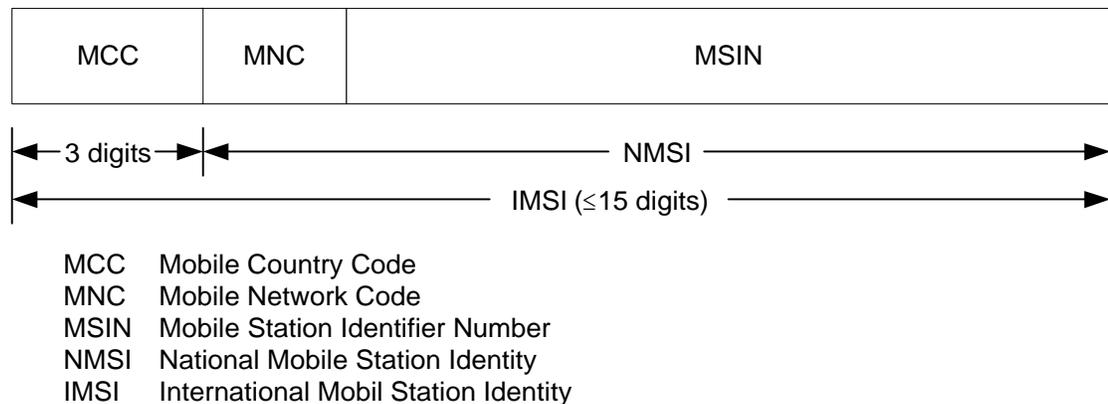

Figure 2.3.1-1. IMSI Structure

An IMSI that is 15 digits in length is called a class 0 IMSI (the NMSI is 12 digits in length); an IMSI that is less than 15 digits in length is called a class 1 IMSI (the NMSI is less than 12 digits in length).

IMSI_M is an IMSI that contains a MIN in the lower ten digits of the NMSI. An IMSI_M is always a class 0 IMSI. If the IMSI_M is not programmed, the mobile station shall set the

⁹ See [18].

1 four least-significant digits of the IMSI_M to the value of the ESN_p, converted directly from
 2 binary to decimal, modulo 10000, and the mobile station shall set the other digits to 0.

3 IMSI_T is an IMSI that is not associated with the MIN assigned to the mobile station. An
 4 IMSI_T can be a class 0 or class 1 IMSI. If the IMSI_T is not programmed, the mobile
 5 station shall set the four least-significant digits of the IMSI_T to the value of the ESN_p,
 6 converted directly from binary to decimal, modulo 10000, and the mobile station shall set
 7 the other digits to 0.

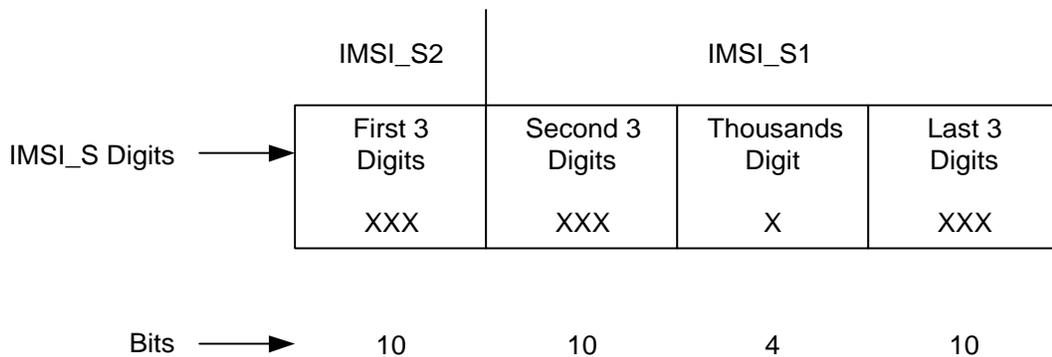

8 When operating in the CDMA mode the mobile station shall set its operational IMSI value,
 9 IMSI_O, to either the IMSI_M or the IMSI_T depending on the capabilities of the base
 10 station (See 2.6.2.2.5).

11 An IMSI_S is a 10-digit (34-bit) number derived from the IMSI. When an IMSI has 15
 12 digits, IMSI_S is equal to the least significant ten digits of the IMSI. When an IMSI has
 13 fewer than fifteen digits, zeros are added to the most significant side of MSIN to obtain a
 14 15-digit padded IMSI; IMSI_S is equal to the last 10-digit of the padded IMSI.

15 A 10-digit IMSI_S consists of 3- and 7-digit parts, called IMSI_S2 and IMSI_S1,
 16 respectively, as illustrated in Figure 2.3.1-2. IMSI_S is mapped into a 34-bit number (see
 17 2.3.1.1). The IMSI_S derived from IMSI_M is designated IMSI_M_S. The IMSI_S derived
 18 from IMSI_T is designated IMSI_T_S. The IMSI_S derived from IMSI_O is designated
 19 IMSI_O_S.

20 The mobile station shall have memory to store the 34-bit IMSI_M_S_p and the 34-bit
 21 IMSI_T_S_p. IMSI_M_S_p is represented by the 10-bit IMSI_M_S2_p and the 24 bit
 22 IMSI_M_S1_p. IMSI_T_S_p is represented by the 10-bit IMSI_T_S2_p and the 24 bit
 23 IMSI_T_S1_p.

24

25

26

27

Figure 2.3.1-2. IMSI_S Binary Mapping

28

29 When an IMSI has 15 digits, IMSI_{11_12} is equal to the 11th and 12th digits of the IMSI.
 30 When an IMSI has fewer than 15 digits, zeros are added to the most significant side of
 31 MSIN to obtain a 15-digit padded IMSI; the IMSI_{11_12} is equal to the 11th and 12th digits
 32 of the resulting number.

1 IMSI_11_12 is encoded as described in 2.3.1.2. The mobile station shall have memory to
2 store the 7-bit IMSI_M_11_12_p and the 7-bit IMSI_T_11_12_p.

3 The 3-digit MCC is encoded as described in 2.3.1.3. The mobile station shall have memory
4 to store the 10-bit MCC_M_p and the 10-bit MCC_T_p.

5 If the mobile station has a class 1 IMSI_T, it shall have memory to store
6 IMSI_T_ADDR_NUM_p. IMSI_T_ADDR_NUM_p is equal to the number of digits in the NMSI¹⁰
7 minus four.

8 2.3.1.1 Encoding of IMSI_M_S and IMSI_T_S

9 The IMSI_M_S and IMSI_T_S binary mapping is defined as follows:

- 10 1. The first three digits of the IMSI_M_S and the first three digits of the IMSI_T_S are
11 mapped into ten bits (corresponding to IMSI_M_S2_p and IMSI_T_S2_p, respectively)
12 by the following coding algorithm:
 - 13 a. Represent these three digits as D₁ D₂ D₃ with the digit equal to zero being given
14 the value of ten.
 - 15 b. Compute $100 \times D_1 + 10 \times D_2 + D_3 - 111$.
 - 16 c. Convert the result in step b to binary by the standard decimal-to-binary
17 conversion as shown in Table 2.3.1.1-1.

18

19

Table 2.3.1.1-1. Decimal to Binary Conversion Table

Decimal Number	Binary Number
0	0000000000
1	0000000001
2	0000000010
3	0000000011
4	0000000100
•	•
•	•
•	•
998	1111100110
999	1111100111

20

¹⁰ It is assumed that the number of digits in NMSI is greater than three.

- 1 a. $D_1 = 3; D_2 = 4; D_3 = 5$.
- 2 b. $100 \times D_1 + 10 \times D_2 + D_3 - 111 = 100 \times 3 + 10 \times 4 + 5 - 111 = 234$.
- 3 c. 234 in binary is '0011 1010 10'.

4 The next four most significant bits of IMSI_T_S1_p are derived from the thousands digit of
5 the IMSI_T_S (i.e., 6) by BCD conversion: 6 in BCD is '0110'.

6 The ten least significant bits of IMSI_T_S1_p are derived from the last three digits of the
7 IMSI_T_S (i.e., 789):

- 8 a. $D_1 = 7; D_2 = 8; D_3 = 9$.
- 9 b. $100 \times D_1 + 10 \times D_2 + D_3 - 111 = 100 \times 7 + 10 \times 8 + 9 - 111 = 678$.
- 10 c. 678 in binary is '10 1010 0110'.

11 Therefore, IMSI_T_S1_p is '0011 1010 1001 1010 1010 0110'.

12 2.3.1.2 Encoding of IMSI_M_11_12 and IMSI_T_11_12

13 The IMSI_M_11_12 and IMSI_T_11_12 binary mapping is defined as follows:

- 14 1. Represent the 11th digit as D_{11} and the 12th digit as D_{12} with the digit equal to
15 zero being given the value of ten.
- 16 2. Compute $10 \times D_{12} + D_{11} - 11$.
- 17 3. Convert the result in step 2 to binary by a standard decimal-to-binary conversion as
18 described in Table 2.3.1.1-1 and limit the resulting number to the 7 least significant
19 bits.

20 2.3.1.3 Encoding of the MCC_M and MCC_T

21 The MCC_M and MCC_T binary mapping is defined as follows:

- 22 1. Represent the 3-digit Mobile Country Code as $D_1 D_2 D_3$ with the digit equal to zero
23 being given the value of ten.
- 24 2. Compute $100 \times D_1 + 10 \times D_2 + D_3 - 111$.
- 25 3. Convert the result in step (2) to binary by a standard decimal-to-binary conversion
26 as described in Table 2.3.1.1-1.

27 2.3.1.4 Mobile Directory Number

28 A Mobile Directory Number (MDN) is a dialable number associated with the mobile station
29 through a service subscription. A Mobile Directory Number is not necessarily the same as
30 the mobile station identification on the air interface, i.e., MIN, IMSI_M or IMSI_T. An MDN
31 consists of up to 15 digits. The mobile station should have memory to store at least one
32 Mobile Directory Number (see Table F.3-1).

33 2.3.2 Electronic Serial Number (ESN), R-UIM Identifier (UIM_ID), and Mobile Equipment 34 Identifier (MEID)

35 The mobile station shall be configured with 32-bit ESN or 56-bit MEID, but not both. All
36 mobile stations with MOB_P_REV_p less than 11 shall be configured with ESN. All mobile

1 stations with MOB_P_REV_p greater than or equal to 11 shall be configured with MEID. The
2 ESN or MEID is used to uniquely identify a mobile station in a wireless system.

3 2.3.2.1 Electronic Serial Number (ESN)

4 The ESN value is available to procedures in the mobile station as the value of the variable
5 ESN_p. The value of the variable RN_HASH_KEY_s is the same as the value of the variable
6 ESN_p, and need not be stored separately.

7 2.3.2.2 Mobile Equipment Identifier (MEID)

8 The MEID value is available to procedures in the mobile station as the value of the variable
9 MEID_p. If the mobile station is configured with MEID, ESN_p stores 32-bit pseudo-ESN
10 value derived from MEID as defined in 2.3.2.2.1.

11 2.3.2.2.1 Pseudo-ESN

12 Pseudo-ESN is a 32-bit identifier derived from MEID.

13 Mobile station shall use the following procedure to derive pseudo-ESN from MEID¹¹:

- 14 1. The upper 8 bits of pseudo-ESN shall be set to 0x80.
- 15 2. The lower 24 bits of pseudo-ESN shall be the 24 least significant bits of the SHA-
16 1 digest of the MEID. See [41] for the specification of the SHA-1 algorithm.

17 2.3.2.3 R-UIM Identifier (UIM_ID, EXT_UIM_ID)

18 If the mobile station has a R-UIM which indicates that UIM ID is to be used, then the mobile
19 station shall use UIM_ID instead of ESN in every place where ESN is used in this document
20 with the exception of the ESN_ME information record (see [40]).

21 If the mobile station has a R-UIM which indicates that SF_EUIMID is to be used in place of
22 MEID, then the mobile station shall use SF_EUIMID instead of MEID in every place where
23 MEID is used in this document with the exception of the MEID_ME information record (see
24 [40]).

25 2.3.3 Station Class Mark

26 Class-of-station information referred to as the station class mark (SCM_p) must be stored in
27 a mobile station. The digital representation of this class mark is specified in Table 2.3.3-1.

28

¹¹ Example: if the 56-bit MEID is (hexadecimal) FF 00 00 01 12 34 56, the pseudo-ESN is (hexadecimal) 80 07 37 E1.

Table 2.3.3-1. Station Class Mark

Function	Bit(s)	Setting
Extended SCM Indicator	7	Band Classes 1,4,14 1XXXXXXX Other bands 0XXXXXXX
Dual Mode	6	Always 0 ¹² (CDMA Only) X0XXXXXX
Slotted Class	5	Non-Slotted XX0XXXXX Slotted XX1XXXXX
MEID support indicator ¹³	4	MEID not configured XXX0XXXX MEID configured XXX1XXXX
25 MHz Bandwidth	3	Always 1 XXXX1XXX
Transmission	2	Continuous XXXXX0XX Discontinuous XXXXX1XX
Power Class for Band Class 0 Analog Operation	1 - 0	Always 00 ¹⁴ XXXXXXX00

The mobile station shall set the Power Class function bits to '00'.

The mobile station shall set bit 4 (MEID support indicator) of the Station Class Mark field to '1' in the *Registration Message*, *Origination Message*, *Page Response Message*, *Terminal Information* and *Extended Terminal Information* information record.

2.3.4 Registration Memory

The mobile station shall have memory to store one element in the zone-based registration list ZONE_LIST_{s-p} (see 2.6.5.1.5 and 2.6.5.5). This stored element shall include both REG_ZONE and the corresponding (SID, NID) pair. The data retention time under power-off conditions shall be at least 48 hours. If, after 48 hours, the data integrity cannot be guaranteed, then the entry in ZONE_LIST_{s-p} shall be deleted upon power-on.

The mobile station shall have memory to store one element in the system/network registration list SID_NID_LIST_{s-p} (see 2.6.5.1.5 and 2.6.5.5). The data retention time under

¹² 'Dual Mode' bit is always set to '0' to indicate 'CDMA only' mode.

¹³ The corresponding bit '4' was previously defined as the IS-54 Power Class which was always set to '0'. The base station uses this field to identify mobile stations that comply with [47].

¹⁴ 'Power Class for Band Class 0 Analog Operation' bits are always set to '00' to indicate mobile station does not support analog mode operation.

1 power-off conditions shall be at least 48 hours. If, after 48 hours, the data integrity cannot
2 be guaranteed, then the entry in SID_NID_LIST_{s-p} shall be deleted upon power-on.

3 The mobile station shall have memory to store the distance-based registration variables
4 BASE_LAT_REG_{s-p}, BASE_LONG_REG_{s-p}, and REG_DIST_REG_{s-p} (see 2.6.5.1.4 and
5 2.6.5.5). The data retention time under power-off conditions shall be at least 48 hours. If,
6 after 48 hours, the data integrity cannot be guaranteed, then REG_DIST_REG_{s-p} shall be
7 set to zero upon power-on.

8 2.3.5 Access Overload Class

9 The 4-bit access overload class indicator (ACCOLC_p) is used to identify which overload
10 class controls access attempts by the mobile station and is used to identify redirected
11 overload classes in global service redirection.

12 The mobile station shall store 4-bit access overload class (ACCOLC_p). Mobile stations that
13 are not for test or emergency use should be assigned to overload classes ACCOLC 0
14 through ACCOLC 9. For mobile stations that are classified as overload classes ACCOLC 0
15 through ACCOLC 9, the mobile station's 4-bit access overload class indicator (ACCOLC_p)
16 shall be automatically derived from the last digit of the associated decimal representation of
17 the IMSI_M by a decimal to binary conversion as specified in Table 2.3.5-1. When a mobile
18 station's IMSI_M is updated, the mobile station shall re-calculate the ACCOLC_p as
19 indicated above. Mobile stations designated for test use should be assigned to ACCOLC
20 10; mobile stations designated for emergency use should be assigned to ACCOLC 11.

21 [Mobile stations designated for National Security/Emergency Preparedness should be](#)
22 [assigned to ACCOLC 12.](#) ACCOLC 13~~2~~ through ACCOLC 15 are reserved.¹⁵ Programming
23 the 4-bit ACCOLC_p for overload classes ACCOLC 10 through ACCOLC 15 as specified in
24 Table 2.3.5-2 shall require a special facility only available to equipment manufacturers and
25 system operators.

26 The content of ACCOLC_p shall not be visible through the mobile station's display.

27

¹⁵ For more information, refer to [28].

Table 2.3.5-1. ACCOLC_p Mapping for ACCOLC 0 through ACCOLC 9

2.3.6 Public Long Code Mask and Private Long Code Mask

The Public Long Code Mask and the Private Long Code Mask consist of 42 bits (see [2]).

When using a Public Long Code Mask, the long code mask is generated based on the value of PLCM_TYPE_S. When using the Private Long Code Mask, the value of PLCM_TYPE_S is maintained unless updated by the base station.

2.3.6.1 Public Long Code Mask Formats

The 42 bit Public Long Code Mask PLCM₄₂ is generated using PLCM₃₇ or PLCM₄₀ as defined in section 2.3.6.1.1, where the least significant bits PLCM₃₇ or PLCM₄₀ are set as defined in this section below.

1 The 42 bit Public Long Code Mask ADD_PLCM_FOR_FCH_42 is generated using
 2 ADD_PLCM_FOR_FCH_40 as defined in section 2.3.6.1.1, where the least significant bits
 3 ADD_PLCM_FOR_FCH_40 are set as defined in this section below.

4 The 42 bit Public Long Code Mask ADD_PLCM_FOR_SCH_42 is generated using
 5 ADD_PLCM_FOR_SCH_35 as defined in section 2.3.6.1.1, where the least significant bits
 6 ADD_PLCM_FOR_SCH_35 are set as defined in this section below.

7 If $PLCM_TYPE_s$ is equal to '0000', the 37 least significant bits (PLCM_37) are set as follows:

- 8 • Bits M_{36} through M_{32} shall be set to '11000';
- 9 • Bits M_{31} through M_0 shall be set to a permutation of the mobile station's ESN as
 10 follows:

$$11 \quad ESN = (E_{31}, E_{30}, E_{29}, E_{28}, E_{27}, E_{26}, E_{25}, \dots, E_2, E_1, E_0)$$

$$12 \quad \text{Permuted ESN} = (E_0, E_{31}, E_{22}, E_{13}, E_4, E_{26}, E_{17}, E_8, E_{30}, E_{21}, E_{12}, E_3, E_{25}, E_{16},$$

$$13 \quad E_7, E_{29}, E_{20}, E_{11}, E_2, E_{24}, E_{15}, E_6, E_{28}, E_{19}, E_{10}, E_1, E_{23}, E_{14},$$

$$14 \quad E_5, E_{27}, E_{18}, E_9).$$

15 If $PLCM_TYPE_s$ is equal to '0001', the 40 least significant bits (PLCM_40) are set as follows:

- 16 • Bit M_{39} shall be set to '1';
- 17 • Bits M_{38} through M_0 of the public long code mask shall be specified by $PLCM_39_s$
 18 and shall be set as follows:

$$19 \quad PLCM_39_s = (P_{38}, P_{37}, P_{36}, P_{35}, P_{34}, P_{33}, P_{32}, \dots, P_2, P_1, P_0)$$

20 If $ADD_PLCM_FOR_FCH_TYPE_s$ is equal to '1', the 40 least significant bits
 21 ($ADD_PLCM_FOR_FCH_40$) are set as follows:

- 22 • Bit M_{39} shall be set to '1';
- 23 • Bits M_{38} through M_0 of the public long code mask shall be specified by
 24 $ADD_PLCM_FOR_FCH_39_s$ and shall be set as follows:

$$25 \quad ADD_PLCM_FOR_FCH_39_s = (P_{38}, P_{37}, P_{36}, P_{35}, P_{34}, P_{33}, P_{32}, \dots, P_2, P_1, P_0)$$

26 If $ADD_PLCM_FOR_SCH_TYPE_s$ is equal to '1', the 35 least significant bits
 27 ($ADD_PLCM_FOR_SCH_35$) are set as follows:

- 28 • Bits M_{34} through M_0 of the public long code mask shall be specified by
 29 $ADD_PLCM_FOR_SCH_35_s$ and shall be set as follows:

$$30 \quad ADD_PLCM_FOR_SCH_35_s = (P_{34}, P_{33}, P_{32}, P_{31}, P_{30}, P_{29}, P_{28}, \dots, P_2, P_1, P_0)$$

31 If $PLCM_TYPE_s$ is equal to '0010', the 37 least significant bits (PLCM_37) are set as follows:

- 32 • Bits M_{36} through M_{34} shall be set to '001';
- 33 • Bits M_{33} through M_0 shall be set to IMSI_O_S.

34 If $PLCM_TYPE_s$ is equal to '0011', the 37 least significant bits (PLCM_37) are set as follows:

- 35 • Bits M_{36} through M_{34} shall be set to '000';
- 36 • Bits M_{33} through M_0 shall be set to IMSI_O_S.

1 If $PLCM_TYPE_s$ is equal to '0100', the 40 least significant bits ($PLCM_40$) are set as follows:

- 2 • Bit M_{39} shall be set to '0';
- 3 • Bits M_{38} through M_0 shall be set as follows:
 - 4 • The 39 least significant bits of the SHA-1 digest of the MEID¹⁶. See [41] for the
 - 5 specification of the SHA-1 algorithm.

6 2.3.6.1.1 Public Long Code Mask $PLCM_42$, $ADD_PLCM_FOR_FCH_42$ and
7 $ADD_PLCM_FOR_SCH_42$

8 If $PLCM_37$ is defined, the public long code mask $PLCM_42$ shall be as follows: bits M_{36}
9 through M_0 of the public long code mask shall be specified by $PLCM_37$ (see 2.3.6). Bits
10 M_{41} through M_{37} shall be set to '11000'. The resulting public long code mask $PLCM_42$ is
11 shown in Figure 2.3.6.1-1 (a).

12 If $PLCM_40$ is defined, the public long code mask $PLCM_42$ shall be as follows: bits M_{39}
13 through M_0 of the public long code mask shall be specified by $PLCM_40$ (see 2.3.6.1). Bits
14 M_{41} through M_{40} shall be set to '10'. The resulting public long code mask $PLCM_42$ is
15 shown in Figure 2.3.6.1-1 (b).

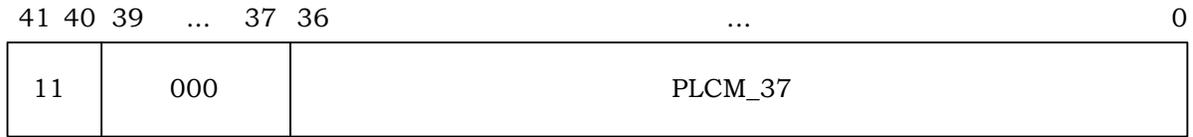

16 If $ADD_PLCM_FOR_FCH_40$ is defined, the public long code mask
17 $ADD_PLCM_FOR_FCH_42$ shall be as follows: bits M_{39} through M_0 of the public long code
18 mask shall be specified by $ADD_PLCM_FOR_FCH_40$ (see 2.3.6.1). Bits M_{41} through M_{40}
19 shall be set to '10'. The resulting public long code mask $ADD_PLCM_FOR_FCH_42$ is
20 shown in Figure 2.3.6.1-1 (c).

21 If $ADD_PLCM_FOR_SCH_35$ is defined, the public long code mask
22 $ADD_PLCM_FOR_SCH_42$ shall be as follows: bits M_{34} through M_0 of the public long code
23 mask shall be specified by $ADD_PLCM_FOR_SCH_35$ (see 2.3.6.1). Bits M_{41} through M_{35}
24 shall be set to '1100111'. The resulting public long code mask $ADD_PLCM_FOR_SCH_42$ is
25 shown in Figure 2.3.6.1-1 (d).

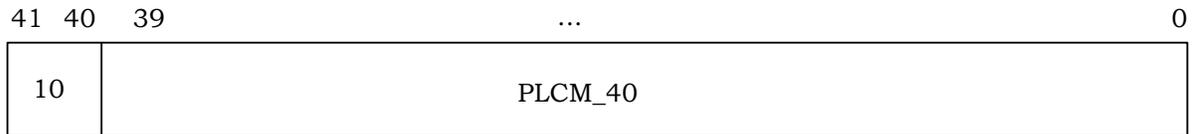

26

¹⁶ Example: if the 56-bit MEID is (hexadecimal) FF 00 00 01 12 34 56, the bits M_{38} through M_0 of $PLCM$ are (hexadecimal) 1A 0E 07 37 E1, and (binary) '001 1010 0000 1110 0000 0111 0011 0111 1110 0001'.

6

2.3.6.2 Private Long Code Mask PVTLCM_42

7

The 42 bit private long code mask PVTLCM_42 shall be as follows: Bits M₄₁ through M₄₀ shall be set to '01'. Bits M₃₉ through M₀ shall be the 40 least significant bits of the Voice Privacy Mask (VPM) generated by the Key_VPM_Generation procedure or CDMA_3G_2G_Conversion procedure. M₀ of the private long code mask shall be the least significant bit of the VPM. See [15] for details of the Key_VPM_Generation procedure and see [44] for details of the CDMA_3G_2G_Conversion procedure. The resulting private long code mask PVTLCM_42 is shown in Figure 2.3.6.2-1.

9

10

11

12

13

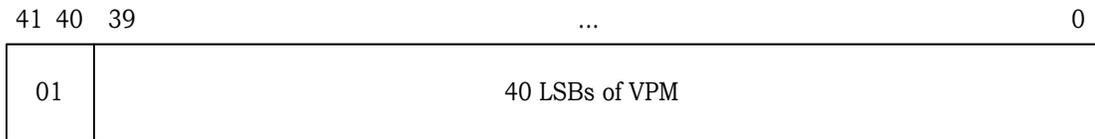

Figure 2.3.6.2-1 Private Long Code Mask PVTLCM_42 Format

2.3.7 Reserved

2.3.8 Home System and Network Identification

The mobile station shall provide memory to store at least one home (SID_p, NID_p) pair. The mobile station shall also provide memory to store the 1-bit parameters MOB_TERM_HOME_p, MOB_TERM_FOR_SID_p, and MOB_TERM_FOR_NID_p (see 2.6.5.3).

2.3.9 Local Control Option

If the mobile station supports the local control option, a means shall be provided within the mobile station to enable or disable the local control option.

2.3.10 Preferred Operation Selection

2.3.10.1 Preferred System

If the mobile station supports operation in Band Class 0 or Band Class 3 (see [2]), a means shall be provided within the mobile station to identify the preferred system. In addition, the mobile station may provide a means for allowing operation only with System A or only with System B.

2.3.10.2 Reserved

2.3.11 Discontinuous Reception

The mobile station shall provide memory to store the preferred slot cycle index, SLOT_CYCLE_INDEX_p (see 2.6.2.1.1.3.2).

2.3.12 Authentication, Encryption of Signaling Information/User Data and Voice Privacy

2.3.12.1 Authentication

Authentication is the process by which information is exchanged between a mobile station and base station for the purpose of confirming the identity of the mobile station. A successful outcome of the authentication process occurs only when it can be demonstrated that the mobile station and base station possess identical sets of shared secret data.

The authentication algorithms are described in [15]. The interface (input and output parameters) for the algorithms is described in [23], Table 2.3.12.1-1 summarizes the setting of the input parameters of the Auth_Signature procedure for each of its uses in this standard.

For authentication purposes, the mobile station shall use IMSI_M if it is programmed; otherwise, the mobile station shall use IMSI_T. The base station uses the IMSI selected according to the same criteria.

Table 2.3.12.1-1. Auth_Signature Input Parameters

Procedure	RAND_CHALLENGE	ESN	AUTH_DATA	SSD_AUTH	SAVE_REGISTERS
Unique Challenge (2.3.12.1.4)	RANDU and 8 LSBs of IMSI_S2	ESN _p	IMSI_S1	SSD_A	TRUE if GEN_CMEKEY is set to 1 in the AUCM; otherwise FALSE

2.3.12.1.1 Shared Secret Data (SSD)

SSD is a 128-bit quantity that is stored in semi-permanent memory in the mobile station and is readily available to the base station. As depicted in Figure 2.3.12.1.1-1, SSD is partitioned into two distinct subsets. Each subset is used to support a different process.

Contents	SSD_A	SSD_B
Length (bits)	64	64

Figure 2.3.12.1.1-1. Partitioning of SSD

SSD_A is used to support the authentication procedures and SSD_B is used to support voice privacy (see 2.3.12.3) and message encryption (see 2.3.12.2). SSD is generated according to the procedure specified in 2.3.12.1.5. The SSD shall not be accessible to the user.

2.3.12.1.2 Random Challenge Memory (RAND)

RAND is a 32-bit value held in the mobile station. When operating in CDMA mode, it is equal to the RAND value received in the last *Access Parameters Message* (see 3.7.2.3.2.2) or the *ANSI-41 RAND Message* (see 3.7.2.3.2.31) of the CDMA f-csch.

RAND_s is used in conjunction with SSD_A and other parameters, as appropriate, to authenticate mobile station originations, terminations and registrations.

2.3.12.1.3 Call History Parameter (COUNT_{s-p})

COUNT_{s-p} is a modulo-64 count held in the mobile station. COUNT_{s-p} is updated by the mobile station when a *Parameter Update Order* is received on the f-dsch (see 3.7.4).

2.3.12.1.4 Unique Challenge-Response Procedure

The Unique Challenge-Response Procedure is initiated by the base station and can be carried out either on the f-csch and r-csch, or on the f-dsch and r-dsch. The procedure is as follows:

The base station generates the 24-bit quantity RANDU and sends it to the mobile station in the *Authentication Challenge Message* on either the f-csch or f-dsch. Upon receipt of the

1 *Authentication Challenge Message*, the mobile station shall set the input parameters of the
 2 Auth_Signature procedure (see [23] section 2.3) as illustrated in Figure 2.3.12.1.5-3. The
 3 24 most significant bits of the RAND_CHALLENGE input parameter shall be filled with
 4 RANDU, and the 8 least significant bits of RAND_CHALLENGE shall be filled with the 8
 5 least significant bits of IMSI_S2.

6 The mobile station shall set the SAVE_REGISTERS input parameter to TRUE if the
 7 GEN_CMEAKEKEY field is set to '1' and FALSE if the GEN_CMEAKEKEY is set to '0'.

8 The mobile station shall then execute the Auth_Signature procedure. The 18-bit output
 9 AUTH_SIGNATURE shall be used to fill the AUTHU field of the *Authentication Challenge*
 10 *Response Message*, which shall be sent to the base station.

11 The base station computes the value of AUTHU in the same manner as the mobile station,
 12 but using its internally stored value of SSD_A. The base station compares its computed
 13 value of AUTHU to the value received from the mobile station. If the comparison fails, the
 14 base station may deny further access attempts by the mobile station, drop the call in
 15 progress, or initiate the process of updating SSD (see 2.3.12.1.5).

16 Upon receiving delivery confirmation for the *Authentication Challenge Response Message*
 17 from the LAC layer indicating a successful Unique Challenge, MS may perform the
 18 following procedure: If GEN_CMEAKEKEY was set to '1' in the *Authentication Challenge*
 19 *Message* and either of the following conditions is met:

- 20 • If neither encryption nor integrity protection is turned on and mobile station wants
 21 to turn on encryption or integrity protection or both.
- 22 • If the encryption or integrity protection is turned on and mobile station wants to
 23 switch to new keys based on new SSD.

24 the mobile station shall perform the following procedures:

- 25 • If MSG_INTEGRITY_SUPs is equal to '1', the mobile station then associates a
 26 pending key id NEW_KEY_ID with the pending CMEAKEKEY.
- 27 • The mobile station shall send a *Security Mode Request Message*. If
 28 MSG_INTEGRITY_SUPs is equal to '0', the mobile station shall select a 24-bit
 29 number and include this number in the NEW_SSEQ_H field in the *Security Mode*
 30 *Request Message*; otherwise, the mobile station shall select a 24-bit number and
 31 deliver this number to the LAC Layer along with the *Security Mode Request Message*.
- 32 • Upon reception of the *Security Mode Request Message*, the base station validates the
 33 NEW_SSEQ_H_SIG field in the message. If validation returns success, then the
 34 CMEAKEKEY associated with the AUTHU generated during Unique Challenge-
 35 Response procedure and the pending NEW_SSEQ_H can become "in use" in the
 36 base station. If Voice Privacy was enabled during this procedure, the base station
 37 shall indicate to the mobile station to disable Voice Privacy. The base station then
 38 confirms the key set-up by sending the *Security Mode Command Message* to the
 39 mobile station. Upon reception of *Security Mode Command Message*, the CMEAKEKEY
 40 associated with the AUTHU generated during Unique Challenge-Response
 41 procedure, the pending NEW_SSEQ_H and key id become "in use" for the mobile
 42 station.

2.3.12.1.5 Updating the Shared Secret Data (SSD)

SSD is updated using the SSD_Generation procedure (see [23], section 2.2.1), initialized with mobile station specific information, random data, and the mobile station's A-key. The A-key is 64 bits long. It is assigned to the mobile station and is stored in the mobile station's permanent security and identification memory. The A-key is known only to the mobile station and to its associated Home Location Register/Authentication Center (HLR/AC) (see [13]). Non-manual methods, such as described in [26], are preferred for entry of the A-key into the mobile station. A manual method of entry that may be used when automated methods are not available is described in [29].

The SSD update procedure is performed as follows (see Figure 2.3.12.1.5-1):

The base station sends an *SSD Update Message* on either the f-csch or the f-dsch. The RANDSSD field of the *SSD Update Message* contains the same value used for the HLR/AC computation of SSD.

Upon receipt of the *SSD Update Message* the mobile station shall set the input parameters of the SSD_Generation procedure (see [23], section 2.2.1) as illustrated in Figure 2.3.12.1.5-2. The mobile station shall then execute the SSD_Generation procedure. The mobile station shall set SSD_A_NEW and SSD_B_NEW to the outputs of the SSD_Generation procedure.

The mobile station shall then select a 32-bit random number, RANDBS, and shall send it to the base station in a *Base Station Challenge Order* on the r-csch or r-dsch.

Both the mobile station and the base station shall then set the input parameters of the Auth_Signature procedure (see [23], section 2.3) as illustrated in Figure 2.3.12.1.5-3 and shall execute the Auth_Signature procedure.

The mobile station and base station shall set the SAVE_REGISTERS input parameter to FALSE.

The mobile station and base station shall execute the Auth_Signature procedure. AUTHBS is set to the 18-bit result AUTH_SIGNATURE. The base station sends its computed value of AUTHBS to the mobile station in a *Base Station Challenge Confirmation Order* on the f-csch or the f-dsch.

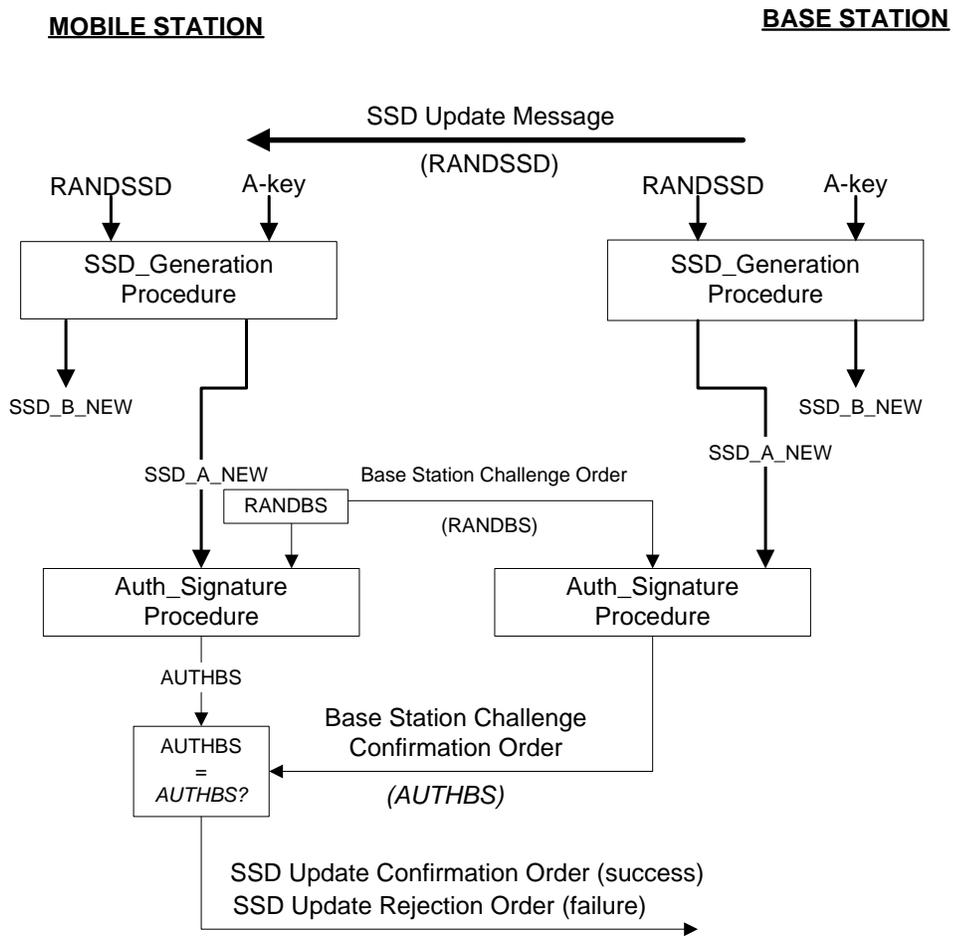

Upon receipt of the *Base Station Challenge Confirmation Order* the mobile station shall compare the received value of AUTHBS to its internally computed value. (If the mobile station receives a *Base Station Challenge Confirmation Order* when an SSD update is not in progress, the mobile station shall respond with an *SSD Update Rejection Order*.)

If the comparison is successful, the mobile station shall execute the SSD_Update procedure (see [23], section 2.2.2) to set SSD_A and SSD_B to SSD_A_NEW and SSD_B_NEW, respectively. The mobile station shall then send an *SSD Update Confirmation Order* to the base station, indicating successful completion of the SSD update.

If the comparison is not successful, the mobile station shall discard SSD_A_NEW and SSD_B_NEW. The mobile station shall then send an *SSD Update Rejection Order* to the base station, indicating unsuccessful completion of the SSD update.

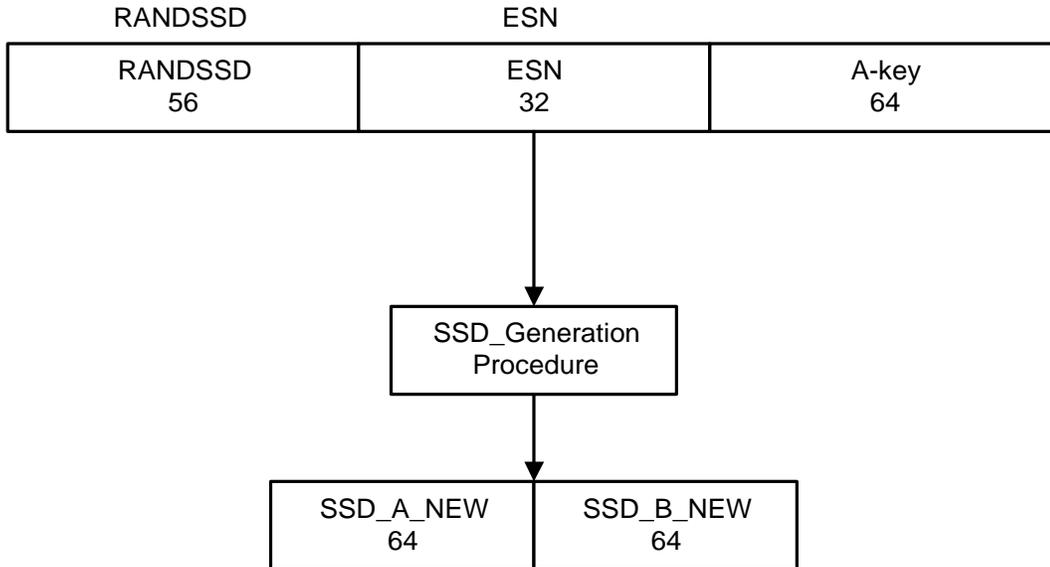

1 Upon receipt of the *SSD Update Confirmation Order*, the base station sets SSD_A and
 2 SSD_B to the values received from the HLR/AC (see [13]).
 3 If the mobile station fails to receive the *Base Station Challenge Confirmation Order* within
 4 T_{64m} seconds of when the acknowledgment to the *Base Station Challenge Order* was
 5 received, the mobile station shall discard SSD_A_NEW and SSD_B_NEW. The mobile
 6 station shall then terminate the SSD update process.

2.3.12.2 Signaling Message Encryption

In an effort to enhance the authentication process and to protect sensitive subscriber information (such as PINs), a method is provided to encrypt certain fields of selected f-dsch or r-dsch signaling messages.

The following is a description of the messages on f-dsch (see 2.3.12.2.1) and r-dsch (see 2.3.12.2.2) that are enciphered using the Cellular Message Encryption Algorithm (see section 2.5.1, [15]) or the Enhanced Cellular Message Encryption Algorithm (see section 2.5.2, [15]), and when ENCRYPT_MODE_s is set to '01' or '10'. The availability of encryption algorithm information is under government control.

For each message, the enciphered fields are identified. The messages are grouped by channel designation.

Messages shall not be encrypted if authentication is not performed (AUTH_s is set to '00'). See [23] for details of the initialization and use of the encryption procedure.

Signaling message encryption is controlled for each call individually. If P_REV_IN_USE_s is less than or equal to six, the mobile station identifies its encryption capability in the ENCRYPTION_SUPPORTED field in *the Origination Message* and the *Page Response Message* as shown in Table 2.7.1.3.2.4-5. If P_REV_IN_USE_s is greater than or equal to seven, the mobile station identifies its encryption capability in the SIG_ENCRYPT_SUP field in *Registration Message*, *Origination Message*, *Page Response Message*, *Security Mode Request Message*, and the encryption capability information record in *Status Response Message* and *Extended Status Response Message*, as shown in Table 2.7.1.3.2.1-5. The initial encryption mode for the call is established by setting the ENCRYPT_MODE field to '00', '01', or '10' in the *Channel Assignment Message* or in the *Extended Channel Assignment Message*. If ENCRYPT_MODE is set to '00', message encryption is off. To turn encryption on after channel assignment, the base station sends one of the following f-dsch messages to the mobile station:

- *Extended Handoff Direction Message* with the ENCRYPT_MODE field set to '01' or '10'
- *General Handoff Direction Message* with the ENCRYPT_MODE field set to '01' or '10'
- *Universal Handoff Direction Message* with the ENCRYPT_MODE field set to '01' or '10'
- *Message Encryption Mode Order* with the ENCRYPT_MODE field set to '01' or '10'

To turn signaling message encryption off, the base station sends one of the following f-dsch messages to the mobile station:

- *Extended Handoff Direction Message* with the ENCRYPT_MODE field set to '00'
- *General Handoff Direction Message* with the ENCRYPT_MODE field set to '00'
- *Universal Handoff Direction Message* with the ENCRYPT_MODE field set to '00'
- *Message Encryption Mode Order* with the ENCRYPT_MODE field set to '00'

Encryption shall apply only to the part of the Layer 3 message specified below.

1 When encryption is off, all fields of all Layer 3 messages sent by the mobile station and
2 base station are unencrypted.

3 When additional octets are inserted, the overall Lower Layers message length is updated to
4 reflect the addition. Specific Layer 3 record length fields (e.g., RECORD_LEN,
5 NUM_FIELDS, or NUM_DIGITS) shall not be affected by the insertion of additional bits.

6 If the Enhanced Cellular Message Encryption Algorithm is used, the following requirements
7 apply:

- 8 • The mobile station and base station shall each maintain an 8-bit encryption
9 sequence counter. The encryption sequence counter shall be incremented modulo
10 256 for each new encryption. The counter value, hereafter called ES_COUNT, shall
11 be used to form the SYNC parameter of the Enhanced Cellular Message Encryption
12 Algorithm as described below.
- 13 • As part of each encryption, an additional octet of value ES_COUNT shall be inserted
14 immediately following the encrypted part of the message. This additional octet shall
15 not be encrypted. The additional octet shall be removed from the message after
16 decryption.

17 2.3.12.2.1 Encrypted Messages on the f-dsch

18 When encryption is on (ENCRYPT_MODE_s equal to binary '01' or '10'), the encryptable
19 fields of the following messages sent on f-dsch, as listed below, shall be encrypted. All other
20 messages sent on f-dsch shall be unencrypted.

21 1. Alert With Information Message (see 3.7.3.3.2.3) and Extended Alert With Information
22 Message (see 3.7.3.3.2.42) are encrypted.

23 The type-specific fields of all information records (see 3.7.5) shall be encrypted. For
24 each information record, the type-specific fields shall be treated by the encryption
25 procedure as a new single message. If the type-specific fields of an information record
26 consist of a single octet (RECORD_LEN field equal to 1), an additional octet of value
27 '00000000' shall be inserted following the information record and shall be encrypted as
28 if part of the record. (If the RECORD_LEN field is 0, the information record contains no
29 type-specific fields, and the record contains no encrypted data.)

30 No other fields in the *Alert With Information Message* and *Extended Alert With*
31 *Information Message* are encrypted.

32 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_s
33 equal to binary '10'), the following requirements apply for each information record:

- 34 • The DATA_TYPE parameter shall be set to '0'.
- 35 • The SYNC parameter shall be set as follows:
 - 36 - SYNC[0] = ES_COUNT
 - 37 - SYNC[1] = RECORD_TYPE

38 2. Flash With Information Message (see 3.7.3.3.2.14) and Extended Flash With
39 Information Message (see 3.7.3.3.2.43) are encrypted.

1 The type-specific fields of all information records (see 3.7.5) shall be encrypted. For
 2 each information record, the type-specific fields shall be treated by the encryption
 3 procedure as a new single message. If the type-specific fields of an information record
 4 consist of a single octet (RECORD_LEN field equal to 1), an additional octet of value
 5 '00000000' shall be inserted following the information record and shall be encrypted as
 6 if part of the record. (If the RECORD_LEN field is 0, the information record contains no
 7 type-specific fields, and the record contains no encrypted data.)

8 No other fields in the *Flash With Information Message* and *Extended Flash With*
 9 *Information Message* are encrypted.

10 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_s
 11 equal to binary '10'), the following requirements apply for each information record:

- 12 • The DATA_TYPE parameter shall be set to '0'.
- 13 • The SYNC parameter shall be set as follows:
 - 14 - SYNC[0] = ES_COUNT
 - 15 - SYNC[1] = RECORD_TYPE

16 3. *Send Burst DTMF Message* (see 3.7.3.3.2.9) is encrypted.

17 The DIGIT_i fields of the *Send Burst DTMF Message* shall be encrypted. These fields are
 18 treated by the encryption procedure as a new single message, with the 4-bit digit codes
 19 packed into consecutive octets. If the NUM_DIGITS field contains an odd number, four
 20 bits of value '0000' shall follow the last digit and shall be included in the encrypted
 21 message. If NUM_DIGITS is less than 3, an additional eight bits of value '00000000'
 22 shall follow the DIGIT_i fields and shall be included in the encrypted part of the
 23 message.

24 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_s
 25 equal to binary '10'), the following requirements apply:

- 26 • The DATA_TYPE parameter shall be set to '0'.
- 27 • The SYNC parameter shall be set as follows:
 - 28 - SYNC[0] = ES_COUNT
 - 29 - SYNC[1] = MSG_TYPE = '00001001'

30 4. *Continuous DTMF Tone Order* (see 3.7.3.3.2.1) is encrypted.

31 The 16 bits comprised of ADD_RECORD_LEN, the order-specific fields and the first five
 32 (5) bits of the RESERVED field shall be encrypted. These fields shall be treated by the
 33 encryption procedure as a new single message.

34 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_s
 35 equal to binary '10'), the following requirements apply:

- 36 • The DATA_TYPE parameter shall be set to '0'.
- 37 • The SYNC parameter shall be set as follows:
 - 38 - SYNC[0] = ES_COUNT

1 - SYNC[1] = MSG_TYPE = '00000001'

2 5. *Data Burst Message* (see 3.7.3.3.2.4) is encrypted.

3 If BURST_TYPE is equal to '111110' or '111111', all CHAR_i fields after the first two shall
4 be encrypted; otherwise, all CHAR_i fields shall be encrypted.

5 If the CHAR_i field consists of a single octet (NUM_FIELDS field equal to 1), an
6 additional octet of value '00000000' shall be inserted following the information record
7 and shall be encrypted as if part of the record. (If the NUM_FIELDS field is 0, the
8 information record contains no type-specific fields, and the record contains no
9 encrypted data).

10 If the Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_s equal to
11 binary '01'), the following requirements apply:

- 12 • If BURST_TYPE is equal to '000011' (SMS) or '000100' (OTASP), the message shall
13 be encrypted.
- 14 • For all other values of BURST_TYPE, the message shall be encrypted only if
15 encryption is required by the service option standard governing use of the *Data*
16 *Burst Message*; otherwise, the message shall not be encrypted.

17 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_s
18 equal to binary '10'), the following requirements apply:

- 19 • If BURST_TYPE is equal to '000100' (OTASP), the DATA_TYPE parameter shall be
20 set to '0'. Otherwise, the DATA_TYPE parameter shall be set to '1'.
- 21 • The SYNC parameter shall be set as follows:
 - 22 - SYNC[0] = ES_COUNT
 - 23 - SYNC[1] = MSG_TYPE = '00000100'

24 6. *Power Up Function Completion Message* (see 3.7.3.3.2.30) is encrypted.

25 If the LOC_IND field is set to '1', the fields RESERVED (3 bits), MS_LAT (22 bits),
26 MS_LONG (23 bits), and MS_LOC_TSTAMP (24 bits) are encrypted. These fields shall be
27 treated by the encryption procedure as a new single message.

28 Otherwise, if the LOC_IND field is set to '0', no fields in this message are encrypted.

29 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_s
30 equal to binary '10'), the following requirements apply:

- 31 • The DATA_TYPE parameter shall be set to '1'.
- 32 • The SYNC parameter shall be set as follows:
 - 33 - SYNC[0] = ES_COUNT
 - 34 - SYNC[1] = MSG_TYPE = '00011110'

1 2.3.12.2 Encrypted Messages on the r-dsch

2 When encryption is on (ENCRYPT_MODE_s equal to binary '01' or '10') the encryptable fields
3 of the following r-dsch Layer 3 messages, as listed below, shall be encrypted. All other r-
4 dsch messages shall be unencrypted.

5 1. Origination Continuation Message (see 2.7.2.3.2.9) and Enhanced Origination Message
6 are encrypted.

7 The CHARi fields of the *Origination Continuation Message* and *Enhanced Origination*
8 *Message* shall be encrypted. These fields shall be treated by the encryption procedure
9 as a new single message, with the character codes packed into consecutive octets. If
10 DIGIT_MODE is '0' and the NUM_FIELDS field contains an odd number, four bits of
11 value '0000' shall follow the last digit and shall be included in the encrypted part of the
12 message. In addition, if ENCRYPT_MODE_s is equal to '01', the following requirement
13 applies

- 14 • If DIGIT_MODE is '0' and NUM_FIELDS is less than 3, or if DIGIT_MODE is '1' and
15 NUM_FIELDS is less than 2, an additional eight bits of value '00000000' shall follow
16 the CHARi fields and shall be included in the encrypted part of the message.

17 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_s
18 equal to binary '10'), the following requirements apply:

- 19 • The DATA_TYPE parameter shall be set to '0'.
- 20 • The SYNC parameter shall be set as follows:
 - 21 - SYNC[0] = ES_COUNT
 - 22 - SYNC[1] = MSG_TYPE = '00001001' for *Origination Continuation Message*
 - 23 - SYNC[1] = MSG_TYPE = '00011010' for *Enhanced Origination Message*

24 The type-specific fields of all information records (see 2.7.4) in the *Origination*
25 *Continuation Message* and *Enhanced Origination Message* shall be encrypted. For each
26 information record, the type-specific fields shall be treated by the encryption procedure
27 as a new single message. If the type-specific fields of an information record consist of a
28 single octet (RECORD_LEN field equal to 1), an additional octet of value '00000000'
29 shall be inserted following the information record and shall be encrypted as if part of
30 the record. (If the RECORD_LEN field is 0, the information record contains no type-
31 specific fields, and the record contains no encrypted data.)

32 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_s
33 equal to binary '10'), the following requirements apply for each information record:

- 34 • The DATA_TYPE parameter shall be set to '0'.
- 35 • The SYNC parameter shall be set as follows:
 - 36 - SYNC[0] = ES_COUNT
 - 37 - SYNC[1] = RECORD_TYPE

38 2. Flash With Information Message (see 2.7.2.3.2.3) and Extended Flash With Information

1 Message (see 2.7.2.3.2.32) are encrypted.

2 The type-specific fields of all information records (see 2.7.4) shall be encrypted. For
 3 each information record, the type-specific fields shall be treated by the encryption
 4 procedure as a new single message. If the type-specific fields of an information record
 5 consist of a single octet (RECORD_LEN field equal to 1), an additional octet of value
 6 '00000000' shall be inserted following the information record and shall be encrypted as
 7 if part of the record. (If the RECORD_LEN field is 0, the information record contains no
 8 type-specific fields, and the record contains no encrypted data.)

9 No other fields in the *Flash With Information Message* and *Extended Flash With*
 10 *Information Message* are encrypted.

11 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_s
 12 equal to binary '10'), the following requirements apply for each information record:

- 13 • The DATA_TYPE parameter shall be set to '0'.
- 14 • The SYNC parameter shall be set as follows:
 - 15 - SYNC[0] = ES_COUNT
 - 16 - SYNC[1] = RECORD_TYPE

17 3. *Send Burst DTMF Message* (see 2.7.2.3.2.7) is encrypted.

18 The DIGIT_i fields of the *Send Burst DTMF Message* shall be encrypted. These fields
 19 shall be treated by the encryption procedure as a new single message, with the 4-bit
 20 digit codes packed into consecutive octets. If the NUM_DIGITS field contains an odd
 21 number, four bits of value '0000' shall follow the last digit and shall be included in the
 22 encrypted message. If NUM_DIGITS is less than 3, an additional eight bits of value
 23 '00000000' shall follow the DIGIT_i fields and shall be included in the encrypted part of
 24 the message.

25 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_s
 26 equal to binary '10'), the following requirements apply:

- 27 • The DATA_TYPE parameter shall be set to '0'.
- 28 • The SYNC parameter shall be set as follows:
 - 29 - SYNC[0] = ES_COUNT
 - 30 - SYNC[1] = MSG_TYPE = '00000111'

31 4. *Continuous DTMF Tone Order* (see 2.7.2.3.2.1) is encrypted.

32 The 16 bits comprised of ADD_RECORD_LEN, the order-specific fields and the first five
 33 (5) bits of the RESERVED field shall be encrypted. These fields shall be treated by the
 34 encryption procedure as a new single message.

35 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_s
 36 equal to binary '10'), the following requirements apply:

- 37 • The DATA_TYPE parameter shall be set to '0'.
- 38 • The SYNC parameter shall be set as follows:

- 1 - SYNC[0] = ES_COUNT
2 - SYNC[1] = MSG_TYPE = '00000001'

3 5. *Data Burst Message* (see 2.7.2.3.2.4) is encrypted.

4 If BURST_TYPE is equal to '111110' or '111111', all CHAR_i fields after the first two shall
5 be encrypted; otherwise, all CHAR_i fields shall be encrypted.

6 If the CHAR_i field consists of a single octet (NUM_FIELDS field equal to 1), an
7 additional octet of value '00000000' shall be inserted following the information record
8 and shall be encrypted as if part of the record. (If the NUM_FIELDS field is 0, the
9 information record contains no type-specific fields, and the record contains no
10 encrypted data).

11 If the Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_S equal to
12 binary '01'), the following requirements apply:

- 13 • If BURST_TYPE is equal to '000011' (SMS) or '000100' (OTASP), the message shall
14 be encrypted.
- 15 • For all other values of BURST_TYPE, the message shall be encrypted only if
16 encryption is required by the service option standard governing use of the *Data*
17 *Burst Message*; otherwise, the message shall not be encrypted.

18 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT_MODE_S
19 equal to binary '10'), the following requirements apply:

- 20 • If BURST_TYPE is equal to '000100' (OTASP), the DATA_TYPE parameter shall be
21 set to '0'. Otherwise, the DATA_TYPE parameter shall be set to '1'.
- 22 • The SYNC parameter shall be set as follows:

- 23 - SYNC[0] = ES_COUNT
- 24 - SYNC[1] = MSG_TYPE = '00000100'

25 2.3.12.3 Voice Privacy

26 Also see [2].

27 Voice privacy is provided in the CDMA system by means of the private long code mask used
28 for PN spreading.

29 Voice privacy is provided on the Traffic Channels only. All calls are initiated using the
30 public long code mask for PN spreading. The mobile station user may request voice privacy
31 during call set-up using the *Origination Message* or *Page Response Message*, and during
32 Traffic Channel operation using the *Long Code Transition Request Order*.

33 The transition to private long code mask shall not be performed if authentication is not
34 performed (AUTH_S is set to '00' or mobile station unable to perform authentication).

35 To initiate a transition to the private or public long code mask, either the base station or
36 the mobile station sends a *Long Code Transition Request Order* on the f-dsch or r-dsch. The
37 mobile station actions in response to receipt of this order are specified in 2.6.4, and the
38 base station actions in response to receipt of this order are specified in 3.6.4.

1 The base station can also cause a transition to the private or public long code mask by
 2 sending the *Extended Handoff Direction Message*, the *General Handoff Direction Message*, or
 3 the *Universal Handoff Direction Message* with the PRIVATE_LCM bit set appropriately.

4 2.3.12.4 Extended Encryption for Signaling Message and User Information

5 Extended encryption is an encryption framework used for encrypting/decrypting both
 6 signaling messages and user information on f/r-dsch, f/r-csch, or f/r-dtch. Signaling
 7 message and user information encryption algorithms can be negotiated independently.
 8 Signaling message and user information encryption can be turned on or off independently.

9 Signaling messages or user information shall not be encrypted if authentication is not
 10 performed (i.e., when MSG_INTEGRITY_SUP_s is equal to '0' and AUTH_s is set to '00' (see
 11 2.3.12.1)) or authentication has not been performed (i.e., when MSG_INTEGRITY_SUP_s
 12 is equal to '1' and the INT_KEY[KEY_ID] is equal to NULL (see 2.3.12.5)).

13 2.3.12.4.1 Extended Encryption for Signaling Messages

14 Signaling messages with zero length shall be sent un-encrypted, in which case Layer 3
 15 shall indicate to LAC layer that the messages are sent un-encrypted.

16 All mini messages shall be sent un-encrypted.

17 When sending a Registration Accepted Order, Security Mode Command Message, or Base
 18 Station Reject Order, the base station should use assured mode.

19 2.3.12.4.1.1 Extended Encryption for Signaling on f/r-csch

20 To turn f/r-csch signaling encryption on or off, the base station sends a *Registration*
 21 *Accepted Order* or *Security Mode Command Message* on f-csch, with the
 22 C_SIG_ENCRYPT_MODE field set to one of the values specified in Table 3.7.4.5-1. The
 23 value of C_SIG_ENCRYPT_MODE_r is then stored in C_SIG_ENCRYPT_MODE_s.

24 If C_SIG_ENCRYPT_MODE_s is not equal to '000' and ENC_KEY[KEY_ID] is not equal to
 25 NULL, all f/r-csch signaling messages shall be encrypted based on the value of
 26 C_SIG_ENCRYPT_MODE_s using the procedures specified in 2.3.12.4.1.3; except for the
 27 exceptions listed below in the rest of this section.

28 On the f-csch, *General Page Message*, *Universal Page Message*, *Registration Request Order*,
 29 *Authentication Challenge Message*, *Registration Accepted Order*, *Base Station Reject Order*,
 30 and *Authentication Request Message* shall be sent un-encrypted. *Channel Assignment*
 31 *Message*, *Extended Channel Assignment Message*, and *Security Mode Command Message*
 32 may be sent un-encrypted. All overhead messages and all signaling messages with a
 33 broadcast address type shall be sent un-encrypted.

34 On the r-csch, *Registration Message*, *Page Response Message*, *Reconnect Message* (if sent
 35 in response to a *General Page Message* or a *Universal Page Message*), *Authentication*
 36 *Challenge Response Message*, *Security Mode Request Message*, *Authentication Response*
 37 *Message*, *Mobile Station Reject Order* (ORDQ = '00010110', '00011000', '00011001' or
 38 '00011010') and *Authentication Resynchronization Message* shall be sent un-encrypted.

39 When sending an *Origination Message*, if all of the following conditions are true, the mobile

1 station shall not include the dialed digits in the *Origination Message*, and the mobile station
2 shall include the dialed digits in the *Origination Continuation Message*:

- 3 • The base station supports extended encryption;
- 4 • C_SIG_ENCRYPT_MODE_s is equal to '000' or ENC_KEY[KEY_ID] is equal to NULL;
- 5 • C_SIG_ENCRYPT_REQ is set to '1' or D_SIG_ENCRYPT_REQ is set to '1' in the
6 *Origination Message*;
- 7 • The mobile station does not recognize that this is an emergency call.

8 2.3.12.4.1.2 Extended Encryption for Signaling on f/r-dsch

9 The initial mode of extended encryption for f/r-dsch signaling messages is established by
10 sending a *Channel Assignment Message* or *Extended Channel Assignment Message* with the
11 ENCRYPT_MODE field set to '11'¹⁷ and the D_SIG_ENCRYPT_MODE field set to one of the
12 values specified in Table 3.7.4.5-1. The value of D_SIG_ENCRYPT_MODE_r is then stored in
13 D_SIG_ENCRYPT_MODE_s.

14 To turn f/r-dsch signaling encryption on or off after channel assignment, the base station
15 sends a *General Handoff Direction Message* or *Universal Handoff Direction Message* with the
16 ENCRYPT_MODE field and the D_SIG_ENCRYPT_MODE field set accordingly. Alternatively,
17 the base station may send a *Security Mode Command Message* on f-dsch with the
18 D_SIG_ENCRYPT_MODE field set accordingly.

19 If D_SIG_ENCRYPT_MODE_s is not equal to '000' and ENC_KEY[KEY_ID] is not equal to
20 NULL, all f/r-dsch signaling messages shall be encrypted based on the value of
21 D_SIG_ENCRYPT_MODE_s using the procedures specified in 2.3.12.4.1.3, except for the
22 exceptions listed below in the rest of this section.

23 On the f-dsch, the *Security Mode Command Message* may be sent un-encrypted. The *Base*
24 *Station Reject Order*, *Authentication Challenge Message* and *Authentication Request Message*
25 shall be sent un-encrypted.

26 On the r-dsch, the *Security Mode Request Message*, *Authentication Challenge Response*
27 *Message*, *Authentication Response Message*, *Mobile Station Reject Order* (ORDQ =
28 '00010110', '00011000', '00011001' or '00011010') and *Authentication Resynchronization*
29 *Message* shall be sent un-encrypted.

30 2.3.12.4.1.3 Signaling Encryption/Decryption Procedures

31 In order to perform signaling encryption, message integrity, or both, on f/r-csch or f/r-
32 dsch, both the mobile station and the base station shall each maintain the following 32-bit
33 counters:

- 34 • TX_EXT_SSEQ[i][j] (the 32-bit crypto-sync for encryption and message integrity. $i =$
35 0 and 1, $j =$ '00' to '11')

¹⁷ If ENCRYPT_MODE is set to a value other than '11', see section 2.3.12.2.1.

- 1 • RX_EXT_SEQ[*i*][*j*] (the 32-bit crypto-sync for decryption and message integrity. *i* = 0
2 and 1, *j* = '00' to '11')

3 The above counters in the base station and the mobile station shall only be initialized by a
4 *Registration Accepted Order*, *Channel Assignment Message*, *Extended Channel Assignment*
5 *Message*, or *Security Mode Command Message* in response to a *Registration Message*,
6 *Origination Message*, *Page Response Message*, or *Security Mode Request Message* that
7 carries a NEW_SSEQ_H field with a valid NEW_SSEQ_H_SIG field.¹⁸ The response to a
8 *Registration Message* is a *Registration Accepted Order*. The response to an *Origination*
9 *Message* or *Page Response Message* is a *Channel Assignment Message* or *Extended Channel*
10 *Assignment Message*. The response to a *Security Mode Request Message* is a *Security Mode*
11 *Command Message*.

12 Upon initialization of the crypto-sync counters, the following initialization shall be
13 performed at the mobile station: the 24 most significant bits of TX_EXT_SSEQ[*i*][KEY_ID]
14 and RX_EXT_SSEQ[*i*][KEY_ID] shall be initialized by the value of the NEW_SSEQ_H field
15 included in the message for *i* = 0 and 1.

16 The sender shall perform the following procedures for each Layer 3 PDU (including all
17 Layer 3 PDU retransmitted by Layer 3) that is to be encrypted:

- 18 1. Append between 0 and 7 inclusive padding bits (set to any random combination of
19 '0's and '1's) to the Layer 3 PDU such that the padded Layer 3 PDU in bits is an
20 integer multiple of eight (the padding bits become part of the L3 PDU).
- 21 2. Compute an 8-bit Layer 3 PDU CRC as specified in 2.3.12.1.4 over the un-
22 encrypted Layer 3 PDU (including the padding bits, if any).
- 23 3. Append the 8-bit CRC to the end of the Layer 3 PDU.
- 24 4. If the PDU is to be transmitted on f/r-csch, let SDU_ENCRYPT_MODE equal
25 C_SIG_ENCRYPT_MODE_s. If the PDU is to be transmitted on f/r-dsch, let
26 SDU_ENCRYPT_MODE equal D_SIG_ENCRYPT_MODE_s. If the Layer 3 PDU uses
27 unassured mode, let *i* = 0; otherwise, let *i* = 1.
- 28 5. Let EXT_SSEQ equal TX_EXT_SSEQ[*i*][KEY_ID]. Encrypt the concatenated Layer 3
29 PDU and the 8-bit CRC by using EXT_SSEQ and the encryption algorithm specified
30 by SDU_ENCRYPT_MODE, in accordance with 2.3.12.4.3.
- 31 6. The sender shall pass the encrypted concatenated Layer 3 PDU, the 8-bit Layer 3
32 CRC, the 32-bit EXT_SSEQ, SDU_ENCRYPT_MODE, and an indication whether the
33 Layer 3 PDU shall be integrity-protected to the LAC layer.
- 34 7. Set TX_EXT_SSEQ[*i*][KEY_ID] to (TX_EXT_SSEQ[*i*][KEY_ID] + 1) mod 2³².

¹⁸ The mobile station should select a different value of NEW_SSEQ_H every time NEW_SSEQ_H is included in a message. This is to prevent the re-use of the same 24 most significant bits of the 32-bit crypto-sync.

1 The receiver shall perform the following procedures upon reception of an encrypted
 2 signaling message with an 8-bit SDU_SSEQ field or a 32-bit EXT_SSEQ passed by the LAC
 3 Layer (e.g., if SDU_ENCRYPT_MODE indicated by LAC Layer is not equal to '000'):

- 4 1. If the Layer 3 PDU uses unassured mode, let $i = 0$ and $N = 8$; otherwise, let $i = 1$ and
 5 $N = 4$. Let V be the 8 least significant bits of $RX_EXT_SSEQ[i][SDU_KEY_ID]$.
 6 Perform the duplicate detection procedures in accordance with 2.3.12.4.1.5 using N
 7 and V , before proceeding further.
- 8 2. If SDU_SSEQ is supplied by the LAC Layer, the mobile station shall construct
 9 EXT_SSEQ as follows:
 10 If $(SDU_SSEQ - V) \bmod 256 < 128$:
 11 $EXT_SSEQ = (RX_EXT_SSEQ[i][SDU_KEY_ID] + (SDU_SSEQ - V) \bmod 256) \bmod 2^{32}$
 12 Else:
 13 $EXT_SSEQ = (RX_EXT_SSEQ[i][SDU_KEY_ID] - (V - SDU_SSEQ) \bmod 256) \bmod 2^{32}$
- 14 3. Remove the LAC Layer padding, at the end of the Layer 3 PDU, if any, such that the
 15 Layer 3 PDU is octet aligned.
- 16 4. Decrypt the concatenated Layer 3 PDU and the 8-bit Layer 3 CRC using EXT_SSEQ
 17 and the encryption algorithm specified by SDU_ENCRYPT_MODE, in accordance
 18 with 2.3.12.4.3.
- 19 5. Compute an 8-bit CRC as specified in 2.3.12.4.1.4 over the un-encrypted Layer 3
 20 PDU (excluding the received 8-bit CRC).
- 21 6. Compare the value of the computed CRC with the decrypted 8-bit CRC. If the two
 22 CRCs are equal, the decryption is defined to be successful; otherwise the decryption
 23 is defined to be unsuccessful.
- 24 7. If the decryption was unsuccessful, the message shall be discarded; otherwise, if
 25 SDU_SSEQ is supplied by the LAC Layer and $((SDU_SSEQ - V) \bmod 256) < 128$, the
 26 receiver shall set $RX_EXT_SEQ[i]$ to EXT_SSEQ constructed in step 2 above.
- 27 8. If the base station can not decrypt an *Origination Message* or the LAC Layer
 28 indicates that the MACI is not valid in an *Origination Message*, the base station
 29 should send a *Base Station Reject Order* (ORDQ = '00000000'). If the base station
 30 can not decrypt any other message or the LAC Layer indicates that the MACI is not
 31 valid for other message, the base station should send a *Base Station Reject Order*
 32 (ORDQ = '00000001').

33 2.3.12.4.1.4 Computation of the 8-bit Layer 3 PDU CRC Field

34 The generator polynomials for the 8-bit Layer 3 PDU CRC field shall be as follows:

$$35 \quad g(x) = x^8 + x^7 + x^4 + x^3 + x + 1$$

36 The Layer 3 PDU CRC field shall be computed according to the following procedure using
 37 the logic shown in Figures 2.3.12.4.5-1:

- 1 • Initially, all shift register elements shall be set to logical one and the switches shall
- 2 be set in the up position.
- 3 • The register shall be clocked a number of times equal to the number bits in the
- 4 Layer 3 PDU with those bits as input.
- 5 • The switches shall be set in the down position so that the output is a modulo-2
- 6 addition with a '0' and the successive shift register inputs are '0'.
- 7 • The register shall be clocked an additional 8 number of times.
- 8 • These additional bits shall be the Layer 3 PDU CRC field indicator bits.
- 9 • The bits shall be transmitted in the order calculated.

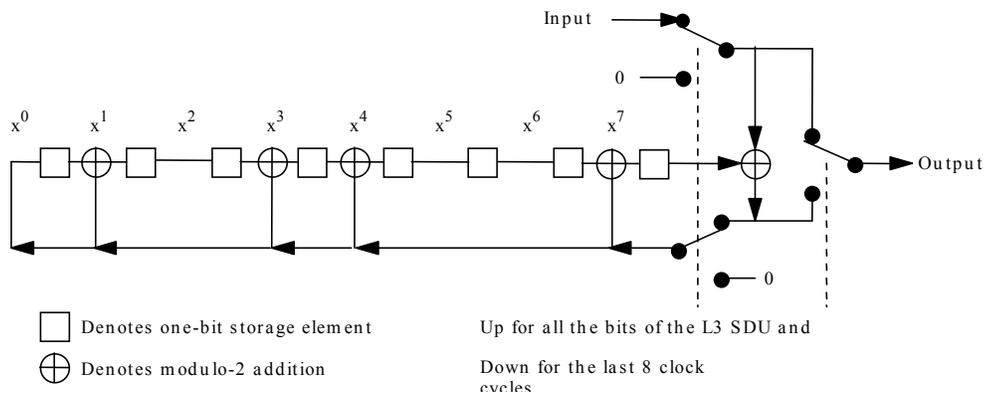

Figure 2.3.12.4.1.4-1. 8-Bit Layer 3 SDU CRC Field Calculation

2.3.12.4.1.5 Duplicate Detection of Security Sequence Number

This section describes the duplicate detection of encrypted signaling messages (see the decryption procedures at the receiver described in 2.3.12.4.1.3).

Given the value of the latest sequence number received, V , and the window size, N (see the decryption procedures at the receiver described in 2.3.12.4.1.3), the 8-bit encryption sequence number space at the receiver can be divided into the following three segments as shown in Figure 2.3.12.4.1.5-1:

- Segment #1 - sequence numbers from $((V - N + 1) \bmod 256)$ to V inclusive (the anti-replay window)
- Segment #2 - sequence numbers from $((V + 1) \bmod 256)$ to $((V + 127) \bmod 256)$ inclusive (future sequence numbers)
- Segment #3 - sequence numbers from $((V + 128) \bmod 256)$ to $((V - N) \bmod 256)$ inclusive (past sequence numbers)

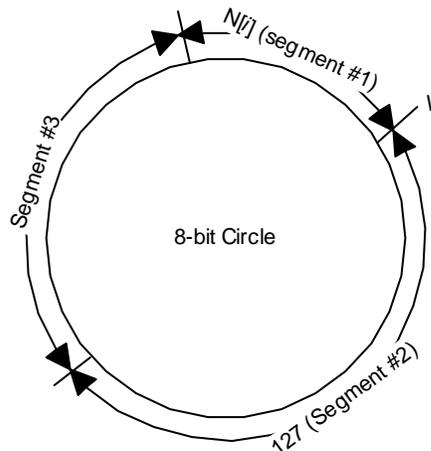

Figure 2.3.12.4.1.5-1 An 8-bit Encryption Sequence Number Space Divided into 3 Segments

If the received sequence number, SDU_SSEQ, belongs to segment #1, the receiver shall check whether SDU_SSEQ has already been received.¹⁹ If SDU_SSEQ has been received already, the receiver shall discard the message and shall not perform the remaining steps of the decryption procedures described in 2.3.12.4.1.3; otherwise, the receiver shall continue the decryption procedures described in 2.3.12.4.1.3.

If the received sequence number, SDU_SSEQ, belongs to segment #2, the receiver shall continue the decryption procedures described in 2.3.12.4.1.3.

If the received sequence number, SDU_SSEQ, belongs to segment #3, the receiver shall discard the message and shall not perform the remaining steps of the decryption procedures described in 2.3.12.4.1.3.

2.3.12.4.2 Extended Encryption for User Information

Extended encryption can be turned on or off independently for each individual service on f/r-dtch.

¹⁹ The actual means of checking is left to implementation. One simple implementation is for the receiver to maintain an N -bit bitmap, w , to represent the sequence numbers in segment #1. The order of w is most significant bit first (i.e., $w[N-1], w[N-2], \dots, w[1], w[0]$). Let $w[0]$ represent V , $w[1]$ represent $((V - 1) \bmod 256)$, etc. $w[i] = '1'$ means sequence number i has already been received. When a message with sequence number i has been decrypted successfully, $w[i]$ is set to '1'. Whenever V moves from V_1 to V_2 , left-shift w $((V_2 - V_1) \bmod 256)$ times. Each time w is left-shifted, stuff a '0' at the eight end of w . After all the shifting, set $w[0]$ to '1'.

1 The initial encryption mode of user information of a service is established by sending a
2 *Security Mode Command Message* on f-csch or by setting the UI_ENCRYPT_MODE field in
3 the Service Configuration information record, with the UI_ENCRYPT_MODE field set to one
4 of the values specified in 3.7.5.7-3. The value of the UI_ENCRYPT_MODE field is then
5 stored in SO_CON_REC_s[j].UI_ENCRYPT_MODE, where SO_CON_REC_s[j] is the service
6 option connection record (see 2.6.4.1.12) corresponding to the service.

7 To turn user information encryption for a service on or off after channel assignment,
8 the base station sends a *Security Mode Command Message* on f-dsch with the
9 UI_ENCRYPT_MODE field set accordingly. Explicit action time should be used when
10 sending the *Security Mode Command Message*.

11 User information shall be encrypted based on the value of
12 SO_CON_REC_s[j].UI_ENCRYPT_MODE, where SO_CON_REC_s[j] is the service option
13 connection record (see 2.6.4.1.12) corresponding to the service.

14 2.3.12.4.2.1 User Information Encryption/Decryption Procedures

15 If P_REV_IN_USE_s is less than nine and extended encryption for user information is turned
16 on for a service, the sender shall encrypt each data block (see [3]) from that service, in
17 accordance with 2.3.12.4.3, before passing the data blocks to MAC Layer. On the receiver
18 side, the receiver shall decrypt each data block for that service from MAC Layer, in
19 accordance with 2.3.12.4.3, before passing them to that service.

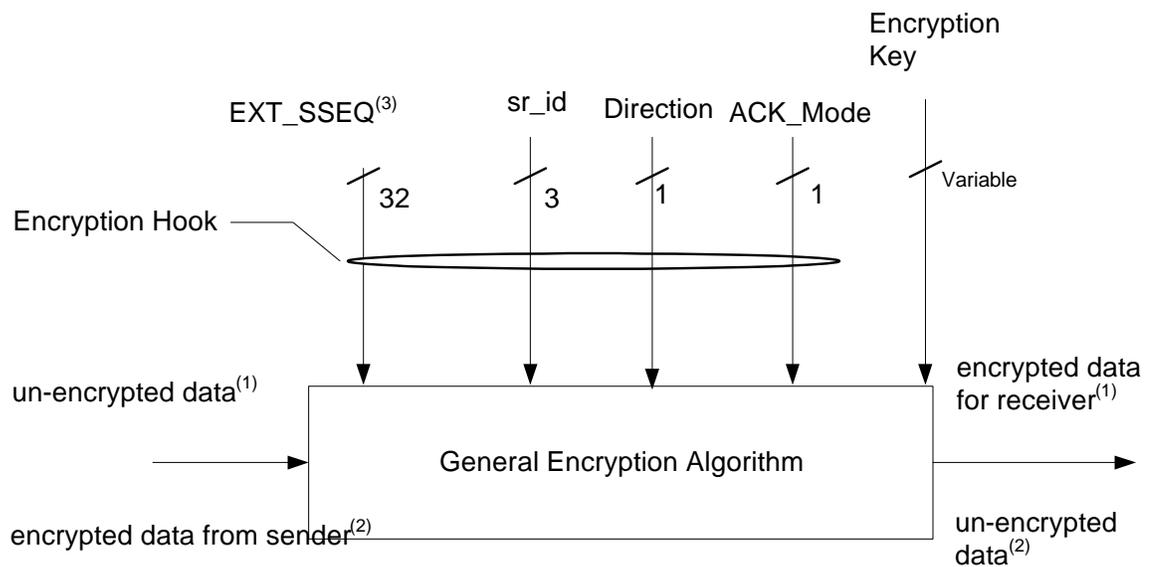

20 If P_REV_IN_USE_s is greater than or equal to nine and extended encryption for user
21 information is turned on for a service, the sender shall encrypt the user data in the service
22 layer before passing it to the MAC Layer. On the receiver side, the receiver shall pass each
23 data block from MAC Layer to that service. Details of encryption are specified in the
24 corresponding service option specification (see [30]).

25 If P_REV_IN_USE_s is greater than or equal to nine and extended encryption for user
26 information is turned on for a voice service option²⁰, the sender shall encrypt each data
27 block from the voice service, in accordance with 2.3.12.4.3, before passing the data blocks
28 to MAC Layer. On the receiver side, the receiver shall decrypt each data block for the voice
29 service from MAC Layer, in accordance with 2.3.12.4.3, before passing them to that service.

30 2.3.12.4.3 Interface to the Encryption Algorithms

31 Figure 2.3.12.4.3-1 shows the structure for encrypting/decrypting both signaling messages
32 and user information. Various encryption algorithms can be used with this structure. The
33 encryption algorithm takes all or part of the following parameters as inputs, as illustrated
34 in Figure 2.3.12.4.3-1. The actual inputs to the algorithm are specified in the rest of this
35 section.

²⁰ Voice service option refers to SO 60, SO 61 or any service option in Service Option Group 0 in [30].

Notes:

(1) For encryption only

(2) For decryption only

(3) The following value shall be used instead of EXT_SSEQ for user information: $\lfloor \text{sys_time}/20 \rfloor \bmod 2^{32}$, where sys_time is the system time, in units of ms, corresponding to the start of the frame that carries the user information bits.

1
2
3 **Figure 2.3.12.4.3-1. Encryption Input Parameters**
4

5 The inputs to the encryption algorithm are described as follows:

- 6
- 7 • EXT_SSEQ - A 32-bit Security Encryption Sequence Number for encryption/decryption.
 - 8 • sr_id - Service Reference Identifier (see [3]), which identifies the associated service option instance.
 - 9
 - 10 • Direction - The direction of the data being encrypted/decrypted. This shall be set to
 - 11 '0' if the data is transmitted on or received on a forward link. Otherwise, it shall be
 - 12 set to '1'.
 - 13 • Encryption Key – Session Key for Encryption. This shall be a result of successful
 - 14 Session Key Agreement between the base station and the mobile station. The
 - 15 Encryption Key shall be stored by the mobile station in ENC_KEY[KEY_ID].
 - 16 • Channel_id – Channel identifier, which identifies the physical channel that carries
 - 17 the data to be encrypted or decrypted. This is applicable only to user information
 - 18 encryption on f/r-dtch. Channel_id shall be set to, '000' for Fundamental Channel,
 - 19 '001' for Dedicated Control Channel, '010' for Supplemental Code Channel, '011' for
 - 20 Supplemental Channel 0, and '101' for Supplemental Channel 1.

- 1 • ACK_Mode – The delivery mode (unassured or assured) of the signaling message.
 2 This shall be set to ‘0’ if the message is delivered using unassured mode; otherwise,
 3 this shall be set to ‘1’.

4 If the Enhanced Cellular Message Encryption Algorithm is used for encrypting/decrypting
 5 signaling messages, the input parameters of the Enhanced Cellular Message Encryption
 6 Algorithm (see [23]) shall be set as follows:

- 7 • The DATA_TYPE parameter shall be set to ‘0’.
 8 • The SYNC parameter shall be set as follows:
 9 - SYNC[0] = EXT_SSEQ [7:0]²¹.
 10 - SYNC[1] = (ACK_Mode | Direction | EXT_SSEQ [13:8]), where “|” denotes
 11 concatenation and EXT_SSEQ_s [13:8] is bits 8 through 13 of EXT_SSEQ (with
 12 the LSB being bit 0).
 13 • The CMEAKEY[0-7] parameter shall be set to the first 64 bits of ENC_KEY[KEY_ID].

14 If the Rijndael Encryption Algorithm is used for encrypting/decrypting signaling messages,
 15 the input parameters of ESP_AES (see [44]) shall be set as follows:

- 16 • The encryption key parameter shall be set to ENC_KEY[KEY_ID].
 17 • The FRESH parameter shall be set to (ACK_Mode | sr_id [2:0] | Direction |
 18 EXT_SSEQ [31:0] | ‘000’).
 19 • The FRESHSIZE parameter shall be set to 5.
 20 • The BUF parameter shall be set to the pointer of the most significant bit of the
 21 buffer²² that contains the data to be encrypted or decrypted.
 22 • The BIT_OFFSET parameter shall be set to the offset between the bit position of the
 23 most significant bit of the data to be encrypted/decrypted and the bit position of the
 24 most significant bit of the buffer (e.g., if the bit position of the most significant bit of
 25 the data to be encrypted/decrypted and the bit position of the most significant bit of
 26 the buffer are equal, BIT_OFFSET = 0).
 27 • The BIT_COUNT parameter shall be set to the number of bits of the data to be
 28 encrypted/decrypted.
 29 • The full 128 bits of ENC_KEY[KEY_ID] shall be used.

30 If the Rijndael Encryption Algorithm is used for encrypting/decrypting user information,
 31 the input parameters of ESP_AES (see [44]) shall be set as follows:

²¹ $Z [y:x]$ denotes bit x to bit y of the binary value Z with bit 0 the least significant bit of Z .

²² “Buffer” refers to the physical memory that stores the data to be encrypted or decrypted. The octets in the buffer are assumed to be most-significant first, and the first bit of the buffer is the most significant bit of the first octet.

- 1 • The encryption key parameter shall be set to ENC_KEY[KEY_ID].
- 2 • The FRESH parameter shall be set to $(sr_id [2:0] \mid Direction \mid (\lfloor sys_time/20 \rfloor \bmod$
3 $2^{32}) [31:0] \mid Channel_id [2:0] \mid '0')$, where sys_time is the system time, in units of
4 ms, corresponding to the start of the physical layer frame that carries the data
5 block(s).
- 6 • The FRESHSIZE parameter shall be set to 5.
- 7 • The BUF parameter shall be set to the pointer of the most significant bit of the
8 buffer²³ that contains the data to be encrypted or decrypted.
- 9 • The BIT_OFFSET parameter shall be set to the offset between the bit position of the
10 most significant bit of the data to be encrypted/decrypted and the bit position of the
11 most significant bit of the buffer (e.g., if the bit position of the most significant bit of
12 the data to be encrypted/decrypted and the bit position of the most significant bit of
13 the buffer are equal, BIT_OFFSET = 0).
- 14 • The BIT_COUNT parameter shall be set to the number of bits of the data to be
15 encrypted/decrypted.
- 16 • The full 128 bits of ENC_KEY[KEY_ID] shall be used.

17 2.3.12.4.4 Encryption Negotiation

18 The mobile station shall indicate to the base station the encryption algorithms supported
19 by using SIG_ENCRYPT_SUP and UI_ENCRYPT_SUP in one of the following messages:

- 20 • *Registration Message*
- 21 • *Origination Message*
- 22 • *Page Response Message*
- 23 • *Security Mode Request Message*
- 24 • *Status Response Message* (in Encryption Capability information record)
- 25 • *Extended Status Response Message* (in Encryption Capability information record)

26 The base station may turn on or turn off the encryption of the voice, data services, or
27 signaling encryption with a *Security Mode Command Message*, *Universal Handoff Direction*
28 *Message*, or *General Handoff Direction Message* sent on f-dsch or *Security Mode Command*
29 *Message* sent on f-csch. Similarly, the mobile station may propose to turn on or turn off
30 the user information encryption or signaling encryption with a *Security Mode Request*
31 *Message* sent on r-dsch or r-csch.

32

²³ “Buffer” refers to the implementation-dependent physical memory that stores the data to be encrypted or decrypted. The octets in the buffer are assumed to be most-significant first, and the first bit of the buffer is the most significant bit of the first octet.

2.3.12.4.5 Computation of NEW_SSEQ_H_SIG

The NEW_SSEQ_H_SIG field (included in the *Registration Message*, *Origination Message*, *Page Response Message*, and *Security Mode Request Message*) is a signature of the 24 most significant bits of the crypto-sync (NEW_SSEQ_H). The mobile station shall compute this 8-bit field as follows:

1. The mobile station shall construct the *message bits* as shown in Figure 2.3.12.4.5-1. For messages that are sent on the r-csch, X is set to $RAND_s$. For messages that are sent on the r-dsch, X is set to $(\lfloor \text{sys_time} / 20000 \rfloor) \bmod 2^{32}$, where sys_time is the system time in ms at which the message is assembled.

MSB		LSB
SSD_A (64 bits)	X (32 bits)	ENC_SEQ_H (24 bits)

Figure 2.3.12.4.5-1. Message Bits

2. The mobile station shall pad the *message bits* constructed in the previous step, as specified in [38], and compute the 160-bit *message digest* as specified in [38].
3. The mobile station shall store the 8 rightmost (least significant) bits of the *message digest* in NEW_SSEQ_H_SIG.

2.3.12.5 Authentication and Key Set-up Procedures when P_REV_IN_USE_s >= 10

If P_REV_IN_USE_s is equal to or greater than ten and MSG_INTEGRITY_SUP_s is equal to '1', then message integrity is performed (see [4]). The mobile station performs authentication in accordance with the procedures in this section. Before any message integrity or extended encryption (see 2.3.12.4) can be performed, the mobile station and base station need to set up the same set of integrity key, encryption key, and security sequence number in a secured manner.

There are two types of keys that the base station could obtain from the network – the CMEA key or the (IK, CK) pair. Each requires a different method to be established. CMEA key is the key generated using CAVE during 2G authentication as described in 2.3.12.1. The (IK, CK) pair is a result of AKA (3G authentication. See [44]).

All base stations with P_REV greater than or equal to ten shall be able to execute 2G authentication or AKA. Whether the AKA procedures are actually performed on a mobile station depends on various factors such as whether the HLR/AC has enabled AKA, whether the ANSI-41 interfaces between the MSC/VLR and AC supports AKA, etc.

All mobile stations with MOB_P_REV greater than or equal to ten shall support 2G authentication, AKA, and message integrity.

1 In general, when an idle mobile station does not have any integrity key and encryption key
2 to use, it starts the 2G authentication and key set-up procedures by registering via a
3 *Registration Message, Origination Message, or Page Response Message.*

4 Details of Authentication and Key Set-Up Procedures are described in the rest of this
5 section.

6 The mobile station requests (IK, CK) from the UIM. If (IK, CK) are available, the mobile
7 station has already performed the 3G authentication and the (IK, CK) may still be valid, in
8 which case, the mobile station needs to perform the (IK, CK) restoration procedures in
9 2.3.12.5.3 to restore the (IK, CK).

10 If (IK, CK) in the UIM are not available, the mobile station sets KEY_ID to NULL to indicate
11 that the mobile station does not have any integrity key and encryption key and thus not
12 authenticated. The mobile station then registers and sends an *ROP*. The *ROP* contains a
13 new key id (NEW_KEY_ID) and a new security sequence number (NEW_SSEQ_H) associated
14 with the AUTHR (see [4]) of the message. The mobile station also starts a Key Set-Up timer.
15 24

16 Since the mobile station does not know beforehand whether the serving base station it
17 roams to supports 2G authentication, 3G authentication, or both, the mobile station
18 always starts with 2G authentication. When a mobile station sends an *ROP*, it always starts
19 with performing the 2G authentication by including an AUTHR (see [4]) in the message. If
20 an AKA is performed during a 2G authentication, the mobile station will abort the 2G
21 authentication.

22 The types of authentication are distinguished according to what the network provides the
23 base station with during the authentication process. If the base station receives a CMEA
24 key, 2G authentication is performed (see 2.3.12.5.1). If the base station receives
25 Authentication Vectors (AV's), 3G authentication is performed (see 2.3.12.5.2).

26 In the 2G authentication, the mobile station concatenates the CMEA key with a copy of
27 itself to form a 128-bit key to be used as both the integrity key, CIK, and the encryption
28 key, CCK. The CIK and CCK will be referred to as the (CIK, CCK) pair.

29 In the 3G authentication, the mobile station uses IK as the integrity key and CK as the
30 encryption key – referred to as the (IK, CK) pair.

31 The key strength of CCK or CK may be reduced by the “Key Strength Reduction Algorithm”
32 (see 2.3.12.5.4), which takes the key and converts it into another key of the same length
33 but with the entropy reduced. For simplicity, all the procedures hereafter only mention
34 CCK and CK.

24 If the base station knows it is not going to get any keys from the network for whatever reason, the base station should indicate so in the *Registration Accepted Order*, so that the mobile station could stop waiting. However, if there is no current CIK “in use”, the *Registration Accepted Order* could not be MAC'ed, in which case, it is up to the mobile station whether or not to trust the *Registration Accepted Order*.

1 Whenever the key set-up is complete, all the messages shall include a MACI with the
2 following exceptions:

- 3 • On the f-csch, the *General Page Message*, *Universal Page Message*, *Registration*
4 *Request Order*, *Authentication Request Message* and *Authentication Challenge*
5 *Message* shall not include a MACI. The *Extended Channel Assignment Message* may
6 not include a MACI. All overhead messages and all signaling messages with a
7 broadcast address type shall not include a MACI.
- 8 • On the f-dsch, the *Authentication Challenge Message* shall not include a MACI.
- 9 • On the r-csch or r-dsch, the *Authentication Response Message*, *Authentication*
10 *Resynchronization Message* and *Mobile Station Reject Order* (ORDQ = '00010110',
11 '00011000', '00011001' or '00011010') shall not include a MACI.
- 12 • All mini messages shall not include a MACI.

13 When the mobile station sends a *Registration Message*, *Origination Message*, or *Page*
14 *Response Message* when RESTORE_KEYS is equal to '1', Layer 3 shall deliver the message
15 with a 24-bit number (selected by Layer 3) to LAC. The 24-bit number is used to perform
16 the MAC-I computation and to initialize TX_EXT_SSEQ[i][j] and RX_EXT_SSEQ[i][j], where i
17 = '0' or '1', j = '00' to '11'.

18 2.3.12.5.12G Authentication when P_REV_IN_USE_s >= 10

19 This section applies to a base station that performs 2G authentication with the mobile
20 station.

21 If KEY_ID is equal to NULL and mobile station wants to set up encryption and integrity
22 keys, it shall start Key Set-Up timer with expiration time of T75m seconds and execute the
23 key set-up procedure described in this section by sending an *ROP*.

24 If an *ROP* does not include a MACI, it implies that the mobile station does not have an
25 integrity key, in which case, the base station gets a CMEA key from the network and
26 authenticates the mobile station's AUTHR (which is always included, see [4]). If the
27 authentication is successful, when the CMEA key is available at the base station, the base
28 station uses assured mode to send a *RES* that includes a Message Authentication Code
29 generated using the pending CIK, and the pending NEW_SSEQ_H (proposed by the mobile
30 station). Upon reception of the *RES*, the mobile station validates the MACI. If the validation
31 is successful, the pending (CIK, CCK) and NEW_SSEQ_H can become "in use" in the mobile
32 station. The mobile station stores the NEW_KEY_ID in KEY_ID, the CIK in
33 INT_KEY[KEY_ID], and the CCK in ENC_KEY[KEY_ID].

34 The mobile station then stops the Key Set-Up timer and sends a *Security Mode Completion*
35 *Order* using assured mode to the base station that includes a Message Authentication
36 Code. At this point, if the base station successfully validates the *Security Mode Completion*
37 *Order* that the mobile station sends, the pending (CIK, CCK) and NEW_SSEQ_H can
38 become "in use" in the base station; otherwise, the base station resends the *RES* until it
39 receives a valid *Security Mode Completion Order* from the mobile station. If the mobile
40 station receives a *RES* with an invalid MACI, the mobile station shall enter the *System*
41 *Determination Substate* with an encryption/message integrity failure indication.

1 Once (CIK, CCK) has been established, the mobile station can perform integrity protection
2 and encryption.

3 If the Key Set-Up timer expires and the mobile station determines that it is not attempting
4 to originate an emergency call, the mobile station may go to the *System Determination*
5 *Substate* with an encryption/message integrity failure indication, which will trigger re-
6 registrations or the mobile station may continue with normal Layer 3 Signaling procedures,
7 not to retry key set-up, and not to perform message integrity in both directions²⁵. If the
8 mobile station retries key set-up but still cannot establish the keys after an implementation
9 dependent number of retries, the mobile station may reject the serving base station.

10 If the *ROP* includes a MACI in addition to AUTHR, this implies the mobile station has an
11 integrity key, in which case, the base station has two options. It can either continue using
12 the current (CIK, CCK) or change to a new pair.

13 If the base station decides to change to a new pair of (CIK, CCK), the base station will
14 perform the key set-up procedures described above.

15 If the base station decides not to change to any new keys, the base station sends to the
16 mobile station an *RES* that includes a Message Authentication Code. Upon reception of the
17 *RES*, the mobile station validates the MACI and if the MAC-I checks, the mobile station
18 sends a *Security Mode Completion Order* that includes a Message Authentication Code using
19 assured mode and removes the pending keys, the associated key id, and the associated
20 NEW_SSEQ_H.

21 To minimize race conditions, on the base station side, the base station does not send any
22 messages that are encrypted or include a Message Authentication Code, and are non-
23 essential to the key set-up between the time it receives an *ROP* and the time it receives the
24 *Security Mode Completion Order* of an *RES*, which is always sent using the assured mode.
25 On the mobile station side, to the same purpose, the mobile station does not send any
26 messages that are encrypted or include a Message Authentication Code, and are non-
27 essential to the key set-up between the time it sends an *ROP* and the time it receives an
28 *RES*. Also, the mobile station does not send another *ROP* between the time it sends an *ROP*
29 and the time it receives a *RES*.

30 2.3.12.5.23G Authentication (AKA) when $P_REV_IN_USE_s \geq 10$

31 This section applies to a base station that performs 3G authentication (AKA) with the
32 mobile station. The AKA procedure and related algorithms take mobile station specific
33 information, data received from base station and the mobile station's subscriber
34 authentication key as inputs. The subscriber authentication key is 128-bits long. It is
35 assigned to the mobile station and is stored in the mobile station's permanent security and
36 identification memory. The subscriber authentication key is known only to the mobile
37 station and to its associated Authentication Center (AC) (see [13]). Refer to Figures

²⁵ This is to allow the mobile station to operate and accept services from the base station without message integrity protection in case the keys cannot be established for whatever reason (e.g., shared secret root keys in the mobile station and base station do not match).

1 2.3.12.5.2-1, 2.3.12.5.2-2, 2.3.12.5.2-3, and 2.3.12.5.2-4. In these figures, the input K is
2 the mobile station's subscriber authentication key.

3 The purposes of AKA are to mutually authenticate the mobile station and the serving base
4 station, and to establish a new set of (IK, CK) and UAK, if supported. Upon completion of
5 AKA, CK and IK are stored in the mobile station while UAK, if supported, is stored in the
6 UIM. Mentioning of (IK, CK) hereafter already implicitly implies that UAK is also included, if
7 supported. When extended encryption is turned on, CK is used as the encryption key in the
8 extended encryption described in 2.3.12.4. IK is used as the integrity key to provide
9 message integrity check in the base station. UAK is used to convert the result of message
10 integrity check, MAC-I, into UMAC.

11 AKA can be initiated by the base station at any time for any reason. For example, when (IK,
12 CK) expires in the mobile station. Also, when the base station receives an *ROP*, the base
13 station checks if the *ROP* contains a MACI or not. If there is no MACI, or the MACI does not
14 check, or can not be checked, the base station may initiate AKA. Regardless of the reasons,
15 if the base station initiates AKA, the following events occur.

16 The base station invokes the procedure by selecting the next unused AV from the ordered
17 array of AV's stored in the VLR. If an AV is not available in the serving node, one (or more)
18 AV's are requested from the subscriber's home system. The base station sends the mobile
19 station an *Authentication Request Message* which contains the random challenge RANDA
20 and the authentication token for network authentication, AUTN, associated with the
21 selected AV.

22 Each AV contains the following information (see figure 2.3.12.5.2-1):

- 23 • Authentication Random Challenge Number (RANDA)
- 24 • Expected Result (XRES)
- 25 • Encryption Key (CK)
- 26 • Integrity Key (IK)
- 27 • UIM Authentication Key (UAK) (support of this field is optional)
- 28 • Authentication Token (AUTN), which consists of the Concealed Sequence Number
29 (CON_SQN), the Authentication Management Function (AMF), and the Message
30 Authentication Code (MAC-A).

31 Upon reception of the *Authentication Request Message*, the mobile station aborts any
32 pending 2G key set-up, starts the Key Set-Up timer with expiration time of T75m seconds
33 and the UIM computes the expected message authentication code (XMAC). If this is not
34 equal to the MAC-A received in the AUTN, the mobile station shall enter the *System*
35 *Determination Substate* with an encryption/message integrity failure indication; otherwise,
36 the UIM verifies that the sequence number SQN (see [46]) received in the AUTN is in the
37 correct range (a test of freshness).

38 If the UIM determines that the received SQN is not in the correct range (see [46]), the
39 mobile station sends an *Authentication Resync Message* to the base station that includes
40 the concealed value of the sequence number stored in the UIM (CON_MS_SQN). If the SQN
41 is in the correct range, the UIM computes the (IK, CK) pair and the RES and passes the (IK,

1 CK) pair and RES to the mobile station. The mobile station then associates a pending key
2 id NEW_KEY_ID and a pending NEW_SSEQ_H with the pending (IK, CK) pair and sends an
3 *Authentication Response Message* containing RES to the base station. The *Authentication*
4 *Response Message* shall contain a Message Authentication Code that is computed based on
5 the pending NEW_SSEQ_H and the pending IK.

6 The mobile station also stores (RANDA, RES, IK, CK, key id, NEW_SSEQ_H) in case it
7 receives, in the near future, the same retransmitted *Authentication Request Message* that
8 requires the mobile station to resend the same *Authentication Response Message*. The UIM
9 stores (IK, CK) until the next successful execution of AKA.

10 Upon reception of the *Authentication Response Message*, the base station compares RES
11 with the expected response XRES from the selected AV. If XRES equals RES, then the
12 authentication of the user has passed and the pending (IK, CK) and the pending
13 NEW_SSEQ_H can become “in use” in the base station. The base station then confirms the
14 AKA completion by sending an *RES* that includes a Message Authentication Code generated
15 using the pending IK to confirm the use of the pending (IK, CK). Upon reception of this
16 confirmation, the mobile station stops the Key Set-Up timer and the pending (IK, CK),
17 NEW_SSEQ_H, and key id become “in use” for the mobile station. The mobile station stores
18 the NEW_KEY_ID in KEY_ID, the IK in INT_KEY[KEY_ID], and the CK in ENC_KEY[KEY_ID].

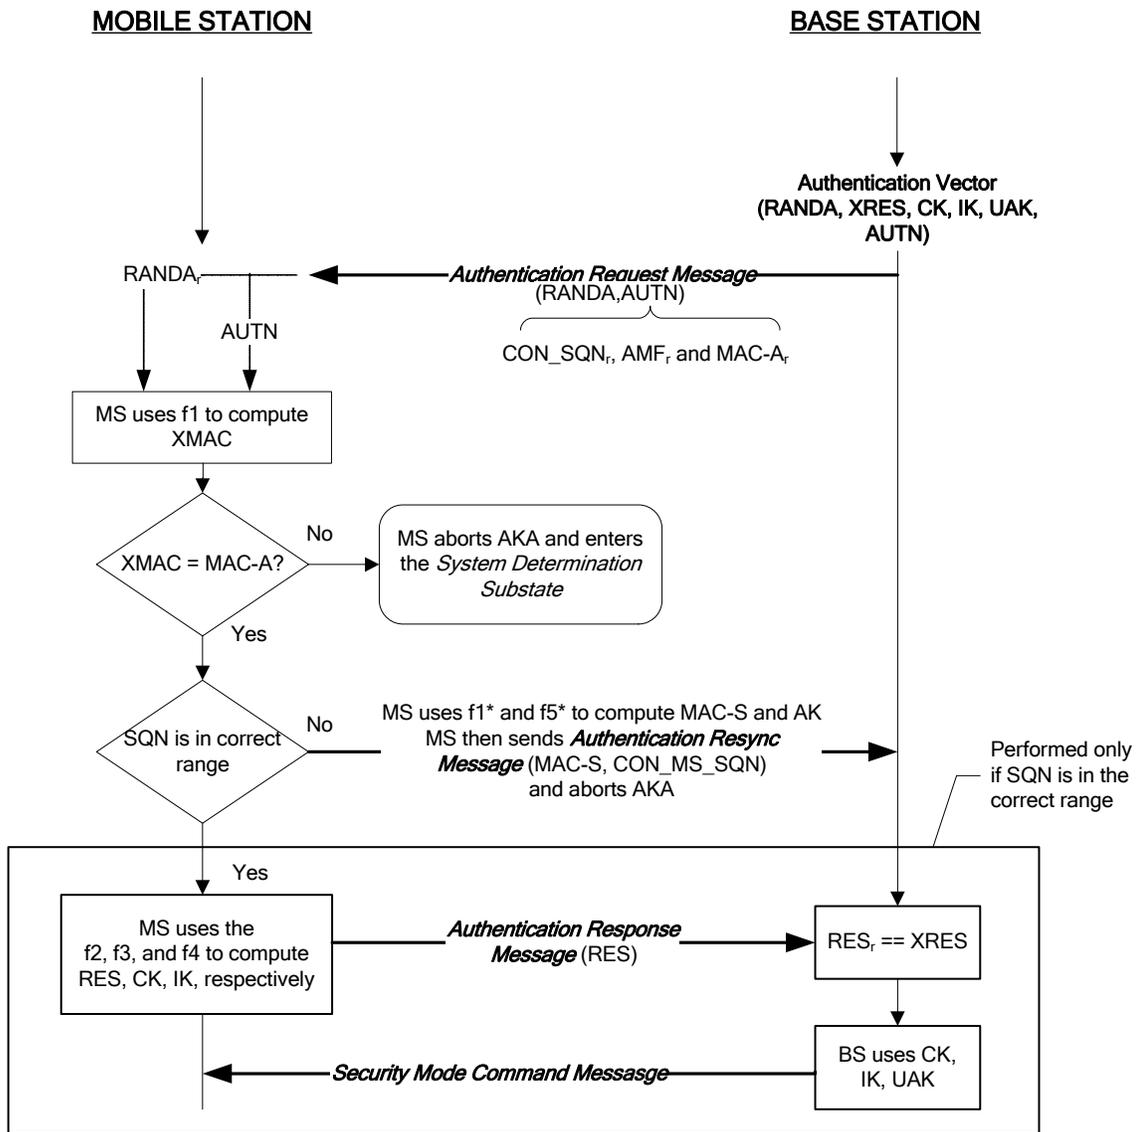

19 Once (IK, CK) has been established, the mobile station may start integrity protection and
20 encryption.

21 If the Key Set-Up timer expires and the mobile station determines that it is not attempting
22 to originate an emergency call, the mobile station shall go to the *System Determination*
23 *Substate* with an encryption/message integrity failure indication, which will trigger re-
24 registrations. If the mobile station retries key set-up but still cannot establish the keys
25 after an implementation dependent number of retries, the mobile station may reject the
26 serving base station.

27 To ensure the base station has agreed to switch to the pending (IK, CK), the mobile station
28 keeps sending the *Authentication Response Message* until it gets the *RES* that includes a
29 Message Authentication Code generated using the pending IK (or until the Key Set-Up
30 timer expires, whichever comes first). Also, if the ME receives the (RANDA, AUTN) that are
31 the same as the last received, the ME does not pass the (RANDA, AUTN) to the UIM but
32 responds with an *Authentication Response Message* including the corresponding RES.

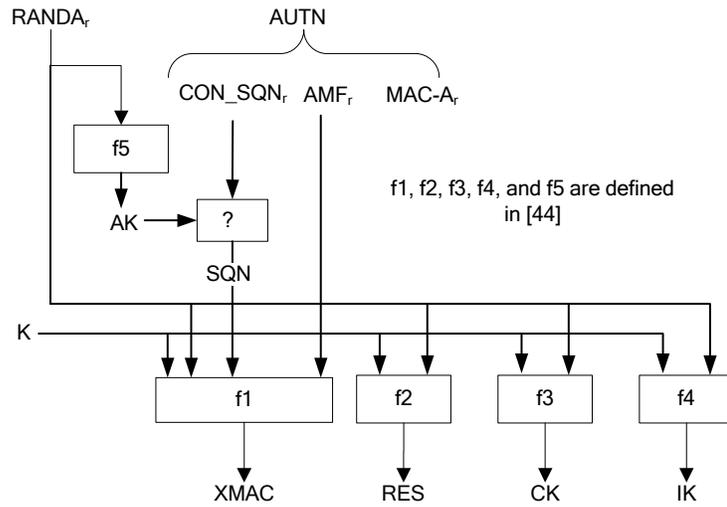

33 To minimize race conditions, on the base station side, the base station does not send any
34 messages that are encrypted or include a Message Authentication Code, and are non-
35 essential to the key set-up between the time it sends the *Authentication Request Message*
36 and the time it receives the *Authentication Response Message*. On the mobile station side,
37 the mobile station does not send any messages that are encrypted or include a Message
38 Authentication Code, and are non-essential to the key set-up between the time it receives
39 the *Authentication Request Message* and the time it receives the *Security Mode Command*
40 *Message* that includes a Message Authentication Code generated using the pending IK.

2.3.12.5.3 Restoring (IK, CK) upon power on

Since (IK, CK) is stored in UIM even when the mobile station is powered off, it is possible for the mobile station, when the mobile station powers on again, to try to restore and use the stored (IK, CK) in order to avoid unnecessary AKA. However, the mobile station will need to re-establish the crypto-sync and key id, which are not stored when the mobile station is powered off.

If the base station no longer has the (IK, CK) available, the base station initiates an AKA and establishes a new (IK, CK) anyway, thus it will not need the following procedures.

The mobile station could try to restore the key id association with its (IK, CK) via an *ROP* and a subsequent response from the base station. The mobile station sends an *ROP* that includes a Message Authentication Code generated using the stored IK and a pending *NEW_SSEQ_H*. The mobile station includes the *NEW_SSEQ_H* in the LAC Layer in the *ROP* and sets the *SDU_KEY_ID* to a value selected by the mobile station to associate with this (IK, CK). When the base station receives the *ROP*, it validates the MACI using its own IK stored for this mobile station and with the pending *NEW_SSEQ_H* provided in the message. If the MACI is valid, the base station sends a *Security Mode Command Message* that includes a Message Authentication Code generated using the stored IK and *NEW_SSEQ_H*.

When the mobile station receives the *RES*, the mobile station validates the MACI. If the MACI checks, the mobile station then starts using the key id for the stored (IK, CK) and the (IK, CK) and *NEW_SSEQ_H* can become “in use” in the mobile station. The mobile station then sends a *Security Mode Completion Order* that includes a Message Authentication Code using assured mode.

Upon reception of the *Security Mode Completion Order*, base station validates the MACI and if the MACI is valid, the base station starts to set the key id for the (IK, CK) to the value selected by the mobile station (in *NEW_KEY_ID* and *SDU_KEY_ID*), regardless of the current key id being used at the base station. The (IK, CK) pair and *NEW_SSEQ_H* can become in “in use” in the base station. The (IK, CK) pair is now successfully restored. The base station resends the *RES* until it gets the expected *Security Mode Completion Order*.

2.3.12.5.4 Key Strength Reduction Algorithm

Due to local security regulations, the base station may ask the mobile station to perform the Key Strength Reduction Algorithm (by setting *ENC_KEY_SIZE_r*) and use the resultant key from the algorithm. The Key Strength Reduction Algorithm uses the encryption key, *RAND*, and *ENC_KEY_SIZE_r* to determine the values of the inputs to the algorithm. The key strength reduction procedure is shown in Figure 2.3.12.5.4-1. The algorithm is defined in [44].

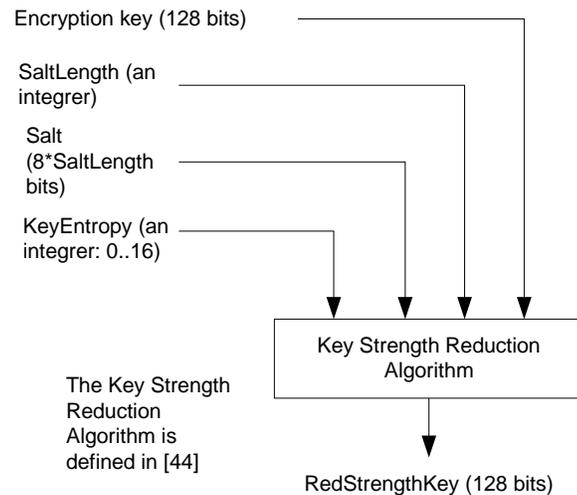

Figure 2.3.12.5.4-1. Key Strength Reduction

The input parameters of KeyStrengthRedAlg (see [44]) shall be set as follows:

- KeyLength shall be set to 16.
- OriginalKey shall be set to ENC_KEY[KEY_ID].
- SaltLength shall be set to 4.
- Salt shall be set to RAND_S.
- KeyEntropy shall be set to ENC_KEY_SIZE_r.

The mobile station shall set the ENC_KEY[KEY_ID] to RedStrengthKey.

2.3.12.5.5 Message Integrity Check Negotiation and Other Requirements

The base station shall indicate the supported user integrity algorithms in the SIG_INTEGRITY_SUP field in the *Extended System Parameters Message* and *ANSI-41 System Parameters Message*.

The mobile station shall indicate to the base station the message integrity algorithms supported and preferred by using SIG_INTEGRITY_SUP and SIG_INTEGRITY_REQ in one of the following messages:

- *Registration Message*
- *Origination Message*
- *Page Response Message*
- *Security Mode Request Message*
- *Status Response Message* (in Encryption Capability information record)
- *Extended Status Response Message* (in Encryption Capability information record)

1 In response, the base station shall select the integrity algorithm to be used among the
 2 integrity algorithms that are supported by both the mobile station and the base station,
 3 and then compute the MAC-I of a *Registration Accepted Order*, *Extended Channel*
 4 *Assignment Message*, or *Security Mode Command Message* based on the selected algorithm.

5 If and only if the base station sends a *Registration Accepted Order*, *Extended Channel*
 6 *Assignment Message*, or *Security Mode Command Message* with the CHANGE_KEYS field²⁶
 7 set to '1', the base station shall supply the base station LAC layer with the 24-bit value
 8 carried in NEW_SSEQ_H field and the 2-bit value in the NEW_KEY_ID field in the
 9 *Registration Message*, *Origination Message*, *Page Response Message*, *Authentication*
 10 *Response Message*, or the *Security Mode Request Message* that the base station is
 11 responding to.

12 2.3.13 Lock and Maintenance Required Orders

13 The mobile station shall have memory to store the lock reason code (LCKRSN_{P_{s-p}}) received
 14 in the *Lock Until Power-Cycled Order*. The data retention time under power-off conditions
 15 shall be at least 48 hours.

16 The mobile station shall have memory to store the maintenance reason code
 17 (MAINTRSN_{S-p}) received in the *Maintenance Required Order*. The data retention time under
 18 power-off conditions shall be at least 48 hours.

19 There are no requirements on the use of the lock and maintenance reason codes, and
 20 interpretation and use are implementation dependent.

21 2.3.14 Mobile Station Revision Identification

22 The mobile station shall provide memory to store the following parameters sent in the
 23 *Status Message*, the *Status Response Message*, or the *Extended Status Response Message*
 24 (*Terminal Information* record or *Extended Terminal information* record):

- 25 • Mobile manufacturer code (MOB_MFG_CODE_p)
- 26 • Manufacturer's model number (MOB_MODEL_p)
- 27 • Firmware revision number (MOB_FIRM_REV_p)

28 In addition, the mobile station shall provide memory to store the following parameter for
 29 each supported band class:

- 30 • Protocol revision number (MOB_P_REV_p)

31 2.3.15 Temporary Mobile Subscriber Identity

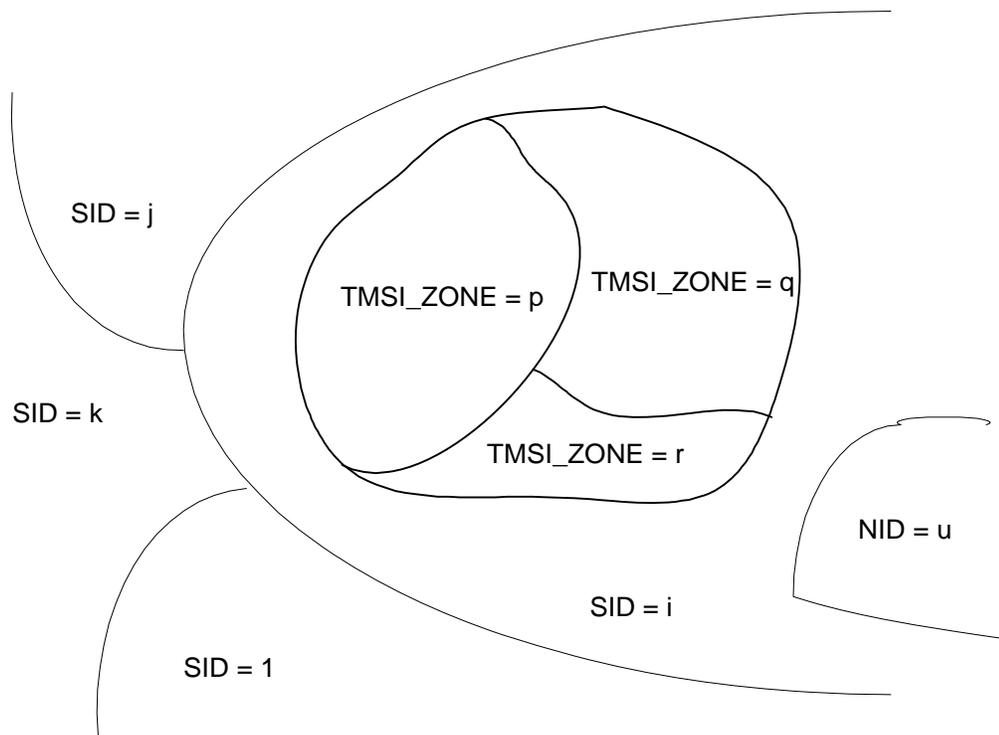

32 2.3.15.1 Overview

33 The Temporary Mobile Subscriber Identity (TMSI) is a temporary locally assigned number
 34 used for addressing the mobile station. The mobile station obtains a TMSI when assigned

²⁶ The base station sets the CHANGE_KEYS field to '1' to trigger the mobile station to reinitialize the crypto-sync and the keys or to reinitialize just the crypto-sync alone depending on different cases.

1 by the base station. The TMSI as a number does not have any association with the mobile
 2 station's IMSI, ESN, or directory number all of which are permanent identifications.

3 A TMSI zone is an arbitrary set of base stations for the administrative assignment of TMSIs.
 4 A TMSI_CODE is uniquely assigned to a mobile station inside a TMSI zone. A TMSI zone is
 5 identified by the TMSI_ZONE field. The same TMSI_CODE may be reused to identify a
 6 different mobile station in a different TMSI zone. The pair (TMSI_ZONE, TMSI_CODE) is a
 7 globally unique identity for the mobile station. This pair is called the full TMSI. The
 8 TMSI_CODE can be two, three, or four octets in length. The TMSI_ZONE can range from 1
 9 to 8 octets in length. Figure 2.3.15-1 shows an example of a TMSI_ZONE where the
 10 TMSI_ZONE is a subset of the NID (see 2.6.5.2).

11
 12 **Figure 2.3.15-1. TMSI Zone Example**

13

14 The base station sends a *TMSI Assignment Message* to assign a TMSI. In response, the
 15 mobile station sends a *TMSI Assignment Completion Message*. The base station instructs
 16 the mobile station to delete the TMSI by sending a *TMSI Assignment Message* with all the
 17 bits in the TMSI_CODE field set equal to '1'.

18 The TMSI expiration time is used to automatically delete the assigned TMSI. The mobile
 19 station obtains the expiration time when the TMSI is assigned in the *TMSI Assignment*
 20 *Message*. The mobile station compares the expiration time to the current System Time
 21 when it powers up and periodically during operation.

22 Whenever the mobile station sends its full TMSI, the mobile station sets a timer, called the
 23 full-TMSI timer. If the full-TMSI timer expires, the mobile station deletes the TMSI by
 24 setting all bits in the TMSI_CODE field to '1'.

2.3.15.2 TMSI Assignment Memory

The mobile station shall provide memory to store the following parameters:

- 4-bit assigning TMSI zone length (ASSIGNING_TMSI_ZONE_LEN_{s-p})
- 8-octet assigning TMSI zone (ASSIGNING_TMSI_ZONE_{s-p})
- 4-octet TMSI code (TMSI_CODE_{s-p})
- 3-octet TMSI expiration time (TMSI_EXP_TIME_{s-p})

2.4 Accumulated Statistics

2.4.1 Monitored Quantities and Statistics

The mobile station shall store the value described in Table 2.4.1-1.

Table 2.4.1-1. Monitored Quantities and Statistics

Quantity Identifier	Length (bits)	Description
OTHER_SYS_TIME	36	The SYS_TIME field from the most recently received <i>Sync Channel Message</i>

2.4.2 Accumulated Paging, Broadcast, and Forward Common Control Channel Statistics

The mobile station shall maintain the counters shown in Table 2.4.2-1. The counters shall have the length as specified in Table 2.4.2-1. The mobile station shall initialize each counter described herein to zero upon power-on; the mobile station shall not re-initialize any counter described herein at any other time except upon command from the base station. Each counter shall be maintained modulo 2^{Length} , where Length is specified in Table 2.4.2-1.

The mobile station shall increment the counter PAG_6 each time that it declares a loss of the Paging Channel (see 2.6.2.1.1.4). The mobile station shall increment the counter PAG_7 for each idle handoff it performs. The mobile station shall increment the counter FCCCH_4 each time that it declares a loss of the Forward Common Control Channel (see 2.6.2.1.1.4). The mobile station shall increment the counter BCCH_5 each time that it declares a loss of the Broadcast Control Channel (see 2.6.2.1.1.4).

Table 2.4.2-1. Accumulated PCH/BCCH/F-CCCH Channel Statistics

Counter Identifier	Length (bits)	Description
PAG_6	16	Number of times that the mobile station declared a loss of the Paging Channel
PAG_7	16	Number of mobile station idle handoffs
FCCCH_4	16	Number of times that the mobile station declared a loss of the Forward Common Control Channel

Counter Identifier	Length (bits)	Description
BCCH_5	16	Number of times that the mobile station declared a loss of the Broadcast Control Channel

2.5 Reserved

2.6 Layer 3 Processing

This section describes mobile station Layer 3 processing. It contains frequent references to the messages that flow between the mobile station and base station. While reading this section, it may be helpful to refer to the PDU formats (see 2.7 and 3.7), and to the message flow examples (see Annex B and Annex C).

The mobile station shall ignore fields at the end of messages that do not exist in the protocol revision supported by the mobile station.

The values for the time and numerical constants used in this section (e.g., T_{20m} , N_{4m}) are specified in Annex D.

As illustrated in Figure 2.6-1, mobile station Layer 3 processing consists of the following states:

- *Mobile Station Initialization State* - In this state, the mobile station selects and acquires a system.
- *Mobile Station Idle State* - In this state, the mobile station monitors messages on the f-csch.
- *System Access State* - In this state, the mobile station sends messages to the base station on the r-csch and receives messages from the base station on the f-csch.
- *Mobile Station Control on the Traffic Channel State* - In this state, the mobile station communicates with the base station using the f/r-dsch and f/r-dtch.

After power is applied to the mobile station, it shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a power-up indication (see 2.6.1.1).

1 2.6.1 Mobile Station Initialization State

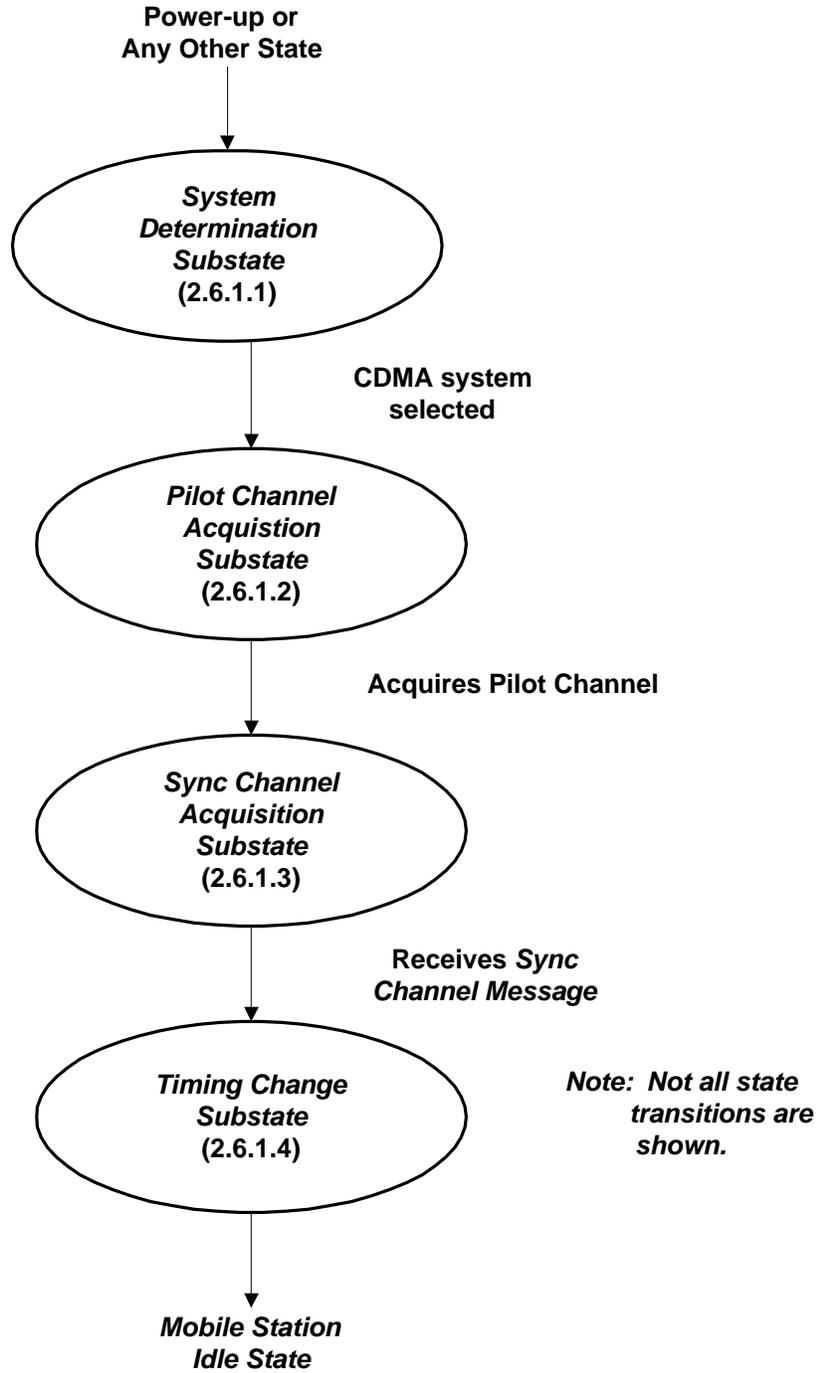

2 In this state, the mobile station first selects a system to use. If the selected system is a
3 CDMA system, the mobile station proceeds to acquire and then synchronize to the CDMA
4 system.

5 As illustrated in Figure 2.6.1-1, the *Mobile Station Initialization State* consists of the
6 following substates:

- 7 • *System Determination Substate* - In this substate, the mobile station selects which
8 system to use.
- 9 • *Pilot Channel Acquisition Substate* - In this substate, the mobile station acquires the
10 Pilot Channel of a CDMA system.
- 11 • *Sync Channel Acquisition Substate* - In this substate, the mobile station obtains
12 system configuration and timing information for a CDMA system.
- 13 • *Timing Change Substate* - In this substate, the mobile station synchronizes its
14 timing to that of a CDMA system.

15 While in the *Mobile Station Initialization State*, the mobile station shall update all active
16 registration timers as specified in 2.6.5.5.1.2.

17

1
2
3

Figure 2.6.1-1. Mobile Station Initialization State

2.6.1.1 System Determination Substate

In this substate, the mobile station selects the system to use.

Upon entering the *System Determination Substate*, the mobile station shall initialize the registration parameters as specified in 2.6.5.5.1.1.

If the mobile station enters the *System Determination Substate* with a power-up indication, the mobile station shall set $RAND_S$ to 0 (see 2.3.12.1.2), $PACA_S$ to disabled, $PACA_CANCEL$ to '0', the $PACA$ state timer to disabled, $NDSS_ORIG_S$ to disabled, $MAX_REDIRECT_DELAY_S$ to 31, $REDIRECTION_S$ to disabled, all entries of $SDB_SO_OMIT_S$ to '0',

$RER_MODE_ENABLED$ to NO, $TKZ_MODE_ENABLED$ to NO, $TKZ_MODE_PENDING$ to NO, $RSC_MODE_ENABLED$ to NO, and $T_SLOTTED_S$ to T_{74m} . The mobile station shall select a system in accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see 2.6.1.1.4).

If the mobile station enters the *System Determination Substate* with any indication other than a power-up indication, and if $PACA_S$ is equal to enabled, the mobile station shall also set $PACA_S$ to disabled, $PACA_CANCEL$ to '0', the $PACA$ state timer to disabled, and should indicate to the user that the $PACA$ call has been canceled.

If the mobile station enters the *System Determination Substate* with an acquisition failure indication, the mobile station shall perform the following:

- If $REDIRECTION_S$ is equal to enabled, the mobile station shall attempt to select another system in accordance with the current redirection criteria (see 2.6.1.1.2). If the mobile station is able to select another system, the mobile station shall attempt to acquire the selected system (see 2.6.1.1.4). Otherwise, if the mobile station has exhausted all possible selections using the current redirection criteria, the mobile station shall perform the following:
 - The mobile station shall set $REDIRECTION_S$ to disabled.
 - The mobile station shall set $RETURN_CAUSE_S$ to '0001'.
 - If $RETURN_IF_FAIL_S$ is equal to '1', the mobile station shall attempt to select the system from which it was redirected and shall attempt to acquire the selected system (see 2.6.1.1.4). The precise process for determining how to select the system from which the mobile station was redirected is left to the mobile station manufacturer.
 - If $RETURN_IF_FAIL_S$ is equal to '0', the mobile station shall select a system other than the system from which it was redirected in accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see 2.6.1.1.4). The precise process that the mobile station uses to avoid selecting the system from which it was redirected is left to the mobile station manufacturer.
- If $REDIRECTION_S$ is equal to disabled, the mobile station shall select a system in accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see 2.6.1.1.4).

1 If the mobile station enters the *System Determination Substate* with a new system
 2 indication, the mobile station shall set REDIRECTION_S to disabled. If NDSS_ORIG_S is
 3 enabled, the mobile station shall set NDSS_ORIG_S to disabled and should indicate to the
 4 user that the call origination has been canceled. The mobile station shall select a system
 5 in accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt to
 6 acquire the selected system (see 2.6.1.1.4).

7 If the mobile station enters the *System Determination Substate* with a new band indication,
 8 the mobile station shall set REDIRECTION_S to disabled. If NDSS_ORIG_S is enabled, the
 9 mobile station shall set NDSS_ORIG_S to disabled and should indicate to the user that the
 10 call origination has been canceled. The mobile station shall attempt to acquire the system
 11 found on the frequency and band defined in NEW_BAND_RECORD (see 2.6.1.1.4).

12 If the mobile station enters the *System Determination Substate* with a CDMA available
 13 indication, the mobile station shall set REDIRECTION_S to disabled. If NDSS_ORIG_S is
 14 enabled, the mobile station shall set NDSS_ORIG_S to disabled and should indicate to the
 15 user that the call origination is canceled. The mobile station should set CDMACH_S to the
 16 CDMA Channel (CDMA_FREQ) specified in the *CDMA Capability Global Action Message* and
 17 should attempt to acquire a CDMA system on the specified CDMA channel (see 2.6.1.1.4).
 18 If the mobile station does not attempt to acquire a CDMA system on the specified CDMA
 19 Channel, the mobile station shall select a system in accordance with the custom system
 20 selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see
 21 2.6.1.1.4).

22 If the mobile station enters the *System Determination Substate* with an additional CDMA
 23 available indication, the mobile station shall set REDIRECTION_S to disabled. If
 24 NDSS_ORIG_S is enabled, the mobile station shall set NDSS_ORIG_S to disabled and should
 25 indicate to the user that the call origination is canceled. The mobile station should set
 26 CDMACH_S to the CDMA Channel (CDMA_FREQ) specified in the *CDMA Info Order* and
 27 should attempt to acquire a CDMA system on the specified CDMA channel (see 2.6.1.1.4).
 28 If the mobile station does not attempt to acquire a CDMA system on the specified CDMA
 29 Channel, the mobile station shall select a system in accordance with the custom system
 30 selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see
 31 2.6.1.1.4).

32 If the mobile station enters the *System Determination Substate* with a reselection indication,
 33 the mobile station shall set REDIRECTION_S to disabled. If NDSS_ORIG_S is enabled, the
 34 mobile station shall set NDSS_ORIG_S to disabled and should indicate to the user that the
 35 call origination is canceled. The mobile station shall select a system in accordance with the
 36 custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected
 37 system (see 2.6.1.1.4).

38 If the mobile station enters the *System Determination Substate* with an encryption/message
 39 integrity failure indication, the mobile station shall set REDIRECTION_S to disabled, KEY_ID
 40 to '00', D_SIG_ENCRYPT_MODE_S to '000', C_SIG_ENCRYPT_MODE_S to '000',
 41 LAST_2G_KEY_ID_S to '00', LAST_3G_KEY_ID_S to '10', ENC_KEY[j] to NULL, INT_KEY[j] to
 42 NULL, TX_EXT_SSEQ[i][j] to 0, RX_EXT_SSEQ[i][j] to 0, where i ranges from '0' to '1' and j
 43 ranges from '00' to '11'. If NDSS_ORIG_S is enabled, the mobile station shall set
 44 NDSS_ORIG_S to disabled and should indicate to the user that the call origination is

1 canceled. The mobile station shall select a system in accordance with the custom system
2 selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see
3 2.6.1.1.4).

4 If the mobile station enters the *System Determination Substate* with a system reselection
5 indication, the mobile station shall set REDIRECTION_s to disabled. If NDSS_ORIG_s is
6 enabled, the mobile station shall set NDSS_ORIG_s to disabled and should indicate to the
7 user that the call origination is canceled. The mobile station should attempt to select a
8 system available for system reselection as specified in 2.6.1.1.3, and should attempt to
9 acquire the selected system (see 2.6.1.1.4). The precise process for determining how to
10 select such a system is left to the mobile station manufacturer. If the mobile station does
11 not attempt to select such a system, the mobile station shall select a system in accordance
12 with the custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the
13 selected system (see 2.6.1.1.4).

14 If the mobile station enters the *System Determination Substate* with a rescan indication, the
15 mobile station shall set REDIRECTION_s to disabled. If NDSS_ORIG_s is enabled, the mobile
16 station shall set NDSS_ORIG_s to disabled and should indicate to the user that the call
17 origination is canceled. The mobile station shall select a system in accordance with the
18 custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected
19 system (see 2.6.1.1.4).

20 If the mobile station enters the *System Determination Substate* with a protocol mismatch
21 indication, the mobile station shall perform the following:

- 22 • If REDIRECTION_s is equal to enabled, the mobile station shall attempt to select
23 another system in accordance with the current redirection criteria (see 2.6.1.1.2). If
24 the mobile station is able to select another system, the mobile station shall attempt
25 to acquire the selected system (see 2.6.1.1.4). Otherwise, if the mobile station has
26 exhausted all possible selections using the current redirection criteria, the mobile
27 station shall perform the following:
 - 28 - The mobile station shall set REDIRECTION_s to disabled.
 - 29 - The mobile station shall set RETURN_CAUSE_s to '0010'.
 - 30 - If RETURN_IF_FAIL_s is equal to '1', the mobile station shall attempt to select the
31 system from which it was redirected and shall attempt to acquire the selected
32 system (see 2.6.1.1.4). The precise process for determining how to select the
33 system from which the mobile station was redirected is left to the mobile station
34 manufacturer.
 - 35 - If RETURN_IF_FAIL_s is equal to '0', the mobile station shall select a system other
36 than the system from which it was redirected in accordance with the custom
37 system selection process (see 2.6.1.1.1) and shall attempt to acquire the
38 selected system (see 2.6.1.1.4). The precise process for determining how to
39 avoid the system from which the mobile station was redirected is left to the
40 mobile station manufacturer.

- 1 • If REDIRECTION_S is equal to disabled, the mobile station shall select a system in
2 accordance with the custom system selection process (see 2.6.1.1.1) and shall
3 attempt to acquire the selected system (see 2.6.1.1.4).

4 If the mobile station enters the *System Determination Substate* with a system lost indication,
5 the mobile station shall set REDIRECTION_S to disabled. If NDSS_ORIG_S is enabled, the
6 mobile station shall set NDSS_ORIG_S to disabled and should indicate to the user that the
7 call origination is canceled. The mobile station should attempt to select the same system
8 that was lost, and should attempt to acquire the selected system (see 2.6.1.1.4). The
9 precise process for determining how to select the same system is left to the mobile station
10 manufacturer. If the mobile station does not attempt to select the same system, the mobile
11 station shall select a system in accordance with the custom system selection process (see
12 2.6.1.1.1) and shall attempt to acquire the selected system (see 2.6.1.1.4).

13 If the mobile station enters the *System Determination Substate* with a lock indication, the
14 mobile station shall set REDIRECTION_S to disabled. If NDSS_ORIG_S is enabled, the mobile
15 station shall set NDSS_ORIG_S to disabled and should indicate to the user that the call
16 origination is canceled. The mobile station shall select a system in accordance with the
17 custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected
18 system (see 2.6.1.1.4).

19 If the mobile station enters the *System Determination Substate* with an unlock indication,
20 the mobile station shall set REDIRECTION_S to disabled. If NDSS_ORIG_S is enabled, the
21 mobile station shall set NDSS_ORIG_S to disabled and should indicate to the user that the
22 call origination is canceled. The mobile station shall select a system in accordance with the
23 custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected
24 system (see 2.6.1.1.4).

25 If the mobile station enters the *System Determination Substate* with an access denied
26 indication, the mobile station shall set REDIRECTION_S to disabled. If NDSS_ORIG_S is
27 enabled, the mobile station shall set NDSS_ORIG_S to disabled and should indicate to the
28 user that the call origination is canceled. The mobile station shall select a system in
29 accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt to
30 acquire the selected system (see 2.6.1.1.4).

31 If the mobile station enters the *System Determination Substate* with an ACCT blocked
32 indication, the mobile station shall set REDIRECTION_S to disabled. If NDSS_ORIG_S is
33 enabled, the mobile station shall set NDSS_ORIG_S to disabled. The mobile station shall
34 select a system in accordance with the custom system selection process (see 2.6.1.1.1) and
35 shall attempt to acquire the selected system (see 2.6.1.1.4).

36 If the mobile station enters the *System Determination Substate* with an NDSS off indication,
37 the mobile station shall set REDIRECTION_S to disabled. If NDSS_ORIG_S is enabled, the
38 mobile station shall set NDSS_ORIG_S to disabled and should indicate to the user that the
39 call origination is canceled. The mobile station shall select a system in accordance with the
40 custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected
41 system (see 2.6.1.1.4).

42 If the mobile station enters the *System Determination Substate* with a release indication and
43 REDIRECTION_S is equal to enabled, the mobile station shall attempt to select the same

1 system on which the release occurred and shall attempt to acquire the selected system (see
2 2.6.1.1.4). The precise process for determining how to select the same system is left to the
3 mobile station manufacturer. If REDIRECTION_S is equal to disabled, the mobile station
4 shall select a system in accordance with the custom system selection process (see
5 2.6.1.1.1) and shall attempt to acquire the selected system (see 2.6.1.1.4). If NDSS_ORIG_S
6 is enabled, the mobile station shall set NDSS_ORIG_S to disabled.

7 If the mobile station enters the *System Determination Substate* with an error indication, the
8 mobile station shall set REDIRECTION_S to disabled. If NDSS_ORIG_S is enabled, the mobile
9 station shall set NDSS_ORIG_S to disabled and should indicate to the user that the call
10 origination is canceled. The mobile station shall select a system in accordance with the
11 custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected
12 system (see 2.6.1.1.4).

13 If the mobile station enters the *System Determination Substate* with a redirection indication,
14 the mobile station shall set REDIRECTION_S to enabled. The mobile station shall delete all
15 entries from the ZONE_LIST_S and SID_NID_LIST_S. The mobile station shall select a system
16 in accordance with the current redirection criteria (see 2.6.1.1.2) and shall attempt to
17 acquire the selected system (see 2.6.1.1.4).

18 If the mobile station enters the *System Determination Substate* with a registration rejected
19 indication, the mobile station shall perform the following:

- 20 • The mobile station shall delete the newly generated encryption key (if any).
- 21 • If REDIRECTION_S is equal to enabled, the mobile station shall perform the
22 following:
 - 23 - The mobile station shall set REDIRECTION_S to disabled.
 - 24 - The mobile station shall set RETURN_CAUSE_S to '0011'.
 - 25 - If RETURN_IF_FAIL_S is equal to '1', the mobile station shall attempt to select the
26 system from which it was redirected and shall attempt to acquire the selected
27 system (see 2.6.1.1.4). The precise process for determining how to select the
28 system from which the mobile station was redirected is left to the mobile station
29 manufacturer.
 - 30 - If RETURN_IF_FAIL_S is equal to '0', the mobile station shall select a system other
31 than the system from which it was redirected in accordance with the custom
32 system selection process (see 2.6.1.1.1) and shall attempt to acquire the
33 selected system (see 2.6.1.1.4). The precise process for determining how to
34 avoid the system from which the mobile station was redirected is left to the
35 mobile station manufacturer.
- 36 • If REDIRECTION_S is equal to disabled, the mobile station shall select a system in
37 accordance with the custom system selection process (see 2.6.1.1.1) and shall
38 attempt to acquire the selected system (see 2.6.1.1.4).

39 If the mobile station enters the *System Determination Substate* with a wrong system
40 indication, the mobile station shall perform the following:

- 1 • If REDIRECTION_S is equal to enabled, the mobile station shall attempt to select
2 another system in accordance with the current redirection criteria (see 2.6.1.1.2). If
3 the mobile station is able to select another system, the mobile station shall attempt
4 to acquire the selected system (see 2.6.1.1.4). Otherwise, if the mobile station has
5 exhausted all possible selections using the current redirection criteria, the mobile
6 station shall perform the following:
- 7 - The mobile station shall set REDIRECTION_S to disabled.
8 - The mobile station shall set RETURN_CAUSE_S to '0100'.
9 - If RETURN_IF_FAIL_S is equal to '1', the mobile station shall attempt to select the
10 system from which it was redirected and shall attempt to acquire the selected
11 system (see 2.6.1.1.4). The precise process for determining how to select the
12 system from which the mobile station was redirected is left to the mobile station
13 manufacturer.
14 - If RETURN_IF_FAIL_S is equal to '0', the mobile station shall select a system other
15 than the system from which it was redirected in accordance with the custom
16 system selection process (see 2.6.1.1.1) and shall attempt to acquire the
17 selected system (see 2.6.1.1.4). The precise process for determining how to
18 avoid the system from which the mobile station was redirected is left to the
19 mobile station manufacturer.
- 20 • If REDIRECTION_S is equal to disabled, the mobile station shall select a system in
21 accordance with the custom system selection process (see 2.6.1.1.1) and shall
22 attempt to acquire the selected system (see 2.6.1.1.4).

23 If the mobile station enters the *System Determination Substate* with a wrong network
24 indication, the mobile station shall perform the following:

- 25 • If REDIRECTION_S is equal to enabled, the mobile station shall attempt to select
26 another system in accordance with the current redirection criteria (see 2.6.1.1.2). If
27 the mobile station is able to select another system, the mobile station shall attempt
28 to acquire the selected system (see 2.6.1.1.4). Otherwise, if the mobile station has
29 exhausted all possible selections using the current redirection criteria, the mobile
30 station shall perform the following:
- 31 - The mobile station shall set REDIRECTION_S to disabled.
32 - The mobile station shall set RETURN_CAUSE_S to '0101'.
33 - If RETURN_IF_FAIL_S is equal to '1', the mobile station shall attempt to select the
34 system from which it was redirected and shall attempt to acquire the selected
35 system (see 2.6.1.1.4). The precise process for determining how to select the
36 system from which the mobile station was redirected is left to the mobile station
37 manufacturer.

- 1 - If RETURN_IF_FAIL_s is equal to '0', the mobile station shall select a system other
2 than the system from which it was redirected in accordance with the custom
3 system selection process (see 2.6.1.1.1) and shall attempt to acquire the
4 selected system (see 2.6.1.1.4). The precise process for determining how to
5 avoid the system from which the mobile station was redirected is left to the
6 mobile station manufacturer.
- 7 • If REDIRECTION_s is equal to disabled, the mobile station shall select a system in
8 accordance with the custom system selection process (see 2.6.1.1.1) and shall
9 attempt to acquire the selected system (see 2.6.1.1.4).

10 2.6.1.1.1 Custom System Selection Process

11 The precise process for custom system selection is left to the mobile station manufacturer.

12 The mobile station shall perform the custom system selection process as follows:

- 13 • The mobile station shall determine which system to use.
- 14 • If the mobile station is to use a CDMA system, it shall set CDMABAND_s to the band
15 class (see [30]) for the selected system.
- 16 • If the mobile station is to use a CDMA system with CDMABAND_s = '00000' or
17 CDMABAND_s = '00011', it shall perform the following:
- 18 - If the mobile station is to use System A, it shall set SERVSYS_s to SYS_A. If the
19 mobile station is to use System B, it shall set SERVSYS_s to SYS_B.
- 20 - The mobile station shall set CDMACH_s either to the Primary or Secondary
21 CDMA Channel number (see [2]) for the selected serving system (SERVSYS_s). If
22 the mobile station fails to acquire a CDMA system on the first CDMA Channel it
23 tries, the mobile station should attempt to acquire on the alternate CDMA
24 Channel (Primary or Secondary) before attempting other alternatives.
- 25 • If the mobile station is to use a CDMA system with CDMABAND_s other than '00000'
26 or '00011', it shall set CDMACH_s to the CDMA Channel number (see [2]) for the
27 selected system.

28 2.6.1.1.2 System Selection Using Current Redirection Criteria

29 To perform system selection using current redirection criteria:

- 30 • When a single redirection record is received in a *Service Redirection Message*, a
31 *Global Service Redirection Message*, or an *Extended Global Service Redirection*
32 *Message*, the mobile station shall use the information received and stored in the
33 variable REDIRECT_REC_s to perform current system selection as specified in
34 2.6.1.1.2.1.
- 35 • If multiple redirection records are received in an *Extended Global Service Redirection*
36 *Message*, the mobile station shall process at most *j* sequential redirection records,
37 where *j* is equal to the number of redirection records in REDIRECT_REC_LIST as
38 follows:

- 1 - If the DELETE_TMSI field of REDIRECT_REC_LIST[k] is equal to '1', the mobile
2 station shall set all the bits of TMSI_CODE_{s-p} to '1'; otherwise the mobile station
3 shall set TMSI_CODE_{s-p} to TEMP_TMSI_CODE.
- 4 - Store the redirection record (REDIRECT_REC_s = REDIRECT_REC_LIST[k]).
- 5 - If the RECORD_TYPE field of REDIRECT_REC_LIST[k] is equal to '00000001' the
6 mobile station shall:
- 7 + Set CDMA_MODE_s to '1'.
- 8 + Set DIGITAL_REG_{s-p} to '00000000'.
- 9 + Set the maximum delay upon redirection (MAX_REDIRECT_DELAY_s =
10 MAX_REDIRECT_DELAY field of REDIRECT_REC_LIST[k]).
- 11 - If the mobile station has not exhausted all possible selections using the
12 REDIRECT_REC_LIST[k], the mobile station shall attempt to select a system
13 according to 2.6.1.1.2.1; otherwise, if k is not the last record in
14 REDIRECT_REC_LIST, the mobile station shall continue the system selection
15 with REDIRECT_REC_LIST[k+1].

16 2.6.1.1.2.1 System Selection Using Current Redirection Record

17 If the RECORD_TYPE field of REDIRECT_REC_s is equal to '00000001' and the mobile
18 station supports Band Class 0, the mobile station shall perform system selection as
19 follows:

- 20 • If the SYS_ORDERING field is equal to '000', the mobile station shall make
21 sequential system selections as follows:
- 22 - The mobile station shall set SERVSYS_s either to SYS_A or SYS_B. The precise
23 process for determining how many system selections to make and for
24 determining whether to use SYS_A or SYS_B is left to the mobile station
25 manufacturer.
- 26 • If the SYS_ORDERING field is equal to '001', the mobile station shall select no more
27 than one system selection as follows:
- 28 - The mobile station shall set SERVSYS_s to SYS_A.
- 29 • If the SYS_ORDERING field is equal to '010', the mobile station shall select no more
30 than one system selection as follows:
- 31 - The mobile station shall set SERVSYS_s to SYS_B.
- 32 • If the SYS_ORDERING field is equal to '011', the mobile station shall make at most
33 two sequential system selections as follows:
- 34 - For the first system selection, the mobile station shall set SERVSYS_s to SYS_A.
35 - For the second system selection, the mobile station shall set SERVSYS_s to
36 SYS_B.
- 37 • If the SYS_ORDERING field is equal to '100', the mobile station shall make at most
38 2 sequential system selections as follows:

- 1 - For the first system selection, the mobile station shall set $SERVSYS_S$ to SYS_B .
- 2 - For the second system selection, the mobile station shall set $SERVSYS_S$ to
- 3 SYS_A .
- 4 • If the $SYS_ORDERING$ field is equal to '101', the mobile station shall make at most
- 5 2 sequential system selections as follows:
- 6 - For the first system selection, the mobile station shall set $SERVSYS_S$ either to
- 7 SYS_A or SYS_B . The precise process for determining whether to use SYS_A or
- 8 SYS_B first is left to the mobile station manufacturer.
- 9 - For the second system selection, the mobile station shall set $SERVSYS_S$ to
- 10 SYS_B if SYS_A was used for the first selection, or to SYS_A if SYS_B was used
- 11 for the first selection.

12 If the $RECORD_TYPE$ field of $REDIRECT_REC_S$ is equal to '00000010', the mobile station

13 shall perform system selection as follows:

- 14 • If the mobile station supports CDMA mode operation in the band class identified by
- 15 the $BAND_CLASS$ field, the mobile station shall make at most n sequential system
- 16 selections, where n is equal to the value of the NUM_CHANS field, as follows:
- 17 - For the i^{th} system selection, where i ranges from 1 to n :
- 18 + If the mobile station supports operation on the CDMA channel associated
- 19 with the value of the i^{th} occurrence of the $CDMA_CHAN$ field and the CDMA
- 20 channel is supported for at least one band subclass listed in the record
- 21 (when included), the mobile station shall set $CDMACH_S$ to the value of the i^{th}
- 22 occurrence of the $CDMA_CHAN$ field and shall set $CDMABAND_S$ to the value
- 23 specified in the $BAND_CLASS$ field.
- 24 + Otherwise, the mobile station shall not make the i^{th} system selection.

25 2.6.1.1.3 System Selection Using System Reselection Criteria

26 The precise process for selecting a system using system reselection criteria is left to the

27 mobile station manufacturer. The mobile station should use information received in the

28 *Neighbor List Message*, *Extended Neighbor List Message*, *General Neighbor List Message*, or

29 the *Universal Neighbor List Message* to perform the system reselection process as follows:

- 30 • If there are pilots in the Neighbor List on a different Frequency Assignment than
- 31 that of the mobile station, the mobile station may select the CDMA system
- 32 consisting of these neighbor pilots. If the mobile station is to use a CDMA system,
- 33 it shall set $CDMABAND_S$ to the band class (see [30]) for the selected system and
- 34 shall set $CDMACH_S$ to the CDMA Channel number (see [2]) for the selected system.

35 2.6.1.1.4 Acquiring the Selected System

36 The mobile station shall attempt to acquire the selected system as follows:

- 37 • If the selected system is a CDMA system, the mobile station shall enter the *Pilot*
- 38 *Channel Acquisition Substate*.

1 2.6.1.2 Pilot Channel Acquisition Substate

2 In this substate, the mobile station acquires the Pilot Channel of the selected CDMA
3 system.

4 Upon entering the *Pilot Channel Acquisition Substate*, the mobile station shall tune to the
5 CDMA Channel number equal to $CDMACH_s$, shall set its code channel for the Pilot
6 Channel (see [2]) and shall search for the Pilot Channel for no longer than T_{20m} seconds
7 (see Annex D). If the mobile station acquires the Pilot Channel, the mobile station shall
8 enter the *Sync Channel Acquisition Substate*.

9 If the mobile station determines that it is unlikely to acquire the Pilot Channel within T_{20m}
10 seconds, the mobile station may enter the *System Determination Substate* with an
11 acquisition failure indication (see 2.6.1.1). The time, to either acquire the Pilot Channel or
12 determine that Pilot Channel acquisition is unlikely, shall not exceed T_{20m} seconds (see
13 Annex D), after which the mobile station shall enter the *System Determination Substate* with
14 an acquisition failure indication (see 2.6.1.1).

15 2.6.1.3 Sync Channel Acquisition Substate

16 In this substate, the mobile station receives and processes the *Sync Channel Message* to
17 obtain system configuration and timing information. A valid *Sync Channel Message* is one
18 that passes the CRC check and is in the appropriate format according to the protocol
19 revision of the base station.

20 Upon entering the *Sync Channel Acquisition Substate*, the mobile station shall set its code
21 channel for the Sync Channel (see [2]).

22 If the mobile station does not receive a valid *Sync Channel Message* within T_{21m} seconds,
23 the mobile station shall enter the *System Determination Substate* with an acquisition failure
24 indication.

25 If the mobile station receives a valid *Sync Channel Message* within T_{21m} seconds, but the
26 protocol revision level supported by the mobile station ($MOB_P_REV_p$ of the current band
27 class) is less than the minimum protocol revision level supported by the base station
28 ($MIN_P_REV_r$), the mobile station shall enter the *System Determination Substate* with a
29 protocol mismatch indication (see 2.6.1.1).

30 If the mobile station receives a valid *Sync Channel Message* within T_{21m} seconds, but the
31 values of the $PRAT_r$, the $SR1_BRAT_NON_TD_r$, the $SR1_BRAT_TD_r$, or the $SR3_BRAT_r$ fields
32 are designated as reserved by the protocol revision level supported by the mobile station
33 ($MOB_P_REV_p$ of the current band class), the mobile station shall enter the *System*
34 *Determination Substate* with a protocol mismatch indication (see 2.6.1.1).

35 If the mobile station receives a valid *Sync Channel Message* within T_{21m} seconds and the
36 protocol revision level supported by the mobile station ($MOB_P_REV_p$ of the current band
37 class) is greater than or equal to the minimum protocol revision level supported by the base
38 station ($MIN_P_REV_r$), the mobile station shall store the following information from the
39 message:

- 40 • Protocol revision level ($P_REV_s = P_REV_r$)
- 41 • Minimum protocol revision level ($MIN_P_REV_s = MIN_P_REV_r$)

- 1 • System identification ($SID_S = SID_T$)
 - 2 • Network identification ($NID_S = NID_T$)
 - 3 • Pilot PN sequence offset index ($PILOT_PN_S = PILOT_PN_T$)
 - 4 • Long code state ($LC_STATE_S = LC_STATE_T$)
 - 5 • System Time ($SYS_TIME_S = SYS_TIME_T$)
 - 6 • Paging Channel data rate ($PRAT_S = PRAT_T$)
 - 7 • Protocol revision level currently in use ($P_REV_IN_USE_S =$ the lesser value of
 - 8 P_REV_S and $MOB_P_REV_P$ of the current band class)

 - 9 • SR1 Non-TD BCCH support indicator ($SR1_BCCH_NON_TD_INCL_S =$
 - 10 $SR1_BCCH_NON_TD_INCL_T$)
 - 11 • SR1 TD BCCH support indicator ($SR1_TD_INCL_S = SR1_TD_INCL_T$)
 - 12 • If $SR1_BCCH_NON_TD_INCL_T$ is equal to '1':
 - 13 - $SR1_BRAT_NON_TD_S = SR1_BRAT_NON_TD_T$;
 - 14 - $SR1_CRAT_NON_TD_S = SR1_CRAT_NON_TD_T$;
 - 15 - $BCCH_CODE_CHAN_NON_TD_S = SR1_BCCH_CODE_CHAN_NON_TD_T$.
 - 16 • If $SR1_TD_INCL_T$ is included and is equal to '1', and the mobile station supports the
 - 17 Transmit Diversity indicated by $SR1_TD_MODE_T$:
 - 18 - $SR1_BRAT_TD_S = SR1_BRAT_TD_T$;
 - 19 - $SR1_CRAT_TD_S = SR1_CRAT_TD_T$;
 - 20 - $BCCH_CODE_CHAN_TD_S = SR1_BCCH_CODE_CHAN_TD_T$.
 - 21 • If the mobile station supports the Transmit Diversity, $SR1_BCCH_NON_TD_INCL_T$ is
 - 22 equal to '1', and $SR1_TD_INCL_T$ is equal to '0':
 - 23 - $SR1_BRAT_TD_S = SR1_BRAT_NON_TD_T$;
 - 24 - $SR1_CRAT_TD_S = SR1_CRAT_NON_TD_T$;
 - 25 - $BCCH_CODE_CHAN_TD_S = SR1_BCCH_CODE_CHAN_NON_TD_T$.
 - 26 • SR3 support indicator ($SR3_INCL_S = SR3_INCL_T$)
- 27 The mobile station shall ignore any fields at the end of the *Sync Channel Message* that are
- 28 not defined according to the protocol revision level ($MOB_P_REV_P$ of the current band class)
- 29 being used by the mobile station.

30 The mobile station may store the following information from the message:

- 31 • Number of leap seconds that have occurred since the start of System Time
- 32 ($LP_SEC_S = LP_SEC_T$)
- 33 • Offset of local time from System Time ($LTM_OFF_S = LTM_OFF_T$)
- 34 • Daylight savings time indicator ($DAYLT_S = DAYLT_T$)

1 If REDIRECTION_s and NDSS_ORIG_s are equal to disabled, the mobile station may enter the
2 *System Determination Substate* with a reselection indication (see 2.6.1.1).

3 If REDIRECTION_s is equal to enabled, the EXPECTED_SID field of REDIRECT_REC_s is not
4 equal to 0, and SID_r is not equal to EXPECTED_SID, the mobile station shall enter the
5 *System Determination Substate* with a wrong system indication (see 2.6.1.1). If
6 REDIRECTION_s is equal to enabled, the EXPECTED_NID field of REDIRECT_REC_s is not
7 equal to 65535, and NID_r is not equal to EXPECTED_NID, the mobile station shall enter
8 the *System Determination Substate* with a wrong network indication.

9 If P_REV_IN_USE_s is less than 6, the mobile station shall set POTENTIAL_CDMACH_s to
10 CDMA_FREQ_r.

11 If P_REV_IN_USE_s is equal to six, the mobile station shall perform the following:

- 12 • If the mobile station supports the Quick Paging Channel or any radio configuration
13 in the Radio Configuration Class 2 or 3 (see 1.1.1), the mobile station shall set
14 POTENTIAL_CDMACH_s equal to EXT_CDMA_FREQ_r; otherwise, the mobile station
15 shall set POTENTIAL_CDMACH_s equal to CDMA_FREQ_r.

16 If P_REV_IN_USE_s is greater than six, the mobile station shall perform the following:

- 17 • If the mobile station supports Spreading Rate 3 on the common channels and
18 SR3_INCL_s is equal to '1', the mobile station shall set:

19 - BRAT_s = SR3_BRAT_r;

20 + BCCH_CODE_RATE_s = 1/3;

21 - BCCH_s = SR3_BCCH_CODE_CHAN_r;

22 - SR3_PRIMARY_PILOT_s = SR3_PRIMARY_PILOT_r;

23 - SR3_PILOT_POWER1_s = SR3_PILOT_POWER1_r;

24 - SR3_PILOT_POWER2_s = SR3_PILOT_POWER2_r;

25 - If SR3_CENTER_FREQ_INCL_r is equal to '1', POTENTIAL_CDMACH_s =
26 SR3_CENTER_FREQ_r; otherwise, POTENTIAL_CDMACH_s = EXT_CDMA_FREQ_r.

- 27 • If the mobile station does not support Spreading Rate 3 on the common channel or
28 if SR3_INCL_s is equal to '0', the mobile station shall perform the following:

29 - If SR1_TD_INCL_r is equal to '1' and the mobile station supports the Transmit
30 Diversity mode specified by SR1_TD_MODE_r, the mobile station shall set:

31 + SR1_TD_MODE_s = SR1_TD_MODE_r

32 + SR1_TD_POWER_LEVEL_s = SR1_TD_POWER_LEVEL_r

33 + BRAT_s = SR1_BRAT_TDr

34 + BCCH_CODE_RATE_s = SR1_CRAT_TDr,

35 + BCCH_s = SR1_BCCH_CODE_CHAN_TDr,

36 + POTENTIAL_CDMACH_s = SR1_CDMA_FREQ_TDr

- 1 - Otherwise, if $SR1_BCCH_NON_TD_INCL_r$ is equal to '1', the mobile station shall
2 set:
- 3 + $BRAT_s = SR1_BRAT_NON_TD_r$
- 4 + $BCCH_CODE_RATE_s = SR1_CRAT_NON_TD_r$,
- 5 + $BCCH_s = SR1_BCCH_CODE_CHAN_NON_TD_r$,
- 6 + If $SR1_NON_TD_FREQ_INCL_r$ is equal to '1', $POTENTIAL_CDMACH_s =$
7 $SR1_CDMA_FREQ_NON_TD_r$; otherwise, $POTENTIAL_CDMACH_s =$
8 $EXT_CDMA_FREQ_r$
- 9 - Otherwise, the mobile station shall perform the following:
- 10 + If the mobile station supports the Quick Paging Channel or any radio
11 configuration in the Radio Configuration Class 2 or 3 (see 1.1.1), the mobile
12 station shall set $POTENTIAL_CDMACH_s = EXT_CDMA_FREQ_r$; otherwise,
13 the mobile station shall set $POTENTIAL_CDMACH_s = CDMA_FREQ_r$.
- 14 If $POTENTIAL_CDMACH_s$ is different from $CDMACH_s$, the mobile station shall set
15 $CDMACH_s = POTENTIAL_CDMACH_s$ and then tune to the CDMA Channel ($CDMACH_s$).

16 The mobile station shall enter the *Timing Change Substate*.

17 2.6.1.4 Timing Change Substate

18 Figure 2.6.1.4-1 illustrates the mobile station timing changes that occur in this substate.
19 The mobile station synchronizes its long code timing and system timing to those of the
20 CDMA system, using the $PILOT_PN_s$, LC_STATE_s , and SYS_TIME_s values obtained from the
21 received *Sync Channel Message*. SYS_TIME_s is equal to the System Time (see [2])
22 corresponding to 320 ms past the end of the last 80 ms superframe (see [2]) of the received
23 *Sync Channel Message* minus the pilot PN sequence offset. LC_STATE_s is equal to the
24 system long code state (see [2]) corresponding to SYS_TIME_s .

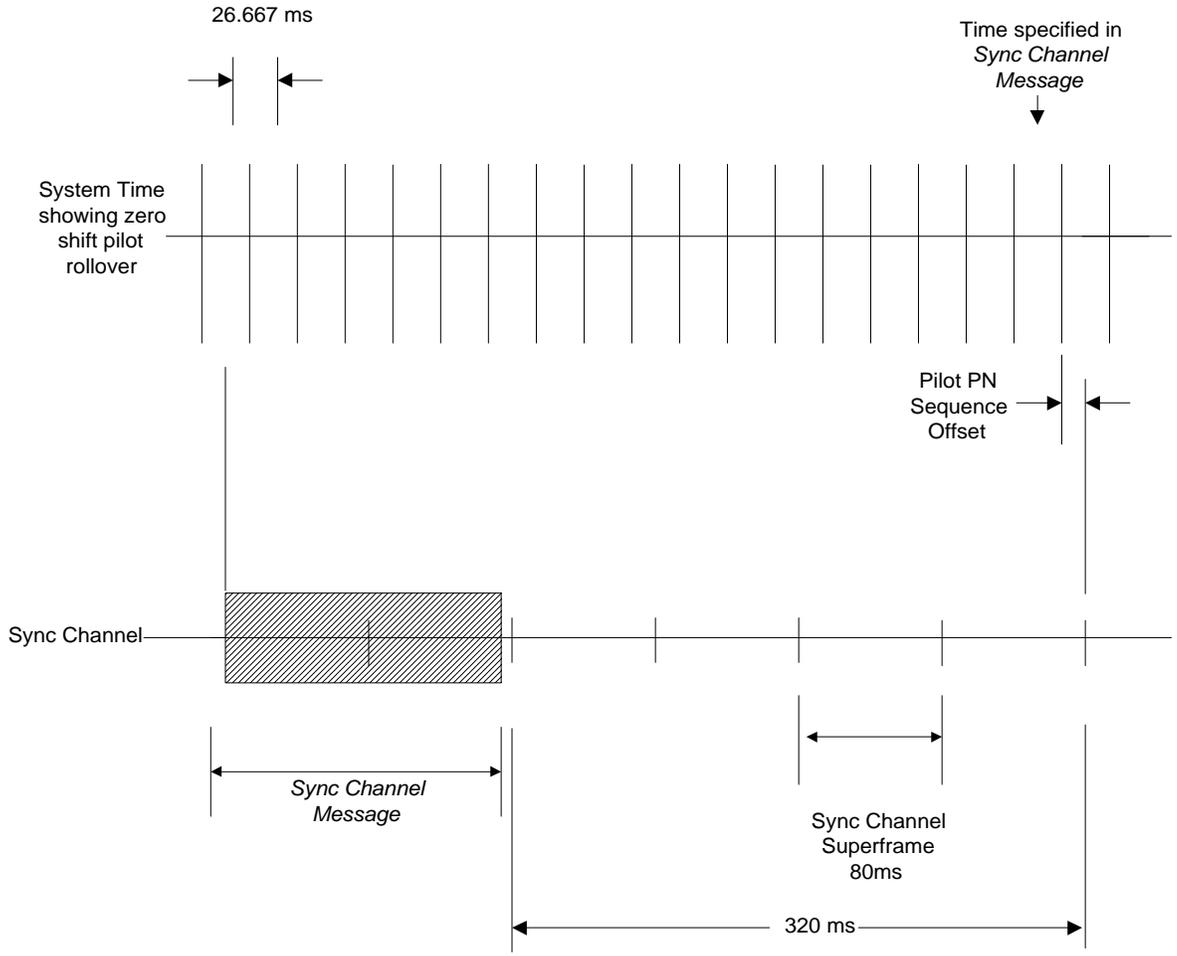

25 In the *Timing Change Substate*, the mobile station shall synchronize its long code timing to
26 the CDMA system long code timing derived from LC_STATE_s , and synchronize its system
27 timing to the CDMA system timing derived from SYS_TIME_s .

28 The mobile station shall perform the following:

- 29 • If $SR1_BCCH_NON_TD_INCL_s$ is equal to '1', or if $SR1_TD_INCL_s$ is equal to '1' and
30 the mobile supports the transmit diversity mode specified by $SR1_TD_MODE_s$, or if
31 the mobile station supports Spreading Rate 3 on the common channel and
32 $SR3_INCL_s$ is equal to '1', the mobile station shall:
- 33 - Set the stored message sequence numbers $CONFIG_MSG_SEQ_s$,
34 $A41_SYS_PAR_MSG_SEQ_s$, $ACC_MSG_SEQ_s$, $MC_RR_PAR_MSG_SEQ_s$,
35 $UNI_NGHBR_LST_MSG_SEQ_s$, $EXT_GLOB_SERV_REDIR_MSG_SEQ_s$,
36 $EXT_CHAN_LST_MSG_SEQ_s$, $FD_CHAN_LST_MSG_SEQ_s$,
37 $USER_ZONE_ID_MSG_SEQ_s$, $AP_PILOT_INFO_MSG_SEQ_s$, $AP_IDT_MSG_SEQ_s$,
38 $AP_ID_TEXT_MSG_SEQ_s$, $GOI_MSG_SEQ_s$, $FREQ_GOI_MSG_SEQ_s$,
39 $ATIM_MSG_SEQ_s$ and $PRI_NGHBR_LST_MSG_SEQ_s$ variables to NULL (see
40 2.6.2.2);

- 1 - Set the index number of the Primary Broadcast Control Channel (BCN) to 1;
- 2 - Set IMSI_11_12_s, IMSI_10_s and MCC_s to NULL;
- 3 - Perform registration initialization as specified in 2.6.5.5.1.3; and
- 4 - If the bits of TMSI_CODE_{s-p} are not all equal to '1' and if SYS_TIME_s exceeds
- 5 TMSI_EXP_TIME_{s-p} × 2¹², the mobile station shall set all the bits of
- 6 TMSI_CODE_{s-p} to '1'.
- 7 • Otherwise, the mobile station shall:
- 8 - Set PAGECH_s to the Primary Paging Channel (see [2]);
- 9 - Set PAGE_CHAN_s to '1';
- 10 - Set the stored message sequence numbers CONFIG_MSG_SEQ_s,
- 11 SYS_PAR_MSG_SEQ_s, ACC_MSG_SEQ_s, NGHBR_LST_MSG_SEQ_s,
- 12 GEN_NGHBR_LST_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s,
- 13 CHAN_LST_MSG_SEQ_s, EXT_SYS_PAR_MSG_SEQ_s,
- 14 GLOB_SERV_REDIR_MSG_SEQ_s, EXT_GLOB_SERV_REDIR_MSG_SEQ_s,
- 15 EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s,
- 16 USER_ZONE_ID_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s,
- 17 AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s,
- 18 ATIM_MSG_SEQ_s and PRI_NGHBR_LST_MSG_SEQ_s variables to NULL (see
- 19 2.6.2.2);
- 20 - Set IMSI_11_12_s, IMSI_10_s and MCC_s to NULL;
- 21 - Perform registration initialization as specified in 2.6.5.5.1.3; and
- 22 - If the bits of TMSI_CODE_{s-p} are not all equal to '1' and if SYS_TIME_s exceeds
- 23 TMSI_EXP_TIME_{s-p} × 2¹², the mobile station shall set all the bits of
- 24 TMSI_CODE_{s-p} to '1'.

25 The mobile station shall enter the *Mobile Station Idle State*.

1

3
4
5

Figure 2.6.1.4-1. Mobile Station Internal Timing

1 2.6.2 Mobile Station Idle State

2 In this state, the mobile station monitors the Paging Channel or the Quick Paging Channel
3 or Forward Common Control Channel/Primary Broadcast Control Channel. The mobile
4 station can receive messages, receive an incoming call (mobile station terminated call),
5 initiate a call (mobile station originated call), cancel a PACA call, initiate a registration, or
6 initiate a message transmission.

7 The mobile station may monitor the Quick Paging Channel to determine if it should receive
8 messages from the Paging Channel or Forward Common Control Channel.

9 Upon entering the *Mobile Station Idle State*, the mobile station shall perform the following if
10 RSC_MODE_ENABLED is equal to NO:

- 11 • Set SLOTTED_s to YES if T_SLOTTED_s is equal to 0 or if the mobile station does not
12 support the slotted timer; otherwise, enable the T_{MS_Slotted} timer with the duration
13 specified by T_SLOTTED_s if it is not already enabled, and set SLOTTED_s to NO.

14 Upon entering the *Mobile Station Idle State* from the *Mobile Station Initialization State*, the
15 mobile station shall perform the following:

- 16 • If SR1_BCCH_NON_TD_INCL_s is equal to '1', or if SR1_TD_INCL_s is equal to '1' and
17 the mobile station supports the transmit diversity mode specified by
18 SR1_TD_MODE_s, or if the mobile station supports Spreading Rate 3 on the common
19 channel and SR3_INCL_s is equal to '1', the mobile station shall perform the
20 following:
 - 21 - Set its Primary Broadcast Control Channel code channel to BCCH_s,
 - 22 - Set the Primary Broadcast Control Channel data rate as determined by BRAT_s,
 - 23 - Set the Primary Broadcast Control Channel code rate as determined by
24 BCCH_CODE_RATE_s, and
 - 25 - Perform common channel supervision as specified in 2.6.2.1.1.4.
- 26 • Otherwise, the mobile station shall perform the following:
 - 27 - Set its code channel to PAGECH_s,
 - 28 - Set the Paging Channel data rate as determined by PRAT_s, and
 - 29 - Perform Paging Channel supervision as specified in 2.6.2.1.1.4.

30 Upon entering the *Mobile Station Idle State* from the *Mobile Station Control on the Traffic*
31 *Channel State*, the mobile station shall perform all of the following:

- 32 • Perform common channel supervision as specified in 2.6.2.1.1.4.

33 If REDIRECTION_s, PACA_s, and NDSS_ORIG_s are equal to disabled, the mobile station may
34 exit the *Mobile Station Idle State* at any time and enter the *System Determination Substate* of
35 the *Mobile Station Initialization State* with a reselection indication (see 2.6.1.1).

36 While in the *Mobile Station Idle State*, the mobile station shall perform the following
37 procedures:

- 1 • The mobile station shall perform Paging Channel or Forward Common Control
2 Channel monitoring procedures as specified in 2.6.2.1.1.
- 3 • The mobile station shall perform message acknowledgment procedures as specified
4 in [4].
- 5 • The mobile station shall perform registration procedures as specified in 2.6.2.1.3.
- 6 • The mobile station shall perform idle handoff procedures as specified in 2.6.2.1.4.
- 7 • The mobile station shall perform system reselection procedures as specified in
8 2.6.2.1.6.
- 9 • The mobile station shall perform the *Response to Overhead Information Operation* as
10 specified in 2.6.2.2 whenever the mobile station receives a system overhead
11 message (*ANSI-41 System Parameters Message, Enhanced Access Parameters*
12 *Message, Extended CDMA Channel List Message, MC-RR Parameters Message,*
13 *Universal Neighbor List Message, ANSI-41 RAND Message, System Parameters*
14 *Message, Access Point Identification Message, Access Point Identification Text*
15 *Message, CDMA Channel List Message, Extended System Parameters Message,*
16 *Neighbor List Message, Extended Neighbor List Message, General Neighbor List*
17 *Message, Access Point Pilot Information Message, Global Service Redirection Message,*
18 *Extended Global Service Redirection Message, User Zone Identification Message,*
19 *Private Neighbor List Message, Access Parameters Message, General Overhead*
20 *Information Message, Frequent General Overhead Information Message, Flex Duplex*
21 *CDMA Channel List Message or Alternative Technologies Information Message).*
- 22 • The mobile station shall perform the *Mobile Station Page Match Operation* as
23 specified in 2.6.2.3 whenever it receives a mobile station-directed page.
- 24 • The mobile station shall perform the *Mobile Station Order and Message Processing*
25 *Operation* as specified in 2.6.2.4 whenever a message or order directed to the mobile
26 station is received other than a mobile station-directed page.
- 27 • The mobile station shall set NDSS_ORIG_s to disabled if directed by the user to
28 cancel the call origination.
- 29 • The mobile station shall perform the *Mobile Station Origination Operation* as specified
30 in 2.6.2.5 if directed by the user to initiate a call, or if NDSS_ORIG_s is equal to
31 enabled.
- 32 • If RETRY_DELAY_s[001] or RETRY_DELAY_s[101] is not set to 0:
 - 33 - The mobile station shall not send any *Origination Message* containing a packet
34 data service option²⁷ or *Reconnect Message* (with ORIG_IND set to '1') for
35 connecting a packet data service option until the maximum of the system time
36 stored in RETRY_DELAY_s[001] and RETRY_DELAY_s[101].

²⁷ Packet data service option refers to SO 60, SO 61 or any service option in Service Option Group 4 and 5 in [30]

- 1 - At the system time stored in $\text{RETRY_DELAY}_s[001]$, the mobile station shall reset
2 $\text{RETRY_DELAY}_s[001]$ to 0.
- 3 - At the system time stored in $\text{RETRY_DELAY}_s[101]$, the mobile station shall reset
4 $\text{RETRY_DELAY}_s[101]$ to 0.
- 5 • The mobile station shall perform the *Mobile Station PACA Cancel Operation* as
6 specified in 2.6.2.8, if PACA_s is equal to enabled and any one of the following
7 conditions is met:
- 8 - PACA_CANCEL is equal to '1'; or
9 - The mobile station is directed by the user to cancel the PACA call.
- 10 • If the PACA state timer expires, the mobile station shall perform the following:
- 11 - The mobile station should enter the *Update Overhead Information Substate* of the
12 *System Access State* (see 2.6.3) with an origination indication within T_{33m}
13 seconds to re-originate the PACA call.
- 14 - Otherwise, the mobile station shall perform the *Mobile Station PACA Cancel*
15 *Operation* as specified in 2.6.2.8.
- 16 • If the mobile station supports *Data Burst Message* transmission, it shall perform the
17 *Mobile Station Message Transmission Operation* as specified in 2.6.2.6 if directed by
18 the user to transmit a message.
- 19 • If the mobile station supports BCMC operation, it shall perform the procedures as
20 specified in 2.6.13.
- 21 • If $\text{RETRY_DELAY}_s[100]$ or $\text{RETRY_DELAY}_s[101]$ is not set to 0:
- 22 - The mobile station shall not send any Short Data Burst (see [30], [42]) until the
23 maximum of the system time stored in $\text{RETRY_DELAY}_s[100]$ and
24 $\text{RETRY_DELAY}_s[101]$.
- 25 - At the system time stored in $\text{RETRY_DELAY}_s[100]$, the mobile station shall reset
26 $\text{RETRY_DELAY}_s[100]$ to 0.
- 27 - At the system time stored in $\text{RETRY_DELAY}_s[101]$, the mobile station shall reset
28 $\text{RETRY_DELAY}_s[101]$ to 0.
- 29 • If the mobile station supports the *Device Information Message* on the r-csch,
30 $\text{AUTO_MSG_SUPPORTED}_s$ is equal to '1', and the mobile station has detected a
31 change in hook status since the last time when the mobile station sent hook status
32 information, the mobile station shall perform the following:
- 33 - If the autonomous message timer has expired or is disabled, the mobile station
34 shall perform the *Mobile Station Message Transmission Operation* as specified in
35 2.6.2.6.
- 36 - If the autonomous message timer has not expired, the mobile station shall set
37 the autonomous message timer equal to $\text{AUTO_MSG_INTERVAL}_s$ and shall
38 restart the timer.

- 1 • If the mobile station supports the *Fast Call Setup Order* with ORDQ equal to
2 ‘00000000’ on the r-csch, AUTO_FCSD_ALLOWED_s is equal to ‘1’,
3 RSC_MODE_ENABLED is equal to NO, SLOTTED_s is equal to YES, and the mobile
4 station would like to request operation in reduced slot cycle mode, it shall perform
5 the *Mobile Station Message Transmission Operation* as specified in 2.6.2.6.
- 6 • The mobile station shall perform the *Mobile Station Power-Down Operation* as
7 specified in 2.6.2.7 if directed by the user to power down.
- 8 • If the bits of TMSI_CODE_{s-p} are not all equal to ‘1’ and if System Time (in 80 ms
9 units) exceeds TMSI_EXP_TIME_{s-p} × 2¹², the mobile station shall set all the bits of
10 TMSI_CODE_{s-p} to ‘1’ within T_{66m} seconds.
- 11 • If the full-TMSI timer expires or has expired, the mobile station shall set all the bits
12 of TMSI_CODE_{s-p} to ‘1’. The mobile station shall update the registration variables
13 as described in 2.6.5.5.2.5.
- 14 • If the key setup timer expires or has expired and mobile station determines that it is
15 not originating an emergency call, the mobile station may set
16 REG_SECURITY_RESYNC²⁸ to YES and go to the *System Determination Substate*
17 with an encryption/message integrity failure indication (see 2.3.12.5 for details).
- 18 • If TKZ_MODE_ENABLED is set to YES, the mobile station shall perform the
19 following:
- 20 - If TKZ_ID_s is not equal to any entry in TKZ_LIST, TKZ_SID_s is equal to SID_s,
21 TKZ_NID_s is equal to NID_s, and TKZ_MODE_SUPPORTED_s is equal to ‘1’, the
22 mobile station shall send a *Radio Environment Message* by performing the *Mobile*
23 *Station Message Transmission Operation* as specified in 2.6.2.6.
- 24 - If the TKZ timer of any entry in TKZ_LIST has expired, the mobile station shall
25 delete that entry.
- 26 - If the tracking zone update timer expires, the mobile station shall disable the
27 tracking zone update timer and set TKZ_MODE_ENABLED to NO.
- 28 • If P_REV_IN_USE_s is less than 11 after the mobile station performs an idle handoff,
29 the mobile station shall set TBR_RAND_SUPPR_ENABLE_s to ‘0’, and shall set
30 TBR_RAND_WINDOW_s to ‘11’.

31 2.6.2.1 Idle Procedures

32 2.6.2.1.1 Forward Channel Monitoring Procedures

33 2.6.2.1.1.1 General Overview

34 The Paging Channel is divided into 80 ms slots called Paging Channel slots. Paging and
35 control messages for a mobile station operating in the non-slotted mode can be received in

²⁸ REG_SECURITY_RESYNC was formerly called REG_ENCRYPT_RESYNC.

1 any of the Paging Channel slots; therefore, the non-slotted mode of operation requires the
2 mobile station to monitor all slots.

3 The Forward Common Control Channel is divided into 80 ms slots called Forward Common
4 Control Channel slots. Paging and mobile directed messages for a mobile station operating
5 in the non-slotted mode can be received in any of the Forward Common Control Channel
6 slots. The overhead messages can be received on the Primary Broadcast Control Channel.
7 Therefore, the non-slotted mode of operation requires the mobile station to continuously
8 monitor the Forward Common Control Channel/Primary Broadcast Control Channel.

9 2.6.2.1.1.1.1 General Overview for Individually Addressed Messages

10 The Paging Channel or the Forward Common Control Channel protocol provides for
11 scheduling the transmission of messages for a specific mobile station in certain assigned
12 slots. Support of this feature is optional and may be enabled by each mobile station. A
13 mobile station that monitors the Paging Channel or the Forward Common Control Channel
14 only during certain assigned slots is referred to as operating in the slotted mode. During
15 the slots in which the Paging Channel or the Forward Common Control Channel is not
16 being monitored, the mobile station can stop or reduce its processing for power
17 conservation. A mobile station may not operate in the slotted mode in any state except the
18 *Mobile Station Idle State*.

19 A mobile station operating in the slotted mode generally monitors the Paging Channel or
20 the Forward Common Control Channel for one or two slots per slot cycle. The mobile
21 station can specify its preferred slot cycle using the SLOT_CYCLE_INDEX and
22 SIGN_SLOT_CYCLE_INDEX fields in the *Registration Message*, *Origination Message*, or *Page*
23 *Response Message*. The mobile station can also specify a reduced slot cycle using the RSCI
24 field of the *Fast Call Setup Order*, *Release Order* (ORDQ = '00000011') or *Extended Release*
25 *Response Message*, which enables the mobile station to operate in the reduced slot cycle
26 mode. The length of the slot cycle, T, in units of 1.28 seconds,²⁹ is given by

$$27 \quad T = 2^i,$$

28 where i is the selected slot cycle index (see 2.6.2.1.1.3) which can take the values -4, -3, -2,
29 -1, 0, 1, 2, 3, 4, 5, 6, and 7.

30 Using the Terminal Information record of the *Status Response Message* or the *Extended*
31 *Status Response Message*,

- 32 • if P_REV_IN_USE_s is less than eleven, the mobile station reports max (0,
33 SLOT_CYCLE_INDEX_REG) with the SLOT_CYCLE_INDEX field.

²⁹ When SIGN_SLOT_CYCLE_INDEX is equal to '1', the minimum length slot cycle consists of 16 slots of 80 ms each, hence 1.28 seconds. When SIGN_SLOT_CYCLE_INDEX is equal to '0', the minimum length slot cycle consists of one slot of 80 ms, hence 80 ms. When operating in the reduced slot cycle mode, the minimum length slot cycle is also 80 ms.

- 1 • if $P_REV_IN_USE_s$ is greater than or equal to eleven, the mobile station reports its
2 last registered slot cycle, $SLOT_CYCLE_INDEX_REG$ with the $SLOT_CYCLE_INDEX$
3 and $SIGN_SLOT_CYCLE_INDEX$ fields.

4 Using the Extended Terminal Information record of the *Extended Status Response Message*
5 the mobile station reports its last registered slot cycle, $SLOT_CYCLE_INDEX_REG$ with the
6 $SLOT_CYCLE_INDEX$ and $SIGN_SLOT_CYCLE_INDEX$ fields.

7 When in the *Mobile Station Control on the Traffic Channel State*, using the Terminal
8 Information record of the *Status Response Message* or the *Status Message*,

- 9 • if $P_REV_IN_USE_s$ is less than eleven, the mobile station reports $\max(0,$
10 $SLOT_CYCLE_INDEX_REG)$ with the $SLOT_CYCLE_INDEX$ field.
11 • if $P_REV_IN_USE_s$ is greater than or equal to eleven, the mobile station reports its
12 last registered slot cycle, $SLOT_CYCLE_INDEX_REG$ with the $SLOT_CYCLE_INDEX$
13 and $SIGN_SLOT_CYCLE_INDEX$ fields.

14 When in the *Mobile Station Control on the Traffic Channel State*, using the Extended
15 Terminal Information record of the *Status Response Message*, the mobile station reports its
16 last registered slot cycle, $SLOT_CYCLE_INDEX_REG$ with the $SLOT_CYCLE_INDEX$ and
17 $SIGN_SLOT_CYCLE_INDEX$ fields.

18 A mobile station operating in the slotted mode may optionally monitor additional slots to
19 receive broadcast messages and/or broadcast pages (see 2.6.2.1.1.3.3 and 2.6.2.1.1.3.4).

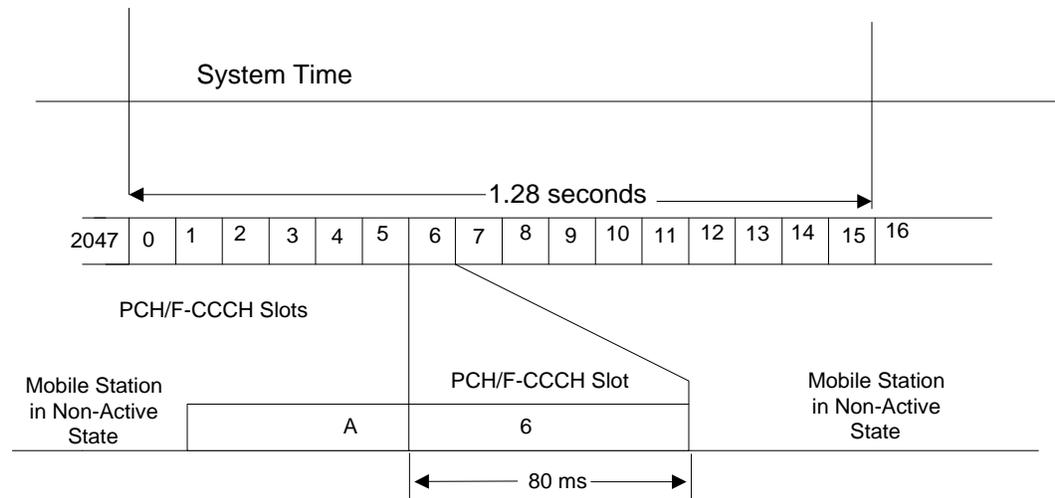

20 There are $16 \times T$ slots in a slot cycle.

21 $SLOT_NUM$ is the Paging Channel or the Forward Common Control Channel slot number,
22 modulo the maximum length slot cycle (2048 slots). That is, the value of $SLOT_NUM$ is

$$23 \qquad \qquad \qquad \text{SLOT_NUM} = \lfloor t/4 \rfloor \text{ mod } 2048,$$

24 where t is the System Time in 20ms frames. For each mobile station, the starting times of
25 its slot cycles are offset from the slot in which $SLOT_NUM$ equals zero by a fixed, randomly
26 selected number of slots as specified in 2.6.2.1.1.3.

27 Figure 2.6.2.1.1.1-1 shows an example for a slot cycle length of 1.28 seconds, in which the
28 computed value of $PGSLOT$ (see 2.6.2.1.1.3) is equal to 6, so that one of the mobile
29 station's slot cycles begins when $SLOT_NUM$ equals 6. The mobile station begins
30 monitoring the Paging Channel or the Forward Common Control Channel at the start of the
31 slot in which $SLOT_NUM$ equals 6. The next slot in which the mobile station must begin
32 monitoring the Paging Channel or the Forward Common Control Channel is 16 slots later,
33 i.e., the slot in which $SLOT_NUM$ is 22.

A - Reacquisition of CDMA System

6 - Mobile Station's Assigned PCH/F-CCCH Slot

Figure 2.6.2.1.1.1-1. Mobile Station Idle Slotted Mode Structure Example

2.6.2.1.1.1.1.1 Overview of Stopping Monitoring via the General Page Message

Layer 3 determines when a mobile station operating in the slotted mode may stop monitoring the Paging Channel or the Forward Common Control Channel based upon indications received from Layer 2 (see [4]). When the *General Page Message* is used, Layer 2 determines whether there is an address mismatch or a broadcast address mismatch, based upon the address information received in the *General Page Message*. Based upon the address mismatch and broadcast address mismatch indications received from Layer 2, Layer 3 can determine when no further messages or records addressed to an individual mobile station will be present in the slot.

A *General Page Message* contains four fields: CLASS_0_DONE, CLASS_1_DONE, TMSI_DONE, and ORDERED_TMSIS, which indicate when a mobile station operating in the slotted mode may stop monitoring the Paging Channel or the Forward Common Control Channel.

When CLASS_0_DONE is set to '1' during a mobile station's assigned slot and the mobile station is operating in the slotted mode, no further messages or records addressed by a class 0 IMSI will be directed to the mobile station during the current slot. When CLASS_1_DONE is set to '1' during a mobile station's assigned slot and the mobile station is operating in the slotted mode, no further messages or records addressed by a class 1 IMSI will be directed to the mobile station during the current slot. Similarly, when TMSI_DONE is set to '1' during a mobile station's assigned slot and the mobile station is operating in the slotted mode, no further messages or records addressed by a TMSI will be directed to the mobile station during the current slot.

1 The field ORDERED_TMSIS, when set to '1' during a mobile station's assigned slot,
2 indicates that the base station has ordered TMSI page records directed to mobile stations
3 operating in the slotted mode so that the resulting TMSI_CODE values are in ascending
4 order in the *General Page Messages* in the slot.

5 A mobile station which is operating in the slotted mode, has a class 0 IMSI assigned, and
6 does not have a TMSI assigned (all the bits of TMSI_CODE_{s-p} are equal to '1'), may stop
7 monitoring the Paging Channel or the Forward Common Control Channel after processing a
8 *General Page Message* containing CLASS_0_DONE equal to '1'. Similarly, a mobile station
9 which is operating in the slotted mode, has a class 1 IMSI assigned, and does not have a
10 TMSI assigned (all the bits of TMSI_CODE_{s-p} are equal to '1'), may stop monitoring the
11 Paging Channel or the Forward Common Control Channel after processing a *General Page*
12 *Message* containing CLASS_1_DONE equal to '1'.

13 A mobile station which is operating in the slotted mode, has a class 0 IMSI assigned, and
14 has a TMSI assigned (the bits of TMSI_CODE_{s-p} are not all equal to '1'), may stop
15 monitoring the Paging Channel or the Forward Common Control Channel after processing a
16 *General Page Message* containing both CLASS_0_DONE equal to '1' and TMSI_DONE equal
17 to '1'. Similarly, a mobile station which is operating in the slotted mode, has a class 1 IMSI
18 assigned, and has a TMSI assigned (the bits of TMSI_CODE_{s-p} are not all equal to '1'), may
19 stop monitoring the Paging Channel or the Forward Common Control Channel after
20 processing a *General Page Message* containing both CLASS_1_DONE equal to '1' and
21 TMSI_DONE equal to '1'.

22 If ORDERED_TMSIS is equal to '1' and CLASS_0_DONE is equal to '1', a mobile station
23 which has a class 0 IMSI assigned, is operating in the slotted mode, and has a TMSI
24 assigned (the bits of TMSI_CODE_{s-p} are not all equal to '1'), may stop monitoring the
25 Paging Channel or the Forward Common Control Channel after processing a page record
26 with a TMSI_CODE value of higher numerical value than TMSI_CODE_{s-p}.

27 If ORDERED_TMSIS is equal to '1' and CLASS_1_DONE is equal to '1', a mobile station
28 which has a class 1 IMSI assigned, is operating in the slotted mode, and has a TMSI
29 assigned (the bits of TMSI_CODE_{s-p} are not all equal to '1'), may stop monitoring the
30 Paging Channel or the Forward Common Control Channel after processing a page record
31 with a TMSI_CODE value of higher numerical value than TMSI_CODE_{s-p}.

32 The mobile station continues to monitor the Paging Channel or the Forward Common
33 Control Channel for one additional slot unless, within its assigned slot, the mobile station
34 receives a *General Page Message* containing the appropriate indicator permitting it to stop
35 monitoring the Paging Channel or the Forward Common Control Channel (CLASS_0_DONE,
36 CLASS_1_DONE, TMSI_DONE, or ORDERED_TMSIS equal to '1', whichever is appropriate).
37 This allows the base station to carry over a message begun in the assigned slot into the
38 following slot, if necessary.

2.6.2.1.1.1.2 Overview of Stopping Monitoring via the Universal Page Message

Layer 3 determines when a mobile station operating in the slotted mode may stop monitoring the Forward Common Control Channel based upon indications from Layer 2 (see [4]). When the *Universal Page Message* is used on the Forward Common Control Channel, Layer 2 determines whether there is an address mismatch or a broadcast address mismatch, based upon the address information received in the *Universal Page Message*. Based upon the address mismatch and broadcast address mismatch indications received from Layer 2, Layer 3 can determine when no further messages or records addressed to an individual mobile station will be present in the slot.

The *Universal Page Message* contains the READ_NEXT_SLOT field, which, when equal to '1' and received in an assigned slot, indicates to a mobile station that it is to monitor the Forward Common Control Channel in time to receive the first bit of the slot following the assigned slot. This allows the base station to use both an assigned slot and the following slot for pages if all of the pages for an assigned slot cannot be fit into the assigned slot. The *Universal Page Message* also contains the READ_NEXT_SLOT_BCAST field, which, when equal to '1' and received in an assigned slot or broadcast slot, indicates to a mobile station configured to receive broadcast messages that it is to monitor the Forward Common Control Channel in time to receive the first bit of the subsequent slot. This allows the base station to use the subsequent slot for enhanced broadcast pages if all of the enhanced broadcast pages for an assigned slot or broadcast slot cannot be fit into the slot.

2.6.2.1.1.1.2 Overview of Broadcast Messages on Paging Channel

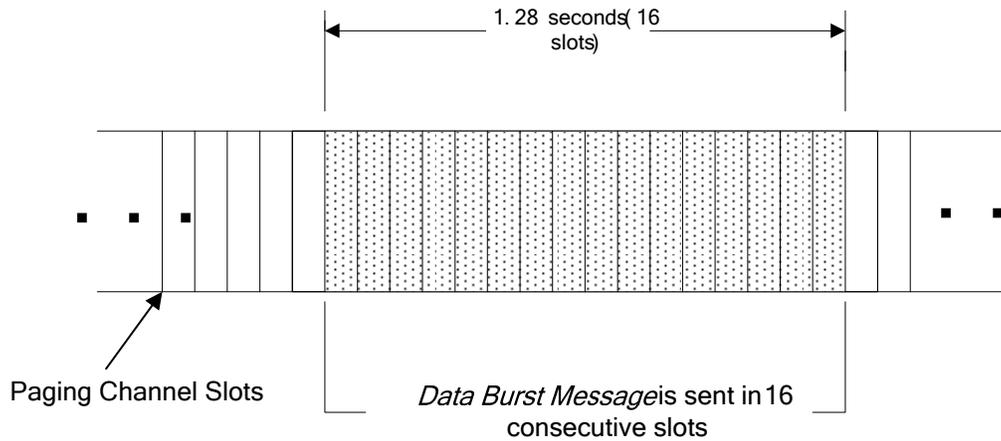

The Paging Channel protocol provides two methods for the transmission of broadcast messages. Each method enables mobile stations operating in the slotted mode or in the non-slotted mode to receive broadcast messages. A broadcast message on the Paging Channel is a *Data Burst Message* that has a broadcast address type. A mobile station operating in the slotted mode has assigned slots that it monitors to receive Paging Channel messages (see 2.6.2.1.1.1). A broadcast page is a record within a *General Page Message* that has a broadcast address type. A base station may transmit a broadcast page in an assigned slot to inform mobile stations monitoring that slot that a broadcast message will be transmitted in a predetermined subsequent slot. A slot that a mobile station monitors in order to receive either a broadcast page or a broadcast message is referred to as a broadcast slot.

2.6.2.1.1.1.2.1 Method 1: Multi-Slot Broadcast Message Transmission

According to this method, a broadcast message is sent in a sufficient number of assigned slots such that it may be received by all mobile stations that are operating in the slotted mode.

Figure 2.6.2.1.1.1.2.1-1 shows an example for the case when the maximum slot cycle index is equal to 0. In this example, the broadcast message fits in a single slot. The *Data Burst Message* is transmitted in 16 consecutive slots.

1

2

3 **Figure 2.6.2.1.1.2.1-1. Multi-Slot Broadcast Message Transmission Example**

4 2.6.2.1.1.2.2 Method 2: Periodic Broadcast Paging

5 According to this method, mobile stations configured to receive broadcast messages
 6 monitor a specific broadcast slot (the first slot of a broadcast paging cycle; see
 7 2.6.2.1.1.3.3). There are two methods of sending broadcast messages used with Periodic
 8 Broadcast Paging.

9 If all of the broadcast messages to be transmitted fit within the first slot of a broadcast
 10 paging cycle, they may all be transmitted in this broadcast slot. If there is a single
 11 broadcast message to be transmitted, it may be transmitted beginning in this broadcast
 12 slot.

13 Alternately, one or more broadcast pages may be transmitted in the first slot of a broadcast
 14 paging cycle. Each broadcast page is associated with a subsequent broadcast slot. For
 15 each broadcast page, an associated broadcast message may be transmitted in the
 16 associated subsequent broadcast slot. The broadcast slot for the associated broadcast
 17 message is determined according to the position of the broadcast page within the *General*
 18 *Page Message* transmitted in the first slot of the broadcast paging cycle.

19 Figure 2.6.2.1.1.2.2-1 shows an example of Periodic Broadcast Paging when the
 20 broadcast index is set to 1. A *General Page Message* containing three broadcast pages is
 21 transmitted in the first slot of the broadcast paging cycle. For each of the three broadcast
 22 pages, a *Data Burst Message* is transmitted in a subsequent slot.

23

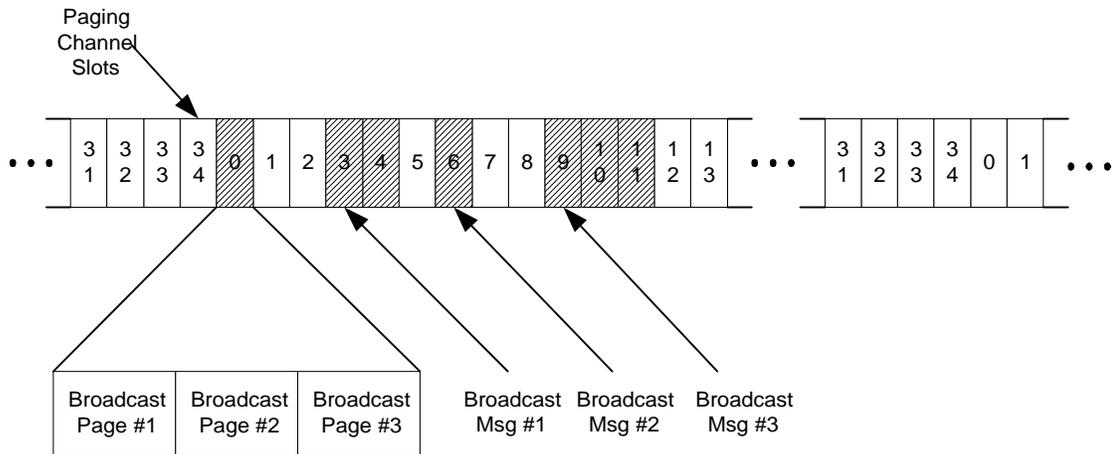

Figure 2.6.2.1.1.1.2.2-1. Periodic Broadcast Paging Example

2.6.2.1.1.1.3 Overview of Broadcast Messages on Broadcast Control Channel

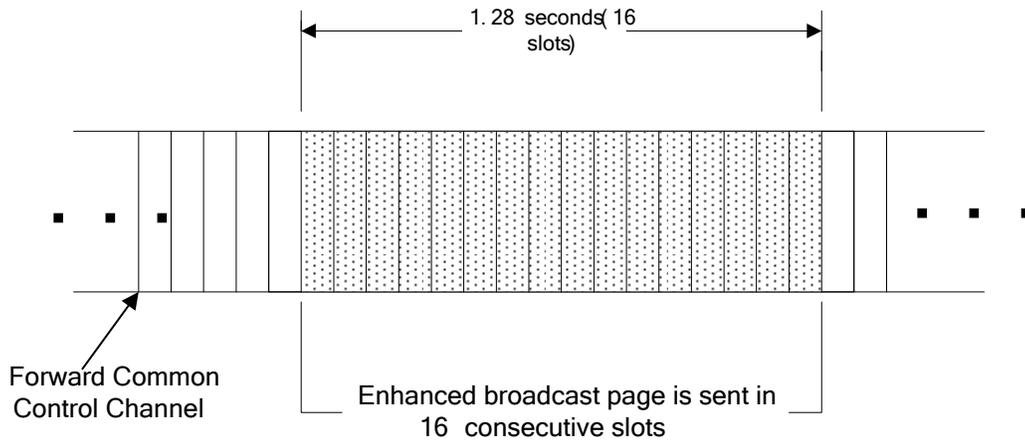

The Broadcast Control Channel/Forward Common Control Channel protocol provides two methods for the transmission of broadcast messages. Each method enables mobile stations operating in the slotted mode or in the non-slotted mode to receive broadcast messages on the Broadcast Control Channel when $NUM_BCCH_BCAST_S$ is not equal to '000'. A broadcast message on the Broadcast Control Channel is a *Data Burst Message* that has a broadcast address type. A mobile station operating in the slotted mode has assigned Forward Common Control Channel slots that it monitors to receive Forward Common Control Channel messages (see 2.6.2.1.1.1). A mobile station operating in the slotted mode and configured to receive broadcast messages may also have special assigned Forward Common Control Channel slots, called broadcast slots, that it monitors to receive enhanced broadcast pages. An enhanced broadcast page is a record within a *General Page Message* or a *Universal Page Message* that has a broadcast address type and that includes broadcast message scheduling information. A base station may transmit an enhanced broadcast page in an assigned Forward Common Control Channel slot, or in a broadcast slot, to inform mobile stations that a broadcast message will be transmitted in a specified Broadcast Control Channel slot. The enhanced broadcast page identifies the Broadcast Control Channel and the slot the mobile station is to monitor to receive the broadcast message.

2.6.2.1.1.1.3.1 Method 1: Multi-Slot Enhanced Broadcast Paging

According to this method, an enhanced broadcast page is sent in a sufficient number of assigned slots on the Forward Common Control Channel such that it may be received by all mobile stations that are operating in the slotted mode.

Figure 2.6.2.1.1.1.3.1-1 shows an example for the case when the maximum slot cycle index is equal to 0. The enhanced broadcast page is transmitted in 16 consecutive slots.

1

2

3 **Figure 2.6.2.1.1.1.3.1-1. Multi-Slot Enhanced Broadcast Paging Example**

4

5 2.6.2.1.1.1.3.2 Method 2: Periodic Enhanced Broadcast Paging

6 According to this method, mobile stations configured to receive broadcast messages
 7 monitor a specific broadcast slot (the first slot of a broadcast paging cycle).

8 One or more enhanced broadcast pages may be transmitted in the first slot of a broadcast
 9 paging cycle and/or in the subsequent slot. Each enhanced broadcast page is associated
 10 with a subsequent broadcast slot. The broadcast slot for the associated broadcast message
 11 is determined according to a time offset specified in the enhanced broadcast page. In
 12 addition, a broadcast slot for a repeat of the broadcast message can be specified via a time
 13 offset from the slot of the first broadcast message.

14 2.6.2.1.1.1.4 Overview of Broadcast Messages on Forward Common Control Channel
 15 The Forward Common Control Channel protocol provides two methods for the transmission
 16 of broadcast messages. Each method enables mobile stations operating in the slotted
 17 mode or in the non-slotted mode to receive broadcast messages on the Forward Common
 18 Control Channel when NUM_BCCH_BCAST_s equals '000'. A broadcast message on the
 19 Forward Common Control Channel is a *Data Burst Message* that has a broadcast address
 20 type. A mobile station operating in the slotted mode has assigned Forward Common
 21 Control Channel slots that it monitors to receive Forward Common Control Channel
 22 messages (see 2.6.2.1.1.1). An enhanced broadcast page is a record within a *General Page*
 23 *Message* or a *Universal Page Message* that has a broadcast address type. A base station
 24 may transmit an enhanced broadcast page in an assigned slot to inform mobile stations
 25 monitoring that slot that a broadcast message will be transmitted in the same F-CCCH
 26 where the enhanced broadcast page is received. A slot that a mobile station monitors in
 27 order to receive either an enhanced broadcast page or a broadcast message is referred to as
 28 a broadcast slot.

2.6.2.1.1.4.1 Method 1: Multi-Slot Broadcast Message Transmission

According to this method, a broadcast message is sent in a sufficient number of assigned slots on the Forward Common Control Channel such that it may be received by all mobile stations that are operating in the slotted mode.

Figure 2.6.2.1.1.4.1-1 shows an example for the case when the maximum slot cycle index is equal to 0. In this example, the broadcast message fits in a single slot. The *Data Burst Message* is transmitted in 16 consecutive slots.

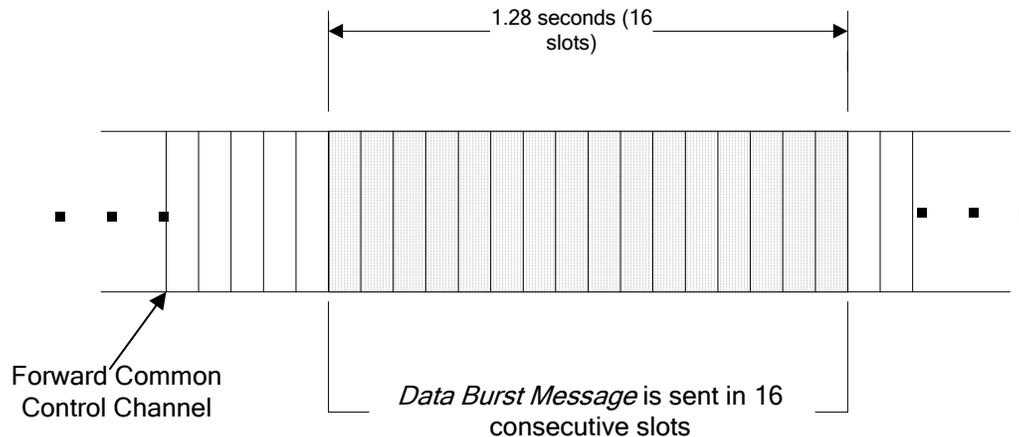

Figure 2.6.2.1.1.4.1-1. Multi-Slot Broadcast Message Transmission Example

2.6.2.1.1.4.2 Method 2: Periodic Enhanced Broadcast Paging

According to this method, mobile stations configured to receive broadcast messages monitor a specific broadcast slot (the first slot of a broadcast paging cycle). There are two methods of sending broadcast messages used with Periodic Enhanced Broadcast Paging.

If all of the broadcast messages to be transmitted fit within the first slot of a broadcast paging cycle, they may all be transmitted in this broadcast slot. If there is a single broadcast message to be transmitted, it may be transmitted beginning in this broadcast slot.

Alternately, one or more enhanced broadcast pages may be transmitted in the first slot of a broadcast paging cycle. Each enhanced broadcast page is associated with a subsequent broadcast slot. For each enhanced broadcast page, an associated broadcast message may be transmitted in the associated subsequent broadcast slot. The broadcast slot for the associated broadcast message is determined according to a time offset specified in the enhanced broadcast page. In addition, a broadcast slot for a repeat of the broadcast message can be specified via a time offset from the slot of the first broadcast message.

2.6.2.1.1.2 Non-Slotted Mode Requirements

A mobile station operating in the non-slotted mode shall monitor the Paging Channel or the Forward Common Control Channel/Primary Broadcast Control Channel at all times. If the mobile station declares a loss of the Paging Channel or the Forward Common Control Channel/Primary Broadcast Control Channel (see 2.6.2.1.1.4), the mobile station shall

1 enter the *System Determination Substate* of the *Mobile Station Initialization State* with a
2 system lost indication (see 2.6.1.1).

3 When a mobile station monitors the Paging Channel or the Forward Common Control
4 Channel in any state other than the *Mobile Station Idle State*, it shall operate in the non-
5 slotted mode.

6 A mobile station monitoring the Paging Channel shall operate in the non-slotted mode
7 when $PACA_S$ is equal to enabled.

8 A mobile station monitoring the Paging Channel shall operate in the non-slotted mode
9 when $SLOTTED_S$ is equal to NO.

10 2.6.2.1.1.3 Slotted Mode Requirements

11 A mobile station monitoring the Paging Channel shall not operate in the slotted mode if any
12 of the following conditions are true:

- 13 • $SLOTTED_S$ is equal to NO,
- 14 • Bit 5 of the station class mark is set to '0' (see 2.3.3),
- 15 • $PACA_S$ is equal to enabled, or
- 16 • The mobile station's configuration parameters are not current (see 2.6.2.2).

17 A mobile station monitoring the Forward Common Control Channel shall not operate in the
18 slotted mode if either of the following conditions is true:

- 19 • Bit 5 of the station class mark is set to '0' (see 2.3.3), or
- 20 • The mobile station's configuration parameters are not current (see 2.6.2.2).

21 A mobile station monitoring the Forward Common Control Channel with bit 5 of the station
22 class mark set to '1' shall monitor all Forward Common Control Channel slots (see
23 2.6.2.1.1.3.1) if either of the following conditions is true:

- 24 • $SLOTTED_S$ is equal to NO, or
- 25 • $PACA_S$ is equal to enabled.

26 During operation in the slotted mode, the mobile station shall ensure that its stored
27 configuration parameter values are current (see 2.6.2.2).

28 If the mobile station declares a loss of the Paging Channel or the Forward Common Control
29 Channel/Primary Broadcast Control Channel (see 2.6.2.1.1.4), the mobile station shall
30 enter the *System Determination Substate* of the *Mobile Station Initialization State* with a
31 system lost indication (see 2.6.1.1).

32 2.6.2.1.1.3.1 Monitoring Assigned Slots

33 The mobile station shall monitor the Paging Channel or the Forward Common Control
34 Channel in each of its assigned slots, if any of the following conditions is true:

- 35 • The mobile station does not support Quick Paging Channel operation, or
- 36 • $QPCH_SUPPORTED_S$ is equal to '0', or

- 1 • RSC_MODE_ENABLED is equal to YES, IGNORE_QPCH_s is equal to '1', and RSCI_s
2 is equal to -3 or -4.

3 If none of the above conditions is true, then for each of its assigned slots, the mobile
4 station shall perform the following:

- 5 • The mobile station should check its assigned paging indicators in the complete
6 Quick Paging Channel slot immediately preceding its assigned Paging Channel or
7 Forward Common Control Channel slot, as specified in 2.6.2.1.2.1; the mobile
8 station shall monitor the assigned Paging Channel or Forward Common Control
9 Channel slot if the paging indicators meet the conditions specified in 2.6.2.1.2.2.
10 • If the mobile station does not check its assigned paging indicators, the mobile
11 station shall monitor its assigned Paging Channel or Forward Common Control
12 Channel slot.

13 If the mobile station supports Quick Paging Channel operation, the mobile station is
14 configured to receive broadcast messages, BCAST_INDEX_s is not equal to '000', and
15 QPCH_BI_SUPPORTED_s equals '1', then for each of its assigned broadcast slots on the
16 Forward Common Control Channel or Paging Channel, the mobile station shall perform the
17 following:

- 18 • The mobile station should check the broadcast indicators in the complete Quick
19 Paging Channel broadcast slot immediately preceding its assigned broadcast slot, as
20 specified in 2.6.2.1.1.3.3.
21 • The mobile station should receive its assigned broadcast slot on the Forward
22 Common Control Channel or Paging Channel if the broadcast indicators meet the
23 conditions specified in 2.6.2.1.2.1.

24 The mobile station shall monitor each slot following an assigned slot in which the mobile
25 station received a *Universal Page Message* with READ_NEXT_SLOT equal to '1', and shall
26 begin monitoring the Forward Common Control Channel in time to receive the first bit of
27 the slot. If the mobile station is configured to receive broadcast messages, it shall monitor
28 each slot following an assigned slot in which the mobile station received a *Universal Page*
29 *Message* with READ_NEXT_SLOT_BCAST equal to '1', and shall begin monitoring the
30 Forward Common Control Channel in time to receive the first bit of the slot.

31 If SLOTTED_s is equal to NO or PACA_s is equal to enabled, the mobile station may stop
32 monitoring a Forward Common Control Channel slot when Layer 3 receives an address
33 mismatch indication from Layer 2. When the mobile station stops monitoring a Forward
34 Common Control Channel slot when SLOTTED_s is equal to NO or PACA_s is equal to
35 enabled, the mobile station shall begin monitoring the subsequent Forward Common
36 Control Channel slot in time to receive the first bit of the slot.

37 If the mobile station monitors a Paging Channel or Forward Common Control Channel slot,
38 it shall begin monitoring the Paging Channel or the Forward Common Control Channel in
39 time to receive the first bit of the slot. If the mobile station is not configured to receive
40 broadcast addresses, the mobile station shall continue to monitor the Paging Channel or
41 the Forward Common Control Channel until one of the following conditions is satisfied:

- 42 • Layer 3 receives an address mismatch indication from Layer 2 (see [4]); or

- 1 • The mobile station monitors the assigned slot and the slot following the assigned
2 slot, and the mobile station receives at least one valid message (see [4]).

3 If the mobile station is configured to receive broadcast addresses and the mobile station is
4 monitoring a Paging Channel, the mobile station shall continue to monitor the Paging
5 Channel until one of the preceding conditions is satisfied and should monitor the Paging
6 Channel until Layer 3 receives a broadcast address mismatch indication from Layer 2 (see
7 [4]).

8 If the mobile station is configured to receive broadcast addresses and the mobile station is
9 monitoring a Forward Common Control Channel, the mobile station shall continue to
10 monitor the Forward Common Control Channel until one of the preceding conditions is
11 satisfied and should monitor the Forward Common Control Channel until Layer 3 receives
12 a broadcast address mismatch indication from Layer 2 (see [4]).

13 The mobile station shall monitor each slot following a broadcast slot in which the mobile
14 station received a *Universal Page Message* with READ_NEXT_SLOT_BCAST equal to '1', and
15 shall begin monitoring the Forward Common Control Channel in time to receive the first bit
16 of the slot.

17 For each broadcast slot monitored to receive broadcast pages or broadcast messages that is
18 not one of its assigned slots, the mobile station should begin monitoring the Paging
19 Channel or the Forward Common Control Channel in the first bit of the broadcast slot.
20 The mobile station should continue to monitor the Paging Channel or the Forward
21 Common Control Channel until one of the following conditions is satisfied:

- 22 • Layer 3 receives a broadcast address mismatch indication from Layer 2; or
23 • The mobile station monitors the Paging Channel or the Forward Common Control
24 Channel to receive all messages beginning in the broadcast slot and in the slot
25 following the broadcast slot, and the mobile station receives at least one valid
26 message (see [4]).

27 To determine its assigned slots, the mobile station shall use the hash function specified in
28 2.6.7.1 to select a number, PGSLOT, in the range 0 to 2047 (spanning the maximum slot
29 cycle length, which is 163.84 seconds). The mobile station's assigned slots shall be those
30 slots in which

$$31 \quad (\lfloor t/4 \rfloor - \text{PGSLOT}) \bmod (16 \times T) = 0,$$

32 where t is the System Time in 20ms frames and T is the slot cycle length in units of 1.28
33 seconds given by

$$34 \quad T = 2^i,$$

35 where i is the slot cycle index which can take the values -4, -3, -2, -1, 0, 1, 2, 3, 4, 5, 6,
36 and 7.

37 For each slot on the Broadcast Control Channel monitored to receive broadcast messages,
38 the mobile station should begin monitoring the Broadcast Control Channel in the first bit of
39 the slot. The mobile station should continue to monitor the Broadcast Control Channel
40 until one of the following conditions is satisfied:

- 1 • The mobile station has monitored all frames of a Broadcast Control Channel slot
2 and the frame quality for all of the frames of the slot was insufficient; or
- 3 • The mobile station monitors the Broadcast Control Channel slot specified by the
4 enhanced broadcast page and the slot did not contain an SCI bit set to '1' (see [4]).
- 5 • The mobile station has received a broadcast *Data Burst Message* having the same
6 BURST_TYPE and broadcast address as the enhanced broadcast page which
7 announced the *Data Burst Message*.

8 2.6.2.1.1.3.2 Determination of the Slot Cycle Index

9 When the SID and NID of the current base station (SID_s and NID_s, as stored from the
10 *System Parameters Message* or *ANSI-41 System Parameters Message*) do not match any
11 entry of SID_NID_LIST_s, the mobile station shall use a slot cycle index no greater than the
12 smaller of MAX_SLOT_CYCLE_INDEX_s and 1; otherwise:

- 13 • If RSC_MODE_ENABLED is equal to YES, the mobile station shall use a slot cycle
14 index no greater than min(RSCI_s, SLOT_CYCLE_INDEX_s).
- 15 • Otherwise, the mobile station shall use a slot cycle index no greater than
16 SLOT_CYCLE_INDEX_s (see 2.6.2.2.1.6).

17 If the mobile station is directed by the user to modify the preferred slot cycle index
18 (SLOT_CYCLE_INDEX_p), the mobile station shall perform parameter-change registration
19 (see 2.6.5.1.6).

20 2.6.2.1.1.3.3 Slot Cycles for Broadcast Message Transmission

21 2.6.2.1.1.3.3.1 Slot Cycles for Broadcast Message Transmission on the Paging Channel

22 Distribution of broadcast messages relies on specially defined Paging Channel slot cycles.
23 The definitions are as follows:

24 *Maximum paging cycle:* On the Paging Channel, a maximum paging cycle is a Paging
25 Channel slot cycle (see 2.6.2.1.1.3.1) having a duration of M slots such that:

$$26 \quad M = 2^i \times 16, 0 \leq i \leq 7$$

27 where $i = \text{MAX_SLOT_CYCLE_INDEX}_s$ as received in the *System Parameters Message*.

28 The first slot of each maximum paging cycle is any Paging Channel slot in which

$$29 \quad \lfloor t/4 \rfloor \bmod M = 0,$$

30 where t represents system time in 20ms frames.

31 *Broadcast paging cycle:* On the Paging Channel, a broadcast paging cycle is a Paging
32 Channel slot cycle (see 2.6.2.1.1.3.1) having a duration of B + 3 slots where:

$$33 \quad B = 2^i \times 16, 1 \leq i \leq 7$$

1 where $i = \text{BCAST_INDEX}_S$ as received in the *Extended System Parameters Message*, or set
2 by default when the *Extended System Parameters Message* is not sent.

3 The first slot of each broadcast paging cycle is any Paging Channel slot in which

$$4 \quad \lfloor t/4 \rfloor \bmod (B + 3) = 0,$$

5 where t represents system time in 20ms frames.

6 2.6.2.1.1.3.3.2 Slot Cycles for Broadcast Message Transmission on the Forward 7 Common Control Channel

8 Distribution of broadcast messages relies on specially defined Forward Common Control
9 Channel slot cycles. The definitions are as follows:

10 *Maximum paging cycle:* On the Forward Common Control Channel, a maximum paging
11 cycle is a Forward Common Channel slot cycle (see 2.6.2.1.1.3.1) having a duration of M
12 slots such that:

$$13 \quad M = 2^i \times 16, 0 \leq i \leq 7$$

14 where $i = \text{MAX_SLOT_CYCLE_INDEX}_S$ as received in the *MC-RR Parameters Message*.

15 The first slot of each maximum paging cycle is any Forward Common Control Channel slot
16 in which

$$17 \quad \lfloor t/4 \rfloor \bmod M = 0,$$

18 where t represents system time in 20ms frames.

19 *Broadcast paging cycle:* On the Forward Common Control Channel, a broadcast paging
20 cycle is a Forward Common Control Channel slot cycle (see 2.6.2.1.1.3.1) having a duration
21 of $B + 7$ slots where:

$$22 \quad B = 2^{1+i} \times 16, 1 \leq i \leq 7$$

23 where $i = \text{BCAST_INDEX}_S$ as received in the *MC-RR Parameters Message*.

24 The first slot of each broadcast paging cycle is any Forward Common Control Channel slot
25 in which

$$26 \quad \lfloor t/4 \rfloor \bmod (B + 7) = 0,$$

27 where t represents system time in 20ms frames.

28 2.6.2.1.1.3.4 Monitoring Paging Channel Broadcasts

29 The following requirements apply to mobile stations monitoring the Paging Channel and
30 supporting the reception of broadcast messages.

31 If BCAST_INDEX_S is equal to '000', the mobile station shall monitor only its assigned
32 Paging Channel slots (see 2.6.2.1.1.3.1).

1 If $BCAST_INDEX_s$ is not equal to '000', and the mobile station is configured to receive
 2 messages addressed to broadcast addresses, the mobile station should also monitor the
 3 Paging Channel beginning with the first slot of each broadcast paging cycle (see
 4 2.6.2.1.1.3.3).

5 If the mobile station receives a broadcast page containing a burst type and broadcast
 6 address for a *Data Burst Message* that the mobile station has been configured to receive
 7 (see 2.6.2.3), the mobile station should monitor the slot in which the corresponding
 8 broadcast Paging Channel message will be sent, determined as follows:

- 9 • The mobile station shall consider a broadcast page to have been received in the
 10 paging slot in which the *General Page Message* containing the broadcast page
 11 began.
- 12 • If $BCAST_INDEX_s$ is not equal to '000', the paging slot containing the broadcast
 13 page is defined as the reference slot.
- 14 • Let n represent the ordinal number of the broadcast page relative to other broadcast
 15 pages that are contained in the same *General Page Message* ($n = 1, 2, 3, \dots$). The
 16 mobile station should monitor the Paging Channel slot that occurs $n \times 3$ paging
 17 slots after the reference slot.

18 After receiving a broadcast message or a broadcast page for a *Data Burst Message* and a
 19 corresponding broadcast Paging Channel message when $BCAST_INDEX_s$ is not equal to
 20 '000', the mobile station should discard all further broadcast pages and all further
 21 broadcast Paging Channel messages containing the same $BURST_TYPE$ and BC_ADDR
 22 fields that are received within $4 \times (B + 3)$ paging slots of the first paging slot in the
 23 broadcast paging cycle in which the broadcast page or broadcast message was first
 24 received. ($B + 3$ is the duration of the broadcast paging cycle as defined in 2.6.2.1.1.3.3).

25 After receiving a broadcast message or a broadcast page for a *Data Burst Message* and a
 26 corresponding broadcast Paging Channel message when $BCAST_INDEX_s$ is equal to '000',
 27 the mobile station should discard all further broadcast pages and all further broadcast
 28 Paging Channel messages containing the same $BURST_TYPE$ and BC_ADDR fields that are
 29 received within $16 \times 2^{MAX_SLOT_CYLCE_INDEX_s}$ slots of the paging slot in which the
 30 broadcast page or broadcast message was first received.

31 If the mobile station receives a broadcast page containing a burst type and broadcast
 32 address for BCMC that the mobile station has been configured to receive (see 2.6.2.3), the
 33 mobile station shall do the following:

- 34 • If the burst type and broadcast address³⁰ indicates that response to the broadcast
 35 page is required, then the mobile station shall enter the *Update Overhead*
 36 *Information Substate* of the *System Access State* (see 2.6.3.2) with a page response
 37 indication within T_{33m} seconds after the page message is received.

³⁰ Format of broadcast address for BCMC is defined in BCMC service document (see [30]).

- 1 • If the burst type and broadcast address indicates to monitor broadcast messages,
2 then the mobile station shall continue to monitor the paging channel for a *BCMC*
3 *Service Parameters Message* containing the *BCMC_FLOW_ID* in the broadcast
4 address as follows:
- 5 - The mobile station shall monitor the F-PCH for the duration of four F-PCH slots
6 from the slot in which the broadcast page was received or until the *BCMC*
7 *Service Parameters Message* containing the *BCMC_FLOW_ID* is received; if the
8 mobile station detects the start of the *BCMC Service Parameters Message*, the
9 mobile station shall monitor the F-PCH until the entire *BCMC Service*
10 *Parameters Message* is received.

11 2.6.2.1.1.3.5 Support of Broadcast Delivery Options on the Paging Channel

12 A mobile station configured to receive broadcast messages shall support reception of
13 broadcast messages transmitted using Multi-Slot Broadcast Message Transmission (see
14 3.6.2.4.1.1.2.1.1).

15 A mobile station configured to receive broadcast messages shall support reception of
16 broadcast messages transmitted using Periodic Broadcast Paging (see 3.6.2.4.1.1.2.1.2).

17 2.6.2.1.1.3.6 Monitoring the Forward Common Control Channel for the Enhanced 18 Broadcast Page

19 The following requirements apply to mobile stations monitoring the Forward Common
20 Control Channel and supporting the reception of broadcast messages.

21 If *BCAST_INDEX_s* is equal to '000', the mobile station shall monitor only its assigned Quick
22 Paging Channel slots or its assigned Forward Common Control Channel slots (see
23 2.6.2.1.2) for enhanced broadcast pages.

24 If *BCAST_INDEX_s* is not equal to '000', and the mobile station is configured to receive
25 messages addressed to broadcast addresses, the mobile station should also monitor the
26 Quick Paging Channel broadcast slots or the Forward Common Control Channel broadcast
27 slots (see 2.6.2.1.2) beginning with the first slot of each broadcast paging cycle.

28 If the mobile station receives an enhanced broadcast page containing a burst type and
29 broadcast address for a *Data Burst Message* that the mobile station has been configured to
30 receive and *NUM_BCCH_BCAST_s* does not equal '000', the mobile station should monitor at
31 least one Broadcast Control Channel slot in which the corresponding broadcast message
32 will be sent, determined as follows:

- 33 • The mobile station shall monitor the Broadcast Control Channel slot which begins
34 40 ms × (1 + *TIME_OFFSET*) later than the beginning of the slot in which the
35 message containing the enhanced broadcast page began or the Broadcast Control
36 Channel slot which begins 40 ms × (1 + *REPEAT_TIME_OFFSET*) later than the
37 Broadcast Control Channel slot in which the first transmission began.

38 If the mobile station receives an enhanced broadcast page containing a burst type and
39 broadcast address for a *Data Burst Message* that the mobile station has been configured to
40 receive and *NUM_BCCH_BCAST_s* equals '000', the mobile station should monitor the slot in

1 which the corresponding broadcast Forward Common Control Channel message will be
2 sent, determined as follows:

- 3 • The mobile station shall consider an enhanced broadcast page to have been
4 received in the Forward Common Control Channel slot in which the *General Page*
5 *Message* or the *Universal Page Message* containing the enhanced broadcast page
6 began.
- 7 • When NUM_BCCH_BCAST_s equals 0, the mobile station shall monitor the Forward
8 Common Control Channel slot which begins $40 \text{ ms} \times (1 + \text{TIME_OFFSET})$ later than
9 the beginning of the slot in which the message containing the enhanced broadcast
10 page began or the Forward Common Control Channel slot which begins $40 \text{ ms} \times (1$
11 $+ \text{REPEAT_TIME_OFFSET})$ later than the Forward Common Control Channel slot in
12 which the first transmission began. After receiving an enhanced broadcast page for a
13 *Data Burst Message* and a corresponding broadcast message when BCAST_INDEX_s
14 is not equal to '000', the mobile station should discard all further enhanced
15 broadcast pages containing the same BURST_TYPE and having the same broadcast
16 address that are received within $4 \times (B + 7)$ slots of the first slot in the broadcast
17 paging cycle in which the enhanced broadcast page was received. ($B + 7$ is the
18 duration of the broadcast paging cycle as defined in 2.6.2.1.1.3.3.1). The mobile
19 station should ignore broadcast messages for which a corresponding enhanced
20 broadcast page was not received.

21 After receiving an enhanced broadcast page for a *Data Burst Message* and a corresponding
22 broadcast message when BCAST_INDEX_s is equal to '000', the mobile station should
23 discard all further enhanced broadcast pages containing the same BURST_TYPE and
24 having the same broadcast address that are received within $16 \times 2^{\text{MAX_SLOT_CYLCE_INDEX}_s}$
25 slots of the slot in which the enhanced broadcast page was received. The mobile station
26 should ignore broadcast messages for which a corresponding enhanced broadcast page was
27 not received.

28 If the mobile station received an enhanced broadcast page for a *Data Burst Message* and a
29 corresponding broadcast message, and the broadcast message announced by a pending
30 enhanced broadcast page containing the same BURST_TYPE and having the same
31 broadcast address has not yet been received, the mobile station shall ignore the pending
32 enhanced broadcast page.

33 If the mobile station receives a broadcast page containing a burst type and broadcast
34 address for BCMC that the mobile station has been configured to receive (see 2.6.2.3), the
35 mobile station shall do the following:

- 36 • If the burst type and broadcast address indicates that response to the broadcast
37 page is required, then the mobile station shall enter the *Update Overhead*
38 *Information Substate* of the *System Access State* (see 2.6.3.2) with a page response
39 indication within T_{33m} seconds after the page message is received.
- 40 • If the burst type and broadcast address indicates to monitor broadcast messages,
41 then the mobile station shall monitor the Primary Broadcast Control Channel slot
42 for a *BCMC Service Parameters Message* containing the BCMC_FLOW_ID in the
43 broadcast address, determined as follows:

1 where t represents system time in 20ms frames.

2 2.6.2.1.1.3.8.2 BSPM Slot Cycle on the Primary Broadcast Control Channel

3 On the Primary Broadcast Control Channel, a BSPM slot cycle is a Primary Broadcast
4 Control Channel slot cycle having a duration of B + 1 slots where:

$$5 \quad B = 2^i \times 16, 0 \leq i \leq 15$$

6 where i = BSPM_PERIOD_INDEX_s as received in the *MC-RR Parameters Message*.

7 The first slot of each BSPM slot cycle is any Primary Broadcast Control Channel slot in
8 which

$$9 \quad \lfloor t/2 \rfloor \bmod (B + 1) = 0, (40\text{ms})$$

$$10 \quad \lfloor t/4 \rfloor \bmod (B + 1) = 0, (80\text{ms})$$

$$11 \quad \lfloor t/8 \rfloor \bmod (B + 1) = 0, (160\text{ms})$$

12 where t represents system time in 20ms frames and the number in the parenthesis
13 represents the duration of the Primary Broadcast Control Channel slot (see [2]).

14 2.6.2.1.1.4 Common Channel Supervision

15 The mobile station shall monitor the Paging Channel, the Forward Common Control
16 Channel, or the Primary Broadcast Control Channel as specified in 2.6.2.1.1. The mobile
17 station shall set a timer for T_{30m} seconds whenever it begins to monitor the Paging
18 Channel, the Forward Common Control Channel, or the Primary Broadcast Control
19 Channel. The mobile station shall reset the timer for T_{30m} seconds whenever it gets an
20 indication that a valid message was received on the Paging Channel, the Forward Common
21 Control Channel, or the Primary Broadcast Control Channel, whether addressed to the
22 mobile station or not (see [4]). The mobile station shall disable the timer when it is not
23 monitoring the Paging Channel, the Forward Common Control Channel, or the Primary
24 Broadcast Control Channel. If the timer expires, the mobile station shall declare a loss of
25 the Paging Channel, the Forward Common Control Channel, or the Primary Broadcast
26 Control Channel.

27 2.6.2.1.2 Quick Paging Channel Monitoring Procedures

28 2.6.2.1.2.1 Overview

29 The Quick Paging Channel is divided into 80 ms slots called Quick Paging Channel slots.

30 The Quick Paging Channel protocol provides for scheduling the transmission of paging
31 indicators for a mobile station in Quick Paging Channel slots assigned to the mobile
32 station. Support of this feature is optional.

33 The Quick Paging Channel protocol provides for scheduling the transmission of
34 configuration change indicators for mobile stations in Quick Paging Channel slots.
35 Support of this feature is optional.

1 The Quick Paging Channel protocol provides for scheduling the transmission of broadcast
2 indicators for mobile stations in Quick Paging Channel broadcast slots. Support of this
3 feature is optional.

4 If the mobile station is operating in the slotted mode and it supports the Quick Paging
5 Channel, and QPCH_SUPPORTED_s is equal to '1', the mobile station monitors paging
6 indicators on the Quick Paging Channel³¹ as follows:

7 The mobile station's assigned Quick Paging Channel slots are offset from its assigned
8 Paging Channel slots or its assigned Forward Common Control Channel slots by 100 ms,
9 as shown in Figure 2.6.2.1.2.1-1. Two paging indicators are assigned to a mobile station in
10 its assigned Quick Paging Channel slot. In the following, t^* is the start time of the mobile
11 station's assigned Paging Channel or Forward Common Control Channel slot. According to
12 the hash function specified in 2.6.7.1, paging indicators are assigned as follows:

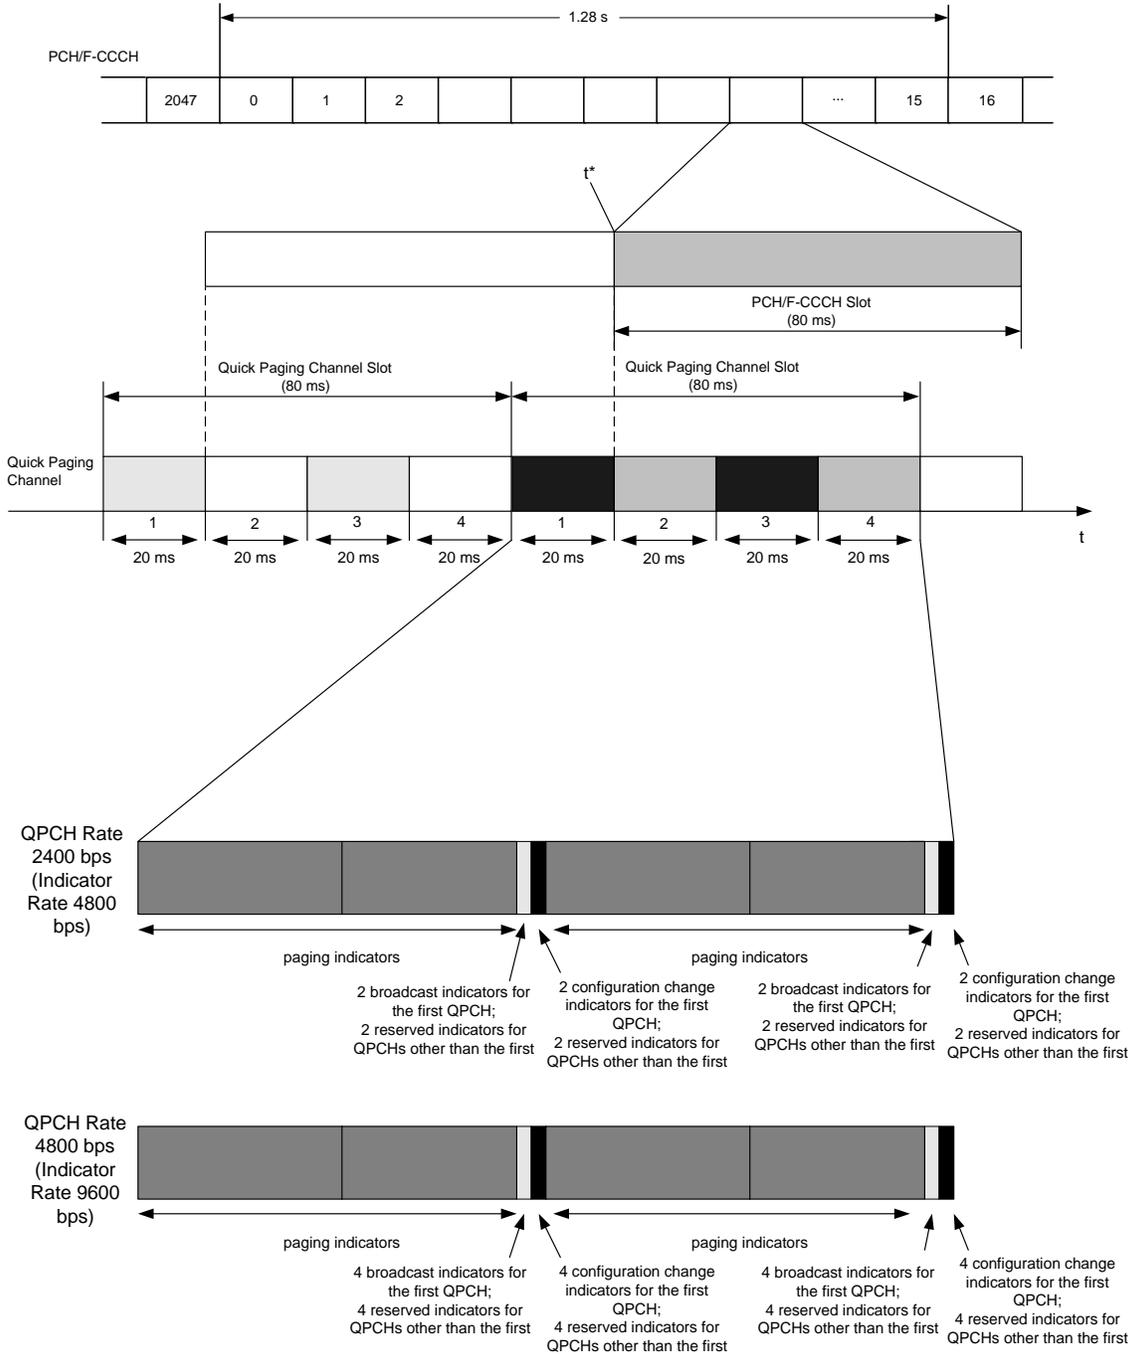

- 13 • The first paging indicator for the mobile station is assigned between (t^*-100) ms and
14 (t^*-80) ms (marked as 1 in Figure 2.6.2.1.2.1-1) and the second paging indicator is
15 assigned between (t^*-60) ms and (t^*-40) ms (marked as 3 in the figure); or
- 16 • The first paging indicator for the mobile station is assigned between (t^*-80) ms and
17 (t^*-60) ms (marked as 2 in the figure) and the second paging indicator is assigned
18 between (t^*-40) ms and (t^*-20) ms (marked as 4 in the figure).

19 If the mobile station is operating in the slotted mode and it supports the Quick Paging
20 Channel, the mobile station can, when performing an idle handoff to a base station whose
21 Paging Channel or Forward Common Control Channel/Primary Broadcast Control Channel
22 has recently been monitored, monitor one or more configuration change indicators.
23 Configuration change indicators are scheduled every 40 ms on the first Quick Paging
24 Channel.

25 If the mobile station is operating in the slotted mode, is configured to receive the broadcast
26 messages, supports the Quick Paging Channel, BCAST_INDEX_s is not equal to '000',
27 QPCH_SUPPORTED_s is equal to '1', and QPCH_BI_SUPPORTED_s is equal to '1', the mobile
28 station monitors broadcast indicators on the Quick Paging Channel as follows:

- 29 • The mobile station's assigned Quick Paging Channel broadcast slots are offset from
30 its assigned Forward Common Control Channel or Paging Channel broadcast slots
31 by 100 ms, as shown in Figure 2.6.2.1.2.1-1.
- 32 • The mobile station monitors one or more broadcast indicators in an assigned Quick
33 Paging Channel broadcast slot.

³¹ One exception is if the mobile station is operating in the reduced slot cycle mode with a reduced slot cycle index of -3 or -4, and IGNORE_QPCH_s is equal to '1'.

1

3
4

Figure 2.6.2.1.2.1-1. Quick Paging Channel Timeline

1 2.6.2.1.2.2 Requirements

2 A mobile station operating in the slotted mode should monitor the paging indicators in the
3 mobile station's assigned Quick Paging Channel slot if all of the following conditions hold:

- 4 • The mobile station supports the Quick Paging Channel;
- 5 • $QPCH_SUPPORTED_s = '1'$; and
- 6 • The mobile station is not monitoring the Paging Channel or the Forward Common
7 Control Channel.

8 The mobile station's assigned Quick Paging Channel slots shall be those slots in which

$$9 \quad \lfloor (t+5)/4 \rfloor - PGSLOT \pmod{(16 \times T)} = 0.$$

10 where t is the System Time in 20ms frames, PGSLOT is selected in the range 0 to 2047 by
11 using the hash function specified in 2.6.7.1, and T is the slot cycle length in units of 1.28
12 seconds such that

$$13 \quad T = 2^i,$$

14 and i is the slot cycle index which can take the values -4, -3, -2, -1, 0, 1, 2, 3, 4, 5, 6, and
15 7.

16 To determine the position of the mobile station's two assigned paging indicators respective
17 to the beginning of the mobile station's assigned Quick Paging Channel slot, the mobile
18 station shall use the hash function specified in 2.6.7.1. The R1 and R2 outputs of the
19 hashing algorithm correspond to an indicator bit position relative to the beginning of the
20 Quick Paging Channel slot. The hashing algorithm is so devised that two paging indicators
21 (R1 and R2) for a mobile station will be in the first and third quarter slot or the second and
22 fourth quarter slot.

23 If the mobile station checks assigned paging indicators, the mobile station shall perform
24 the following:

- 25 • If the mobile station detects that one of the paging indicators is set to "OFF", the
26 mobile station need not detect another paging indicator.
- 27 • If the mobile station does not detect that at least one of the paging indicators is set
28 to "OFF", the mobile station shall monitor its assigned Paging Channel or Forward
29 Common Control Channel slot immediately following its assigned Quick Paging
30 Channel slot.³²

31 When performing an idle handoff to a base station whose Paging Channel or Forward
32 Common Control Channel was previously monitored, a mobile station operating in the

³² A case for which the mobile station may not be able to detect that at least one of the paging indicators is set to "OFF" is for a mobile station that misses a part of or its entire Quick Paging Channel slot during overhead information update. In this case, the mobile station monitors its assigned Paging Channel slot.

1 slotted mode should monitor one or more configuration change indicators on the first
2 Quick Paging Channel for the new base station if all of the following conditions hold:

- 3 • The mobile station supports the Quick Paging Channel;
- 4 • The mobile station has knowledge that the new base station supports the Quick
5 Paging Channel;
- 6 • The mobile station has knowledge that the new base station supports configuration
7 change indicators,
- 8 • The mobile station is not monitoring the Paging Channel or the Forward Common
9 Control Channel; and
- 10 • No more than T_{31m} seconds have elapsed since the mobile station last received a
11 valid message on the new Paging Channel or the new Forward Common Control
12 Channel.

13 Before monitoring a configuration change indicator, the mobile station shall perform the
14 following:

- 15 • The mobile station shall set ASSIGNED_QPAGECH_s equal to QPAGECH_s, and
- 16 • The mobile station shall set QPAGECH_s equal to 1.

17 Before monitoring a paging indicator subsequent to monitoring a configuration change
18 indicator, the mobile station shall set QPAGECH_s equal to ASSIGNED_QPAGECH_s.

19 If the Quick Paging Channel data rate is 2400 bps (indicator rate is 4800 bps), the bit
20 positions of the mobile station's first pair of configuration change indicators shall be the
21 last two bits in the first 40 ms half of a Quick Paging Channel slot. The bit positions of the
22 mobile station's second pair of configuration change indicators shall be the last two bits in
23 a Quick Paging Channel slot.

24 If the Quick Paging Channel data rate is 4800 bps (indicator rate is 9600 bps), the bit
25 positions of the mobile station's first four configuration change indicators shall be the last
26 four bits in the first 40 ms half of a Quick Paging Channel slot. The bit positions of the
27 mobile station's second four configuration change indicators shall be the last four bits in a
28 Quick Paging Channel slot.

29 If the mobile station monitors a configuration change indicator and determines that it is set
30 to "OFF", the mobile station can enter or remain in the slotted mode after an idle handoff
31 (see 2.6.2.1.4.2).

32 If a mobile station is operating in the slotted mode and is configured to receive broadcast
33 messages, it should monitor the broadcast indicators in the mobile station's assigned
34 Quick Paging Channel broadcast slot if all of the following conditions hold:

- 35 • The mobile station supports the Quick Paging Channel;
- 36 • BCAST_INDEX_s is not equal to '000'
- 37 • QPCH_BI_SUPPORTED_s = '1'; and
- 38 • The mobile station is not monitoring the Forward Common Control Channel, the
39 Primary Broadcast Control Channel, or the Paging Channel.

1 The mobile station's assigned Quick Paging Channel broadcast slots shall be those slots in
2 which

$$3 \quad \lfloor (t+5)/4 \rfloor \bmod (B + 7) = 0.$$

4 where t is the System Time in 20ms frames, and B is the broadcast paging cycle such that
5 $B = 2^{1+i} \times 16$, $1 \leq i \leq 7$ and $i = \text{BCAST_INDEX}_S$ as received in the *MC-RR Parameters*
6 *Message*.

7 The mobile station's assigned Quick Paging Channel broadcast slots shall be those slots in
8 which

$$9 \quad \lfloor (t+5)/4 \rfloor \bmod (B + 3) = 0.$$

10 where t is the System Time in 20ms frames, and B is the broadcast paging cycle such that
11 $B = 2^i \times 16$, $1 \leq i \leq 7$ and $i = \text{BCAST_INDEX}_S$ as received in the *Extended System Parameters*
12 *Message*.

13 The mobile station should monitor one or more broadcast indicators on the Quick Paging
14 Channel. If the Quick Paging Channel data rate is 2400 bps (indicator rate is 4800 bps),
15 the bit positions of the mobile station's first pair of broadcast indicators shall be the two
16 bits prior to the last two bits in the first 40 ms half of a Quick Paging Channel slot. The bit
17 positions of the mobile station's second pair of broadcast indicators shall be the two bits
18 prior to the last two bits in a Quick Paging Channel slot.

19 If the Quick Paging Channel data rate 4800 bps (indicator rate is 9600 bps), the bit
20 positions of the mobile station's first four broadcast indicators shall be the four bits prior to
21 the last four bits in the first 40 ms half of a Quick Paging Channel slot. The bit positions of
22 the mobile station's second four broadcast indicators shall be the four bits prior to the last
23 four bits in a Quick Paging Channel slot.

24 If the mobile station monitors broadcast indicators and determines that they are not set to
25 "OFF", the mobile station should perform the following:

- 26 • The mobile station should receive its assigned broadcast slot on the Forward
27 Common Control Channel or Paging Channel immediately following its assigned
28 Quick Paging Channel broadcast slot.

29 2.6.2.1.3 Registration

30 While in the *Mobile Station Idle State*, the mobile station shall perform the registration
31 procedures specified in 2.6.5.5.2.1.

32 2.6.2.1.4 Idle Handoff

33 2.6.2.1.4.1 Pilot Search

34 An idle handoff occurs when a mobile station has moved from the coverage area of one
35 base station into the coverage area of another base station during the *Mobile Station Idle*
36 *State*. If the mobile station detects a Pilot Channel signal from another base station that is
37 sufficiently stronger than that of the current base station, the mobile station determines
38 that an idle handoff should occur.

1 If both AP_IDT_MSG_SEQ_s and INTRA_FREQ_HO_HYS_s are not set to NULL, the mobile
 2 station shall only perform idle handoff to another pilot on the same frequency as the
 3 current base station when the following condition is satisfied:

$$4 \quad \text{Target Pilot Ec/Io (dB)} > (\text{INTRA_FREQ_HO_SLOPE}_s/8) \times \text{Current Pilot Ec/Io (dB)} + \\
 5 \quad \text{INTRA_FREQ_HO_HYS}_s \text{ (dB)}.$$

6 If both AP_IDT_MSG_SEQ_s and INTER_FREQ_HO_HYS_s are not set to NULL, the mobile
 7 station shall only perform idle handoff to another pilot on a different frequency than that of
 8 the current base station when the following condition is satisfied:

$$9 \quad \text{Target Pilot Ec/Io (dB)} > (\text{INTER_FREQ_HO_SLOPE}_s/8) \times \text{Current Pilot Ec/Io (dB)} + \\
 10 \quad \text{INTER_FREQ_HO_HYS}_s \text{ (dB)}.$$

11 When multiple idle handoff candidates are available, the mobile station should select, if
 12 any, a candidate which supports Primary Broadcast Control Channel.

13 Pilot Channels are identified by their offsets relative to the zero offset pilot PN sequence
 14 (see 3.1.3.2.1). Pilot offsets are grouped into sets describing their status with regard to
 15 pilot searching.

16 The following sets of pilot offsets are defined for a mobile station in the *Mobile Station Idle*
 17 *State*. Each pilot offset is a member of only one set.

- 18 • Active Set: The pilot offset of the Forward CDMA Channel whose Paging Channel or
 19 Forward Common Control Channel is being monitored.
- 20 • Neighbor Set: The offsets of the Pilot Channels that are likely candidates for idle
 21 handoff. The members of the Neighbor Set are specified in the *Neighbor List*
 22 *Message*, *Extended Neighbor List Message*, and the *General Neighbor List Message* on
 23 the Paging Channel, and the *Universal Neighbor List Message* on the Primary
 24 Broadcast Control Channel.
- 25 • Remaining Set: The set of all possible pilot offsets in the current system (integer
 26 multiples of PILOT_INC_s) on the current CDMA Frequency Assignment, excluding
 27 the pilots in the Neighbor Set and the Active Set.
- 28 • Private Neighbor Set: The offsets of the Pilot Channels for the private systems that
 29 are likely candidates for idle handoff. The members of the Private Neighbor Set are
 30 specified in the *Private Neighbor List Message*.

31 The mobile station shall support a Neighbor Set size of at least N_{8m} pilots (see Annex D).

32 In the *Mobile Station Idle State*, the mobile station shall continuously search for the
 33 strongest Pilot Channel signal on the corresponding CDMA Frequency Assignment
 34 whenever it monitors the Paging Channel or the Forward Common Control Channel.

35 The mobile station may search other frequencies and band classes. For example, if a pilot
 36 in the Neighbor Set or in the Private Neighbor Set is on a different Frequency Assignment
 37 than that of the mobile station, this frequency should be included in the search criteria.
 38 Search performance criteria are defined in [11]. If both AP_IDT_MSG_SEQ_s and
 39 INTER_FREQ_SRCH_TH_s are not set to NULL, the MS shall only start searching on different

1 frequencies than that of the current pilot when its current pilot E_c/I_o is below
 2 $INTER_FREQ_SRCH_TH_S$.

3 This search should be governed by the following:

- 4 • Active Set: The search window size for the pilot in the Active Set shall be the
 5 number of PN chips specified in Table 2.6.6.2.1-1 corresponding to $SRCH_WIN_A_S$.
 6 The mobile station should center the search window for the pilot of the Active Set
 7 around the earliest arriving usable multipath component of the pilot. If the mobile
 8 station receives a value greater than or equal to 13 for $SRCH_WIN_A_r$, it may store
 9 and use the value 13 in $SRCH_WIN_A_S$.
- 10 • Neighbor Set: The search window size for each pilot in the Neighbor Set shall be the
 11 number of PN chips specified in Table 2.6.6.2.1-1 corresponding to
 12 $SRCH_WIN_NGHBR_S$ field of the $NGHBR_REC$ for the pilot. The mobile station
 13 should center the search window for each pilot in the Neighbor Set around the
 14 pilot's PN sequence offset plus the corresponding $SRCH_OFFSET_NGHBR_S$ (see
 15 Table 2.6.6.2.1-2) using timing defined by the mobile station's time reference (see
 16 [2]). The mobile station should use the $SEARCH_PRIORITY$ field of the
 17 $NGHBR_REC$ for the corresponding pilot to schedule its neighbor search. If
 18 $ADD_PILOT_REC_INCL$ field of the $NGHBR_REC$ for the corresponding pilot is equal
 19 to '1', the mobile station shall use the information included in the
 20 $NGHBR_PILOT_REC$ field for searching the neighbor.

21 If the mobile station supports hopping pilot beacons and the $TIMING_INCL$ field of the
 22 $NGHBR_REC$ for the corresponding pilot is equal to '1', then the mobile station shall use
 23 the information included in the $NGHBR_TX_OFFSET$, $NGHBR_TX_DURATION$, and
 24 $NGHBR_TX_PERIOD$ fields of the $NGHBR_REC$ for the corresponding pilot to schedule the
 25 time for searching the neighbor.

- 26 • Remaining Set: The search window size for each pilot in the Remaining Set shall be
 27 the number of PN chips specified in Table 2.6.6.2.1-1 corresponding to
 28 $SRCH_WIN_R_S$. The mobile station should center the search window for each pilot
 29 in the Remaining Set around the pilot's PN sequence offset using timing defined by
 30 the mobile station's time reference (see [2]). The mobile station should only search
 31 for Remaining Set pilots whose pilot PN sequence offset indices are equal to integer
 32 multiples of $PILOT_INC_S$.
- 33 • Private Neighbor Set: The search window size for each pilot in the Private Neighbor
 34 Set shall be the number of PN chips specified in Table 2.6.6.2.1-1 corresponding to
 35 $SRCH_WIN_PRI_NGHBR_S$ field of the PRI_NGHBR_REC for the pilot. The mobile
 36 station should center the search window for each pilot in the Private Neighbor Set
 37 around the pilot's PN sequence offset using timing defined by the mobile station's
 38 time reference (see [2]).

39 If the mobile station determines that one of the Neighbor Set, Private Neighbor Set or
 40 Remaining Set Pilot Channel signals is sufficiently stronger (see [11]) than the Pilot
 41 Channel of the Active Set, the mobile station should perform an idle handoff as follows:

- 42 • If the mobile station is currently monitoring a Forward Supplemental Channel, the
 43 mobile station shall perform an idle handoff as specified in 2.6.13.4;

- Otherwise, the mobile station shall perform an idle handoff as specified in 2.6.2.1.4.2.

If RER_MODE_ENABLED is equal to YES, the mobile station performs idle handoff to a Pilot Channel that is not in RER_PILOT_LIST (see 2.6.4.4.2 and [4]), RER_SID_s is equal to SID_s, RER_NID_s is equal to NID_s, and RER_MODE_SUPPORTED_s is equal to '1', the mobile station shall send a *Radio Environment Message* by performing the *Mobile Station Message Transmission Operation* as specified in 2.6.2.6.

A mobile station operating in slotted mode, which is successfully demodulating the Paging Channel or the Forward Common Control Channel, should not perform an idle handoff while it is required to monitor its assigned slot (see 2.6.2.1.1.3.1).

2.6.2.1.4.2 Idle Handoff Procedures

While performing an idle handoff, the mobile station should not begin operating in non-slotted mode after the idle handoff if all of the following conditions hold:

- The mobile station supports the Quick Paging Channel;
- The mobile station has knowledge that the new base station supports configuration change indicators;
- The mobile station determines that the Quick Paging Channel configuration change indicator for the new Quick Paging Channel is set to "OFF" (see 2.6.2.1.2.1); and
- No more than T_{31m} seconds have elapsed since the mobile station last received a valid message on the new Paging Channel or Forward Common Control Channel/Primary Broadcast Control Channel.

Otherwise, the mobile station shall operate in non-slotted mode until the mobile station has received at least one valid configuration message or mobile station-addressed page on the new Paging Channel or Forward Common Control Channel/Primary Broadcast Control Channel. Following the reception of this message the mobile station may resume slotted mode operation in accordance with 2.6.2.1.1.3. After performing an idle handoff, the mobile station shall discard all unprocessed messages received on the old Paging Channel or Forward Common Control Channel/Primary Broadcast Control Channel.

If the new base station is listed in NGHBR_REC_LIST for the old base station (see 2.6.2.2.3, 2.6.2.2.7, and 2.6.2.1.4.1), the mobile station shall use the corresponding 3-bit NGHBR_CONFIG field to determine the actions required to transition to the new base station. If the new base station is not listed in NGHBR_REC_LIST for the old base station, the mobile station shall perform the handoff operation using the same procedure as for a pilot in NGHBR_REC_LIST with the NGHBR_CONFIG field set to '011'.

If the mobile station is currently monitoring the Paging Channel and selected a neighbor base station for idle handoff which supports Primary Broadcast Control Channel, the mobile station shall perform the following:

- The mobile station shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a new system indication, upon performing idle handoff to this neighbor base station.

- 1 • The mobile station shall not perform any of the remaining procedures in this
2 section.

3 If the NGHBR_CONFIG field is '000', the mobile station shall perform the following:

- 4 • The mobile station shall set ACC_MSG_SEQ_s and CURR_ACC_MSG_SEQ to NULL
5 (see 2.6.2.2) and shall set PILOT_PN_s to the pilot offset index of the base station
6 transmitting the new Paging Channel or Forward Common Control
7 Channel/Primary Broadcast Control Channel.
- 8 • If the mobile station has not stored configuration parameters for the new Paging
9 Channel or Forward Common Control Channel and Primary Broadcast Control
10 Channel, or if the stored information is not current, the mobile station shall perform
11 the following:
- 12 - If the mobile station has monitored the Paging Channel before the idle handoff,
13 the mobile station shall set CONFIG_MSG_SEQ_s, SYS_PAR_MSG_SEQ_s,
14 NGHBR_LST_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s,
15 GEN_NGHBR_LST_MSG_SEQ_s, CHAN_LST_MSG_SEQ_s,
16 EXT_SYS_PAR_MSG_SEQ_s, GLOB_SERV_REDIR_MSG_SEQ_s,
17 EXT_GLOB_SERV_REDIR_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
18 FD_CHAN_LST_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s,
19 AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s,
20 GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s and
21 PRI_NGHBR_LST_MSG_SEQ_s to NULL.
- 22 - If the mobile station has monitored the Forward Common Control
23 Channel/Primary Broadcast Control Channel before the idle handoff, the mobile
24 station shall set CONFIG_MSG_SEQ_s, A41_SYS_PAR_MSG_SEQ_s,
25 UNI_NGHBR_LST_MSG_SEQ_s, MC_RR_PAR_MSG_SEQ_s,
26 EXT_GLOB_SERV_REDIR_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
27 FD_CHAN_LST_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s, and
28 PRI_NGHBR_LST_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s,
29 AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s,
30 ATIM_MSG_SEQ_s to NULL.
- 31 • If the stored information for the new Paging Channel or the Forward Common
32 Control Channel and Primary Broadcast Control Channel is current, the mobile
33 station shall set CONFIG_MSG_SEQ_s to the stored information for the new Paging
34 Channel or Forward Common Control Channel and Primary Broadcast Control
35 Channel, and the mobile station shall set NGHBR_REC_LIST to the stored
36 information for the new Paging Channel or the new Forward Common Control
37 Channel and Primary Broadcast Control Channel.
- 38 - If the associated NGHBR_BAND_s or NGHBR_FREQ_s of the new base station in
39 NGHBR_REC_LIST of the old base station is not equal to CDMABAND_s and
40 CDMACH_s respectively, the mobile station shall set CDMABAND_s to
41 NGHBR_BAND_s, CDMACH_s to NGHBR_FREQ_s, and tune to the new CDMA
42 Channel. The mobile station shall begin monitoring the Paging Channel or the

1 Forward Common Control Channel/Primary Broadcast Control Channel of the
 2 new base station, using the same rate, code rate, and code channel, as
 3 applicable.

- 4 - If PACA_s is equal to enabled, the mobile station shall enter the *Update Overhead*
 5 *Information Substate* of the *System Access State* (see 2.6.3) with an origination
 6 indication within T_{33m} seconds to re-originate the PACA call using the new base
 7 station.

8 If the NGHBR_CONFIG field is '001', the mobile station shall perform the following:

- 9 • The mobile station shall set ACC_MSG_SEQ_s and CURR_ACC_MSG_SEQ to NULL
 10 and shall set PILOT_PN_s to the pilot offset index of the base station transmitting the
 11 new Paging Channel.
- 12 • If the stored information for Primary Paging Channel or any of the Paging Channels
 13 on the associated NGHBR_FREQ_s of the new base station in NGHBR_REC_LIST of
 14 the old base station is current, the mobile station shall perform the following:
 - 15 - The mobile station shall use the hash algorithm specified in 2.6.7.1 to select a
 16 new Paging Channel number in the range 1 to PAGE_CHAN_s, where
 17 PAGE_CHAN_s is the value stored for the Paging Channel whose stored
 18 information is current. The mobile station shall store the new Paging Channel
 19 number as PAGECH_s. The mobile station shall perform the following:
 - 20 + If the mobile station has not stored configuration parameters for the new
 21 Paging Channel, or if the stored parameters are not current (see 2.6.2.2), the
 22 mobile station shall set CONFIG_MSG_SEQ_s, SYS_PAR_MSG_SEQ_s,
 23 NGHBR_LST_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s,
 24 GEN_NGHBR_LST_MSG_SEQ_s, CHAN_LST_MSG_SEQ_s,
 25 EXT_SYS_PAR_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s,
 26 PRI_NGHBR_LST_MSG_SEQ_s, and EXT_GLOB_SERV_REDIR_MSG_SEQ_s,
 27 EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s,
 28 AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s,
 29 GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s and
 30 GLOB_SERV_REDIR_MSG_SEQ_s to NULL.
 - 31 + If the stored information for the new Paging Channel is current, the mobile
 32 station shall set CONFIG_MSG_SEQ_s to the stored information for the new
 33 Paging Channel and set NGHBR_REC_LIST to the stored information for the
 34 new Paging Channel.
 - 35 - If the mobile station has monitored the Forward Common Control
 36 Channel/Primary Broadcast Control Channel before the idle handoff, the mobile
 37 station shall set Paging Channel data rate, PRATs = '00'.

- 1 - If the associated NGHBR_BANDs or NGHBR_FREQs of the new base station in
2 NGHBR_REC_LIST of the old base station is not equal to CDMABANDs and
3 CDMACHs respectively, the mobile station shall set CDMABANDs to
4 NGHBR_BANDs, CDMACHs to NGHBR_FREQs, and tune to the new CDMA
5 Channel. The mobile station shall begin monitoring the new Paging Channel of
6 the new base station.
- 7 • If none of the Paging Channel stored information on the associated NGHBR_FREQs
8 of the new base station in NGHBR_REC_LIST of the old base station are current, the
9 mobile station shall perform the following:
- 10 - The mobile station shall set CONFIG_MSG_SEQs, SYS_PAR_MSG_SEQs,
11 NGHBR_LST_MSG_SEQs, EXT_NGHBR_LST_MSG_SEQs,
12 GEN_NGHBR_LST_MSG_SEQs, CHAN_LST_MSG_SEQs,
13 EXT_SYS_PAR_MSG_SEQs, GLOB_SERV_REDIR_MSG_SEQs,
14 EXT_GLOB_SERV_REDIR_MSG_SEQs, EXT_CHAN_LST_MSG_SEQs,
15 FD_CHAN_LST_MSG_SEQs, USER_ZONE_ID_MSG_SEQs,
16 AP_PILOT_INFO_MSG_SEQs, AP_IDT_MSG_SEQs, AP_ID_TEXT_MSG_SEQs,
17 GOI_MSG_SEQs, FREQ_GOI_MSG_SEQs, ATIM_MSG_SEQs and
18 PRI_NGHBR_LST_MSG_SEQs to NULL.
- 19 - If the mobile station has monitored the Forward Common Control
20 Channel/Primary Broadcast Control Channel before the idle handoff, the mobile
21 station shall set Paging Channel data rate, PRATs = '00'.
- 22 - The mobile station shall set PAGE_CHANs to '1' and PAGECHs to the Primary
23 Paging Channel. If the associated NGHBR_BANDs or NGHBR_FREQs of the new
24 base station in NGHBR_REC_LIST of the old base station is not equal to
25 CDMABANDs and CDMACHs respectively, the mobile station shall set
26 CDMABANDs to NGHBR_BANDs, CDMACHs to NGHBR_FREQs, and tune to the
27 new CDMA Channel. The mobile station shall begin monitoring the Primary
28 Paging Channel of the new base station.
- 29 • If PACAs is equal to enabled, the mobile station shall enter the *Update Overhead*
30 *Information Substate* of the *System Access State* (see 2.6.3) with an origination
31 indication within T_{33m} seconds to re-originate the PACA call using the new base
32 station.

33 If the NGHBR_CONFIG field is '010', the mobile station shall perform the following:

- 34 • The mobile station shall set ACC_MSG_SEQs and CURR_ACC_MSG_SEQ to NULL
35 and shall set PILOT_PNs to the pilot offset index of the base station transmitting the
36 new Paging Channel or Forward Common Control Channel/Primary Broadcast
37 Control Channel.
- 38 • If the mobile station has monitored the Paging Channel before the idle handoff, the
39 mobile station shall perform the following:

- 1 - If the stored information for Primary Paging Channel or any of the Paging
2 Channels on the target frequency or any of the frequencies of the new base
3 station is current, the mobile station shall perform the following:
- 4 + The mobile station shall use the hash algorithm specified in 2.6.7.1 and the
5 stored value of the number of CDMA channels to determine the new CDMA
6 Channel and shall set `FREQ_NEW` to this new CDMA Channel. The mobile
7 station shall perform the following:
- 8 ○ If the stored information for any of the Paging Channels on the CDMA
9 channel specified by `FREQ_NEW` is current, the mobile station shall
10 perform the following:

11 The mobile station shall use the hash algorithm specified in 2.6.7.1 to
12 select a new Paging Channel number in the range 1 to `PAGE_CHANs`,
13 where `PAGE_CHANs` is the value stored for the Paging Channel
14 whose stored information is current. The mobile station shall store
15 the new Paging Channel number as `PAGECHs`. The mobile station
16 shall perform the following:

- 17 - If the mobile station has not stored configuration parameters for
18 the new Paging Channel, or if the stored parameters are not
19 current (see 2.6.2.2), the mobile station shall set `CONFIG-`
20 `_MSG_SEQs`, `SYS_PAR_MSG_SEQs`, `NGHBR_LST_MSG_SEQs`,
21 `EXT_NGHBR_LST_MSG_SEQs`, `GEN_NGHBR_LST_MSG_SEQs`,
22 `CHAN_LST_MSG_SEQs`, `EXT_SYS_PAR_MSG_SEQs`,
23 `USER_ZONE_ID_MSG_SEQs`, `PRI_NGHBR_LST_MSG_SEQs`, and
24 `EXT_GLOB_SERV_REDIR_MSG_SEQs`,
25 `EXT_CHAN_LST_MSG_SEQs`, `FD_CHAN_LST_MSG_SEQs`,
26 `AP_PILOT_INFO_MSG_SEQs`, `AP_IDT_MSG_SEQs`,
27 `AP_ID_TEXT_MSG_SEQs`, `GOI_MSG_SEQs`,
28 `FREQ_GOI_MSG_SEQs`, `ATIM_MSG_SEQs` and
29 `GLOB_SERV_REDIR_MSG_SEQs` to NULL.
- 30 - If the stored information for the new Paging Channel is current,
31 the mobile station shall set `CONFIG_MSG_SEQs` to the stored
32 information for the new Paging Channel and set
33 `NGHBR_REC_LIST` to the stored information for the new Paging
34 Channel.

35 If the band class corresponding to `FREQ_NEW` is not equal to
36 `CDMABANDs` of the old base station or `FREQ_NEW` is not equal to
37 `CDMACHs` of the old base station, the mobile station shall set
38 `CDMABANDs` to band class corresponding to `FREQ_NEW` and shall
39 set `CDMACHs` to `FREQ_NEW`, and tune to the new CDMA Channel.
40 The mobile station shall begin monitoring the new Paging Channel of
41 the new base station.

- 1 ○ If none of the Paging Channel stored information on the CDMA channel
2 specified by `FREQ_NEW` are current, the mobile station shall perform the
3 following:
- 4 The mobile station shall set `CONFIG_MSG_SEQs`, `SYS_PAR_MSG_SEQs`,
5 `NGHBR_LST_MSG_SEQs`, `EXT_NGHBR_LST_MSG_SEQs`,
6 `GEN_NGHBR_LST_MSG_SEQs`, `CHAN_LST_MSG_SEQs`,
7 `EXT_SYS_PAR_MSG_SEQs`, `GLOB_SERV_REDIR_MSG_SEQs`,
8 `EXT_GLOB_SERV_REDIR_MSG_SEQs`, `EXT_CHAN_LST_MSG_SEQs`,
9 `FD_CHAN_LST_MSG_SEQs`, `USER_ZONE_ID_MSG_SEQs`, and
10 `PRI_NGHBR_LST_MSG_SEQs`, `AP_PILOT_INFO_MSG_SEQs`,
11 `AP_IDT_MSG_SEQs`, `AP_ID_TEXT_MSG_SEQs`, `GOI_MSG_SEQs`,
12 `FREQ_GOI_MSG_SEQs`, `ATIM_MSG_SEQs` to NULL.
- 13 The mobile station shall set `PAGE_CHANs` to '1' and `PAGECHs` to the
14 Primary Paging Channel. If the band class corresponding to
15 `FREQ_NEW` is not equal to `CDMABANDs` of the old base station or
16 `FREQ_NEW` is not equal to `CDMACHs` of the old base station, the
17 mobile station shall set `CDMABANDs` to band class corresponding to
18 `FREQ_NEW` and shall set `CDMACHs` to `FREQ_NEW`, and tune to the
19 new CDMA Channel. The mobile station shall begin monitoring the
20 Primary Paging Channel of the new base station.
- 21 - If none of the Paging Channel stored information on any of the frequencies of
22 the new base station are current, the mobile station shall perform the following:
- 23 + The mobile station shall set `CONFIG_MSG_SEQs`, `SYS_PAR_MSG_SEQs`,
24 `NGHBR_LST_MSG_SEQs`, `EXT_NGHBR_LST_MSG_SEQs`,
25 `GEN_NGHBR_LST_MSG_SEQs`, `CHAN_LST_MSG_SEQs`,
26 `EXT_SYS_PAR_MSG_SEQs`, `GLOB_SERV_REDIR_MSG_SEQs`,
27 `EXT_GLOB_SERV_REDIR_MSG_SEQs`, `EXT_CHAN_LST_MSG_SEQs`,
28 `FD_CHAN_LST_MSG_SEQs`, `USER_ZONE_ID_MSG_SEQs`, and
29 `PRI_NGHBR_LST_MSG_SEQs`, `AP_PILOT_INFO_MSG_SEQs`,
30 `AP_IDT_MSG_SEQs`, `AP_ID_TEXT_MSG_SEQs`, `GOI_MSG_SEQs`,
31 `FREQ_GOI_MSG_SEQs`, `ATIM_MSG_SEQs` to NULL.
- 32 + The mobile station shall set `PAGE_CHANs` to '1' and `PAGECHs` to the
33 Primary Paging Channel. If the associated `NGHBR_BANDs` or
34 `NGHBR_FREQs` of the new base station in `NGHBR_REC_LIST` of the old base
35 station is not equal to `CDMABANDs` and `CDMACHs` of the old base station
36 respectively, the mobile station shall set `CDMABANDs` to `NGHBR_BANDs`,
37 and `CDMACHs` to `NGHBR_FREQs`; otherwise, the mobile station shall set
38 `CDMACHs` as follows:
- 39 ○ If the *Extended CDMA Channel List Message* is being sent on the old base
40 station, set `CDMACHs` to the first CDMA Channel given in the *Extended*
41 *CDMA Channel List Message* for the old base station.

- 1 ○ Otherwise, set $CDMACH_s$ to the first CDMA Channel given in the *CDMA*
2 *Channel List Message* for the old base station.

3 Then the mobile station shall tune to the new CDMA channel and begin
4 monitoring the Primary Paging Channel of the new base station.

- 5 • If the mobile station has monitored the Forward Common Control Channel/Primary
6 Broadcast Control Channel before the idle handoff, the mobile station shall perform
7 the following:

8 - If the stored information for any of the Forward Common Control Channels and
9 Primary Broadcast Control Channel on any of the frequencies of the new base
10 station is current, the mobile station shall perform the following:

11 + The mobile station shall use the hash algorithm specified in 2.6.7.1 and the
12 stored value of the number of CDMA channels to determine the new CDMA
13 Channel and shall set $FREQ_NEW$ to this new CDMA Channel. The mobile
14 station shall perform the following

15 ○ If the stored information for any of the Forward Common Control
16 Channels and Primary Broadcast Control Channel on the CDMA channel
17 specified by $FREQ_NEW$ is current, the mobile station shall perform the
18 following:

19 ◇ The mobile station shall use the hash algorithm specified in 2.6.7.1
20 to select a new Forward Common Control Channel number in the
21 range 1 to NUM_FCCCH_s , where NUM_FCCCH_s is the stored value.
22 The mobile station shall store the new Forward Common Control
23 Channel number as $FCCCH_ID_s$.

24 ◇ If the stored information for this new Forward Common Control
25 Channel and Primary Broadcast Control Channel is current, the
26 mobile station shall perform the following:

27 — The mobile station shall set $CONFIG_MSG_SEQ_s$ to the stored
28 information for this new Forward Common Control Channel and
29 Primary Broadcast Control Channel and the mobile station shall
30 set $NGHBR_REC_LIST$ to the stored information for this new
31 Forward Common Control Channel and Primary Broadcast
32 Control Channel.

33 — If the band class corresponding to $FREQ_NEW$ is not equal to
34 $CDMABAND_s$ of the old base station or $FREQ_NEW$ is not equal
35 to $CDMACH_s$ of the old base station, the mobile station shall set
36 $CDMABAND_s$ to band class corresponding to $FREQ_NEW$ and
37 shall set $CDMACH_s$ to $FREQ_NEW$, and tune to the new CDMA
38 Channel. The mobile station shall begin monitoring the new
39 Forward Common Control Channel/Primary Broadcast Control
40 Channel of the new base station.

- 1 ◇ If the stored information for this new Forward Common Control
2 Channel and Primary Broadcast Control Channel is not current, the
3 mobile station shall perform the following:
- 4 — The mobile station shall set CONFIG_MSG_SEQ_s,
5 A41_SYS_PAR_MSG_SEQ_s, UNI_NGHBR_LST_MSG_SEQ_s,
6 MC_RR_PAR_MSG_SEQ_s, EXT_GLOB_SERV_REDIR_MSG_SEQ_s,
7 EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s,
8 USER_ZONE_ID_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s,
9 AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s,
10 FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s and
11 PRI_NGHBR_LST_MSG_SEQ_s to NULL.
- 12 — If the band class corresponding to FREQ_NEW is not equal to
13 CDMABAND_s of the old base station or FREQ_NEW is not equal
14 to CDMACH_s of the old base station, the mobile station shall set
15 CDMABAND_s to band class corresponding to FREQ_NEW and
16 shall set CDMACH_s to FREQ_NEW, and tune to the new CDMA
17 Channel. The mobile station shall begin monitoring the Primary
18 Broadcast Control Channel of the new base station.
- 19 ○ If none of the Forward Common Control Channel and Primary Broadcast
20 Control Channel stored information on the CDMA channel specified by
21 FREQ_NEW are current, the mobile station shall perform the following:
- 22 The mobile station shall set CONFIG_MSG_SEQ_s,
23 A41_SYS_PAR_MSG_SEQ_s, UNI_NGHBR_LST_MSG_SEQ_s,
24 MC_RR_PAR_MSG_SEQ_s, EXT_GLOB_SERV_REDIR_MSG_SEQ_s,
25 EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s,
26 USER_ZONE_ID_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s,
27 AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s,
28 FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s and
29 PRI_NGHBR_LST_MSG_SEQ_s to NULL.
- 30 If the associated NGHBR_BAND_s of the new base station in
31 NGHBR_REC_LIST of the old base station is not equal to
32 CDMABAND_s or the associated NGHBR_FREQ_s of the new base
33 station in NGHBR_REC_LIST of the old base station is not equal to
34 CDMACH_s of the old base station, the mobile station shall set
35 CDMABAND_s to NGHBR_BAND_s, CDMACH_s to NGHBR_FREQ_s, and
36 tune to the new CDMA Channel. Otherwise, the mobile station shall
37 set CDMACH_s to the first CDMA Channel given in the *Extended*
38 *CDMA Channel List Message* for the old base station and tune to the
39 new CDMA channel.
- 40 Then the mobile station shall begin monitoring the Primary Broadcast
41 Control Channel of the new base station, using the same rate, code
42 rate, and code channel.

- 1 - If none of the Forward Common Control Channel and Primary Broadcast
2 Control Channel stored information on any of the frequencies of the new base
3 station are current, the mobile station shall perform the following:
- 4 + The mobile station shall set CONFIG_MSG_SEQ_s,
5 A41_SYS_PAR_MSG_SEQ_s, UNI_NGHR_LST_MSG_SEQ_s,
6 MC_RR_PAR_MSG_SEQ_s, EXT_GLOB_SERV_REDIR_MSG_SEQ_s,
7 EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s,
8 USER_ZONE_ID_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s,
9 AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s,
10 FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s and PRI_NGHR_LST_MSG_SEQ_s
11 to NULL.
- 12 + If the associated NGHR_BAND_s or NGHR_FREQ_s of the new base station
13 in NGHR_REC_LIST of the old base station is not equal to CDMABAND_s
14 and CDMACH_s of the old base station respectively, the mobile station shall
15 set CDMABAND_s to NGHR_BAND_s, CDMACH_s to NGHR_FREQ_s, and
16 tune to the new CDMA Channel. Otherwise, the mobile station shall set
17 CDMACH_s to the first CDMA Channel given in the *Extended CDMA Channel*
18 *List Message* for the old base station and tune to the new CDMA channel.
- 19 + Then the mobile station shall begin monitoring the Primary Broadcast
20 Control Channel of the new base station, using the same rate, code rate, and
21 code channel.
- 22 • If PACA_s is equal to enabled, the mobile station shall enter the *Update Overhead*
23 *Information Substate* of the *System Access State* (see 2.6.3) with an origination
24 indication within T_{33m} seconds to re-originate the PACA call using the new base
25 station.
- 26 If the NGHR_CONFIG field is '011', the mobile station shall perform the following:
- 27 • Enter the *System Determination Substate* of the *Mobile Station Initialization State* with
28 a new system indication (see 2.6.1.1).
- 29 If the NGHR_CONFIG field is '100', the mobile station shall perform the following:
- 30 • The mobile station shall set ACC_MSG_SEQ_s and CURR_ACC_MSG_SEQ to NULL
31 (see 2.6.2.2) and shall set PILOT_PN_s to the pilot offset index of the base station
32 transmitting the new Forward Common Control Channel/Primary Broadcast
33 Control Channel.
- 34 • If the stored information for any of the Forward Common Control Channels and
35 Primary Broadcast Control Channel on the associated NGHR_FREQ_s of the new
36 base station in NGHR_REC_LIST of the old base station is current, the mobile
37 station shall perform the following:
- 38 - The mobile station shall use the hash algorithm specified in 2.6.7.1 to select a
39 new Forward Common Control Channel number in the range 1 to
40 NUM_FCCCH_s, where NUM_FCCCH_s is the stored value. The mobile station
41 shall store the new Forward Common Control Channel number as FCCCH_ID_s.

- 1 - If the mobile station has not stored configuration parameters for this new
2 Forward Common Control Channel and Primary Broadcast Control Channel, or
3 if the stored information is not current, the mobile station shall perform the
4 following:
- 5 + The mobile station shall set CONFIG_MSG_SEQ_s,
6 A41_SYS_PAR_MSG_SEQ_s, UNI_NGHR_LST_MSG_SEQ_s,
7 MC_RR_PAR_MSG_SEQ_s, EXT_GLOB_SERV_REDIR_MSG_SEQ_s,
8 EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s,
9 USER_ZONE_ID_MSG_SEQ_s, and PRI_NGHR_LST_MSG_SEQ_s,
10 AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s,
11 GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s to NULL.
- 12 + If the associated NGHR_BAND_s or NGHR_FREQ_s of the new base station
13 in NGHR_REC_LIST of the old base station is not equal to CDMABAND_s
14 and CDMACH_s respectively, the mobile station shall set CDMABAND_s to
15 NGHR_BAND_s, CDMACH_s to NGHR_FREQ_s, and tune to the new CDMA
16 Channel.
- 17 + Then the mobile station shall begin monitoring the Primary Broadcast
18 Control Channel of the new base station, using the same rate, code rate, and
19 code channel.
- 20 - If the stored information for this new Forward Common Control Channel and
21 Primary Broadcast Control Channel is current, the mobile station shall perform
22 the following:
- 23 + The mobile station shall set CONFIG_MSG_SEQ_s to the stored information
24 for this new Forward Common Control Channel and Primary Broadcast
25 Control Channel and the mobile station shall set NGHR_REC_LIST to the
26 stored information for this new Forward Common Control Channel and
27 Primary Broadcast Control Channel.
- 28 + If the associated NGHR_BAND_s or NGHR_FREQ_s of the new base station
29 in NGHR_REC_LIST of the old base station is not equal to CDMABAND_s
30 and CDMACH_s respectively, the mobile station shall set CDMABAND_s to
31 NGHR_BAND_s, CDMACH_s to NGHR_FREQ_s, and tune to the new CDMA
32 Channel. The mobile station shall begin monitoring the new Forward
33 Common Control Channel/Primary Broadcast Control Channel of the new
34 base station.
- 35 • If none of the Forward Common Control Channel and Primary Broadcast Control
36 Channel stored information on the associated NGHR_FREQ_s of the new base
37 station in NGHR_REC_LIST of the old base station are current, the mobile station
38 shall perform the following:

- 1 - The mobile station shall set CONFIG_MSG_SEQ_s, A41_SYS_PAR_MSG_SEQ_s,
 2 UNI_NGHRB_LST_MSG_SEQ_s, MC_RR_PAR_MSG_SEQ_s,
 3 EXT_GLOB_SERV_REDIR_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
 4 FD_CHAN_LST_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s, and
 5 PRI_NGHRB_LST_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s,
 6 AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s,
 7 ATIM_MSG_SEQ_s to NULL.
- 8 - If the associated NGHRB_BAND_s or NGHRB_FREQ_s of the new base station in
 9 NGHRB_REC_LIST of the old base station is not equal to CDMABAND_s and
 10 CDMACH_s respectively, the mobile station shall set CDMABAND_s to
 11 NGHRB_BAND_s, CDMACH_s to NGHRB_FREQ_s, and tune to the new CDMA
 12 Channel.
- 13 - The mobile station shall begin monitoring the Primary Broadcast Control
 14 Channel of the new base station, using the same rate, code rate, and code
 15 channel.
- 16 • If PACA_s is equal to enabled, the mobile station shall enter the *Update Overhead*
 17 *Information Substate* of the *System Access State* (see 2.6.3) with an origination
 18 indication within T_{33m} seconds to re-originate the PACA call using the new base
 19 station.

20 2.6.2.1.5 Primary Broadcast Control Channel Monitoring

21 2.6.2.1.5.1 General Overview

22 The Broadcast Control Channel is divided into 40, 80, or 160 ms slots called the Broadcast
 23 Control Channel slots (see 3.1.3.5 in [2]). The Primary Broadcast Control Channel will be
 24 used for control messages. Support for the Primary Broadcast Control Channel is
 25 mandatory for mobile stations. The Primary Broadcast Control Channel will operate with
 26 the Forward Common Control Channels and the Quick Paging Channels, or only with the
 27 Forward Common Control Channels.

28 After a mobile station acquires and synchronizes with a new base station that supports a
 29 Primary Broadcast Control Channel, the mobile station monitors the Primary Broadcast
 30 Control Channel to receive overhead information. Once the mobile station has received the
 31 updated overhead information from the Primary Broadcast Control Channel, the mobile
 32 station may begin to monitor a Forward Common Control Channel or a Quick Paging
 33 Channel, if it is supported.

34 2.6.2.1.5.2 Requirements

35 If the base station supports the Primary Broadcast Control Channel, the mobile station
 36 shall monitor the Primary Broadcast Control Channel for overhead messages. If the mobile
 37 station determines that the CONFIG_MSG_SEQ has changed, the mobile station shall
 38 monitor the Primary Broadcast Control Channel to receive updated overhead messages.

1 2.6.2.1.6 System Reselection Procedures

2 If the mobile station supports more than one operating mode or the Remaining
3 Set/Neighbor Set contains pilots on frequencies different from the current frequency, the
4 mobile station shall enter the *System Determination Substate* of the *Mobile Station*
5 *Initialization State* with a system reselection indication (see 2.6.1.1) if all of the following are
6 true:

- 7 • RESELECT_INCLUDED_s is equal to '1';

- 8 • The following inequality is satisfied:

$$9 \quad -20 \times \log_{10} (E_C/I_0) > EC_I0_THRESH_s$$

10 where E_C/I_0 is the measured E_C/I_0 of the active pilot; and

- 11 • The following inequality is satisfied:

$$12 \quad pilot_power < EC_THRESH_s - 115$$

13 where $pilot_power$ (dBm/1.23 MHz) = $10 \times \log_{10} (PS)$ (dB) + mean input power

14 (dBm/1.23 MHz) and PS is the strength of the active pilot, as specified in 2.6.6.2.2.

15 2.6.2.1.7 Slotted Timer Expiration

16 Upon expiration of the slotted T_{MS} Slotted timer, the mobile station shall disable the timer,
17 set T_SLOTTED_s to T_{74m}, and set SLOTTED_s to YES.

18 2.6.2.1.8 Exiting the Reduced Slot Cycle Mode

19 If RSC_MODE_ENABLED is equal to YES, then at the system time specified by
20 RSC_END_TIME, the mobile station shall set RSC_MODE_ENABLED to NO and set
21 SLOTTED_s to YES.

22 2.6.2.1.9 Radio Environment Report Timer Expiration

23 Upon expiration of the radio environment report timer, the mobile station shall disable the
24 timer and set RER_MODE_ENABLED to NO. If TKZ_MODE_PENDING is equal to YES, then
25 the mobile station shall perform the following:

- 26 • Set TKZ_MODE_ENABLED to YES and TKZ_MODE_PENDING to NO.
- 27 • Initialize the tracking zone list (TKZ_LIST) to NULL.
- 28 • Enable the tracking zone update timer with an initial value of infinity if
29 TKZ_UPDATE_PRD_s is equal to '1111'; otherwise, the mobile station shall enable the
30 tracking zone update timer with an initial value of $2^{TKZ_UPDATE_PRD_s + 6}$ seconds.

31 2.6.2.2 Response to Overhead Information Operation

32 The overhead messages on the Primary Broadcast Control Channel are:

- 33 • *ANSI-41 System Parameters Message*
- 34 • *MC-RR Parameters Message*
- 35 • *Enhanced Access Parameters Message*
- 36 • *Universal Neighbor List Message*

- 1 • *User Zone Identification Message*
- 2 • *Private Neighbor List Message*
- 3 • *Extended Global Service Redirection Message*
- 4 • *Extended CDMA Channel List Message*
- 5 • *ANSI-41 RAND Message*
- 6 • *BCMC Service Parameters Message*
- 7 • *Access Point Identification Message*
- 8 • *Access Point Identification Text Message*
- 9 • *Access Point Pilot Information Message*
- 10 • *General Overhead Information Message*
- 11 • *Frequent General Overhead Information Message*
- 12 • *Flex Duplex CDMA Channel List Message*
- 13 • *Alternative Technologies Information Message*

14 The overhead messages on the Paging Channel are:

- 15 • *System Parameters Message*
- 16 • *Access Parameters Message*
- 17 • *Neighbor List Message*
- 18 • *CDMA Channel List Message*
- 19 • *Extended System Parameters Message*
- 20 • *Global Service Redirection Message*
- 21 • *Extended Neighbor List Message*
- 22 • *General Neighbor List Message*
- 23 • *User Zone Identification Message*
- 24 • *Private Neighbor List Message*
- 25 • *Extended Global Service Redirection Message*
- 26 • *Extended CDMA Channel List Message*
- 27 • *Access Point Identification Message*
- 28 • *Access Point Identification Text Message*
- 29 • *Access Point Pilot Information Message*
- 30 • *General Overhead Information Message*
- 31 • *Frequent General Overhead Information Message*
- 32 • *Flex Duplex CDMA Channel List Message*

- 1 • *Alternative Technologies Information Message*

2 The *Response to Overhead Information Operation* is performed whenever the mobile station
3 receives an overhead message. The mobile station updates internally stored information
4 from the received message's data fields.

5 Configuration parameters and access parameters are received in the configuration
6 messages and the *Access Parameters Message* or the *Enhanced Access Parameters Message*.

7 The configuration messages on the Primary Broadcast Control Channel are:

- 8 • *ANSI-41 System Parameters Message*
9 • *MC-RR Parameters Message*
10 • *Universal Neighbor List Message*
11 • *User Zone Identification Message*
12 • *Private Neighbor List Message*
13 • *Extended Global Service Redirection Message*
14 • *Extended CDMA Channel List Message*
15 • *Access Point Identification Message*
16 • *Access Point Identification Text Message*
17 • *Access Point Pilot Information Message*
18 • *General Overhead Information Message*
19 • *Frequent General Overhead Information Message*
20 • *Flex Duplex CDMA Channel List Message*
21 • *Alternative Technologies Information Message*

22 The configuration messages on the Paging Channel are:

- 23 • *System Parameters Message*
24 • *Neighbor List Message*
25 • *CDMA Channel List Message*
26 • *Extended System Parameters Message*
27 • *Global Service Redirection Message*
28 • *Extended Neighbor List Message*
29 • *General Neighbor List Message*
30 • *User Zone Identification Message*
31 • *Private Neighbor List Message*
32 • *Extended Global Service Redirection Message*
33 • *Extended CDMA Channel List Message*

- 1 • *Access Point Identification Message*
- 2 • *Access Point Identification Text Message*
- 3 • *Access Point Pilot Information Message*
- 4 • *General Overhead Information Message*
- 5 • *Frequent General Overhead Information Message*
- 6 • *Flex Duplex CDMA Channel List Message*
- 7 • *Alternative Technologies Information Message*

8 Associated with the set of configuration messages sent on each Paging Channel or Primary
 9 Broadcast Control Channel is a configuration message sequence number
 10 (CONFIG_MSG_SEQ). When the contents of one or more of the configuration messages
 11 change, the configuration message sequence number is incremented. For each of the
 12 configuration messages received, the mobile station stores the configuration message
 13 sequence number contained in the configuration message (A41_SYS_PAR_MSG_SEQ_s,
 14 MC_RR_PAR_MSG_SEQ_s, SYS_PAR_MSG_SEQ_s, NGHBR_LST_MSG_SEQ_s,
 15 AP_PILOT_INFO_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s,
 16 GEN_NGHBR_LST_MSG_SEQ_s, UNI_NGHBR_LST_MSG_SEQ_s, CHAN_LST_MSG_SEQ_s,
 17 EXT_SYS_PAR_MSG_SEQ_s, GLOB_SERV_REDIR_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s,
 18 EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s,
 19 EXT_GLOB_SERV_REDIR_MSG_SEQ_s, PRI_NGHBR_LST_MSG_SEQ_s, AP_IDT_MSG_SEQ_s,
 20 AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s or ATIM_MSG_SEQ_s).
 21 The mobile station also stores the most recently received configuration message sequence
 22 number (CONFIG_MSG_SEQ_s) contained in any message (see 2.6.2.2.1, 2.6.2.2.3,
 23 2.6.2.2.4, 2.6.2.2.5, 2.6.2.2.6, 2.6.2.2.7, 2.6.2.2.8, 2.6.2.2.9, 2.6.2.2.10, 2.6.2.2.11,
 24 2.6.2.2.12, 2.6.2.2.13, 2.6.2.2.14, 2.6.2.2.17, 2.6.2.2.19, 2.6.2.2.20, 2.6.2.2.21, 2.6.2.2.22,
 25 2.6.2.2.23, 2.6.2.2.24 and 2.6.2.3). The mobile station examines the stored values of the
 26 configuration message sequence numbers to determine whether the configuration
 27 parameters stored by the mobile station are current.

28 The field EXT_SYS_PARAMETER in the *System Parameters Message*, when set equal to '0',
 29 indicates that the base station is not sending the *Extended System Parameters Message*.
 30 When the mobile station receives the *System Parameters Message* with the
 31 EXT_SYS_PARAMETER field set equal to '0', the mobile station shall set
 32 EXT_SYS_PAR_MSG_SEQ_s to CONFIG_MSG_SEQ_s to indicate that the *Extended System*
 33 *Parameters Message* is current.

34 The field EXT_CHAN_LST in the *System Parameters Message*, when set equal to '0',
 35 indicates that the base station is not sending the *Extended CDMA Channel List Message*.
 36 When the mobile station receives the *System Parameters Message* with the EXT_CHAN_LST
 37 field set equal to '0', the mobile station shall set EXT_CHAN_LST_MSG_SEQ_s to
 38 CONFIG_MSG_SEQ_s to indicate that the *Extended CDMA Channel List Message* is current.

39 The field GEN_NGHBR_LST in the *System Parameters Message*, when set equal to '0',
 40 indicates that the base station is not sending the *General Neighbor List Message*. When the
 41 mobile station receives the *System Parameters Message* with the GEN_NGHBR_LST field set

1 equal to '0', the mobile station shall set the GEN_NGHR_LST_MSG_SEQ_s to
2 CONFIG_MSG_SEQ_s to indicate that the *General Neighbor List Message* is current.

3 The field EXT_NGHR_LST in the *System Parameters Message*, when set equal to '0',
4 indicates that the base station is not sending the *Extended Neighbor List Message*. When
5 the mobile station receives the *System Parameters Message* with the EXT_NGHR_LST field
6 set equal to '0', the mobile station shall set EXT_NGHR_LIST_MSG_SEQ_s to
7 CONFIG_MSG_SEQ_s to indicate that the *Extended Neighbor List Message* is current.

8 The field GLOBAL_REDIRECT in the *System Parameters Message*, when set equal to '0',
9 indicates that the base station is not sending the *Global Service Redirection Message*. When
10 the mobile station receives the *System Parameters Message* with the GLOBAL_REDIRECT
11 field set equal to '0', the mobile station shall set GLOB_SERV_REDIR_MSG_SEQ_s to
12 CONFIG_MSG_SEQ_s to indicate that the *Global Service Redirection Message* is current.

13 The field EXT_GLOBAL_REDIRECT in the *System Parameters Message* or *MC-RR*
14 *Parameters Message*, when set equal to '0', indicates that the base station is not sending
15 the *Extended Global Service Redirection Message*. When the mobile station receives the
16 *System Parameters Message* or *MC-RR Parameters Message* with the
17 EXT_GLOBAL_REDIRECT field set equal to '0', the mobile station shall set
18 EXT_GLOB_SERV_REDIR_MSG_SEQ_s to CONFIG_MSG_SEQ_s to indicate that the *Extended*
19 *Global Service Redirection Message* is current.

20 The field USER_ZONE_ID in the *System Parameters Message* or *MC-RR Parameters*
21 *Message*, when set equal to '0', indicates that the base station is not sending the *User Zone*
22 *Identification Message*. When the mobile station receives the *System Parameters Message* or
23 *MC-RR Parameters Message* with the USER_ZONE_ID field set equal to '0', the mobile
24 station shall set USER_ZONE_ID_MSG_SEQ_s to CONFIG_MSG_SEQ_s to indicate that the
25 *User Zone Identification Message* is current.

26 The field PRI_NGHR_LST in the *System Parameters Message* or *MC-RR Parameters*
27 *Message*, when set equal to '0', indicates that the base station is not sending the *Private*
28 *Neighbor List Message*. When the mobile station receives the *System Parameters Message*
29 or *MC-RR Parameters Message* with the PRI_NGHR_LST field set equal to '0', the mobile
30 station shall set PRI_NGHR_LST_MSG_SEQ_s to CONFIG_MSG_SEQ_s to indicate that the
31 *Private Neighbor List Message* is current.

32 The field ATIM_IND in the *System Parameters Message* or *MC-RR Parameters Message*, when
33 set equal to '0' or if ATIM_IND is omitted, indicates that the base station is not sending the
34 *Alternative Technologies Information Message*. When the mobile station receives the *System*
35 *Parameters Message* or *MC-RR Parameters Message* with the ATIM_IND field set equal to '0',
36 or if the ATIM_IND field is omitted in the *System Parameters Message* or *MC-RR Parameters*
37 *Message*, the mobile station shall set ATIM_MSG_SEQ_s to CONFIG_MSG_SEQ_s to indicate
38 that the *Alternative Technologies Information Message* is current.

39 The field AP_PILOT_INFO in the *System Parameters Message* or *MC-RR Parameters Message*,
40 when set equal to '0' or if AP_PILOT_INFO is omitted, indicates that the base station is not
41 sending the *Access Point Pilot Information Message*. When the mobile station receives the
42 *System Parameters Message* or *MC-RR Parameters Message* with the AP_PILOT_INFO field
43 set equal to '0', or if the AP_PILOT_INFO field is omitted in the *System Parameters Message*

1 or *MC-RR Parameters Message*, the mobile station shall set AP_PILOT_INFO_MSG_SEQ_s to
2 CONFIG_MSG_SEQ_s to indicate that the *Access Point Pilot Information Message* is current.

3 The field AP_IDT in the *System Parameters Message* or *MC-RR Parameters Message*, when
4 set equal to '0' or if AP_IDT is omitted, indicates that the base station is not sending the
5 *Access Point Identification Message*. When the mobile station receives the *System*
6 *Parameters Message* or *MC-RR Parameters Message* with the AP_IDT field set equal to '0', or
7 if the field AP_IDT is omitted in the *System Parameters Message* or *MC-RR Parameters*
8 *Message*, the mobile station shall set AP_IDT_MSG_SEQ_s to CONFIG_MSG_SEQ_s to
9 indicate that the *Access Point Identification Message* is current.

10 The field AP_ID_TEXT in the *System Parameters Message* or *MC-RR Parameters Message*,
11 when set equal to '0' or if AP_ID_TEXT is omitted, indicates that the base station is sending
12 the *Access Point Identification Text Message*. When the mobile station receives the *System*
13 *Parameters Message* or *MC-RR Parameters Message* with the AP_ID_TEXT field set equal to
14 '0', or if the field AP_ID_TEXT is omitted in the *System Parameters Message* or *MC-RR*
15 *Parameters Message*, the mobile station shall set AP_ID_TEXT_MSG_SEQ_s to
16 CONFIG_MSG_SEQ_s to indicate that the *Access Point Identification Text Message* is current.

17 The field GEN_OVHD_INF_IND in the *System Parameters Message* or *MC-RR Parameters*
18 *Message*, when set equal to '0' or if GEN_OVHD_INF_IND is omitted, indicates that the base
19 station is not sending the *General Overhead Information Message*. When the mobile station
20 receives the *System Parameters Message* or *MC-RR Parameters Message* with the
21 GEN_OVHD_INF_IND field set equal to '0', or if the GEN_OVHD_INF_IND field is omitted in
22 the *System Parameters Message* or *MC-RR Parameters Message*, the mobile station shall set
23 GOI_MSG_SEQ_s to CONFIG_MSG_SEQ_s to indicate that the *General Overhead Information*
24 *Message* is current.

25 The field FREQ_GEN_OVHD_INF_IND in the *System Parameters Message* or *MC-RR*
26 *Parameters Message*, when set equal to '0' or if FREQ_GEN_OVHD_INF_IND is omitted,
27 indicates that the base station is not sending the *Frequent General Overhead Information*
28 *Message*. When the mobile station receives the *System Parameters Message* or *MC-RR*
29 *Parameters Message* with the FREQ_GEN_OVHD_INF_IND field set equal to '0', or if the
30 FREQ_GEN_OVHD_INF_IND field is omitted in the *System Parameters Message* or *MC-RR*
31 *Parameters Message*, the mobile station shall set FREQ_GOI_MSG_SEQ_s to
32 CONFIG_MSG_SEQ_s to indicate that the *Frequent General Overhead Information Message* is
33 current.

34 The field FD_CHAN_LST_IND in the *System Parameters Message* or *MC-RR Parameters*
35 *Message*, when set equal to '0' or if FD_CHAN_LST_IND is omitted, indicates that the base
36 station is not sending the *Flex Duplex CDMA Channel List Message*. When the mobile
37 station receives the *System Parameters Message* or *MC-RR Parameters Message* with the
38 FD_CHAN_LST_IND field set equal to '0', or if the FD_CHAN_LST_MSG_SEQ_s field is
39 omitted in the *System Parameters Message* or *MC-RR Parameters Message*, the mobile
40 station shall set FD_CHAN_LST_MSG_SEQ_s to CONFIG_MSG_SEQ_s to indicate that the
41 *Flex Duplex CDMA Channel List Message* is current.

1 The configuration message sequence number is also included in the *General Page Message*
 2 and the *Universal Page Message*. This allows the mobile station to determine whether the
 3 stored configuration parameters are current without waiting for a configuration message.

4 *Access Parameters Messages* or *Enhanced Access Parameters Messages* are independently
 5 sequence-numbered by the ACC_MSG_SEQ field. The mobile station stores the most
 6 recently received *Access Parameters Message* or *Enhanced Access Parameters Messages*
 7 sequence number (ACC_MSG_SEQ_s).

8 Paging Channels, Broadcast Control Channels, and Forward Common Control Channels
 9 shall be considered different if they are transmitted by different base stations, if they are
 10 transmitted on different code channels, or if they are transmitted on different CDMA
 11 Channels. Configuration and access parameters from one Paging Channel or Primary
 12 Broadcast Control Channel shall not be used while monitoring a different Paging Channel
 13 or Primary Broadcast Control Channel/Forward Common Control Channel except for
 14 registration and authentication parameters while the mobile station is performing an
 15 access probe handoff or access handoff. The mobile station shall ignore any overhead
 16 message whose PILOT_PN_r field is not equal to the pilot offset index (PILOT_PN_s) of the
 17 base station whose Paging Channel or Primary Broadcast Control Channel is being
 18 monitored.

19 The mobile station may store the configuration parameters from Paging Channels or
 20 Primary Broadcast Control Channel it has recently monitored. When a mobile station
 21 starts monitoring a Paging Channel or a Primary Broadcast Control Channel/Forward
 22 Common Control Channel that it has recently monitored, the mobile station can determine
 23 whether the stored parameters are current by examining the CONFIG_MSG_SEQ_s in a
 24 configuration message or a page message.

25 The mobile station shall use a special value, NULL, to be stored in place of sequence
 26 numbers for messages that have not been received or are marked as not current. The
 27 special value NULL shall be unequal to any valid message sequence number.

28 The mobile station shall consider the stored configuration parameters to be current only if
 29 all of the following conditions are true:

- 30 • If the mobile station is monitoring the Paging Channel, the following stored
 31 configuration message sequence numbers (SYS_PAR_MSG_SEQ_s,
 32 NGHBR_LST_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s, CHAN_LST_MSG_SEQ_s,
 33 EXT_SYS_PAR_MSG_SEQ_s, GEN_NGHBR_LST_MSG_SEQ_s, AP_IDT_MSG_SEQ_s,
 34 AP_ID_TEXT_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s,
 35 PRI_NGHBR_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
 36 EXT_GLOB_SERV_REDIR_MSG_SEQ_s and GLOB_SERV_REDIR_MSG_SEQ_s) are
 37 equal to CONFIG_MSG_SEQ_s; and
- 38 • If the mobile station is monitoring the Forward Common Control Channel/ Primary
 39 Broadcast Control Channel, the following stored configuration message sequence
 40 numbers (A41_SYS_PAR_MSG_SEQ_s, MC_RR_PAR_MSG_SEQ_s,
 41 UNI_NGHBR_LST_MSG_SEQ_s, AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s,
 42 USER_ZONE_ID_MSG_SEQ_s, PRI_NGHBR_LST_MSG_SEQ_s,

- 1 EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s, and
 2 EXT_GLOB_SERV_REDIR_MSG_SEQ_s) are equal to CONFIG_MSG_SEQ_s; and
- 3 • If the mobile station supports flexible spacing between forward and reverse
 4 channels, stored configuration message sequence number
 5 FD_CHAN_LST_MSG_SEQ_s is equal to CONFIG_MSG_SEQ_s; and
 - 6 • CONFIG_MSG_SEQ_s is not equal to NULL; and
 - 7 • No more than T_{31m} seconds (see Annex D) have elapsed since the mobile station
 8 last received a valid message on the Paging Channel or the Primary Broadcast
 9 Control Channel/Forward Common Control Channel for which the parameters were
 10 stored.

11 If the configuration parameters are not current, the mobile station shall process the stored
 12 parameters upon receipt of the configuration messages as described in 2.6.2.2.1, 2.6.2.2.3,
 13 2.6.2.2.4, 2.6.2.2.5, 2.6.2.2.6, 2.6.2.2.7, 2.6.2.2.8, 2.6.2.2.9, 2.6.2.2.10, 2.6.2.2.11,
 14 2.6.2.2.12, 2.6.2.2.13, 2.6.2.2.14, 2.6.2.2.17, 2.6.2.2.19, 2.6.2.2.20, 2.6.2.2.21, 2.6.2.2.22,
 15 2.6.2.2.23 and 2.6.2.2.24.

16 2.6.2.2.1 System Parameters Message

17 Whenever a *System Parameters Message* is received on the Paging Channel, the
 18 configuration message sequence number, CONFIG_MSG_SEQ_r, shall be compared to that
 19 stored in SYS_PAR_MSG_SEQ_s. If the comparison results in a match, the mobile station
 20 may ignore the message. If the comparison results in a mismatch, then the mobile station
 21 shall process the remaining fields in the message as described in 2.6.2.2.1.1, 2.6.2.2.1.2,
 22 2.6.2.2.1.3, 2.6.2.2.1.4, 2.6.2.2.1.5, 2.6.2.2.1.6, 2.6.2.2.1.7, 2.6.2.2.1.8, and 2.6.2.2.1.9.

23 If PAGE_CHAN, REG_PRD, BASE_LAT, BASE_LONG, or PWR_REP_THRESH are not within
 24 the valid ranges specified in 3.7.2.3.2.1, then the mobile station shall ignore the *System
 25 Parameters Message* that contains them.

26 If BAND_CLASS is equal to '00001' and if EXT_SYS_PARAMETERS_r is not equal to '1', the
 27 mobile station shall ignore the *System Parameters Message* containing these fields.

28 2.6.2.2.1.1 Stored Parameters

29 The mobile station shall store the following parameters:

- 30 • Configuration message sequence number
 31 (CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
 32 SYS_PAR_MSG_SEQ_s = CONFIG_MSG_SEQ_r)
- 33 • Base station identification (BASE_ID_s = BASE_ID_r)
- 34 • Base station class (BASE_CLASS_s = BASE_CLASS_r)
- 35 • Maximum slot cycle index
 36 (MAX_SLOT_CYCLE_INDEX_s = MAX_SLOT_CYCLE_INDEX_r)
- 37 • Home registration indicator (HOME_REG_s = HOME_REG_r)
- 38 • SID roamer registration indicator (FOR_SID_REG_s = FOR_SID_REG_r)

- 1 • NID roamer registration indicator ($FOR_NID_REG_S = FOR_NID_REG_T$)
- 2 • Power-up registration indicator ($POWER_UP_REG_S = POWER_UP_REG_T$)
- 3 • Power-down registration indicator ($POWER_DOWN_REG_S = POWER_DOWN_REG_T$)
- 4 • Parameter-change registration indicator ($PARAMETER_REG_S = PARAMETER_REG_T$)
- 5 • Search window size for the Active Set and Candidate Set
- 6 ($SRCH_WIN_A_S = SRCH_WIN_A_T$)
- 7 • Search window size for the Neighbor Set ($SRCH_WIN_N_S = SRCH_WIN_N_T$)
- 8 • Search window size for the Remaining Set ($SRCH_WIN_R_S = SRCH_WIN_R_T$)
- 9 • Maximum age for retention of Neighbor Set members
- 10 ($NGHBR_MAX_AGE_S = NGHBR_MAX_AGE_T$)
- 11 • Power control reporting threshold ($PWR_REP_THRESH_S = PWR_REP_THRESH_T$)
- 12 • Power control reporting frame count ($PWR_REP_FRAMES_S = PWR_REP_FRAMES_T$)
- 13 • Threshold report mode indicator
- 14 ($PWR_THRESH_ENABLE_S = PWR_THRESH_ENABLE_T$)
- 15 • Periodic report mode indicator ($PWR_PERIOD_ENABLE_S = PWR_PERIOD_ENABLE_T$).
- 16 • Power report delay ($PWR_REP_DELAY_S = PWR_REP_DELAY_T$)
- 17 • Pilot detection threshold ($T_ADD_S = T_ADD_T$)
- 18 • Pilot drop threshold ($T_DROP_S = T_DROP_T$)
- 19 • Active Set versus Candidate Set comparison threshold ($T_COMP_S = T_COMP_T$)
- 20 • Drop timer value ($T_TDROP_S = T_TDROP_T$)
- 21 • Drop timer range value ($T_TDROP_RANGE_S = T_TDROP_RANGE_T$) if
- 22 $T_TDROP_RANGE_INCL_T$ is equal to '1'; otherwise, $T_TDROP_RANGE_S = '0000'$
- 23 • *Extended System Parameters Message sent*
- 24 ($EXT_SYS_PARAMETER_S = EXT_SYS_PARAMETER_T$)
- 25 • *Global Service Redirection Message sent*
- 26 ($GLOBAL_REDIRECT_S = GLOBAL_REDIRECT_T$)
- 27 • *Extended Global Service Redirection Message sent*
- 28 ($EXT_GLOBAL_REDIRECT_S = EXT_GLOBAL_REDIRECT_T$)
- 29 • *Extended Neighbor List Message sent*
- 30 ($EXT_NGHBR_LST_S = EXT_NGHBR_LST_T$)
- 31 • *General Neighbor List Message sent*
- 32 ($GEN_NGHBR_LST_S = GEN_NGHBR_LST_T$)
- 33 • *User Zone Identification Message sent*
- 34 ($USER_ZONE_ID_S = USER_ZONE_ID_T$)

- 1 • *Private Neighbor List Message* sent
2 (PRI_NGHRBR_LST_s = PRI_NGHRBR_LST_r)
- 3 • *Extended CDMA Channel List Message* sent
4 (EXT_CHAN_LST_s = EXT_CHAN_LST_r)
- 5 • If NEG_SLOT_CYCLE_INDEX_SUP_r is included and equal to '1', the mobile station
6 shall set MIN_SLOT_CYCLE_INDEX to -4; otherwise, the mobile station shall set
7 MIN_SLOT_CYCLE_INDEX to 0.
- 8 • If RC_BITMAP_CAPABILITY_EXT_ALLOWED_r is included and is equal to '1', the
9 mobile station shall set RC_BITMAP_CAPABILITY_EXT_ALLOWED_s to '1'; otherwise,
10 the mobile station shall set RC_BITMAP_CAPABILITY_EXT_ALLOWED_s to '0'.
- 11 • If the *Call Recovery Request Message* supported indicator CRRM_MSG_IND is
12 included, the mobile station shall set CRRM_MSG_IND_s = CRRM_MSG_IND_r.
13 Otherwise, the mobile station shall set CRRM_MSG_IND_s to '0'.

14 The mobile station shall also store the following parameters:

- 15 • If the mobile station is not in the *Origination Attempt Substate*, or *Page Response*
16 *Substate*, the mobile station shall store the following prior to storing the remaining
17 parameters:
 - 18 - Registered system identification (REG_SID_s = SID_s).
 - 19 - Registered network identification (REG_NID_s = NID_s).
 - 20 - Registered registration zone (REG_REG_ZONE_s = REG_ZONE_s).
 - 21 - Registered zone timer length (REG_ZONE_TIMER_s = ZONE_TIMER_r).
- 22 • System identification (SID_s = SID_r)
- 23 • Network identification (NID_s = NID_r)
- 24 • Registration zone (REG_ZONE_s = REG_ZONE_r)
- 25 • Number of registration zones to be retained (TOTAL_ZONES_s = TOTAL_ZONES_r)
- 26 • Zone timer length (ZONE_TIMER_s = ZONE_TIMER_r)
- 27 • Multiple SID storage indicator (MULT_SIDS_s = MULT_SIDS_r)
- 28 • Multiple NID storage indicator (MULT_NIDS_s = MULT_NIDS_r)
- 29 • Registration period (REG_PRD_s = REG_PRD_r)
- 30 • Base station latitude (BASE_LAT_s = BASE_LAT_r)
- 31 • Base station longitude (BASE_LONG_s = BASE_LONG_r)
- 32 • Registration distance (REG_DIST_s = REG_DIST_r)
- 33 • Base station horizontal location uncertainty (LOC_UNC_H_s = LOC_UNC_H_r)
- 34 • Base station height (HEIGHT_s = HEIGHT_r)
- 35 • Base station vertical location uncertainty (LOC_UNC_V_s = LOC_UNC_V_r)

1 If EXT_SYS_PARAMETER_s is equal to '0', then the mobile station shall perform the
2 following:

- 3 • Set EXT_SYS_PAR_MSG_SEQ_s to CONFIG_MSG_SEQ_s,
- 4 • Set BCAST_INDEX_s to MAX_SLOT_CYCLE_INDEX_s,
- 5 • Set IMSI_O to IMSI_M by setting IMSI_O_S_s to IMSI_M_S_p (i.e., setting IMSI_O_S1_s
6 to IMSI_M_S1_p and IMSI_O_S2_s to IMSI_M_S2_p), MCC_O_s to MCC_M_p,
7 IMSI_O_11_12_s to IMSI_M_11_12_p, and IMSI_O_ADDR_NUM_s to
8 IMSI_M_ADDR_NUM_p,
- 9 • Set RESELECT_INCLUDED_s to '0',
- 10 • For Band Class 0, if the mobile station determines it is operating in Korea, set
11 P_REV_s to '00000010'; otherwise, set P_REV_s to '00000011'. For Band Class 3, set
12 P_REV_s to '00000011'. For Band Class 1 and Band Class 4, set P_REV_s to
13 '00000001', and
- 14 • Set P_REV_IN_USE_s to the lesser value of P_REV_s and MOB_P_REV_p of the current
15 band class.

16 If EXT_CHAN_LST_s is equal to '0', then the mobile station shall set
17 EXT_CHAN_LST_MSG_SEQ_s to CONFIG_MSG_SEQ_s.

18 If GLOBAL_REDIRECT_s is equal to '0', then the mobile station shall set GLOB_SERV-
19 _REDIR_MSG_SEQ_s to CONFIG_MSG_SEQ_s.

20 If EXT_GLOBAL_REDIRECT_s is equal to '0', then the mobile station shall set
21 EXT_GLOB_SERV_REDIR_MSG_SEQ_s to CONFIG_MSG_SEQ_s.

22 If EXT_NGHBR_LST_s is equal to '0', then the mobile station shall set
23 EXT_NGHBR_LST_MSG_SEQ_s to CONFIG_MSG_SEQ_s.

24 If GEN_NGHBR_LST_s is equal to '0', then the mobile station shall perform the following:

- 25 • Set GEN_NGHBR_LST_MSG_SEQ_s to CONFIG_MSG_SEQ_s.
- 26 • Set the SRCH_WIN_NGHBR field of NGHBR_REC to SRCH_WIN_N_s for all entries.
- 27 • Set the SRCH_OFFSET_NGHBR field of NGHBR_REC to '000' for all entries.
- 28 • Set the TIMING_INCL field of NGHBR_REC to '0' for all entries.
- 29 • Set RESQ_ENABLED_s to '0'.
- 30 • Set the NGHBR_RESQ_CONFIGURED field of NGHBR_REC to '0' for all entries.
- 31 • If EXT_NGHBR_LST_s is equal to '0':
 - 32 - Set the SEARCH_PRIORITY field of the NGHBR_REC to '10' (high) for all entries.
 - 33 - Set the NGHBR_BAND field of the NGHBR_REC to CDMABAND_s for all entries.
 - 34 - Set the NGHBR_FREQ field of the NGHBR_REC to CDMACH_s for all entries.

1 If GEN_NGHRBR_LST_s is equal to '1', GEN_NGHRBR_LST_MSG_SEQ_s is equal to
 2 CONFIG_MSG_SEQ_s, and SETTING_SEARCH_WIN is equal to '1', the mobile station shall
 3 perform the following:

- 4 • Set the SRCH_WIN_NGHRBR field of each NGHRBR_REC to SEARCH_WIN_N_s for all
 5 NGHRBR_SET_SIZE_s entries.
- 6 • Set SETTING_SEARCH_WIN to '0'.

7 If USER_ZONE_ID_s is equal to '0', then the mobile station shall perform the following:

- 8 • Set USER_ZONE_ID_MSG_SEQ_s to CONFIG_MSG_SEQ_s.
- 9 • Set the UZID field of the UZ_REC to '0000000000000000' for all entries.
- 10 • Set the UZ_REV field of the UZ_REC to '0000' for all entries.
- 11 • Set the TEMP_SUB field of the UZ_REC to '0' for all entries.

12 If USER_ZONE_ID_s is equal to '1' and the mobile station does not support Tiered Services,
 13 then the mobile station shall set USER_ZONE_ID_MSG_SEQ_s to CONFIG_MSG_SEQ_s.

14 If PRI_NGHRBR_LST_s is equal to '0', then the mobile station shall set
 15 PRI_NGHRBR_LST_MSG_SEQ_s to CONFIG_MSG_SEQ_s.

16 If PRI_NGHRBR_LST_s is equal to '1' and the mobile station does not support Tiered Services,
 17 then the mobile station shall set PRI_NGHRBR_LST_MSG_SEQ_s to CONFIG_MSG_SEQ_s.

18 The mobile station shall also store the following parameters:

- 19 • *Access Point Pilot Information Message sent*
 20 (AP_PILOT_INFO_s = AP_PILOT_INFO_r) if included; otherwise, AP_PILOT_INFO_s = '0'

21 If the APPIM_PERIOD_INDEX is included in the message APPIM_PERIOD_INDEX_s =
 22 APPIM_PERIOD_INDEX_r. Otherwise, APPIM_PERIOD_INDEX_s = 0.

- 23 • *Access Point Identification Message sent*
 24 (AP_IDTs = AP_IDTr) if included; otherwise, AP_IDTs = '0'
- 25 • *Access Point Identification Text Message sent*
 26 (AP_ID_TEXTs = AP_ID_TEXTr) if included; otherwise, AP_ID_TEXTs = '0'
- 27 • *General Overhead Information Message sent*
 28 (GEN_OVHD_INF_INDs = GEN_OVHD_INF_INDr) if included; otherwise,
 29 GEN_OVHD_INF_INDs = '0'

30 If the GEN_OVHD_CYCLE_INDEX is included in the message GEN_OVHD_CYCLE_INDEX_s
 31 = GEN_OVHD_CYCLE_INDEX_r. Otherwise, GEN_OVHD_CYCLE_INDEX_s = 0.

- 32 • *Frequent General Overhead Information Message sent*
 33 (FREQ_GEN_OVHD_INF_INDs = FREQ_GEN_OVHD_INF_INDr) if included; otherwise,
 34 FREQ_GEN_OVHD_INF_INDs = '0'.
- 35 • *Flex Duplex CDMA Channel List Message sent*
 36 (FD_CHAN_LST_INDs = FD_CHAN_LST_INDr) if included; otherwise,
 37 FD_CHAN_LST_INDs = '0'.

- 1 • *Alternative Technologies Information Message sent*
2 (*ATIM_INDs = ATIM_INDr*) if included; otherwise, *ATIM_INDs = '0'*

3 If the *ATIM_CYCLE_INDEX* is included in the message *ATIM_CYCLE_INDEX_s* =
4 *ATIM_CYCLE_INDEX_r*. Otherwise, *ATIM_CYCLE_INDEX_s* = 0.

- 5 • *Additional Geo Location Type Record allowed in General Extension Message* indicator
6 (*ADD_LOC_GEM_ALLOWED_s* = *ADD_LOC_GEM_ALLOWED_r*) if included; otherwise,
7 *ADD_LOC_GEM_ALLOWED_s* = '0'.

8 The mobile station shall ignore any fields at the end of the *System Parameters Message* that
9 are not defined according to the protocol revision level (*MOB_P_REV_p* of the current band
10 class) being used by the mobile station.

11 2.6.2.2.1.2 Paging Channel Assignment Change

12 If the number of Paging Channels specified in the *System Parameters Message*
13 (*PAGE_CHAN_r*) is different from *PAGE_CHAN_s*, the mobile station shall use the hash
14 algorithm specified in 2.6.7.1 to select a new Paging Channel number in the range 1 to
15 *PAGE_CHAN_r*. The mobile station shall store the new Paging Channel number as
16 *PAGECH_s*. The mobile station shall then set *PAGE_CHAN_s* to *PAGE_CHAN_r*. The mobile
17 station shall set *ACC_MSG_SEQ_s* to NULL. If the mobile station has not stored
18 configuration parameters for the new Paging Channel, or if the stored parameters are not
19 current (see 2.6.2.2), the mobile station shall set *CONFIG_MSG_SEQ_s*, *SYS_PAR_MSG-*
20 *_SEQ_s*, *NGHBR_LST_MSG_SEQ_s*, *EXT_NGHBR_LST_MSG_SEQ_s*,
21 *GEN_NGHBR_LST_MSG_SEQ_s*, *CHAN_LST_MSG_SEQ_s*, *EXT_SYS_PAR_MSG_SEQ_s*,
22 *USER_ZONE_ID_MSG_SEQ_s*, *PRI_NGHBR_LST_MSG_SEQ_s*, and
23 *EXT_GLOB_SERV_REDIR_MSG_SEQ_s*, *EXT_CHAN_LST_MSG_SEQ_s*,
24 *FD_CHAN_LST_MSG_SEQ_s*, *AP_PILOT_INFO_MSG_SEQ_s*, *AP_IDT_MSG_SEQ_s*,
25 *AP_ID_TEXT_MSG_SEQ_s*, *GOI_MSG_SEQ_s*, *FREQ_GOI_MSG_SEQ_s*, *ATIM_MSG_SEQ_s* and
26 *GLOB_SERV_REDIR_MSG_SEQ_s* to NULL. The mobile station shall then begin monitoring
27 the new Paging Channel as specified in 2.6.2.1.1.

28 2.6.2.2.1.3 RESCAN Parameter

29 If the *RESCAN_r* field in the *System Parameters Message* equals '1', the mobile station shall
30 enter the *System Determination Substate* of the *Mobile Station Initialization State* with a
31 rescan indication (see 2.6.1.1).

32 2.6.2.2.1.4 Roaming Status

33 The mobile station shall determine the roaming status for the mobile station (see 2.6.5.3).
34 The mobile station should indicate to the user whether the mobile station is roaming.

35 2.6.2.2.1.5 Registration

36 The mobile station shall update stored variables and perform other registration procedures
37 as specified in 2.6.5.5.2.2.

1 2.6.2.2.1.6 Slot Cycle Index

2 The mobile station shall set $SLOT_CYCLE_INDEX_S$ to :

$$3 \max \left(\begin{array}{l} MIN_SLOT_CYCLE_INDEX_S, \\ \min(SLOT_CYCLE_INDEX_REG, MAX_SLOT_CYCLE_INDEX_S) \end{array} \right).$$

4 Where, $SLOT_CYCLE_INDEX_REG$ is computed based on the slot cycle index value
5 included in the last registration attempt (see 2.6.5.5.3.1 and 2.6.5.5.3.2).

6 If the mobile station is operating in the slotted mode, it shall set its slot cycle length as
7 described in 2.6.2.1.1.3.

8 2.6.2.2.1.7 PACA Disable for SID Change

9 If $PACA_S$ is equal to enabled, and SID_S is not equal to $PACA_SID_S$, the mobile station shall
10 set $PACA_S$ to disabled and $PACA_CANCEL$ to '0', shall disable the PACA state timer, and
11 should indicate to the user that the PACA call has been canceled.

12 2.6.2.2.1.8 Retry Delay Disable for Packet Zone ID or SID/NID Change

13 The mobile station shall set $RETRY_DELAY_S[RETRY_TYPE]$ to 0 when the mobile station
14 determines that the Packet Zone Identification or the System Identification/Network
15 Identification (SID/NID pair) has been changed, where $RETRY_TYPE$ is equal to '001', '010',
16 '011', '100', or '101'.

17 2.6.2.2.1.9 Encryption key reset for SID/NID Change

18 When the mobile station determines that the System Identification/Network Identification
19 (SID/NID pair) has been changed, it shall perform the following:

- 20 • The mobile station shall disable the key setup timer if the timer is running.
- 21 • If there is an entry in the mobile station's $SID_NID_LIST_S$ that matches the previous
22 SID/NID pair, the mobile station shall perform the following:
 - 23 - The mobile station shall save the following encryption/integrity related
24 parameters associated with previous SID/NID pair:
 - 25 + KEY_ID ,
 - 26 + $ENC_KEY[KEY_ID]$ and $INT_KEY[KEY_ID]$,
 - 27 + $TX_EXT_SSEQ[0][KEY_ID]$, $TX_EXT_SSEQ[1][KEY_ID]$,
 - 28 $RX_EXT_SSEQ[0][KEY_ID]$, and $RX_EXT_SSEQ[1][KEY_ID]$ and
 - 29 + $C_SIG_ENCRYPT_MODE_S$.
 - 30 - If there are more than one SID/NID pairs in the $SID_NID_LIST_S$ for which there
31 are associated encryption/integrity related parameters saved, the mobile station
32 may remove the parameters associated with the SID/NID pair that was visited
33 at the earliest time.
- 34 • If there is an entry in the mobile station's $SID_NID_LIST_S$ that matches the base
35 station's SID and NID and the following encryption/integrity related parameters last

1 used in that system (SID/NID pair) are stored in the mobile station, the mobile
2 station shall restore them:

- 3 - KEY_ID,
- 4 - ENC_KEY[KEY_ID] and INT_KEY[KEY_ID],
- 5 - TX_EXT_SSEQ[0][KEY_ID], TX_EXT_SSEQ[1][KEY_ID],
- 6 RX_EXT_SSEQ[0][KEY_ID], and RX_EXT_SSEQ[1][KEY_ID] and
- 7 - C_SIG_ENCRYPT_MODE_s.
- 8 • Otherwise, the mobile station shall set ENC_KEY['00'], ENC_KEY['01'],
- 9 INT_KEY['00'], and INT_KEY['01'] to NULL.

10 2.6.2.2.2 Access Parameters Message

11 Whenever an *Access Parameters Message* is received on the Paging Channel, the sequence
12 number, ACC_MSG_SEQ_r, shall be compared to ACC_MSG_SEQ_s. If the comparison
13 results in a match, the mobile station may ignore the message. If the comparison results
14 in a mismatch, then the mobile station shall process the remaining fields in the message as
15 follows.

16 If PROBE_PN_RAN, MAX_REQ_SEQ, or MAX_RSP_SEQ are not within the valid ranges
17 specified in 3.7.2.3.2.2, then the mobile station shall ignore the *Access Parameters Message*
18 that contains them.

19 The mobile station shall store the following parameters:

- 20 • *Access Parameters Message* sequence number (ACC_MSG_SEQ_s = ACC_MSG_SEQ_r)
- 21 • Number of Access Channels (ACC_CHAN_s = ACC_CHAN_r)
- 22 • Nominal transmit power offset (NOM_PWR_s = NOM_PWR_r)
- 23 • Initial power offset for access (INIT_PWR_s = INIT_PWR_r)
- 24 • Power increment (PWR_STEP_s = PWR_STEP_r)
- 25 • Number of access probes (NUM_STEP_s = NUM_STEP_r)
- 26 • Maximum Access Channel message capsule size (MAX_CAP_SZ_s = MAX_CAP_SZ_r)
- 27 • Access Channel preamble length (PAM_SZ_s = PAM_SZ_r)
- 28 • Persistence modifier for Access Channel attempts for registrations which are not
- 29 responses to the *Registration Request Order* (REG_PSIST_s = REG_PSIST_r)
- 30 • Persistence modifier for Access Channel attempts for message transmissions
- 31 (MSG_PSIST_s = MSG_PSIST_r)
- 32 • If PSIST_EMG_INCL_r is equal to '0', the mobile station shall set the persistence
- 33 modifier for emergency calls from mobile stations in access overload classes 0 to 9
- 34 (PSIST_EMG_s) to '000'; otherwise, the mobile station shall set PSIST_EMG_s equal
- 35 to PSIST_EMG_r.
- 36 • Time randomization for Access Channel probes
- 37 (PROBE_PN_RAN_s = PROBE_PN_RAN_r)

- 1 • Acknowledgment timeout ($ACH_ACC_TMO_S = ACC_TMO_T$)
- 2 • Access Channel probe backoff range ($PROBE_BKOFF_S = PROBE_BKOFF_T$)
- 3 • Access Channel probe sequence backoff range ($BKOFF_S = BKOFF_T$)
- 4 • Maximum number of probe sequences for an Access Channel request
- 5 ($MAX_REQ_SEQ_S = MAX_REQ_SEQ_T$)
- 6 • Maximum number of probe sequences for an Access Channel response
- 7 ($MAX_RSP_SEQ_S = MAX_RSP_SEQ_T$)
- 8 • If $CDMABAND_S$ is equal to '0', the mobile station shall set extended nominal
- 9 transmit power $NOM_PWR_EXT_S$ to '0'; otherwise, the mobile station shall store
- 10 extended nominal transmit power ($NOM_PWR_EXT_S = NOM_PWR_EXT_T$).
- 11 • IC threshold ($IC_THRESH_S = -7$)
- 12 • The mobile station shall also store the following parameters:
- 13 • Authentication mode (if $AUTH_T$ is equal to '00' or '01', then $AUTH_S = AUTH_T$;
- 14 otherwise $AUTH_S = '01'$)
- 15 • Random challenge value ($RAND_S = RAND_T$)

16 The mobile station shall ignore any fields at the end of the *Access Parameters Message*
 17 which are not defined according to the protocol revision level ($MOB_P_REV_P$ of the current
 18 band class) being used by the mobile station.

19 The mobile station shall store the persistence parameter number according to the following
 20 rule: If the mobile station's access overload class is in the range 0-9, set $PSIST_S$ equal to
 21 $PSIST(0-9)_T$; otherwise set $PSIST_S$ equal to $PSIST(n)_T$, where n is equal to the mobile station
 22 access overload class.

23 The mobile station shall store the Access Control based on Call Type (ACCT) information as
 24 follows:

- 25 • Set $ACCT_SO_LIST$ to NULL.
- 26 • Set $ACCT_SO_GRP_LIST$ to NULL.
- 27 • If $ACCT_INCL_T$ is equal to '1' and $ACCOLC_P$ is in the range 0 to 9, then the mobile
- 28 station shall perform the following:
 - 29 - Set $ACCT_INCL_EMG_S$ to $ACCT_INCL_EMG_T$.
 - 30 - If $ACCT_SO_INCL_T$ is equal to '1', then for each $ACCT_SO_T$ included in this
 - 31 message:
 - 32 + If $ACCT_AOC_BITMAP_INCL_T$ is equal to '0', or if $ACCT_AOC_BITMAP_INCL_T$
 - 33 is equal to '1' and the bit in the associated $ACCT_AOC_BITMAP1_T$
 - 34 corresponding to the mobile station's $ACCOLC_P$ (see Table 3.7.2.3.2.2-1) is
 - 35 equal to '1', then add $ACCT_SO_T$ to $ACCT_SO_LIST$.
 - 36 - If $ACCT_SO_GRP_INCL_T$ is equal to '1', then for each $ACCT_SO_GRP_T$ included in
 - 37 this message:

- 1 + If ACCT_AOC_BITMAP_INCL_T is equal to '0', or if ACCT_AOC_BITMAP_INCL_T
2 is equal to '1' and the bit in the associated ACCT_AOC_BITMAP2_T
3 corresponding to the mobile station's ACCOLC_P (see Table 3.7.2.3.2.2-1) is
4 equal to '1', then add ACCT_SO_GRP_T to ACCT_SO_GRP_LIST.

5 The mobile station shall set CURR_ACC_MSG_SEQ equal to ACC_MSG_SEQ_S.

6 2.6.2.2.3 Neighbor List Message

7 Whenever a valid *Neighbor List Message* is received on the current Paging Channel
8 (PAGECH_S), the configuration message sequence number, CONFIG_MSG_SEQ_T, shall be
9 compared to that stored in NGHBR_LST_MSG_SEQ_S. If the comparison results in a match,
10 the mobile station may ignore the message. If the comparison results in a mismatch, then
11 the mobile station shall process the remaining fields in the message as follows.

12 If the PILOT_INC field is not within the valid range specified in 3.7.2.3.2.3, then the mobile
13 station shall ignore the *Neighbor List Message* that contains it.

14 The mobile station shall store the following parameters:

- 15 • Configuration message sequence number
16 (CONFIG_MSG_SEQ_S = CONFIG_MSG_SEQ_T,
17 NGHBR_LST_MSG_SEQ_S = CONFIG_MSG_SEQ_T)
- 18 • Pilot PN sequence offset increment (PILOT_INC_S = PILOT_INC_T)

19 The mobile station shall set NGHBR_SET_SIZE_S to the number of neighboring base stations
20 contained in the *Neighbor List Message*.

21 For each of the neighboring base stations contained in the *Neighbor List Message*, the
22 mobile station shall perform the following:

- 23 • If the *i*th occurrence of NGHBR_CONFIG_T is equal to '000', '001', or '010', set the
24 NGHBR_CONFIG field of NGHBR_REC[i] to the *i*th occurrence of NGHBR_CONFIG_T;
25 otherwise, set the NGHBR_CONFIG field of NGHBR_REC [i] to '011'.
- 26 • Set the NGHBR_PN field of NGHBR_REC [i] to the *i*th occurrence of NGHBR_PN_T.

27 If GEN_NGHBR_LST_MSG_SEQ_S is not equal to CONFIG_MSG_SEQ_S, the mobile station
28 shall perform the following:

- 29 • Set the SEARCH_PRIORITY field of the NGHBR_REC to '10' (high) for all
30 NGHBR_SET_SIZE_S entries.
- 31 • Set the NGHBR_BAND field of NGHBR_REC to CDMABAND_S for all
32 NGHBR_SET_SIZE_S entries.
- 33 • If NGHBR_CONFIG_T equals '010', set the NGHBR_FREQ field of NGHBR_REC to the
34 first CDMA Channel listed in the *CDMA Channel List Message* or *Extended CDMA*
35 *Channel List Message* transmitted by the current base station for all
36 NGHBR_SET_SIZE_S entries; otherwise, set the NGHBR_FREQ field of NGHBR_REC
37 to CDMACH_S for all NGHBR_SET_SIZE_S entries.
- 38 • Set the SRCH_WIN_NGHBR field of NGHBR_REC to SRCH_WIN_N_S for all
39 NGHBR_SET_SIZE_S entries.

- 1 • Set the SRCH_OFFSET_NGHR field of NGHR_REC to '000' for all entries.

2 The mobile station shall set the ACCESS_ENTRY_HO field of the NGHR_REC to '0' for all
3 NGHR_SET_SIZE_s entries if any of the following conditions are met:

- 4 • EXT_SYS_PARAMETER_s is equal to '0',
5 • NGHR_SET_ENTRY_INFO_s is equal to '0', or
6 • EXT_SYS_PAR_MSG_SEQ_s is not equal to CONFIG_MSG_SEQ_s.

7 The mobile station shall set the ACCESS_HO_ALLOWED field of the NGHR_REC to '0' for
8 all NGHR_SET_SIZE_s entries if any of the following conditions are met:

- 9 • EXT_SYS_PARAMETER_s is equal to '0',
10 • NGHR_SET_ACCESS_INFO_s is equal to '0', or
11 • EXT_SYS_PAR_MSG_SEQ_s is not equal to CONFIG_MSG_SEQ_s.

12 The mobile station shall update the idle handoff Neighbor Set (see 2.6.2.1.4) so that it
13 consists only of pilot offsets listed in the *Neighbor List Message*. If the *Neighbor List*
14 *Message* contains more pilot offsets than the mobile station can store, the mobile station
15 shall store the pilot offsets beginning at the start of the *Neighbor List Message*, up to the
16 limits of the mobile station's Neighbor Set storage capacity.

17 2.6.2.2.4 CDMA Channel List Message

18 Whenever a *CDMA Channel List Message* is received on the Paging Channel, the
19 configuration message sequence number, CONFIG_MSG_SEQ_r, shall be compared to that
20 stored in CHAN_LST_MSG_SEQ_s. If the comparison results in a match, the mobile station
21 may ignore the message. If the comparison results in a mismatch, then the mobile station
22 shall process the remaining fields in the message as follows.

23 The mobile station shall store the following parameters:

- 24 • Configuration message sequence number
25 (CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
26 CHAN_LST_MSG_SEQ_s = CONFIG_MSG_SEQ_r)

27 The mobile station shall perform the following:

- 28 • If SYS_PAR_MSG_SEQ_s, EXT_SYS_PAR_MSG_SEQ_s, and
29 FD_CHAN_LST_MSG_SEQ_s are current,
30 - If EXT_CHAN_LST_s is equal to '1', the mobile station shall ignore this message.
31 - If EXT_CHAN_LST_s is equal to '0', the mobile station shall process this message
32 as described below.
33 • Otherwise,
34 - if the mobile station does not support flexible spacing between forward and
35 reverse channels the mobile station shall process this message after
36 SYS_PAR_MSG_SEQ_s and EXT_SYS_PAR_MSG_SEQ_s are current.

- 1 - Otherwise, the mobile station shall process this message after
2 SYS_PAR_MSG_SEQ_s, EXT_SYS_PAR_MSG_SEQ_s, and
3 FD_CHAN_LST_MSG_SEQ_s become current.

4 If the FD_CHAN_LST_SEQ_s is current and the mobile station supports at least one
5 bandclass listed by the base station in the *Flex Duplex CDMA Channel List Message*, the
6 mobile station shall ignore this message. Otherwise, mobile station shall process this
7 message as follows:

8 The mobile station shall use the hash algorithm specified in 2.6.7.1 and the number of
9 channels listed in the *CDMA Channel List Message* to determine the CDMA Channel
10 (Frequency Assignment) for its Paging Channel. If the CDMA Frequency Assignment has
11 changed (the computed CDMA Channel is different from CDMACH_s), the mobile station
12 shall perform the following actions:

- 13 • Set CDMACH_s to the new CDMA Channel.
- 14 • Set PAGE_CHAN_s to '1'.
- 15 • Set PAGECH_s to the Primary Paging Channel.
- 16 • If the stored configuration parameters is not current (see 2.6.2.2) for the
17 corresponding base station and frequency assignment, set CONFIG_MSG_SEQ_s,
18 SYS_PAR_MSG_SEQ_s, NGHBR_LST_MSG_SEQ_s, CHAN_LST_MSG_SEQ_s,
19 EXT_NGHBR_LST_MSG_SEQ_s, GEN_NGHBR_LST_MSG_SEQ_s,
20 EXT_SYS_PAR_MSG_SEQ_s, GLOB_SERV_REDIR_MSG_SEQ_s, USER_ZONE_ID-
21 _MSG_SEQ_s, PRI_NGHBR_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
22 FD_CHAN_LST_MSG_SEQ_s, EXT_GLOB_SERV_REDIR_MSG_SEQ_s,
23 AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s,
24 GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s and ACC_MSG_SEQ_s to
25 NULL.
- 26 • Tune to the new CDMA Channel.

27 2.6.2.2.5 Extended System Parameters Message

28 Whenever an *Extended System Parameters Message* is received on the Paging Channel, the
29 configuration message sequence number, CONFIG_MSG_SEQ_r, shall be compared to that
30 stored in EXT_SYS_PAR_MSG_SEQ_s. If the comparison results in a match, the mobile
31 station may ignore the message. If the comparison results in a mismatch, then the mobile
32 station shall process the remaining fields in the message as follows.

33 If the protocol revision level supported by the mobile station (MOB_P_REV_p) is less than the
34 minimum protocol revision level supported by the base station (MIN_P_REV_r), the mobile
35 station shall enter the *System Determination Substate* of the *Mobile Station Initialization State*
36 with a protocol mismatch indication (see 2.6.1.1). Otherwise, the mobile station shall store
37 the following parameters:

- 38 • Configuration message sequence number
39 (CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
40 EXT_SYS_PAR_MSG_SEQ_s = CONFIG_MSG_SEQ_r)
- 41 • Preferred Access Channel MSID type (PREF_MSID_TYPE_s = PREF_MSID_TYPE_r)

- 1 • Extended Preferred Access Channel MSID type
2 (EXT_PREF_MSID_TYPE_s = EXT_PREF_MSID_TYPE_r) if included; otherwise, set
3 EXT_PREF_MSID_TYPE_s to NULL.
- 4 • MEID Required indicator (MEID_REQD_s = MEID_REQD_r) if included; otherwise, set
5 MEID_REQD_s to '0'
- 6 • Broadcast slot cycle index (BCAST_INDEX_s = BCAST_INDEX_r)
- 7 • The mobile station shall set its operational IMSI, IMSI_O, as follows:
- 8 - If IMSI_T_SUPPORTED_r is equal to '0', the mobile station shall set IMSI_O to
9 IMSI_{Mp}.
- 10 - If IMSI_T_SUPPORTED_r is equal to '1' and the mobile station's IMSI_{Tp} has been
11 programmed, the mobile station shall set IMSI_O to IMSI_{Tp}.
- 12 - If IMSI_T_SUPPORTED_r is equal to '1' and the mobile station's IMSI_{Tp} has not
13 been programmed, the mobile station shall set IMSI_O to IMSI_{Mp}.
- 14 • If MCC_r = '111111111' and IMSI_11_12_r = '1111111', the mobile station shall set
15 the IMSI_O to IMSI_{Mp} and store:
- 16 - Mobile Country Code (MCC_s = MCC_{Mp}) and
17 - IMSI 11th and 12th digits (IMSI_11_12_s = IMSI_{M_11_12p});
- 18 otherwise, the mobile station shall store:
- 19 - Mobile Country Code (MCC_s = MCC_r) and
20 - IMSI 11th and 12th digits (IMSI_11_12_s = IMSI_11_12_r).
- 21 • Least significant digit of MNC (IMSI_10_s = IMSI_10_r), if included.
- 22 • If IMSI_O is set to the IMSI_M, the mobile station shall set:
- 23 - IMSI_{O_Ss} to IMSI_{M_Sp} (i.e., IMSI_{O_S1s} to IMSI_{M_S1p} and IMSI_{O_S2s} to
24 IMSI_{M_S2p})
- 25 - IMSI_{O_11_12s} to IMSI_{M_11_12p}
- 26 - MCC_{O_s} to MCC_{Mp}
- 27 - IMSI_{O_ADDR_NUMs} to IMSI_{M_ADDR_NUMp}
- 28 • If IMSI_O is set to the IMSI_T, the mobile station shall set:
- 29 - IMSI_{O_Ss} to IMSI_{T_Sp} (i.e., IMSI_{O_S1s} to IMSI_{T_S1p} and IMSI_{O_S2s} to
30 IMSI_{T_S2p}).
- 31 - IMSI_{O_11_12s} to IMSI_{T_11_12p}
- 32 - MCC_{O_s} to MCC_{Tp}
- 33 - IMSI_{O_ADDR_NUMs} to IMSI_{T_ADDR_NUMp}
- 34 • If IMSI_O has been changed, the mobile station shall set SYS_PAR_MSG_SEQ_s,
35 CHAN_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s to

- 1 NULL, and set PAGE_CHAN_s to '1', and set PAGECH_s to the Primary Paging
2 Channel.
- 3 • Protocol revision level (P_REV_s = P_REV_r) if included in the message; otherwise, set
4 P_REV_s as follows:
 - 5 - For Band Class 0, if the mobile station determines it is operating in Korea, set
6 P_REV_s to '00000010'; otherwise, set P_REV_s to '00000011'.
 - 7 - For Band Class 3, set P_REV_s to '00000011'.
 - 8 - For Band Class 1 and Band Class 4, set P_REV_s to '00000001'.
 - 9 • Minimum protocol revision level (MIN_P_REV_s = MIN_P_REV_r) if included in the
10 message; otherwise, MIN_P_REV_s = '00000010' for Band Class 0, MIN_P_REV_s =
11 '00000001' for Band Class 1 and Band Class 4, and MIN_P_REV_s = '00000011' for
12 Band Class 3.
 - 13 • Protocol revision level currently in use (P_REV_IN_USE_s = the lesser value of
14 P_REV_s and MOB_P_REV_p of the current band class)
 - 15 • Slope of the handoff add/drop criterion (SOFT_SLOPE_s = SOFT_SLOPE_r) if included
16 in the message; otherwise, SOFT_SLOPE_s = '000000'.
 - 17 • Intercept of the handoff add criterion (ADD_INTERCEPT_s = ADD_INTERCEPT_r)
 - 18 • Intercept of the handoff drop criterion (DROP_INTERCEPT_s = DROP_INTERCEPT_r)
 - 19 • Delete foreign TMSI (DELETE_FOR_TMSI_s = DELETE_FOR_TMSI_r)
 - 20 • Use TMSI (USE_TMSI_s = USE_TMSI_r)
 - 21 • TMSI zone length (TMSI_ZONE_LEN_s = TMSI_ZONE_LEN_r)
 - 22 • TMSI zone number (TMSI_ZONE_s = TMSI_ZONE_r)
 - 23 • Maximum number of alternative service options (MAX_NUM_ALT_SO_s =
24 MAX_NUM_ALT_SO_r).
 - 25 • System reselection indicator (RESELECT_INCLUDED_s = RESELECT_INCLUDED_r) if
26 included in the message; otherwise, RESELECT_INCLUDED_s = '0'.
 - 27 • Pilot reporting indicator (PILOT_REPORT_s = PILOT_REPORT_r)
 - 28 • Neighbor Set access entry handoff information indicator
29 (NGHBR_SET_ENTRY_INFO_s = NGHBR_SET_ENTRY_INFO_r) if included in the
30 message; otherwise, NGHBR_SET_ENTRY_INFO_s = '0'.
 - 31 • Neighbor Set access handoff information indicator (NGHBR_SET_ACCESS_INFO_s =
32 NGHBR_SET_ACCESS_INFO_r) if included in the message; otherwise,
33 NGHBR_SET_ACCESS_INFO_s = '0'.
 - 34 • Short Data Burst supported indicator (SDB_SUPPORTED_s = SDB_SUPPORTED_r)
 - 35 • Nominal reverse traffic channel output power offset relative to Reverse Pilot Channel
36 power (RLGAIN_TRAFFIC_PILOT_s = RLGAIN_TRAFFIC_PILOT_r)

- 1 • Broadcast GPS Assist Indicator ($BROADCAST_GPS_ASST_S =$
2 $BROADCAST_GPS_ASST_T$)
- 3 • Reverse Power Control Delay ($REV_PWR_CNTL_DELAY_S = REV_PWR_CNTL_DELAY_T$)
4 if included
- 5 • Permission for the mobile station to request QoS settings in the *Origination*
6 *Message*, *Origination Continuation Message*, or *Enhanced Origination Message*
7 ($MOB_QOS_S = MOB_QOS_T$)
- 8 • If $ENC_SUPPORTED_T$ is equal to '1', the mobile station shall store:
 - 9 - Signaling encryption supported indicator ($SIG_ENCRYPT_SUP_S =$
10 $SIG_ENCRYPT_SUP_T$)
 - 11 - User information encryption supported indicator ($UI_ENCRYPT_SUP_S =$
12 $UI_ENCRYPT_SUP_T$)
- 13 • Sync ID supported indicator ($USE_SYNC_ID_S = USE_SYNC_ID_T$)
- 14 • Concurrent services supported indicator ($CS_SUPPORTED_S = CS_SUPPORTED_T$)
- 15 • Maximum number of additional service reference identifiers allowed in origination
16 ($MAX_ADD_SERV_INSTANCE_S = MAX_ADD_SERV_INSTANCE_T$), if included;
17 otherwise, the mobile station shall set $MAX_ADD_SERV_INSTANCE_S$ to 0.
- 18 • Primary Broadcast Control Channel supported indicator ($BCCH_SUPPORTED_S =$
19 $BCCH_SUPPORTED_T$).
- 20 • Pilot information request supported indicator ($PILOT_INFO_REQ_SUPPORTED_S =$
21 $PILOT_INFO_REQ_SUPPORTED_T$).
- 22 • Message integrity supported indicator ($MSG_INTEGRITY_SUP_S =$
23 $MSG_INTEGRITY_SUP_T$), if $P_REV_IN_USE_S$ is greater than or equal to 10;
24 otherwise, $MSG_INTEGRITY_SUP_S = 0$.
- 25 • If $MSG_INTEGRITY_SUP_T$ is equal to '1' and $SIG_INTEGRITY_SUP_INCL_T$ is equal to
26 '1', the mobile station shall store the message integrity algorithms that the base
27 station supports ($SIG_INTEGRITY_SUP_S = SIG_INTEGRITY_SUP_T$); otherwise, the
28 mobile station shall set $SIG_INTEGRITY_SUP_S$ to '00000000'.
- 29 • Band class information request indicator ($BAND_CLASS_INFO_REQ_S =$
30 $BAND_CLASS_INFO_REQ_T$)
- 31 • Alternate CDMA band class ($ALT_BAND_CLASS_S = ALT_BAND_CLASS_T$), if
32 $BAND_CLASS_INFO_REQ_T$ is equal to '1'.
- 33 • CDMA off time report supported indicator
34 ($CDMA_OFF_TIME_REP_SUP_IND_S = CDMA_OFF_TIME_REP_SUP_IND_T$)
- 35 • If $CDMA_OFF_TIME_REP_SUP_IND_T$ is equal to '1', the mobile station shall store:
 - 36 - CDMA off time report threshold ($CDMA_OFF_TIME_REP_THRESHOLD_S =$
37 $CDMA_OFF_TIME_REP_THRESHOLD_T$ in units specified by
38 $CDMA_OFF_TIME_REP_UNIT_T$)

- 1 • Control Hold Mode supported indicator ($CHM_SUPPORTED_S = CHM_SUPPORTED_T$)
2 if included; otherwise, the mobile station shall perform the following:
- 3 - If $P_REV_IN_USE_S$ is less than six, set $CHM_SUPPORTED_S$ to '0'.
4 - Otherwise, set $CHM_SUPPORTED_S$ to '1'.
- 5 • Release to Idle State allowed indicator ($RELEASE_TO_IDLE_IND_S =$
6 $RELEASE_TO_IDLE_IND_T$).
- 7 • *Reconnect Message* supported indicator
8 ($RECONNECT_MSG_IND_S = RECONNECT_MSG_IND_T$).
- 9 • Short Data Burst allowed in *Reconnect Message* allowed indicator
10 ($SDB_IN_RCNM_IND_S = SDB_IN_RCNM_IND_T$), if included; otherwise, set
11 $SDB_IN_RCNM_IND_S$ to '0'.
- 12 • Forward Packet Data Channel supported Indicator ($FOR_PDCH_SUPPORTED_S =$
13 $FOR_PDCH_SUPPORTED_T$).
- 14 • PDCH Control Hold Mode supported indicator ($PDCH_CHM_SUPPORTED_S =$
15 $PDCH_CHM_SUPPORTED_T$) if included; otherwise, set $PDCH_CHM_SUPPORTED_S$ to
16 '0'.
- 17 • If $RER_MODE_SUPPORTED_T$ is not included, the mobile station shall set
18 $RER_MODE_SUPPORTED_S$ to '0'; otherwise, the mobile station shall set
19 $RER_MODE_SUPPORTED_S$ to $RER_MODE_SUPPORTED_T$.
- 20 • If $TKZ_MODE_SUPPORTED_T$ is not included, the mobile station shall set
21 $TKZ_MODE_SUPPORTED_S$ to '0'; otherwise, the mobile station shall set
22 $TKZ_MODE_SUPPORTED_S$ to $TKZ_MODE_SUPPORTED_T$. If
23 $TKZ_MODE_SUPPORTED_S$ is equal to '1', the mobile station shall store the tracking
24 zone identifier ($TKZ_ID_S = TKZ_ID_T$).
- 25 • If $AUTO_FCISO_ALLOWED_T$ is not included, the mobile station shall set
26 $AUTO_FCISO_ALLOWED_S$ to '0'; otherwise, the mobile station shall set
27 $AUTO_FCISO_ALLOWED_S$ to $AUTO_FCISO_ALLOWED_T$.
- 28 • If $CAND_BAND_INFO_REQ_T$ is included, the mobile station shall set
29 $CAND_BAND_INFO_REQ_S$ to $CAND_BAND_INFO_REQ_T$; otherwise, the mobile
30 station shall set $CAND_BAND_INFO_REQ_S$ to '0'.
- 31 If $BYPASS_REG_IND_T$ is included, the mobile station shall set $BYPASS_REG_IND_S$ to
32 $BYPASS_REG_IND_T$; otherwise, the mobile station shall set $BYPASS_REG_IND_S$ to '00'.
- 33 If $BCCH_SUPPORTED_S$ equals '1', the mobile station shall enter the *System Determination*
34 *Substate of the Mobile Station Initialization State* with a new system indication.
- 35 If $P_REV_IN_USE_S$ has been changed, the mobile station shall set $ACC_MSG_SEQ_S$,
36 $CURR_ACC_MSG_SEQ$, $SYS_PAR_MSG_SEQ_S$, $EXT_NGHBR_LST_MSG_SEQ_S$,
37 $GEN_NGHBR_LST_MSG_SEQ_S$, and $GLOB_SERV_REDIR_MSG_SEQ_S$ to NULL.

- 1 If NGHBR_SET_ENTRY_INFO is equal to '1', the mobile station shall store the access entry
 2 handoff in order and message processing operation indicator ($ACC_ENT_HO_ORDER_S =$
 3 $ACC_ENT_HO_ORDER_T$).
- 4 If the mobile station supports packet data service options, the mobile station shall store the
 5 packet data services zone identifier ($PACKET_ZONE_ID_S = PACKET_ZONE_ID_T$); otherwise,
 6 the mobile station shall set $PACKET_ZONE_ID_S$ to '00000000'.
- 7 If the mobile station supports packet data service options and the PZ_HYST_ENABLED field
 8 is included, the mobile station shall store the packet zone hysteresis enabled indicator
 9 ($PZ_HYST_ENABLED_S = PZ_HYST_ENABLED_T$); otherwise, the mobile station shall set
 10 $PZ_HYST_ENABLED_S$ to '1'.
- 11 If the mobile station supports packet data service options and the PZ_HYST_LIST_LEN field
 12 is included, the mobile station shall store the packet zone hysteresis list length
 13 ($PZ_HYST_LIST_LEN_S = PZ_HYST_LIST_LEN_T$); otherwise, the mobile station shall set
 14 $PZ_HYST_LIST_LEN_S$ to 4.
- 15 If the mobile station supports packet data service options and the PZ_HYST_ACT_TIMER
 16 field is included, the mobile station shall store the packet zone hysteresis activation timer
 17 ($PZ_HYST_ACT_TIMER_S = PZ_HYST_ACT_TIMER_T$); otherwise, the mobile station shall set
 18 $PZ_HYST_ACT_TIMER_S$ to 30 seconds.
- 19 If the mobile station supports packet data service options and the PZ_HYST_TIMER_MUL
 20 field and the PZ_HYST_TIMER_EXP field are included, the mobile station shall store the
 21 packet zone hysteresis timer ($PZ_HYST_TIMER_S = PZ_HYST_TIMER_MUL_T \times 8 \wedge$
 22 $PZ_HYST_TIMER_EXP_T$); otherwise, the mobile station shall set $PZ_HYST_TIMER_S$ to 60
 23 seconds.
- 24 If RESELECT_INCLUDED_S is equal to '1', the mobile station shall store:
- 25 • Pilot power threshold ($EC_THRESH_S = EC_THRESH_T$)
 - 26 • Pilot E_c/I_0 threshold ($EC_IO_THRESH_S = EC_IO_THRESH_T$)
- 27 If NGHBR_SET_ACCESS_INFO_S is equal to '1', the mobile station shall store:
- 28 • Access handoff permitted indicator ($ACCESS_HO_S = ACCESS_HO_T$)
 - 29 • Access probe handoff permitted indicator ($ACCESS_PROBE_HO_S =$
 30 $ACCESS_PROBE_HO_T$)
 - 31 • If $ACCESS_PROBE_HO_S$ is equal to '1', access handoff list update permitted
 32 indicator ($ACC_HO_LIST_UPD_S = ACC_HO_LIST_UPD_T$)
 - 33 • Maximum number of times that the mobile station is permitted to perform an
 34 access probe handoff ($MAX_NUM_PROBE_HO_S = MAX_NUM_PROBE_HO_T$)
 - 35 • Access handoff permitted for message response indicator ($ACCESS_HO_MSG_RSP_S$
 36 $= ACCESS_HO_MSG_RSP_T$)
 - 37 • Access probe handoff permitted for other messages indicator
 38 ($ACC_PROBE_HO_OTHER_MSG_S = ACC_PROBE_HO_OTHER_MSG_T$)

1 If NGHBR_SET_ENTRY_INFO_s or NGHBR_SET_ACCESS_INFO_s is equal to '1', the mobile
2 station shall store the size of the Neighbor Set (NGHBR_SET_SIZE_s = NGHBR_SET_SIZE_r).

3 If NGHBR_SET_ENTRY_INFO_s is equal to '0', then for all NGHBR_SET_SIZE_s occurrences of
4 ACCESS_ENTRY_HO, the mobile station shall set the ACCESS_ENTRY_HO field of
5 NGHBR_REC[i] to '0'.

6 If NGHBR_SET_ENTRY_INFO_s is equal to '1', then for all NGHBR_SET_SIZE_s occurrences of
7 ACCESS_ENTRY_HO, the mobile station shall set the ACCESS_ENTRY_HO field of
8 NGHBR_REC[i] to the ith occurrence of ACCESS_ENTRY_HO_r.

9 If NGHBR_SET_ACCESS_INFO_s is equal to '0', then for all NGHBR_SET_SIZE_s occurrences
10 of ACCESS_HO_ALLOWED, the mobile station shall set the ACCESS_HO_ALLOWED field of
11 NGHBR_REC[i] to '0'.

12 If NGHBR_SET_ACCESS_INFO_s is equal to '1', then for all NGHBR_SET_SIZE_s occurrences
13 of ACCESS_HO_ALLOWED, the mobile station shall set the ACCESS_HO_ALLOWED field of
14 NGHBR_REC[i] to the ith occurrence of ACCESS_HO_ALLOWED_r.

15 The mobile station shall set all bits of TMSI_CODE_{s-p} to '1' if all of the following conditions
16 are met:

- 17 • The bits of TMSI_CODE_{s-p} are not all equal to '1',
- 18 • DELETE_FOR_TMSI_s is equal to '1', and
- 19 • ASSIGNING_TMSI_ZONE_LEN_{s-p} is not equal to TMSI_ZONE_LEN_s, or the least
20 significant ASSIGNING_TMSI_ZONE_LEN_{s-p} octets of ASSIGNING_TMSI_ZONE_{s-p}
21 are not equal to TMSI_ZONE_s.

22 If the mobile station supports the Quick Paging Channel operation:

- 23 • The mobile station shall set QPCH_SUPPORTED_s to QPCH_SUPPORTED_r.
- 24 • If QPCH_SUPPORTED_r = '1':
 - 25 - The mobile station shall set QPCH_RATE_s to QPCH_RATE_r.
 - 26 - If the number of Quick Paging Channels specified in the received message
27 (NUM_QPCH_r) is different from NUM_QPCH_s, the mobile station shall use the
28 hash algorithm specified in 2.6.7.1 to select a new Quick Paging Channel
29 number in the range 1 to NUM_QPCH_r. The mobile station shall store the new
30 Quick Paging Channel number as QPAGECH_s and as ASSIGNED_QPAGECH_s.
31 The mobile station shall then set NUM_QPCH_s to NUM_QPCH_r.
 - 32 - The mobile station shall set QPCH_POWER_LEVEL_PAGE_s to
33 QPCH_POWER_LEVEL_PAGE_r.
 - 34 - The mobile station shall set QPCH_CCI_SUPPORTED_s to
35 QPCH_CCI_SUPPORTED_r.
 - 36 - If QPCH_CCI_SUPPORTED_r = '1', the mobile station shall set
37 QPCH_POWER_LEVEL_CONFIG_s to QPCH_POWER_LEVEL_CONFIG_r.

- 1 • The mobile station shall set QPCH_BI_SUPPORTED_S to QPCH_BI_SUPPORTED_T, if
2 included.
- 3 • If QPCH_BI_SUPPORTED_T = '1', the mobile station shall set
4 QPCH_POWER_LEVEL_BCAST_S to QPCH_POWER_LEVEL_BCAST_T.

5 If the mobile station supports the *Device Information Message* on the r-csch, the mobile
6 station shall store:

- 7 • Autonomous message supported indicator
8 (AUTO_MSG_SUPPORTED_S = AUTO_MSG_SUPPORTED_T)

9 If AUTO_MSG_SUPPORTED_T is equal to '1' and the mobile station supports the *Device
10 Information Message* on the r-csch, the mobile station shall store:

- 11 • Autonomous message interval
12 (AUTO_MSG_INTERVAL_S = AUTO_MSG_INTERVAL_T)

13 The mobile station shall store mobile station initiated position location determination
14 supported indicator (MS_INIT_POS_LOC_SUP_IND_S = MS_INIT_POS_LOC_SUP_IND_T).

15 The mobile station shall set FOR_PDCH_COMMON_PARMS_S = '0'.

16 If both FOR_PDCH_SUPPORTED_T and PDCH_PARMS_INCL_T are included and equal to '1',
17 the mobile station shall perform the following:

- 18 • If FOR_PDCH_RLGAIN_INCL_T is included and equal to '1', the mobile station shall
19 set:
- 20 - (RLGAIN_ACKCH_PILOT_S = RLGAIN_ACKCH_PILOT_T).
- 21 - (RLGAIN_CQICH_PILOT_S = RLGAIN_CQICH_PILOT_T).
- 22 • The mobile station shall set
23 NUM_SOFT_SWITCHING_FRAMES_S = NUM_SOFT_SWITCHING_FRAMES_T + 1, and
24 NUM_SOFTER_SWITCHING_FRAMES_S = NUM_SOFTER_SWITCHING_FRAMES_T + 1.
- 25 • The mobile station shall set
26 NUM_SOFT_SWITCHING_FRAMES_CHM_S = NUM_SOFT_SWITCHING_FRAMES_T + 1,
27 and NUM_SOFTER_SWITCHING_FRAMES_CHM_S =
28 NUM_SOFTER_SWITCHING_FRAMES_T + 1.
- 29 • The mobile station shall set NUM_SOFT_SWITCHING_SLOTS_S according to Table
30 3.7.2.3.2.21-9 based on the value of NUM_SOFT_SWITCHING_SLOTS_T.
- 31 • The mobile station shall set NUM_SOFTER_SWITCHING_SLOTS_S according to Table
32 3.7.2.3.2.21-9 based on the value of NUM_SOFTER_SWITCHING_SLOTS_T.
- 33 • The mobile station shall set PDCH_SOFT_SWITCHING_DELAY_S to
34 PDCH_SOFT_SWITCHING_DELAY_T + 1, and PDCH_SOFTER_SWITCHING_DELAY_S
35 to PDCH_SOFTER_SWITCHING_DELAY_T + 1.
- 36 • The mobile station shall set FOR_PDCH_COMMON_PARMS_S = '1'.
- 37 • The mobile station shall set WALSH_TABLE_ID_S = WALSH_TABLE_ID_T.
- 38 • The mobile station shall set NUM_PDCCH_S = NUM_PDCCH_T.

- 1 • The mobile station shall store FOR_PDCCH_WALSH_S[i] to the ith occurrence of
2 FOR_PDCCH_WALSH_T.

3 If FOR_PDCH_SUPPORTED_T is included and equal to '1', then the mobile station shall set
4 Reverse Packet Data Channel supported indicator (REV_PDCH_SUPPORTED_S =
5 REV_PDCH_SUPPORTED_T).

6 If REV_PDCH_PARAMS_INCL_T is not included, or if it is included and equal to '0', the mobile
7 station shall set REV_PDCH_PARAMS_INCL_S to '0'; otherwise, the mobile station shall set
8 REV_PDCH_PARAMS_INCL_S to '1' and perform the following:

- 9 • If REV_PDCH_RLGAIN_INCL_T is equal to '1', the mobile station shall set:
- 10 - (RLGAIN_SPICH_PILOT_S = RLGAIN_SPICH_PILOT_T).
 - 11 - (RLGAIN_REQCH_PILOT_S = RLGAIN_REQCH_PILOT_T).
 - 12 - (RLGAIN_PDCCH_PILOT_S = RLGAIN_PDCCH_PILOT_T).
- 13 • If REV_PDCH_PARAMS_1_INCL_T is equal to '1', the mobile station shall set:
- 14 - (REV_PDCH_TABLE_SEL_S = REV_PDCH_TABLE_SEL_T).
 - 15 - (REV_PDCH_MAX_AUTO_TPR_S to REV_PDCH_MAX_AUTO_TPR_T).
 - 16 - (REV_PDCH_NUM_ARQ_ROUNDS_NORMAL_S =
17 REV_PDCH_NUM_ARQ_ROUNDS_NORMAL_T+1).
- 18 • If REV_PDCH_OPER_PARAMS_INCL_T is equal to '1', the mobile station shall set:
- 19 - (REV_PDCH_MAX_SIZE_ALLOWED_ENCODER_PACKET_S
20 =REV_PDCH_MAX_SIZE_ALLOWED_ENCODER_PACKET_T+1).
 - 21 - (REV_PDCH_DEFAULT_PERSISTENCE_S =
22 REV_PDCH_DEFAULT_PERSISTENCE_T).
 - 23 - (REV_PDCH_RESET_PERSISTENCE_S = REV_PDCH_RESET_PERSISTENCE_T).
 - 24 - (REV_PDCH_GRANT_PRECEDENCE_S = REV_PDCH_GRANT_PRECEDENCE_T).
 - 25 - (REV_PDCH_MSIB_SUPPORTED_S = REV_PDCH_MSIB_SUPPORTED_T).
 - 26 - (REV_PDCH_SOFT_SWITCHING_RESET_IND_S =
27 REV_PDCH_SOFT_SWITCHING_RESET_IND_T).

28 The mobile station shall store the following parameters:

- 29 • *BCMC Service Parameters Message* sent
30 (SENDING_BSPM_S = SENDING_BSPM_T), if included; otherwise, set
31 SENDING_BSPM_S to '0'.
- 32 • *BCMC Service Parameters Message* transmission periodicity index
33 (BSPM_PERIOD_INDEX_S = BSPM_PERIOD_INDEX_T) if SENDING_BSPM_T equals '1';
34 otherwise, BSPM_PERIOD_INDEX_S = NULL.
- 35 • If BSPM_PERIOD_INDEX_S is not equal to NULL, the mobile station shall set
36 BSPM_WAIT_TIME to (B + 1) × 160ms, where

1 $B = 2^i \times 16, 0 \leq i \leq 15$

2 and $i = \text{BSPM_PERIOD_INDEX}_S$.

3 If $\text{CAND_BAND_INFO_REQ}_R$ is set to '1', the mobile station shall store the number of
4 candidate band classes minus one ($\text{NUM_CAND_BAND_CLASS}_S =$
5 $\text{NUM_CAND_BAND_CLASS}_R$).

6 If $\text{CAND_BAND_INFO_REQ}_R$ is set to '1', the mobile station shall perform the following for
7 each occurrence of the CAND_BAND_CLASS record:

- 8 • Set the CAND_BAND_CLASS field of $\text{CAND_BAND_CLASS_REC}[i]$ to the i^{th}
9 occurrence of CAND_BAND_CLASS_R .
- 10 • Set the $\text{SUBCLASS_INFO_INCL}$ field of $\text{CAND_BAND_CLASS_REC}[i]$ to the i^{th}
11 occurrence of $\text{SUBCLASS_INFO_INCL}_R$.
- 12 • If the i^{th} occurrence of $\text{SUBCLASS_INFO_INCL}_R$ is set to '1', set the
13 SUBCLASS_REC_LEN field of $\text{CAND_BAND_CLASS_REC}[i]$ to the corresponding
14 value of $\text{SUBCLASS_REC_LEN}_R$.
- 15 • If the i^{th} occurrence of $\text{SUBCLASS_INFO_INCL}_R$ is set to '1', the mobile station shall
16 perform the following for each band subclass indicator received:
 - 17 - Set the $\text{BAND_SUBCLASS_IND_REC}[j]$ field of $\text{CAND_BAND_CLASS_REC}[i]$ to
18 the j^{th} occurrence of $\text{BAND_SUBCLASS_IND}_R$ in the
19 $\text{CDMA_BAND_CLASS_REC}[i]$.

20 If $\text{TX_PWR_LIMIT_INCL}_R$ is set to '1' and the mobile station is operating in the 1915MHz –
21 1920MHz block of the PCS band, the mobile station shall store the transmit power limit
22 $\text{TX_PWR_LIMIT}_S = (\text{TX_PWR_LIMIT}_R - 30\text{dBm})$; otherwise, the mobile station shall set
23 TX_PWR_LIMIT_S to the limit defined in [11].

24 2.6.2.2.6 Global Service Redirection Message

25 Whenever a *Global Service Redirection Message* is received on the Paging Channel, the
26 configuration message sequence number, CONFIG_MSG_SEQ_R , shall be compared to that
27 stored in $\text{GLOB_SERV_REDIR_MSG_SEQ}_S$. If the comparison results in a match or if
28 SYS_PAR_MSG_SEQ_S is not current, the mobile station may ignore the message; otherwise,
29 the mobile station shall store the following parameters:

- 30 • Configuration message sequence number
31 ($\text{CONFIG_MSG_SEQ}_S = \text{CONFIG_MSG_SEQ}_R$,
32 $\text{GLOB_SERV_REDIR_MSG_SEQ}_S = \text{CONFIG_MSG_SEQ}_R$)
- 33 • The mobile station shall ignore this message, if any of the following conditions is
34 true:
 - 35 - $\text{EXT_GLOBAL_REDIRECT}_S = '1'$
 - 36 - $\text{EXCL_P_REV_MS}_R = '1'$
 - 37 - Type of redirection as specified by RECORD_TYPE_R is not supported

- 1 - BAND_CLASS_r is not supported (RECORD_TYPE_r = '00000010')
- 2 - None of the included CDMA_CHAN_r are supported (RECORD_TYPE_r =
- 3 '00000010')

4 If the subfield corresponding to the access overload class, ACCOLC_p, of the mobile station
5 is set equal to '1' in the REDIRECT_ACCOLC_r field of the received message, the mobile
6 station shall store the following parameters and then shall enter the *System Determination*
7 *Substate* of the *Mobile Station Initialization State* with a redirection indication (see 2.6.1.1):

- 8 • Return if fail indicator (RETURN_IF_FAIL_s = RETURN_IF_FAIL_r)
- 9 • If DELETE_TMSI_r is equal to '1', the mobile station shall set all the bits of
- 10 TMSI_CODE_{s-p} to '1'
- 11 • Redirection record (REDIRECT_REC_s = redirection record from received message)
- 12 • If RECORD_TYPE_r = '00000001', the mobile station shall:
- 13 - Set CDMA_MODE_s to '1'
- 14 - Set DIGITAL_REG_{s-p} to '00000000'
- 15 - Set the maximum delay upon redirection (MAX_REDIRECT_DELAY_s =
- 16 MAX_REDIRECT_DELAY_r)

17 2.6.2.2.7 Extended Neighbor List Message

18 Whenever a valid *Extended Neighbor List Message* is received on the current Paging
19 Channel (PAGECH_s), the configuration message sequence number, CONFIG_MSG_SEQ_r,
20 shall be compared to that stored in EXT_NGHBR_LST_MSG_SEQ_s. If the comparison
21 results in a match, the mobile station may ignore the message. If the comparison results
22 in a mismatch, then the mobile station shall process the remaining fields in the message as
23 follows.

24 If the PILOT_INC field is not within the valid range specified in 3.7.2.3.2.14, then the
25 mobile station shall ignore the *Extended Neighbor List Message* that contains it.

26 The mobile station shall store the following parameters:

- 27 • Configuration message sequence number
28 (CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
29 EXT_NGHBR_LST_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
30 NGHBR_LST_MSG_SEQ_s = CONFIG_MSG_SEQ_r)
- 31 • Pilot PN sequence offset increment (PILOT_INC_s = PILOT_INC_r)

1 The mobile station shall set NGHBR_SET_SIZE_S to the number of neighboring base stations
2 contained in the *Extended Neighbor List Message*.

3 For each of the neighboring base stations contained in the *Extended Neighbor List Message*,
4 if FREQ_INCL_T equals '0', or if FREQ_INCL_T equals '1' and NGHBR_BAND_T is supported, the
5 mobile station shall perform the following:

- 6 • If the *i*th occurrence of NGHBR_CONFIG_T is equal to '000', '001', or '010', set the
7 NGHBR_CONFIG field of NGHBR_REC[i] to the *i*th occurrence of NGHBR_CONFIG_T;
8 otherwise, set the NGHBR_CONFIG field of NGHBR_REC [i] to '011'.
- 9 • Set the NGHBR_PN field of NGHBR_REC[i] to the *i*th occurrence of NGHBR_PN_T.
- 10 • Set the SEARCH_PRIORITY field of NGHBR_REC[i] to the *i*th occurrence of
11 SEARCH_PRIORITY_T.

12 For each of the neighboring base stations contained in the *Extended Neighbor List Message*,
13 if FREQ_INCL_T equals '1' and NGHBR_BAND_T is supported, the mobile station shall also
14 perform the following:

- 15 • Set the NGHBR_BAND field of NGHBR_REC[i] to the *i*th occurrence of
16 NGHBR_BAND_T.
- 17 • Set the NGHBR_FREQ field of NGHBR_REC[i] to the *i*th occurrence of
18 NGHBR_FREQ_T.

19 For each of the neighboring base stations contained in the *Extended Neighbor List Message*,
20 if FREQ_INCL_T equals '0', the mobile station shall also perform the following:

- 21 • Set the NGHBR_BAND field of NGHBR_REC[i] to CDMABAND_S.
- 22 • If NGHBR_CONFIG_T equals '010', set the NGHBR_FREQ field of NGHBR_REC[i] to
23 the first CDMA Channel listed in the *CDMA Channel List Message or Extended*
24 *CDMA Channel List Message* transmitted by the current base station; otherwise, set
25 the NGHBR_FREQ field of NGHBR_REC[i] to CDMACH_S.

26 If GEN_NGHBR_LST_MSG_SEQ_S is not equal to CONFIG_MSG_SEQ_S, the mobile station
27 shall perform the following:

- 28 • Set the SRCH_WIN_NGHBR field of NGHBR_REC to SRCH_WIN_N_S for all
29 NGHBR_SET_SIZE_S entries.
- 30 • Set the SRCH_OFFSET_NGHBR field of NGHBR_REC to '000' for all entries.

31 The mobile station shall set the ACCESS_ENTRY_HO field of the NGHBR_REC to '0' for all
32 NGHBR_SET_SIZE_S entries if any of the following conditions are met:

- 33 • EXT_SYS_PARAMETER_S is equal to '0',
- 34 • NGHBR_SET_ENTRY_INFO_S is equal to '0', or
- 35 • EXT_SYS_PAR_MSG_SEQ_S is not equal to CONFIG_MSG_SEQ_S.

36 The mobile station shall set the ACCESS_HO_ALLOWED field of the NGHBR_REC to '0' for
37 all NGHBR_SET_SIZE_S entries if any of the following conditions are met:

- 1 • EXT_SYS_PARAMETER_s is equal to '0',
- 2 • NGHBR_SET_ACCESS_INFO_s is equal to '0', or
- 3 • EXT_SYS_PAR_MSG_SEQ_s is not equal to CONFIG_MSG_SEQ_s.

4 The mobile station shall update the idle handoff Neighbor Set (see 2.6.2.1.4) so that it
5 consists only of pilot offsets listed in the *Extended Neighbor List Message*. If the *Extended*
6 *Neighbor List Message* contains more pilot offsets than the mobile station can store, the
7 mobile station shall store the pilot offsets beginning at the start of the *Extended Neighbor*
8 *List Message*, up to the limits of the mobile station's Neighbor Set storage capacity.

9 2.6.2.2.8 General Neighbor List Message

10 Whenever a valid *General Neighbor List Message* is received on the current Paging Channel
11 (PAGECH_s), the configuration message sequence number, CONFIG_MSG_SEQ_r shall be
12 compared to that stored in GEN_NGHBR_LST_MSG_SEQ_s. If the comparison results in a
13 match, the mobile station may ignore the message. If the comparison results in a
14 mismatch, then the mobile station shall process the remaining fields in the message as
15 follows.

16 If the PILOT_INC field is not within the valid range specified in 3.7.2.3.2.22, then the
17 mobile station shall ignore the *General Neighbor List Message* that contains it.

18 The mobile station shall store the following parameters:

- 19 • Configuration message sequence number
20 (CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
21 GEN_NGHBR_LST_MSG_SEQ_s = CONFIG_MSG_SEQ_r).
- 22 • Pilot PN sequence offset increment (PILOT_INC_s = PILOT_INC_r).

23 If NGHBR_CONFIG_PN_INCL_r is equal to '1' and FREQ_FIELDS_INCL_r is equal to '1', the
24 mobile station shall store the following parameters:

- 25 • Configuration message sequence number
26 (EXT_NGHBR_LST_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
27 NGHBR_LST_MSG_SEQ_s = CONFIG_MSG_SEQ_r).

28 The mobile station shall set NGHBR_SET_SIZE_s to the number of neighboring base stations
29 contained in the *General Neighbor List Message*.

30 For each of the neighboring base stations contained in the *General Neighbor List Message*, if
31 FREQ_INCL_r equal '0', or if FREQ_INCL_r equal '1' and NGHBR_BAND_r is supported, the
32 mobile station shall perform the following:

- 33 • If NGHBR_CONFIG_PN_INCL_r is equal to '1', set the NGHBR_CONFIG and
34 NGHBR_PN fields as follows:
 - 35 - If the *i*th occurrence of NGHBR_CONFIG_r is equal to '000', '001', or '010', set the
36 NGHBR_CONFIG field of NGHBR_REC[*i*] to the *i*th occurrence of
37 NGHBR_CONFIG_r; otherwise, set the NGHBR_CONFIG field of NGHBR_REC[*i*] to
38 '011'.
 - 39 - Set the NGHBR_PN field of NGHBR_REC[*i*] to the *i*th occurrence of NGHBR_PN_r.

- 1 • If $\text{NGHBR_SRCH_MODE}_T = '00'$ or $'10'$ and $\text{EXT_NGHBR_LST_MSG_SEQ}_S$ is not
2 equal to CONFIG_MSG_SEQ_T , set SEARCH_PRIORITY field of each NGHBR_REC to
3 $'10'$ (high) for all NGHBR_SET_SIZE_S entries.
- 4 • If $\text{NGHBR_SRCH_MODE}_T = '01'$ or $'11'$, set the SEARCH_PRIORITY field of
5 $\text{NGHBR_REC}[i]$ to the i^{th} occurrence of SEARCH_PRIORITY_T .
- 6 • If $\text{NGHBR_SRCH_MODE}_T = '00'$ or $'01'$, set the SRCH_WIN_NGHBR field of each
7 NGHBR_REC to SEARCH_WIN_S for all NGHBR_SET_SIZE_S entries if
8 SYS_PAR_MSG_SEQ_S is equal to CONFIG_MSG_SEQ_S ; otherwise, set
9 $\text{SETTING_SEARCH_WIN}$ to $'1'$.
- 10 • If $\text{NGHBR_SRCH_MODE}_T = '00'$ or $'01'$, set the SRCH_OFFSET_NGHBR field of each
11 NGHBR_REC to $'000'$.
- 12 • If $\text{NGHBR_SRCH_MODE}_T = '10'$ or $'11'$:
 - 13 - set the SRCH_WIN_NGHBR field of $\text{NGHBR_REC}[i]$ to the i^{th} occurrence of
14 SRCH_WIN_NGHBR_T
 - 15 - if $\text{SRCH_OFFSET_INCL}_T$ equals $'1'$, set the SRCH_OFFSET_NGHBR field of
16 $\text{NGHBR_REC}[i]$ to the i^{th} occurrence of $\text{SRCH_OFFSET_NGHBR}_T$, and
 - 17 - if $\text{SRCH_OFFSET_INCL}_T$ equals $'0'$, set the SRCH_OFFSET_NGHBR field of each
18 NGHBR_REC to $'000'$.
- 19 • If USE_TIMING_T is equal to $'1'$, set the TIMING_INCL field of $\text{NGHBR_REC}[i]$ to the
20 i^{th} occurrence of TIMING_INCL_T ; otherwise, set the TIMING_INCL field of
21 NGHBR_REC to $'0'$ for all entries.
- 22 • If BCCH_IND_INCL_T is equal to $'1'$, set the BCCH_SUPPORT field of $\text{NGHBR_REC}[i]$
23 to the i^{th} occurrence of BCCH_SUPPORT_T ; otherwise, set the BCCH_IND_INCL field
24 of NGHBR_REC to $'0'$ for all entries.
- 25 • Set the $\text{NGHBR_PDCH_SUPPORTED}$ field of $\text{NGHBR_REC}[i]$ to the i^{th} occurrence of
26 $\text{NGHBR_PDCH_SUPPORTED}_T$ if included; otherwise, set the
27 $\text{NGHBR_PDCH_SUPPORTED}$ field of NGHBR_REC to $'0'$ for all entries.
- 28 • The mobile station shall set $\text{RESQ_ENABLED}_S = \text{RESQ_ENABLED}_T$. If
29 RESQ_ENABLED_S is equal to $'1'$, then the mobile station shall store:
 - 30 - Call rescue delay timer value ($\text{RESQ_DELAY_TIME}_S = \text{RESQ_DELAY_TIME}_T$)
 - 31 - Call rescue allowed timer value ($\text{RESQ_ALLOWED_TIME}_S =$
32 $\text{RESQ_ALLOWED_TIME}_T$)
 - 33 - Call rescue attempt timer value ($\text{RESQ_ATTEMPT_TIME}_S =$
34 $\text{RESQ_ATTEMPT_TIME}_T$)
 - 35 - Code channel index for call rescue ($\text{RESQ_CODE_CHAN}_S =$
36 RESQ_CODE_CHAN_T)
 - 37 - Quasi-Orthogonal Function mask identifier for call rescue ($\text{RESQ_QOF}_S =$
38 RESQ_QOF_T)

- 1 - Minimum time between consecutive rescues ($RESQ_MIN_PERIOD_S =$
2 $RESQ_MIN_PERIOD_T + 1$) if $RESQ_MIN_PERIOD_INCL_T$ is equal to '1'; otherwise,
3 $RESQ_MIN_PERIOD_S = '00000'$.
- 4 - The required number of transmissions of a regular PDU before declaring L2
5 Acknowledgment Failure when Call Rescue is enabled
6 ($RESQ_NUM_TOT_TRANS_20MS_S = RESQ_NUM_TOT_TRANS_20MS_T$) if
7 included; otherwise, set $RESQ_NUM_TOT_TRANS_20MS_S$ to N_{1m} .
- 8 - The required number of transmissions of a mini PDU before declaring L2
9 Acknowledgment Failure when Call Rescue is enabled
10 ($RESQ_NUM_TOT_TRANS_5MS_S = RESQ_NUM_TOT_TRANS_5MS_T$) if included;
11 otherwise, set $RESQ_NUM_TOT_TRANS_5MS_S$ to N_{15m} .
- 12 - The Traffic Channel preamble length for Call Rescue Soft Handoff when
13 operating in Radio Configuration 1 or 2 ($RESQ_NUM_PREAMBLE_RC1_RC2_S =$
14 $RESQ_NUM_PREAMBLE_RC1_RC2_T$).
- 15 - The Traffic Channel preamble length for Call Rescue Soft Handoff when
16 operating in Radio Configuration greater than 2 ($RESQ_NUM_PREAMBLE_S =$
17 $RESQ_NUM_PREAMBLE_T$).
- 18 - The power level adjustment to be applied to the last closed-loop power level
19 when re-enabling the transmitter for call rescue soft handoff
20 ($RESQ_POWER_DELTA_S = RESQ_POWER_DELTA_T$).
- 21 - Set the $NGHBR_RESQ_CONFIGURED$ field of $NGHBR_REC[i]$ to the i^{th}
22 occurrence of $NGHBR_RESQ_CONFIGURED_T$.

23 For each of the neighboring base stations contained in the *General Neighbor List Message*, if
24 $FREQ_FIELDS_INCL_T$ equals '1', $FREQ_INCL_T$ equals '1', and $NGHBR_BAND_T$ is supported,
25 the mobile station shall also perform the following:

- 26 • Set the $NGHBR_BAND$ field of $NGHBR_REC[i]$ to the i^{th} occurrence of
27 $NGHBR_BAND_T$.
- 28 • Set the $NGHBR_FREQ$ field of $NGHBR_REC[i]$ to the i^{th} occurrence of
29 $NGHBR_FREQ_T$.

30 For each of the neighboring base stations contained in the *General Neighbor List Message*, if
31 USE_TIMING_T is equal to '1' and $TIMING_INCL_T$ equals '1', the mobile station shall also
32 perform the following:

- 33 • Set the $NGHBR_TX_OFFSET$ field of $NGHBR_REC[i]$ to the i^{th} occurrence of
34 $NGHBR_TX_OFFSET_T$.
- 35 • If $GLOBAL_TIMING_INCL_T$ is equal to '1', then the mobile station shall:
- 36 - Set the $NGHBR_TX_DURATION$ field of $NGHBR_REC$ to
37 $GLOBAL_TX_DURATION_T$ for all entries.
- 38 - Set the $NGHBR_TX_PERIOD$ field of $NGHBR_REC$ to $GLOBAL_TX_PERIOD_T$ for
39 all entries.

- 1 • If GLOBAL_TIMING_INCL_r is equal to '0', then the mobile station shall:
 - 2 - Set the NGHBR_TX_DURATION field of NGHBR_REC[i] to the ith occurrence of
 - 3 NGHBR_TX_DURATION_r.
 - 4 - Set the NGHBR_TX_PERIOD field of NGHBR_REC[i] to the ith occurrence of
 - 5 NGHBR_TX_PERIOD_r.

6 For each of the neighboring base stations contained in the *General Neighbor List Message*, if
 7 `FREQ_FIELDS_INCLr` equals '1' and `FREQ_INCLr` equals '0', or if `FREQ_FIELDS_INCLr`
 8 equals '0' and `EXT_NGHRBR_LST_MSG_SEQs` is not equal to `CONFIG_MSG_SEQr`, the
 9 mobile station shall also perform the following:

- 10 • Set the NGHBR_BAND field of NGHBR_REC[i] to CDMABAND_s.
- 11 • If NGHBR_CONFIG_r equals '010', set the NGHBR_FREQ field of NGHBR_REC[i] to
- 12 the first CDMA Channel listed in the *CDMA Channel List Message or Extended*
- 13 *CDMA Channel List Message* transmitted by the current base station; otherwise, set
- 14 the NGHBR_FREQ field of NGHBR_REC[i] to CDMACH_s.

15 The mobile station shall set the ACCESS_ENTRY_HO field of the NGHBR_REC to '0' for all
 16 NGHBR_SET_SIZE_s entries if any of the following conditions are met:

- 17 • EXT_SYS_PARAMETER_s is equal to '0'
- 18 • NGHBR_SET_ENTRY_INFO_s is equal to '0', or
- 19 • EXT_SYS_PAR_MSG_SEQ_s is not equal to CONFIG_MSG_SEQ_s.

20 The mobile station shall set the ACCESS_HO_ALLOWED field of the NGHBR_REC to '0' for
 21 all NGHBR_SET_SIZE_s entries if any of the following conditions are met:

- 22 • EXT_SYS_PARAMETER_s is equal to '0'
- 23 • NGHBR_SET_ACCESS_INFO_s is equal to '0', or
- 24 • EXT_SYS_PAR_MSG_SEQ_s is not equal to CONFIG_MSG_SEQ_s.

25 The mobile station shall update the idle handoff Neighbor Set (see 2.6.2.1.4) so that it
 26 consists only of pilot offsets listed in the *General Neighbor List Message*. If the *General*
 27 *Neighbor List Message* contains more pilot offsets than the mobile station can store, the
 28 mobile station shall store the pilot offsets beginning at the start of the *General Neighbor List*
 29 *Message*, up to the limits of the mobile station's Neighbor Set storage capacity.

30 For each of the neighboring base stations contained in the *General Neighbor List Message*,
 31 the mobile station shall set the ADD_PILOT_REC_INCL field of NGHBR_REC[i] to the ith
 32 occurrence of ADD_PILOT_REC_INCL_r. If ADD_PILOT_REC_INCL_r equals '1', for each pilot
 33 included in the message, the mobile station shall also perform the following:

- 34 • Set the NGHBR_PILOT_REC_TYPE field of NGHBR_PILOT_REC to
- 35 NGHBR_PILOT_REC_TYPE_r.
- 36 • If NGHBR_PILOT_REC_TYPE_r is equal to '000'. The mobile station shall:
 - 37 - Set the TD_POWER_LEVEL field of NGHBR_PILOT_REC to TD_POWER_LEVEL_r.
 - 38 - Set the TD_MODE field of NGHBR_PILOT_REC to TD_MODE_r.

- 1 • If NGHBR_PILOT_REC_TYPE_r is equal to '001', the mobile station shall:
- 2 - Set the AUX_PILOT_QOF field of NGHBR_PILOT_REC to QOF_r.
- 3 - Set the AUX_PILOT_WALSH_CODE field of NGHBR_PILOT_REC to
- 4 AUX_PILOT_WALSH_r with the Walsh Code length specified by
- 5 WALSH_LENGTH_r.
- 6 • If NGHBR_PILOT_REC_TYPE_r is equal to '010', the mobile station shall:
- 7 - Set the AUX_PILOT_QOF field of NGHBR_PILOT_REC to QOF_r.
- 8 - Set the AUX_PILOT_WALSH_CODE field of NGHBR_PILOT_REC to
- 9 AUX_PILOT_WALSH_r with the Walsh Code length specified by
- 10 WALSH_LENGTH_r.
- 11 - Set the AUX_TD_POWER_LEVEL field of NGHBR_PILOT_REC to
- 12 AUX_TD_POWER_LEVEL_r.
- 13 - Set the TD_MODE field of NGHBR_PILOT_REC to TD_MODE_r.
- 14 • If NGHBR_PILOT_REC_TYPE_r is equal to '011', the mobile station shall:
- 15 - Set the SR3_PRIMARY_PILOT field of NGHBR_PILOT_REC to
- 16 SR3_PRIMARY_PILOT_r.
- 17 - Set the SR3_PILOT_POWER1 field of NGHBR_PILOT_REC to
- 18 SR3_PILOT_POWER1_r.
- 19 - Set the SR3_PILOT_POWER2 field of NGHBR_PILOT_REC to
- 20 SR3_PILOT_POWER2_r.
- 21 • If NGHBR_PILOT_REC_TYPE_r is equal to '100', the mobile station shall:
- 22 - Set the SR3_PRIMARY_PILOT field of NGHBR_PILOT_REC to
- 23 SR3_PRIMARY_PILOT_r.
- 24 - Set the SR3_PILOT_POWER1 field of NGHBR_PILOT_REC to
- 25 SR3_PILOT_POWER1_r.
- 26 - Set the SR3_PILOT_POWER2 field of NGHBR_PILOT_REC to
- 27 SR3_PILOT_POWER2_r.
- 28 - Set the AUX_PILOT_QOF field of NGHBR_PILOT_REC to QOF_r.
- 29 - Set the AUX_PILOT_WALSH_CODE field of NGHBR_PILOT_REC to
- 30 AUX_PILOT_WALSH_r with the Walsh Code length specified by
- 31 WALSH_LENGTH_r.
- 32 - If ADD_INFO_INCL1_r is equal to '1', set the AUX_PILOT_QOF1 field of
- 33 NGHBR_PILOT_REC to QOF1_r and set the AUX_PILOT_WALSH_CODE1 field of
- 34 NGHBR_PILOT_REC to AUX_PILOT_WALSH1_r with the Walsh Code length
- 35 specified by WALSH_LENGTH1_r.

- 1 - Otherwise, set the AUX_PILOT_QOF1 field of NGHBR_PILOT_REC to QOF_r and
 2 set the AUX_PILOT_WALSH_CODE1 field of NGHBR_PILOT_REC to
 3 AUX_PILOT_WALSH_r with the Walsh Code length specified by
 4 WALSH_LENGTH_r.
- 5 - If ADD_INFO_INCL2_r is equal to '1', set the AUX_PILOT_QOF2 field of
 6 NGHBR_PILOT_REC to QOF2_r and set the AUX_PILOT_WALSH_CODE2 field of
 7 NGHBR_PILOT_REC to AUX_PILOT_WALSH2_r with the Walsh Code length
 8 specified by WALSH_LENGTH2_r.
- 9 - Otherwise, set the AUX_PILOT_QOF2 field of NGHBR_PILOT_REC to QOF_r and
 10 set the AUX_PILOT_WALSH_CODE2 field of NGHBR_PILOT_REC to
 11 AUX_PILOT_WALSH_r with the Walsh Code length specified by
 12 WALSH_LENGTH_r.

13 If HRPD_NGHBR_INCL_r equals '1', the mobile station shall set NUM_HRPD_NGHBR_s to
 14 NUM_HRPD_NGHBR_r, the number of neighboring HRPD systems contained in the *General*
 15 *Neighbor List Message*. For each of the neighboring HRPD systems contained in the
 16 *General Neighbor List Message*, the mobile station shall perform the following:

- 17 • Set the PN field of HRPD_NGHBR_LIST[i] to the ith occurrence of NGHBR_PN_r.
- 18 • Set the BAND_CLASS field of HRPD_NGHBR_LIST[i] to the ith occurrence of
 19 NGHBR_BAND_r if NGHBR_FREQ_INCL_r equals '1'; otherwise, set the BAND_CLASS
 20 field of HRPD_NGHBR_LIST[i] to CDMABAND_s.
- 21 • Set the CDMA_FREQ field of HRPD_NGHBR_LIST[i] to the ith occurrence of
 22 NGHBR_FREQ_r if NGHBR_FREQ_INCL_r equals '1'; otherwise, set the BAND_CLASS
 23 field of HRPD_NGHBR_LIST[i] to CDMACH_s.
- 24 • Set the PN_ASSOCIATION field of HRPD_NGHBR_LIST[i] to the ith occurrence of
 25 PN_ASSOCIATION_IND_r.
- 26 • Set the DATA_ASSOCIATION field of HRPD_NGHBR_LIST[i] to the ith occurrence of
 27 DATA_ASSOCIATION_IND_r.

28 2.6.2.2.9 User Zone Identification Message

29 Whenever a *User Zone Identification Message* is received on the Paging Channel or Primary
 30 Broadcast Control Channel, and if the mobile station supports Tiered Services, the mobile
 31 station shall compare the configuration message sequence number, CONFIG_MSG_SEQ_r,
 32 to that stored in USER_ZONE_ID_MSG_SEQ_s. If the comparison results in a match, the
 33 mobile station may ignore the message. If the comparison results in a mismatch, then the
 34 mobile station shall process the remaining fields in the message as follows.

35 The mobile station shall store the following parameters:

- 36 • Configuration message sequence number
 37 (CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
 38 USER_ZONE_ID_MSG_SEQ_s = CONFIG_MSG_SEQ_r)
- 39 • UZ_EXIT_RCVD_s = UZ_EXIT_r

1 The mobile station shall set NUM_UZID_S to the number of User Zones contained in the *User*
2 *Zone Identification Message*.

3 For each User Zone contained in the *User Zone Identification Message*, the mobile station
4 shall perform the following:

- 5 • Set the UZID field of UZ_REC(i) to the ith occurrence of UZID_r.
- 6 • Set the UZ_REV field of the UZ_REC(i) to the ith occurrence of UZ_REV_r.
- 7 • Set the TEMP_SUB field of the UZ_REC(i) to the ith occurrence of TEMP_SUB_r.

8 2.6.2.2.10 Private Neighbor List Message

9 Whenever a *Private Neighbor List Message* is received on the Paging Channel or Primary
10 Broadcast Control Channel, and if the mobile station supports Tiered Services, the mobile
11 station shall compare the configuration message sequence number, CONFIG_MSG_SEQ_r,
12 to that stored in PRI_NGHBR_LST_MSG_SEQ_S. If the comparison results in a match, the
13 mobile station may ignore the message. If the comparison results in a mismatch, then the
14 mobile station shall process the remaining fields in the message as follows.

15 The mobile station shall store the following parameters:

- 16 • Configuration message sequence number
17 (CONFIG_MSG_SEQ_S = CONFIG_MSG_SEQ_r,
18 PRI_NGHBR_LST_MSG_SEQ_S = CONFIG_MSG_SEQ_r)
- 19 • Common configuration included indicator (COMMON_INCL_S = COMMON_INCL_r)

20 The mobile station shall set NUM_PRI_NGHBR_S to the number of Private Neighbor base
21 stations contained in the *Private Neighbor List Message*.

22 For each Private Neighbor base station contained in the *Private Neighbor List Message* the
23 mobile station shall perform the following:

- 24 • Set the SRCH_WIN_PRI_NGHBR field of PRI_NGHBR_REC(i) to SRCH_WIN_PN_r.
- 25 • Set the SID field of PRI_NGHBR_REC(i) to the ith occurrence SID_r.
- 26 • Set the NID field of PRI_NGHBR_REC(i) to the ith occurrence NID_r.
- 27 • Set the PRI_NGHBR_PN field of PRI_NGHBR_REC(i) to the ith occurrence
28 PRI_NGHBR_PN_r.
- 29 • If COMMON_INCL_r is equal to '1', then the mobile station shall:
 - 30 - Set the BAND_CLASS field of PRI_NGHBR_REC(i) to COMMON_BAND_CLASS_r.
 - 31 - Set the NGHBR_FREQ field of PRI_NGHBR_REC(i) to COMMON_NGHBR_FREQ_r.
- 32 • If COMMON_INCL_r is equal to '0', then the mobile station shall:
 - 33 - Set the BAND_CLASS field of PRI_NGHBR_REC(i) to the ith occurrence of
34 BAND_CLASS_r.
 - 35 - Set the NGHBR_FREQ field of PRI_NGHBR_REC(i) to the ith occurrence of
36 NGHBR_FREQ_r.

- 1 • If i^{th} occurrence of UZID_INCL_r is equal to '0', then the mobile station shall set the
2 PS_NUM_UZID field of $\text{PRI_NGHBR_REC}(i)$ to '0000'.
- 3 • If i^{th} occurrence of UZID_INCL_r is equal to '1', then the mobile station shall set the
4 PS_NUM_UZID field of $\text{PRI_NGHBR_REC}(i)$ to the NUM_UZID_r associated with the i^{th}
5 occurrence of UZID_INCL_r .
- 6 • For each User Zone supported by the i^{th} private system, the mobile station shall
7 perform the following:
 - 8 - Set the $\text{PS_UZID}(j)$ field of $\text{PRI_NGHBR_REC}(i)$ to the j^{th} occurrence of UZID_r .
 - 9 - Set the $\text{PS_UZ_REV}(j)$ field of $\text{PRI_NGHBR_REC}(i)$ to the j^{th} occurrence of
10 UZ_REV_r .
 - 11 - Set the $\text{PS_TEMP_SUB}(j)$ field of $\text{PRI_NGHBR_REC}(i)$ to the j^{th} occurrence of
12 TEMP_SUB_r .

13 2.6.2.2.11 Extended Global Service Redirection Message

14 Whenever an *Extended Global Service Redirection Message* is received on the Paging
15 Channel or Primary Broadcast Control Channel, the configuration message sequence
16 number, CONFIG_MSG_SEQ_r , shall be compared to that stored in
17 $\text{EXT_GLOB_SERV_REDIR_MSG_SEQ}_s$. If the comparison results in a match, the mobile
18 station may ignore the message. If the comparison results in a mismatch, the mobile
19 station shall store the following parameters:

- 20 • Configuration message sequence number
21 $(\text{CONFIG_MSG_SEQ}_s = \text{CONFIG_MSG_SEQ}_r,$
22 $\text{GLOB_SERV_REDIR_MSG_SEQ}_s = \text{CONFIG_MSG_SEQ}_r,$
23 $\text{EXT_GLOB_SERV_REDIR_MSG_SEQ}_s = \text{CONFIG_MSG_SEQ}_r)$

24 The mobile station shall perform the following:

- 25 • The mobile station shall set $(\text{RETURN_IF_FAIL}_s = \text{RETURN_IF_FAIL}_r),$
26 TEMP_TMSI_CODE to TMSI_CODE_{s-p} , and clear the REDIRECT_REC_LIST . For i
27 = 1 to $(\text{NUM_ADD_RECORD}_r + 1)$, the mobile station shall perform the following:
 - 28 - If all the following conditions are satisfied from the i^{th} redirection record:
 - 29 + The subfield corresponding to the access overload class, ACCOLC_p , of the
30 mobile station is set equal to '1' in the REDIRECT_ACCOLC_r field or
31 $\text{ADD_REDIRECT_ACCOLC}_r$ of the i^{th} redirection record.
 - 32 + MOB_P_REV_p is in the redirection mobile protocol revision range associated
33 with the i^{th} redirection record ($\text{REDIRECT_P_REV_INCL}_r = '1'$ and
34 $\text{EXCL_P_REV_IND}_r = '0'$, and $(\text{REDIRECT_P_MIN}_r \leq \text{MOB_P_REV}_p \leq$
35 $\text{REDIRECT_P_MAX}_r)$ where i is equal to 1).
 - 36 + MOB_P_REV_p is not in any of the excluded mobile protocol revision range
37 associated with the i^{th} redirection record ($\text{REDIRECT_P_REV_INCL}_r = '1'$ and
38 $\text{EXCL_P_REV_IND}_r = '1'$ and $(\text{MOB_P_REV}_p < \text{REDIRECT_P_MIN}_r$ or
39 $\text{MOB_P_REV}_p > \text{REDIRECT_P_MAX}_r)$).

- 1 + Type of redirection as specified by RECORD_TYPE_r (*i* is equal to 1) or
2 ADD_RECORD_TYPE_r is supported.
- 3 + BAND_CLASS_r is supported (RECORD_TYPE_r = '00000010' or
4 ADD_RECORD_TYPE_r = '00000010').
- 5 + At least one of the CDMA_CHAN_r is supported for at least one band subclass
6 (when included) corresponding to REDIRECT_SUBCLASS_r = '1'.
7 (RECORD_TYPE_r = '00000010' or ADD_RECORD_TYPE_r = '00000010').
- 8 then mobile station shall store the following parameters from the redirection
9 record:
- 10 + Set DELETE_TMSI field of REDIRECT_REC_LIST[*j*] to DELETE_TMSI_r (*i* is
11 equal to 1) or ADD_DELETE_TMSI_r, where *j* (i.e., the initial *j* value is set to
12 0) is incremented by 1 whenever the *i*th redirection record satisfies the
13 redirection record selection conditions above.
- 14 + Set REDIRECT_REC_LIST[*j*] to the *i*th redirection record from the received
15 message.
- 16 + Set RECORD_TYPE field of REDIRECT_REC_LIST[*j*] to RECORD_TYPE_r (*i* is
17 equal to 1) or ADD_RECORD_TYPE_r.
- 18 + If RECORD_TYPE_r = '00000001' (*i* is equal to 1) or ADD_RECORD_TYPE_r =
19 '00000001', the mobile station shall:
- 20 ○ Set CDMA_MODE_s to '1'
- 21 ○ Set DIGITAL_REG field of REDIRECT_REC_LIST[*j*] to '00000000'.
- 22 ○ Set MAX_REDIRECT_DELAY field of REDIRECT_REC_LIST[*j*] to
23 MAX_REDIRECT_DELAY_r.
- 24 + If LAST_SEARCH_RECORD_IND_r or ADD_LAST_SEARCH_RECORD_IND_r is
25 equal to '1', the mobile station shall ignore the rest of the message.
- 26 • If REDIRECT_REC_LIST[*j*] is not empty, the mobile station shall enter the *System*
27 *Determination Substate* of the *Mobile Station Initialization State* with a redirection
28 indication (see 2.6.1.1); otherwise, the mobile station shall ignore the *Extended*
29 *Global Service Redirection Message*.

30 2.6.2.2.12 Extended CDMA Channel List Message Overview

31 The mobile station may receive the *Extended CDMA Channel List Message* from the Paging
32 Channel or from the Primary Broadcast Control Channel. The mobile station shall follow
33 requirements defined in 2.6.2.2.12.1 or 2.6.2.2.12.2 to process the *Extended CDMA*
34 *Channel List Message*.

35 2.6.2.2.12.1 Extended CDMA Channel List Message on Paging Channel

36 Whenever an *Extended CDMA Channel List Message* is received on the Paging Channel, the
37 mobile station shall compare the configuration message sequence number,
38 CONFIG_MSG_SEQ_r, to that stored in EXT_CHAN_LST_MSG_SEQ_s. If the comparison
39 results in a match, the mobile station may ignore the message. If the comparison results

1 in a mismatch, then the mobile station shall process the remaining fields in the message as
2 follows:

3 If the *Extended CDMA Channel List Message* lists CDMA channels from more than one band
4 class and the mobile station hashes to a band class other than the current band class, the
5 mobile station shall process this message after NGHBR_LST_MSG_SEQ_s,
6 EXT_NGHBR_LST_MSG_SEQ_s and GEN_NGHBR_LST_MSG_SEQ_s become current.

7 The mobile station shall store the following parameters:

- 8 • Configuration message sequence number
9 (CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
10 EXT_CHAN_LST_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
11 CHAN_LST_MSG_SEQ_s = CONFIG_MSG_SEQ_r).

12 The mobile station shall process this message if FD_CHAN_LST_SEQ_s is current and the
13 mobile station does not support any bandclass listed by the base station in the *Flex Duplex*
14 *CDMA Channel List Message* or if the mobile station does not support flexible spacing
15 between forward and reverse channels. Otherwise, the mobile station shall ignore this
16 message.

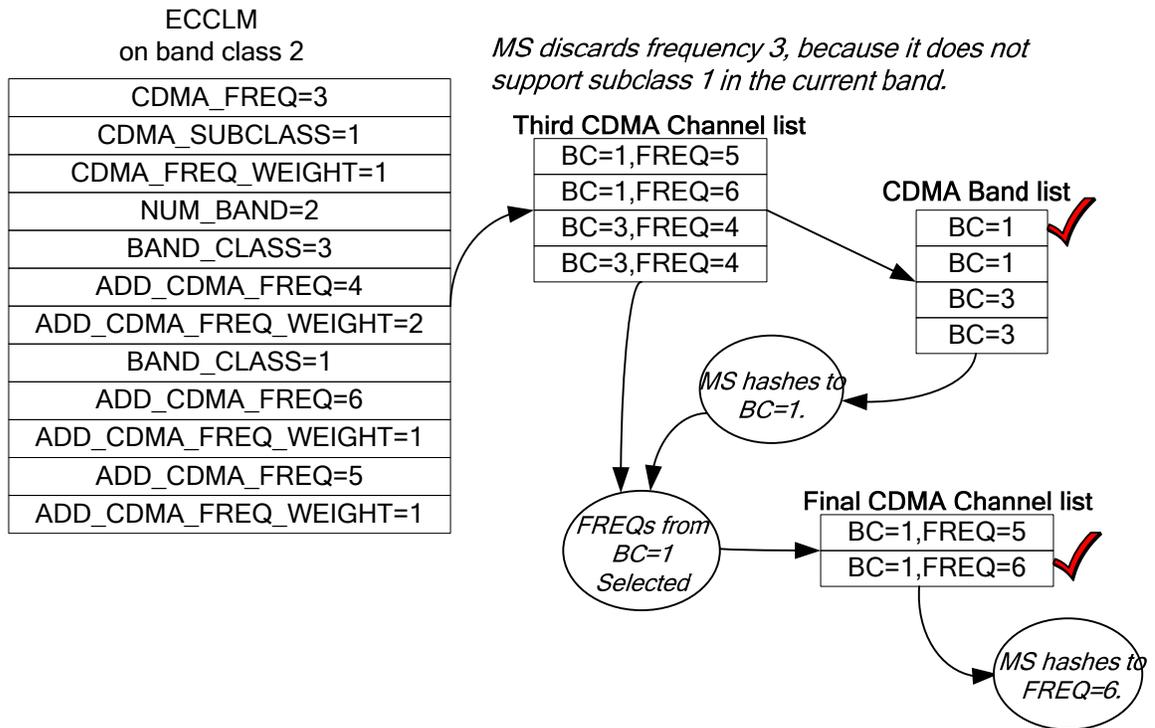

17 The mobile station shall determine the CDMA Channel (Frequency Assignment) for its
18 Paging Channel as follows:

- 19 • Starting from an empty list, the mobile station shall generate the first CDMA
20 Channel list from the *Extended CDMA Channel List Message* as follows:
 - 21 - For each band class record included in this message, the mobile station shall
22 perform the following:
 - 23 + If band subclass information is included for this band class record
24 (SUBCLASS_INFO_INCL_r = '1' or ADD_SUBCLASS_INFO_INCL_r = '1'), the
25 mobile station shall add only those channels belonging to the band class
26 and band subclasses that are supported by both the mobile station and the
27 base station, in the order they appear in the *Extended CDMA Channel List*
28 *Message*³³.
 - 29 + Otherwise (SUBCLASS_INFO_INCL_r = '0', ADD_SUBCLASS_INFO_INCL_r = '0'
30 or P_REV_IN_USE_s is less than 11), the mobile station shall add only those
31 channels that it supports for the associated band class, in the order they
32 appear in the *Extended CDMA Channel List Message*.

³³ The mobile station will not discard frequencies as long as they belong to a subclass that is both listed in the message and supported by the mobile station. If the base station does not list any subclass, the mobile station assumes that all subclasses are supported by the base station. The subclass to frequency mapping is not provided in the *Extended CDMA Channel List Message*; the mobile station needs to refer to [45] to find the mapping.

- 1 - If P_REV_IN_USE_s is greater than or equal to 11, the mobile station shall sort
2 the channels first by the ascending order of band class value, as specified in
3 [30], then by the ascending order of CDMA_FREQ within each band class.
- 4 • If RC_QPCH_SEL_INCL_r is equal to '1' and the mobile station is capable of RC
5 greater than 2 or capable of supporting Quick Paging Channel, the mobile station
6 shall eliminate the channels with RC_QPCH_HASH_IND_r equal to '0' from the first
7 CDMA Channel list to generate the second CDMA Channel list while preserving the
8 order in the first CDMA Channel list. Otherwise, the mobile station shall set the
9 second CDMA Channel list to be equal to the first CDMA Channel list.
- 10 • The mobile station shall generate the third CDMA Channel list as follows.
- 11 - If CDMA_FREQ_WEIGHT_INCL_r is equal to '0', the mobile station shall set the
12 third CDMA Channel list to be equal to the second CDMA Channel list.
- 13 - If CDMA_FREQ_WEIGHT_INCL_r is equal to '1', starting with an empty third
14 CDMA Channel list, for each entry "E" in the second CDMA Channel list in the
15 order they appear, the mobile station shall append N consecutive entries "E" at
16 the end of the third CDMA Channel list, where N is the weight of "E" and equals
17 either CDMA_FREQ_WEIGHT_{r+1} or ADD_CDMA_FREQ_WEIGHT_{r+1}
18 appropriately.
- 19 • The mobile station shall generate a CDMA band list as follows. Starting with an
20 empty CDMA band list, for each channel in the third CDMA Channel list in the
21 order they appear, the mobile station shall append an entry equal to the band class
22 of that channel, at the end of the CDMA band list.
- 23 • The mobile station shall use the hash algorithm specified in 2.6.7.1 and the size of
24 the CDMA band list to compute the band class for its Paging Channel.
- 25 • The mobile station shall eliminate those channels which are not in the computed
26 band class from the third CDMA channel list to generate the final CDMA channel
27 list.
- 28 • If the final CDMA Channel list is empty, the mobile station shall enter the *System*
29 *Determination Substate* with an acquisition failure indication.
- 30 • The mobile station shall then use the hash algorithm specified in 2.6.7.1 and the
31 size of the final CDMA channel list to determine the CDMA Channel (Frequency
32 Assignment) for its Paging Channel.

33 Figure 2.6.2.2.12.1-1 shows an example of the hashing procedure.

Figure 2.6.2.2.12.1-1. Hashing Example

If the CDMA Frequency Assignment has changed but the band class is the same (the computed CDMA Channel is different from CDMACH_s but the computed CDMA band class is the same as CDMABAND_s), the mobile station shall perform the following actions:

- If the stored configuration parameters is not current (see 2.6.2.2) for the corresponding base station and frequency assignment, the mobile station shall perform the following actions:
 - Set CDMACH_s to the new CDMA Channel.
 - Set PAGE_CHAN_s to '1'.
 - Set PAGECH_s to the Primary Paging Channel.

- 1 - Set CONFIG_MSG_SEQ_s, SYS_PAR_MSG_SEQ_s, NGHBR_LST_MSG_SEQ_s,
 2 CHAN_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
 3 FD_CHAN_LST_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s,
 4 GEN_NGHBR_LST_MSG_SEQ_s, EXT_SYS_PAR_MSG_SEQ_s,
 5 GLOB_SERV_REDIR_MSG_SEQ_s, EXT_GLOB_SERV_REDIR_MSG_SEQ_s,
 6 USER_ZONE_IDMSG_SEQ_s, PRI_NGHBR_LST_MSG_SEQ_s,
 7 AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s,
 8 GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s and
 9 ACC_MSG_SEQ_s to NULL. The mobile station shall keep the parameters
 10 associated with the current overhead messages until they are updated on the
 11 new Paging Channel³⁴.
- 12 - Tune to the new CDMA Channel.
- 13 • Otherwise, the mobile station shall perform the following actions:
- 14 - Set CDMACH_s to the new CDMA Channel.
- 15 - The mobile station shall use the hash algorithm specified in 2.6.7.1 to select a
 16 new Paging Channel number in the range 1 to PAGE_CHAN_s, where
 17 PAGE_CHAN_s is the value stored for the Paging Channel whose stored
 18 information is current. The mobile station shall store the new Paging Channel
 19 number as PAGECH_s.
- 20 - Tune to the new CDMA Channel and shall begin monitoring the new Paging
 21 Channel.

22 If the band class has changed (the computed CDMA band class is different than
 23 CDMABAND_s), the mobile station shall perform the following actions:

- 24 • If BYPASS_SYS_DET_IND_s is equal to '0' for this CDMA channel, the mobile station
 25 shall perform the following:
- 26 - Set NEW_BAND_RECORD.NEW_BAND_CLASS to the computed band class
- 27 - Set NEW_BAND_RECORD.NEW_FREQ to the computed CDMA Channel
- 28 - The mobile station shall enter the *System Determination Substate* of the *Mobile*
 29 *Station Initialization State* with a new band indication.
- 30 • If BYPASS_SYS_DET_IND_s is equal to '1' for this CDMA channel, the mobile station
 31 shall perform the following:
- 32 - If the stored configuration parameters is not current (see 2.6.2.2) for the
 33 corresponding base station and frequency assignment, the mobile station shall
 34 perform the following actions:

³⁴ This is primarily needed when hashing to a band with a different coverage footprint than the current band. The current neighbor list is to be used to search for pilots in the hashed-to band. The search priorities are to be adjusted to take into account the hashed-to frequency (e.g., the pilots in the hashed-to frequency should have the highest priority).

- 1 + Set CDMACH_S to the new CDMA Channel.
- 2 + Set CDMABAND_S to the new band class.
- 3 + Set PAGE_CHAN_S to '1'.
- 4 + Set PAGECH_S to the Primary Paging Channel.
- 5 + Set CONFIG_MSG_SEQ_S, SYS_PAR_MSG_SEQ_S, NGHBR_LST_MSG_SEQ_S,
6 CHAN_LST_MSG_SEQ_S, EXT_CHAN_LST_MSG_SEQ_S,
7 FD_CHAN_LST_MSG_SEQ_S, EXT_NGHBR_LST_MSG_SEQ_S,
8 GEN_NGHBR_LST_MSG_SEQ_S, EXT_SYS_PAR_MSG_SEQ_S,
9 GLOB_SERV_REDIR_MSG_SEQ_S, EXT_GLOB_SERV_REDIR_MSG_SEQ_S,
10 USER_ZONE_IDMSG_SEQ_S, PRI_NGHBR_LST_MSG_SEQ_S,
11 AP_PILOT_INFO_MSG_SEQ_S, AP_IDT_MSG_SEQ_S, AP_ID_TEXT_MSG_SEQ_S,
12 GOI_MSG_SEQ_S, FREQ_GOI_MSG_SEQ_S, ATIM_MSG_SEQ_S and
13 ACC_MSG_SEQ_S to NULL. The mobile station shall keep the parameters
14 associated with the current overhead messages until they are updated on
15 the new Paging Channel³⁵.
- 16 + Tune to the new CDMA Channel.
- 17 - Otherwise, the mobile station shall perform the following actions:
- 18 + Set CDMACH_S to the new CDMA Channel.
- 19 + Set CDMABAND_S to the new band class.
- 20 + The mobile station shall use the hash algorithm specified in 2.6.7.1 to select
21 a new Paging Channel number in the range 1 to PAGE_CHAN_S, where
22 PAGE_CHAN_S is the value stored for the Paging Channel whose stored
23 information is current. The mobile station shall store the new Paging
24 Channel number as PAGECH_S.
- 25 + Tune to the new CDMA Channel and shall begin monitoring the new Paging
26 Channel.

27 2.6.2.2.12.2 Extended CDMA Channel List Message on Primary Broadcast Control 28 Channel

29 Whenever the *Extended CDMA Channel List Message* is received on the Primary Broadcast
30 Control Channel, the mobile station shall compare the configuration message sequence
31 number, CONFIG_MSG_SEQ_T, to that stored in CONFIG_MSG_SEQ_S. If the comparison
32 results in a match, the mobile station may ignore the message. If the comparison results

³⁵ This is primarily needed when hashing to a band with a different coverage footprint than the current band. The current neighbor list is to be used to search for pilots in the hashed-to band. The search priorities are to be adjusted to take into account the hashed-to frequency (e.g., the pilots in the hashed-to frequency should have the highest priority).

1 in a mismatch, the mobile station shall process the remaining fields in the message as
2 follows:

3 If the *Extended CDMA Channel List Message* lists CDMA channels from more than one band
4 class and the mobile station hashes to a band class other than the current band class, the
5 mobile station shall process this message after UNI_NGHBR_LST_MSG_SEQ_s becomes
6 current.

7 The mobile station shall store the following parameters:

- 8 • Configuration message sequence number
9 (CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
10 EXT_CHAN_LST_MSG_SEQ_s = CONFIG_MSG_SEQ_r).

11 The mobile station shall process this message if FD_CHAN_LST_SEQ_s is current and the
12 mobile station does not support any bandclass listed by the base station in the *Flex Duplex*
13 *CDMA Channel List Message* or if the mobile station does not support flexible spacing
14 between forward and reverse channels. Otherwise, the mobile station shall ignore this
15 message.

16 To determine the CDMA Channel (Frequency Assignment) for its Primary Broadcast Control
17 Channel, the mobile station shall first select a subset of CDMA channels from the *Extended*
18 *CDMA Channel List Message* that will be used for channel hashing. The attributes for
19 channel selection are support for that frequency, the band subclass (if included), RC
20 greater than 2, Quick Paging Channel and transmit diversity. The mobile station shall first
21 select the entire CDMA channel list for channel hashing. Starting from an empty list, the
22 mobile station shall then select the first CDMA Channel list as follows:

- 23 • For each band class record included in this message, the mobile station shall
24 perform the following:
 - 25 - If band subclass information is included for this band class record
26 (SUBCLASS_INFO_INCL_r = '1' or ADD_SUBCLASS_INFO_INCL_r = '1'), the mobile
27 station shall add only those channels belonging to the band class and band
28 subclasses that are supported by both the mobile station and the base station,
29 in the order they appear in the *Extended CDMA Channel List Message*³⁶.
 - 30 - Otherwise (SUBCLASS_INFO_INCL_r = '0', ADD_SUBCLASS_INFO_INCL_r = '0' or
31 P_REV_IN_USE_s is less than 11), the mobile station shall add only those
32 channels that it supports for the associated band class, in the order they appear
33 in the *Extended CDMA Channel List Message*.

³⁶ The mobile station will not discard frequencies as long as they belong to a subclass that is both listed in the message and supported by the mobile station. If the base station does not list any subclass, the mobile station assumes that all subclasses are supported by the base station. The subclass to frequency mapping is not provided in the *Extended CDMA Channel List Message*; the mobile station needs to refer to [45] to find the mapping.

- 1 • If $P_REV_IN_USE_S$ is greater than or equal to 11, the mobile station shall sort the
2 channels first by the ascending order of band class value as specified in [30], then
3 by the ascending order of $CDMA_FREQ$ within each band class.
- 4 • If $TD_SEL_INCL_T$ is equal to '1', the mobile station shall perform the following:
- 5 - If the mobile station is capable of supporting the transmit diversity mode
6 specified by TD_MODE_T , the mobile station shall select those CDMA channels
7 that have $TD_HASH_IND_T$ set to '1' from the CDMA channel list for the first
8 CDMA Channel list while preserving the order.
- 9 - If the mobile station is not capable of supporting the transmit diversity mode
10 specified by TD_MODE_T , the mobile station shall select those CDMA channels
11 that have $TD_HASH_IND_T$ set to '0' from the CDMA channel list for the first
12 CDMA Channel list while preserving the order.
- 13 • If $TD_SEL_INCL_T$ is equal to '0', the mobile station shall select the entire list for the
14 first CDMA Channel list.

15 From this first CDMA Channel list, the mobile station shall select the second CDMA
16 Channel list as follows:

- 17 • If $RC_QPCH_SEL_INCL_T$ is equal to '1' and the mobile station is capable of RC
18 greater than 2 or capable of supporting QPCH, the mobile station shall select those
19 CDMA channels with $RC_QPCH_HASH_IND_T$ set to '1' for the second CDMA
20 Channel list for CDMA channel hashing while preserving the order. If this list is
21 empty, the mobile station shall use the first CDMA Channel list as the second
22 CDMA Channel list for CDMA channel hashing.
- 23 • Otherwise, the mobile station shall use the first CDMA Channel list as the second
24 CDMA Channel list for CDMA channel hashing.

25 From this second CDMA Channel list, the mobile station shall select the third CDMA
26 Channel list subset as follows:

- 27 • If $CDMA_FREQ_WEIGHT_INCL_T$ is equal to '0', the mobile station shall set the third
28 CDMA Channel list to be equal to the second CDMA Channel list
- 29 • If $CDMA_FREQ_WEIGHT_INCL_T$ is equal to '1', starting with an empty third CDMA
30 Channel list, for each entry "E" in the second CDMA Channel list in the order they
31 appear, the mobile station shall append N consecutive entries "E" at the end of the
32 third CDMA Channel, where N is the weight of "E" and equals either
33 $CDMA_FREQ_WEIGHT_{T+1}$ or $ADD_CDMA_FREQ_WEIGHT_{T+1}$ appropriately

34 The mobile station shall determine the band class for its Primary Broadcast Control
35 Channel as follows:

- 36 • The mobile station shall generate a CDMA band list as follows. Starting with an
37 empty CDMA band list, for each channel in the third CDMA Channel list in the
38 order they appear, the mobile station shall append an entry equal to the band class
39 of that channel, at the end of the CDMA band list

- 1 • The mobile station shall use the hash algorithm specified in 2.6.7.1 and the size of
2 the CDMA band list to compute the band class for its Primary Broadcast Control
3 Channel.

4 After the band class has been selected, the mobile station shall determine the CDMA
5 Channel (Frequency Assignment) for its Primary Broadcast Control Channel as follows:

- 6 • The mobile station shall eliminate those channels which are not in the computed
7 band class from the third CDMA Channel list to generate the final CDMA Channel
8 list.
- 9 • If the final CDMA Channel list is empty, the mobile station shall enter the *System*
10 *Determination Substate* with an acquisition failure indication
- 11 • The mobile station shall then use the hash algorithm specified in 2.6.7.1 with the
12 number of channels in the final CDMA Channel list to determine the CDMA
13 Channel (Frequency Assignment) for its Primary Broadcast Control Channel.

14 If the CDMA Frequency Assignment has changed but the band class is the same (the
15 computed CDMA Channel is different from CDMACH_s but the computed CDMA band class
16 is CDMABAND_s), the mobile station shall perform the following:

- 17 • Set CDMACH_s to the new CDMA Channel.
- 18 • Set CONFIG_MSG_SEQ_s, A41_SYS_PAR_MSG_SEQ_s, MC_RR_PAR_MSG_SEQ_s,
19 UNI_NGHR_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
20 FD_CHAN_LST_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s, and
21 PRI_NGHR_LST_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s,
22 AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s,
23 ATIM_MSG_SEQ_s and ACC_MSG_SEQ_s to NULL. The mobile station shall keep the
24 parameters associated with the current overhead messages until they are updated
25 on the new Primary Broadcast Control Channel³⁷.
- 26 • If the mobile station is operating in the Spreading Rate 1:
- 27 - If the assigned CDMA channel supports transmit diversity, the mobile station
28 shall set the following fields corresponding to the assigned CDMA channel:
- 29 + SR1_TD_POWER_LEVEL_s = TD_POWER_LEVEL_r.
- 30 + SR1_TD_MODE_s = TD_MODE_r.
- 31 + BRAT_s = SR1_BRAT_TD_s.
- 32 + BCCH_CODE_RATE_s = SR1_CRAT_TD_s.

³⁷ This is primarily needed when hashing to a band with a different coverage footprint than the current band. The current neighbor list is to be used to search for pilots in the hashed-to band. The search priorities are to be adjusted to take into account the hashed-to frequency (e.g., the pilots in the hashed-to frequency should have the highest priority).

- 1 + BCCH_s = BCCH_CODE_CHAN_TD_s.
- 2 - Otherwise, the mobile station shall set the following fields corresponding to the
- 3 assigned CDMA channel:
- 4 + BRAT_s = SR1_BRAT_NON_TD_s,
- 5 + BCCH_CODE_RATE_s = SR1_CRAT_NON_TD_s,
- 6 + BCCH_s = BCCH_CODE_CHAN_NON_TD_s,
- 7 • Tune to the new CDMA Channel

8 If the band class has changed (the computed CDMA band class is different than

9 CDMABAND_s), the mobile station shall perform the following actions:

- 10 • If BYPASS_SYS_DET_IND_r is equal to '0' for this CDMA channel, the mobile station
- 11 shall perform the following:
- 12 - Set NEW_BAND_RECORD.NEW_BAND_CLASS to the computed band class.
- 13 - Set NEW_BAND_RECORD.NEW_FREQ to the computed CDMA Channel.
- 14 - The mobile station shall enter the *System Determination Substate* of the *Mobile*
- 15 *Station Initialization State* with a new band indication.
- 16 • If BYPASS_SYS_DET_IND_r is equal to '1' for this CDMA channel, the mobile station
- 17 shall perform the following:
- 18 - Set CDMACH_s to the new CDMA Channel.
- 19 - Set CDMABAND_s to the new band class.
- 20 - Set CONFIG_MSG_SEQ_s, A41_SYS_PAR_MSG_SEQ_s, MC_RR_PAR_MSG_SEQ_s,
- 21 UNI_NGHBR_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
- 22 FD_CHAN_LST_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s, and
- 23 PRI_NGHBR_LST_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s,
- 24 AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s,
- 25 ATIM_MSG_SEQ_s and ACC_MSG_SEQ_s to NULL. The mobile station shall keep
- 26 the parameters associated with the current overhead messages until they are
- 27 updated on the new Primary Broadcast Control Channel³⁸.
- 28 - If the mobile station is operating in the Spreading Rate 1:
- 29 + If the assigned CDMA channel supports transmit diversity, the mobile
- 30 station shall set the following fields corresponding to the assigned CDMA
- 31 channel:
- 32 ○ SR1_TD_POWER_LEVEL_s = TD_POWER_LEVEL_r.

³⁸ This is primarily needed when hashing to a band with a different coverage footprint than the current band. The current neighbor list is to be used to search for pilots in the hashed-to band. The search priorities are to be adjusted to take into account the hashed-to frequency (e.g., the pilots in the hashed-to frequency should have the highest priority).

- 1 ○ SR1_TD_MODE_S = TD_MODE_T.
- 2 ○ BRAT_S = SR1_BRAT_TD_S.
- 3 ○ BCCH_CODE_RATE_S = SR1_CRAT_TD_S.
- 4 ○ BCCH_S = BCCH_CODE_CHAN_TD_S.
- 5 - Otherwise, the mobile station shall set the following fields corresponding to the
- 6 assigned CDMA channel:
- 7 + BRAT_S = SR1_BRAT_NON_TD_S,
- 8 + BCCH_CODE_RATE_S = SR1_CRAT_NON_TD_S,
- 9 + BCCH_S = BCCH_CODE_CHAN_NON_TD_S,
- 10 - Tune to the new CDMA Channel

11 2.6.2.2.13 ANSI-41 System Parameters Message

12 Whenever an *ANSI-41 System Parameters Message* is received, the configuration message
 13 sequence number, CONFIG_MSG_SEQ_T, shall be compared to that stored in
 14 A41_SYS_PAR_MSG_SEQ_S. If the comparison results in a match, the mobile station may
 15 ignore the message. If the comparison results in a mismatch, then the mobile station shall
 16 process the remaining fields in the message as described in 2.6.2.2.13.1, 2.6.2.2.13.2,
 17 2.6.2.2.13.3, and 2.6.2.2.13.4.

18 If REG_PRD is not within the valid range specified in 3.7.2.3.2.31, then the mobile station
 19 shall ignore the *ANSI-41 System Parameters Message* that contains it.

20 2.6.2.2.13.1 Stored Parameters

21 The mobile station shall store the following parameters:

- 22 • Configuration message sequence number
 23 (CONFIG_MSG_SEQ_S = CONFIG_MSG_SEQ_T,
 24 A41_SYS_PAR_MSG_SEQ_S = CONFIG_MSG_SEQ_T)
- 25 • Home registration indicator (HOME_REG_S = HOME_REG_T)
- 26 • SID roamer registration indicator (FOR_SID_REG_S = FOR_SID_REG_T)
- 27 • NID roamer registration indicator (FOR_NID_REG_S = FOR_NID_REG_T)
- 28 • Power-up registration indicator (POWER_UP_REG_S = POWER_UP_REG_T)
- 29 • Power-down registration indicator (POWER_DOWN_REG_S = POWER_DOWN_REG_T)
- 30 • Parameter-change registration indicator (PARAMETER_REG_S = PARAMETER_REG_T)
- 31 • Preferred Enhanced Access Channel MSID type
 32 (PREF_MSID_TYPE_S = PREF_MSID_TYPE_T)
- 33 • Extended Preferred Enhanced Access Channel MSID type
 34 (EXT_PREF_MSID_TYPE_S = EXT_PREF_MSID_TYPE_T), if included; otherwise, set
 35 EXT_PREF_MSID_TYPE_S to NULL.

- 1 • MEID Required indicator is included ($MEID_REQD_S = MEID_REQD_R$), if included;
2 otherwise, set $MEID_REQD_S$ to '0'
- 3 • The mobile station shall set its operational IMSI, $IMSI_O$, as follows:
- 4 - If $IMSI_T_SUPPORTED_R$ is equal to '0', the mobile station shall set $IMSI_O$ to
5 $IMSI_M_P$.
- 6 - If $IMSI_T_SUPPORTED_R$ is equal to '1' and the mobile station's $IMSI_T_P$ has been
7 programmed, the mobile station shall set $IMSI_O$ to $IMSI_T_P$.
- 8 - If $IMSI_T_SUPPORTED_R$ is equal to '1' and the mobile station's $IMSI_T_P$ has not
9 been programmed, the mobile station shall set $IMSI_O$ to $IMSI_M_P$.
- 10 - If $IMSI_O$ has been changed, the mobile station shall set
11 $MC_RR_PAR_MSG_SEQ_S$, $EXT_CHAN_LST_MSG_SEQ_S$,
12 $FD_CHAN_LST_MSG_SEQ_S$ to NULL and set NUM_FCCCH_S to '1' and
13 $FCCCH_ID_S$ to '1'.
- 14 • If $OTHER_INFO_INCL_R$ is set to '1', the mobile station shall store:
- 15 - Base station identification ($BASE_ID_S = BASE_ID_R$)
- 16 - If $MCC_R = '111111111'$ and $IMSI_11_12_R = '1111111'$, the mobile station shall
17 set the $IMSI_O$ to $IMSI_M_P$ and store:
- 18 + Mobile Country Code ($MCC_S = MCC_M_P$) and
19 + IMSI 11th and 12th digits ($IMSI_11_12_S = IMSI_M_11_12_P$);
20 - Otherwise, the mobile station shall store:
- 21 + Mobile Country Code ($MCC_S = MCC_R$) and
22 + IMSI 11th and 12th digits ($IMSI_11_12_S = IMSI_11_12_R$).
- 23 - Broadcast GPS assist indicator ($BROADCAST_GPS_ASST_S =$
24 $BROADCAST_GPS_ASST_R$)
- 25 - Signaling encryption supported indicator ($SIG_ENCRYPT_SUP_S =$
26 $SIG_ENCRYPT_SUP_R$)
- 27 • Least significant digit of MNC ($IMSI_10_S = IMSI_10_R$), if included.
- 28 • If $IMSI_O$ is set to the $IMSI_M$, the mobile station shall set:
- 29 - $IMSI_O_S_S$ to $IMSI_M_S_P$ (i.e., $IMSI_O_S1_S$ to $IMSI_M_S1_P$ and $IMSI_O_S2_S$ to
30 $IMSI_M_S2_P$)
- 31 - $IMSI_O_11_12_S$ to $IMSI_M_11_12_P$
- 32 - MCC_O_S to MCC_M_P
- 33 - $IMSI_O_ADDR_NUM_S$ to $IMSI_M_ADDR_NUM_P$
- 34 • If $IMSI_O$ is set to the $IMSI_T$, the mobile station shall set:
- 35 - $IMSI_O_S_S$ to $IMSI_T_S_P$ (i.e., $IMSI_O_S1_S$ to $IMSI_T_S1_P$ and $IMSI_O_S2_S$ to
36 $IMSI_T_S2_P$).

- 1 - IMSI_O_11_12_s to IMSI_T_11_12_p
- 2 - MCC_O_s to MCC_T_p
- 3 - IMSI_O_ADDR_NUM_s to IMSI_T_ADDR_NUM_p
- 4 • Delete foreign TMSI (DELETE_FOR_TMSI_s = DELETE_FOR_TMSI_r)
- 5 • Use TMSI (USE_TMSI_s = USE_TMSI_r)
- 6 • TMSI zone length (TMSI_ZONE_LEN_s = TMSI_ZONE_LEN_r)
- 7 • TMSI zone number (TMSI_ZONE_s = TMSI_ZONE_r)
- 8 • Maximum number of alternative service options (MAX_NUM_ALT_SO_s =
- 9 MAX_NUM_ALT_SO_r).
- 10 • The mobile station shall set all bits of TMSI_CODE_{s-p} to '1' if all of the following
- 11 conditions are met:
- 12 - The bits of TMSI_CODE_{s-p} are not all equal to '1',
- 13 - DELETE_FOR_TMSI_s is equal to '1', and
- 14 - ASSIGNING_TMSI_ZONE_LEN_{s-p} is not equal to TMSI_ZONE_LEN_s, or the least
- 15 significant ASSIGNING_TMSI_ZONE_LEN_{s-p} octets of
- 16 ASSIGNING_TMSI_ZONE_{s-p} are not equal to TMSI_ZONE_s.
- 17 • Message integrity supported indicator (MSG_INTEGRITY_SUP_s =
- 18 MSG_INTEGRITY_SUP_r), if P_REV_IN_USE_s is greater than or equal to 10;
- 19 otherwise, MSG_INTEGRITY_SUP_s = 0.
- 20 • If MSG_INTEGRITY_SUP_r is equal to '1' and SIG_INTEGRITY_SUP_INCL_r is equal to
- 21 '1', the mobile station shall store the message integrity algorithms that the base
- 22 station supports (SIG_INTEGRITY_SUP_s = SIG_INTEGRITY_SUP_r); otherwise, the
- 23 mobile station shall set SIG_INTEGRITY_SUP_s to '00000000'.
- 24 If the mobile station supports packet data service options, the mobile station shall store the
- 25 packet data services zone identifier (PACKET_ZONE_ID_s = PACKET_ZONE_ID_r); otherwise,
- 26 the mobile station shall set PACKET_ZONE_ID_s to '00000000'.
- 27 If the mobile station supports packet data service options and the PZ_HYST_ENABLED field
- 28 is included, the mobile station shall store the packet zone hysteresis enabled indicator
- 29 (PZ_HYST_ENABLED_s = PZ_HYST_ENABLED_r); otherwise, the mobile station shall set
- 30 PZ_HYST_ENABLED_s to '1'.
- 31 If the mobile station supports packet data service options and the PZ_HYST_LIST_LEN field
- 32 is included, the mobile station shall store the packet zone hysteresis list length
- 33 (PZ_HYST_LIST_LEN_s = PZ_HYST_LIST_LEN_r); otherwise, the mobile station shall set
- 34 PZ_HYST_LIST_LEN_s to 4.
- 35 If the mobile station supports packet data service options and the PZ_HYST_ACT_TIMER
- 36 field is included, the mobile station shall store the packet zone hysteresis activation timer
- 37 (PZ_HYST_ACT_TIMER_s = PZ_HYST_ACT_TIMER_r); otherwise, the mobile station shall set
- 38 PZ_HYST_ACT_TIMER_s to 30 seconds.

1 If the mobile station supports packet data service options and the PZ_HYST_TIMER_MUL
 2 field and the PZ_HYST_TIMER_EXP field are included, the mobile station shall store the
 3 packet zone hysteresis timer ($PZ_HYST_TIMER_S = PZ_HYST_TIMER_MUL_T \times 8 \wedge$
 4 $PZ_HYST_TIMER_EXP_T$); otherwise, the mobile station shall set PZ_HYST_TIMER_S to 60
 5 seconds.

6 If the mobile station supports the *Device Information Message* on the r-csch, the mobile
 7 station shall store:

- 8 • Autonomous message supported indicator
 9 (AUTO_MSG_SUPPORTED_S = AUTO_MSG_SUPPORTED_T)

10 If AUTO_MSG_SUPPORTED_T is equal to '1' and the mobile station supports the *Device*
 11 *Information Message* on the r-csch, the mobile station shall store:

- 12 • Autonomous message interval
 13 (AUTO_MSG_INTERVAL_S = AUTO_MSG_INTERVAL_T)

14 The mobile station shall store concurrent service supported indicator (CS_SUPPORTED_S=
 15 CS_SUPPORTED_T).

16 Maximum number of additional service reference identifiers allowed in origination
 17 ($MAX_ADD_SERV_INSTANCE_S = MAX_ADD_SERV_INSTANCE_T$), if included; otherwise, the
 18 mobile station shall set MAX_ADD_SERV_INSTANCE_S to 0.

19 The mobile station shall store mobile station initiated position location determination
 20 supported indicator ($MS_INIT_POS_LOC_SUP_IND_S = MS_INIT_POS_LOC_SUP_IND_T$).

21 The mobile station shall also perform the following:

- 22 • If the mobile station is not in the *Origination Attempt Substate*, or *Page Response*
 23 *Substate*, the mobile station shall store the following prior to storing the remaining
 24 parameters:
 - 25 - Registered system identification ($REG_SID_S = SID_S$).
 - 26 - Registered network identification ($REG_NID_S = NID_S$).
 - 27 - Registered registration zone ($REG_REG_ZONE_S = REG_ZONE_S$).
 - 28 - Registered zone timer length ($REG_ZONE_TIMER_S = ZONE_TIMER_T$).
- 29 • System identification ($SID_S = SID_T$)
- 30 • Network identification ($NID_S = NID_T$)
- 31 • Registration zone ($REG_ZONE_S = REG_ZONE_T$)
- 32 • Number of registration zones to be retained ($TOTAL_ZONES_S = TOTAL_ZONES_T$)
- 33 • Zone timer length ($ZONE_TIMER_S = ZONE_TIMER_T$)
- 34 • Multiple SID storage indicator ($MULT_SIDS_S = MULT_SIDS_T$)
- 35 • Multiple NID storage indicator ($MULT_NIDS_S = MULT_NIDS_T$)
- 36 • Registration period ($REG_PRD_S = REG_PRD_T$)

- 1 • If DIST_REG_INCL is equal to '1', the mobile station shall store:
 - 2 - Registration distance ($REG_DIST_S = REG_DIST_R$)
- 3 • If DIST_REG_INCL is equal to '0', then the mobile station shall set REG_DIST_S equal
 - 4 to '0000000000'.
- 5 • If $TKZ_MODE_SUPPORTED_R$ is not included, the mobile station shall set
 - 6 $TKZ_MODE_SUPPORTED_S$ to '0'; otherwise, the mobile station shall set
 - 7 $TKZ_MODE_SUPPORTED_S$ to $TKZ_MODE_SUPPORTED_R$. If
 - 8 $TKZ_MODE_SUPPORTED_S$ is equal to '1', the mobile station shall store the tracking
 - 9 zone identifier ($TKZ_ID_S = TKZ_ID_R$).

10 The mobile station shall ignore any fields at the end of the *ANSI-41 System Parameters*
 11 *Message* that are not defined according to the protocol revision level ($MOB_P_REV_P$ of the
 12 current band class) being used by the mobile station.

13 2.6.2.2.13.2 Roaming Status

14 The mobile station shall determine the roaming status for the mobile station (see 2.6.5.3).
 15 The mobile station should indicate to the user whether the mobile station is roaming.

16 2.6.2.2.13.3 Registration

17 The mobile station shall update stored variables and perform other registration procedures
 18 as specified in 2.6.5.5.2.2.

19 2.6.2.2.13.4 PACA Disable for SID Change

20 If $PACA_S$ is equal to enabled, and SID_S is not equal to $PACA_SID_S$, the mobile station shall
 21 set $PACA_S$ to disabled and $PACA_CANCEL$ to '0', shall disable the PACA state timer, and
 22 should indicate to the user that the PACA call has been canceled

23 2.6.2.2.14 MC-RR Parameters Message

24 Whenever an *MC-RR Parameters Message* is received, the configuration message sequence
 25 number, $CONFIG_MSG_SEQ_R$, shall be compared to that stored in
 26 $MC_RR_PAR_MSG_SEQ_S$. If the comparison results in a match, the mobile station may
 27 ignore the message. If the comparison results in a mismatch, then the mobile station shall
 28 process the remaining fields in the message as described in 2.6.2.2.14.1, 2.6.2.2.14.2, and
 29 2.6.2.2.14.3.

30 If the protocol revision level supported by the mobile station ($MOB_P_REV_P$) is less than the
 31 minimum protocol revision level supported by the base station ($MIN_P_REV_R$), the mobile
 32 station shall enter the *System Determination Substate* of the *Mobile Station Initialization State*
 33 with a protocol mismatch indication (see 2.6.1.1).

34 If $BASE_LAT$, $BASE_LONG$, or PWR_REP_THRESH is not within the valid ranges specified
 35 in 3.7.2.3.2.31, then the mobile station shall ignore the *MC-RR Parameters Message* that
 36 contains them.

37 If the mobile station supports Spreading Rate 3 on the common channel and $SR3_INCL_S$ is
 38 equal to '1', the mobile station shall set:

- 1 • $BRAT_s = SR3_BRAT_r$,
- 2 • $BCCH_s = SR3_BCCH_CODE_CHAN_r$;
- 3 • $BCCH_CODE_RATE_s = 1/3$;
- 4 • $SR3_PRIMARY_PILOT_s = SR3_PRIMARY_PILOT_r$;
- 5 • $SR3_PILOT_POWER1_s = SR3_PILOT_POWER1_r$;
- 6 • $SR3_PILOT_POWER2_s = SR3_PILOT_POWER2_r$;
- 7 • If $SR3_CENTER_FREQ_INCL_r$ is equal to '1', $POTENTIAL_CDMACH_s =$
- 8 $SR3_CENTER_FREQ_r$.

9 If $POTENTIAL_CDMACH_s$ is different from $CDMACH_s$, the mobile station shall set
 10 $CDMACH_s = POTENTIAL_CDMACH_s$ and then tune to the CDMA Channel ($CDMACH_s$).

11 2.6.2.2.14.1 Stored Parameters

12 The mobile station shall store the following parameters:

- 13 • Configuration message sequence number
 14 ($CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r$,
 15 $MC_RR_PAR_MSG_SEQ_s = CONFIG_MSG_SEQ_r$)
- 16 • Base station identification ($BASE_ID_s = BASE_ID_r$)
- 17 • Protocol revision level ($P_REV_s = P_REV_r$)
- 18 • Protocol revision level currently in use ($P_REV_IN_USE_s =$ the lesser value of
 19 P_REV_s and $MOB_P_REV_p$ of the current band class)
- 20 • Minimum protocol revision level ($MIN_P_REV_s = MIN_P_REV_r$).
- 21 • Search window size for the Active Set and Candidate Set
 22 ($SRCH_WIN_A_s = SRCH_WIN_A_r$)
- 23 • Search window size for the Remaining Set ($SRCH_WIN_R_s = SRCH_WIN_R_r$)
- 24 • Pilot detection threshold ($T_ADD_s = T_ADD_r$)
- 25 • Pilot drop threshold ($T_DROP_s = T_DROP_r$)
- 26 • Active Set versus Candidate Set comparison threshold ($T_COMP_s = T_COMP_r$)
- 27 • Drop timer value ($T_TDROP_s = T_TDROP_r$)
- 28 • Drop timer range value ($T_TDROP_RANGE_s = T_TDROP_RANGE_r$) if
 29 $T_TDROP_RANGE_INCL_r$ is equal to '1'; otherwise, $T_TDROP_RANGE_s = '0000'$
- 30 • Maximum age for retention of Neighbor Set members
 31 ($NGHBR_MAX_AGE_s = NGHBR_MAX_AGE_r$)
- 32 • Slope of the handoff add/drop criterion ($SOFT_SLOPE_s = SOFT_SLOPE_r$)
- 33 • Intercept of the handoff add criterion ($ADD_INTERCEPT_s = ADD_INTERCEPT_r$)
- 34 • Intercept of the handoff drop criterion ($DROP_INTERCEPT_s = DROP_INTERCEPT_r$)

- 1 • If ENC_SUPPORTED_r is equal to '1', the mobile station shall store:
- 2 - Signaling encryption supported indicator (SIG_ENCRYPT_SUP_s =
- 3 SIG_ENCRYPT_SUP_r)
- 4 - User information encryption supported indicator (UI_ENCRYPT_SUP_s =
- 5 UI_ENCRYPT_SUP_r)

6 If P_REV_IN_USE_s has been changed, the mobile station shall set ACC_MSG_SEQ_s,
7 CURR_ACC_MSG_SEQ, A41_SYS_PAR_MSG_SEQ_s, UNI_NGHBR_LST_MSG_SEQ_s, and
8 EXT_GLOB_SERV_REDIR_MSG_SEQ_s to NULL.

9 If CCH_INFO_INCL_r is equal to '1', the mobile station shall store:

- 10 • If MCC_r = '111111111' and IMSI_11_12_r = '111111', the mobile station shall set
11 the IMSI_O to IMSI_M_p and store:
- 12 - Mobile Country Code (MCC_s = MCC_{M_p}) and
- 13 - IMSI 11th and 12th digits (IMSI_11_12_s = IMSI_M_11_12_p);
- 14 • Otherwise, the mobile station shall store:
- 15 - Mobile Country Code (MCC_s = MCC_r) and
- 16 - IMSI 11th and 12th digits (IMSI_11_12_s = IMSI_11_12_r).
- 17 • Least significant digit of MNC (IMSI_10_s = IMSI_10_r), if included.
- 18 • If IMSI_O has been changed, the mobile station shall set
19 EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s to NULL, and set
20 NUM_FCCCH_s to '1' and FCCCH_ID_s to '1'.
- 21 • *Extended Global Service Redirection Message* sent
22 (EXT_GLOBAL_REDIRECT_s = EXT_GLOBAL_REDIRECT_r) if included; otherwise,
23 EXT_GLOBAL_REDIRECT_s = '0'
- 24 • *User Zone Identification Message* sent
25 (USER_ZONE_ID_s = USER_ZONE_ID_r) if included; otherwise, USER_ZONE_ID_s = '0'
- 26 • *Private Neighbor List Message* sent
27 (PRI_NGHBR_LST_s = PRI_NGHBR_LST_r) if included; otherwise,
28 PRI_NGHBR_LST_s = '0'
- 29 • *ANSI-41 RAND Message* sent
30 (SENDING_RAND_s = SENDING_RAND_r) if included; otherwise,
31 SENDING_RAND_s = '0'
- 32 • *Access Point Pilot Information Message* sent
33 (AP_PILOT_INFO_s = AP_PILOT_INFO_r) if included; otherwise, AP_PILOT_INFO_s = '0'
- 34 If the APPIM_PERIOD_INDEX is included in the message APPIM_PERIOD_INDEX_s =
35 APPIM_PERIOD_INDEX_r. Otherwise, APPIM_PERIOD_INDEX_s = 0.
- 36 • *Access Point Identification Message* sent
37 (AP_IDT_s = AP_IDT_r) if included; otherwise, AP_IDT_s = '0'

- 1 • *Access Point Identification Text Message* sent
2 (AP_ID_TEXT_S = AP_ID_TEXT_T) if included; otherwise, AP_ID_TEXT_S = '0'
- 3 • *General Overhead Information Message* sent
4 (GEN_OVHD_INF_IND_S = GEN_OVHD_INF_IND_T) if included; otherwise,
5 GEN_OVHD_INF_IND_S = '0'

6 If the GEN_OVHD_CYCLE_INDEX is included in the message GEN_OVHD_CYCLE_INDEX_S
7 = GEN_OVHD_CYCLE_INDEX_T. Otherwise, GEN_OVHD_CYCLE_INDEX_S = 0.

- 8 • *Frequent General Overhead Information Message* sent
9 (FREQ_GEN_OVHD_INF_IND_S = FREQ_GEN_OVHD_INF_IND_T) if included; otherwise,
10 FREQ_GEN_OVHD_INF_IND_S = '0'.
- 11 • *Flex Duplex CDMA Channel List Message* sent
12 (FD_CHAN_LST_IND_S = FD_CHAN_LST_IND_T) if included; otherwise,
13 FD_CHAN_LST_IND_S = '0'.
- 14 • *Alternative Technologies Information Message* sent
15 (ATIM_IND_S = ATIM_IND_T) if included; otherwise, ATIM_IND_S = '0'

16 If the ATIM_CYCLE_INDEX is included in the message ATIM_CYCLE_INDEX_S =
17 ATIM_CYCLE_INDEX_T.

18 Otherwise, ATIM_CYCLE_INDEX_S = 0.

- 19 • *Maximum slot cycle index*
20 (MAX_SLOT_CYCLE_INDEX_S = MAX_SLOT_CYCLE_INDEX_T)
- 21 • *BCMC Service Parameters Message* sent
22 (SENDING_BSPM_S = SENDING_BSPM_T), if included; otherwise, set
23 SENDING_BSPM_S to '0'.
- 24 • *BCMC Service Parameters Message* transmission periodicity index
25 (BSPM_PERIOD_INDEX_S = BSPM_PERIOD_INDEX_T) if SENDING_BSPM_T equals '1';
26 otherwise, BSPM_PERIOD_INDEX_S = NULL.
- 27 • BSPM_PERIOD_INDEX_S is not equal to NULL, the mobile station shall set
28 BSPM_WAIT_TIME to $(B + 1) \times 160\text{ms}$ where
- 29
$$B = 2^i \times 16, 0 \leq i \leq 15$$
- 30 and $i = \text{BSPM_PERIOD_INDEX}_S$.
- 31 • Power control reporting threshold (PWR_REP_THRESH_S = PWR_REP_THRESH_T)
- 32 • Power control reporting frame count (PWR_REP_FRAMES_S = PWR_REP_FRAMES_T)
- 33 • Threshold report mode indicator
34 (PWR_THRESH_ENABLE_S = PWR_THRESH_ENABLE_T)
- 35 • Periodic report mode indicator (PWR_PERIOD_ENABLE_S = PWR_PERIOD_ENABLE_T).
- 36 • Power report delay (PWR_REP_DELAY_S = PWR_REP_DELAY_T)
- 37 • System reselection indicator (RESELECT_INCLUDED_S = RESELECT_INCLUDED_T).

- 1 • Pilot reporting indicator ($PILOT_REPORT_S = PILOT_REPORT_T$)
- 2 • Short Data Burst supported indicator ($SDB_SUPPORTED_S = SDB_SUPPORTED_T$)
- 3 • Broadcast GPS Assist Indicator ($BROADCAST_GPS_ASST_S =$
- 4 $BROADCAST_GPS_ASST_T$)
- 5 • Nominal reverse traffic channel output power offset relative to Reverse Pilot Channel
- 6 power ($RLGAIN_TRAFFIC_PILOT_S = RLGAIN_TRAFFIC_PILOT_T$)
- 7 • If NUM_FCCCH_T is not equal to '0':
- 8 - Number of the Forward Common Control Channels ($NUM_FCCCH_S =$
- 9 NUM_FCCCH_T)
- 10 - Data rate for the Forward Common Control Channels ($FCCCH_RATE_S =$
- 11 $FCCCH_RATE_T$)
- 12 - Code rate for the Forward Common Control Channels ($FCCCH_CODE_RATE_S =$
- 13 $FCCCH_CODE_RATE_T$)
- 14 - For $i = 0$ to $NUM_FCCCH_T - 1$, store the channel code index for each Forward
- 15 Common Control Channel ($FCCCH_CODE_CHAN_S[i] = FCCCH_CODE_CHAN_T$)
- 16 • Broadcast index ($BCAST_INDEX_S = BCAST_INDEX_T$)
- 17 • The number of Broadcast Control Channels ($NUM_BCCH_BCAST_S =$
- 18 $NUM_BCCH_BCAST_T$)
- 19 • If $NUM_BCCH_BCAST_T$ is greater than '000', i occurrences of the following fields,
- 20 where i ranges from 1 to $NUM_BCCH_BCAST_T$:
- 21 - Set the Broadcast Control Channel Number (BCN) to $i+1$
- 22 - BCCH Walsh code index ($BCCH_CODE_CHAN[BCN]_S = BCCH_CODE_CHAN[i]_T$)
- 23 - BCCH data rate ($BRAT[BCN]_S = BRAT[i]_T$)
- 24 - BCCH code rate ($BCCH_CODE_RATE[BCN]_S = BCCH_CODE_RATE[i]_T$)
- 25 • Sync ID supported indicator ($USE_SYNC_ID_S = USE_SYNC_ID_T$)
- 26 • Pilot information request supported indicator ($PILOT_INFO_REQ_SUPPORTED_S =$
- 27 $PILOT_INFO_REQ_SUPPORTED_T$).
- 28 • Band class information request indicator ($BAND_CLASS_INFO_REQ_S =$
- 29 $BAND_CLASS_INFO_REQ_T$)
- 30 • Alternate CDMA band class ($ALT_BAND_CLASS_S = ALT_BAND_CLASS_T$), if
- 31 $BAND_CLASS_INFO_REQ_T$ is equal to '1'.
- 32 • Access entry handoff in order and message processing operation indicator
- 33 ($ACC_ENT_HO_ORDER_S = ACC_ENT_HO_ORDER_T$).
- 34 • If $REV_PWR_CNTL_DELAY_INCL$ is equal to '1', reverse power control delay
- 35 ($REV_PWR_CNTL_DELAY_S = REV_PWR_CNTL_DELAY_T$)

- 1 • Permission indicator for the mobile station to request QoS settings in the *Origination*
2 *Message, Origination Continuation Message, or Enhanced Origination Message*
3 (MOB_QOS_s = MOB_QOS_r)
- 4 • If RESELECT_INCLUDED_s is equal to '1', the mobile station shall store:
- 5 - Pilot power threshold (EC_THRESH_s = EC_THRESH_r)
- 6 - Pilot E_c/I₀ threshold (EC_IO_THRESH_s = EC_IO_THRESH_r)
- 7 • Access handoff permitted indicator (ACCESS_HO_s = ACCESS_HO_r)
- 8 • Access probe handoff permitted indicator (ACCESS_PROBE_HO_s =
9 ACCESS_PROBE_HO_r)
- 10 • If ACCESS_PROBE_HO_s is equal to '1', access handoff list update permitted
11 indicator (ACC_HO_LIST_UPD_s = ACC_HO_LIST_UPD_r)
- 12 • Maximum number of times that the mobile station is permitted to perform an
13 access probe handoff (MAX_NUM_PROBE_HO_s = MAX_NUM_PROBE_HO_r)
- 14 • Access handoff permitted for message response indicator (ACCESS_HO_MSG_RSP_s
15 = ACCESS_HO_MSG_RSP_r)
- 16 • Access probe handoff permitted for other messages indicator
17 (ACC_PROBE_HO_OTHER_MSG_s = ACC_PROBE_HO_OTHER_MSG_r)
- 18 • If USER_ZONE_ID_s is equal to '0', then the mobile station shall perform the
19 following:
- 20 - Set USER_ZONE_ID_MSG_SEQ_s to CONFIG_MSG_SEQ_s.
- 21 - Set the UZID field of the UZ_REC to '0000000000000000' for all entries.
- 22 - Set the UZ_REV field of the UZ_REC to '0000' for all entries.
- 23 - Set the TEMP_SUB field of the UZ_REC to '0' for all entries.
- 24 • If USER_ZONE_ID_s is equal to '1' and the mobile station does not support Tiered
25 Services, then the mobile station shall set USER_ZONE_ID_MSG_SEQ_s to
26 CONFIG_MSG_SEQ_s.
- 27 • If PRI_NGHBR_LST_s is equal to '0', then the mobile station shall set
28 PRI_NGHBR_LST_MSG_SEQ_s to CONFIG_MSG_SEQ_s.
- 29 • If PRI_NGHBR_LST_s is equal to '1' and the mobile station does not support Tiered
30 Services, then the mobile station shall set PRI_NGHBR_LST_MSG_SEQ_s to
31 CONFIG_MSG_SEQ_s.
- 32 • If EXT_GLOBAL_REDIRECT_s is equal to '0', then the mobile station shall set
33 EXT_GLOB_SERV_REDIR_MSG_SEQ_s to CONFIG_MSG_SEQ_s.
- 34 • The mobile station shall perform the following:
- 35 - If SENDING_RAND_s is equal to '1', the mobile station shall set AUTH_s to '01';
36 otherwise, the mobile station shall set AUTH_s to '00'.
- 37 • The mobile station shall store the following:

- 1 - Base station latitude ($BASE_LAT_S = BASE_LAT_R$)
- 2 - Base station longitude ($BASE_LONG_S = BASE_LONG_R$)
- 3 • If $CAND_BAND_INFO_REQ_R$ is included, the mobile station shall set
- 4 $CAND_BAND_INFO_REQ_S$ to $CAND_BAND_INFO_REQ_R$; otherwise, the mobile
- 5 station shall set $CAND_BAND_INFO_REQ_S$ to '0'.
- 6 • If $CAND_BAND_INFO_REQ_R$ is set to '1', the mobile station shall store the number of
- 7 candidate band classes minus one ($NUM_CAND_BAND_CLASS_S =$
- 8 $NUM_CAND_BAND_CLASS_R$).
- 9 • If $CAND_BAND_INFO_REQ_R$ is set to '1', the mobile station shall perform the
- 10 following for each occurrence of the $CAND_BAND_CLASS$ record:
- 11 - Set the $CAND_BAND_CLASS$ field of $CAND_BAND_CLASS_REC[i]$ to the i^{th}
- 12 occurrence of $CAND_BAND_CLASS_R$.
- 13 - Set the $SUBCLASS_REC_LEN$ field of $CAND_BAND_CLASS_REC[i]$ to the
- 14 corresponding value of $SUBCLASS_REC_LEN_R$.
- 15 - If the i^{th} occurrence of $SUBCLASS_REC_LEN_R$ field is non-zero, the mobile
- 16 station shall perform the following for each band subclass indicator received:
- 17 + Set the $BAND_SUBCLASS_IND_REC[j]$ field of $CAND_BAND_CLASS_REC[i]$
- 18 to the j^{th} occurrence of $BAND_SUBCLASS_IND_R$ in the
- 19 $CDMA_BAND_CLASS_REC[i]$.
- 20 If $TX_PWR_LIMIT_INCL_R$ is set to '1' and the mobile station is operating in the 1915MHz –
- 21 1920MHz block of the PCS band, the mobile station shall store the transmit power limit
- 22 $TX_PWR_LIMIT_S = (TX_PWR_LIMIT_R - 30dB)$; otherwise, the mobile station shall set
- 23 $TX_PWR_LIMIT_S$ to the limit defined in [11].
- 24 If $CCH_INFO_INCL_R$ is equal to '1' and the mobile station supports the Quick Paging
- 25 Channel operation:
- 26 • The mobile station shall set $QPCH_SUPPORTED_S$ to $QPCH_SUPPORTED_R$.
- 27 • If $QPCH_SUPPORTED_R = '1'$:
- 28 - The mobile station shall set $QPCH_RATE_S$ to $QPCH_RATE_R$.
- 29 - If the mobile station is monitoring the Primary Broadcast Control Channel in
- 30 Spreading Rate 1 and the number of Quick Paging Channels specified in the
- 31 received message (NUM_QPCH_R) is different from NUM_QPCH_S , the mobile
- 32 station shall use the hash algorithm specified in 2.6.7.1 to select a new Quick
- 33 Paging Channel number in the range 1 to NUM_QPCH_R . The mobile station
- 34 shall store the new Quick Paging Channel number as $QPAGECH_S$ and as
- 35 $ASSIGNED_QPAGECH_S$. The mobile station shall then set NUM_QPCH_S to
- 36 NUM_QPCH_R .
- 37 - If the mobile station is monitoring the Primary Broadcast Control Channel in
- 38 Spreading Rate 3 and the number of Quick Paging Channels specified in the

1 received message (NUM_QPCH_r) is different from NUM_QPCH_s, the mobile
 2 station shall perform the following:

- 3 + The mobile station shall use the hash algorithm specified in 2.6.7.1 to select
 4 a new Quick Paging Channel number in the range 1 to NUM_QPCH_r.
- 5 + The mobile station shall store the new Quick Paging Channel number as
 6 QPAGECH_s and as ASSIGNED_QPAGECH_s.
- 7 + For $i = 0$ to NUM_QPCH_s - 1, store the channel code index for each Quick
 8 Paging Channel (QPCH_CODE_CHAN_s[i] = QPCH_CODE_CHAN_r).

- 9 • The mobile station shall set QPCH_POWER_LEVEL_PAGE_s to
 10 QPCH_POWER_LEVEL_PAGE_r.
- 11 • The mobile station shall set QPCH_CCI_SUPPORTED_s to QPCH_CCI_SUPPORTED_r.
- 12 • If QPCH_CCI_SUPPORTED_r = '1', the mobile station shall set
 13 QPCH_POWER_LEVEL_CONFIG_s to QPCH_POWER_LEVEL_CONFIG_r.
- 14 • The mobile station shall set QPCH_BI_SUPPORTED_s to QPCH_BI_SUPPORTED_r.
- 15 • If QPCH_BI_SUPPORTED_r = '1', the mobile station shall set
 16 QPCH_POWER_LEVEL_BCAST_s to QPCH_POWER_LEVEL_BCAST_r.

17 The mobile station shall store the following:

- 18 • CDMA off time report supported indicator
 19 (CDMA_OFF_TIME_REP_SUP_IND_s = CDMA_OFF_TIME_REP_SUP_IND_r)
- 20 • If CDMA_OFF_TIME_REP_SUP_IND_r is equal to '1', the mobile station shall store:
 21 - CDMA off time report threshold (CDMA_OFF_TIME_REP_THRESHOLD_s =
 22 CDMA_OFF_TIME_REP_THRESHOLD_r in units specified by
 23 CDMA_OFF_TIME_REP_UNIT_r)
- 24 • Control Hold Mode supported indicator (CHM_SUPPORTED_s = CHM_SUPPORTED_r)
 25 if included; otherwise, set CHM_SUPPORTED_s to '1'.
- 26 • Release to Idle State allowed indicator (RELEASE_TO_IDLE_IND_s =
 27 RELEASE_TO_IDLE_IND_r).
- 28 • *Reconnect Message* supported indicator
 29 (RECONNECT_MSG_IND_s = RECONNECT_MSG_IND_r).
- 30 • Short Data Burst allowed in *Reconnect Message* allowed indicator
 31 (SDB_IN_RCNM_IND_s = SDB_IN_RCNM_IND_r), if included; otherwise, set
 32 SDB_IN_RCNM_IND_s to '0'.
- 33 • Forward Packet Data Channel supported indicator (FOR_PDCH_SUPPORTED_s =
 34 FOR_PDCH_SUPPORTED_r).
- 35 • PDCH Control Hold Mode supported indicator (PDCH_CHM_SUPPORTED_s =
 36 PDCH_CHM_SUPPORTED_r) if included; otherwise, set PDCH_CHM_SUPPORTED_s to
 37 '0'.

38 The mobile station shall set FOR_PDCH_COMMON_PARMS_s = '0'.

- 1 If both FOR_PDCH_SUPPORTED_r and PDCH_PARAMS_INCL_r are included and equal to '1',
 2 the mobile station shall perform the following:
- 3 • If FOR_PDCH_RLGAIN_INCL_r is included and equal to '1', the mobile station shall
 4 set:
 - 5 - (RLGAIN_ACKCH_PILOT_s = RLGAIN_ACKCH_PILOT_r).
 - 6 - (RLGAIN_CQICH_PILOT_s = RLGAIN_CQICH_PILOT_r).
 - 7 • The mobile station shall set
 8 NUM_SOFT_SWITCHING_FRAMES_s = NUM_SOFT_SWITCHING_FRAMES_r + 1, and
 9 NUM_SOFTER_SWITCHING_FRAMES_s = NUM_SOFTER_SWITCHING_FRAMES_r + 1.
 - 10 • The mobile station shall set
 11 NUM_SOFT_SWITCHING_FRAMES_CHM_s = NUM_SOFT_SWITCHING_FRAMES_r + 1,
 12 and NUM_SOFTER_SWITCHING_FRAMES_CHM_s =
 13 NUM_SOFTER_SWITCHING_FRAMES_r + 1.
 - 14 • The mobile station shall set NUM_SOFT_SWITCHING_SLOTS_s according to Table
 15 3.7.2.3.2.21-9 based on the value of NUM_SOFT_SWITCHING_SLOTS_r.
 - 16 • The mobile station shall set NUM_SOFTER_SWITCHING_SLOTS_s according to Table
 17 3.7.2.3.2.21-9 based on the value of NUM_SOFTER_SWITCHING_SLOTS_r.
 - 18 • The mobile station shall set PDCH_SOFT_SWITCHING_DELAY_s to
 19 PDCH_SOFT_SWITCHING_DELAY_r + 1, and PDCH_SOFTER_SWITCHING_DELAY_s
 20 to PDCH_SOFTER_SWITCHING_DELAY_r + 1.
 - 21 • The mobile station shall set FOR_PDCH_COMMON_PARAMS_s = '1'.
 - 22 • The mobile station shall set WALSH_TABLE_ID_s = WALSH_TABLE_ID_r.
 - 23 • The mobile station shall set NUM_PDCCH_s = NUM_PDCCH_r.
 - 24 • The mobile station shall store FOR_PDCCH_WALSH_s[i] to the ith occurrence of
 25 FOR_PDCCH_WALSH_r.
- 26 The mobile station shall store the following:
- 27 • If NEG_SLOT_CYCLE_INDEX_SUP_r is included and equal to '1', the mobile station
 28 shall set MIN_SLOT_CYCLE_INDEX to -4; otherwise, the mobile station shall set
 29 MIN_SLOT_CYCLE_INDEX to 0.
 - 30 • If RER_MODE_SUPPORTED_r is not included, the mobile station shall set
 31 RER_MODE_SUPPORTED_s to '0'; otherwise, the mobile station shall set
 32 RER_MODE_SUPPORTED_s to RER_MODE_SUPPORTED_r.
 - 33 • If AUTO_FCSO_ALLOWED_r is not included, the mobile station shall set
 34 AUTO_FCSO_ALLOWED_s to '0'; otherwise, the mobile station shall set
 35 AUTO_FCSO_ALLOWED_s to AUTO_FCSO_ALLOWED_r.
- 36 If FOR_PDCH_SUPPORTED_r is equal to '1', then the mobile station shall set Reverse Packet
 37 Data Channel supported indicator (REV_PDCH_SUPPORTED_s =
 38 REV_PDCH_SUPPORTED_r).

1 If $REV_PDCH_PARMS_INCL_T$ is not included, or if it is included and equal to '0', the mobile
 2 station shall set $REV_PDCH_PARMS_INCL_S$ to '0'; otherwise, the mobile station shall set
 3 $REV_PDCH_PARMS_INCL_S$ to '1' and perform the following:

- 4 • If $REV_PDCH_RLGAIN_INCL_T$ is equal to '1', the mobile station shall set:
 - 5 - $(RLGAIN_SPICH_PILOT_S = RLGAIN_SPICH_PILOT_T)$.
 - 6 - $(RLGAIN_REQCH_PILOT_S = RLGAIN_REQCH_PILOT_T)$.
 - 7 - $(RLGAIN_PDCCH_PILOT_S = RLGAIN_PDCCH_PILOT_T)$.
- 8 • If $REV_PDCH_PARMS_1_INCL_T$ is equal to '1', the mobile station shall set:
 - 9 - $(REV_PDCH_TABLE_SEL_S = REV_PDCH_TABLE_SEL_T)$.
 - 10 - $(REV_PDCH_MAX_AUTO_TPR_S$ to $REV_PDCH_MAX_AUTO_TPR_T)$.
 - 11 - $(REV_PDCH_NUM_ARQ_ROUNDS_NORMAL_S =$
 12 $REV_PDCH_NUM_ARQ_ROUNDS_NORMAL_T+1)$.
- 13 • If $REV_PDCH_OPER_PARMS_INCL_T$ is equal to '1', the mobile station shall set:
 - 14 - $(REV_PDCH_MAX_SIZE_ALLOWED_ENCODER_PACKET_S$
 15 $= REV_PDCH_MAX_SIZE_ALLOWED_ENCODER_PACKET_T+1)$.
 - 16 - $(REV_PDCH_DEFAULT_PERSISTENCE_S =$
 17 $REV_PDCH_DEFAULT_PERSISTENCE_T)$.
 - 18 - $(REV_PDCH_RESET_PERSISTENCE_S = REV_PDCH_RESET_PERSISTENCE_T)$.
 - 19 - $(REV_PDCH_GRANT_PRECEDENCE_S = REV_PDCH_GRANT_PRECEDENCE_T)$.
 - 20 - $(REV_PDCH_MSIB_SUPPORTED_S = REV_PDCH_MSIB_SUPPORTED_T)$.
 - 21 - $(REV_PDCH_SOFT_SWITCHING_RESET_IND_S$
 22 $= REV_PDCH_SOFT_SWITCHING_RESET_IND_T)$.

23 The mobile station shall store the following:

- 24 • If $BYPASS_REG_IND_T$ is included, the mobile station shall set $BYPASS_REG_IND_S$ to
 25 $BYPASS_REG_IND_T$; otherwise, the mobile station shall set $BYPASS_REG_IND_S$ to
 26 '00'.
- 27 • If $RC_BITMAP_CAPABILITY_EXT_ALLOWED_T$ is included and is equal to '1', the
 28 mobile station shall set $RC_BITMAP_CAPABILITY_EXT_ALLOWED_S$ to '1'; otherwise,
 29 the mobile station shall set $RC_BITMAP_CAPABILITY_EXT_ALLOWED_S$ to '0'.
- 30 • *Call Recovery Request Message* supported indicator $CRRM_MSG_IND$ is included,
 31 the mobile station shall set $CRRM_MSG_IND_S = CRRM_MSG_IND_T$. Otherwise, the
 32 mobile station shall set $CRRM_MSG_IND_S$ to '0'.
- 33 • Base station horizontal location uncertainty ($LOC_UNC_H_S = LOC_UNC_H_T$)
- 34 • Base station height ($HEIGHT_S = HEIGHT_T$)
- 35 • Base station vertical location uncertainty ($LOC_UNC_V_S = LOC_UNC_V_T$)

- 1 • *Additional Geo Location Type Record* allowed in *General Extension Message* indicator
 2 (ADD_LOC_GEM_ALLOWED_S = ADD_LOC_GEM_ALLOWED_T) if included; otherwise,
 3 ADD_LOC_GEM_ALLOWED_S = '0'.

4 The mobile station shall ignore any fields at the end of the *MC-RR Parameters Message* that
 5 are not defined according to the protocol revision level (MOB_P_REV_P of the current band
 6 class) being used by the mobile station.

7 2.6.2.2.14.2 Slot Cycle Index

8 The mobile station shall set SLOT_CYCLE_INDEX_S to:

$$9 \quad \max \left(\begin{array}{l} \text{MIN_SLOT_CYCLE_INDEX}_S, \\ \min(\text{SLOT_CYCLE_INDEX_REG}, \text{MAX_SLOT_CYCLE_INDEX}_S) \end{array} \right).$$

10 Where, SLOT_CYCLE_INDEX_REG is computed based on the slot cycle index value
 11 included in the last registration attempt (see 2.6.5.5.3.1 and 2.6.5.5.3.2).

12 If the mobile station is operating in the slotted mode, it shall set its slot cycle length as
 13 described in 2.6.2.1.1.3.

14 2.6.2.2.14.3 Forward Common Control Channel Assignment Change

15 If the number of Forward Common Control Channels specified in the *MC-RR Parameters*
 16 *Message* (NUM_FCCCH_T) is not equal to '0' and is different from NUM_FCCCH_S, the mobile
 17 station shall use the hash algorithm specified in 2.6.7.1 to select a new Forward Common
 18 Control Channel number in the range 1 to NUM_FCCCH_T and shall store this value as
 19 FCCCH_ID_S. If NUM_FCCCH_T is not equal to '0', the mobile station shall store the FCCCH
 20 rate (FCCCH_RATE_S = FCCCH_RATE_T), the FCCCH code rate (FCCCH_CODE_RATE_S =
 21 FCCCH_CODE_RATE_T), and store FCCCH_CODE_CHAN_T of the corresponding Forward
 22 Common Control Channel as FCCCH_CODE_CHAN_S. The mobile station shall then set
 23 NUM_FCCCH_S to NUM_FCCCH_T.

24 The mobile station shall set ACC_MSG_SEQ_S to NULL.

25 2.6.2.2.14.4 RESCAN Parameter

26 If the RESCAN_T field in the *MC-RR Parameters Message* equals '1', the mobile station shall
 27 enter the *System Determination Substate* of the *Mobile Station Initialization State* with a
 28 rescan indication (see 2.6.1.1).

29 2.6.2.2.15 Enhanced Access Parameters Message

30 Whenever an *Enhanced Access Parameters Message* is received on the f-csch, the sequence
 31 number, ACC_MSG_SEQ_T, shall be compared to ACC_MSG_SEQ_S. If the comparison
 32 results in a match, the mobile station may ignore the message. If the comparison results
 33 in a mismatch, then the mobile station shall process the remaining fields in the message as
 34 follows:

35 If MAX_REQ_SEQ or MAX_RSP_SEQ are not within the valid ranges specified in
 36 3.7.2.3.2.2, then the mobile station shall ignore the *Enhanced Access Parameters Message*
 37 that contains them.

1 The mobile station shall store the following parameters:

- 2 • *Enhanced Access Parameters Message* sequence number
3 (ACC_MSG_SEQ_S = ACC_MSG_SEQ_T)
- 4 • Persistence related parameters:
 - 5 - If PSIST_PARMS_INCL is equal to '1', store the following:
 - 6 + Persistence parameter number according to the following rule: If the mobile
7 station's access overload class is in the range 0-9 inclusive, set PSIST_S equal
8 to PSIST(0-9)_EACH_T; otherwise set PSIST_S equal to PSIST(n)_EACH_T, where
9 n is equal to the mobile station access overload class.
 - 10 + Persistence modifier for Enhanced Access Channel attempts for registrations
11 which are not responses to the *Registration Request Order*
12 (REG_PSIST_S = REG_PSIST_EACH_T).
 - 13 + Persistence modifier for Enhanced Access Channel attempts for message
14 transmissions (MSG_PSIST_S = MSG_PSIST_EACH_T).
 - 15 + Persistence modifier for emergency calls by the mobile stations in access
16 overload classes 0 to 9 (PSIST_EMG_S = PSIST_EMG_T).
 - 17 - If PSIST_PARMS_INCL_T is equal to '0', store the following:
 - 18 + Set PSIST_S to 0.
 - 19 + Persistence modifier for emergency calls by a mobile station in access
20 overload classes 0 to 9 (PSIST_EMG_S = '000').
 - 21 + Persistence modifier for Enhanced Access Channel attempts for message
22 transmissions (MSG_PSIST_S = '000').
 - 23 + Persistence modifier for Enhanced Access Channel attempts for registrations
24 which are not responses to the *Registration Request Order*
25 (REG_PSIST_S = '000').
- 26 • The mobile station shall store the Access Control based on Call Type (ACCT)
27 information as follows:
 - 28 - Set ACCT_SO_LIST to NULL.
 - 29 - Set ACCT_SO_GRP_LIST to NULL.
 - 30 - If ACCT_INCL_T is equal to '1' and ACCOLC_P is in the range 0 to 9, then the
31 mobile station shall perform the following:
 - 32 + Set ACCT_INCL_EMG_S to ACCT_INCL_EMG_T.
 - 33 + If ACCT_SO_INCL_T is equal to '1', then for each ACCT_SO_T included in this
34 message:
 - 35 ○ If ACCT_AOC_BITMAP_INCL_T is equal to '0', or if
36 ACCT_AOC_BITMAP_INCL_T is equal to '1' and the bit in the associated
37 ACCT_AOC_BITMAP_{1,T} corresponding to the mobile station's ACCOLC_P

- 1 (see Table 3.7.2.3.2.2-1) is equal to '1', then add ACCT_SO_r to
 2 ACCT_SO_LIST.
- 3 + If ACCT_SO_GRP_INCL_r is equal to '1', then for each ACCT_SO_GRP_r
 4 included in this message:
- 5 ○ If ACCT_AOC_BITMAP_INCL_r is equal to '0', or if
 6 ACCT_AOC_BITMAP_INCL_r is equal to '1' and the bit in the associated
 7 ACCT_AOC_BITMAP2_r corresponding to the mobile station's ACCOLC_p
 8 (see Table 3.7.2.3.2.2-1) is equal to '1', then add ACCT_SO_GRP_r to
 9 ACCT_SO_GRP_LIST.
- 10 • Link Access Control related parameters:
- 11 - Acknowledgment timeout (EACH_ACC_TMO_s = ACC_TMO_r)
- 12 - Maximum number of probe sequences for an Enhanced Access Channel request
 13 (MAX_REQ_SEQ_s = MAX_REQ_SEQ_r)
- 14 - Maximum number of probe sequences for an Enhanced Access Channel
 15 response (MAX_RSP_SEQ_s = MAX_RSP_SEQ_r)
- 16 • Mode Selection Table:
- 17 NUM_MODE_SELECTION_ENTRIES_s = (NUM_MODE_SELECTION_ENTRIES_r + 1)
- 18 For i = 1 to NUM_MODE_SELECTION_ENTRIES_s:
- 19 - MODE_SELECTION_s[i].ACCESS_MODE = ACCESS_MODE field of the ith
 20 occurrence of the record
- 21 - MODE_SELECTION_s[i].MIN_DURATION = ACCESS_MODE_MIN_DURATION field
 22 of the ith occurrence of the record
- 23 - MODE_SELECTION_s[i].MAX_DURATION = ACCESS_MODE_MAX_DURATION
 24 field of the ith occurrence of the record
- 25 • Reverse gain adjustment of the Enhanced Access Channel or Reverse Common
 26 Control Channel relative to the Reverse Pilot Channel (RLGAIN_COMMON_PILOT_s =
 27 RLGAIN_COMMON_PILOT_r)
- 28 • The threshold level at which the interference correction begins to be applied
 29 (IC_THRESH_s = - IC_THRESH_r)
- 30 • The maximum interference correction that can be applied (IC_MAX_s = IC_MAX_r)
- 31 • Mode-specific parameters for the Enhanced Access Channel:
- 32 For i = 1 to NUM_MODE_PARM_REC + 1:
- 33 For j = 0 to 7:
- 34 If the (j+1)th subfield of APPLICABLE_MODES is equal to '1', store the
 35 following parameters:
- 36 - Nominal transmit power offset on the Enhanced Access Channel
 37 (MODE_PARAMS_s[j].EACH_NOM_PWR = EACH_NOM_PWR field of the ith

- 1 occurrence of the record)
- 2 – Initial power offset for access on the Enhanced Access Channel
3 (MODE_PARMS_s[j].EACH_INIT_PWR = EACH_INIT_PWR field of the *i*th
4 occurrence of the record)
- 5 – Power increment on the Enhanced Access Channel
6 (MODE_PARMS_s[j].EACH_PWR_STEP = EACH_PWR_STEP field of the *i*th
7 occurrence of the record)
- 8 – Number of access probes on the Enhanced Access Channel
9 (MODE_PARMS_s[j].EACH_NUM_STEP = EACH_NUM_STEP field of the *i*th
10 occurrence of the record)
- 11 – Preamble enabled indicator on the Enhanced Access Channel
12 (MODE_PARMS_s[j].EACH_PREAMBLE_ENABLED = EACH_PREAMBLE_E
13 NABLED field of the *i*th occurrence of the record)
- 14 – Number of preamble fractions sent on the Enhanced Access Channel if
15 MODE_PARMS_s[j].EACH_PREAMBLE_ENABLED is equal to '1'
16 (MODE_PARMS_s[j].EACH_PREAMBLE_NUM_FRAC =
17 EACH_PREAMBLE_NUM_FRAC field of the *i*th occurrence of the record)
- 18 – Fractional preamble duration on the Enhanced Access Channel if
19 MODE_PARMS_s[j].EACH_PREAMBLE_ENABLED is equal to '1'
20 (MODE_PARMS_s[j].EACH_PREAMBLE_FRAC_DURATION = EACH_PREA
21 MBLE_FRAC_DURATION field of the *i*th occurrence of the record)
- 22 – Preamble gated-off duration on the Enhanced Access Channel if
23 MODE_PARMS_s[j].EACH_PREAMBLE_ENABLED is equal to '1'
24 (MODE_PARMS_s[j].EACH_PREAMBLE_OFF_DURATION = EACH_PREAM
25 BLE_OFF_DURATION field of the *i*th occurrence of the record)
- 26 – Additional preamble duration on the Enhanced Access Channel if
27 MODE_PARMS_s[j].EACH_PREAMBLE_ENABLED is equal to '1'
28 (MODE_PARMS_s[j].EACH_PREAMBLE_ADD_DURATION =
29 EACH_PREAMBLE_ADD_DURATION field of the *i*th occurrence of the
30 record)
- 31 – Enhanced Access Channel probe backoff range
32 (MODE_PARMS_s[j].EACH_PROBE_BKOFF = EACH_PROBE_BKOFF field
33 of the *i*th occurrence of the record)
- 34 – Enhanced Access Channel probe sequence backoff range
35 (MODE_PARMS_s[j].EACH_BKOFF = EACH_BKOFF field of the *i*th
36 occurrence of the record)
- 37 – Enhanced Access Channel slot (MODE_PARMS_s[j].EACH_SLOT = 1 +
38 EACH_SLOT field of the *i*th occurrence of the record)
- 39 – Enhanced Access Channel first slot offset
40 (MODE_PARMS_s[j].EACH_SLOT_OFFSET1 = EACH_SLOT_OFFSET1 field
41 of the *i*th occurrence of the record)

- 1 – Enhanced Access Channel second slot offset
2 (MODE_PARMS_s[j].EACH_SLOT_OFFSET2 = EACH_SLOT_OFFSET2 field
3 of the ith occurrence of the record)
- 4 • Additional parameters for the Basic Access Mode:
5 If BA_PARMS_LEN_r is equal to '000', set the Basic Access Mode supported indicator,
6 BA_SUPPORTED_s, to '0'; otherwise store the following parameters:
 - 7 – Basic Access Mode supported indicator (BA_SUPPORTED_s = '1')
 - 8 – Number of Enhanced Access Channels (NUM_EACH_BA_s = (NUM_EACH_BA_r +
9 1))
 - 10 – Rate words supported on the Enhanced Access Channels
11 (EACH_BA_RATES_SUPPORTED_s = EACH_BA_RATES_SUPPORTED_r)
 - 12 • Additional parameters for the Reservation Access Mode:
13 If RA_PARMS_LEN_r is equal to '0000', set the Reservation Access Mode supported
14 indicator, RA_SUPPORTED_s, to '0'; otherwise store the following parameters, if
15 included in the message:
 - 16 – Reservation Access Mode supported indicator (RA_SUPPORTED_s = '1')
 - 17 – Number of Enhanced Access Channels (NUM_EACH_RA_s = (NUM_EACH_RA_r +
18 1))
 - 19 – Number of Common Assignment Channels (NUM_CACH_s = (NUM_CACH_r + 1))
 - 20 – Code rate of Common Assignment Channels (CACH_CODE_RATE_s =
21 CACH_CODE_RATE_r)
 - 22 – For i = 0 to NUM_CACH_s - 1, store the channel code index for each Common
23 Assignment Channel (CACH_CODE_CHAN_s[i] = CACH_CODE_CHAN_r).
 - 24 – Number of Reverse Common Control Channels (NUM_RCCCH_s = (NUM_RCCCH_r
25 + 1))
 - 26 – Rate words supported on the Reverse Common Control Channels
27 (RCCCH_RATES_SUPPORTED_s = RCCCH_RATES_SUPPORTED_r)
 - 28 – Preamble enabled indicator on the Reverse Common Control Channels
29 (RCCCH_PREAMBLE_ENABLED_s = RCCCH_PREAMBLE_ENABLED_r)
 - 30 – Number of preamble fractions sent on the Reverse Common Control Channel if
31 RCCCH_PREAMBLE_ENABLED_r is equal to '1'
32 (RCCCH_PREAMBLE_NUM_FRAC_s = RCCCH_PREAMBLE_NUM_FRAC_r)
 - 33 – Fractional preamble duration on the Reverse Common Control Channel if
34 RCCCH_PREAMBLE_ENABLED_r is equal to '1'
35 (RCCCH_PREAMBLE_FRAC_DURATION_s =
36 RCCCH_PREAMBLE_FRAC_DURATION_r)
 - 37 – Preamble gated-off duration on the Reverse Common Control Channel if
38 RCCCH_PREAMBLE_ENABLED_r is equal to '1'
39 (RCCCH_PREAMBLE_OFF_DURATION_s =

- 1 RCCCH_PREAMBLE_OFF_DURATION_r)
- 2 - Additional preamble duration on the Reverse Common Control Channel if
- 3 RCCCH_PREAMBLE_ENABLED_r is equal to '1'
- 4 (RCCCH_PREAMBLE_ADD_DURATION_s =
- 5 RCCCH_PREAMBLE_ADD_DURATION_r)
- 6 - Slot duration on the Reverse Common Control Channel (RCCCH_SLOT_s = 1 +
- 7 RCCCH_SLOT_r)
- 8 - First slot offset of the Reverse Common Control Channel
- 9 (RCCCH_SLOT_OFFSET1_s = RCCCH_SLOT_OFFSET1_r)
- 10 - Second slot offset of the Reverse Common Control Channel
- 11 (RCCCH_SLOT_OFFSET2_s = RCCCH_SLOT_OFFSET2_r)
- 12 - Nominal transmit power offset on the Reverse Common Control Channel
- 13 (RCCCH_NOM_PWR_s = RCCCH_NOM_PWR_r)
- 14 - Initial power offset for access on the Reverse Common Control Channel
- 15 (RCCCH_INIT_PWR_s = RCCCH_INIT_PWR_r)
- 16 - Power Control delay for the Reservation Access Mode
- 17 (RA_PC_DELAY_s = RA_PC_DELAY_r)
- 18 - Maximum delay to receive the *Early Acknowledgment Channel Assignment*
- 19 *Message* on the Common Assignment Channel
- 20 (EACAM_CACH_DELAY_s = EACAM_CACH_DELAY_r)
- 21 - Indicator for handoff supported on the Reverse Common Control Channels
- 22 (RCCCH_HO_SUPPORTED_s = RCCCH_HO_SUPPORTED_r)
- 23 - Threshold for handoff on the Reverse Common Control Channels if
- 24 RCCCH_HO_SUPPORTED_r is equal to '1'
- 25 (RCCCH_HO_THRESH_s = RCCCH_HO_THRESH_r)
- 26 - Maximum delay to receive the *Early Acknowledgment Channel Assignment*
- 27 *Message* and the *Power Control Channel Assignment Message* if
- 28 RCCCH_HO_SUPPORTED_r is equal to '1'
- 29 (EACAM_PCCAM_DELAY_s = EACAM_PCCAM_DELAY_r)
- 30 - Number of Common Power Control Channels (NUM_CPCCH_s = (NUM_CPCCH_r +
- 31 1))
- 32 - Power control rate for the Common Power Control Channels
- 33 (CPCCH_RATE_s = CPCCH_RATE_r)
- 34 - For i = 0 to NUM_CPCCH_s - 1, store the channel code index for each Common
- 35 Power Control Channel (CPCCH_CODE_CHAN_s[i] = CPCCH_CODE_CHAN_r).
- 36 - Number of Power Control Subchannels for the Reservation Access Mode
- 37 (NUM_PCSCH_RA_s = (NUM_PCSCH_RA_r + 1))
- 38 The mobile station shall set CURR_ACC_MSG_SEQ equal to ACC_MSG_SEQ_s.

2.6.2.2.16 ANSI-41 RAND Message

Whenever an *ANSI-41 RAND Message* is received, the mobile station shall process the fields in the message as follows.

The mobile station shall store the following parameters:

- Random challenge value ($RAND_S = RAND_T$)
- Current *Enhanced Access Parameters Message* Sequence Number ($CURR_ACC_MSG_SEQ = ACC_MSG_SEQ_T$).
- Pilot PN sequence offset increment ($PILOT_PN_S = PILOT_PN_T$)

The mobile station shall also compare the *Enhanced Access Parameters Message* sequence number, $ACC_MSG_SEQ_T$, with that stored in $ACC_MSG_SEQ_S$. If the comparison results in a mismatch, then the mobile station shall set $ACC_MSG_SEQ_S$ to NULL (see 2.6.2.2).

The mobile station shall ignore any fields at the end of the *ANSI-41 RAND Message* which are not defined according to the protocol revision level ($MOB_P_REV_P$ of the current band class) being used by the mobile station.

2.6.2.2.17 Universal Neighbor List Message

Whenever a valid *Universal Neighbor List Message* is received on the Primary Broadcast Control Channel, the configuration message sequence number, $CONFIG_MSG_SEQ_T$ shall be compared to that stored in $UNIV_NGHBR_LST_MSG_SEQ_S$. If the comparison results in a mismatch, then the mobile station shall process the remaining fields in the message as described below.

The mobile station shall store the following parameters:

- Configuration message sequence number ($CONFIG_MSG_SEQ_S = CONFIG_MSG_SEQ_T$, $UNIV_NGHBR_LST_MSG_SEQ_S = CONFIG_MSG_SEQ_T$).

If $RADIO_INTERFACE_TYPE_T$ is equal to '0000' but the $PILOT_INC$ field is not within the valid range specified in 3.7.2.3.2.33, then the mobile station shall ignore the entire record that contains it.

If $RADIO_INTERFACE_TYPE_T$ is equal to '0000' and the $PILOT_INC$ field is within the valid range specified in 3.7.2.3.2.33, the mobile station shall perform the following:

The mobile station shall store the Pilot PN sequence offset increment ($PILOT_INC_S = PILOT_INC_T$).

The mobile station shall set $NGHBR_SET_SIZE_S$ to NUM_NGHBR_T .

For each of the neighboring base stations contained in the *Universal Neighbor List Message*, if $FREQ_INCL_T$ is equal to '0', or if $FREQ_INCL_T$ is equal to '1' and $NGHBR_BAND_T$ is supported, the mobile station shall perform the following:

- If the i^{th} occurrence of $NGHBR_CONFIG_T$ is equal to '000', '001', '010', or '100', set the $NGHBR_CONFIG$ field of $NGHBR_REC[i]$ to the i^{th} occurrence of $NGHBR_CONFIG_T$; otherwise, set the $NGHBR_CONFIG$ field of $NGHBR_REC[i]$ to '011'.

- 1 • Set the NGHBR_PN field of NGHBR_REC[i] to the ith occurrence of NGHBR_PN_r.
- 2 • If NGHBR_CONFIG_r is equal to '011', set the BCCH_SUPPORT field of
3 NGHBR_REC[i] to BCCH_SUPPORT_r of the corresponding record.
- 4 • Set the ADD_PILOT_REC_INCL field of NGHBR_REC[i] to the ith occurrence of
5 ADD_PILOT_REC_INCL_r. If ADD_PILOT_REC_INCL_r equals '1', for each pilot
6 included in the message, the mobile station shall also perform the following:
- 7 - Set the NGHBR_PILOT_REC_TYPE field of NGHBR_PILOT_REC to
8 NGHBR_PILOT_REC_TYPE_r.
- 9 - If NGHBR_PILOT_REC_TYPE_r is equal to '000'. The mobile station shall:
- 10 + Set the TD_POWER_LEVEL field of NGHBR_PILOT_REC to
11 TD_POWER_LEVEL_r.
- 12 + Set the TD_MODE field of NGHBR_PILOT_REC to TD_MODE_r.
- 13 - If NGHBR_PILOT_REC_TYPE_r is equal to '001', the mobile station shall:
- 14 + Set the AUX_PILOT_QOF field of NGHBR_PILOT_REC to QOF_r.
- 15 + Set the AUX_PILOT_WALSH_CODE field of NGHBR_PILOT_REC to
16 AUX_PILOT_WALSH_r with the Walsh Code length specified by
17 WALSH_LENGTH_r.
- 18 - If NGHBR_PILOT_REC_TYPE_r is equal to '010', the mobile station shall:
- 19 + Set the AUX_PILOT_QOF field of NGHBR_PILOT_REC to QOF_r.
- 20 + Set the AUX_PILOT_WALSH_CODE field of NGHBR_PILOT_REC to
21 AUX_WALSH_r with the Walsh Code length specified by WALSH_LENGTH_r.
- 22 + Set the AUX_TD_POWER_LEVEL field of NGHBR_PILOT_REC to
23 AUX_TD_POWER_LEVEL_r.
- 24 + Set the TD_MODE field of NGHBR_PILOT_REC to TD_MODE_r.
- 25 - If NGHBR_PILOT_REC_TYPE_r is equal to '011', the mobile station shall:
- 26 + Set the SR3_PRIMARY_PILOT field of NGHBR_PILOT_REC to
27 SR3_PRIMARY_PILOT_r.
- 28 + Set the SR3_PILOT_POWER1 field of NGHBR_PILOT_REC to
29 SR3_PILOT_POWER1_r.
- 30 + Set the SR3_PILOT_POWER2 field of NGHBR_PILOT_REC to
31 SR3_PILOT_POWER2_r.
- 32 - If NGHBR_PILOT_REC_TYPE_r is equal to '100', the mobile station shall:
- 33 + Set the SR3_PRIMARY_PILOT field of NGHBR_PILOT_REC to
34 SR3_PRIMARY_PILOT_r.
- 35 + Set the SR3_PILOT_POWER1 field of NGHBR_PILOT_REC to
36 SR3_PILOT_POWER1_r.

- 1 + Set the SR3_PILOT_POWER2 field of NGHBR_PILOT_REC to
2 SR3_PILOT_POWER2r.
- 3 + Set the AUX_PILOT_QOF field of NGHBR_PILOT_REC to QOFr.
- 4 + Set the AUX_PILOT_WALSH_CODE field of NGHBR_PILOT_REC to
5 AUX_PILOT_WALSHr with the Walsh Code length specified by
6 WALSH_LENGTHr.
- 7 + If ADD_INFO_INCL1r is equal to '1', set the AUX_PILOT_QOF1 field of
8 NGHBR_PILOT_REC to QOF1r and set the AUX_PILOT_WALSH_CODE1 field
9 of NGHBR_PILOT_REC to AUX_PILOT_WALSH1r with the Walsh Code length
10 specified by WALSH_LENGTH1r; otherwise, set the AUX_PILOT_QOF1 field
11 of NGHBR_PILOT_REC to QOFr and set the AUX_PILOT_WALSH_CODE1
12 field of NGHBR_PILOT_REC to AUX_PILOT_WALSHr with the Walsh Code
13 length specified by WALSH_LENGTHr.
- 14 + If ADD_INFO_INCL2r is equal to '1', set the AUX_PILOT_QOF2 field of
15 NGHBR_PILOT_REC to QOF2r and set the AUX_PILOT_WALSH_CODE2 field
16 of NGHBR_PILOT_REC to AUX_PILOT_WALSH2r with the Walsh Code length
17 specified by WALSH_LENGTH2r; otherwise, set the AUX_PILOT_QOF2 field
18 of NGHBR_PILOT_REC to QOFr and set the AUX_PILOT_WALSH_CODE2
19 field of NGHBR_PILOT_REC to AUX_PILOT_WALSHr with the Walsh Code
20 length specified by WALSH_LENGTHr.
- 21 • If NGHBR_SRCH_MODE_r = '00' or '10', set the SEARCH_PRIORITY field of each
22 NGHBR_REC to '10' (high) for all NGHBR_SET_SIZE_s entries.
- 23 • If NGHBR_SRCH_MODE_r = '01' or '11', set the SEARCH_PRIORITY field of
24 NGHBR_REC[i] to the ith occurrence of SEARCH_PRIORITY_r.
- 25 • If NGHBR_SRCH_MODE_r = '00' or '01', set the SRCH_WIN_NGHBR field of each
26 NGHBR_REC to SRCH_WIN_N_r for all NGHBR_SET_SIZE_s entries.
- 27 • If NGHBR_SRCH_MODE_r = '00' or '01', set the SRCH_OFFSET_NGHBR field of each
28 NGHBR_REC to '000'.
- 29 • If NGHBR_SRCH_MODE_r = '10' or '11':
- 30 - set the SRCH_WIN_NGHBR field of NGHBR_REC[i] to the ith occurrence of
31 SRCH_WIN_NGHBR_r
- 32 - if SRCH_OFFSET_INCL_r equals '1', set the SRCH_OFFSET_NGHBR field of
33 NGHBR_REC[i] to the ith occurrence of SRCH_OFFSET_NGHBR_r, and
- 34 - if SRCH_OFFSET_INCL_r equals '0', set the SRCH_OFFSET_NGHBR field of each
35 NGHBR_REC to '000'.
- 36 • If USE_TIMING_r is equal to '1', set the TIMING_INCL field of NGHBR_REC[i] to the
37 ith occurrence of TIMING_INCL_r; otherwise, set the TIMING_INCL field of
38 NGHBR_REC to '0' for all entries.

- 1 • Set the NGHBR_PDCH_SUPPORTED field of NGHBR_REC[i] to the i^{th} occurrence of
2 NGHBR_PDCH_SUPPORTED_T if included; otherwise, set the
3 NGHBR_PDCH_SUPPORTED field of NGHBR_REC to '0' for all entries.
- 4 • The mobile station shall set RESQ_ENABLED_S = RESQ_ENABLED_T. If
5 RESQ_ENABLED_S is equal to '1', then the mobile station shall store:
- 6 - Call rescue delay timer value (RESQ_DELAY_TIME_S = RESQ_DELAY_TIME_T)
- 7 - Call rescue allowed timer value (RESQ_ALLOWED_TIME_S =
8 RESQ_ALLOWED_TIME_T)
- 9 - Call rescue attempt timer value (RESQ_ATTEMPT_TIME_S =
10 RESQ_ATTEMPT_TIME_T)
- 11 - Code channel index for call rescue (RESQ_CODE_CHAN_S =
12 RESQ_CODE_CHAN_T)
- 13 - Quasi-Orthogonal Function mask identifier for call rescue (RESQ_QOF_S =
14 RESQ_QOF_T)
- 15 - Minimum time between consecutive rescues (RESQ_MIN_PERIOD_S =
16 RESQ_MIN_PERIOD_T + 1) if RESQ_MIN_PERIOD_INCL_T is equal to '1'; otherwise,
17 RESQ_MIN_PERIOD_S = '00000'.
- 18 - The required number of transmissions of a regular PDU before declaring L2
19 Acknowledgment Failure when Call Rescue is enabled
20 (RESQ_NUM_TOT_TRANS_20MS_S = RESQ_NUM_TOT_TRANS_20MS_T) if
21 included; otherwise, set RESQ_NUM_TOT_TRANS_20MS_S to N_{1m}.
- 22 - The required number of transmissions of a mini PDU before declaring L2
23 Acknowledgment Failure when Call Rescue is enabled
24 (RESQ_NUM_TOT_TRANS_5MS_S = RESQ_NUM_TOT_TRANS_5MS_T) if included;
25 otherwise, set RESQ_NUM_TOT_TRANS_5MS_S to N_{15m}.
- 26 - The Traffic Channel preamble length for Call Rescue Soft Handoff when
27 operating in Radio Configuration 1 or 2 (RESQ_NUM_PREAMBLE_RC1_RC2_S =
28 RESQ_NUM_PREAMBLE_RC1_RC2_T).
- 29 - The Traffic Channel preamble length for Call Rescue Soft Handoff when
30 operating in Radio Configuration greater than 2 (RESQ_NUM_PREAMBLE_S =
31 RESQ_NUM_PREAMBLE_T).
- 32 - The power level adjustment to be applied to the last closed-loop power level
33 when re-enabling the transmitter for call rescue soft handoff
34 (RESQ_POWER_DELTA_S = RESQ_POWER_DELTA_T).
- 35 - Set the NGHBR_RESQ_CONFIGURED field of NGHBR_REC[i] to the i^{th}
36 occurrence of NGHBR_RESQ_CONFIGURED_T.

37 For each of the neighboring base stations contained in the *Universal Neighbor List Message*,
38 if $\text{FREQ_FIELDS_INCL}_T$ equals '1', FREQ_INCL_T equals '1', and NGHBR_BAND_T is
39 supported, the mobile station shall also perform the following:

- 1 • Set the NGHBR_BAND field of NGHBR_REC[i] to the i^{th} occurrence of
2 NGHBR_BAND_T.
- 3 • Set the NGHBR_FREQ field of NGHBR_REC[i] to the i^{th} occurrence of
4 NGHBR_FREQ_T.

5 For each of the neighboring base stations contained in the *Universal Neighbor List Message*,
6 if USE_TIMING_T is equal to '1' and TIMING_INCL_T equals '1', the mobile station shall also
7 perform the following:

- 8 • Set the NGHBR_TX_OFFSET field of NGHBR_REC[i] to the i^{th} occurrence of
9 NGHBR_TX_OFFSET_T.
- 10 • If GLOBAL_TIMING_INCL_T is equal to '1', then the mobile station shall:
- 11 - Set the NGHBR_TX_DURATION field of NGHBR_REC to
12 GLOBAL_TX_DURATION_T for all entries.
- 13 - Set the NGHBR_TX_PERIOD field of NGHBR_REC to GLOBAL_TX_PERIOD_T for
14 all entries.
- 15 • If GLOBAL_TIMING_INCL_T is equal to '0', then the mobile station shall:
- 16 - Set the NGHBR_TX_DURATION field of NGHBR_REC[i] to the i^{th} occurrence of
17 NGHBR_TX_DURATION_T.
- 18 - Set the NGHBR_TX_PERIOD field of NGHBR_REC[i] to the i^{th} occurrence of
19 NGHBR_TX_PERIOD_T.

20 For each of the neighboring base stations contained in the *Universal Neighbor List Message*,
21 if FREQ_FIELDS_INCL_T equals '1' and FREQ_INCL_T equals '0', the mobile station shall also
22 perform the following:

- 23 • Set the NGHBR_BAND field of NGHBR_REC[i] to CDMABAND_S.
- 24 • If NGHBR_CONFIG_T equals '010', set the NGHBR_FREQ field of NGHBR_REC[i] to
25 the first CDMA Channel listed in the *CDMA Channel List Message or Extended*
26 *CDMA Channel List Message* transmitted by the current base station; otherwise, set
27 the NGHBR_FREQ field of NGHBR_REC[i] to CDMACH_S.

28 If NGHBR_SET_ENTRY_INFO_T is equal to '0', then for all NGHBR_SET_SIZE_S occurrences of
29 ACCESS_ENTRY_HO, the mobile station shall set the ACCESS_ENTRY_HO field of
30 NGHBR_REC[i] to '0'.

31 If NGHBR_SET_ENTRY_INFO_T is equal to '1', then for all NGHBR_SET_SIZE_S occurrences of
32 ACCESS_ENTRY_HO, the mobile station shall set the ACCESS_ENTRY_HO field of
33 NGHBR_REC[i] to the i^{th} occurrence of ACCESS_ENTRY_HO_T.

34 If NGHBR_SET_ACCESS_INFO_T is equal to '0', then for all NGHBR_SET_SIZE_S occurrences
35 of ACCESS_HO_ALLOWED, the mobile station shall set the ACCESS_HO_ALLOWED field of
36 NGHBR_REC[i] to '0'.

37 If NGHBR_SET_ACCESS_INFO_T is equal to '1', then for all NGHBR_SET_SIZE_S occurrences
38 of ACCESS_HO_ALLOWED, the mobile station shall set the ACCESS_HO_ALLOWED field of
39 NGHBR_REC[i] to the i^{th} occurrence of ACCESS_HO_ALLOWED_T.

1 The mobile station shall update the idle handoff Neighbor Set (see 2.6.2.1.4) so that it
 2 consists only of pilot offsets listed in the *Universal Neighbor List Message*. If the *Universal*
 3 *Neighbor List Message* contains more pilot offsets than the mobile station can store, the
 4 mobile station shall store the pilot offsets beginning at the start of the *Universal Neighbor*
 5 *List Message*, up to the limits of the mobile station's Neighbor Set storage capacity.

6 If RADIO_INTERFACE_TYPE_r is equal to '0001', the mobile station shall process the fields
 7 contained in the record as follows:

8 If RADIO_INTERFACE_TYPE_r is equal to '0010', the mobile station shall process the fields
 9 contained in the record as follows:

10 The mobile station shall set NUM_HRPD_NGHRB_s to NUM_HRPD_NGHRB_r, the number of
 11 neighboring HRPD systems contained in the *Universal Neighbor List Message*. For each of
 12 the neighboring HRPD systems contained in the *Universal Neighbor List Message*, the
 13 mobile station shall perform the following:

- 14 • Set the PN field of HRPD_NGHRB_LIST[i] to the ith occurrence of NGHBR_PN_r.
- 15 • Set the BAND_CLASS field of HRPD_NGHRB_LIST[i] to the ith occurrence of
 16 NGHBR_BAND_r if NGHBR_FREQ_INCL_r equals '1'; otherwise, set the BAND_CLASS
 17 field of HRPD_NGHRB_LIST[i] to CDMABAND_s.
- 18 • Set the CDMA_FREQ field of HRPD_NGHRB_LIST[i] to the ith occurrence of
 19 NGHBR_FREQ_r if NGHBR_FREQ_INCL_r equals '1'; otherwise, set the BAND_CLASS
 20 field of HRPD_NGHRB_LIST[i] to CDMACH_s.
- 21 • Set the PN_ASSOCIATION field of HRPD_NGHRB_LIST[i] to the ith occurrence of
 22 PN_ASSOCIATION_IND_r.
- 23 • Set the DATA_ASSOCIATION field of HRPD_NGHRB_LIST[i] to the ith occurrence of
 24 DATA_ASSOCIATION_IND_r.

25 2.6.2.2.18BCMC Service Parameters Message

26 The mobile station may receive the *BCMC Service Parameters Message* on the Paging
 27 Channel or on the Primary Broadcast Control Channel.

28 When the mobile station desires to receive the *BCMC Service Parameters Message* on the
 29 Paging Channel, the mobile station shall monitor the F-PCH for the duration of four F-PCH
 30 slots from the first slot of a BSPM slot cycle (see 2.6.2.1.1.3.8.1) for the start of the *BCMC*
 31 *Service Parameters Message* transmission or until the *BCMC Service Parameters Message*
 32 with DIFF_BSPM_r equal to '0' is received; if the mobile station detects the start of the *BCMC*
 33 *Service Parameters Message*, the mobile station shall monitor the F-PCH until the entire
 34 *BCMC Service Parameters Message* is received.

35 When the mobile station desires to receive the *BCMC Service Parameters Message* on the
 36 Primary Broadcast Control Channel, the mobile station shall monitor the F-BCCH for the
 37 duration of four F-BCCH slots from the first slot of a BSPM slot cycle (see 2.6.2.1.1.3.8.2)
 38 for the start of the *BCMC Service Parameters Message* transmission or until the *BCMC*
 39 *Service Parameters Message* with DIFF_BSPM_r equal to '0' is received; if the mobile station
 40 detects the start of the *BCMC Service Parameters Message*, the mobile station shall monitor
 41 the F-BCCH until the entire *BCMC Service Parameters Message* is received.

1 Whenever the *BCMC Service Parameters Message* is received, the mobile station shall
 2 compare the BSPM sequence number, $BSPM_MSG_SEQ_r$, to that stored in
 3 $BSPM_MSG_SEQ_s$. If the comparison results in a match and $FULL_BSPM_IND = '1'$, the
 4 mobile station may ignore the message. If the comparison results in a mismatch, the
 5 mobile station shall process the remaining fields in the message as follows:

6 The mobile station shall perform the following:

- 7 • If $DIFF_BSPM_r$ equals '0', the mobile station shall perform the following:
 - 8 - The mobile station shall delete the currently stored *BCMC Service Parameters*
 9 *Message* parameters and shall store the parameters received in this *BCMC*
 10 *Service Parameters Message* as described below.
 - 11 - The mobile station shall set $FULL_BSPM_IND$ to '1'.
- 12 • If $DIFF_BSPM_r$ equals '1',
 - 13 - If $(BSPM_MSG_SEQ_r - BSPM_MSG_SEQ_s)$ modulo 64 is greater than one, the
 14 mobile station shall perform the following:
 - 15 + The mobile station shall delete the currently stored *BCMC Service Parameters*
 16 *Message* parameters and shall store the parameters received in this *BCMC*
 17 *Service Parameters Message* as described below.
 - 18 + The mobile station shall set $FULL_BSPM_IND$ to '0'.
 - 19 - Otherwise, the mobile station shall perform the following:
 - 20 + The mobile station shall update the currently stored *BCMC Service*
 21 *Parameters Message* parameters with the parameters received in this *BCMC*
 22 *Service Parameters Message* as described below.

23 The mobile station shall delete $BCMC_RETRY_DELAY_LIST_s[i]$ from BCMC Retry Delay List
 24 if $BCMC_RETRY_DELAY_LIST_s[i].BCMC_FLOW_ID$ is included in the *BCMC Service*
 25 *Parameters Message*.

26 The mobile station shall store the following parameters:

- 27 • BSPM sequence number ($BSPM_MSG_SEQ_s = BSPM_MSG_SEQ_r$).
- 28 • Frequency change registration required indication ($FREQ_CHG_REG_REQUIRED_s$
 29 $= FREQ_CHG_REG_REQUIRED_r$).
- 30 • Frequency change registration timer
 31 ($FREQ_CHG_REG_TIMER_s = FREQ_CHG_REG_TIMER_r$) if
 32 $FREQ_CHG_REG_TIMER_IND_r$ equals '1'; otherwise, set
 33 $FREQ_CHG_REG_TIMER_s$ to NULL.
- 34 • Autonomous BCMC request allowed indicator
 35 ($AUTO_REQ_ALLOWED_IND_s = AUTO_REQ_ALLOWED_IND_r$).
- 36 • If USE_TIME_r is set to '1' set the $BSPM_ACTION_TIME_s = ACTION_TIME_r$;
 37 otherwise, set the $BSPM_ACTION_TIME_s = NULL$. A BSPM with an explicit action

- 1 time shall take effect when System Time (in 80 ms units) modulo 64 becomes equal
2 to BSPM_ACTION_TIME_S.
- 3 • BCMC on traffic channel supported indicator
4 (BCMC_ON_TRAFFIC_SUP_S = BCMC_ON_TRAFFIC_SUP_T).
 - 5 • Length of time stamp for use on r-csch
6 (ACH_TIME_STAMP_SHORT_LENGTH_S = ACH_TIME_STAMP_SHORT_LENGTH_T) if
7 NON_DEFAULT_VALUE_INCLUDED_T equals '1'; otherwise,
8 ACH_TIME_STAMP_SHORT_LENGTH_S shall be set to 10.
 - 9 • Length of time stamp
10 (TIME_STAMP_LONG_LENGTH_S = TIME_STAMP_LONG_LENGTH_T) if
11 NON_DEFAULT_VALUE_INCLUDED_T equals '1'; otherwise,
12 TIME_STAMP_LONG_LENGTH_S shall be set to 52.
 - 13 • Unit for time stamp length (TIME_STAMP_UNIT_S = TIME_STAMP_UNIT_T) if
14 NON_DEFAULT_VALUE_INCLUDED_T equals '1'; otherwise,
15 TIME_STAMP_UNIT_S shall be set to 6.
 - 16 • If REGISTRATION_REQ_FLAG_INCL_T equals '1', the mobile station shall compute
17 and store a BCMC registration required timer expiration value:
18
$$\text{REGISTRATION_REQ_TIMER_MAX} = (2^{\text{REGISTRATION_REQ_TIMER_PERIOD}_T} \times 80 \text{ ms}).$$
 - 19 • For $i=1$ to NUM_FSCH_T, store the following:
 - 20 - FBSCH_LIST_S[i].FSCH_ID = the position where this Forward Supplemental
21 Channel is listed in this message (i.e. First Forward Supplemental Channel
22 listed is given FSCH_ID of '001', second one is given FSCH_ID of '010', and so
23 on).
 - 24 - FBSCH_LIST_S[i].FSCH_BAND_CLASS = i th occurrence of FSCH_BAND_CLASS_T
25 (Band class of the Forward Supplemental Channel) if
26 FSCH_BAND_CLASS_INCL_T equals '1'; otherwise,
27 FBSCH_LIST_S[i].FSCH_BAND_CLASS = CDMABAND_S.
 - 28 - FBSCH_LIST_S[i].FSCH_FREQ = i th occurrence of FSCH_FREQ_T (Frequency
29 assignment of the forward broadcast supplemental channel) if
30 FSCH_FREQ_INCL_T equals '1'; otherwise, FBSCH_LIST_S[i].FSCH_FREQ =
31 CDMACH_S.
 - 32 - FBSCH_LIST_S[i].FSCH_CODE_CHAN = i th occurrence of FSCH_CODE_CHAN_T
33 (Code channel index of the forward broadcast supplemental channel)
 - 34 - FBSCH_LIST_S[i].FSCH_PLCM (Public Long code mask of the Forward Broadcast
35 Supplemental Channel) shall be set as follows:
 - 36 + If FSCH_PLCM_SCHEME_INDR equals '00',
37 FBSCH_LIST_S[i].FSCH_PLCM shall be set to PLCM_42 as specified in
38 2.6.13.10.1.

- 1 + If FSCH_PLCM_SCHEME_INDr equals '01',
2 FBSCH_LISTs[i].FSCH_PLCM shall be set to PLCM_42 as specified in
3 2.6.13.10.2.
- 4 + If FSCH_PLCM_SCHEME_INDr equals '10', the mobile station shall perform
5 the following:
- 6 ○ If FSCH_PLCM_INDr equals '0', FBSCH_LISTs[i].FSCH_PLCM shall be set
7 to PLCM_42 as specified in 2.6.13.10.1.
- 8 ○ If FSCH_PLCM_INDr equals '1', FBSCH_LISTs[i].FSCH_PLCM shall be set
9 to PLCM_42 as specified in 2.6.13.10.2.
- 10 - FBSCH_LISTs[i].FSCH_MUX_OPTION = ith occurrence of FSCH_MUX_OPTIONr
11 (Multiplex Option of the Forward Broadcast Supplemental Channel).
- 12 - FBSCH_LISTs[i].FSCH_RC = ith occurrence of FSCH_RCr (Radio configuration of
13 the forward broadcast supplemental channel).
- 14 - FBSCH_LISTs[i].FSCH_CODING = ith occurrence of FSCH_CODINGr (Coding
15 type of the Forward Broadcast Supplemental Channel).
- 16 - FBSCH_LISTs[i].FSCH_OUTERCODE_RATE = ith occurrence of
17 FSCH_OUTERCODE_RATEr (Outer Code Rate of the Forward Broadcast
18 Supplemental Channel) if FSCH_OUTERCODE_INCLr equals '1'; otherwise,
19 FBSCH_LISTs[i].FSCH_OUTERCODE_RATE = NULL.
- 20 - FBSCH_LISTs[i].FSCH_OUTERCODE_OFFSET = ith occurrence of
21 FSCH_OUTERCODE_OFFSETr (Outer Coding Buffer Offset of the Forward
22 Broadcast Supplemental Channel) if FSCH_OUTERCODE_INCLr equals '1';
23 otherwise, FBSCH_LISTs[i].FSCH_OUTERCODE_OFFSET = NULL.
- 24 - FBSCH_LISTs[i].FSCH_NUM_BITS_IDX = ith occurrence of
25 FSCH_NUM_BITS_IDXr (Number of information bits index of the forward
26 broadcast supplemental channel).
- 27 - FBSCH_LISTs[i].FSCH_FRAME_40_USED = ith occurrence of
28 FSCH_FRAME_40_USEDr (40ms frame used indicator of the forward broadcast
29 supplemental channel).
- 30 - FBSCH_LISTs[i].FSCH_FRAME_80_USED = ith occurrence of
31 FSCH_FRAME_80_USEDr (80ms frame used indicator of the forward broadcast
32 supplemental channel).
- 33 - FBSCH_LISTs[i].TDM_STRUCTURE_IND = ith occurrence of TDM_
34 STRUCTURE_INDr (TDM structure used indicator).
- 35 + FBSCH_LISTs[i].TDM_SLOT_LENGTH = ith occurrence of
36 TDM_SLOT_LENGTHr (TDM slot length).

- 1 + If TDM_SUPER_PERIOD_MASK_LEN_r is included, FBSCH_LIST_s[i].
2 TDM_SUPER_PERIOD_MASK_LEN = ith occurrence of
3 TDM_SUPER_PERIOD_MASK_LEN_r (TDM super period mask length
4 indicator). Otherwise, set FBSCH_LIST_s[i].TDM_SUPER_PERIOD_MASK_LEN
5 as specified in Table 3.7.2.3.2.38-3, based on FSCH_OUTERCODE_RATE
6 field corresponding to FSCH_ID field included in this record
- 7 + If TDM_MEGA_PERIOD_MASK_LEN_r is included, FBSCH_LIST_s[i].
8 TDM_MEGA_PERIOD_MASK_LEN = ith occurrence of
9 TDM_MEGA_PERIOD_MASK_LEN_r (TDM mega period mask length
10 indicator). Otherwise, set FBSCH_LIST_s[i]. TDM_MEGA_PERIOD_MASK_LEN
11 as specified in Table 3.7.2.3.2.38-6.
- 12 • For i=1 to the number of flows included in this message, store the following:
- 13 - BCMC_FLOW_LIST_s[i].BCMC_FLOW_ID = ith occurrence of BCMC_FLOW_ID
14 (BCMC flow identifier). See section 2.6.13.11.
- 15 - If REGISTRATION_REQ_FLAG_INCL_r equals '1', and ith occurrence of
16 FLOW_INFO_ON_OTHER_FREQ_r equals '0',
17 BCMC_FLOW_LIST_s[i].REGISTRATION_REQ_FLAG = ith occurrence of
18 REGISTRATION_REQ_FLAG_r(Registration required flag).
- 19 - If AUTH_SIGNATURE_REQUIRED_r equals '1',
20 BCMC_FLOW_LIST_s[i].AUTH_SIGNATURE_REQ_IND = ith occurrence of
21 AUTH_SIGNATURE_REQ_IND_r(Authorization signature required indication).
- 22 - If BCMC_ON_TRAFFIC_SUP_r is set to '1',
23 BCMC_FLOW_LIST_s[i].BCMC_FLOW_ON_TRAFFIC_IND = ith occurrence of
24 BCMC_FLOW_ON_TRAFFIC_IND_r (BCMC flow on traffic channel supported
25 identifier); otherwise, BCMC_FLOW_LIST_s[i].BCMC_FLOW_ON_TRAFFIC_IND =
26 '0'.
- 27 - If the ith occurrence of NUM_LPM_ENTRIES_r equals '000', then
28 BCMC_FLOW_LIST_s[i].BCMC_FLOW_ON_IND = 0; otherwise,
29 BCMC_FLOW_LIST_s[i].BCMC_FLOW_ON_IND = 1 (BCMC flow On or Off
30 Indicator).
- 31 - For j=1 to NUM_LPM_ENTRIES_r, store the following:
- 32 + BCMC_FLOW_LIST_s[i].LPM_INFO[j].FSCH_ID = jth occurrence of FSCH_ID_r
33 (Forward broadcast supplemental channel identifier).
- 34 + If jth occurrence of TDM_USED_IND_r is set to 1, the mobile station shall
35 store the following:
- 36 ○ BCMC_FLOW_LIST_s[i].LPM_INFO[j]. TDM_MASK = jth occurrence of
37 TDM_MASK_r (TDM mask).

- 1 ○ If TDM_SUPER_PERIOD_MASK_INCL_T is set to '1',
2 BCMC_FLOW_LIST_S[i].LPM_INFO[j].TDM_SUPER_PERIOD_MASK = jth
3 occurrence of TDM_SUPER_PERIOD_MASK_T (TDM super period mask).
4 Otherwise, set all bits of
5 BCMC_FLOW_LIST_S[i].LPM_INFO[j].TDM_SUPER_PERIOD_MASK to '1'.
- 6 ○ If TDM_MEGA_PERIOD_MASK_INCL_T is set to '1',
7 BCMC_FLOW_LIST_S[i].LPM_INFO[j].TDM_MEGA_PERIOD_MASK = jth
8 occurrence of TDM_MEGA_PERIOD_MASK_T (TDM mega period mask).
9 Otherwise, set all bits of
10 BCMC_FLOW_LIST_S[i].LPM_INFO[j].TDM_MEGA_PERIOD_MASK to '1'.
- 11 ○ TDM period for BCMC flow identified by
12 BCMC_FLOW_LIST_S[i].BCMC_FLOW_ID on Forward Supplemental
13 Channel identified by BCMC_FLOW_LIST_S[i].LPM_INFO[j].FSCH_ID is
14 aligned at system time (t) as specified in section 2.6.13.12.
- 15 + BCMC_FLOW_LIST_S[i].LPM_INFO[j].BSR_ID = jth occurrence of BSR_ID_T
16 (BCMC Service Reference identifier).
- 17 + For k=0 to NUM_NGHBR_T, store the following:
- 18 ○ BCMC_FLOW_LIST_S[i].LPM_INFO[j].NGHBR_INFO[k].NGHBR_PN = kth
19 occurrence of NGHBR_PN_T (Neighbor pilot PN sequence offset index).
- 20 ○ BCMC_FLOW_LIST_S[i].LPM_INFO[j].NGHBR_INFO[k].
21 NGHBR_BCMC_CONFIG = kth occurrence of NGHBR_BCMC_CONFIG_T
22 (Neighbor BCMC flow configuration).
- 23 ○ If NGHBR_BCMC_CONFIG_T equals '000', BCMC_FLOW_LIST_S[i].
24 LPM_INFO[j].NGHBR_INFO[k].NGHBR_FSCH_BAND_CLASS = NULL;
25 otherwise, the mobile station shall store the following:
- 26 ◇ If NGHBR_BCMC_CONFIG_T equals '010' or NGHBR_BCMC_CONFIG_T
27 equals '001' and NGHBR_FSCH_BAND_CLASS_INCL_T equals '0',
28 BCMC_FLOW_LIST_S[i].LPM_INFO[j].NGHBR_INFO[k].
29 NGHBR_FSCH_BAND_CLASS =
30 FBSCH_LIST_S[i].NGHBR_FSCH_BAND_CLASS where i corresponds to
31 the entry of FBSCH_LIST_S where FBSCH_LIST_S[i].FSCH_ID equals
32 FSCH_ID of this Forward Supplemental Channel.
- 33 ◇ Otherwise, BCMC_FLOW_LIST_S[i].LPM_INFO[j].NGHBR_INFO[k].
34 NGHBR_FSCH_BAND_CLASS = kth occurrence of NGHBR_
35 FSCH_BAND_CLASS_T (Band class of the Forward Supplemental
36 Channel in the neighbor base station).
- 37 ○ If NGHBR_BCMC_CONFIG_T equals '000',
38 BCMC_FLOW_LIST_S[i].LPM_INFO[j].NGHBR_INFO[k].
39 NGHBR_FSCH_CDMA_FREQ = NULL; otherwise, the mobile station shall
40 store the following:

- 1 ◇ If $\text{NGHBR_BCMC_CONFIG}_r$ equals '010' or $\text{NGHBR_BCMC_CONFIG}_r$
2 equals '001' and $\text{NGHBR_FSCH_FREQ_INCL}_r$ equals '0',
3 $\text{BMC}_\text{M}_\text{C_FLOW_LIST}_s[i].\text{LPM_INFO}[j].\text{NGHBR_INFO}[k]$.
4 $\text{NGHBR_FSCH_CDMA_FREQ} =$
5 $\text{FBSCH_LIST}_s[i].\text{FSCH_CDMA_FREQ}$ where i corresponds to the entry
6 of FBSCH_LIST_s where $\text{FBSCH_LIST}_s[i].\text{FSCH_ID}$ equals FSCH_ID of
7 this Forward Supplemental Channel.
- 8 ◇ Otherwise, $\text{BMC}_\text{M}_\text{C_FLOW_LIST}_s[i].\text{LPM_INFO}[j].\text{NGHBR_INFO}[k]$.
9 $\text{NGHBR_FSCH_CDMA_FREQ} = k$ th occurrence of
10 $\text{NGHBR_FSCH_CDMA_FREQ}_r$ (Neighbor Frequency assignment of the
11 forward broadcast supplemental channel).
- 12 ○ If $\text{NGHBR_BCMC_CONFIG}_r$ equals '000',
13 $\text{BMC}_\text{M}_\text{C_FLOW_LIST}_s[i].\text{LPM_INFO}[j].\text{NGHBR_INFO}[k]$.
14 $\text{NGHBR_FSCH_CODE_CHAN} = \text{NULL}$; otherwise, the mobile station shall
15 store the following:
- 16 ◇ If $\text{NGHBR_BCMC_CONFIG}_r$ equals '001' or '010' and
17 $\text{NGHBR_FSCH_CODE_CHAN_INCL}_r$ equals '0',
18 $\text{BMC}_\text{M}_\text{C_FLOW_LIST}_s[i].\text{LPM_INFO}[j].\text{NGHBR_INFO}[k]$.
19 $\text{NGHBR_FSCH_CODE_CHAN} =$
20 $\text{FBSCH_LIST}_s[i].\text{FSCH_CODE_CHAN}$ where i corresponds to the entry
21 of FBSCH_LIST_s where $\text{FBSCH_LIST}_s[i].\text{FSCH_ID}$ equals FSCH_ID of
22 this Forward Supplemental Channel.
- 23 ◇ Otherwise, $\text{BMC}_\text{M}_\text{C_FLOW_LIST}_s[i].\text{LPM_INFO}[j].\text{NGHBR_INFO}[k]$.
24 $\text{NGHBR_FSCH_CODE_CHAN} = k$ th occurrence of
25 $\text{NGHBR_FSCH_CODE_CHAN}_r$ (Neighbor pilot forward broadcast
26 supplemental channel code channel index).
- 27 ○ If $\text{NGHBR_BCMC_CONFIG}_r$ equals '000',
28 $\text{BMC}_\text{M}_\text{C_FLOW_LIST}_s[i].\text{LPM_INFO}[j].\text{NGHBR_INFO}[k]$.
29 $\text{NGHBR_FSCH_PLCM} = \text{NULL}$; otherwise, the mobile station shall store
30 the following:
- 31 ◇ If $\text{NGHBR_BCMC_CONFIG}_r$ equals '010' or $\text{NGHBR_BCMC_CONFIG}_r$
32 equals '001' and $\text{NGHBR_FSCH_PARMS_INCL}_r$ equals '0',
33 $\text{BMC}_\text{M}_\text{C_FLOW_LIST}_s[i].\text{LPM_INFO}[j].\text{NGHBR_INFO}[k]$.
34 $\text{NGHBR_FSCH_PLCM} = \text{FBSCH_LIST}_s[i].\text{FSCH_PLCM}$ where i
35 corresponds to the entry of FBSCH_LIST_s where
36 $\text{FBSCH_LIST}_s[i].\text{FSCH_ID}$ equals FSCH_ID of this FORWARD
37 SUPPLEMENTAL CHANNEL.
- 38 ◇ Otherwise, the mobile station shall perform the following:
- 39 — If $\text{NGHBR_FSCH_PLCM_IND}_r$ equals '0'
40 $\text{BMC}_\text{M}_\text{C_FLOW_LIST}_s[i].\text{LPM_INFO}[j].\text{NGHBR_INFO}[k]$.

- 1 NGHBR_FSCH_PLCM shall be set to PLCM_42 as specified in
2 2.6.13.10.1.
- 3 — If NGHBR_FSCH_PLCM_IND_r equals '1'
4 BCMC_FLOW_LIST_s[i].LPM_INFO[j].NGHBR_INFO[k].
5 NGHBR_FSCH_PLCM shall be set to PLCM_42 as specified in
6 2.6.13.10.2.
- 7 ○ If NGHBR_BCMC_CONFIG_r equals '000',
8 BCMC_FLOW_LIST_s[i].LPM_INFO[j].NGHBR_INFO[k].
9 NGHBR_FSCH_MUX_OPTION = NULL; otherwise, the mobile station shall
10 store the following:
- 11 ◇ If NGHBR_BCMC_CONFIG_r equals '010' or NGHBR_BCMC_CONFIG_r
12 equals '001' and NGHBR_FSCH_PARAMS_INCL_r equals '0',
13 BCMC_FLOW_LIST_s[i].LPM_INFO[j].NGHBR_INFO[k].
14 NGHBR_FSCH_MUX_OPTION =
15 FBSCH_LIST_s[i].FSCH_MUX_OPTION where i corresponds to the
16 entry of FBSCH_LIST_s where FBSCH_LIST_s[i].FSCH_ID equals
17 FSCH_ID of this Forward Supplemental Channel.
- 18 ◇ Otherwise, BCMC_FLOW_LIST_s[i].LPM_INFO[j].NGHBR_INFO[k].
19 NGHBR_FSCH_MUX_OPTION = kth occurrence of
20 NGHBR_FSCH_MUX_OPTION_r (Multiplex Option of the Forward
21 Broadcast Supplemental Channel in the neighbor base station).
- 22 ○ If NGHBR_BCMC_CONFIG_r equals '000',
23 BCMC_FLOW_LIST_s[i].LPM_INFO[j].NGHBR_INFO[k]. NGHBR_FSCH_RC
24 = NULL; otherwise, the mobile station shall store the following:
- 25 ◇ If NGHBR_BCMC_CONFIG_r equals '010' or NGHBR_BCMC_CONFIG_r
26 equals '001' and NGHBR_FSCH_PARAMS_INCL_r equals '0',
27 BCMC_FLOW_LIST_s[i].LPM_INFO[j].NGHBR_INFO[k].
28 NGHBR_FSCH_RC = FBSCH_LIST_s[i].FSCH_RC where i corresponds
29 to the entry of FBSCH_LIST_s where FBSCH_LIST_s[i].FSCH_ID equals
30 FSCH_ID of this Forward Supplemental Channel.
- 31 ◇ Otherwise, BCMC_FLOW_LIST_s[i].LPM_INFO[j].NGHBR_INFO[k].
32 NGHBR_FSCH_RC = kth occurrence of NGHBR_FSCH_RC_r (Neighbor
33 Radio configuration of the forward broadcast supplemental channel).
- 34 ○ If NGHBR_BCMC_CONFIG_r equals '000',
35 BCMC_FLOW_LIST_s[i].LPM_INFO[j].NGHBR_INFO[k].NGHBR_FSCH_COD
36 ING = NULL; otherwise, the mobile station shall store the following:

- 1 ◇ If NGHBR_BCMC_CONFIG_r equals '010' or NGHBR_BCMC_CONFIG_r
2 equals '001' and NGHBR_FSCH_PARAMS_INCL_r equals '0',
3 BCMC_FLOW_LIST_s[i].LPM_INFO[j].NGHBR_INFO[k].NGHBR_FSCH_
4 CODING = FBSCH_LIST_s[i].NGHBR_FSCH_CODING where i
5 corresponds to the entry of FBSCH_LIST_s where
6 FBSCH_LIST_s[i].FSCH_ID equals FSCH_ID of this Forward
7 Supplemental Channel.
- 8 ◇ Otherwise,
9 BCMC_FLOW_LIST_s[i].LPM_INFO[j].NGHBR_INFO[k].NGHBR_FSCH_
10 CODING = kth occurrence of NGHBR_FSCH_CODING_r (Coding type
11 of the Forward Broadcast Supplemental Channel in this neighbor
12 base station).
- 13 ○ If NGHBR_BCMC_CONFIG_r equals '000',
14 BCMC_FLOW_LIST_s[i].LPM_INFO[j].NGHBR_INFO[k].NGHBR_FSCH_OUT
15 ERCODE_RATE = NULL; otherwise, the mobile station shall store the
16 following:
- 17 ◇ If NGHBR_BCMC_CONFIG_r equals '010' or NGHBR_BCMC_CONFIG_r
18 equals '001' and NGHBR_FSCH_PARAMS_INCL_r equals '0',
19 BCMC_FLOW_LIST_s[i].LPM_INFO[j].NGHBR_INFO[k].NGHBR_FSCH_
20 OUTERCODE_RATE =
21 FBSCH_LIST_s[i].NGHBR_FSCH_OUTERCODE_RATE where i
22 corresponds to the entry of FBSCH_LIST_s where
23 FBSCH_LIST_s[i].FSCH_ID equals FSCH_ID of this Forward
24 Supplemental Channel.
- 25 ◇ Otherwise,
26 BCMC_FLOW_LIST_s[i].LPM_INFO[j].NGHBR_INFO[k].NGHBR_FSCH_
27 OUTERCODE_RATE = kth occurrence of
28 NGHBR_FSCH_OUTERCODE_RATE_r (Outer Code Rate of the
29 Forward Broadcast Supplemental Channel in this neighbor base
30 station) if NGHBR_FSCH_OUTERCODE_INCL_r equals '1' ; otherwise,
31 BCMC_FLOW_LIST_s[i].LPM_INFO[j].NGHBR_INFO[k].NGHBR_FSCH_
32 OUTERCODE_RATE = NULL.
- 33 ○ If NGHBR_BCMC_CONFIG_r equals '000',
34 BCMC_FLOW_LIST_s[i].LPM_INFO[j].NGHBR_INFO[k].NGHBR_FSCH_OUT
35 ERCODE_OFFSET = NULL; otherwise, the mobile station shall store the
36 following:

- 1 ◇ If NGHBR_BCMC_CONFIG_T equals '010' or NGHBR_BCMC_CONFIG_T
2 equals '001' and NGHBR_FSCH_PARAMS_INCL_T equals '0',
3 BCMC_FLOW_LIST_S[i].LPM_INFO[j].NGHBR_INFO[k].NGHBR_FSCH_
4 OUTERCODE_OFFSET =
5 FBSCH_LIST_S[i].NGHBR_FSCH_OUTERCODE_OFFSET where i
6 corresponds to the entry of FBSCH_LIST_S where
7 FBSCH_LIST_S[i].FSCH_ID equals FSCH_ID of this Forward
8 Supplemental Channel.
- 9 ◇ Otherwise,
10 BCMC_FLOW_LIST_S[i].LPM_INFO[j].NGHBR_INFO[k].NGHBR_FSCH_
11 OUTERCODE_OFFSET = kth occurrence of
12 NGHBR_FSCH_OUTERCODE_OFFSET_T (Outer Coding Buffer Offset
13 of the Forward Broadcast Supplemental Channel in this neighbor
14 base station) if NGHBR_FSCH_OUTERCODE_INCL_T equals '1' ;
15 otherwise,
16 BCMC_FLOW_LIST_S[i].LPM_INFO[j].NGHBR_INFO[k].NGHBR_FSCH_
17 OUTERCODE_OFFSET = NULL.
- 18 ○ If NGHBR_BCMC_CONFIG_T equals '000',
19 BCMC_FLOW_LIST_S[i].LPM_INFO[j].NGHBR_INFO[k].
20 NGHBR_FSCH_NUM_BITS_IDX = NULL; otherwise, the mobile station
21 shall store the following:
- 22 ◇ If NGHBR_BCMC_CONFIG_T equals '010' or NGHBR_BCMC_CONFIG_T
23 equals '001' and NGHBR_FSCH_PARAMS_INCL_T equals '0',
24 BCMC_FLOW_LIST_S[i].LPM_INFO[j].NGHBR_INFO[k].
25 NGHBR_FSCH_NUM_BITS_IDX =
26 FBSCH_LIST_S[i].FSCH_NUM_BITS_IDX where i corresponds to the
27 entry of FBSCH_LIST_S where FBSCH_LIST_S[i].FSCH_ID equals
28 FSCH_ID of this Forward Supplemental Channel.
- 29 ◇ Otherwise, BCMC_FLOW_LIST_S[i].LPM_INFO[j].NGHBR_INFO[k].
30 NGHBR_FSCH_NUM_BITS_IDX = kth occurrence of
31 NGHBR_FSCH_NUM_BITS_IDX_T (Neighbor Number of information
32 bits index of the forward broadcast supplemental channel).
- 33 ○ If NGHBR_BCMC_CONFIG_T equals '000',
34 BCMC_FLOW_LIST_S[i].LPM_INFO[j].NGHBR_INFO[k].
35 NGHBR_FSCH_FRAME_40_USED = NULL; otherwise, the mobile station
36 shall store the following:

- 1 ◇ If $\text{NGHBR_BCMC_CONFIG}_r$ equals '010' or $\text{NGHBR_BCMC_CONFIG}_r$
2 equals '001' and $\text{NGHBR_FSCH_PARMS_INCL}_r$ equals '0',
3 $\text{BCMC_FLOW_LIST}_s[i].\text{LPM_INFO}[j].\text{NGHBR_INFO}[k]$.
4 $\text{NGHBR_FSCH_FRAME_40_USED} =$
5 $\text{FBSCH_LIST}_s[i].\text{FSCH_FRAME_40_USED}$ where i corresponds to the
6 entry of FBSCH_LIST_s where $\text{FBSCH_LIST}_s[i].\text{FSCH_ID}$ equals
7 FSCH_ID of this FORWARD SUPPLEMENTAL CHANNEL.
- 8 ◇ Otherwise, $\text{BCMC_FLOW_LIST}_s[i].\text{LPM_INFO}[j].\text{NGHBR_INFO}[k]$.
9 $\text{NGHBR_FSCH_FRAME_40_USED} =$ k th occurrence of
10 $\text{NGHBR_FSCH_FRAME_40_USED}_r$ (Neighbor 40ms frame used
11 indicator of the forward broadcast supplemental channel).
- 12 ○ If $\text{NGHBR_BCMC_CONFIG}_r$ equals '000',
13 $\text{BCMC_FLOW_LIST}_s[i].\text{LPM_INFO}[j].\text{NGHBR_INFO}[k]$.
14 $\text{NGHBR_FSCH_FRAME_80_USED} = \text{NULL}$; otherwise, the mobile station
15 shall store the following:
- 16 ◇ If $\text{NGHBR_BCMC_CONFIG}_r$ equals '010' or $\text{NGHBR_BCMC_CONFIG}_r$
17 equals '001' and $\text{NGHBR_FSCH_PARMS_INCL}_r$ equals '0',
18 $\text{BCMC_FLOW_LIST}_s[i].\text{LPM_INFO}[j].\text{NGHBR_INFO}[k]$.
19 $\text{NGHBR_FSCH_FRAME_80_USED} =$
20 $\text{FBSCH_LIST}_s[i].\text{FSCH_FRAME_80_USED}$ where i corresponds to the
21 entry of FBSCH_LIST_s where $\text{FBSCH_LIST}_s[i].\text{FSCH_ID}$ equals
22 FSCH_ID of this FORWARD SUPPLEMENTAL CHANNEL.
- 23 ◇ Otherwise, $\text{BCMC_FLOW_LIST}_s[i].\text{LPM_INFO}[j].\text{NGHBR_INFO}[k]$.
24 $\text{NGHBR_FSCH_FRAME_80_USED} =$ k th occurrence of
25 $\text{NGHBR_FSCH_FRAME_80_USED}_r$ (Neighbor 80ms frame used
26 indicator of the forward broadcast supplemental channel).

27 For each of the neighboring base stations contained in the *BCMC Service Parameters*
28 *Message* and supports the broadcast control channel, the mobile station shall store the
29 following informations from the message:

- 30 • SR1 Non-TD BCCH support indicator ($\text{BCMC_SR1_BCCH_NON_TD_INCL}_s =$
31 $\text{BCMC_SR1_BCCH_NON_TD_INCL}_r$)
- 32 • SR1 TD BCCH support indicator ($\text{BCMC_SR1_TD_INCL}_s = \text{BCMC_SR1_TD_INCL}_r$)
- 33 • If $\text{BCMC_SR1_BCCH_NON_TD_INCL}_r$ is equal to '1':
- 34 - $\text{BCMC_SR1_BRAT_NON_TD}_s = \text{BCMC_SR1_BRAT_NON_TD}_r$;
35 - $\text{BCMC_SR1_CRAT_NON_TD}_s = \text{BCMC_SR1_CRAT_NON_TD}_r$;
- 36 - $\text{BCMC_BCCH_CODE_CHAN_NON_TD}_s =$
37 $\text{BCMC_SR1_BCCH_CODE_CHAN_NON_TD}_r$.
- 38 • If $\text{BCMC_SR1_TD_INCL}_r$ is included and is equal to '1', and the mobile station
39 supports the Transmit Diversity indicated by $\text{BCMC_SR1_TD_MODE}_r$:

- 1 - BCMC_SR1_BRAT_TD_S = BCMC_SR1_BRAT_TD_T;
- 2 - BCMC_SR1_CRAT_TD_S = BCMC_SR1_CRAT_TD_T;
- 3 - BCMC_BCCH_CODE_CHAN_TD_S = BCMC_SR1_BCCH_CODE_CHAN_TD_T.
- 4 • If the mobile station supports the Transmit Diversity,
5 BCMC_SR1_BCCH_NON_TD_INCL_T is equal to '1', and SR1_TD_INCL_T is equal to '0':
- 6 - BCMC_SR1_BRAT_TD_S = BCMC_SR1_BRAT_NON_TD_T;
- 7 - BCMC_SR1_CRAT_TD_S = BCMC_SR1_CRAT_NON_TD_T;
- 8 - BCMC_BCCH_CODE_CHAN_TD_S = BCMC_SR1_BCCH_CODE_CHAN_NON_TD_T.

9 2.6.2.2.19 Access Point Pilot Information Message

10 Whenever an *Access Point Pilot Information Message* is received on the Paging Channel or
11 the Primary Broadcast Control Channel, the configuration message sequence number,
12 CONFIG_MSG_SEQ_T, shall be compared to that stored in AP_PILOT_INFO_MSG_SEQ_S. If
13 the comparison results in a match, the mobile station may refresh the lifetime that the
14 information in the message remains valid to LIFETIME_S minutes after the reception of the
15 message. If the comparison results in a mismatch, then the mobile station shall process
16 the remaining fields in the message as follows.

17 The mobile station shall store the following parameters:

- 18 • Configuration message sequence number
19 (CONFIG_MSG_SEQ_S = CONFIG_MSG_SEQ_T,
20 AP_PILOT_INFO_MSG_SEQ_S = CONFIG_MSG_SEQ_T)
- 21 • Lifetime of the message
22 (LIFETIME_S = LIFETIME_T),

23 For each of the Access Point Pilot Information record contained in the *Access Point Pilot*
24 *Information Message*, the mobile station shall perform the following:

- 25 • Set the AP_ASSN_TYPE field of AP_NGHBR_REC_S[i] to the AP_ASSN_TYPE field of
26 the *i*th occurrence of APPI_REC_T.
- 27 • If the AP_SID_SAME_AS_PREVIOUS field of the *i*th occurrence of APPI_REC_T is set
28 to '1', set the AP_SID field of AP_NGHBR_REC_S[i] to the value of AP_SID field of
29 AP_NGHBR_REC_S[i-1]. Otherwise, set the AP_SID field of AP_NGHBR_REC_S[i] to the
30 AP_SID field of the *i*th occurrence of APPI_REC_T.
- 31 • If the AP_NID_SAME_AS_PREVIOUS field of the *i*th occurrence of APPI_REC_T is set
32 to '1', set the AP_NID field of AP_NGHBR_REC_S[i] to the value of AP_NID field of
33 AP_NGHBR_REC_S[i-1]. Otherwise, set the AP_NID field of AP_NGHBR_REC_S[i] to the
34 AP_NID field of the *i*th occurrence of APPI_REC_T.
- 35 • If the AP_BAND_SAME_AS_PREVIOUS field of the *i*th occurrence of APPI_REC_T is set
36 to '1', set the AP_BAND field of AP_NGHBR_REC_S[i] to the value of AP_BAND field of
37 AP_NGHBR_REC_S[i-1]. Otherwise, set the AP_BAND field of AP_NGHBR_REC_S[i] to
38 the AP_BAND field of the *i*th occurrence of APPI_REC_T.

- 1 • If the AP_FREQ_SAME_AS_PREVIOUS field of the i^{th} occurrence of APPI_REC_r is set
2 to '1', set the AP_FREQ field of AP_NGHBR_REC_s[i] to the value of AP_FREQ field of
3 AP_NGHBR_REC_s[i-1]. Otherwise, set the AP_FREQ field of AP_NGHBR_REC_s[i] to
4 the AP_FREQ field of the i^{th} occurrence of APPI_REC_r.
- 5 • If the AP_PN_REC_SAME_AS_PREVIOUS field of the i^{th} occurrence of APPI_REC_r is
6 set to '1', set the AP_PN_REC array values of AP_NGHBR_REC_s[i] to the values of
7 AP_PN_REC array of AP_NGHBR_REC_s[i-1]. Otherwise, set the AP_PN_REC array
8 values (of length AP_PN_COUNT) of AP_NGHBR_REC_s[i] as follows:
- 9 - If AP_PN_REC_TYPE field of the i^{th} occurrence of APPI_REC_r is set to '000', set
10 the k^{th} value of the AP_PN_REC array of AP_NGHBR_REC_s[i] to the k^{th} value of
11 AP_PN field in the i^{th} occurrence of APPI_REC_r, where k is between 0 and
12 AP_PN_COUNT-1.
- 13 - If AP_PN_REC_TYPE field of the i^{th} occurrence of APPI_REC_r is set to '001', set
14 the k^{th} value of the AP_PN_REC array of AP_NGHBR_REC_s[i] to the
15 AP_PN_START + ($k \times$ AP_PN_INC), where AP_PN_START and AP_PN_INC are
16 fields in the i^{th} occurrence of APPI_REC_r, where k is between 0 and
17 AP_PN_COUNT-1.

18 The mobile station may store and use the information in the message if no *Access Point*
19 *Pilot Information Message* is received within LIFETIME_s minutes of the reception of the
20 *Access Point Pilot Information Message* that the information is obtained. The mobile station
21 shall not use the information after LIFETIME_s minutes of the reception of the last *Access*
22 *Point Pilot Information Message*.

23 The mobile station may use the information in the *Access Point Pilot Information Message* to
24 identify access point pilots. E.g. While on traffic channel, if mobile station detects access
25 point pilot then the mobile station may read *Access Point Identification Message* on that
26 pilot to get handoff information in the HO_INFO_RECORD field.

27 2.6.2.2.20 Access Point Identification Message

28 Whenever an *Access Point Identification Message* is received on the Paging Channel or the
29 Primary Broadcast Control Channel, the configuration message sequence number,
30 CONFIG_MSG_SEQ_r, shall be compared to that stored in AP_IDT_MSG_SEQ_s. If the
31 comparison results in a match, the mobile station may ignore the message. If the
32 comparison results in a mismatch, then the mobile station shall process the remaining
33 fields in the message as follows.

34 The mobile station shall store the following parameters:

- 35 • Configuration message sequence number
36 (CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
37 AP_IDT_MSG_SEQ_s = CONFIG_MSG_SEQ_r)
- 38 • ASSTN_TYPE_s = ASSTN_TYPE_r
- 39 • System identification (SID_s = SID_r)

- 1 • Network identification ($NID_S = NID_R$)
- 2 • Access Point identification ($AP_ID_S = AP_ID_R$)
- 3 • Access Point identification mask ($AP_ID_MASK_S = AP_ID_MASK_R$)

4 If the HRPD_ACQ_REC_INCL field in the message is set to '1', then the mobile station shall
5 store the following fields:

- 6 • High Rate Packet Data PN ($HRPD_PN_S = HRPD_PN_R$)
- 7 • High Rate Packet Data band class ($HRPD_BAND_CLASS_S = HRPD_BAND_CLASS_R$)
- 8 • High Rate Packet Data channel number ($HRPD_CHANNEL_S = HRPD_CHANNEL_R$)

9 Otherwise, the mobile station shall set the HRPD_BAND_CLASS_S and HRPD_CHANNEL_S
10 fields to NULL.

11 If the LOC_REC_TYPE field in the message is set to '001' the mobile station shall store the
12 following:

- 13 • Base station latitude ($BASE_LAT_S = BASE_LAT_R$)
- 14 • Base station longitude ($BASE_LONG_S = BASE_LONG_R$)
- 15 • Base station height ($BASE_HEIGHT_S = BASE_HEIGHT_R$)
- 16 • Base station horizontal uncertainty ($LOC_UNC_H_S = LOC_UNC_H_R$)
- 17 • Base station horizontal uncertainty ($LOC_UNC_V_S = LOC_UNC_H_R$)

18 Otherwise, the mobile station shall set the BASE_LAT_S, BASE_LONG_S, BASE_HEIGHT_S,
19 LOC_UNC_H_S and LOC_UNC_V_S fields to NULL.

20 If the INTRA_FREQ_HO_HYS_INCL field in the message is set to '1', then the mobile station
21 shall store the following field:

- 22 • Intra-frequency idle handoff hysteresis ($INTRA_FREQ_HO_HYS_S =$
23 $INTRA_FREQ_HO_HYS_R$)

24 Otherwise, the mobile station shall set the INTRA_FREQ_HO_HYS_S field to NULL.

25 If the INTRA_FREQ_HO_SLOPE_INCL field in the message is set to '1', then the mobile
26 station shall store the following field:

- 27 • Intra-frequency idle handoff slope ($INTRA_FREQ_HO_SLOPE_S =$
28 $INTRA_FREQ_HO_SLOPE_R$)

29 Otherwise, the mobile station shall set the INTRA_FREQ_HO_SLOPE_S field to 8.

30 If the INTER_FREQ_HO_HYS_INCL field in the message is set to '1', then the mobile station
31 shall store the following field:

- 32 • Inter-frequency idle handoff hysteresis ($INTER_FREQ_HO_HYS_S =$
33 $INTER_FREQ_HO_HYS_R$)

34 Otherwise, the mobile station shall set the INTER_FREQ_HO_HYS_S field to NULL.

1 If the INTER_FREQ_HO_SLOPE_INCL field in the message is set to '1', then the mobile
2 station shall store the following field:

- 3 • Inter-frequency idle handoff slope ($\text{INTER_FREQ_HO_SLOPE}_s =$
4 $\text{INTER_FREQ_HO_SLOPE}_r$)

5 Otherwise, the mobile station shall set the $\text{INTER_FREQ_HO_SLOPE}_s$ field to 8. If the
6 $\text{INTER_FREQ_SRCH_TH_INCL}$ field in the message is set to '1', then the mobile station
7 shall store the following field:

- 8 • Inter-frequency idle search threshold ($\text{INTER_FREQ_SRCH_TH}_s =$
9 $\text{INTER_FREQ_SRCH_TH}_r$)

10 Otherwise, the mobile station shall set the $\text{INTER_FREQ_SRCH_TH}_s$ field to NULL.

11 The mobile station shall store HO_INFO_RECORDs included in the message as follows:

- 12 • $\text{HO_INFO_COUNT}_s = \text{HO_INFO_COUNT}_r$
- 13 • $\text{HO_INFO_RECORD}_s[i] = i^{\text{th}}$ HO_INFO_RECORD record in the message.

14 2.6.2.2.21 Access Point Identification Text Message

15 Whenever an *Access Point Identification Text Message* is received on the Paging Channel or
16 the Primary Broadcast Control Channel, the configuration message sequence number,
17 CONFIG_MSG_SEQ_r , shall be compared to that stored in $\text{AP_ID_TEXT_MSG_SEQ}_s$. If the
18 comparison results in a match, the mobile station may ignore the message. If the
19 comparison results in a mismatch, then the mobile station shall process the remaining
20 fields in the message as follows.

21 The mobile station shall store the following parameters:

- 22 • Configuration message sequence number
23 $(\text{CONFIG_MSG_SEQ}_s = \text{CONFIG_MSG_SEQ}_r,$
24 $\text{AP_ID_TEXT_MSG_SEQ}_s = \text{CONFIG_MSG_SEQ}_r)$
- 25 • Message Encoding ($\text{MSG_ENCODING}_s = \text{MSG_ENCODING}_r$)
- 26 • Mobile station shall store i^{th} occurrence of the CHAR_i field as follows
27 $\text{CHAR}_s[i] = \text{CHAR}_i$

28 2.6.2.2.22 General Overhead Information Message

29 Whenever a *General Overhead Information Message* is received on the Paging Channel or
30 the Primary Broadcast Control Channel, the configuration message sequence number,
31 CONFIG_MSG_SEQ_r , shall be compared to that stored in GOI_MSG_SEQ_s . If the
32 comparison results in a match, the mobile station may ignore the message. If the
33 comparison results in a mismatch, then the mobile station shall process the remaining
34 fields in the message as follows.

35 The mobile station shall store the following parameters:

- 36 • Configuration message sequence number
37 $(\text{CONFIG_MSG_SEQ}_s = \text{CONFIG_MSG_SEQ}_r,$

1 GOI_MSG_SEQ_s = CONFIG_MSG_SEQ_r)

2 For each of the General Overhead Information record contained in the *General Overhead*
3 *Information Message*, the mobile station shall perform the following:

- 4 • Set the GOI_REC_TYPE_s[i] to the GOI_REC_TYPE field of the *i*th occurrence of
5 GOI_REC_TYPE_r.
- 6 • Set the GOI_REC_s[i] to the GOI_REC field of the *i*th occurrence of GOI_REC_r.

7 2.6.2.2.23 Flex Duplex CDMA Channel List Message Overview

8 The mobile station may receive the *Flex Duplex CDMA Channel List Message* from the
9 Paging Channel or from the Primary Broadcast Control Channel. Whenever a *Flex Duplex*
10 *CDMA Channel List Message* is received on the Paging Channel, the mobile station shall
11 compare the configuration message sequence number, CONFIG_MSG_SEQ_r, to that stored
12 in FD_CHAN_LST_MSG_SEQ_s. If the comparison results in a match, the mobile station
13 may ignore the message. If the comparison results in a mismatch, then the mobile station
14 shall process the remaining fields in the message as follows:

15 If the *Flex Duplex CDMA Channel List Message* lists CDMA channels from more than one
16 band class and the mobile station hashes to a band class other than the current band
17 class, the mobile station shall process this message after NGHBR_LST_MSG_SEQ_s,
18 EXT_NGHBR_LST_MSG_SEQ_s and GEN_NGHBR_LST_MSG_SEQ_s become current.

19 If any of the REMAINING_FIELD_INCL fields included in this message is set to '0', the
20 mobile station shall process the remaining message after EXT_CHAN_LST_MSG_SEQ_s is
21 current.

22 The mobile station shall store the following parameters:

- 23 • Configuration message sequence number
24 (CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
25 FD_CHAN_LST_MSG_SEQ_s = CONFIG_MSG_SEQ_r).
- 26 • If CAND_BAND_INFO_REQ_r is included, the mobile station shall set
27 CAND_BAND_INFO_REQ_s to CAND_BAND_INFO_REQ_r; otherwise, the mobile
28 station shall set CAND_BAND_INFO_REQ_s to '0'.
- 29 • The mobile station shall perform the following for each occurrence of the
30 CAND_BAND_CLASS record:
 - 31 - Set the CAND_BAND_CLASS field of CAND_BAND_CLASS_REC[i] to the *i*th
32 occurrence of CAND_BAND_CLASS_r.
 - 33 - Set the SUBCLASS_INFO_INCL field of CAND_BAND_CLASS_REC[i] to the
34 corresponding value of SUBCLASS_INFO_INCL_r.
 - 35 - If the *i*th occurrence of SUBCLASS_INFO_INCL field of
36 CAND_BAND_CLASS_REC[i] is set to '1', set the SUBCLASS_REC_LEN field of
37 CAND_BAND_CLASS_REC[i] to the corresponding value of
38 SUBCLASS_REC_LEN_r.

- 1 - If the i^{th} occurrence of SUBCLASS_INFO_INCL field of
2 CAND_BAND_CLASS_REC[i] is set to '1', the mobile station shall perform the
3 following for each band subclass indicator received:
- 4 + Set the BAND_SUBCLASS_IND_REC[j] field of CAND_BAND_CLASS_REC[i]
5 to the j^{th} occurrence of BAND_SUBCLASS_IND_r in the i^{th}
6 CAND_BAND_CLASS_REC record.
- 7 - Set the TD_MODE field of CAND_BAND_CLASS_REC[i] to the i^{th} occurrence of
8 TD_MODE_r
- 9 - Set the BYPASS_SYS_DET_IND field of CAND_BAND_CLASS_REC[i] to the i^{th}
10 occurrence of BYPASS_SYS_DET_IND_r.
- 11 - Set the NUM_FREQ field of CAND_BAND_CLASS_REC[i] to the i^{th} occurrence of
12 NUM_FREQ_r.
- 13 - For each FREQ record included in the CAND_BAND_CLASS_REC[i], the mobile
14 station shall store the following:
- 15 + Set the CDMA_FREQ[j] field of CAND_BAND_CLASS_REC[i] to the j^{th}
16 occurrence of CDMA_FREQ_r in the i^{th} CAND_BAND_CLASS_REC record.
- 17 + If the j^{th} occurrence of REMAINING_FIELD_INCL field of the
18 CAND_BAND_CLASS_REC[i] is set to '1', the mobile station shall store the
19 following:
- 20 ○ Set the REV_CDMA_FREQ[j] field of CAND_BAND_CLASS_REC[i] to the
21 j^{th} occurrence of REV_CDMA_FREQ_r in the i^{th}
22 CAND_BAND_CLASS_REC record.
- 23 ○ Set the RC_QPCH_HASH_IND[j] field of CAND_BAND_CLASS_REC[i] to
24 the j^{th} occurrence of RC_QPCH_HASH_IND_r if the field corresponding to
25 the CDMA_FREQ[j] field of the i^{th} CAND_BAND_CLASS_REC record is
26 included, otherwise set it to '0'.
- 27 ○ Set the TD_HASH_IND[j] field of CAND_BAND_CLASS_REC[i] to the j^{th}
28 occurrence of TD_HASH_IND_r if the field corresponding to the
29 CDMA_FREQ[j] field of the i^{th} CAND_BAND_CLASS_REC record is
30 included, otherwise set it to '0'.
- 31 ○ Set the TD_POWER_LEVEL[j] field of CAND_BAND_CLASS_REC[i] to the
32 j^{th} occurrence of TD_POWER_LEVEL_r if the field corresponding to the
33 CDMA_FREQ[j] field of the i^{th} CAND_BAND_CLASS_REC record is
34 included, otherwise set it to '0'.
- 35 ○ Set the CDMA_FREQ_WEIGHT[j] field of CAND_BAND_CLASS_REC[i] to
36 the j^{th} occurrence of CDMA_FREQ_WEIGHT_r if the field corresponding to
37 the CDMA_FREQ[j] field of the i^{th} CAND_BAND_CLASS_REC record is
38 included, otherwise set it to '0'.
- 39 + Otherwise, the mobile station should set these fields as follows:

- 1 ○ If the base station is sending the *Extended CDMA Channel List Message*
2 and includes CDMA_FREQ[j] and CAND_BAND_CLASS pair the mobile
3 station shall store the following:
- 4 ◇ Set the REV_CDMA_FREQ[j] field of CAND_BAND_CLASS_REC[i]
5 according to [45].
- 6 ◇ If the RC_QPCH_HASH_IND_r field corresponding to the
7 CDMA_FREQ[j] and CAND_BAND_CLASS pair in the *Extended CDMA*
8 *Channel List Message* is included, set the RC_QPCH_HASH_IND[j]
9 field of CAND_BAND_CLASS_REC[i] to this value, Otherwise, set it to
10 '0'.
- 11 ◇ If the TD_HASH_IND_r field corresponding to the CDMA_FREQ[j] and
12 CAND_BAND_CLASS pair in the *Extended CDMA Channel List*
13 *Message* is included, set the TD_HASH_IND[j] field of
14 CAND_BAND_CLASS_REC[i] to this value, Otherwise, set it to '0'.
- 15 ◇ If the TD_POWER_LEVEL_r field corresponding to the CDMA_FREQ[j]
16 and CAND_BAND_CLASS pair in the *Extended CDMA Channel List*
17 *Message* is included, set the TD_POWER_LEVEL[j] field of
18 CAND_BAND_CLASS_REC[i] to this value, Otherwise, set it to '0'.
- 19 ◇ If the CDMA_FREQ_WEIGHT_r field corresponding to the
20 CDMA_FREQ[j] and CAND_BAND_CLASS pair in the *Extended CDMA*
21 *Channel List Message* is included, set the CDMA_FREQ_WEIGHT[j]
22 field of CAND_BAND_CLASS_REC[i] to this value, Otherwise, set it to
23 '0'.
- 24 ○ If the base station is not sending the *Extended CDMA Channel List*
25 *Message* or if the CDMA_FREQ[j] and CAND_BAND_CLASS pair is not
26 included in the *Extended CDMA Channel List Message* the mobile station
27 shall set store the following:
- 28 ◇ Set the REV_CDMA_FREQ[j] field of CAND_BAND_CLASS_REC[i]
29 according to [45].
- 30 ◇ Set the RC_QPCH_HASH_IND[j] field of CAND_BAND_CLASS_REC[i]
31 to '0'.
- 32 ◇ Set the TD_HASH_IND[j] field of CAND_BAND_CLASS_REC[i] to '0'.
- 33 ◇ Set the TD_POWER_LEVEL[j] field of CAND_BAND_CLASS_REC[i] to
34 '0'.
- 35 ◇ Set the CDMA_FREQ_WEIGHT[j] field of CAND_BAND_CLASS_REC[i]
36 to '0'.

37 If this message is received on the Paging Channel, the mobile station shall process it as
38 specified in the section 2.6.2.2.23.1. Otherwise the mobile station shall process the
39 message as specified in section 2.6.2.2.23.2.

1 2.6.2.2.23.1 Flex Duplex CDMA Channel List Message on Paging Channel

2 The mobile station shall determine the CDMA Channel (Frequency Assignment) for its
3 Paging Channel as follows:

- 4 • Starting from an empty list, the mobile station shall generate the first CDMA
5 Channel list from the *Flex Duplex CDMA Channel List Message* as follows:
 - 6 - For each band class record included in this message, the mobile station shall
7 perform the following:
 - 8 + If band subclass information is included for this band class record
9 (SUBCLASS_INFO_INCL_S = '1'), the mobile station shall add only those
10 channels belonging to the band class and band subclasses that are
11 supported by both the mobile station and the base station, in the order they
12 appear in the *Flex Duplex CDMA Channel List Message*³⁹.
 - 13 + Otherwise (SUBCLASS_INFO_INCL_S = '0' or P_REV_IN_USE_S is less than 11),
14 the mobile station shall add only those channels that it supports for the
15 associated band class, in the order they appear in the *Flex Duplex CDMA*
16 *Channel List Message*.
 - 17 - If P_REV_IN_USE_S is greater than or equal to 11, the mobile station shall sort
18 the channels first by the ascending order of band class value, as specified in
19 [30], then by the ascending order of CDMA_FREQ within each band class.
 - 20 • If RC_QPCH_SEL_INCL_T is equal to '1' and the mobile station is capable of RC
21 greater than 2 or capable of supporting Quick Paging Channel, the mobile station
22 shall eliminate the channels with RC_QPCH_HASH_IND_S equal to '0' from the first
23 CDMA Channel list to generate the second CDMA Channel list while preserving the
24 order in the first CDMA Channel list. Otherwise, the mobile station shall set the
25 second CDMA Channel list to be equal to the first CDMA Channel list.
 - 26 • The mobile station shall generate the third CDMA Channel list as follows.
 - 27 - If CDMA_FREQ_WEIGHT_INCL_T is equal to '0', the mobile station shall set the
28 third CDMA Channel list to be equal to the second CDMA Channel list.
 - 29 - If CDMA_FREQ_WEIGHT_INCL_T is equal to '1', starting with an empty third
30 CDMA Channel list, for each entry "E" in the second CDMA Channel list in the
31 order they appear, the mobile station shall append N consecutive entries "E" at
32 the end of the third CDMA Channel list, where N is the weight of "E" and equals
33 CDMA_FREQ_WEIGHT_S+1.

³⁹ The mobile station will not discard frequencies as long as they belong to a subclass that is both listed in the message and supported by the mobile station. If the base station does not list any subclass, the mobile station assumes that all subclasses are supported by the base station. The subclass to frequency mapping is not provided in the *Extended CDMA Channel List Message*; the mobile station needs to refer to [45] to find the mapping.

- 1 • The mobile station shall generate a CDMA band list as follows. Starting with an
2 empty CDMA band list, for each channel in the third CDMA Channel list in the
3 order they appear, the mobile station shall append an entry equal to the band class
4 of that channel, at the end of the CDMA band list.
- 5 • The mobile station shall use the hash algorithm specified in 2.6.7.1 and the size of
6 the CDMA band list to compute the band class for its Paging Channel.
- 7 • The mobile station shall eliminate those channels which are not in the computed
8 band class from the third CDMA channel list to generate the final CDMA channel
9 list.
- 10 • If the final CDMA Channel list is empty, the mobile station shall proceed with the
11 processing of *Extended CDMA Channel List message* and the *CDMA Channel List*
12 *message*.
- 13 • The mobile station shall then use the hash algorithm specified in 2.6.7.1 and the
14 size of the final CDMA channel list to determine the CDMA Channel (Frequency
15 Assignment) for its Paging Channel.

16 Figure 2.6.2.2.12.1-1 shows an example of the hashing procedure.

17 If the CDMA Frequency Assignment has changed but the band class is the same (the
18 computed CDMA Channel is different from $CDMACH_S$ but the computed CDMA band class
19 is the same as $CDMABAND_S$), the mobile station shall perform the following actions:

- 20 • If the stored configuration parameters is not current (see 2.6.2.2) for the
21 corresponding base station and frequency assignment, the mobile station shall
22 perform the following actions:
 - 23 - Set $CDMACH_S$ to the new CDMA Channel.
 - 24 - Set $REVCDMACH_S$ to the Reverse CDMA Channel.
 - 25 - Set $PAGE_CHAN_S$ to '1'.
 - 26 - Set $PAGECH_S$ to the Primary Paging Channel.

- 1 - Set CONFIG_MSG_SEQ_s, SYS_PAR_MSG_SEQ_s, NGHBR_LST_MSG_SEQ_s,
 2 CHAN_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
 3 FD_CHAN_LST_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s,
 4 GEN_NGHBR_LST_MSG_SEQ_s, EXT_SYS_PAR_MSG_SEQ_s,
 5 GLOB_SERV_REDIR_MSG_SEQ_s, EXT_GLOB_SERV_REDIR_MSG_SEQ_s,
 6 USER_ZONE_IDMSG_SEQ_s, PRI_NGHBR_LST_MSG_SEQ_s,
 7 AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s,
 8 GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s and
 9 ACC_MSG_SEQ_s to NULL. The mobile station shall keep the parameters
 10 associated with the current overhead messages until they are updated on the
 11 new Paging Channel⁴⁰
- 12 - Tune to the new CDMA Channel.
- 13 • Otherwise, the mobile station shall perform the following actions:
- 14 - Set CDMACH_s to the new CDMA Channel.
- 15 - The mobile station shall use the hash algorithm specified in 2.6.7.1 to select a
 16 new Paging Channel number in the range 1 to PAGE_CHAN_s, where
 17 PAGE_CHAN_s is the value stored for the Paging Channel whose stored
 18 information is current. The mobile station shall store the new Paging Channel
 19 number as PAGECH_s.
- 20 - Tune to the new CDMA Channel and shall begin monitoring the new Paging
 21 Channel.

22 If the band class has changed (the computed CDMA band class is different than
 23 CDMABAND_s), the mobile station shall perform the following actions:

- 24 • If BYPASS_SYS_DET_IND_s is equal to '0' for this CDMA channel, the mobile station
 25 shall perform the following:
- 26 - Set NEW_BAND_RECORD.NEW_BAND_CLASS to the computed band class
- 27 - Set NEW_BAND_RECORD.NEW_FREQ to the computed CDMA Channel
- 28 - The mobile station shall enter the *System Determination Substate* of the *Mobile*
 29 *Station Initialization State* with a new band indication.
- 30 • If BYPASS_SYS_DET_IND_s is equal to '1' for this CDMA channel, the mobile station
 31 shall perform the following:
- 32 - If the stored configuration parameters is not current (see 2.6.2.2) for the
 33 corresponding base station and frequency assignment, the mobile station shall
 34 perform the following actions:

⁴⁰ This is primarily needed when hashing to a band with a different coverage footprint than the current band. The current neighbor list is to be used to search for pilots in the hashed-to band. The search priorities are to be adjusted to take into account the hashed-to frequency (e.g., the pilots in the hashed-to frequency should have the highest priority).

- 1 + Set CDMACH_S to the new CDMA Channel.
- 2 + Set REVCDMACH_S to the Reverse CDMA Channel.
- 3 + Set CDMABAND_S to the new band class.
- 4 + Set PAGE_CHAN_S to '1'.
- 5 + Set PAGECH_S to the Primary Paging Channel.
- 6 + Set CONFIG_MSG_SEQ_S, SYS_PAR_MSG_SEQ_S, NGHBR_LST_MSG_SEQ_S,
7 CHAN_LST_MSG_SEQ_S, EXT_CHAN_LST_MSG_SEQ_S,
8 FD_CHAN_LST_MSG_SEQ_S, EXT_NGHBR_LST_MSG_SEQ_S,
9 GEN_NGHBR_LST_MSG_SEQ_S, EXT_SYS_PAR_MSG_SEQ_S,
10 GLOB_SERV_REDIR_MSG_SEQ_S, EXT_GLOB_SERV_REDIR_MSG_SEQ_S,
11 USER_ZONE_IDMSG_SEQ_S, PRI_NGHBR_LST_MSG_SEQ_S,
12 AP_PILOT_INFO_MSG_SEQ_S, AP_IDT_MSG_SEQ_S, AP_ID_TEXT_MSG_SEQ_S,
13 GOI_MSG_SEQ_S, FREQ_GOI_MSG_SEQ_S, ATIM_MSG_SEQ_S and
14 ACC_MSG_SEQ_S to NULL. The mobile station shall keep the parameters
15 associated with the current overhead messages until they are updated on
16 the new Paging Channel⁴¹.
- 17 + Tune to the new CDMA Channel.
- 18 - Otherwise, the mobile station shall perform the following actions:
- 19 + Set CDMACH_S to the new CDMA Channel.
- 20 + Set CDMABAND_S to the new band class.
- 21 + The mobile station shall use the hash algorithm specified in 2.6.7.1 to select
22 a new Paging Channel number in the range 1 to PAGE_CHAN_S, where
23 PAGE_CHAN_S is the value stored for the Paging Channel whose stored
24 information is current. The mobile station shall store the new Paging
25 Channel number as PAGECH_S.
- 26 + Tune to the new CDMA Channel and shall begin monitoring the new Paging
27 Channel.

28 2.6.2.2.23.2 Flex Duplex CDMA Channel List Message on Primary Broadcast Control 29 Channel

30 To determine the CDMA Channel (Frequency Assignment) for its Primary Broadcast Control
31 Channel, the mobile station shall first select a subset of CDMA channels from the *Flex*
32 *Duplex CDMA Channel List Message* that will be used for channel hashing. The attributes
33 for channel selection are support for that frequency, the band subclass (if included), RC

⁴¹ This is primarily needed when hashing to a band with a different coverage footprint than the current band. The current neighbor list is to be used to search for pilots in the hashed-to band. The search priorities are to be adjusted to take into account the hashed-to frequency (e.g., the pilots in the hashed-to frequency should have the highest priority).

1 greater than 2, Quick Paging Channel and transmit diversity. The mobile station shall first
2 select the entire CDMA channel list for channel hashing.

- 3 • Starting from an empty list, the mobile station shall then select the first CDMA
4 Channel list as follows:
 - 5 - For each band class record included in this message, the mobile station shall
6 perform the following:
 - 7 - If band subclass information is included for this band class record
8 (SUBCLASS_INFO_INCL_S = '1'), the mobile station shall add only those channels
9 belonging to the band class and band subclasses that are supported by both the
10 mobile station and the base station, in the order they appear in the *Flex Duplex*
11 *CDMA Channel List Message*⁴².
 - 12 - Otherwise (SUBCLASS_INFO_INCL_S = '0' or P_REV_IN_USE_S is less than 11), the
13 mobile station shall add only those channels that it supports for the associated
14 band class, in the order they appear in the *Flex Duplex CDMA Channel List*
15 *Message*.
 - 16 • If P_REV_IN_USE_S is greater than or equal to 11, the mobile station shall sort the
17 channels first by the ascending order of band class value as specified in [30], then
18 by the ascending order of CDMA_FREQ within each band class.
 - 19 • If TD_SEL_INCL_T is equal to '1', the mobile station shall perform the following:
 - 20 - If the mobile station is capable of supporting the transmit diversity mode
21 specified by TD_MODE_S, the mobile station shall select those CDMA channels
22 that have TD_HASH_IND_S set to '1' from the CDMA channel list for the first
23 CDMA Channel list while preserving the order.
 - 24 - If the mobile station is not capable of supporting the transmit diversity mode
25 specified by TD_MODE_S, the mobile station shall select those CDMA channels
26 that have TD_HASH_IND_S set to '0' from the CDMA channel list for the first
27 CDMA Channel list while preserving the order.
 - 28 • If TD_SEL_INCL_T is equal to '0', the mobile station shall select the entire list for the
29 first CDMA Channel list.

30 From this first CDMA Channel list, the mobile station shall select the second CDMA
31 Channel list as follows:

- 32 • If RC_QPCH_SEL_INCL_T is equal to '1' and the mobile station is capable of RC
33 greater than 2 or capable of supporting QPCH, the mobile station shall select those

⁴² The mobile station will not discard frequencies as long as they belong to a subclass that is both listed in the message and supported by the mobile station. If the base station does not list any subclass, the mobile station assumes that all subclasses are supported by the base station. The subclass to frequency mapping is not provided in the *Extended CDMA Channel List Message*; the mobile station needs to refer to [45] to find the mapping.

1 CDMA channels with RC_QPCH_HASH_IND_s set to '1' for the second CDMA
 2 Channel list for CDMA channel hashing while preserving the order. If this list is
 3 empty, the mobile station shall use the first CDMA Channel list as the second
 4 CDMA Channel list for CDMA channel hashing.

- 5 • Otherwise, the mobile station shall use the first CDMA Channel list as the second
 6 CDMA Channel list for CDMA channel hashing.

7 From this second CDMA Channel list, the mobile station shall select the third CDMA
 8 Channel list subset as follows:

- 9 • If CDMA_FREQ_WEIGHT_INCL_r is equal to '0', the mobile station shall set the third
 10 CDMA Channel list to be equal to the second CDMA Channel list
- 11 • If CDMA_FREQ_WEIGHT_INCL_r is equal to '1', starting with an empty third CDMA
 12 Channel list, for each entry "E" in the second CDMA Channel list in the order they
 13 appear, the mobile station shall append N consecutive entries "E" at the end of the
 14 third CDMA Channel, where N is the weight of "E" and equals
 15 CDMA_FREQ_WEIGHT_s+1.

16 The mobile station shall determine the band class for its Primary Broadcast Control
 17 Channel as follows:

- 18 • The mobile station shall generate a CDMA band list as follows. Starting with an
 19 empty CDMA band list, for each channel in the third CDMA Channel list in the
 20 order they appear, the mobile station shall append an entry equal to the band class
 21 of that channel, at the end of the CDMA band list
- 22 • The mobile station shall use the hash algorithm specified in 2.6.7.1 and the size of
 23 the CDMA band list to compute the band class for its Primary Broadcast Control
 24 Channel.

25 After the band class has been selected, the mobile station shall determine the CDMA
 26 Channel (Frequency Assignment) for its Primary Broadcast Control Channel as follows:

- 27 • The mobile station shall eliminate those channels which are not in the computed
 28 band class from the third CDMA Channel list to generate the final CDMA Channel
 29 list.
- 30 • If the final CDMA Channel list is empty, the mobile station shall proceed with the
 31 processing of the *Extended CDMA Channel List message*.
- 32 • The mobile station shall then use the hash algorithm specified in 2.6.7.1 with the
 33 number of channels in the final CDMA Channel list to determine the CDMA
 34 Channel (Frequency Assignment) for its Primary Broadcast Control Channel.

35 If the CDMA Frequency Assignment has changed but the band class is the same (the
 36 computed CDMA Channel is different from CDMACH_s but the computed CDMA band class
 37 is CDMABAND_s), the mobile station shall perform the following:

- 38 • Set CDMACH_s to the new CDMA Channel.
- 39 • Set REVCDMACH_s to the new Reverse CDMA Channel.

- 1 • Set CONFIG_MSG_SEQ_s, A41_SYS_PAR_MSG_SEQ_s, MC_RR_PAR_MSG_SEQ_s,
2 UNI_NGHRBR_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
3 FD_CHAN_LST_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s,
4 AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s,
5 GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s and
6 PRI_NGHRBR_LST_MSG_SEQ_s and ACC_MSG_SEQ_s to NULL. The mobile station
7 shall keep the parameters associated with the current overhead messages until they
8 are updated on the new Primary Broadcast Control Channel⁴³.
- 9 • If the mobile station is operating in the Spreading Rate 1:
- 10 - If the assigned CDMA channel supports transmit diversity, the mobile station
11 shall set the following fields corresponding to the assigned CDMA channel:
- 12 + SR1_TD_POWER_LEVEL_s = TD_POWER_LEVEL_r.
13 + SR1_TD_MODE_s = TD_MODE_r.
14 + BRAT_s = SR1_BRAT_TD_s.
15 + BCCH_CODE_RATE_s = SR1_CRAT_TD_s.
16 + BCCH_s = BCCH_CODE_CHAN_TD_s.
- 17 - Otherwise, the mobile station shall set the following fields corresponding to the
18 assigned CDMA channel:
- 19 + BRAT_s = SR1_BRAT_NON_TD_s,
20 + BCCH_CODE_RATE_s = SR1_CRAT_NON_TD_s,
21 + BCCH_s = BCCH_CODE_CHAN_NON_TD_s,
- 22 • Tune to the new CDMA Channel
- 23 If the band class has changed (the computed CDMA band class is different than
24 CDMABAND_s), the mobile station shall perform the following actions:
- 25 • If BYPASS_SYS_DET_IND_s is equal to '0' for this CDMA channel, the mobile station
26 shall perform the following:
- 27 - Set NEW_BAND_RECORD.NEW_BAND_CLASS to the computed band class.
28 - Set NEW_BAND_RECORD.NEW_FREQ to the computed CDMA Channel.
29 - The mobile station shall enter the *System Determination Substate* of the *Mobile*
30 *Station Initialization State* with a new band indication.

⁴³ This is primarily needed when hashing to a band with a different coverage footprint than the current band. The current neighbor list is to be used to search for pilots in the hashed-to band. The search priorities are to be adjusted to take into account the hashed-to frequency (e.g., the pilots in the hashed-to frequency should have the highest priority).

- 1 • If $BYPASS_SYS_DET_IND_S$ is equal to '1' for this CDMA channel, the mobile station
2 shall perform the following:
- 3 - Set $CDMACH_S$ to the new CDMA Channel.
- 4 - Set $REVCDMACH_S$ to the new Reverse CDMA Channel.
- 5 - Set $CDMABAND_S$ to the new band class.
- 6 - Set $CONFIG_MSG_SEQ_S$, $A41_SYS_PAR_MSG_SEQ_S$, $MC_RR_PAR_MSG_SEQ_S$,
7 $UNI_NGHBR_LST_MSG_SEQ_S$, $EXT_CHAN_LST_MSG_SEQ_S$,
8 $FD_CHAN_LST_MSG_SEQ_S$, $USER_ZONE_ID_MSG_SEQ_S$, and
9 $PRI_NGHBR_LST_MSG_SEQ_S$, $AP_PILOT_INFO_MSG_SEQ_S$, $AP_IDT_MSG_SEQ_S$,
10 $AP_ID_TEXT_MSG_SEQ_S$, $GOI_MSG_SEQ_S$, $FREQ_GOI_MSG_SEQ_S$,
11 $ATIM_MSG_SEQ_S$ and $ACC_MSG_SEQ_S$ to NULL. The mobile station shall keep
12 the parameters associated with the current overhead messages until they are
13 updated on the new Primary Broadcast Control Channel⁴⁴.
- 14 - If the mobile station is operating in the Spreading Rate 1:
- 15 + If the assigned CDMA channel supports transmit diversity, the mobile
16 station shall set the following fields corresponding to the assigned CDMA
17 channel:
- 18 ○ $SR1_TD_POWER_LEVEL_S = TD_POWER_LEVEL_T$.
- 19 ○ $SR1_TD_MODE_S = TD_MODE_T$.
- 20 ○ $BRAT_S = SR1_BRAT_TD_S$.
- 21 ○ $BCCH_CODE_RATE_S = SR1_CRAT_TD_S$.
- 22 ○ $BCCH_S = BCCH_CODE_CHAN_TD_S$.
- 23 - Otherwise, the mobile station shall set the following fields corresponding to the
24 assigned CDMA channel:
- 25 + $BRAT_S = SR1_BRAT_NON_TD_S$,
- 26 + $BCCH_CODE_RATE_S = SR1_CRAT_NON_TD_S$,
- 27 + $BCCH_S = BCCH_CODE_CHAN_NON_TD_S$,
- 28 - Tune to the new CDMA Channel

29 2.6.2.2.24 Alternative Technologies Information Message

30 Whenever a *Alternative Technologies Information Message* is received on the Paging Channel
31 or the Primary Broadcast Control Channel, the configuration message sequence number,

⁴⁴ This is primarily needed when hashing to a band with a different coverage footprint than the current band. The current neighbor list is to be used to search for pilots in the hashed-to band. The search priorities are to be adjusted to take into account the hashed-to frequency (e.g., the pilots in the hashed-to frequency should have the highest priority).

1 CONFIG_MSG_SEQ_r, shall be compared to that stored in ATIM_MSG_SEQ_s. If the
 2 comparison results in a match, the mobile station may ignore the message. If the
 3 comparison results in a mismatch, then the mobile station shall process the remaining
 4 fields in the message as follows.

5 The mobile station shall store the following parameters:

- 6 • Configuration message sequence number
 7 (CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
 8 ATIM_MSG_SEQ_s = CONFIG_MSG_SEQ_r)

9 The mobile station shall store all the Radio Interface records contained in the *Alternative*
 10 *Technologies Information Message*.

11 2.6.2.2.25 Frequent General Overhead Information Message

12 Whenever a *Frequent General Overhead Information Message* is received on the Paging
 13 Channel or the Primary Broadcast Control Channel, the configuration message sequence
 14 number, CONFIG_MSG_SEQ_r, shall be compared to that stored in FREQ_GOI_MSG_SEQ_s.
 15 If the comparison results in a match, the mobile station may ignore the message. If the
 16 comparison results in a mismatch, then the mobile station shall process the remaining
 17 fields in the message as follows.

18 The mobile station shall store the following parameters:

- 19 • Configuration message sequence number
 20 (CONFIG_MSG_SEQ_s = CONFIG_MSG_SEQ_r,
 21 FREQ_GOI_MSG_SEQ_s = CONFIG_MSG_SEQ_r)

22 For each of the General Overhead Information record contained in the *Frequent General*
 23 *Overhead Information Message*, the mobile station shall perform the following:

- 24 • Set the FREQ_GOI_REC_TYPE_s[i] to the GOI_REC_TYPE field of the *i*th occurrence of
 25 GOI_REC_TYPE_r.
- 26 • Set the FREQ_GOI_REC_s[i] to the GOI_REC field of the *i*th occurrence of GOI_REC_r.

27 If the mobile station supports the processing of GOI_REC_TYPE value of '00000010' in the
 28 General Overhead Information record and receives a General Overhead Information record
 29 with GOI_REC_TYPE of '00000010', the mobile station shall process the General Overhead
 30 Information as follows:

- 31 • The mobile station should use the information in the GOI_REC_TYPE of '00000010'
 32 to search for preferred networks⁴⁵. If the General Overhead Information record with

⁴⁵ For example, mobile station that is roaming may use this information to search for a home network if the home network is listed in the GOI_REC. Procedures for search is beyond the scope of this specification.

- 1 GOI_REC_TYPE of '00000010' includes the MCC and MNC⁴⁶, the mobile station
 2 should attempt to acquire the home system if all of the following conditions are met:
- 3 - The mobile station is currently not on the home system.
 - 4 - The MCC and MNC values contained in the General Overhead Information
 5 record match the home system of the mobile station.
 - 6 - The user has not directed the mobile station to stay on the current system.

7 If the mobile station is unable to acquire the home system, the mobile station may return
 8 and acquire the current system and continue to stay on this system⁴⁷.

9 2.6.2.3 Mobile Station Page Match Operation

10 The *Mobile Station Page Match Operation* is performed whenever the mobile station receives
 11 a mobile-station-addressed page or a broadcast page. If the mobile station receives a
 12 mobile-station-addressed page that contains the IMSI or TMSI assigned to the mobile
 13 station (see [4]) on the Paging Channel, the mobile station transmits a *Page Response*
 14 *Message* on the Access Channel. If the mobile station receives a mobile-station-addressed
 15 page that contains the IMSI or TMSI assigned to the mobile station (see [4]) on the Forward
 16 Common Control Channel, the mobile station transmits a *Page Response Message* on the r-
 17 csch. If the mobile station is configured to receive broadcast messages and it receives a
 18 *General Page Message* that contains a burst type and broadcast address that the mobile
 19 station has been configured to receive (see [4]) on the Paging Channel, the mobile station
 20 performs the broadcast page procedures as described in 2.6.2.1.1.3.4. If the mobile station
 21 is configured to receive broadcast messages and it receives a *General Page Message* or a
 22 *Universal Page Message* that contains a burst type and broadcast address that the mobile
 23 station has been configured to receive (see [4]) on the Forward Common Control Channel,
 24 the mobile station performs the enhanced broadcast page procedures as described in
 25 2.6.2.1.1.3.6.

26 When the mobile station receives a page message, it shall compare the configuration
 27 message sequence number, CONFIG_MSG_SEQ_r, to CONFIG_MSG_SEQ_s. If the
 28 comparison results in a mismatch, then the mobile station shall set CONFIG_MSG_SEQ_s to
 29 CONFIG_MSG_SEQ_r. The mobile station shall also compare the *Access Parameters*
 30 *Message* or the *Enhanced Access Parameters Message* sequence number, ACC_MSG_SEQ_r,
 31 with that stored in ACC_MSG_SEQ_s. If the comparison results in a mismatch, then the
 32 mobile station shall set ACC_MSG_SEQ_s to NULL (see 2.6.2.2). The mobile station shall set
 33 CURR_ACC_MSG_SEQ to ACC_MSG_SEQ_s.

34 The mobile station shall process each record for which it declares a page match (see [4]).

35 If the mobile station receives a broadcast page that contains a burst type and broadcast
 36 address that the mobile station has been configured to receive on the Paging Channel, the

⁴⁶ MNC is IMSI_11_12 when IMSI_10 is not included or concatenation of IMSI_11_12 and IMSI_10 when IMSI_10 is included.

⁴⁷ The system selection procedure for this scenario is beyond the scope of this specification.

1 mobile station should perform the broadcast page procedures described in 2.6.2.1.1.3.4. If
 2 the mobile station receives a broadcast page that contains a burst type and broadcast
 3 address that the mobile station has been configured to receive on the Forward Common
 4 Control Channel, the mobile station should perform the enhanced broadcast page
 5 procedures as described in 2.6.2.1.1.3.6.

6 If a page match is declared, the mobile station shall perform the following:

- 7 • The mobile station shall enter the *Update Overhead Information Substate* of the
 8 *System Access State* (see 2.6.3.2) with a page response indication within T_{33m}
 9 seconds after the page message is received.

10 If a page match is declared and the mobile station determines that it should be monitoring
 11 a neighboring base station, the mobile station may perform an access entry handoff to the
 12 neighboring base station, if all of the following conditions hold:

- 13 • The neighboring base station is listed in NGHBR_REC.
- 14 • The ACCESS_ENTRY_HO field of the NGHBR_REC corresponding to the neighboring
 15 base station is equal to '1'.
- 16 • If the mobile station performs an access entry handoff on the Access Channel, none
 17 of CONFIG_MSG_SEQ_s, SYS_PAR_MSG_SEQ_s, NGHBR_LST_MSG_SEQ_s,
 18 EXT_NGHBR_LST_MSG_SEQ_s, GEN_NGHBR_LST_MSG_SEQ_s,
 19 CHAN_LST_MSG_SEQ_s, EXT_SYS_PAR_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
 20 FD_CHAN_LST_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s,
 21 AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s,
 22 GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s and
 23 PRI_NGHBR_LST_MSG_SEQ_s are equal to NULL.
- 24 • If the mobile station performs an access entry handoff on the Enhanced Access
 25 Channel, none of CONFIG_MSG_SEQ_s, A41_SYS_PAR_MSG_SEQ_s,
 26 MC_RR_PAR_MSG_SEQ_s, UNI_NGHBR_LST_MSG_SEQ_s,
 27 EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s,
 28 USER_ZONE_ID_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s,
 29 AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s,
 30 ATIM_MSG_SEQ_s and PRI_NGHBR_LST_MSG_SEQ_s are equal to NULL.

31 Otherwise, the mobile station shall not perform an access entry handoff to the neighboring
 32 base station.

33 The mobile station need not perform an access entry handoff to a base station operating on
 34 another frequency.

35 If the mobile station performs an access entry handoff, it shall follow the procedures
 36 specified in 2.6.2.1.4.2 and shall perform the access entry handoff before entering the
 37 *Update Overhead Information Substate* of the *System Access State* (see 2.6.3.2).

38 If PACA is enabled, and if the mobile station performs an access entry handoff, the mobile
 39 station shall respond to the mobile-station-addressed page first and shall then re-originate
 40 the PACA call on the new base station.

2.6.2.4 Mobile Station Order and Message Processing Operation

During the *Mobile Station Order and Message Processing Operation*, the mobile station processes all messages except overhead messages (see 2.6.2.2) and page messages (see 2.6.2.3).

The mobile station shall set CURR_ACC_MSG_SEQ to NULL.

The mobile station shall perform address matching as described in [4].

If Layer 3 receives a message that requires acknowledgment, the mobile station shall enter the *Update Overhead Information Substate* of the *System Access State* with an order/message response indication within T_{33m} seconds, unless otherwise specified for a particular message.

If Layer 3 receives a message that does not require acknowledgment, the mobile station shall transmit a response only if it is required by the message or order. If a response is required, the mobile station shall enter the *Update Overhead Information Substate* of the *System Access State* with an order/message response indication within T_{33m} seconds, unless otherwise specified for a particular message.

If the mobile station is to enter the *Update Overhead Information Substate* of the *System Access State* with an order/message response indication and the mobile station determines that it should be monitoring a neighboring base station, the mobile station may perform an access entry handoff to the neighboring base station, if all of the following conditions hold:

- The neighboring base station is listed in NGHBR_REC.
- The ACCESS_ENTRY_HO field of the NGHBR_REC corresponding to the neighboring base station is equal to '1'.
- ACC_ENT_HO_ORDER_s is equal to '1'.
- If the mobile station performs an access entry handoff on the Access Channel, none of CONFIG_MSG_SEQ_s, SYS_PAR_MSG_SEQ_s, NGHBR_LST_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s, GEN_NGHBR_LST_MSG_SEQ_s, CHAN_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s, PRI_NGHBR_LST_MSG_SEQ_s, and EXT_SYS_PAR_MSG_SEQ_s, GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s are equal to NULL.
- If the mobile station performs an access entry handoff on the Enhanced Access Channel, none of CONFIG_MSG_SEQ_s, A41_SYS_PAR_MSG_SEQ_s, MC_RR_PAR_MSG_SEQ_s, UNI_NGHBR_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s and PRI_NGHBR_LST_MSG_SEQ_s are equal to NULL.

Otherwise, the mobile station shall not perform an access entry handoff to the neighboring base station.

1 The mobile station need not perform an access entry handoff to a base station operating on
2 another frequency.

3 If the mobile station performs an access entry handoff, it shall follow the procedures
4 specified in 2.6.2.1.4.2 and shall perform the access entry handoff before entering the
5 *Update Overhead Information Substate* of the *System Access State* (see 2.6.3.2). If PACA is
6 enabled and the mobile station performs an access entry handoff, the mobile station shall
7 respond to the order/message first and then re-originate the PACA call in the new base
8 station.

9 The following directed messages and orders can be received. If any field value of the
10 message or order is outside its permissible range, the mobile station shall send a *Mobile*
11 *Station Reject Order* with ORDQ equal to '00000100' (message field not in valid range).

- 12 1. *Abbreviated Alert Order*: The mobile station may alert the user.
- 13 2. *Audit Order*
- 14 3. *Authentication Challenge Message*: The mobile station shall process the message
15 and shall respond with an *Authentication Challenge Response Message* as specified
16 in 2.3.12.1.4, regardless of the value of AUTH_s. The mobile station shall enter the
17 *Update Overhead Information Substate* of the *System Access State* with an
18 order/message response indication within T_{32m} seconds.
- 19 4. *Authentication Request Message*: The mobile station shall process the message and
20 shall respond as specified in 2.3.12.5.2. The mobile station shall enter the *Update*
21 *Overhead Information Substate* of the *System Access State* with an order/message
22 response indication within T_{32m} seconds.
- 23 5. *Base Station Challenge Confirmation Order*: The mobile station shall process the
24 message and shall respond with an *SSD Update Confirmation Order* or *SSD Update*
25 *Rejection Order* as specified in 2.3.12.1.5. The mobile station shall enter the
26 *Update Overhead Information Substate* of the *System Access State* with an
27 order/message response indication within T_{32m} seconds.
- 28 6. *Base Station Reject Order*: The mobile station shall perform the procedures as
29 specified in 2.6.11.5.
- 30 7. *Channel Assignment Message*: The mobile station shall process the message as
31 follows:
 - 32 • If ASSIGN_MODE_r equals '001', the mobile station shall perform the following
33 actions:
 - 34 - If the message requires acknowledgment, the mobile station shall wait until
35 Layer 3 receives an indication from Layer 2 that the acknowledgment to the
36 message has been sent and acknowledged.

- 1 - If a CDMA channel (CDMA_FREQ) is specified in the assignment, the mobile
2 station shall set CDMACH_s = CDMA_FREQ_r, tune to the new Frequency
3 Assignment, and measure the strength of each pilot listed in the
4 assignment using the Neighbor Set search procedures specified in 2.6.6.2.1
5 and 2.6.6.2.2.
- 6 - The mobile station shall set CONFIG_MSG_SEQ_s and ACC_MSG_SEQ_s to
7 NULL (see 2.6.2.2) and shall set PILOT_PN_s to the pilot PN sequence offset
8 of the strongest pilot in the list (PILOT_PN_r).
- 9 - If the mobile station has not stored configuration parameters for the Primary
10 Paging Channel of the new base station, or if the stored information is not
11 current (see 2.6.2.2), the mobile station shall set SYS_PAR_MSG_SEQ_s,
12 NGHBR_LST_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s,
13 GEN_NGHBR_LST_MSG_SEQ_s, CHAN_LST_MSG_SEQ_s,
14 EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s,
15 EXT_SYS_PAR_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s,
16 PRI_NGHBR_LST_MSG_SEQ_s, GLOB_SERV_REDIR_MSG_SEQ_s, and
17 EXT_GLOB_SERV_REDIR_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s,
18 AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s,
19 FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s to NULL. The mobile station
20 shall set PAGE_CHAN_s to '1' and PAGECH_s to the Primary Paging Channel.
21 The mobile station shall then begin monitoring the Primary Paging Channel
22 of the selected base station.
- 23 • If ASSIGN_MODE_r equals '101' and FREQ_INCL_r equals '0', the mobile station
24 shall perform the following actions:
- 25 • If the message requires acknowledgment, the mobile station shall wait until
26 Layer 3 receives an indication from Layer 2 that the acknowledgment to the
27 message has been sent and acknowledged.
- 28 - The mobile station shall measure the strength of each pilot listed in the
29 assignment using the Neighbor Set search procedures specified in 2.6.6.2.1
30 and 2.6.6.2.2, set PILOT_PN_s to the pilot PN sequence offset of the strongest
31 pilot in the list (PILOT_PN_r), and set CONFIG_MSG_SEQ_s and
32 ACC_MSG_SEQ_s to NULL (see 2.6.2.2).
- 33 - If the mobile station has not stored configuration parameters for the Primary
34 Paging Channel of the new base station, or if the stored information is not
35 current (see 2.6.2.2), the mobile station shall set SYS_PAR_MSG_SEQ_s,
36 NGHBR_LST_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s,
37 GEN_NGHBR_LST_MSG_SEQ_s, CHAN_LST_MSG_SEQ_s,
38 EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s,
39 EXT_SYS_PAR_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s,
40 PRI_NGHBR_LST_MSG_SEQ_s, GLOB_SERV_REDIR_MSG_SEQ_s, and
41 EXT_GLOB_SERV_REDIR_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s,
42 AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s,
43 FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s to NULL. The mobile station
44 shall set PAGE_CHAN_s to '1' and PAGECH_s to the Primary Paging Channel.

- 1 The mobile station shall then begin monitoring the Primary Paging Channel
2 of the selected base station.
- 3 • If ASSIGN_MODE_r equals '101', FREQ_INCL_r equals '1', and the band class is
4 not supported by the mobile station, the mobile station shall enter the *Update*
5 *Overhead Information Substate* of the *System Access State* with an
6 order/message response indication within T_{33m} seconds and send a *Mobile*
7 *Station Reject Order* with ORDQ field set to '00000110' (capability not supported
8 by the mobile station).
 - 9 • If ASSIGN_MODE_r equals '101', FREQ_INCL_r equals '1', and the band class is
10 supported by the mobile station, the mobile station shall perform the following
11 actions:
 - 12 • If the message requires acknowledgment, the mobile station shall wait until
13 Layer 3 receives an indication from Layer 2 that the acknowledgment to the
14 message has been sent and acknowledged.
 - 15 - The mobile station shall set CDMACH_s = CDMA_FREQ_r and CDMABAND_s =
16 BAND_CLASS_r. Then the mobile station shall tune to the new Frequency
17 Assignment, measure the strength of each pilot listed in the assignment
18 using the Neighbor Set search procedures specified in 2.6.6.2.1 and
19 2.6.6.2.2, set PILOT_PN_s to the pilot PN sequence offset of the strongest
20 pilot in the list (PILOT_PN_r), and set CONFIG_MSG_SEQ_s and
21 ACC_MSG_SEQ_s to NULL (see 2.6.2.2).
 - 22 - If the mobile station has not stored configuration parameters for the Primary
23 Paging Channel of the new base station, or if the stored information is not
24 current (see 2.6.2.2), the mobile station shall set SYS_PAR_MSG_SEQ_s,
25 NGHBR_LST_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s,
26 GEN_NGHBR_LST_MSG_SEQ_s, CHAN_LST_MSG_SEQ_s,
27 EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s,
28 EXT_SYS_PAR_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s,
29 PRI_NGHBR_LST_MSG_SEQ_s, GLOB_SERV_REDIR_MSG_SEQ_s, and
30 EXT_GLOB_SERV_REDIR_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s,
31 AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s,
32 FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s to NULL. The mobile station
33 shall set PAGE_CHAN_s to '1' and PAGECH_s to the Primary Paging Channel.
34 The mobile station shall then begin monitoring the Primary Paging Channel
35 of the selected base station.
 - 36 • If ASSIGN_MODE_r is not equal to '001' or '101', the mobile station shall enter
37 the *Update Overhead Information Substate* of the *System Access State* with an
38 order/message response indication within T_{33m} seconds and send a *Mobile*
39 *Station Reject Order* with ORDQ field set to '00000010' (message not accepted in
40 this state).
- 41 8. *Data Burst Message*
- 42 9. *Extended Channel Assignment Message*: The mobile station shall process the

1 message as follows:

- 2 • If ASSIGN_MODE_r equals '001', FREQ_INCL_r equals '0', the mobile station shall
3 perform the following actions:

- 4 - If the message requires acknowledgment, the mobile station shall wait until
5 Layer 3 receives an indication from Layer 2 that the acknowledgment to the
6 message has been sent and acknowledged.
7 - The mobile station shall measure the strength of each pilot listed in the
8 assignment using the Neighbor Set search procedures specified in 2.6.6.2.1
9 and 2.6.6.2.2 set PILOT_PN_s to the pilot PN sequence offset of the strongest
10 pilot in the list (PILOT_PN_r), and set CONFIG_MSG_SEQ_s and
11 ACC_MSG_SEQ_s to NULL (see 2.6.2.2).

- 12 - If the mobile station has not stored configuration parameters for the Primary
13 Paging Channel of the new base station, or if the stored information is not
14 current (see 2.6.2.2), the mobile station shall set SYS_PAR_MSG_SEQ_s,
15 NGHBR_LST_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s,
16 GEN_NGHBR_LST_MSG_SEQ_s, CHAN_LST_MSG_SEQ_s,
17 EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s,
18 EXT_SYS_PAR_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s,
19 PRI_NGHBR_LST_MSG_SEQ_s, GLOB_SERV_REDIR_MSG_SEQ_s, and
20 EXT_GLOB_SERV_REDIR_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s,
21 AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s,
22 FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s to NULL. The mobile station
23 shall set PAGE_CHAN_s to '1' and PAGECH_s to the Primary Paging Channel.
24 If the mobile station was monitoring Forward Common Control Channel, the
25 mobile station shall set the PRAT_s to '00'. The mobile station shall then
26 begin monitoring the Primary Paging Channel of the selected base station.

- 27 • If ASSIGN_MODE_r equals '001', FREQ_INCL_r equals '1', and the band class is
28 not supported by the mobile station, the mobile station shall enter the *Update*
29 *Overhead Information Substate* of the *System Access State* with an
30 order/message response indication within T_{33m} seconds and send a *Mobile*
31 *Station Reject Order* with ORDQ field set to '00000110' (capability not supported
32 by the mobile station).

- 33 • If ASSIGN_MODE_r equals '001', FREQ_INCL_r equals '1', and the band class is
34 supported by the mobile station, the mobile station shall perform the following
35 actions:

- 36 - If the message requires acknowledgment, the mobile station shall wait until
37 Layer 3 receives an indication from Layer 2 that the acknowledgment to the
38 message has been sent and acknowledged.
39 - The mobile station shall set CDMACH_s = CDMA_FREQ_r and CDMABAND_s =
40 BAND_CLASS_r. The mobile station shall set CONFIG_MSG_SEQ_s and
41 ACC_MSG_SEQ_s to NULL (see 2.6.2.2). Then the mobile station shall tune
42 to the new Frequency Assignment, measure the strength of each pilot listed
43 in the assignment using the Neighbor Set search procedures specified in

- 1 2.6.6.2.1 and 2.6.6.2.2, and set $PILOT_PN_S$ to the pilot PN sequence offset
2 of the strongest pilot in the list ($PILOT_PN_T$).
- 3 - If the mobile station has not stored configuration parameters for the Primary
4 Paging Channel of the new base station, or if the stored information is not
5 current (see 2.6.2.2), the mobile station shall set $SYS_PAR_MSG_SEQ_S$,
6 $NGHBR_LST_MSG_SEQ_S$, $EXT_NGHBR_LST_MSG_SEQ_S$,
7 $GEN_NGHBR_LST_MSG_SEQ_S$, $CHAN_LST_MSG_SEQ_S$,
8 $EXT_CHAN_LST_MSG_SEQ_S$, $FD_CHAN_LST_MSG_SEQ_S$,
9 $EXT_SYS_PAR_MSG_SEQ_S$, $USER_ZONE_ID_MSG_SEQ_S$,
10 $PRI_NGHBR_LST_MSG_SEQ_S$, $GLOB_SERV_REDIR_MSG_SEQ_S$,
11 $AP_PILOT_INFO_MSG_SEQ_S$, $AP_IDT_MSG_SEQ_S$, $AP_ID_TEXT_MSG_SEQ_S$,
12 $GOI_MSG_SEQ_S$, $FREQ_GOI_MSG_SEQ_S$, $ATIM_MSG_SEQ_S$ and
13 $EXT_GLOB_SERV_REDIR_MSG_SEQ_S$ to NULL. The mobile station shall set
14 $PAGE_CHAN_S$ to '1' and $PAGECH_S$ to the Primary Paging Channel. If the
15 mobile station was monitoring Forward Common Control Channel, the
16 mobile station shall set the $PRAT_S$ to '00'. The mobile station shall then
17 begin monitoring the Primary Paging Channel of the selected base station.
- 18 • If $ASSIGN_MODE_T$ equals '100' or '101', the mobile station shall perform the
19 following actions:
- 20 - If $DIRECT_CH_ASSIGN_IND_T$ is included and is set to '1', the mobile station
21 shall process the message as defined below in the order specified:
- 22 + The mobile station shall set $CONFIG_MSG_SEQ_S$ to $CONFIG_MSG_SEQ_T$.
23 + If $RESPOND_IND_T$ is equal to '1', the mobile station shall process the
24 message as specified in section 2.6.3.3⁴⁸; otherwise, the mobile station
25 shall enter the *Update Overhead Information Substate* of the *System*
26 *Access State* with a direct channel assignment update overhead
27 indication within T_{33m} seconds.
- 28 - Otherwise, the mobile station shall enter the *Update Overhead Information*
29 *Substate* of the *System Access State* with an order/message response
30 indication within T_{33m} seconds and send a *Mobile Station Reject Order* with
31 ORDQ field set to '00000010' (message not accepted in this state).
- 32 • If $ASSIGN_MODE_T$ is not equal to '001', '100' or '101', the mobile station shall
33 enter the *Update Overhead Information Substate* of the *System Access State* with
34 an order/message response indication within T_{33m} seconds and send a *Mobile*
35 *Station Reject Order* with ORDQ field set to '00000010' (message not accepted in
36 this state).

⁴⁸ The mobile station processes the message as defined in section 2.6.3.3, but no requirements other than the *Extended Channel Assignment Message* processing requirements in section 2.6.3.3 are applicable.

1 10. *Feature Notification Message*

2 11. *Local Control Order*

3 12. *Lock Until Power-Cycled Order*: The mobile station shall record the reason for the
4 *Lock Until Power-Cycled Order* in the mobile station's semi-permanent memory
5 (LCKRSN_{P_{s-p}} equals the least significant four bits of ORDQ_r). After a mobile
6 station receives this order, it shall not enter the *System Access State* (see 2.6.3)
7 until it has received an *Unlock Order* or until after power-cycling the mobile station
8 (i.e., after the next mobile station power-up). This requirement shall take
9 precedence over any other mobile station requirement specifying entry to the
10 *System Access State*. The mobile station should notify the user of the locked
11 condition. The mobile station shall exit the *Mobile Station Idle State* and enter the
12 *System Determination Substate* of the *Mobile Station Initialization State* with a lock
13 indication (see 2.6.1.1). This allows the mobile station to operate in an alternate
14 operating mode while locked.

15 13. *Maintenance Required Order*: The mobile station shall record the reason for the
16 *Maintenance Required Order* in the mobile station's semi-permanent memory
17 (MAINTRSN_{S-p} equals the least significant four bits of ORDQ_r). If the mobile
18 station has previously received a *Lock Until Power-Cycled Order*, it shall remain in
19 the locked condition; otherwise the mobile station shall remain in the unlocked
20 condition. The mobile station should notify the user of the maintenance required
21 condition.

22 14. *PACA Message*: If P_REV_IN_USE_s is less than or equal to four, and if the mobile
23 station does not support PACA capability, the mobile station shall send a *Mobile*
24 *Station Reject Order* with the ORDQ field set to '00000110' (message requires a
25 capability that is not supported by the mobile station); otherwise, the mobile
26 station shall process the message as follows:

- 27 • If PACA_s is equal to disabled, the mobile station shall enter the *Update Overhead*
28 *Information Substate* of the *System Access State* with an order/message response
29 indication within T_{33m} seconds and shall send a *Mobile Station Reject Order* with
30 the ORDQ field set to '00000010' (message not accepted in this state).
- 31 • If PACA_s is equal to enabled, the mobile station shall perform the following:
 - 32 - If the purpose of the message is to respond to an *Origination Message*
33 (PURPOSE_r is equal to '0000'), the mobile station shall enter the *Update*
34 *Overhead Information Substate* of the *System Access State* with an
35 order/message response indication within T_{33m} seconds and send a *Mobile*
36 *Station Reject Order* with the ORDQ field set to '00000010' (message not
37 accepted in this state).

- 1 - If the purpose of the message is to provide the queue position of the PACA
2 call (PURPOSE_r is equal to '0001'), the mobile station shall set the PACA
3 state timer to the duration shown in Table 3.7.2.3.2.20-2, corresponding to
4 the value of PACA_TIMEOUT_s, should indicate to the user that the PACA call
5 is still queued, and should indicate the current queue position (Q_POS_r) of
6 the call.
- 7 - If the purpose of the message is to instruct the mobile station to re-originate
8 the PACA call (PURPOSE_r is equal to '0010'), the mobile station shall set the
9 PACA state timer to the duration shown in Table 3.7.2.3.2.20-2
10 corresponding to the value of PACA_TIMEOUT_s, and the mobile station shall
11 enter the *Update Overhead Information Substate* of the *System Access State*
12 (see 2.6.3) with a PACA response indication within T_{33m} seconds to re-
13 originate the PACA call.
- 14 - If the purpose of the message is to cancel the PACA call (PURPOSE_r is equal
15 to '0011'), the mobile station shall set PACA_s to disabled and PACA_CANCEL
16 to '0', shall disable the PACA state timer, and should indicate to the user
17 that the PACA call has been canceled.
- 18 15. *Registration Accepted Order*: The mobile station shall perform the procedures as
19 specified in 2.6.11.1.
- 20 16. *Registration Rejected Order*: This order indicates that normal service is not
21 available on this system. The mobile station shall disable the full-TMSI timer. If
22 the received order specifies to delete the TMSI (ORDQ = '00000100'), the mobile
23 station shall set all the bits of the TMSI_CODE_{s-p} to '1'. The mobile station shall
24 enter the *System Determination Substate* of the *Mobile Station Initialization State* with
25 a registration rejected indication (see 2.6.1.1).
- 26 17. *Registration Request Order*: The mobile station shall process the message and
27 perform registration procedures as specified in 2.6.5.5.2.3.
- 28 18. *Security Mode Command Message*: The mobile station shall perform the procedures
29 as specified in 2.6.11.4.
- 30 19. *Service Redirection Message*: The mobile station shall process the message as
31 follows:
- 32 • If the mobile station is directed to an unsupported operation mode or band
33 class, the mobile station shall respond with a *Mobile Station Reject Order* with
34 ORDQ equal to '00000110' (message requires a capability that is not supported
35 by the mobile station).
 - 36 • If DELETE_TMSI_r is equal to '1', the mobile station shall set all the bits of
37 TMSI_CODE_{s-p} to '1'. The mobile station shall disable the full-TMSI timer.
 - 38 • The mobile station shall set RETURN_IF_FAIL_s = RETURN_IF_FAIL_r.
 - 39 • If RECORD_TYPE_r is equal to '00000000', the mobile station shall enter the
40 *System Determination Substate* of the *Mobile Station Initialization State* with an
41 NDSS off indication (see 2.6.1.1); otherwise, the mobile station shall store the
42 redirection record received in the message as REDIRECT_REC_s and shall enter

1 the *System Determination Substate* of the *Mobile Station Initialization State* with a
2 redirection indication (see 2.6.1.1).

3 20. *Retry Order*: The mobile station shall process the message as follows:

- 4 • If RETRY_TYPE_R is equal to '000', the mobile station shall set
5 $\text{RETRY_DELAY}_S[\text{RETRY_TYPE}]$ to 0, where RETRY_TYPE is equal to '001', '010',
6 '011', '100', or '101'.
- 7 • If RETRY_TYPE_R is equal to '001', '100', or '101', the mobile station shall
8 perform the following:
 - 9 - If RETRY_DELAY_R is equal to '00000000', then the mobile station shall set
10 $\text{RETRY_DELAY}_S[\text{RETRY_TYPE}_R]$ to 0.
 - 11 - If RETRY_DELAY_R is not equal to '00000000', the mobile station shall set
12 $\text{RETRY_DELAY}_S[\text{RETRY_TYPE}_R]$ as follows:
 - 13 + If the most significant bit of the RETRY_DELAY_R is '0', set
14 $\text{RETRY_DELAY_UNIT}_S$ to 1000ms. If the most significant bit of the
15 RETRY_DELAY_R is '1', set $\text{RETRY_DELAY_UNIT}_S$ to 60000ms.
 - 16 + The mobile station shall set $\text{RETRY_DELAY_VALUE}_S$ to the seven least
17 significant bits of RETRY_DELAY_R .
 - 18 + The mobile station shall store the next system time 80 ms boundary +
19 $\text{RETRY_DELAY_VALUE}_S \times \text{RETRY_DELAY_UNIT}_S$ ms as
20 $\text{RETRY_DELAY}_S[\text{RETRY_TYPE}_R]$.

21 21. *Slotted Mode Order*: After receiving this order, the mobile station shall set
22 SLOTTED_S to YES. The mobile station shall disable the $T_{MS_Slotted}$ timer.

23 22. *SSD Update Message*: The mobile station shall process the message and shall
24 respond with a *Base Station Challenge Order* as specified in 2.3.12.1.5. The mobile
25 station shall enter the *Update Overhead Information Substate* of the *System Access*
26 *State* with an order/message response indication within T_{32m} seconds.

27 23. *Status Request Message*: The mobile station shall process the message. If
28 $P_REV_IN_USE_S$ is less than or equal to three, the mobile station shall respond
29 with a *Status Response Message*. If $P_REV_IN_USE_S$ is greater than three, the
30 mobile station shall respond with an *Extended Status Response Message*. The
31 mobile station shall enter the *Update Overhead Information Substate* of the *System*
32 *Access State* with an order/message response indication within T_{33m} seconds. If
33 the message does not specify any qualification information (QUAL_INFO_TYPE_R is
34 equal to '00000000'), the mobile station shall include the requested information
35 records in the response. If the message specifies a band class (QUAL_INFO_TYPE_R
36 is equal to '00000001'), the mobile station shall only include the requested
37 information records for the specified band class (BAND_CLASS_R) in the response.
38 If the message specifies a band class and an operating mode (QUAL_INFO_TYPE_R is
39 equal to '00000010'), the mobile station shall only include the requested
40 information records for the specified band class (BAND_CLASS_R) and operating
41 mode (OP_MODE_R) in the response. If the message specifies a band class or a

band class and an operating mode which is not supported by the mobile station, the mobile station shall send a *Mobile Station Reject Order* with ORDQ set to '00000110' (message requires a capability that is not supported by the mobile station). If the response to this message exceeds the allowable length, the mobile station shall send a *Mobile Station Reject Order* with ORDQ set to '00001000' (response message would exceed the allowable length). If the message specifies an information record which is not supported by the mobile station for the specified band class and operating mode, the mobile station shall send a *Mobile Station Reject Order* with ORDQ set to '00001001' (information record is not supported for the specified band class and operating mode).

24. *TMSI Assignment Message*: The mobile station shall store the TMSI zone and code as follows:

- The mobile station shall store the length of the TMSI zone field by setting ASSIGNING_TMSI_ZONE_LEN_{s-p} to TMSI_ZONE_LEN_r,
- The mobile station shall store the assigning TMSI zone number by setting the ASSIGNING_TMSI_ZONE_LEN_{s-p} least significant octets of ASSIGNING_TMSI_ZONE_{s-p} to TMSI_ZONE_r, and
- The mobile station shall store the TMSI code by setting TMSI_CODE_{s-p} to TMSI_CODE_r.

The mobile station shall set the TMSI expiration time by setting TMSI_EXP_TIME_{s-p} to TMSI_EXP_TIME_r. The mobile station shall disable the full-TMSI timer. The mobile station shall then respond with a *TMSI Assignment Completion Message* within T_{56m} seconds.

25. *Unlock Order*: After receiving this order, the mobile station is no longer locked. The mobile station should notify the user that the locked condition has been removed. The mobile station shall enter the *System Determination Substate of the Mobile Station Initialization State* with an *unlock indication* (see 2.6.1.1).

26. *User Zone Reject Message*

27. *Fast Call Setup Order*:

- If ORDQ_r is equal to '00000000', the mobile station shall process the message and respond with a *Fast Call Setup Order* as specified in 2.6.12.1. The mobile station shall enter the *Update Overhead Information Substate* of the *System Access State* with an order/message response indication within T_{32m} seconds.
- If ORDQ_r is equal to '00000001', the mobile station shall process the message as specified in 2.6.12.1.

28. *General Extension Message*: The mobile station shall process this message as specified in section 2.6.18.

The mobile station shall ignore all other messages and orders.

1 2.6.2.5 Mobile Station Origination Operation

2 The *Mobile Station Origination Operation* is performed when the mobile station is directed by
3 the user to initiate a call, or if the *Mobile Station Idle State* is entered with NDSS_ORIG_S
4 enabled.

5 If the mobile station is directed by the user to initiate a call, the mobile station shall
6 perform the following:

- 7 • If PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled and
8 PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to the
9 user that the PACA call has been canceled.
- 10 • The mobile station shall set CURR_ACC_MSG_SEQ to NULL.

11 The mobile station shall enter the *Update Overhead Information Substate* of the *System*
12 *Access State* (see 2.6.3) with an origination indication within T_{33m} seconds.

13 2.6.2.6 Mobile Station Message Transmission Operation

14 Support of this operation is optional. If the mobile station supports the *Mobile Station*
15 *Message Transmission Operation*, the operation is performed when the user directs the
16 mobile station to transmit a *Data Burst Message*, or when the mobile station detects a
17 change in hook status since the last time when the mobile station sent hook status
18 information and the mobile station supports the *Device Information Message* on the r-csch,
19 or when the mobile station determines that a *Radio Environment Message* is to be
20 transmitted on the r-csch, or when the mobile station requests to operate in reduced slot
21 cycle mode.

22 If the mobile station supports this operation, the mobile station shall set
23 CURR_ACC_MSG_SEQ to NULL.

24 If the mobile station supports this operation and the operation is performed when the user
25 directs the mobile station to transmit a *Data Burst Message*, the mobile station shall enter
26 the *Update Overhead Information Substate* of the *System Access State* (see 2.6.3.2) with a
27 message transmission indication within T_{33m} seconds.

28 If the mobile station supports this operation and the operation is performed when the
29 mobile station detects a change in hook status since the last time when the mobile station
30 sent hook status information, the mobile station shall enter the *Update Overhead*
31 *Information Substate* of the *System Access State* (see 2.6.3.2) with a hook status indication
32 within T_{33m} seconds.

33 If the mobile station supports this operation and the operation is performed when the
34 mobile station determines that a *Radio Environment Message* is to be transmitted on the r-
35 csch, the mobile station shall perform the following:

- 36 • If RER_MODE_ENABLED is set to YES, the mobile station shall enter the *Update*
37 *Overhead Information Substate* of the *System Access State* (see 2.6.3.2) with a radio
38 environment report indication within T_{33m} seconds.

- 1 • Otherwise, if TKZ_MODE_ENABLED is set to YES, the mobile station shall enter the
2 *Update Overhead Information Substate* of the *System Access State* (see 2.6.3.2) with a
3 tracking zone indication within T_{33m} seconds.

4 If the mobile station supports this operation and the operation is performed when the
5 mobile station requests to operate in reduced slot cycle mode, the mobile station shall
6 enter the *Update Overhead Information Substate* of the *System Access State* (see 2.6.3.2)
7 with a fast call setup indication within T_{33m} seconds.

8 2.6.2.7 Mobile Station Power-Down Operation

9 The *Mobile Station Power-Down Operation* is performed when the user directs the mobile
10 station to power down.

11 The mobile station shall update stored parameters and perform other registration
12 procedures as specified in 2.6.5.5.2.4.

13 If no power-down registration is performed (see 2.6.5.5.2.4), the mobile station may power
14 down.

15 2.6.2.8 Mobile Station PACA Cancel Operation

16 The *Mobile Station PACA Cancel Operation* is performed when the user directs the mobile
17 station to cancel a PACA call.

18 If PACA_s is equal to enabled, the mobile station shall perform the following:

- 19 • The mobile station shall set PACA_s to disabled.
- 20 • The mobile station shall set PACA_CANCEL to '0', if PACA_CANCEL is equal to '1'.
- 21 • The mobile station shall disable the PACA state timer.
- 22 • The mobile station should indicate to the user that the PACA call has been
23 canceled.
- 24 • The mobile station shall set CURR_ACC_MSG_SEQ to NULL.
- 25 • The mobile station shall enter the *Update Overhead Information Substate* of the
26 *System Access State* (see 2.6.3) with a PACA cancel indication within T_{33m} seconds.

27 2.6.3 System Access State

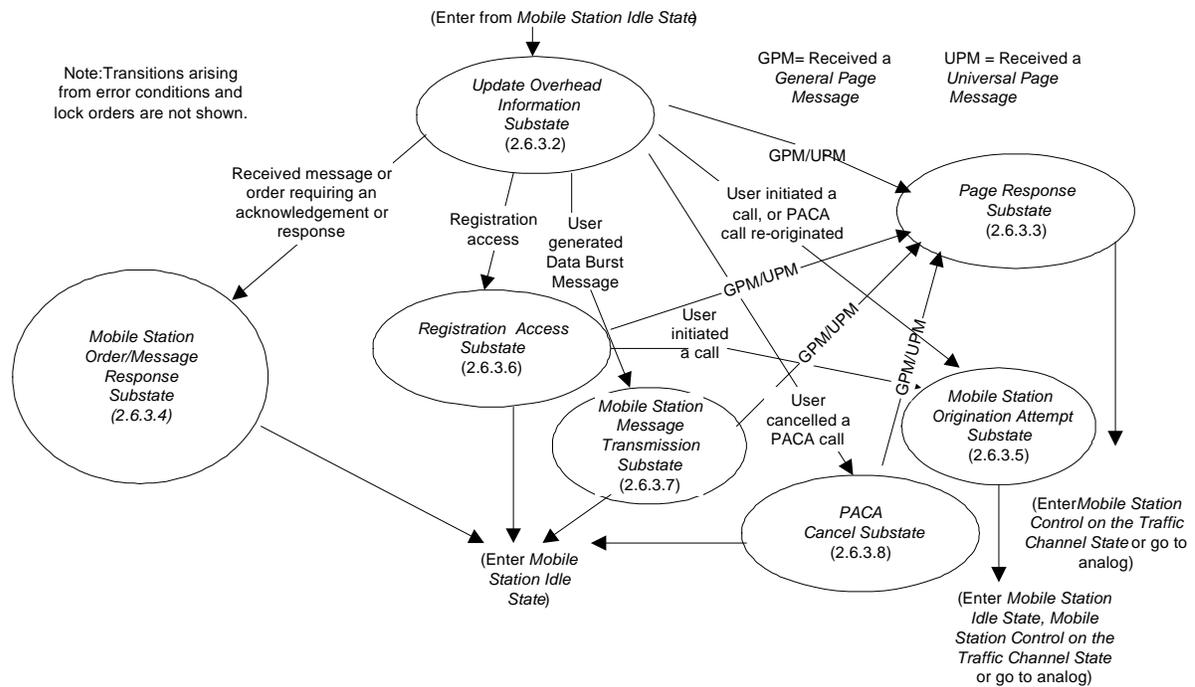

28 In this state, the mobile station sends messages to the base station on the r-csch and
29 receives messages from the base station on the f-csch.

30 As illustrated in Figure 2.6.3-1, the *System Access State* consists of the following substates:

- 31 • *Update Overhead Information Substate* - In this substate, if the base station supports
32 the Primary Broadcast Control Channel for Spreading Rate 1 or if both the base
33 station and mobile station supports the Primary Broadcast Control Channel for
34 Spreading Rate 3 and if the protocol revision level in use is greater than six, the
35 mobile station will monitor the Primary Broadcast Control Channel until it has
36 received a current set of overhead messages; otherwise, the mobile station will
37 monitor the Paging Channel until it has a current set of overhead messages.

- 1 • *Mobile Station Origination Attempt Substate* - In this substate, the mobile station
 2 sends an *Origination Message*, *Call Recovery Request Message* or a *Reconnect*
 3 *Message* (with ORIG_IND set to '1') to the base station.
- 4 • *Page Response Substate* - In this substate, the mobile station sends a *Page*
 5 *Response Message* or a *Reconnect Message* (with ORIG_IND set to '0') to the base
 6 station.
- 7 • *Mobile Station Order/Message Response Substate* - In this substate, the mobile
 8 station sends a response to a message received from the base station.
- 9 • *Registration Access Substate* - In this substate, the mobile station sends a
 10 *Registration Message* to the base station.
- 11 • *Mobile Station Message Transmission Substate* - In this substate, the mobile station
 12 sends a *Data Burst Message* or a *Device Information Message* to the base station.
- 13 • *PACA Cancel Substate* - In this substate, the mobile station sends a *PACA Cancel*
 14 *Message* to the base station.

15

16

17

Figure 2.6.3-1. System Access State

18

20 2.6.3.1 Access Procedures

21 2.6.3.1.1 Access Attempts

22 If the mobile station monitors the Paging Channel, the mobile station transmits on the
 23 Access Channel using a random access procedure. Many parameters of the random access

1 procedure are supplied by the base station in the *Access Parameters Message*. The random
2 access procedure is described in [4] and [3].

3 If the mobile station monitors the Forward Common Control Channel/ Primary Broadcast
4 Control Channel, the mobile station transmits on the Enhanced Access Channel using a
5 random access procedure. Many parameters of the random access procedure are supplied
6 by the base station in the *Enhanced Access Parameters Message*.

7 If Layer 3 receives an indication from Layer 2 that the system access is denied, the mobile
8 station shall update its registration variables using SID_s , NID_s , REG_ZONE_s , and
9 $ZONE_TIMER_s$ that were stored from the first base station to which the mobile station sent
10 an Access Probe, as specified in 2.6.5.5.3.2, and enter the *System Determination Substate* of
11 the *Mobile Station Initialization State* with an access denied indication (see 2.6.1.1).

12 If Layer 3 receives an indication from Layer 2 that the system is lost, the mobile station
13 shall update its registration variables using SID_s , NID_s , REG_ZONE_s , and $ZONE_TIMER_s$
14 that were stored from the first base station to which the mobile station transmitted an
15 Access Probe, as specified in 2.6.5.5.3.2 and enter the *System Determination Substate* of the
16 *Mobile Station Initialization State* with a system lost indication (see 2.6.1.1)

17 2.6.3.1.2 Reserved

18 2.6.3.1.3 Handoffs

19 While in the *System Access State*, the mobile station shall continue its pilot search
20 (see 2.6.3.1.3.1), and may perform access handoffs (see 2.6.3.1.3.2) and/or access probe
21 handoffs (see 2.6.3.1.3.3).

22 If the mobile station performs access handoffs and/or access probe handoffs, the mobile
23 station shall maintain the following variables:

- 24 • $CURRENT_ACTIVE_PILOT_s$
- 25 • $PREVIOUS_ACTIVE_PILOT_s$
- 26 • $FIRST_ACTIVE_PILOT_s$

27 Upon entering the *System Access State* the mobile station shall set
28 $CURRENT_ACTIVE_PILOT_s$, $PREVIOUS_ACTIVE_PILOT_s$ and $FIRST_ACTIVE_PILOT_s$ to
29 NULL. Prior to starting an access attempt, the mobile station shall set
30 $CURRENT_ACTIVE_PILOT_s$ and $PREVIOUS_ACTIVE_PILOT_s$ to NULL. When the mobile
31 station selects a base station for transmission of an access probe, the mobile station shall
32 proceed as follows:

- 33 • If $CURRENT_ACTIVE_PILOT_s$ is not the same as the pilot of the selected base
34 station, the mobile station shall set $PREVIOUS_ACTIVE_PILOT_s$ to the value of
35 $CURRENT_ACTIVE_PILOT_s$.
- 36 • The mobile station shall set $CURRENT_ACTIVE_PILOT_s$ to the identity of the pilot
37 corresponding to the selected base station.
- 38 • If $FIRST_ACTIVE_PILOT_s$ is NULL, the mobile station shall set
39 $FIRST_ACTIVE_PILOT_s$ to the value of $CURRENT_ACTIVE_PILOT_s$.

1 Before the mobile station transmits an access probe to a new base station on the Access
2 Channel, the mobile station shall update parameters based on the *System Parameters*
3 *Message*, the *Access Parameters Message* and the *Extended System Parameters Message* on
4 the associated new Paging Channel and process parameters from the messages (see
5 2.6.2.2.1, 2.6.2.2.2, and 2.6.2.2.5).

6 Before the mobile station transmits an access probe to a new base station on the Enhanced
7 Access Channel, the mobile station shall update parameters based on the *ANSI-41 System*
8 *Parameters Message*, the *Enhanced Access Parameters Message*, and the *MC-RR Parameters*
9 *Message* on the associated new Primary Broadcast Control Channel and process
10 parameters from the messages (see 2.6.2.2.13, 2.6.2.2.14, and 2.6.2.2.15).

11 If the mobile station monitors the Paging Channel, the mobile station shall update
12 parameters based on the *Neighbor List Message*, the *Extended Neighbor List Message*, or the
13 *General Neighbor List Message* on the associated new Paging Channel and process
14 parameters from the message (see 2.6.2.2.3, 2.6.2.2.7, and 2.6.2.2.8).

15 If the mobile station monitors the Forward Common Control Channel/ Primary Broadcast
16 Control Channel, the mobile station shall update parameters based on the *Universal*
17 *Neighbor List Message* on the associated new Primary Broadcast Control Channel and
18 process parameters from the message (see 2.6.2.2.17).

19 If the mobile station receives the *User Zone Identification Message* or the *Private Neighbor*
20 *List Message*, the mobile station shall update parameters based on these messages on the
21 associated new Paging Channel or Primary Broadcast Control Channel and process
22 parameters from the messages (see 2.6.2.2.9 and 2.6.2.2.10). If the mobile station receives
23 a *Global Service Redirection Message* (see 2.6.2.2.6) which directs the mobile station away
24 from the new base station, the mobile station shall not access the new base station. If the
25 mobile station receives an *Extended Global Service Redirection Message* (see 2.6.2.2.11)
26 which directs the mobile station away from the new base station, the mobile station shall
27 not access the new base station. The mobile station shall process these messages only
28 once after each access handoff.

29 2.6.3.1.3.1 Pilot Search

30 The following sets of pilot offsets are defined for a mobile station in the *System Access*
31 *State*. Each pilot offset is a member of only one set.

- 32 • Active Set: The pilot offset of the Forward CDMA Channel whose Paging Channel or
33 Forward Common Control Channel/ Primary Broadcast Control Channel is being
34 monitored.
- 35 • Neighbor Set: The pilots that are not currently in the Active Set and are likely
36 candidates for access handoff or access probe handoff. The members of the
37 Neighbor Set are specified in the *Neighbor List Message*, the *Extended Neighbor List*
38 *Message*, and the *General Neighbor List Message on the Paging Channel*. The
39 members of the Neighbor Set are specified in the *Universal Neighbor List Message on*
40 *the Primary Broadcast Control Channel*.

- 1 • Remaining Set: The set of all possible pilot offsets in the current system (integer
2 multiples of PILOT_INC_s) on the current CDMA Frequency Assignment, excluding
3 the pilots in the Neighbor Set and the Active Set.

4 2.6.3.1.3.2 Access Handoff

5 The mobile station is permitted to perform an access handoff to use the Paging Channel
6 with the best pilot strength and an associated Access Channel. The mobile station is
7 permitted to perform an access handoff to use the Forward Common Control Channel with
8 the best pilot strength and an associated Enhanced Access Channel. The mobile station is
9 permitted to perform an access handoff when waiting for a response from the base station
10 or before sending a response to the base station. An access handoff is permitted after an
11 access attempt while the mobile station is in the *Page Response Substate* or the *Mobile*
12 *Station Origination Attempt Substate*.

13 When the mobile station declares a loss of the Paging Channel or the Forward Common
14 Control Channel while waiting for a response from the base station in the *Page Response*
15 *Substate* or in the *Mobile Station Origination Attempt Substate*, the mobile station shall
16 perform an access handoff, if all of the following conditions hold:

- 17 • The pilot corresponding to the new base station is in the list ACCESS_HO_LIST,
18 • ACCESS_HO_s is equal to '1', and
19 • The mobile station is not already in the process of performing an access attempt.

20 When the mobile station declares a loss of the Paging Channel or the Forward Common
21 Control Channel, after receiving a message but before responding to that message while in
22 the *Page Response Substate* or in the *Mobile Station Origination Attempt Substate*, the mobile
23 station shall perform an access handoff if the following conditions hold:

- 24 • The pilot corresponding to the new base station is in the list ACCESS_HO_LIST,
25 • ACCESS_HO_s is equal to '1',
26 • ACCESS_HO_MSG_RSP_s is equal to '1', and
27 • The mobile station is not already in the process of performing an access attempt.

28 When the mobile station declares an insufficiency of the Paging Channel⁴⁹ or the Forward
29 Common Control Channel, while waiting for a response from the base station in the *Page*
30 *Response Substate* or in the *Mobile Station Origination Attempt Substate*, the mobile station
31 may perform an access handoff if all of the following conditions hold:

- 32 • The pilot corresponding to the new base station is in the list ACCESS_HO_LIST,
33 • ACCESS_HO_s is equal to '1', and
34 • The mobile station is not already in the process of performing an access attempt.

⁴⁹ Insufficiency of the Paging Channel and the Forward Common Control Channel is implementor-defined.

1 When the mobile station declares an insufficiency of the Paging Channel⁵⁰ or the Forward
 2 Common Control Channel, after receiving a message but before responding to that message
 3 while in the *Page Response Substate* or in the *Mobile Station Origination Attempt Substate*,
 4 the mobile station may perform an access handoff if all of the following conditions hold:

- 5 • The pilot corresponding to the new base station is in the list ACCESS_HO_LIST,
- 6 • ACCESS_HO_s is equal to '1',
- 7 • ACCESS_HO_MSG_RSP_s is equal to '1', and
- 8 • The mobile station is not already in the process of performing an access attempt.

9 If ACCESS_PROBE_HO_s is equal to '0' and ACCESS_HO_s is equal to '1', and the mobile
 10 station declares a loss of the Paging Channel or the Forward Common Control Channel
 11 during an access attempt, after sending at least one complete access probe, the mobile
 12 station may monitor other Paging Channels or the Forward Common Control Channels
 13 which are in ACCESS_HO_LIST for T_{42m} seconds after the loss of the Paging Channel or
 14 the Forward Common Control Channel on which the access attempt was made⁵¹.

15 2.6.3.1.3.3 Access Probe Handoff

16 The mobile station is permitted to perform an access probe handoff when the mobile
 17 station is in the *Page Response Substate* or the *Mobile Station Origination Attempt Substate*.

18 The mobile station may perform an access probe handoff during an access attempt to a
 19 pilot in ACCESS_HO_LIST when the message being sent is the *Origination Message*,
 20 *Reconnect Message*, *Call Recovery Request Message* or the *Page Response Message*, if all of
 21 the following conditions hold:

- 22 • ACCESS_PROBE_HO_s is equal to '1',
- 23 • The mobile station is in the *Page Response Substate* or the *Mobile Station Origination*
 24 *Attempt Substate*, and
- 25 • The mobile station has performed fewer than (MAX_NUM_PROBE_HO_s + 1) access
 26 probe handoffs during the current access attempt.

27 The mobile station may also perform an access probe handoff during an access attempt to
 28 a pilot in ACCESS_HO_LIST when the message being sent is a message other than the
 29 *Origination Message*, *Reconnect Message*, *Call Recovery Request Message* or the *Page*
 30 *Response Message*, if all of the preceding conditions hold and
 31 ACC_PROBE_HO_OTHER_MSG_s is equal to '1'.

⁵⁰ Insufficiency of the Paging Channel and the Forward Common Control Channel is implementor-defined.

⁵¹ The mobile station would be waiting for a response to the message transmitted in the access probe.

1 The mobile station may also perform an access probe handoff during an access attempt to
 2 a pilot not in ACCESS_HO_LIST when the message being sent is the *Origination Message*,
 3 *Reconnect Message*, *Call Recovery Request Message* or the *Page Response Message*, if all of
 4 the following conditions hold:

- 5 • ACC_HO_LIST_UPD_s is equal to '1',
- 6 • ACCESS_PROBE_HO_s is equal to '1',
- 7 • The new pilot is stronger than any pilot in ACCESS_HO_LIST,
- 8 • The new pilot has the corresponding ACCESS_HO_ALLOWED field in the
 9 NGHBR_REC equal to '1',
- 10 • Inclusion of the new pilot in ACCESS_HO_LIST does not cause the Access Channel
 11 or Enhanced Access Channel message to exceed the maximum capsule size,
- 12 • Inclusion of the new pilot in ACCESS_HO_LIST does not cause the number of
 13 members to exceed N_{13m},
- 14 • The mobile station is in the *Page Response Substate* or the *Mobile Station Origination*
 15 *Attempt Substate*, and
- 16 • The mobile station has performed fewer than (MAX_NUM_PROBE_HO_s + 1) access
 17 probe handoffs during the current access attempt.

18 The mobile station may also perform an access probe handoff during an access attempt to
 19 a pilot not in ACCESS_HO_LIST when the message being sent is a message other than the
 20 *Origination Message*, *Reconnect Message*, *Call Recovery Request Message* or the *Page*
 21 *Response Message*, if all of the preceding conditions hold and
 22 ACC_PROBE_HO_OTHER_MSG_s is equal to '1'.

23 If the above conditions are met, the mobile station may perform an access probe handoff
 24 when the mobile station declares a loss of the Paging Channel or Forward Common Control
 25 Channel (see 2.6.3.1.8); the mobile station may also perform an access probe handoff after
 26 getting an indication that the TA timer expired (see [4]) and the mobile station declares an
 27 insufficiency of the Paging Channel⁵² or the Forward Common Control Channel.

28 If the mobile station performs an access probe handoff, the mobile station shall suspend
 29 the access attempt on the old pilot and shall restart the access attempt on the new pilot
 30 (*i.e.* starting with the first probe of the first probe sequence of the access sub-attempt), as
 31 specified in [4]. The mobile station shall record the identity of the pilots to which access
 32 probes have been transmitted within the current access attempt.

33 The mobile station shall not reset its access probe handoff count until the access attempt
 34 ends.

⁵² Insufficiency of the Paging Channel and the Forward Common Control Channel is implementor-defined.

1 Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to cancel the access
 2 attempt if the length of the message to be sent exceeds MAX_CAP_SIZE of the new base
 3 station. The mobile station may monitor other Paging Channels or Forward Common
 4 Control Channels which are in ACCESS_HO_LIST for T_{42m} seconds after aborting the
 5 access attempt⁵³.

6 2.6.3.1.4 System Access State Exit Procedures

7 Upon exiting the *System Access State*, the mobile station shall direct Layer 2 to cancel (see
 8 [4]) any access attempt in progress and discard the associated message. The mobile station
 9 shall then disable the *System Access State* timer.

10 2.6.3.1.5 Reserved

11 2.6.3.1.6 Full-TMSI Timer

12 Whenever the mobile station sends its full TMSI, the mobile station enables a timer, called
 13 the full-TMSI timer. If the full-TMSI timer expires, the mobile station deletes the TMSI by
 14 setting all of the bits in the TMSI_CODE_{s-p} field to '1'.

15 The mobile station shall maintain the full-TMSI timer. The mobile station shall provide a
 16 means for enabling or disabling the full-TMSI timer.

17 If the mobile station sends a message with an address including the
 18 ASSIGNING_TMSI_ZONE_{s-p} and the full-TMSI timer is disabled, the mobile station shall
 19 enable the full-TMSI timer with a duration equal to T_{69m} + 2.56 × 2ⁱ seconds where i is
 20 equal to SLOT_CYCLE_INDEX_s.

21 2.6.3.1.7 Monitoring Pilots

22 The mobile station assists the base station in the Traffic Channel assignment process by
 23 monitoring and reporting (see [4]) the pilot strength of the pilot in the mobile station's
 24 Paging Channel or Forward Common Control Channel Active Set (see 2.6.3.1.3.1). The
 25 mobile station can also monitor and report (see [4]) other pilots on the same frequency; in
 26 such cases, the mobile station shall create ACCESS_HO_LIST and
 27 OTHER_REPORTED_LIST and shall monitor the pilots on those lists, if any.

28 For each monitored pilot, the mobile station shall record the pilot PN phase and the pilot
 29 strength PS, using the most recent measurements from the searcher element (see [2]), as
 30 they become available. The mobile station shall identify each pilot through its pilot PN
 31 phase (the phase of the pilot PN sequence, in units of one chip, relative to the zero offset
 32 pilot PN sequence of the pilot (see 2.6.6.2.4)). The mobile station shall determine the pilot
 33 strength, PS, as specified in 2.6.6.2.2.

34 2.6.3.1.7.1 Generation of the Initial Access Handoff List

35 ACCESS_HO_LIST is created immediately before transmitting the first access probe after
 36 entering the *System Access State*. When it is created, ACCESS_HO_LIST is defined as a set

⁵³ The mobile station would be waiting for a response to the message transmitted in the access probe.

1 of at most N_{13m} pilots, having the greatest pilot strength in comparison with other
 2 qualifying pilots and for which all of the following apply:

- 3 • The strength of each member exceeds T_ADD_s .
- 4 • Each member, other than the Active Set pilot, has the corresponding
 5 `ACCESS_HO_ALLOWED` field in the `NGHBR_REC` equal to '1'.
- 6 • The Active Set pilot that the mobile station monitors when the mobile station enters
 7 the *System Access State* is a member.
- 8 • All members can be contained in the Access Channel or Enhanced Access Channel
 9 message without exceeding the maximum capsule size.

10 2.6.3.1.7.2 Update of the Access Handoff List

11 When the mobile station performs an access probe handoff to a pilot which was not
 12 previously included in `ACCESS_HO_LIST` (see 2.6.3.1.3.3), it adds the pilot to
 13 `ACCESS_HO_LIST`.

14 If `ACC_HO_LIST_UPD_s` is equal to '1', the mobile station can update `ACCESS_HO_LIST`, as
 15 follows:

- 16 • The mobile station can add one or more new pilots other than the Active Set pilot to
 17 `ACCESS_HO_LIST` before transmitting an access probe.
- 18 • The mobile station can also drop from `ACCESS_HO_LIST` pilots to which access
 19 probes have not been transmitted since entering the *System Access State* and whose
 20 strength have fallen below T_ADD_s .

21 When it is updated before transmitting a subsequent access probe, `ACCESS_HO_LIST` is
 22 defined as a set of at most N_{13m} pilots, having the greatest pilot strength in comparison
 23 with other qualifying pilots and for which all of the following apply:

- 24 • The strength of each member to which access probes have not been transmitted
 25 exceeds T_ADD_s .
- 26 • Each member other than the pilot to which the first access probe in the System
 27 Access State was transmitted has the corresponding `ACCESS_HO_ALLOWED` field
 28 in the `NGHBR_REC` equal to '1'.
- 29 • The Active Set pilot to which the next access probe is to be transmitted is a
 30 member.
- 31 • All pilots to which access probes have been transmitted since entering the *System*
 32 *Access State* are members.
- 33 • All members can be contained in the Access Channel or Enhanced Access Channel
 34 message without exceeding the maximum capsule size.

35 2.6.3.1.7.3 Generation of the Other Reported List

36 `OTHER_REPORTED_LIST` (specified by `NUM_ADD_PILOTS` and `NUM_AUX_PILOTS`, see [4])
 37 is defined as a set of no more than N_{13m} minus the number of pilots in `ACCESS_HO_LIST`

1 pilots, having the greatest pilot strength in comparison with other qualifying pilots and for
2 which all of the following apply:

- 3 • The strength of each member exceeds T_ADD_s .
- 4 • No member is included in ACCESS_HO_LIST.
- 5 • All members can be contained in the Access Channel or Enhanced Access Channel
6 message without exceeding the maximum capsule size.

7 2.6.3.1.7.4 Update of OTHER_REPORTED_LIST

8 Before transmitting each access probe, the mobile station shall generate
9 OTHER_REPORTED_LIST according to section 2.6.3.1.7.3, using the most recent pilot
10 strength information available from its searcher element (see [2]). If the mobile station
11 updates ACCESS_HO_LIST before transmitting an access probe, it shall update
12 OTHER_REPORTED_LIST after updating ACCESS_HO_LIST.

13 2.6.3.1.8 Paging Channel and Forward Common Control Channel/ Primary Broadcast 14 Control Channel Monitoring

15 When in the *System Access State*, the mobile station shall monitor the Paging Channel or
16 the Forward Common Control Channel/ Primary Broadcast Control Channel at all times.

17 The mobile station shall set a timer for T_{72m} seconds, when it begins to monitor the Paging
18 Channel or the Forward Common Control Channel/ Primary Broadcast Control Channel
19 and whenever it gets an indication that a valid message was received on the Paging
20 Channel or the Forward Common Control Channel/ Primary Broadcast Control Channel,
21 whether addressed to the mobile station or not (see [4]).

22 If the T_{72m} timer expires:

- 23 • The mobile station shall first finish transmitting the access probe in progress, if
24 any.
- 25 • If by declaring a loss of the Paging Channel or the Forward Common Control
26 Channel, the eligibility requirements for performing access handoff are met (see
27 2.6.3.1.3.2), then the mobile station shall declare a loss of the Paging Channel or
28 the Forward Common Control Channel, and perform an access handoff. If by
29 declaring a loss of the Paging Channel or the Forward Common Control Channel,
30 the eligibility requirements for performing access probe handoff are met (see
31 2.6.3.1.3.3), then the mobile station may declare a loss of the Paging Channel or the
32 Forward Common Control Channel, and perform an access probe handoff. If the
33 mobile station performs an access handoff or an access probe handoff, the mobile
34 station restarts the Paging Channel or the Forward Common Control Channel/
35 Primary Broadcast Control Channel monitoring procedure for the new base station.
- 36 • If an access attempt was in progress when the timer expired and that access
37 attempt had already been suspended and resumed previously (see below), the

- 1 mobile station shall declare a loss of the Paging Channel⁵⁴ or the Forward Common
2 Control Channel and shall disable its transmitter.
- 3 • If an access attempt was in progress when the timer expired and that access
4 attempt had not been suspended and resumed before and the mobile station does
5 not perform access probe handoff, the mobile station shall declare a temporary loss
6 of the Paging Channel or the Forward Common Control Channel, shall direct Layer
7 2 to suspend the access attempt (see [4]), and shall perform the following:
 - 8 - The mobile station shall set the timer to $(T_{40m}-T_{72m})$ seconds.
 - 9 - If the mobile station receives an indication that a valid message on the Paging
10 Channel or the Forward Common Control Channel, whether addressed to the
11 mobile station or not, was received (see [4]) prior to the expiration of the $(T_{40m}-$
12 $T_{72m})$ timer, the mobile station shall re-enable the transmitter, shall direct
13 Layer 2 to resume operation from the beginning of the interrupted access probe
14 sequence of the access sub-attempt (see [4]), and shall transmit the first probe
15 of the new access probe sequence immediately after re-enabling the transmitter.
 - 16 - If the $(T_{40m}-T_{72m})$ timer expires, the mobile station shall direct Layer 2 to
17 cancel any access attempt (see [4]) and shall declare a loss of the Paging
18 Channel or the Forward Common Control Channel.
 - 19 • If an access attempt was not in progress when the timer expired and the mobile
20 station does not perform access handoff, the mobile station shall perform the
21 following:
 - 22 - The mobile station shall set the timer to $(T_{40m}-T_{72m})$ seconds.
 - 23 - If the $(T_{40m}-T_{72m})$ timer expires, the mobile station shall declare a loss of the
24 Paging Channel or the Forward Common Control Channel/ Primary Broadcast
25 Control Channel.

26 2.6.3.2 Update Overhead Information Substate

27 In this substate, if the base station supports the Primary Broadcast Control Channel for
28 Spreading Rate 1, or if both the mobile station and base station support Spreading Rate 3
29 on the common channels, then the mobile station shall monitor the Primary Broadcast
30 Control Channel until it has received the current configuration messages; otherwise, the
31 mobile station shall monitor the Paging Channel until it has received the current
32 configuration messages. The mobile station compares sequence numbers to determine
33 whether all of the configuration messages are up-to-date. To make sure it has the latest
34 access parameters, the mobile station receives at least one message containing the
35 ACC_MSG_SEQ field (except in case where the mobile station enters this substate with a
36 page response indication, since the initiating page contains ACC_MSG_SEQ), and waits, if
37 necessary, for an *Access Parameters Message* or an *Enhanced Access Parameters Message*.

⁵⁴ Requirements for processing the loss of Paging Channel are given separately for each substate of the *System Access State*, in the sections describing the substates.

1 In addition, if the mobile station is monitoring the Primary Broadcast Control Channel and
2 `SENDING_RANDS` is equal to '1', then it shall also wait for an *ANSI-41 RAND Message*.

3 Upon entering the *Update Overhead Information Substate*, the mobile station shall set the
4 *System Access State* timer to a value of T_{41m} seconds. The mobile station shall set `PAGED`
5 to `NO`.

6 If the *System Access State* timer expires while in this substate, the mobile station shall
7 enter the *System Determination Substate* of the *Mobile Station Initialization State* with a
8 system lost indication (see 2.6.1.1).

9 If the mobile station declares a loss of the Paging Channel or the Primary Broadcast
10 Control Channel (see 2.6.3.1.8), the mobile station shall perform the following:

- 11 • If `PACAS` is equal to enabled, the mobile station shall set `PACAS` to disabled and
12 `PACA_CANCEL` to '0', shall disable the `PACA` state timer, and should indicate to the
13 user that the `PACA` call has been canceled.
- 14 • The mobile station shall declare an access attempt failure and update its
15 registration variables as specified in 2.6.5.5.3.2.
- 16 • The mobile station shall enter the *Mobile Station Idle State*.

17 If `PACAS` is equal to enabled, the mobile station shall set `PACA_CANCEL` to '1' when the
18 user directs the mobile station to cancel a `PACA` call.

19 If the mobile station receives any of the following messages, it shall process the message as
20 follows:

- 21 1. *System Parameters Message*: The mobile station shall process the parameters from
22 the message (see 2.6.2.2.1).
- 23 2. *Access Parameters Message*: The mobile station shall process the parameters from
24 the message (see 2.6.2.2.2).
- 25 3. *Neighbor List Message*: The mobile station shall process the parameters from the
26 message (see 2.6.2.2.3).
- 27 4. *CDMA Channel List Message*: The mobile station shall process the parameters from
28 the message (see 2.6.2.2.4).
- 29 5. *Extended System Parameters Message*: The mobile station shall process the
30 parameters from the message (see 2.6.2.2.5).
- 31 6. *Global Service Redirection Message*: The mobile station shall process the
32 parameters from the message (see 2.6.2.2.6).
- 33 7. *Extended Neighbor List Message*: The mobile station shall process the parameters
34 from the message (see 2.6.2.2.7).
- 35 8. *General Neighbor List Message*: The mobile station shall process the parameters
36 from the message (see 2.6.2.2.8).
- 37 9. *Lock Until Power-Cycled Order*: The mobile station shall record the reason for the
38 *Lock Until Power-Cycled Order* in the mobile station's semi-permanent memory

- 1 (LCKRSN_P_{s-p} equals the least-significant four bits of ORDQ_r). The mobile station
2 should notify the user of the locked condition. The mobile station shall then enter
3 the *System Determination Substate* of the *Mobile Station Initialization State* with a
4 lock indication (see 2.6.1.1), and shall not enter the *System Access State* again until
5 after the next mobile station power-up or until it has received an *Unlock Order*.
6 This requirement shall take precedence over any other mobile station requirement
7 specifying entry to the *System Access State*.
- 8 10. *General Page Message* or *Universal Page Message*: If CURR_ACC_MSG_SEQ is
9 equal to NULL, the mobile station shall set CURR_ACC_MSG_SEQ to
10 ACC_MSG_SEQ_r. The mobile station shall compare CONFIG_MSG_SEQ_s to
11 CONFIG_MSG_SEQ_r. If the comparison results in a mismatch, the mobile station
12 shall set CONFIG_MSG_SEQ_s to CONFIG_MSG_SEQ_r. The mobile station may
13 ignore the rest of the message. If this substate was not entered with an origination
14 indication, page response indication, direct channel assignment update overhead
15 indication, direct channel assignment respond indication, or direct channel
16 assignment failure indication, the mobile station may also determine whether there
17 is a page match. If the mobile station attempts to determine whether there is a
18 page match, it shall use the procedure as defined in 2.6.2.3. If a match is
19 declared, the mobile station shall set PAGED to YES.
- 20 11. *User Zone Identification Message*: The mobile station shall process the parameters
21 from the message (see 2.6.2.2.9).
- 22 12. *Private Neighbor List Message*: The mobile station shall process the parameters
23 from the message (see 2.6.2.2.10).
- 24 13. *Extended Global Service Redirection Message*: The mobile station shall process the
25 parameters from the message (see 2.6.2.2.11).
- 26 14. *Extended CDMA Channel List Message*: The mobile station shall process the
27 parameters from the message (see 2.6.2.2.12).
- 28 15. *ANSI-41 System Parameters Message*: The mobile station shall process the
29 parameters from the message (see 2.6.2.2.13).
- 30 16. *MC-RR Parameters Message*: The mobile station shall process the parameters from
31 the message (see 2.6.2.2.14).
- 32 17. *Enhanced Access Parameters Message*: The mobile station shall process the
33 parameters from the message (see 2.6.2.2.15).
- 34 18. *ANSI-41 RAND Message*: The mobile station shall process the parameters from the
35 message (see 2.6.2.2.16).
- 36 19. *Universal Neighbor List Message*: The mobile station shall process the parameters
37 from the message (see 2.6.2.2.17).
- 38 20. *Extended Channel Assignment Message*: If this substate was entered with an
39 origination indication, or a direct channel assignment update overhead indication,
40 or a direct channel assignment respond indication, or a direct channel assignment
41 failure indication, or if the DIRECT_CH_ASSIGN_IND_r is not included, or the

- 1 DIRECT_CH_ASSIGN_IND_r is included and is set to '0', the mobile station shall
 2 ignore this message. Otherwise, the mobile station shall process the message as
 3 follows:
- 4 • If RESPOND_IND_r is equal to '0', the mobile station shall perform the following
 5 in the order specified:
 - 6 - The mobile station shall set CONFIG_MSG_SEQ_s to CONFIG_MSG_SEQ_r.
 - 7 - The mobile station shall wait till stored configuration parameters are current
 8 (see 2.6.2.2).
 - 9 - Once the stored configuration parameters are current, the mobile station
 10 shall disable the System Access State timer and process the message as
 11 specified in section 2.6.3.3.
 - 12 • If RESPOND_IND_r is equal to '1', the mobile station shall perform the following
 13 in the order specified:
 - 14 - The mobile station shall set CONFIG_MSG_SEQ_s to CONFIG_MSG_SEQ_r.
 - 15 - When all of the following conditions are met:
 - 16 + the stored configuration parameters are current (see 2.6.2.2)
 - 17 + CURR_ACC_MSG_SEQ_s and ACC_MSG_SEQ_s are equal and are not
 18 NULL, and
 - 19 + if the mobile station is monitoring the Primary Broadcast Control
 20 Channel and SENDING_RAND_s is equal to '1', the *ANSI-41 RAND*
 21 *Message* has been received,
- 22 the mobile station shall disable the System Access State timer and process
 23 the message as specified in section 2.6.3.3.

24 21. *General Extension Message*: The mobile station shall process this message as
 25 specified in section 2.6.18.

26 If the mobile station receives a message which is not included in the above list, the mobile
 27 station shall ignore the message.

28 If this substate was entered with a direct channel assignment update overhead indication,
 29 the mobile station shall perform the following in the order specified:

- 30 • The mobile station shall wait till the stored configuration parameters are current
 31 (see 2.6.2.2).
- 32 • Once the stored configuration parameters are current, the mobile station shall
 33 perform the following:
 - 34 - The mobile station shall disable the System Access State timer.
 - 35 - The mobile station shall process the *Extended Channel Assignment Message*
 36 received in *Mobile Station Idle State* as specified in section 2.6.3.3.

37 When all of the following conditions are met:

- 38 • The stored configuration parameters are current (see 2.6.2.2)

- 1 • CURR_ACC_MSG_SEQ_s and ACC_MSG_SEQ_s are equal and are not NULL, and
- 2 • If the mobile station is monitoring the Primary Broadcast Control Channel and
- 3 SENDING_RAND_s is equal to '1', the *ANSI-41 RAND Message* has been received,
- 4 then the mobile station shall disable the System Access State timer and shall perform one
- 5 of the following:
- 6 • If PAGED is equal to YES, the mobile station shall determine whether the message
- 7 resulting in the page match was received on the current Paging Channel or Forward
- 8 Common Control Channel. If the message was received on the current Paging
- 9 Channel or Forward Common Control Channel, the mobile station shall enter the
- 10 *Page Response Substate*; otherwise, the mobile station shall enter the *Mobile Station*
- 11 *Idle State*.
- 12 • If this substate was entered with a page response indication, direct channel
- 13 assignment respond indication, or direct channel assignment failure indication, and
- 14 the mobile station has not performed an access entry handoff, the mobile station
- 15 shall determine whether the message resulting in the page response was received
- 16 on the current Paging Channel or Forward Common Control Channel. If the
- 17 message was received on the current Paging Channel or Forward Common Control
- 18 Channel, the mobile station shall enter the *Page Response Substate*; otherwise, the
- 19 mobile station shall enter the *Mobile Station Idle State* with the corresponding
- 20 indication.
- 21 • If this substate was entered with a page response indication, direct channel
- 22 assignment respond indication, or direct channel assignment failure indication, and
- 23 the mobile station has performed an access entry handoff, the mobile station shall
- 24 enter the *Page Response Substate* with the corresponding indication.
- 25 • If this substate was entered with a page response retransmission indication, the
- 26 mobile station shall enter the *Page Response Substate*.
- 27 • If this substate was entered with an origination indication, the mobile station shall
- 28 enter the *Mobile Station Origination Attempt Substate* with an origination indication.
- 29 • If this substate was entered with a PACA response indication, the mobile station
- 30 shall enter the *Mobile Station Origination Attempt Substate* with a PACA response
- 31 indication.
- 32 • If this substate was entered with an order/message response indication and the
- 33 mobile station has not performed an access entry handoff, the mobile station shall
- 34 determine whether the message resulting in the response was received on the
- 35 current Paging Channel or Forward Common Control Channel. If the message was
- 36 received on the current Paging Channel or Forward Common Control Channel, the
- 37 mobile station shall enter the *Mobile Station Order/Message Response Substate*;
- 38 otherwise, the mobile station shall discard the response and enter the *Mobile Station*
- 39 *Idle State*.
- 40 • If this substate was entered with an order/message response indication and the
- 41 mobile station has performed an access entry handoff, the mobile station shall enter
- 42 the *Mobile Station Order/Message Response Substate*.

- 1 • If this substate was entered with a registration indication, the mobile station shall
2 enter the *Registration Access Substate*.
- 3 • If this substate was entered with a message transmission indication, the mobile
4 station shall enter the *Mobile Station Message Transmission Substate* with a message
5 transmission indication.
- 6 • If this substate was entered with a hook status indication, the mobile station shall
7 enter the *Mobile Station Message Transmission Substate* with a hook status
8 indication.
- 9 • If this substate was entered with a PACA cancel indication, the mobile station shall
10 enter the *PACA Cancel Substate*.
- 11 • If this substate was entered with a radio environment report indication, the mobile
12 station shall enter the *Mobile Station Message Transmission Substate* with a radio
13 environment report indication.
- 14 • If this substate was entered with a tracking zone indication, the mobile station shall
15 enter the *Mobile Station Message Transmission Substate* with a tracking zone
16 indication.
- 17 • If this substate was entered with a fast call setup indication, the mobile station
18 shall enter the *Mobile Station Message Transmission Substate* with a fast call setup
19 indication.

20 2.6.3.3 Page Response Substate

21 In this substate, the mobile station sends a *Page Response Message* or a *Reconnect*
22 *Message* in response to a mobile-station-addressed page or direct channel assignment from
23 a base station. If the mobile station sends a *Reconnect Message*, it shall set the ORIG_IND
24 field of the message to '0'.

25 If directed by the user to transmit a message, the mobile station may perform either of the
26 following:

- 27 • The mobile station may transmit a *Data Burst Message* to the base station in this
28 substate if all of the following conditions are true:
 - 29 - The mobile station has received confirmation of delivery of the *Page Response*
30 *Message* or a *Reconnect Message*, and
 - 31 - ACCT is not enabled for the service option number associated with the *Data*
32 *Burst Message* as follows:
 - 33 + The service option number associated with the *Data Burst Message* is not
34 equal to any ACCT_SO entry in ACCT_SO_LIST, and
 - 35 + The service option group number of the service option associated with the
36 *Data Burst Message* is not equal to any ACCT_SO_GRP entry in
37 ACCT_SO_GRP_LIST.

- 1 • If the mobile station sends a *Reconnect Message* in assured mode in this substate,
 2 the mobile station may include a Short Data Burst (see [30]) in the *Reconnect*
 3 *Message* by setting the SDB_INCL field to '1', if all of the following conditions are
 4 true:
- 5 - SDB_SUPPORTED_s and SDB_IN_RCNM_IND_s are equal to '1', and
 - 6 - ACCT is not enabled for the service option number associated with the Short
 7 Data Burst as follows:
 - 8 + The service option number associated with the Short Data Burst is not equal
 9 to any ACCT_SO entry in ACCT_SO_LIST, and
 - 10 + The service option group number of the service option associated with the
 11 Short Data Burst is not equal to any ACCT_SO_GRP entry in
 12 ACCT_SO_GRP_LIST.

13 The mobile station shall not send the *Reconnect Message* if RECONNECT_MSG_IND_s equals
 14 '0' or if this message is not being sent to reconnect a dormant packet data service instance.

15 If a base station responds to the *Page Response Message* or the *Reconnect Message* with an
 16 authentication request, the mobile station responds in this substate.

17 If a message received from the base station requires a Layer 2 acknowledgment and does
 18 not require a Layer 3 response, Layer 3 shall indicate to Layer 2 that no response is
 19 outstanding (see [4]).

20 If a message received from the base station requires a Layer 2 acknowledgment and also a
 21 Layer 3 response, Layer 3 shall indicate to Layer 2 that a response is outstanding (see [4]).

22 When transmitting a response to a message received from the base station, Layer 3 shall
 23 indicate to Layer 2 that the type of the message is a response (see [4]).

24 When transmitting an autonomous message (i.e., a message that is not sent as a response
 25 to a message received from the base station) other than the *Data Burst Message*, Layer 3
 26 shall indicate to Layer 2 that the type of the message is a request other than a registration
 27 request or a message transmission request (see [4]).

28 When transmitting an autonomous *Data Burst Message*, Layer 3 shall indicate to Layer 2
 29 that the type of the message is a message transmission request (see [4]).

30 If the mobile station has a stored service configuration (that is, parameters conveyed by
 31 both the Service Configuration information record and the Non-negotiable Service
 32 Configuration information record) and corresponding SYNC_ID with associated SID and
 33 NID that are equal to the SID_s and NID_s respectively, and USE_SYNC_ID_s is equal to '1',
 34 the mobile station may include the SYNC_ID field in the *Page Response Message* or the
 35 *Reconnect Message* and, if included, shall set it to the SYNC_ID corresponding to the stored
 36 service configuration. If the mobile station includes SYNC_ID field in the *Page Response*
 37 *Message* or the *Reconnect Message*, the mobile station shall store the value of the SYNC_ID
 38 field in SYNC_ID_s.

39 If the mobile station enters the *Page Response Substate* with a direct channel assignment
 40 respond indication, the mobile station shall perform the following:

- 1 • The mobile station shall send a *Page Response Message* or a *Reconnect Message* in
2 unassured mode, and shall then enter the *Traffic Channel Initialization Substate* of
3 the *Mobile Station Control on the Traffic Channel State*,
- 4 • While in the *Page Response Substate*, the mobile station shall ignore all received
5 messages, and
- 6 • The mobile station shall not perform any other procedures in this section.
- 7 • Upon entering the *Page Response Substate* for any reason other than with a direct
8 channel assignment respond indication, the mobile station shall perform the
9 following:
 - 10 - Set RLGAIN_ADJ_s to '0000'.
 - 11 - If P_REV_IN_USE_s is less than 11, set PLCM_TYPE_s to '0000'; otherwise set
12 PLCM_TYPE_s to '0100'.
 - 13 - Send a *Page Response Message* or a *Reconnect Message*.

14 While in this substate, the mobile station shall monitor the Paging Channel or the Forward
15 Common Control Channel. The mobile station may perform an access probe handoff or
16 access handoff as described in 2.6.3.1.3.2 and 2.6.3.1.3.3. If the mobile station declares a
17 loss of the Paging Channel or the Forward Common Control Channel (see 2.6.3.1.8) during
18 an access attempt, the mobile station may perform an access probe handoff; otherwise, it
19 shall declare an access attempt failure and shall perform the following actions:

- 20 • The mobile station shall update its registration variables as specified in 2.6.5.5.3.2,
- 21 • If the mobile station is monitoring the Paging Channel, the mobile station shall set
22 SYS_PAR_MSG_SEQ_s and ACC_MSG_SEQ_s to NULL,
- 23 • If the mobile station is monitoring the Forward Common Control Channel, the
24 mobile station shall set MC_RR_PAR_MSG_SEQ_s and ACC_MSG_SEQ_s to NULL.
- 25 • If PACA_s is equal to enabled, the mobile station shall set PACA_s to disabled and
26 PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to the
27 user that the PACA call has been canceled.
- 28 • The mobile station shall disable its transmitter, and
- 29 • The mobile station shall enter the *Mobile Station Idle State*.

30 If the mobile station receives confirmation of delivery of any message sent by the mobile
31 station in this substate, the mobile station shall perform an access handoff if all of the
32 following conditions hold:

- 33 • The mobile station declares a loss of the Paging Channel or the Forward Common
34 Control Channel, and
- 35 • The mobile station is permitted to perform an access handoff (see 2.6.3.1.3.2), and
36 there are pilots other than the active pilot in the access handoff list (see
37 2.6.3.1.3.2).

1 If the mobile station declares a loss of the Paging Channel or the Forward Common Control
 2 Channel and does not perform an access handoff, the mobile station shall perform the
 3 following:

- 4 • If the mobile station is monitoring the Paging Channel, the mobile station shall set
 5 SYS_PAR_MSG_SEQ_s and ACC_MSG_SEQ_s to NULL.
- 6 • If the mobile station is monitoring the Forward Common Control Channel, the
 7 mobile station shall set MC_RR_PAR_MSG_SEQ_s and ACC_MSG_SEQ_s to NULL.
- 8 • If PACA_s is equal to enabled, the mobile station shall set PACA_s to disabled and
 9 PACA_CANCEL to 0, shall disable the PACA state timer, and should indicate to the
 10 user that the PACA call has been canceled,
- 11 • The mobile station shall disable its transmitter, and
- 12 • The mobile station shall enter the *Mobile Station Idle State*.

13 If PACA_s is equal to enabled, the mobile station shall set PACA_CANCEL to '1' when the
 14 user directs the mobile station to cancel a PACA call.

15 If the mobile station receives confirmation of delivery of the *Page Response Message* or the
 16 *Reconnect Message* sent in this substate, the mobile station shall update its registration
 17 variables with respect to the base station to which the first access probe was transmitted
 18 after entering the *System Access State*, as specified in 2.6.5.5.3.1.

19 If the *System Access State* timer expires while in this substate, the mobile station shall
 20 perform the following:

- 21 • If PACA_s is equal to enabled, the mobile station shall set PACA_s to disabled and
 22 PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to the
 23 user that the PACA call has been canceled.
- 24 • If the mobile station is monitoring the Paging Channel, the mobile station shall set
 25 SYS_PAR_MSG_SEQ_s and ACC_MSG_SEQ_s to NULL, and shall enter the *Mobile*
 26 *Station Idle State*.
- 27 • If the mobile station is monitoring the Forward Common Control Channel, the
 28 mobile station shall set MC_RR_PAR_MSG_SEQ_s and ACC_MSG_SEQ_s to NULL and
 29 enter the *Mobile Station Idle State*.

30 The mobile station shall set and disable the *System Access State* timer as follows:

- 31 • The mobile station shall disable the timer whenever it begins an access attempt.
- 32 • The mobile station shall set the timer to T_{42m} seconds whenever it ends an access
 33 attempt.
- 34 • The mobile station shall disable the timer whenever it exits the *System Access State*.

35 If the mobile station receives a *Channel Assignment Message* or the *Extended Channel*
 36 *Assignment Message*, Layer 3 shall send a *dedicated channel assignment* indication to Layer
 37 2 (see [4]). If the mobile station has not received confirmation of delivery of the *Page*
 38 *Response Message* or the *Reconnect Message*, before receiving the *Channel Assignment*
 39 *Message* or the *Extended Channel Assignment Message*, the mobile station shall update its

1 registration variables with respect to the base station to which the first access probe was
 2 transmitted after entering the *System Access State*, as specified in 2.6.5.5.3.1. If the mobile
 3 station has not received confirmation of delivery of a *Data Burst Message* before receiving
 4 the *Channel Assignment Message* or the *Extended Channel Assignment Message*, Layer 3
 5 shall send an L2-Supervision.Request primitive to Layer 2 to abort any access attempt in
 6 progress and the mobile station may store the *Data Burst Message* for later transmission on
 7 the r-dsch.

8 If the mobile station is to exit the *System Access State* as a result of processing Layer 3
 9 fields of a message requiring an acknowledgment, the mobile station shall exit the *System*
 10 *Access State* after Layer 3 receives an indication from Layer 2 that the acknowledgment to
 11 the message has been sent and acknowledged.

12 If Layer 3 receives a message other than a *Channel Assignment Message* or an *Extended*
 13 *Channel Assignment Message* with an indication from Layer 2 that an access attempt for a
 14 message being transmitted was not terminated as a result of processing the Layer 2 fields
 15 of the received message, the mobile station shall ignore the received message.

16 The following directed messages and orders can be received. If any field value of the
 17 message or order is outside its permissible range, the mobile station may send a *Mobile*
 18 *Station Reject Order* with ORDQ equal to '00000100' (message field not in valid range).

- 19 1. *Authentication Challenge Message*: The mobile station shall respond to the message
 20 as specified in 2.3.12.1.4, regardless of the value of AUTH_S.
- 21 2. *Authentication Request Message*: The mobile station shall process the message and
 22 shall respond as specified in 2.3.12.5.2.
- 23 3. *Base Station Challenge Confirmation Order*: The mobile station shall respond to the
 24 message as specified in 2.3.12.1.5.
- 25 4. *Base Station Reject Order*: The mobile station shall perform the procedures as
 26 specified in 2.6.11.5.
- 27 5. *Channel Assignment Message*: The mobile station shall process the message as
 28 follows:
 - 29 • If ASSIGN_MODE_R equals '000', the mobile station shall perform the following
 30 actions:
 - 31 - The mobile station shall set CH_IND_S to '01'.
 - 32 - The mobile station shall store the frame offset (FRAME_OFFSET_S =
 33 FRAME_OFFSET_R), the message encryption mode indicator
 34 (ENCRYPT_MODE_S = ENCRYPT_MODE_R), and, if FREQ_INCL_R equals '1', the
 35 Frequency Assignment (CDMACH_S = CDMA_FREQ_R).
 - 36 - The mobile station shall set SERV_NEG_S to disabled.
 - 37 - If PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled
 38 and PACA_CANCEL to '0', shall disable the PACA state timer, and should
 39 indicate to the user that the PACA call has been canceled.
 - 40 - The mobile station shall initialize CODE_CHAN_LIST as described in 2.6.8.

- 1 - If the mobile station is currently monitoring the Paging Channel, the mobile
2 station shall set IDLE_BCCH_CHAN to '0'; otherwise, the mobile station
3 shall set IDLE_BCCH_CHAN to '1'. The mobile station shall set
4 IDLE_CDMA_CHAN to CDMACH_s, IDLE_CDMABAND to CDMABAND_s,
5 IDLE_SID to SID_s, IDLE_NID to NID_s, and IDLE_P_REV to P_REV_s.
- 6 - The mobile station shall enter the *Traffic Channel Initialization Substate* of
7 the *Mobile Station Control on the Traffic Channel State*.
- 8 • If ASSIGN_MODE_r equals '001', the mobile station shall perform the following
9 actions:
- 10 - If FREQ_INCL_r equals '1', the mobile station shall perform the following:
- 11 + If the message requires acknowledgment, the mobile station shall wait
12 until Layer 3 receives an indication from Layer 2 that the
13 acknowledgment to the message has been sent and acknowledged.
- 14 + The mobile station shall set CDMACH_s to CDMA_FREQ_r, tune to the new
15 Frequency Assignment, and measure the strength of each pilot listed in
16 the assignment using the Neighbor Set search procedures specified in
17 2.6.6.2.1 and 2.6.6.2.2.
- 18 - The mobile station shall set CONFIG_MSG_SEQ_s and ACC_MSG_SEQ_s to
19 NULL (see 2.6.2.2) and shall set PILOT_PN_s to the pilot PN sequence offset
20 of the strongest pilot in the list (PILOT_PN_r).
- 21 - If the mobile station has not stored configuration parameters for the Primary
22 Paging Channel of the new base station, or if the stored information is not
23 current (see 2.6.2.2), the mobile station shall set SYS_PAR_MSG_SEQ_s,
24 NGHBR_LST_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s,
25 GEN_NGHBR_LST_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s,
26 PRI_NGHBR_LST_MSG_SEQ_s, CHAN_LST_MSG_SEQ_s,
27 EXT_CHAN_LST_MSG_SEQ_s, FD_CHAN_LST_MSG_SEQ_s EQ_s,
28 EXT_SYS_PAR_MSG_SEQ_s, GLOB_SERV_REDIR_MSG_SEQ_s,
29 AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s,
30 GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s and
31 EXT_GLOB_SERV_REDIR_MSG_SEQ_s to NULL.
- 32 - The mobile station shall set PAGE_CHAN_s to '1' and PAGECH_s to the
33 Primary Paging Channel. The mobile station shall then begin monitoring
34 the Primary Paging Channel of the selected base station.
- 35 - If RESPOND_r is equal to '1', the mobile station shall enter the *Update*
36 *Overhead Information Substate* with a page response retransmission
37 indication within T_{34m} seconds after receiving the *Channel Assignment*
38 *Message*.
- 39 - If RESPOND_r is equal to '0', the mobile station shall enter the *Mobile Station*
40 *Idle State* within T_{34m} seconds after receiving the *Channel Assignment*
41 *Message*.

- 1 • If ASSIGN_MODE_T equals '100', the mobile station shall perform the following
- 2 actions:
- 3 - The mobile station shall set CH_IND_S to '01'.
- 4 - If PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled
- 5 and PACA_CANCEL to '0', shall disable the PACA state timer, and should
- 6 indicate to the user that the PACA call has been canceled.
- 7 - If GRANTED_MODE_T equals '00', and the multiplex option and radio
- 8 configuration combination specified in the DEFAULT_CONFIG field is not
- 9 supported by the mobile station, the mobile station shall send a *Mobile*
- 10 *Station Reject Order* with ORDQ field set to '00000110' (capability not
- 11 supported by the mobile station) and remain in the *Page Response Substate*.
- 12 - If FREQ_INCL_T equals '0', the mobile station shall perform the following
- 13 actions:
- 14 + The mobile station shall store the frame offset (FRAME_OFFSET_S =
- 15 FRAME_OFFSET_T), the message encryption mode indicator
- 16 (ENCRYPT_MODE_S = ENCRYPT_MODE_T), the granted mode
- 17 (GRANTED_MODE_S = GRANTED_MODE_T), and default configuration
- 18 (DEFAULT_CONFIG_S = DEFAULT_CONFIG_T).
- 19 + The mobile station shall set SERV_NEG_S to enabled.
- 20 + If the mobile station is currently monitoring the Paging Channel, the
- 21 mobile station shall set IDLE_BCCH_CHAN to '0'; otherwise, the mobile
- 22 station shall set IDLE_BCCH_CHAN to '1'. The mobile station shall set
- 23 IDLE_CDMA_CHAN to CDMACH_S, IDLE_CDMABAND to CDMABAND_S,
- 24 IDLE_SID to SID_S, IDLE_NID to NID_S, and IDLE_P_REV to P_REV_S.
- 25 + The mobile station shall initialize CODE_CHAN_LIST as described in
- 26 2.6.8 and shall then enter the *Traffic Channel Initialization Substate* of
- 27 the *Mobile Station Control on the Traffic Channel State*.
- 28 - If FREQ_INCL_T equals '1', the mobile station shall perform the following
- 29 actions:
- 30 + If the band class is not supported by the mobile station, the mobile
- 31 station shall send a *Mobile Station Reject Order* with ORDQ field set to
- 32 '00000110' (capability not supported by the mobile station) and shall
- 33 remain in the *Page Response Substate*.
- 34 + If the band class is supported by the mobile station, the mobile station
- 35 shall perform the following actions:

- 1 ○ The mobile station shall store the frame offset ($FRAME_OFFSET_S =$
2 $FRAME_OFFSET_T$), the message encryption mode indicator
3 ($ENCRYPT_MODE_S = ENCRYPT_MODE_T$), the bypass indicator
4 ($BYPASS_ALERT_ANSWER_S = BYPASS_ALERT_ANSWER_T$), the
5 granted mode ($GRANTED_MODE_S = GRANTED_MODE_T$), the default
6 configuration ($DEFAULT_CONFIG_S = DEFAULT_CONFIG_T$), the idle
7 Frequency Assignment ($IDLE_CDMA_CHAN = CDMACH_S$), the idle
8 band class ($IDLE_CDMABAND = CDMABAND_S$), the band class
9 ($CDMABAND_S = BAND_CLASS_T$), and the Frequency Assignment
10 ($CDMACH_S = CDMA_FREQ_T$).
- 11 ○ The mobile station shall initialize $CODE_CHAN_LIST$ as described in
12 2.6.8, and shall set $SERV_NEG_S$ to enabled.
- 13 ○ If the mobile station is currently monitoring the Paging Channel, the
14 mobile station shall set $IDLE_BCCH_CHAN$ to '0'; otherwise, the
15 mobile station shall set $IDLE_BCCH_CHAN$ to '1'. The mobile
16 station shall set $IDLE_SID$ to SID_S , $IDLE_NID$ to NID_S , and
17 $IDLE_P_REV$ to P_REV_S .
- 18 ○ The mobile station shall then tune to the new Frequency Assignment
19 and shall enter the *Traffic Channel Initialization Substate* of the
20 *Mobile Station Control on the Traffic Channel State*.
- 21 • If $ASSIGN_MODE_T$ equals '101', the mobile station shall perform the following
22 actions:
- 23 - If $FREQ_INCL_T$ equals '0', the mobile station shall perform the following
24 actions:
- 25 + If the message requires acknowledgment, the mobile station shall wait
26 until Layer 3 receives an indication from Layer 2 that the
27 acknowledgment to the message has been sent and acknowledged.
- 28 + The mobile station shall set $CONFIG_MSG_SEQ_S$ and $ACC_MSG_SEQ_S$ to
29 NULL (see 2.6.2.2) and shall set $PILOT_PN_S$ to the pilot PN sequence
30 offset of the strongest pilot in the list ($PILOT_PN_T$).
- 31 + If the mobile station has not stored configuration parameters for the
32 Primary Paging Channel of the new base station, or if the stored
33 information is not current (see 2.6.2.2), the mobile station shall set
34 $SYS_PAR_MSG_SEQ_S$, $NGHBR_LST_MSG_SEQ_S$,
35 $EXT_NGHBR_LST_MSG_SEQ_S$, $GEN_NGHBR_LST_MSG_SEQ_S$,
36 $USER_ZONE_ID_MSG_SEQ_S$, $PRI_NGHBR_LST_MSG_SEQ_S$,
37 $CHAN_LST_MSG_SEQ_S$, $EXT_CHAN_LST_MSG_SEQ_S$,
38 $FD_CHAN_LST_MSG_SEQ_S$, $EXT_SYS_PAR_MSG_SEQ_S$,
39 $GLOB_SERV_REDIR_MSG_SEQ_S$, $AP_PILOT_INFO_MSG_SEQ_S$,
40 $AP_IDT_MSG_SEQ_S$, $AP_ID_TEXT_MSG_SEQ_S$, $GOI_MSG_SEQ_S$,
41 $FREQ_GOI_MSG_SEQ_S$, $ATIM_MSG_SEQ_S$ and
42 $EXT_GLOB_SERV_REDIR_MSG_SEQ_S$ to NULL.

- 1 + The mobile station shall set PAGE_CHAN_s to '1' and PAGECH_s to the
2 Primary Paging Channel. The mobile station shall then begin
3 monitoring the Primary Paging Channel of the selected base station.
- 4 + If RESPOND_r is equal to '1', the mobile station shall perform the
5 following:
6 o If the *Channel Assignment Message* does not require an
7 acknowledgment, the mobile station shall enter the *Update Overhead*
8 *Information Substate* with a page response retransmission indication
9 within T_{34m} seconds after receiving the *Channel Assignment*
10 *Message*.
11 o If the *Channel Assignment Message* requires an acknowledgment, the
12 mobile station shall enter the *Update Overhead Information Substate*
13 with a page response retransmission indication within T_{34m} seconds
14 after Layer 3 receives an indication from Layer 2 that the
15 acknowledgment to the *Channel Assignment Message* has been sent
16 and acknowledged.
- 17 + If RESPOND_r is equal to '0', the mobile station shall perform the
18 following:
19 o If the *Channel Assignment Message* does not require an
20 acknowledgment, the mobile station shall enter the *Mobile Station*
21 *Idle State* within T_{34m} seconds after receiving the *Channel*
22 *Assignment Message*.
23 o If the *Channel Assignment Message* requires an acknowledgment, the
24 mobile station shall enter the *Mobile Station Idle State* within T_{34m}
25 seconds after Layer 3 receives an indication from Layer 2 that the
26 acknowledgment to the *Channel Assignment Message* has been sent
27 and acknowledged.
- 28 - If FREQ_INCL_r equals '1', the mobile station shall perform the following
29 actions:
30 + If the band class is not supported by the mobile station, the mobile
31 station shall send a *Mobile Station Reject Order* with ORDQ field set to
32 '00000110' (capability not supported by the mobile station) and shall
33 remain in the *Page Response Substate*.
34 + If the band class is supported by the mobile station, the mobile station
35 shall perform the following actions:
36 o If the message requires acknowledgment, the mobile station shall
37 wait until Layer 3 receives an indication from Layer 2 that the
38 acknowledgment to the message has been sent and acknowledged.

- 1 ○ The mobile station shall set CDMACH_s to CDMA_FREQ_r and
2 CDMABAND_s to BAND_CLASS_r. Then the mobile station shall tune
3 to the new Frequency Assignment, measure the strength of each
4 pilot listed in the assignment using the Neighbor Set search
5 procedures specified in 2.6.6.2.1 and 2.6.6.2.2, set PILOT_PN_s to the
6 pilot PN sequence offset of the strongest pilot in the list (PILOT_PN_r),
7 and set CONFIG_MSG_SEQ_s and ACC_MSG_SEQ_s to NULL (see
8 2.6.2.2).
- 9 ○ If the mobile station has not stored configuration parameters for the
10 Primary Paging Channel of the new base station, or if the stored
11 information is not current (see 2.6.2.2), the mobile station shall set
12 SYS_PAR_MSG_SEQ_s, NGHBR_LST_MSG_SEQ_s,
13 EXT_NGHBR_LST_MSG_SEQ_s, GEN_NGHBR_LST_MSG_SEQ_s,
14 USER_ZONE_ID_MSG_SEQ_s, PRI_NGHBR_LST_MSG_SEQ_s,
15 CHAN_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
16 FD_CHAN_LST_MSG_SEQ_s, EXT_SYS_PAR_MSG_SEQ_s,
17 GLOB_SERV_REDIR_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s,
18 AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s,
19 FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s and
20 EXT_GLOB_SERV_REDIR_MSG_SEQ_s to NULL.
- 21 ○ The mobile station shall set PAGE_CHAN_s to '1' and PAGECH_s to the
22 Primary Paging Channel. The mobile station shall then begin
23 monitoring the Primary Paging Channel of the selected base station.
- 24 ○ If RESPOND_r is equal to '1', the mobile station shall perform the
25 following:
- 26 ◇ If the *Channel Assignment Message* does not require an
27 acknowledgment, the mobile station shall enter the *Update*
28 *Overhead Information Substate* with a page response
29 retransmission indication within T_{34m} seconds after receiving
30 the *Channel Assignment Message*.
- 31 ◇ If the *Channel Assignment Message* requires an acknowledgment,
32 the mobile station shall enter the *Update Overhead Information*
33 *Substate* with a page response retransmission indication within
34 T_{34m} seconds after Layer 3 receives an indication from Layer 2
35 that the acknowledgment to the *Channel Assignment Message*
36 has been sent and acknowledged.
- 37 ○ If RESPOND_r is equal to '0', the mobile station perform the following:
- 38 ◇ If the *Channel Assignment Message* does not require an
39 acknowledgment, the mobile station shall enter the *Mobile*
40 *Station Idle State* within T_{34m} seconds after receiving the *Channel*
41 *Assignment Message* .

- 1 ◇ If the *Channel Assignment Message* requires an acknowledgment,
 2 the mobile station shall enter the *Mobile Station Idle State* within
 3 T_{34m} seconds after Layer 3 receives an indication from Layer 2
 4 that the acknowledgment to the *Channel Assignment Message*
 5 has been sent and acknowledged.

6 6. *Data Burst Message*

7 7. *Extended Channel Assignment Message*: The mobile station shall process the
 8 message as follows:

- 9 • If the *Extended Channel Assignment Message* requires an acknowledgment and
 10 the mobile station is to enter the *Mobile Station Control on the Traffic Channel*
 11 *State* as a result of processing Layer 3 fields of this message, the mobile station
 12 shall enter the *Mobile Station Control on the Traffic Channel State* only after Layer
 13 3 receives an indication from Layer 2 that the acknowledgment to the message
 14 has been sent and acknowledged.
- 15 • The mobile station shall set RTC_NOM_PWR_USE_IND to '0'.
- 16 • The mobile station shall set DIRECT_CH_ASSIGN_RECOVER_IND_s to '0'.
- 17 • If the mobile station is in *Page Response Substate* and has sent⁵⁵ a *Page*
 18 *Response Message* or a *Reconnect Message* the mobile station shall set
 19 RESPOND_IND_s to '0'; otherwise the mobile station shall set RESPOND_IND_s to
 20 RESPOND_IND_r.
- 21 • If ASSIGN_MODE_r equals '000', the mobile station shall perform the following
 22 actions:
- 23 - The mobile station shall set CH_IND_s to '01'.
- 24 - If PACA_s is equal to enabled, the mobile station shall set PACA_s to disabled
 25 and PACA_CANCEL to '0', shall disable the PACA state timer, and should
 26 indicate to the user that the PACA call has been canceled.
- 27 - If GRANTED_MODE_r equals '00', and the multiplex option and radio
 28 configuration specified in the DEFAULT_CONFIG field are not supported by
 29 the mobile station, the mobile station shall send a *Mobile Station Reject Order*
 30 with ORDQ field set to '00000110' (capability not supported by the mobile
 31 station) and shall remain in the current state⁵⁶.

⁵⁵ A message is considered sent when the mobile station transmits the message at least once, no matter whether the L2 acknowledgment is received or not.

⁵⁶ The current state may be *Page Response Substate* or *Mobile Station Idle State*. The mobile station remains in the state in which *Extended Channel Assignment Message* is received.

- 1 - If GRANTED_MODE_r is equal to '00' and DEFAULT_CONFIG_r is not equal to
2 '100', the mobile station shall send a *Mobile Station Reject Order* with ORDQ
3 field set to '00001110' (RC does not match with DEFAULT_CONFIG_r) and
4 shall remain in the current state if any of the following conditions is true:
- 5 + FOR_FCH_RC_r is not equal to the RC associated with
6 DEFAULT_CONFIG_r (see Table 3.7.2.3.2.21-2).
7 + REV_FCH_RC_r is not equal to the RC associated with
8 DEFAULT_CONFIG_r (see Table 3.7.2.3.2.21-2).
- 9 - If the mobile station does not support either of the Fundamental Channel
10 Radio Configurations (FOR_FCH_RC or REV_FCH_RC), the mobile shall send
11 a *Mobile Station Reject Order* with the ORDQ field set to '00000110'
12 (capability not supported by the mobile station) and remain in the current
13 state.
- 14 - If PLCM_TYPE_r equals '0010' and IMSI_O is derived from IMSI_T, or if
15 PLCM_TYPE_r equals '0011' and IMSI_O is derived from IMSI_M, the mobile
16 station shall send a *Mobile Station Reject Order* with the ORDQ field
17 set to '00011100' (PLCM_TYPE mismatch) and remain in the current state.
- 18 - If P_REV_IN_USE_s is equal to or greater than 6, the mobile station shall
19 store the Forward Fundamental Channel Radio Configuration
20 (FOR_FCH_RC_s = FOR_FCH_RC_r) and the Reverse Fundamental Channel
21 Radio Configuration (REV_FCH_RC_s = REV_FCH_RC_r).
- 22 - If FREQ_INCL_r equals '0', and the band class is supported by the mobile
23 station, the mobile station shall perform the following actions:
- 24 + The mobile station shall store the frame offset (FRAME_OFFSET_s =
25 FRAME_OFFSET_r); the message encryption mode indicator
26 (ENCRYPT_MODE_s = ENCRYPT_MODE_r); the bypass indicator
27 (BYPASS_ALERT_ANSWER_s = BYPASS_ALERT_ANSWER_r); the granted
28 mode (GRANTED_MODE_s = GRANTED_MODE_r); the default
29 configuration (DEFAULT_CONFIG_s = DEFAULT_CONFIG_r); and the
30 occurrences of PILOT_PN and PWR_COMB for each included member of
31 the Active Set.
- 32 + The mobile station shall perform the procedures in 2.6.11.2.
- 33 + If C_SIG_ENCRYPT_MODE is included, the mobile station shall set
34 C_SIG_ENCRYPT_MODE_s to C_SIG_ENCRYPT_MODE_r.
- 35 + The mobile station shall initialize CODE_CHAN_LIST as described in
36 2.6.8, and shall set SERV_NEG_s to enabled.

- 1 + The mobile station shall set FPC_FCH_INIT_SETPT_S to
2 FPC_FCH_INIT_SETPT_R, FPC_FCH_CURR_SETPT_S to
3 FPC_FCH_INIT_SETPT_S, FPC_FCH_FER_S to FPC_FCH_FER_R,
4 FPC_FCH_MIN_SETPT_S to FPC_FCH_MIN_SETPT_R,
5 FPC_FCH_MAX_SETPT_S to FPC_FCH_MAX_SETPT_R, and FPC_PRI_CHAN_S
6 to '0' if the mobile station supports any Radio Configuration greater than
7 2.
- 8 + The mobile station shall set FPC_SUBCHAN_GAIN_S to
9 FPC_SUBCHAN_GAIN_R.
- 10 + The mobile station shall set RLGAIN_ADJ_S to RLGAIN_ADJ_R.
- 11 + The mobile station shall set REV_FCH_GATING_MODE_S to
12 REV_FCH_GATING_MODE_R.
- 13 + The mobile station shall set REV_PWR_CNTL_DELAY_S to
14 REV_PWR_CNTL_DELAY_R if REV_PWR_CNTL_DELAY_INCL_R is equal to
15 '1'.
- 16 + The mobile station shall set PLCM_TYPE_S to PLCM_TYPE_R if
17 PLCM_TYPE_INCL_R is equal to '1'; otherwise, the mobile station shall set
18 PLCM_TYPE_S as follows:
- 19 o If P_REV_IN_USE_S is less than 11, set PLCM_TYPE_S to '0000';
20 otherwise set PLCM_TYPE_S to '0100'.
- 21 + The mobile station shall set PLCM_39_S to PLCM_39_R if PLCM_TYPE_R is
22 equal to '0001'.
- 23 + If the mobile station is currently monitoring the Paging Channel, the
24 mobile station shall set IDLE_BCCH_CHAN to '0'; otherwise, the mobile
25 station shall set IDLE_BCCH_CHAN to '1'. The mobile station shall set
26 IDLE_CDMA_CHAN to CDMACH_S, IDLE_CDMABAND to CDMABAND_S,
27 IDLE_SID to SID_S, IDLE_NID to NID_S, and IDLE_P_REV to P_REV_S.
- 28 + The mobile station shall then enter the *Traffic Channel Initialization*
29 *Substate of the Mobile Station Control on the Traffic Channel State.*
- 30 - If FREQ_INCL_R equals '1', and the band class is not supported by the mobile
31 station, the mobile station shall send a *Mobile Station Reject Order* with
32 ORDQ field set to '00000110' (capability not supported by the mobile
33 station) and remain in the current state.
- 34 - If FREQ_INCL_R equals '1', and the band class is supported by the mobile
35 station, the mobile station shall perform the following actions:

- 1 + The mobile station shall store the frame offset ($FRAME_OFFSET_S =$
2 $FRAME_OFFSET_R$); the message encryption mode indicator
3 ($ENCRYPT_MODE_S = ENCRYPT_MODE_R$); the bypass indicator
4 ($BYPASS_ALERT_ANSWER_S = BYPASS_ALERT_ANSWER_R$); the granted
5 mode ($GRANTED_MODE_S = GRANTED_MODE_R$); the default
6 configuration ($DEFAULT_CONFIG_S = DEFAULT_CONFIG_R$); the idle
7 Frequency Assignment ($IDLE_CDMA_CHAN = CDMACH_S$); the idle band
8 class ($IDLE_CDMABAND = CDMABAND_S$); the band class ($CDMABAND_S$
9 $= BAND_CLASS_R$); the Frequency Assignment
10 ($CDMACH_S = CDMA_FREQ_R$); and the occurrences of PILOT_PN and
11 PWR_COMB_IND for each included member of the Active Set.
- 12 + The mobile station shall perform the procedures in 2.6.11.2.
- 13 + The mobile station shall set $FPC_FCH_INIT_SETPT_S$ to
14 $FPC_FCH_INIT_SETPT_R$, $FPC_FCH_CURR_SETPT_S$ to
15 $FPC_FCH_INIT_SETPT_S$, $FPC_FCH_FER_S$ to $FPC_FCH_FER_R$,
16 $FPC_FCH_MIN_SETPT_S$ to $FPC_FCH_MIN_SETPT_R$,
17 $FPC_FCH_MAX_SETPT_S$ to $FPC_FCH_MAX_SETPT_R$, and $FPC_PRI_CHAN_S$
18 to '0' if the mobile station supports any Radio Configuration greater than
19 2.
- 20 + The mobile station shall set $FPC_SUBCHAN_GAIN_S$ to
21 $FPC_SUBCHAN_GAIN_R$.
- 22 + The mobile station shall set $RLGAIN_ADJ_S$ to $RLGAIN_ADJ_R$.
- 23 + The mobile station shall set $REV_FCH_GATING_MODE_S$ to
24 $REV_FCH_GATING_MODE_R$.
- 25 + The mobile station shall set $REV_PWR_CNTL_DELAY_S$ to
26 $REV_PWR_CNTL_DELAY_R$ if $REV_PWR_CNTL_DELAY_INCL_R$ is equal to
27 '1'.
- 28 + The mobile station shall set $PLCM_TYPE_S$ to $PLCM_TYPE_R$ if
29 $PLCM_TYPE_INCL_R$ is equal to '1'; otherwise, the mobile station shall set
30 $PLCM_TYPE_S$ as follows:
- 31 ○ If $P_REV_IN_USE_S$ is less than 11, set $PLCM_TYPE_S$ to '0000';
32 otherwise set $PLCM_TYPE_S$ to '0100'.
- 33 + The mobile station shall set $PLCM_39_S$ to $PLCM_39_R$ if $PLCM_TYPE_R$ is
34 equal to '0001'.
- 35 + The mobile station shall initialize CODE_CHAN_LIST as described in
36 2.6.8, and shall set SERV_NEG_S to enabled.
- 37 + If the mobile station is currently monitoring the Paging Channel, the
38 mobile station shall set IDLE_BCCH_CHAN to '0'; otherwise, the mobile
39 station shall set IDLE_BCCH_CHAN to '1'. The mobile station shall set
40 IDLE_SID to SID_S , IDLE_NID to NID_S , and IDLE_P_REV to P_REV_S .

- 1 + The mobile station shall then tune to the new Frequency Assignment and
2 shall enter the *Traffic Channel Initialization Substate* of the *Mobile Station*
3 *Control on the Traffic Channel State*.
- 4 • If ASSIGN_MODE_r equals '001', the mobile station shall perform the following
5 actions:
- 6 - If FREQ_INCL_r equals '0', the mobile station shall perform the following
7 actions:
- 8 + If the message requires acknowledgment, the mobile station shall wait
9 until Layer 3 receives an indication from Layer 2 that the
10 acknowledgment to the message has been sent and acknowledged.
- 11 + The mobile station shall set CONFIG_MSG_SEQ_s and ACC_MSG_SEQ_s to
12 NULL (see 2.6.2.2) and shall set PILOT_PN_s to the pilot PN sequence
13 offset of the strongest pilot in the list (PILOT_PN_r).
- 14 + If the mobile station has not stored configuration parameters for the
15 Primary Paging Channel of the new base station, or if the stored
16 information is not current (see 2.6.2.2), the mobile station shall set
17 SYS_PAR_MSG_SEQ_s, NGHBR_LST_MSG_SEQ_s,
18 EXT_NGHBR_LST_MSG_SEQ_s, GEN_NGHBR_LST_MSG_SEQ_s,
19 USER_ZONE_ID_MSG_SEQ_s, PRI_NGHBR_LST_MSG_SEQ_s
20 CHAN_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
21 FD_CHAN_LST_MSG_SEQ_s EXT_SYS_PAR_MSG_SEQ_s,
22 GLOB_SERV_REDIR_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s,
23 AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s,
24 FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s and
25 EXT_GLOB_SERV_REDIR_MSG_SEQ_s to NULL.
- 26 + The mobile station shall set PAGE_CHAN_s to '1' and PAGECH_s to the
27 Primary Paging Channel. If the mobile station was monitoring the
28 Forward Common Control Channel, the mobile station shall set the
29 PRAT_s to '00'. The mobile station shall then begin monitoring the
30 Primary Paging Channel of the selected base station.
- 31 + If RESPOND_r is equal to '1', the mobile station shall perform the
32 following:
- 33 ○ If the *Extended Channel Assignment Message* does not require an
34 acknowledgment, the mobile station shall enter the *Update Overhead*
35 *Information Substate* with a page response retransmission indication
36 within T_{34m} seconds after receiving the *Extended Channel*
37 *Assignment Message*.

- 1 ○ If the *Extended Channel Assignment Message* requires an
2 acknowledgment, the mobile station shall enter the *Update Overhead*
3 *Information Substate* with a page response retransmission indication
4 within T_{34m} seconds after Layer 3 receives an indication from Layer
5 2 that the acknowledgment to the *Extended Channel Assignment*
6 *Message* has been sent and acknowledged.
- 7 + If $RESPOND_r$ is equal to '0', the mobile station shall perform the
8 following:
- 9 ○ If the *Extended Channel Assignment Message* does not require an
10 acknowledgment, the mobile station shall enter the *Mobile Station Idle*
11 *State* within T_{34m} seconds after receiving the *Extended Channel*
12 *Assignment Message*.
- 13 ○ If the *Extended Channel Assignment Message* requires an
14 acknowledgment, the mobile station shall enter the *Mobile Station Idle*
15 *State* within T_{34m} seconds after Layer 3 receives an indication from
16 Layer 2 that the acknowledgment to the *Extended Channel*
17 *Assignment Message* has been sent and acknowledged.
- 18 - If $FREQ_INCL_r$ equals '1', and the band class is not supported by the mobile
19 station, the mobile station shall send a *Mobile Station Reject Order* with
20 ORDQ field set to '00000110' (capability not supported by the mobile
21 station) and remain in the current state.
- 22 - If $FREQ_INCL_r$ equals '1', and the band class is supported by the mobile
23 station, the mobile station shall perform the following actions:
- 24 + If the message requires acknowledgment, the mobile station shall wait
25 until Layer 3 receives an indication from Layer 2 that the
26 acknowledgment to the message has been sent and acknowledged.
- 27 + The mobile station shall set $CDMACH_s$ to $CDMA_FREQ_r$ and
28 $CDMABAND_s$ to $BAND_CLASS_r$. Then the mobile station shall tune to
29 the new Frequency Assignment, measure the strength of each pilot listed
30 in the assignment using the Neighbor Set search procedures specified in
31 2.6.6.2.1 and 2.6.6.2.2, set $PILOT_PN_s$ to the pilot PN sequence offset of
32 the strongest pilot in the list ($PILOT_PN_r$), and set $CONFIG_MSG_SEQ_s$
33 and $ACC_MSG_SEQ_s$ to NULL (see 2.6.2.2).

- 1 + If the mobile station has not stored configuration parameters for the
2 Primary Paging Channel of the new base station, or if the stored
3 information is not current (see 2.6.2.2), the mobile station shall set
4 SYS_PAR_MSG_SEQ_s, NGHBR_LST_MSG_SEQ_s,
5 EXT_NGHBR_LST_MSG_SEQ_s, GEN_NGHBR_LST_MSG_SEQ_s,
6 USER_ZONE_ID_MSG_SEQ_s, PRI_NGHBR_LST_MSG_SEQ_s
7 CHAN_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
8 FD_CHAN_LST_MSG_SEQ_s, EXT_SYS_PAR_MSG_SEQ_s,
9 GLOB_SERV_REDIR_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s,
10 AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s,
11 FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s and
12 EXT_GLOB_SERV_REDIR_MSG_SEQ_s to NULL.
- 13 + The mobile station shall set PAGE_CHAN_s to '1' and PAGECH_s to the
14 Primary Paging Channel. If the mobile station was monitoring Forward
15 Common Control Channel, the mobile station shall set the PRAT_s to '00'.
16 The mobile station shall then begin monitoring the Primary Paging
17 Channel of the selected base station.
- 18 + If RESPOND_r is equal to '1', the mobile station shall perform the
19 following:
- 20 ○ If the *Extended Channel Assignment Message* does not require an
21 acknowledgment, the mobile station shall enter the *Update Overhead*
22 *Information Substate* with a page response retransmission indication
23 within T_{34m} seconds after receiving the *Extended Channel*
24 *Assignment Message*.
- 25 ○ If the *Extended Channel Assignment Message* requires an
26 acknowledgment, the mobile station shall enter the *Update Overhead*
27 *Information Substate* with a page response retransmission indication
28 within T_{34m} seconds after Layer 3 receives an indication from Layer
29 2 that the acknowledgment to the *Extended Channel Assignment*
30 *Message* has been sent and acknowledged.
- 31 + If RESPOND_r is equal to '0', the mobile station shall perform the
32 following:
- 33 ○ If the *Extended Channel Assignment Message* does not require an
34 acknowledgment, the mobile station shall enter the *Mobile Station Idle*
35 *State* within T_{34m} seconds after receiving the *Extended Channel*
36 *Assignment Message*.
- 37 ○ If the *Extended Channel Assignment Message* requires an
38 acknowledgment, the mobile station shall enter the *Mobile Station Idle*
39 *State* within T_{34m} seconds after Layer 3 receives an indication from
40 Layer 2 that the acknowledgment to the *Extended Channel*
41 *Assignment Message* has been sent and acknowledged.
- 42 • If ASSIGN_MODE_r equals '100', the mobile station shall perform the following
43 actions:

- 1 - If PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled
2 and PACA_CANCEL to '0', shall disable the PACA state timer, and should
3 indicate to the user that the PACA call has been canceled.
- 4 - If GRANTED_MODE_R equals '00' and the multiplex option and radio
5 configuration specified in the DEFAULT_CONFIG_R field are not supported by
6 the mobile station, the mobile station shall send a *Mobile Station Reject Order*
7 with ORDQ field set to '00000110' (capability not supported by the mobile
8 station) and shall remain in the current state.
- 9 - If GRANTED_MODE_R equals '11', P_REV_IN_USE_S is less than 11, and the
10 mobile station did not include a SYNC_ID field in the *Page Response*
11 *Message* or *Reconnect Message* that was transmitted in this substate, the
12 mobile station shall send a *Mobile Station Reject Order* with ORDQ field set to
13 '00000110' (capability not supported by the mobile station) and shall remain
14 in the current state.
- 15 - If SYNC_ID_INCL_R is included and equals '1', and the mobile station does not
16 have a stored service configuration corresponding to SYNC_ID_R for the
17 current SID_S and NID_S pair, the mobile station shall send a *Mobile Station*
18 *Reject Order* with ORDQ field set to '00011011' (Requested stored service
19 configuration is not available) and shall remain in the current state.
- 20 - If GRANTED_MODE_R equals '11', SR_ID_RESTORE_R is not equal to '111', and
21 a service option connection record corresponding to SR_ID_RESTORE_R is not
22 contained in the stored service configuration, the mobile station shall send a
23 *Mobile Station Reject Order* with ORDQ field set to '00000110' (capability not
24 supported by the mobile station) and shall remain in the current state.
- 25 - If GRANTED_MODE_R equals '00' and DEFAULT_CONFIG_R is not equal to
26 '100', the mobile station shall send a *Mobile Station Reject Order* with ORDQ
27 field set to '00001110' (RC does not match with DEFAULT_CONFIG) and
28 shall remain in the current state if one of the following conditions is true:
- 29 + FOR_RC_R is not equal to the RC associated with DEFAULT_CONFIG_R as
30 specified in Table 3.7.2.3.2.21-2.
- 31 + REV_RC_R is not equal to the RC associated with DEFAULT_CONFIG_R as
32 specified in Table 3.7.2.3.2.21-2.
- 33 - If the mobile station does not support either of the Radio Configurations
34 (FOR_RC or REV_RC), the mobile station shall send a *Mobile Station Reject*
35 *Order* with the ORDQ field set to '00000110' (capability not supported by the
36 mobile station) and remain in the current state.
- 37 - If CH_IND_R = '01' and the mobile station does not support Fundamental
38 Channel, the mobile station shall send a *Mobile Station Reject Order* with the
39 ORDQ field set to '00000110' (capability not supported by the mobile
40 station) and remain in the current state.
- 41 - If CH_IND_R = '10' and the mobile station does not support the Dedicated
42 Control Channel, the mobile station shall send a *Mobile Station Reject Order*

- 1 with the ORDQ field set to '00000110' (capability not supported by the
2 mobile station) and remain in the current state.
- 3 - If CH_IND_r = '11' and the mobile station does not support the Dedicated
4 Control
5 Channel and Fundamental Channel concurrently, the mobile station shall
6 send a *Mobile Station Reject Order* with the ORDQ field set to '00000110'
7 (capability not supported by the mobile station) and remain in the current
8 state.
- 9 - If FREQ_INCL_r equals '1' and if the band class (BAND_CLASS_r) is not
10 supported by the mobile station, the mobile station shall send a *Mobile
11 Station Reject Order* with ORDQ field set to '00000110' (capability not
12 supported by the mobile station) and remain in the current state.
- 13 - If PLCM_TYPE_r equals '0010' and IMSI_O is derived from IMSI_T, or if
14 PLCM_TYPE_r equals '0011' and IMSI_O is derived from IMSI_M, the mobile
15 station shall send a *Mobile Station Reject Order* with the ORDQ field set to
16 '00011100' (PLCM_TYPE mismatch) and remain in the current state.
- 17 - If FUNDICATED_BCNC_IND_r equals '1', and the mobile station does not
18 support BCNC reception on the Forward Fundicated Channels assigned in
19 this message, the mobile station shall send a *Mobile Station Reject Order* with
20 the ORDQ field set to '00000110' (capability not supported by the mobile
21 station) and remain in the current state.
- 22 - If the mobile station does not send a Mobile Station Reject Order as specified
23 above, it shall continue to perform the actions specified below.
- 24 - The mobile station shall set
- 25 + IDLE_CDMABAND = CDMABAND_s
- 26 + IDLE_CDMACH = CDMACH_s
- 27 - If FREQ_INCL_r equals '1', the mobile station shall set
- 28 + CDMABAND_s = BAND_CLASS_r
- 29 + CDMACH_s = CDMA_FREQ_r
- 30 - The mobile station shall store the bypass indicator
31 (BYPASS_ALERT_ANSWER_s = BYPASS_ALERT_ANSWER_r).
- 32 - The mobile station shall store granted mode (GRANTED_MODE_s =
33 GRANTED_MODE_r). If GRANTED_MODE_r equals '11', the mobile station
34 shall perform the following:
- 35 + The mobile station shall store the service reference to be restored
36 (SR_ID_RESTORE_s = SR_ID_RESTORE_r).
- 37 + If SR_ID_RESTORE_r equals '000', the mobile station shall store bitmap of
38 service reference identifiers to be restored (SR_ID_RESTORE_BITMAP_s =
39 SR_ID_RESTORE_BITMAP_r).

- 1 + If SYNC_ID_INCL_T is included and equals '1', the mobile station shall
2 store the service configuration synchronization identifier (SYNC_ID_S =
3 SYNC_ID_T).
- 4 - The mobile station shall store the default configuration (DEFAULT_CONFIG_S
5 = DEFAULT_CONFIG_T).
- 6 - The mobile station shall store the Forward Traffic Channel Radio
7 Configuration (FOR_RC_S = FOR_RC_T) and the Reverse Traffic Channel Radio
8 Configuration (REV_RC_S = REV_RC_T).
- 9 - The mobile station shall store the frame offset (FRAME_OFFSET_S =
10 FRAME_OFFSET_T).
- 11 - The mobile station shall store the message encryption mode indicator
12 (ENCRYPT_MODE_S = ENCRYPT_MODE_T).
- 13 - The mobile station shall perform the procedures in 2.6.11.2.
- 14 - The mobile station shall store the Forward power control subchannel relative
15 gain [FPC_SUBCHAN_GAIN_S = FPC_SUBCHAN_GAIN_T].
- 16 - The mobile station shall set RLGAIN_ADJ_S to RLGAIN_ADJ_T.
- 17 - The mobile station shall set PLCM_TYPE_S to PLCM_TYPE_T if
18 PLCM_TYPE_INCL_T is equal to '1'; otherwise, the mobile station shall set
19 PLCM_TYPE_S as follows:
- 20 + If P_REV_IN_USE_S is less than 11, set PLCM_TYPE_S to '0000'; otherwise
21 set PLCM_TYPE_S to '0100'.
- 22 - The mobile station shall set PLCM_39_S to PLCM_39_T if PLCM_TYPE_T is equal
23 to '0001'.
- 24 - If FIXED_PREAMBLE_TRANSMIT_IND_T is included, the mobile station shall
25 set FIXED_PREAMBLE_TRANSMIT_IND_S to
26 FIXED_PREAMBLE_TRANSMIT_IND_T; otherwise, the mobile station shall set
27 FIXED_PREAMBLE_TRANSMIT_IND_S to '0'. If
28 FIXED_PREAMBLE_TRANSMIT_IND_S equals '1', the mobile station shall set
29 FIXED_NUM_PREAMBLE_S to FIXED_NUM_PREAMBLE_T.
- 30 - The mobile station shall set REV_FCH_GATING_MODE_S to
31 REV_FCH_GATING_MODE_T.
- 32 - The mobile station shall set REV_PWR_CNTL_DELAY_S to
33 REV_PWR_CNTL_DELAY_T if REV_PWR_CNTL_DELAY_INCL_T is equal to '1'.
- 34 - If 3XFL_1XRL_INCL_T is equal to '1', the mobile station shall set
35 1XRL_FREQ_OFFSET_S to 1XRL_FREQ_OFFSET_T.
- 36 - If DIRECT_CH_ASSIGN_IND_T is equal to '1', the mobile station shall perform
37 the following:
- 38 + The mobile station shall set RTC_NOM_PWR_S to RTC_NOM_PWR_T.

- 1 + If the mobile station has not received confirmation of delivery of the *Page*
2 *Response Message* or the *Reconnect Message* sent in this substate, the
3 mobile station shall perform the following:
- 4 ○ Set RTC_NOM_PWR_USE_IND to '1'.
5 ○ Set DIRECT_CH_ASSIGN_RECOVER_IND_s to
6 DIRECT_CH_ASSIGN_RECOVER_IND_r
- 7 - The mobile station shall set EARLY_RL_TRANSMIT_IND_s to
8 EARLY_RL_TRANSMIT_IND_r.
- 9 - If TX_PWR_LIMIT_INCL_r is set to '1', the mobile station shall perform the
10 following:
- 11 + If the mobile station is being assigned to operate in the 1915MHz –
12 1920MHz block of the PCS band, the mobile station shall store the
13 transmit power limit TX_PWR_LIMIT_s = (TX_PWR_LIMIT_r - 30dB);
- 14 + Otherwise, the mobile station shall set TX_PWR_LIMIT_s to the limit
15 defined in [11] for the target base station.
- 16 - The mobile station shall store the channel indicator (CH_IND_s = CH_IND_r)
17 and the mobile station shall perform the following actions:
- 18 + If CH_IND_r equals '01', the mobile station shall set
19 FPC_FCH_INIT_SETPT_s to FPC_FCH_INIT_SETPT_r,
20 FPC_FCH_CURR_SETPT_s to FPC_FCH_INIT_SETPT_s, FPC_FCH_FER_s to
21 FPC_FCH_FER_r, FPC_FCH_MIN_SETPT_s to FPC_FCH_MIN_SETPT_r,
22 FPC_FCH_MAX_SETPT_s to FPC_FCH_MAX_SETPT_r, and FPC_PRI_CHAN_s
23 to '0' if the mobile station supports any Radio Configuration greater than
24 2. Then for each included member of the Active Set, the mobile station
25 shall store the following:
- 26 ○ Set the PILOT_PN field to PILOT_PN_r.
- 27 ○ Set the ADD_PILOT_REC_INCL field to ADD_PILOT_REC_INCL_r. If
28 ADD_PILOT_REC_INCL_r equals '1', the mobile station shall store the
29 following:
- 30 ◇ Set the PILOT_REC_TYPE field of PILOT_REC to
31 PILOT_REC_TYPE_r.
- 32 ◇ If PILOT_REC_TYPE_r equals '000', the mobile station shall set the
33 TD_POWER_LEVEL field of PILOT_REC to TD_POWER_LEVEL_r
34 and set the TD_MODE field of PILOT_REC to TD_MODE_r.
- 35 ◇ If PILOT_REC_TYPE_r is equal to '001', the mobile station shall.
- 36 — Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
- 37 — Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
38 AUX_PILOT_WALSH_r with the Walsh Code length specified by
39 WALSH_LENGTH_r.

- 1 ◇ If PILOT_REC_TYPE_r is equal to '010', the mobile station shall:
- 2 – Set the AUX_PILOT_TD_QOF field of PILOT_REC to QOF_r.
- 3 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
- 4 AUX_WALSH_r with the Walsh Code length specified by
- 5 WALSH_LENGTH_r.
- 6 – Set the AUX_TD_POWER_LEVEL field of PILOT_REC to
- 7 AUX_TD_POWER_LEVEL_r.
- 8 – Set the TD_MODE field of NGHBR_PILOT_REC to TD_MODE_r.
- 9 ◇ If PILOT_REC_TYPE_r is equal to '011', the mobile station shall:
- 10 – Set the SR3_PRIMARY_PILOT field of PILOT_REC to
- 11 SR3_PRIMARY_PILOT_r.
- 12 – Set the SR3_PILOT_POWER1 field of PILOT_REC to
- 13 SR3_PILOT_POWER1_r.
- 14 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
- 15 SR3_PILOT_POWER2_r.
- 16 ◇ If PILOT_REC_TYPE_r is equal to '100', the mobile station shall:
- 17 – Set the SR3_PRIMARY_PILOT field of PILOT_REC to
- 18 SR3_PRIMARY_PILOT_r.
- 19 – Set the SR3_PILOT_POWER1 field of PILOT_REC to
- 20 SR3_PILOT_POWER1_r.
- 21 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
- 22 SR3_PILOT_POWER2_r.
- 23 – Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
- 24 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
- 25 AUX_PILOT_WALSH_r with the Walsh Code length specified by
- 26 WALSH_LENGTH_r.
- 27 – If ADD_INFO_INCL1_r is equal to '1', set the AUX_PILOT_QOF1
- 28 field of PILOT_REC to QOF1_r and set the
- 29 AUX_PILOT_WALSH_CODE1 field of PILOT_REC to
- 30 AUX_PILOT_WALSH1_r with the Walsh Code length specified
- 31 by WALSH_LENGTH1_r.
- 32 – Otherwise, set the AUX_PILOT_QOF1 field of PILOT_REC to
- 33 QOF_r and set the AUX_PILOT_WALSH_CODE1 field of
- 34 PILOT_REC to AUX_PILOT_WALSH_r with the Walsh Code
- 35 length specified by WALSH_LENGTH_r.

- 1 – If ADD_INFO_INCL_{2r} is equal to ‘1’, set the AUX_PILOT_QOF2
- 2 field of PILOT_REC to QOF2_r and set the
- 3 AUX_PILOT_WALSH_CODE2 field of PILOT_REC to
- 4 AUX_PILOT_WALSH2_r with the Walsh Code length specified
- 5 by WALSH_LENGTH2_r.
- 6 – Otherwise, set the AUX_PILOT_QOF2 field of PILOT_REC to
- 7 QOF_r and set the AUX_PILOT_WALSH_CODE2 field of
- 8 PILOT_REC to AUX_PILOT_WALSH_r with the Walsh Code
- 9 length specified by WALSH_LENGTH_r.
- 10 ○ Set the PWR_COMB_IND field to PWR_COMB_IND_r.
- 11 ○ Set the CODE_CHAN_FCH field to CODE_CHAN_FCH_r.
- 12 ○ Set the QOF_MASK_ID_FCH field to QOF_MASK_ID_FCH_r.
- 13 + If CH_IND_r equals ‘01’ and 3X_FCH_INFO_INCL_r equals ‘1’, for each
- 14 included member of the Active Set, the mobile station store the following:
- 15 ○ If 3X_FCH_LOW_INCL_r equals ‘1’, set the QOF_MASK_ID_FCH_LOW
- 16 field to QOF_MASK_ID_FCH_LOW_r and the CODE_CHAN_FCH_LOW
- 17 field to CODE_CHAN_FCH_LOW_r. Otherwise, set the
- 18 QOF_MASK_ID_FCH_LOW field to QOF_MASK_ID_FCH_r and the
- 19 CODE_CHAN_FCH_LOW to CODE_CHAN_FCH_r.
- 20 ○ If 3X_FCH_HIGH_INCL_r equals ‘1’, set the QOF_MASK_ID_FCH_HIGH
- 21 field to QOF_MASK_ID_FCH_HIGH_r and the
- 22 CODE_CHAN_FCH_HIGH field to CODE_CHAN_FCH_HIGH_r.
- 23 Otherwise, set the QOF_MASK_ID_FCH_HIGH field to
- 24 QOF_MASK_ID_FCH_r and the CODE_CHAN_FCH_HIGH to
- 25 CODE_CHAN_FCH_r.
- 26 + If CH_IND_r equals ‘10’, the mobile station shall set
- 27 FPC_DCCH_INIT_SETPT_s to FPC_DCCH_INIT_SETPT_r,
- 28 FPC_DCCH_CURR_SETPT_s to FPC_DCCH_INIT_SETPT_s,
- 29 FPC_DCCH_FER_s to FPC_DCCH_FER_r, FPC_DCCH_MIN_SETPT_s to
- 30 FPC_DCCH_MIN_SETPT_r, FPC_DCCH_MAX_SETPT_s to
- 31 FPC_DCCH_MAX_SETPT_r, FUNDICATED_BCMC_IND_s to
- 32 FUNDICATED_BCMC_IND_r, and FPC_PRI_CHAN_s to ‘1’ if the mobile
- 33 station supports any Radio Configuration greater than 2. Then for each
- 34 included member of the Active Set, the mobile station shall store the
- 35 following:
- 36 ○ Set the PILOT_PN to PILOT_PN_r.
- 37 ○ Set the ADD_PILOT_REC_INCL field to ADD_PILOT_REC_INCL_r. If
- 38 ADD_PILOT_REC_INCL is equal to ‘1’, the mobile station shall store
- 39 the following:
- 40 ◇ Set the PILOT_REC_TYPE field of PILOT_REC to
- 41 PILOT_REC_TYPE_r.

- 1 ◇ If PILOT_REC_TYPE_r equals '000', the mobile station shall set the
2 TD_POWER_LEVEL field of PILOT_REC to TD_POWER_LEVEL_r
3 and set the TD_MODE field of PILOT_REC to TD_MODE_r.
- 4 ◇ If PILOT_REC_TYPE_r is equal to '001', the mobile station shall.
5 — Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
6 — Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
7 AUX_PILOT_WALSH_r with the Walsh Code length specified by
8 WALSH_LENGTH_r.
- 9 ◇ If PILOT_REC_TYPE_r is equal to '010', the mobile station shall:
10 — Set the AUX_PILOT_TD_QOF field of PILOT_REC to QOF_r.
11 — Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
12 AUX_WALSH_r with the Walsh Code length specified by
13 WALSH_LENGTH_r.
14 — Set the AUX_TD_POWER_LEVEL field of PILOT_REC to
15 AUX_TD_POWER_LEVEL_r.
16 — Set the TD_MODE field of PILOT_REC to TD_MODE_r.
- 17 ◇ If PILOT_REC_TYPE_r is equal to '011', the mobile station shall:
18 — Set the SR3_PRIMARY_PILOT field of PILOT_REC to
19 SR3_PRIMARY_PILOT_r.
20 — Set the SR3_PILOT_POWER1 field of PILOT_REC to
21 SR3_PILOT_POWER1_r.
22 — Set the SR3_PILOT_POWER2 field of PILOT_REC to
23 SR3_PILOT_POWER2_r.
- 24 ◇ If PILOT_REC_TYPE_r is equal to '100', the mobile station shall:
25 — Set the SR3_PRIMARY_PILOT field of PILOT_REC to
26 SR3_PRIMARY_PILOT_r.
27 — Set the SR3_PILOT_POWER1 field of PILOT_REC to
28 SR3_PILOT_POWER1_r.
29 — Set the SR3_PILOT_POWER2 field of PILOT_REC to
30 SR3_PILOT_POWER2_r.
31 — Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
32 — Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
33 AUX_PILOT_WALSH_r with the Walsh Code length specified by
34 WALSH_LENGTH_r.

- 1 + If CH_IND_r equals '10', and FUNDICATED_BCMC_IND_r equals '1', for
2 each included member of the Active Set, the mobile station shall store
3 the following:
- 4 ○ Set FOR_CPCCH_WALSH_s to FOR_CPCCH_WALSH_r.
 - 5 ○ Set FOR_CPCSCH_s to FOR_CPCSCH_r.
- 6 + If CH_IND_r equals '11', the mobile station shall set
7 FPC_FCCH_INIT_SETPT_s to FPC_FCH_INIT_SETPT_r,
8 FPC_FCH_CURR_SETPT_s to FPC_FCH_INIT_SETPT_s, FPC_FCH_FER_s to
9 FPC_FCH_FER_r, FPC_FCH_MIN_SETPT_s to FPC_FCH_MIN_SETPT_r,
10 FPC_FCH_MAX_SETPT_s to FPC_FCH_MAX_SETPT_r,
11 FPC_DCCH_INIT_SETPT_s to FPC_DCCH_INIT_SETPT_r,
12 FPC_DCCH_CURR_SETPT_s to FPC_DCCH_INIT_SETPT_s,
13 FPC_DCCH_FER_s to FPC_DCCH_FER_r, FPC_DCCH_MIN_SETPT_s to
14 FPC_DCCH_MIN_SETPT_r, FPC_DCCH_MAX_SETPT_s to
15 FPC_DCCH_MAX_SETPT_r, FPC_PRI_CHAN_s to FPC_PRI_CHAN_r, and
16 FUNDICATED_BCMC_IND_s to FUNDICATED_BCMC_IND_r. Then for each
17 included member of the Active Set, the mobile station shall store the
18 following:
- 19 ○ Set the PILOT_PN to PILOT_PN_r.
 - 20 ○ Set the ADD_PILOT_REC_INCL field to ADD_PILOT_REC. If
21 ADD_PILOT_REC_INCL is equal to '1', the mobile station shall store
22 the following:
 - 23 ◇ Set the PILOT_REC_TYPE field of PILOT_REC to
24 PILOT_REC_TYPE_r.
 - 25 ◇ If PILOT_REC_TYPE_r equals '000', the mobile station shall set the
26 TD_POWER_LEVEL field of PILOT_REC to TD_POWER_LEVEL_r
27 and set the TD_MODE field of PILOT_REC to TD_MODE_r.
 - 28 ◇ If PILOT_REC_TYPE_r is equal to '001', the mobile station shall:
 - 29 – Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
 - 30 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
31 AUX_PILOT_WALSH_r with the Walsh Code length specified by
32 WALSH_LENGTH_r.
 - 33 ◇ If PILOT_REC_TYPE_r is equal to '010', the mobile station shall:
 - 34 – Set the AUX_PILOT_TD_QOF field of PILOT_REC to QOF_r.
 - 35 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
36 AUX_WALSH_r with the Walsh Code length specified by
37 WALSH_LENGTH_r.
 - 38 – Set the AUX_TD_POWER_LEVEL field of PILOT_REC to
39 AUX_TD_POWER_LEVEL_r.

- 1 – Set the TD_MODE field of PILOT_REC to TD_MODE_r.
- 2 ◇ If PILOT_REC_TYPE_r is equal to ‘011’, the mobile station shall:
- 3 – Set the SR3_PRIMARY_PILOT field of PILOT_REC to
- 4 SR3_PRIMARY_PILOT_r.
- 5 – Set the SR3_PILOT_POWER1 field of PILOT_REC to
- 6 SR3_PILOT_POWER1_r.
- 7 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
- 8 SR3_PILOT_POWER2_r.
- 9 ◇ If PILOT_REC_TYPE_r is equal to ‘100’, the mobile station shall:
- 10 – Set the SR3_PRIMARY_PILOT field of PILOT_REC to
- 11 SR3_PRIMARY_PILOT_r.
- 12 – Set the SR3_PILOT_POWER1 field of PILOT_REC to
- 13 SR3_PILOT_POWER1_r.
- 14 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
- 15 SR3_PILOT_POWER2_r.
- 16 – Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
- 17 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
- 18 AUX_PILOT_WALSH_r with the Walsh Code length specified by
- 19 WALSH_LENGTH_r.
- 20 – If ADD_INFO_INCL1_r is equal to ‘1’, set the AUX_PILOT_QOF1
- 21 field of PILOT_REC to QOF1_r and set the
- 22 AUX_PILOT_WALSH_CODE1 field of PILOT_REC to
- 23 AUX_PILOT_WALSH1_r with the Walsh Code length specified
- 24 by WALSH_LENGTH1_r.
- 25 – Otherwise, set the AUX_PILOT_QOF1 field of PILOT_REC to
- 26 QOF_r and set the AUX_PILOT_WALSH_CODE1 field of
- 27 PILOT_REC to AUX_PILOT_WALSH_r with the Walsh Code
- 28 length specified by WALSH_LENGTH_r.
- 29 – If ADD_INFO_INCL2_r is equal to ‘1’, set the AUX_PILOT_QOF2
- 30 field of PILOT_REC to QOF2_r and set the
- 31 AUX_PILOT_WALSH_CODE2 field of PILOT_REC to
- 32 AUX_PILOT_WALSH2_r with the Walsh Code length specified
- 33 by WALSH_LENGTH2_r.
- 34 – Otherwise, set the AUX_PILOT_QOF2 field of PILOT_REC to
- 35 QOF_r and set the AUX_PILOT_WALSH_CODE2 field of
- 36 PILOT_REC to AUX_PILOT_WALSH_r with the Walsh Code
- 37 length specified by WALSH_LENGTH_r.
- 38 ○ Set the PWR_COMB_IND field to PWR_COMB_IND_r.
- 39 ○ Set the CODE_CHAN_FCH field to CODE_CHAN_FCH_r.

- 1 ○ Set the QOF_MASK_ID_FCH field to QOF_MASK_ID_FCH_r.
- 2 ○ Set the CODE_CHAN_DCCH field to CODE_CHAN_DCCH_r.
- 3 ○ Set the QOF_MASK_ID_DCCH field to QOF_MASK_ID_DCCH.
- 4 + If CH_IND_r equals '11' and 3X_FCH_INFO_INCL_r equals '1', for each
- 5 included member of the Active Set, the mobile station store the following:
- 6 ○ If 3X_FCH_LOW_INCL_r equals '1', set the QOF_MASK_ID_FCH_LOW
- 7 field to QOF_MASK_ID_FCH_LOW_r and the CODE_CHAN_FCH_LOW
- 8 field to CODE_CHAN_FCH_LOW_r. Otherwise, set the
- 9 QOF_MASK_ID_FCH_LOW field to QOF_MASK_ID_FCH_r and the
- 10 CODE_CHAN_FCH_LOW to CODE_CHAN_FCH_r.
- 11 ○ If 3X_FCH_HIGH_INCL_r equals '1', set the QOF_MASK_ID_FCH_HIGH
- 12 field to QOF_MASK_ID_FCH_HIGH_r and the
- 13 CODE_CHAN_FCH_HIGH field to CODE_CHAN_FCH_HIGH_r.
- 14 Otherwise, set the QOF_MASK_ID_FCH_HIGH field to
- 15 QOF_MASK_ID_FCH_r and the CODE_CHAN_FCH_HIGH to
- 16 CODE_CHAN_FCH_r.
- 17 + If CH_IND_r equals '11' and 3X_DCCH_INFO_INCL_r equals '1', for each
- 18 included member of the Active Set, the mobile station store the following:
- 19 ○ If 3X_DCCH_LOW_INCL_r equals '1', set the
- 20 QOF_MASK_ID_DCCH_LOW field to QOF_MASK_ID_DCCH_LOW_r
- 21 and the CODE_CHAN_DCCH_LOW field to
- 22 CODE_CHAN_DCCH_LOW_r. Otherwise, set the
- 23 QOF_MASK_ID_DCCH_LOW field to QOF_MASK_ID_FCH_r and the
- 24 CODE_CHAN_DCCH_LOW to CODE_CHAN_FCH_r.
- 25 ○ If 3X_DCCH_HIGH_INCL_r equals '1', set the
- 26 QOF_MASK_ID_DCCH_HIGH field to QOF_MASK_ID_DCCH_HIGH_r
- 27 and the CODE_CHAN_DCCH_HIGH field to
- 28 CODE_CHAN_DCCH_HIGH_r. Otherwise, set the
- 29 QOF_MASK_ID_DCCH_HIGH field to QOF_MASK_ID_FCH_r and the
- 30 CODE_CHAN_DCCH_HIGH to CODE_CHAN_FCH_r.
- 31 + If CH_IND_r equals '11' and FUNDICATED_BCMC_IND_r equals '1', the
- 32 mobile station shall store the following:
- 33 ○ Set REV_FCH_ASSIGNED_s to REV_FCH_ASSIGNED_r.
- 34 + If CH_IND_r equals '11' and FUNDICATED_BCMC_IND_r equals '1', the
- 35 mobile station shall set FCH_BCMC_IND to '1'; otherwise, the mobile
- 36 station shall set FCH_BCMC_IND to '0'.
- 37 + If CH_IND_r equals '11' and FUNDICATED_BCMC_IND_r equals '1' and
- 38 FOR_CPCCH_INFO_INCL_r is included and is set to '1', for each included
- 39 member of the Active Set, the mobile station shall store the following:
- 40 ○ Set FOR_CPCCH_WALSH_s to FOR_CPCCH_WALSH_r.

- 1 ○ Set FOR_CPCSCH_S to FOR_CPCSCH_T.
- 2 + If CH_IND_T equals '11' and FUNDICATED_BCNC_IND_T equals '1' and
- 3 ADD_PLCM_FOR_FCH_INCL_T is included and is set to '1', the mobile
- 4 station shall store the following:
- 5 ○ Set ADD_PLCM_FOR_FCH_TYPE_S to ADD_PLCM_FOR_FCH_TYPE_T.
- 6 ○ Set ADD_PLCM_FOR_FCH_39_S to ADD_PLCM_FOR_FCH_39_T if
- 7 ADD_PLCM_FOR_FCH_TYPE_T is equal to '1'.
- 8 - The mobile station shall initialize CODE_CHAN_LIST as described in 2.6.8,
- 9 and shall set SERV_NEG_S to enabled.
- 10 - If the mobile station is currently monitoring the Paging Channel, the mobile
- 11 station shall set IDLE_BCCH_CHAN to '0'; otherwise, the mobile station shall
- 12 set IDLE_BCCH_CHAN to '1'. The mobile station shall set IDLE_SID to SID_S,
- 13 IDLE_NID to NID_S, and IDLE_P_REV to P_REV_S.
- 14 - If FREQ_INCL_T equals '1', the mobile station shall then tune to the new
- 15 frequency assignment.
- 16 - If DIRECT_CH_ASSIGN_IND_T is equal to '1' and RESPOND_IND_T is equal to
- 17 '1', the mobile station shall perform the following:
- 18 + If the mobile station is in *Mobile Station Idle State*, then the mobile
- 19 station shall enter the *Update Overhead Information Substate* of the
- 20 *System Access State* (see 2.6.3.2) with a direct channel assignment
- 21 respond indication within T_{33m} seconds after the *Extended Channel*
- 22 *Assignment Message* is received; otherwise, the mobile station shall enter
- 23 the *Page Response Substate* with a direct channel assignment respond
- 24 indication.
- 25 Otherwise, the mobile station shall enter the *Traffic Channel Initialization*
- 26 *Substate* of the *Mobile Station Control on the Traffic Channel State*.
- 27 • If ASSIGN_MODE_T equals '101', the mobile station shall perform the following
- 28 actions:
- 29 - If PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled
- 30 and PACA_CANCEL to '0', shall disable the PACA state timer, and should
- 31 indicate to the user that the PACA call has been canceled.
- 32 - If GRANTED_MODE_T equals '11', P_REV_IN_USE_S is less than 11, and the
- 33 mobile station did not include a SYNC_ID field in the *Page Response*
- 34 *Message* or *Reconnect Message* that was transmitted in this substate, the
- 35 mobile station shall send a *Mobile Station Reject Order* with ORDQ field set to
- 36 '00000110' (capability not supported by the mobile station) and shall remain
- 37 in this state.
- 38 - If GRANTED_MODE_T equals '11', SR_ID_RESTORE_T is not equal to '111', and
- 39 a service option connection record corresponding to SR_ID_RESTORE_T or
- 40 SR_ID_RESTORE_BITMAP_T is not contained in the stored service

- 1 configuration, the mobile station shall send a *Mobile Station Reject Order*
 2 with ORDQ field set to '00000110' (capability not supported by the mobile
 3 station) and shall remain in the current state,.
- 4 - If SYNC_ID_INCL_r is included and equals '1', and the mobile station does not
 5 have stored service configuration corresponding to SYNC_ID_r for the current
 6 SID_s and NID_s pair, the mobile station shall send a *Mobile Station Reject*
 7 *Order* with ORDQ field set to '00011011' (Requested stored service
 8 configuration is not available) and shall remain in the current state.
 - 9 - If the mobile station does not support any of the specified Radio
 10 Configurations (FOR_PDCH_RC, FOR_FCH_DCCH_RC or
 11 REV_FCH_DCCH_RC), the mobile station shall send a *Mobile Station Reject*
 12 *Order* with the ORDQ field set to '00000110' (capability not supported by the
 13 mobile station) and remain in the current state.
 - 14 - If EXT_CH_IND_r signals the allocation of a F-FCH or R-FCH and the mobile
 15 station does not support the Fundamental Channel, the mobile station shall
 16 send a *Mobile Station Reject Order* with the ORDQ field set to '00000110'
 17 (capability not supported by the mobile station) and remain in the current
 18 state.
 - 19 - If EXT_CH_IND_r signals the allocation of a F-DCCH or R-DCCH and the
 20 mobile station does not support the Dedicated Control Channel, the mobile
 21 station shall send a *Mobile Station Reject Order* with the ORDQ field set to
 22 '00000110' (capability not supported by the mobile station) and remain in
 23 the current state.
 - 24 - If FREQ_INCL_r equals '1' and if the band class (BAND_CLASS_r) is not
 25 supported by the mobile station, the mobile station shall send a *Mobile*
 26 *Station Reject Order* with ORDQ field set to '00000110' (capability not
 27 supported by the mobile station) and remain in the current state.
 - 28 - If PLCM_TYPE_r equals '0010' and IMSI_O is derived from IMSI_T, or if
 29 PLCM_TYPE_r equals '0011' and IMSI_O is derived from IMSI_M, the mobile
 30 station shall send a *Mobile Station Reject Order* with the ORDQ field set to
 31 '00011100' (PLCM_TYPE mismatch) and remain in the current state.
 - 32 - If FUNDICATED_BCNC_IND_r equals '1', and the mobile station does not
 33 support BCNC reception on the Forward Fundicated Channels assigned in
 34 this message, the mobile station shall send a *Mobile Station Reject Order* with
 35 the ORDQ field set to '00000110' (capability not supported by the mobile
 36 station) and remain in the current state.
 - 37 - If the mobile station does not send a *Mobile Station Reject Order* as specified
 38 above, it shall continue to perform the actions specified below.
 - 39 - Layer 3 shall send SIG-HandoffPDCH.Indication (handoff_type = ASSIGN) to
 40 the MAC layer.
 - 41 - If FREQ_INCL_r equals '1', the mobile station shall set

- 1 + CDMABAND_S = BAND_CLASS_T
- 2 + CDMACH_S = CDMA_FREQ_T
- 3 - The mobile station shall store the bypass indicator
4 (BYPASS_ALERT_ANSWER_S = BYPASS_ALERT_ANSWER_T).
- 5 - The mobile station shall store the granted mode indicator
6 (GRANTED_MODE_S = GRANTED_MODE_T). Furthermore, if
7 GRANTED_MODE_T equals '11', the mobile station shall store service
8 reference to be restored (SR_ID_RESTORE_S = SR_ID_RESTORE_T).
- 9 - If SR_ID_RESTORE_T equals '000', the mobile station shall store bitmap of
10 service reference identifiers to be restored (SR_ID_RESTORE_BITMAP_S =
11 SR_ID_RESTORE_BITMAP_T).
- 12 - If SYNC_ID_INCL_T is included and equals '1', the mobile station shall store
13 the service configuration synchronization identifier (SYNC_ID_S = SYNC_ID_T).
- 14 - The mobile station shall store the frame offset (FRAME_OFFSET_S =
15 FRAME_OFFSET_T).
- 16 - The mobile station shall store the message encryption mode indicator
17 (ENCRYPT_MODE_S = ENCRYPT_MODE_T).
- 18 - The mobile station shall perform the following procedures in the order listed
19 below:
- 20 + If D_SIG_ENCRYPT_MODE_T is included, the mobile station shall perform
21 the following:
- 22 ○ If D_SIG_ENCRYPT_MODE_T is equal to '000', the mobile station shall
23 set D_SIG_ENCRYPT_MODE_S to C_SIG_ENCRYPT_MODE_S;
24 otherwise, the mobile station shall set D_SIG_ENCRYPT_MODE_S to
25 D_SIG_ENCRYPT_MODE_T, ENC_KEY_S to the most recently generated
26 CMEAKEY in the mobile station associated with AUTHR of the *Page*
27 *Response Message*, and EXT_ENCRYPT_SEQ[0] and
28 EXT_ENCRYPT_SEQ[1] to 256 × ENC_SEQ_H (the ENC_SEQ_H field
29 in the *Page Response Message*).
- 30 + If ENC_KEY_SIZE_T is included, the mobile station shall set
31 ENC_KEY_SIZE_S to ENC_KEY_SIZE_T.
- 32 + If C_SIG_ENCRYPT_MODE is included, the mobile station shall set
33 C_SIG_ENCRYPT_MODE_S to C_SIG_ENCRYPT_MODE_T.
- 34 - The mobile station shall set EXT_CH_IND_S to EXT_CH_IND_T.
- 35 - The mobile station shall set CH_IND_S to '00'.
- 36 - If EXT_CH_IND_T signals the allocation of a F-FCH or a F-DCCH, the mobile
37 station shall store the Forward power control subchannel relative gain
38 [FPC_SUBCHAN_GAIN_S = FPC_SUBCHAN_GAIN_T].
- 39 - The mobile station shall set RLGAIN_ADJ_S to RLGAIN_ADJ_T.

- 1 - The mobile station shall set $PLCM_TYPE_S$ to $PLCM_TYPE_R$ if
2 $PLCM_TYPE_INCL_R$ is equal to '1'; otherwise, the mobile station shall set
3 $PLCM_TYPE_S$ as follows:
- 4 + If $P_REV_IN_USE_S$ is less than 11, set $PLCM_TYPE_S$ to '0000'; otherwise
5 set $PLCM_TYPE_S$ to '0100'.
- 6 - The mobile station shall set $PLCM_39_S$ to $PLCM_39_R$ if $PLCM_TYPE_R$ is equal
7 to '0001'.
- 8 - The mobile station shall set $FUNDICATED_BCMC_IND_S$ to
9 $FUNDICATED_BCMC_IND_R$. If $FUNDICATED_BCMC_IND_R$ equals '1' and the
10 $EXT_CH_IND_R$ signals the allocation of a F-FCH, the mobile station shall set
11 FCH_BCMC_IND to '1'; otherwise, the mobile station shall set
12 FCH_BCMC_IND to '0'.
- 13 - If $FUNDICATED_BCMC_IND_R$ equals '1' and $ADD_PLCM_FOR_FCH_INCL_R$ is
14 included and is set to '1', the mobile station shall store the following:
- 15 + Set $ADD_PLCM_FOR_FCH_TYPE_S$ to $ADD_PLCM_FOR_FCH_TYPE_R$.
- 16 + Set $ADD_PLCM_FOR_FCH_39_S$ to $ADD_PLCM_FOR_FCH_39_R$ if
17 $ADD_PLCM_FOR_FCH_TYPE_R$ is equal to '1'.
- 18 - If $EXT_CH_IND_R$ signals the allocation of R-FCH, the mobile station shall set
19 $REV_FCH_GATING_MODE_S$ to $REV_FCH_GATING_MODE_R$.
- 20 - The mobile station shall set $REV_PWR_CNTL_DELAY_S$ to
21 $REV_PWR_CNTL_DELAY_R$ if $REV_PWR_CNTL_DELAY_INCL_R$ is equal to '1'.
- 22 - The mobile station shall set $FULL_CI_FEEDBACK_IND_S$ to
23 $FULL_CI_FEEDBACK_IND_R$.
- 24 - If $EXT_CH_IND_R$ equals '01000', the mobile station shall set
25 $FOR_CPCCH_RATE_S$ to $FOR_CPCCH_RATE_R$, and
26 $FOR_CPCCH_UPDATE_RATE_S$ to $FOR_CPCCH_UPDATE_RATE_R$; otherwise,
27 the mobile station shall set $FOR_CPCCH_RATE_S$ to '00', and
28 $FOR_CPCCH_UPDATE_RATE_S$ to '00'.
- 29 - The mobile station shall set $REV_CQICH_FRAME_OFFSET_S$ to
30 $REV_CQICH_FRAME_OFFSET_R$.
- 31 - The mobile station shall set $REV_CQICH_REPS_S$ to $REV_CQICH_REPS_R$.
- 32 - The mobile station shall set $REV_ACKCH_REPS_S$ to $REV_ACKCH_REPS_R$.
- 33 - The mobile station shall set $FOR_PDCH_RC_S$ to $FOR_PDCH_RC_R$.
- 34 - If $EXT_CH_IND_R$ signals the allocation of a R-PDCH, the mobile station shall
35 set $REV_PDCH_RC_S$ to $REV_PDCH_RC_R$.
- 36 - If $EXT_CH_IND_R$ signals the allocation of a F-FCH, the mobile station shall
37 set $FOR_FCH_RC_S$ to $FOR_FCH_DCCH_RC_R$.
- 38 - If $EXT_CH_IND_R$ signals the allocation of a F-DCCH, the mobile station shall
39 set $FOR_DCCH_RC_S$ to $FOR_FCH_DCCH_RC_R$.

- 1 - If EXT_CH_IND_r signals the allocation of a R-FCH, the mobile station shall
2 set REV_FCH_RC_s to REV_FCH_DCCH_RC_r.
- 3 - If EXT_CH_IND_r signals the allocation of a R-DCCH, the mobile station shall
4 set REV_DCCH_RC_s to REV_FCH_DCCH_RC_r.
- 5 - If EXT_CH_IND_r signals the allocation of a F-FCH and a F-DCCH, the mobile
6 station shall set FPC_PRI_CHAN_s to FPC_PRI_CHAN_r.
- 7 - If EXT_CH_IND_r signals the allocation of a F-FCH, the mobile station shall
8 set FPC_FCH_INIT_SETPT_s to FPC_FCH_INIT_SETPT_r,
9 FPC_FCH_CURR_SETPT_s to FPC_FCH_INIT_SETPT_s, FPC_FCH_FER_s to
10 FPC_FCH_FER_r, FPC_FCH_MIN_SETPT_s to FPC_FCH_MIN_SETPT_r,
11 FPC_FCH_MAX_SETPT_s to FPC_FCH_MAX_SETPT_r.
- 12 - If EXT_CH_IND_r signals the allocation of a F-DCCH, the mobile station shall
13 set FPC_DCCH_INIT_SETPT_s to FPC_DCCH_INIT_SETPT_r,
14 FPC_DCCH_CURR_SETPT_s to FPC_DCCH_INIT_SETPT_s, FPC_DCCH_FER_s to
15 FPC_DCCH_FER_r, FPC_DCCH_MIN_SETPT_s to FPC_DCCH_MIN_SETPT_r,
16 FPC_DCCH_MAX_SETPT_s to FPC_DCCH_MAX_SETPT_r.
- 17 - If EARLY_RL_TRANSMIT_IND_r is included, the mobile station shall set
18 EARLY_RL_TRANSMIT_IND_s to EARLY_RL_TRANSMIT_IND_r; otherwise, the
19 mobile station shall set EARLY_RL_TRANSMIT_IND_s to '0'.
- 20 - If the FIXED_PREAMBLE_TRANSMIT_IND_r is included, the mobile station
21 shall set FIXED_PREAMBLE_TRANSMIT_IND_s to
22 FIXED_PREAMBLE_TRANSMIT_IND_r; otherwise, the mobile station shall set
23 FIXED_PREAMBLE_TRANSMIT_IND_s to '0'. If
24 FIXED_PREAMBLE_TRANSMIT_IND_s equals '1', the mobile station shall
25 store FIXED_NUM_PREAMBLE_s to FIXED_NUM_PREAMBLE_r.
- 26 - If TX_PWR_LIMIT_INCL_r is set to '1', the mobile station shall perform the
27 following:
- 28 + If the mobile station is being assigned to operate in the 1915MHz –
29 1920MHz block of the PCS band, the mobile station shall store the
30 transmit power limit TX_PWR_LIMIT_s = (TX_PWR_LIMIT_r - 30dB);
- 31 + Otherwise, the mobile station shall set TX_PWR_LIMIT_s to the limit
32 defined in [11] for the target base station.
- 33 - If FOR_PDCH_PARAMS_INCL_r is equal to '1', the mobile station shall set
34 FOR_PDCH_COMMON_PARAMS_s = '0'; otherwise, if
35 FOR_PDCH_COMMON_PARAMS_s is equal to '0', the mobile station shall send
36 a *Mobile Station Reject Order* with ORDQ equal to '00000011' (message
37 structure not acceptable) and remain in the current state.
- 38 - If FOR_PDCH_RLGAIN_INCL_r is included and equal to '1', the mobile station
39 shall set RLGAIN_ACKCH_PILOT_s to RLGAIN_ACKCH_PILOT_r, and
40 RLGAIN_CQICH_PILOT_s to RLGAIN_CQICH_PILOT_r.

- 1 - If FOR_PDCH_PARMS_INCL_r is equal to '1', the mobile station shall set
2 NUM_SOFT_SWITCHING_FRAMES_s to NUM_SOFT_SWITCHING_FRAMES_r +
3 1, and NUM_SOFT_SWITCING_FRAMES_s to
4 NUM_SOFT_SWITCING_FRAMES_r + 1.
- 5 - If CHM_SWITCHING_PARMS_INCL_r is included and equal to '1', the mobile
6 station shall set NUM_SOFT_SWITCHING_FRAMES_CHM_s to
7 NUM_SOFT_SWITCHING_FRAMES_CHM_r + 1, and
8 NUM_SOFT_SWITCING_FRAMES_CHM_s to
9 NUM_SOFT_SWITCING_FRAMES_CHM_r + 1.
- 10 - If CHM_SWITCHING_PARMS_INCL_r is included and equal to '0', the mobile
11 station shall set NUM_SOFT_SWITCHING_FRAMES_CHM_s to
12 NUM_SOFT_SWITCHING_FRAMES_r + 1, and
13 NUM_SOFT_SWITCING_FRAMES_CHM_s to
14 NUM_SOFT_SWITCING_FRAMES_r + 1.
- 15 - If FOR_PDCH_PARMS_INCL_r is equal to '1', the mobile station shall set
16 NUM_SOFT_SWITCHING_SLOTS_s according to Table 3.7.2.3.2.21-9 based
17 on the value of NUM_SOFT_SWITCHING_SLOTS_r.
- 18 - If FOR_PDCH_PARMS_INCL_r is equal to '1', the mobile station shall set
19 NUM_SOFT_SWITCING_SLOTS_s according to Table 3.7.2.3.2.21-9 based
20 on the value of NUM_SOFT_SWITCING_SLOTS_r.
- 21 - If CHM_SWITCHING_PARMS_INCL_r is included and equal to '1', the mobile
22 station shall:
- 23 + Set NUM_SOFT_SWITCHING_SLOTS_CHM_s according to Table
24 3.7.2.3.2.21-9 based on the value of
25 NUM_SOFT_SWITCHING_SLOTS_CHM_r.
- 26 + Set NUM_SOFT_SWITCING_SLOTS_CHM_s according to Table
27 3.7.2.3.2.21-9 based on the value of
28 NUM_SOFT_SWITCING_SLOTS_CHM_r.
- 29 - If CHM_SWITCHING_PARMS_INCL_r is included and equal to '0', the mobile
30 station shall:
- 31 + Set NUM_SOFT_SWITCHING_SLOTS_CHM_s according to Table
32 3.7.2.3.2.21-9 based on the value of NUM_SOFT_SWITCHING_SLOTS_r.
- 33 + Set NUM_SOFT_SWITCING_SLOTS_CHM_s according to Table
34 3.7.2.3.2.21-9 based on the value of
35 NUM_SOFT_SWITCING_SLOTS_r.
- 36 - If FOR_PDCH_PARMS_INCL_r is equal to '1', the mobile station shall set
37 PDCH_SOFT_SWITCHING_DELAY_s to PDCH_SOFT_SWITCHING_DELAY_r +
38 1, and PDCH_SOFT_SWITCING_DELAY_s to
39 PDCH_SOFT_SWITCING_DELAY_r + 1.
- 40 - If TX_DISABLED_TIMER_INCL_r is equal to '1', the mobile station shall set
41 TX_DISABLED_TIMER_s to TX_DISABLED_TIMER_r; otherwise, the mobile
42 station shall set TX_DISABLED_TIMER_s to T_{81m}.

- 1 - If EXT_CH_IND_r signals the allocation of a R-PDCH, the mobile station shall:
- 2 + Set FOR_GCH_ASSIGNED_s to FOR_GCH_ASSIGNED_r.
- 3 + Set FOR_RCCH_ASSIGNED_s to FOR_RCCH_ASSIGNED_r.
- 4 + If FOR_RCCH_ASSIGNED_s is equal to '1', the mobile station shall:
- 5 ○ Set FOR_RCCH_DRC_MODE_s to FOR_RCCH_DRC_MODE_r.
- 6 ○ Set FOR_RCCH_REPETITION_s to FOR_RCCH_REPETITION_r.
- 7 ○ Set FOR_RCCH_UPDATE_RATE_s to FOR_RCCH_UPDATE_RATE_r.
- 8 + If FOR_ACKCH_ASSIGNED_r is equal to '1', the mobile station shall set
- 9 FOR_ACKCH_MODE_s to FOR_ACKCH_MODE_r.
- 10 + If FOR_ACKCH_COMB_SEL_r is included, the mobile station shall set
- 11 FOR_ACKCH_COMB_SEL_s to FOR_ACKCH_COMB_SEL_r; otherwise, the
- 12 mobile station shall set FOR_ACKCH_COMB_SEL_s to '0'.
- 13 + If REV_PDCH_RLGAIN_INCL_r is included and equal to '1', the mobile
- 14 station shall perform the following:
- 15 ○ The mobile station shall set RLGAIN_SPICH_PILOT_s to
- 16 RLGAIN_SPICH_PILOT_r.
- 17 ○ The mobile station shall set RLGAIN_REQCH_PILOT_s to
- 18 RLGAIN_REQCH_PILOT_r.
- 19 ○ The mobile station shall set RLGAIN_PDCCH_PILOT_s to
- 20 RLGAIN_PDCCH_PILOT_r.
- 21 + If REV_PDCH_PARAMS_1_INCL_r is included and equal to '1', the mobile
- 22 station shall perform the following:
- 23 ○ The mobile station shall set REV_PDCH_TABLE_SEL_s to
- 24 REV_PDCH_TABLE_SEL_r.
- 25 ○ The mobile station shall set REV_PDCH_MAX_AUTO_TPR_s to
- 26 REV_PDCH_MAX_AUTO_TPR_r.
- 27 - Otherwise, the mobile station shall:
- 28 + Set FOR_GCH_ASSIGNED_s to NULL.
- 29 + Set FOR_RCCH_ASSIGNED_s to NULL.
- 30 - For each included member of the Active Set, the mobile station shall store
- 31 the following:
- 32 + Set the PILOT_PN field to PILOT_PN_r.
- 33 + Set the ADD_PILOT_REC_INCL field to ADD_PILOT_REC_INCL_r. If
- 34 ADD_PILOT_REC_INCL_r equals '1', the mobile station shall store the
- 35 following:
- 36 ○ Set the PILOT_REC_TYPE field of PILOT_REC to PILOT_REC_TYPE_r.

- 1 ○ If PILOT_REC_TYPE_r equals '000', the mobile station shall set the
2 TD_POWER_LEVEL field of PILOT_REC to TD_POWER_LEVEL_r and
3 set the TD_MODE field of PILOT_REC to TD_MODE_r.
- 4 ○ If PILOT_REC_TYPE_r is equal to '001', the mobile station shall:
5 ◇ Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
6 ◇ Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
7 AUX_PILOT_WALSH_r with the Walsh Code length specified by
8 WALSH_LENGTH_r.
- 9 ○ If PILOT_REC_TYPE_r is equal to '010', the mobile station shall:
10 ◇ Set the AUX_PILOT_TD_QOF field of PILOT_REC to QOF_r.
11 ◇ Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
12 AUX_WALSH_r with the Walsh Code length specified by
13 WALSH_LENGTH_r.
14 ◇ Set the AUX_TD_POWER_LEVEL field of PILOT_REC to
15 AUX_TD_POWER_LEVEL_r.
16 ◇ Set the TD_MODE field of NGHBR_PILOT_REC to TD_MODE_r.
- 17 ○ Set FOR_PDCH_INCL_s to FOR_PDCH_INCL_r.
- 18 ○ If FOR_PDCH_INCL_r is equal to '1', the mobile station shall perform
19 the following:
20 ◇ If FOR_PDCH_PARAMS_INCL_r is equal to '1', the mobile station
21 shall store the following parameters:
22 — The mobile station shall set WALSH_TABLE_ID_s to
23 WALSH_TABLE_ID_r.
24 — The mobile station shall set NUM_PDCCH_s to NUM_PDCCH_r.
25 — The mobile station shall store FOR_PDCCH_WALSH_s[i] to the
26 ith occurrence of FOR_PDCCH_WALSH_r.
27 ◇ The mobile station shall set MAC_ID_s to MAC_ID_r.
28 ◇ The mobile station shall set REV_CQICH_COVER_s to
29 REV_CQICH_COVER_r.
30 ◇ If EXT_CH_IND_r signals the allocation of a F-CPCCH, the mobile
31 station shall set FOR_CPCCH_WALSH_s to FOR_CPCCH_WALSH_r,
32 and, FOR_CPCSCH_s to FOR_CPCSCH_r.
33 ◇ The mobile station shall store FOR_PDCCH_WALSH_s[i] to the ith
34 occurrence of FOR_PDCCH_WALSH_r.
- 35 ○ The mobile station shall set PWR_COMB_IND_s to PWR_COMB_IND_r.
- 36 ○ If PDCH_GROUP_IND_INCL_r is equal to '1', the mobile station shall
37 set PDCH_GROUP_IDENTIFIER_s as follows:

- 1 ◇ If this is the first pilot in the list that has a F-PDCH assignment,
2 the mobile station shall perform the following:
- 3 ○ The mobile station shall set PDCH_GROUP_IDENTIFIER_s to '000';
- 4 ◇ Otherwise, the mobile station shall perform the following:
- 5 - If PDCH_GROUP_IND_r is set to '1', the mobile station shall set
6 PDCH_GROUP_IDENTIFIER_s to the same value as that of the previous pilot
7 in the list that has a F-PDCH assigned; otherwise, the mobile station shall
8 set PDCH_GROUP_IDENTIFIER_s to the value one greater than that of the
9 previous pilot in the list that has a F-PDCH assigned.
- 10 + Otherwise, the mobile station shall perform the following:
- 11 ○ If this is the first pilot in the list that has a F-PDCH assignment, the
12 mobile station shall perform the following:
- 13 ◇ The mobile station shall set PDCH_GROUP_IDENTIFIER_s to '000';
- 14 ○ Otherwise, the mobile station shall perform the following:
- 15 ◇ If F-PDCH is assigned for this pilot, the mobile station shall
16 perform the following:
- 17 — If PWR_COMB_IND_r is set to '1', and there are no pilots
18 between this pilot and the previous pilot in the list that has a
19 F-PDCH assigned, the mobile station shall set
20 PDCH_GROUP_IDENTIFIER_s to the same value as that of the
21 previous pilot in the list that has a F-PDCH assigned.
- 22 — If PWR_COMB_IND_r is set to '1', and all pilots between this
23 pilot and the previous pilot in the list that has a F-PDCH
24 assigned have PWR_COMB_IND set to '1', the mobile station
25 shall set PDCH_GROUP_IDENTIFIER_s to the same value as
26 that of the previous pilot in the list that has a F-PDCH
27 assigned.
- 28 — Otherwise, the mobile station shall set
29 PDCH_GROUP_IDENTIFIER_s to the value one greater than
30 that of the previous pilot in the list.
- 31 ◇ Otherwise, the mobile station shall set
32 PDCH_GROUP_IDENTIFIER_s to NULL.
- 33 + If EXT_CH_IND_r signals the allocation of a F-FCH, the mobile station
34 shall set CODE_CHAN_FCH_s = CODE_CHAN_FCH_r, and
35 QOF_MASK_ID_FCH_s = QOF_MASK_ID_FCH_r.
- 36 + If EXT_CH_IND_r signals the allocation of a F-DCCH, the mobile station
37 shall set CODE_CHAN_DCCH_s = CODE_CHAN_DCCH_r, and
38 QOF_MASK_ID_DCCH_s = QOF_MASK_ID_DCCH_r.

- 1 + If FOR_PDCH_INCL_T is equal to '1', EXT_CH_IND_T signals the allocation
2 of a R-PDCH, and FOR_ACKCH_ASSIGNED_T is equal to '1', the mobile
3 station shall set FOR_ACKCH_WALSH_INDEX_S to
4 FOR_ACKCH_WALSH_INDEX_T, and FOR_ACKSCH_INDEX_S to
5 FOR_ACKSCH_INDEX_T.
- 6 + If FOR_RCCH_INCL_T is included and set to '1', the mobile station shall do
7 the following:
8 ○ Set FOR_RCCH_WALSH_INDEX_S to FOR_RCCH_WALSH_INDEX_T.
9 ○ Set FOR_RCSCH_INDEX_S to FOR_RCSCH_INDEX_T.
- 10 + If FOR_PDCH_INCL_T is equal to '1', and if FOR_GCH_ASSIGNED_T is
11 included and set to '1', the mobile station shall perform the following;
12 ○ Set NUM_FOR_GCH_S to NUM_FOR_GCH_T, and
13 ○ For each of the NUM_FOR_GCH_S occurrences of
14 FOR_GCH_WALSH_INDEX_T, the mobile station shall set
15 FOR_GCH_WALSH_INDEX_S[j] to FOR_GCH_WALSH_INDEX_T[j].
- 16 + Otherwise, the mobile station shall perform the following:
17 ○ Set NUM_FOR_GCH_S to 0, and
18 ○ Set FOR_GCH_WALSH_INDEX_S to NULL.
- 19 - The mobile station shall initialize CODE_CHAN_LIST as described in 2.6.8,
20 and shall set SERV_NEG_S to enabled.
- 21 - If DIRECT_CH_ASSIGN_IND_T is equal to '1', the mobile station shall perform
22 the following:
23 + The mobile station shall set RTC_NOM_PWR_S to RTC_NOM_PWR_T.
24 + If the mobile station has not received confirmation of delivery of the *Page*
25 *Response Message* or the *Reconnect Message* sent in this substate, the
26 mobile station shall perform the following:
27 ○ Set RTC_NOM_PWR_USE_IND to '1'.
28 ○ Set DIRECT_CH_ASSIGN_RECOVER_IND_S to
29 DIRECT_CH_ASSIGN_RECOVER_IND_T
- 30 - If FREQ_INCL_T equals '1', the mobile station shall then tune to the new
31 frequency assignment.
- 32 - If DIRECT_CH_ASSIGN_IND_T is equal to '1' and RESPOND_IND_T is equal to
33 '1', the mobile station shall perform the following:
34 + If the mobile station is in *Mobile Station Idle State*, then the mobile
35 station shall enter the *Update Overhead Information Substate* of the
36 *System Access State* (see 2.6.3.2) with a direct channel assignment
37 respond indication within T_{33m} seconds after the *Extended Channel*
38 *Assignment Message* is received; otherwise, the mobile station shall enter

1 the *Page Response Substate* with a direct channel assignment respond
2 indication.

3 + Otherwise, the mobile station shall enter the *Traffic Channel Initialization*
4 *Substate* of the *Mobile Station Control on the Traffic Channel State*.

5 8. *Fast Call Setup Order:*

- 6 • If $ORDQ_R$ is equal to '00000000', the mobile station shall process the message
7 and respond with a *Fast Call Setup Order* as specified in 2.6.12.1.
- 8 • If $ORDQ_R$ is equal to '00000001', the mobile station shall process the message
9 as specified in 2.6.12.1.

10 9. *Feature Notification Message*

11 10. *Local Control Order*

12 11. *Lock Until Power-Cycled Order:* The mobile station shall disable its transmitter and
13 record the reason for the *Lock Until Power-Cycled Order* in the mobile station's
14 semi-permanent memory ($LCKRSN_{S-p}$ equals the least significant four bits of
15 $ORDQ_R$). The mobile station should notify the user of the locked condition. The
16 mobile station shall enter the *System Determination Substate* of the *Mobile Station*
17 *Initialization State* with a lock indication (see 2.6.1.1), and shall not enter the
18 *System Access State* again until after the next mobile station power-up or until it
19 has received an *Unlock Order*. This requirement shall take precedence over any
20 other mobile station requirement specifying entry to the *System Access State*.

21 12. *Maintenance Required Order:* The mobile station shall record the reason for the
22 *Maintenance Required Order* in the mobile station's semi-permanent memory
23 ($MAINTRSN_{S-p}$ equals the least significant four bits of $ORDQ_R$). The mobile station
24 shall remain in the unlocked condition. The mobile station should notify the user
25 of the maintenance required condition.

26 13. *Registration Accepted Order:* The mobile station shall perform the procedures as
27 specified in 2.6.11.1.

28 14. *Registration Rejected Order:* This order indicates that normal service is not
29 available on this system. The mobile station shall disable the full-TMSI timer. If
30 the received order specifies to delete the TMSI ($ORDQ = '00000100'$), the mobile
31 station shall set all the bits of the $TMSI_CODE_{S-p}$ to '1'. The mobile station shall
32 enter the *System Determination Substate* of the *Mobile Station Initialization State* with
33 a registration rejected indication (see 2.6.1.1).

34 15. *Release Order:* If $NDSS_ORIG_S$ is equal to enabled, the mobile station shall set
35 $NDSS_ORIG_S$ to disabled, and should indicate to the user that the call origination
36 has been canceled. The mobile station shall enter the *Mobile Station Idle State* or
37 the *System Determination Substate* of the *Mobile Station Initialization State* with a
38 release indication (see 2.6.1.1). If the mobile station enters the *Mobile Station Idle*
39 *State*, and if $PACA_S$ is equal to enabled, the mobile station shall set $PACA_S$ to

1 disabled and PACA_CANCEL to '0', shall disable the PACA state timer, and should
2 indicate to the user that the PACA call has been canceled.

3 16. *Retry Order*: The mobile station shall process the message as follows:

- 4 • If RETRY_TYPE_R is equal to '000', the mobile station shall set
5 RETRY_DELAY_S[RETRY_TYPE] to 0, where RETRY_TYPE is equal to '001', '010',
6 '011', '100', or '101'.
- 7 • If RETRY_TYPE_R is equal to '001', '100', or '101', the mobile station shall perform
8 the following:
 - 9 - If RETRY_DELAY_R is equal to '00000000', then the mobile station shall set
10 RETRY_DELAY_S[RETRY_TYPE_R] to 0.
 - 11 - If RETRY_DELAY_R is not equal to '00000000', the mobile station shall set
12 RETRY_DELAY_S[RETRY_TYPE_R] as follows:
 - 13 + If the most significant bit of the RETRY_DELAY_R is '0', set
14 RETRY_DELAY_UNIT_S to 1000ms. If the most significant bit of the
15 RETRY_DELAY_R is '1', set RETRY_DELAY_UNIT_S to 60000ms.
 - 16 + The mobile station shall set RETRY_DELAY_VALUE_S to the seven least
17 significant bits of RETRY_DELAY_R.
 - 18 + The mobile station shall store the next system time 80 ms boundary +
19 RETRY_DELAY_VALUE_S × RETRY_DELAY_UNIT_S ms as
20 RETRY_DELAY_S[RETRY_TYPE_R].

21 17. *Security Mode Command Message*: The mobile station shall perform the procedures
22 as specified in 2.6.11.4.

23 18. *Service Redirection Message*: The mobile station shall process the message as
24 follows:

- 25 • If the mobile station is directed to an unsupported operation mode or band
26 class, the mobile station shall respond with a *Mobile Station Reject Order* with
27 ORDQ equal to '00000110' (message requires a capability that is not supported
28 by the mobile station).
- 29 • If DELETE_TMSI_R is equal to '1', the mobile station shall set all the bits of
30 TMSI_CODE_{S-p} to '1'. The mobile station shall disable the full-TMSI timer.
- 31 • The mobile station shall set RETURN_IF_FAIL_S = RETURN_IF_FAIL_R.
- 32 • If RECORD_TYPE_R is equal to '00000000', the mobile station shall enter the
33 *System Determination Substate* of the *Mobile Station Initialization State* with an
34 NDSS off indication (see 2.6.1.1); otherwise, the mobile station shall store the
35 redirection record received in the message as REDIRECT_REC_S and shall enter
36 the *System Determination Substate* of the *Mobile Station Initialization State* with a
37 redirection indication (see 2.6.1.1).

38 19. *SSD Update Message*: The mobile station shall respond to the message as specified
39 in 2.3.12.1.5.

1 20. *Status Request Message*: The mobile station shall disable the *System Access State*
 2 timer and respond to the message. If $P_REV_IN_USE_s$ is less than or equal to
 3 three, the mobile station shall respond with a *Status Response Message*. If
 4 $P_REV_IN_USE_s$ is greater than three, the mobile station shall respond with an
 5 *Extended Status Response Message*. If the message does not specify any
 6 qualification information ($QUAL_INFO_TYPE_r$ is equal to '00000000'), the mobile
 7 station shall include the requested information records in the response. If the
 8 message specifies a band class ($QUAL_INFO_TYPE_r$ is equal to '00000001'), the
 9 mobile station shall only include the requested information records for the
 10 specified band class ($BAND_CLASS_r$) in the response. If the message specifies a
 11 band class and an operating mode ($QUAL_INFO_TYPE_r$ is equal to '00000010'), the
 12 mobile station shall only include the requested information records for the
 13 specified band class ($BAND_CLASS_r$) and operating mode (OP_MODE_r) in the
 14 response. If the message specifies a band class or a band class and an operating
 15 mode which is not supported by the mobile station, the mobile station shall send a
 16 *Mobile Station Reject Order* with $ORDQ$ set to '00000110' (message requires a
 17 capability that is not supported by the mobile station). If the response to this
 18 message exceeds the allowable length, the mobile station shall send a *Mobile*
 19 *Station Reject Order* with $ORDQ$ set to '00001000' (response message would exceed
 20 the allowable length). If the message specifies an information record which is not
 21 supported by the mobile station for the specified band class and operating mode,
 22 the mobile station shall send a *Mobile Station Reject Order* with $ORDQ$ set to
 23 '00001001' (information record is not supported for the specified band class and
 24 operating mode).

25 21. *TMSI Assignment Message*: The mobile station shall store the TMSI zone and code
 26 as follows:

- 27 • The mobile station shall store the length of the TMSI zone field by setting
 28 $ASSIGNING_TMSI_ZONE_LEN_{s-p}$ to $TMSI_ZONE_LEN_r$;
- 29 • The mobile station shall store the assigning TMSI zone number by setting the
 30 $ASSIGNING_TMSI_ZONE_LEN_{s-p}$ least significant octets of
 31 $ASSIGNING_TMSI_ZONE_{s-p}$ to $TMSI_ZONE_r$, and
- 32 • The mobile station shall store the TMSI code by setting $TMSI_CODE_{s-p}$ to
 33 $TMSI_CODE_r$.

34 The mobile station shall set the TMSI expiration time by setting $TMSI_EXP_TIME_{s-p}$
 35 to $TMSI_EXP_TIME_r$. The mobile station shall disable the full-TMSI timer. The
 36 mobile station shall then respond with a *TMSI Assignment Completion Message*
 37 within T_{56m} seconds.

38 22. *User Zone Reject Message*

39 23. *General Extension Message*: The mobile station shall process this message as
 40 specified in section 2.6.18.

41 24. *Any other message*: If the mobile station receives any other message specified in
 42 Table 3.7.2.3-1, it shall ignore all Layer 3 fields. The mobile station shall ignore all
 43 other messages.

1 If the mobile station performs an access probe handoff or access handoff and receives any
2 of the following messages, it shall process the message as specified in 2.6.3.1.3:

- 3 • If the mobile station is currently monitoring the Paging Channel:
 - 4 1. *System Parameters Message*
 - 5 2. *Access Parameters Message*
 - 6 3. *Neighbor List Message*
 - 7 4. *Extended System Parameters Message*
 - 8 5. *Extended Neighbor List Message*
 - 9 6. *General Neighbor List Message*
 - 10 7. *Global Service Redirection Message*
 - 11 8. *Extended Global Service Redirection Message*
- 12 • If the mobile station is currently monitoring the Primary Broadcast Control
13 Channel:
 - 14 1. *ANSI-41 System Parameters Message*
 - 15 2. *Enhanced Access Parameters Message*
 - 16 3. *Universal Neighbor List Message*
 - 17 4. *MC-RR Parameters Message*
 - 18 5. *Extended Global Service Redirection Message*

19 2.6.3.4 Mobile Station Order/Message Response Substate

20 In this substate, the mobile station sends a message that is a response to a message
21 received from the base station. If the base station responds to the mobile station's message
22 with an authentication request, the mobile station responds in this substate.

23 If a message received from the base station requires a Layer 2 acknowledgment and does
24 not require a Layer 3 response, Layer 3 shall indicate to Layer 2 that no response is
25 outstanding (see [4]).

26 If a message received from the base station requires a Layer 2 acknowledgment and also a
27 Layer 3 response, Layer 3 shall indicate to Layer 2 that a response is outstanding (see [4]).

28 When transmitting a response to a message received from the base station, Layer 3 shall
29 indicate to Layer 2 that the type of the message is a response (see [4]).

30 When transmitting an autonomous message (i.e., a message that is not sent as a response
31 to a message received from the base station), Layer 3 shall indicate to Layer 2 that the type
32 of the message is a request other than a registration request or a message transmission
33 request (see [4]).

34 Upon entering the *Mobile Station Order/Message Response Substate*, the mobile station
35 shall send the response message.

1 While in this substate, the mobile station shall monitor the Paging Channel or the Forward
 2 Common Control Channel. If the mobile station declares a loss of the Paging Channel or
 3 the Forward Common Control Channel (see 2.6.3.1.8), the mobile station shall perform the
 4 following:

- 5 • If PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled and
 6 PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to the
 7 user that the PACA call has been canceled.
- 8 • The mobile station shall declare an access attempt failure and update its
 9 registration variables as specified in 2.6.5.5.3.2.
- 10 • The mobile station shall disable its transmitter.
- 11 • The mobile station shall enter the *Mobile Station Idle State*.

12 If the mobile station receives confirmation of delivery of any message sent by the mobile
 13 station in this substate, it shall send a response in this substate if required, and shall then
 14 enter the *Mobile Station Idle State*.

15 If PACA_S is equal to enabled, the mobile station shall set PACA_CANCEL to '1' when the
 16 user directs the mobile station to cancel a PACA call.

17 If the mobile station is to exit the *System Access State* as a result of processing Layer 3
 18 fields of a message requiring an acknowledgment, the mobile station shall exit the *System*
 19 *Access State* after Layer 3 receives an indication from Layer 2 that the acknowledgment to
 20 the message has been sent and acknowledged.

21 If Layer 3 receives a message with an indication from Layer 2 that an access attempt for a
 22 message being transmitted was not terminated as a result of processing the Layer 2 fields
 23 of the received message, the mobile station shall ignore the received message.

24 The following directed messages and orders can be received. If any field value of the
 25 message or order is outside its permissible range, the mobile station may send a *Mobile*
 26 *Station Reject Order* with ORDQ equal to '00000100' (message field not in valid range).

- 27 1. *Authentication Challenge Message*: The mobile station shall respond to the message
 28 as specified in 2.3.12.1.4, regardless of the value of AUTH_S.
- 29 2. *Authentication Request Message*: The mobile station shall process the message and
 30 shall respond as specified in 2.3.12.5.2.
- 31 3. *Base Station Challenge Confirmation Order*: The mobile station shall respond to the
 32 message as specified in 2.3.12.1.5.
- 33 4. *Base Station Reject Order*: The mobile station shall perform the procedures as
 34 specified in 2.6.11.5.
- 35 5. *Data Burst Message*
- 36 6. *Fast Call Setup Order*:
 37 • If ORDQ_r is equal to '00000000', the mobile station shall process the message
 38 and respond with a *Fast Call Setup Order* as specified in 2.6.12.1.

- If $ORDQ_R$ is equal to '00000001', the mobile station shall process the message as specified in 2.6.12.1.

7. *Feature Notification Message*

8. *Local Control Order*

9. *Lock Until Power-Cycled Order*: The mobile station shall disable its transmitter and record the reason for the *Lock Until Power-Cycled Order* in the mobile station's semi-permanent memory ($LCKRSN_{S-p}$ equals the least significant four bits of $ORDQ_R$). The mobile station should notify the user of the locked condition. The mobile station shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a lock indication (see 2.6.1.1), and shall not enter the *System Access State* again until after the next mobile station power-up or until it has received an *Unlock Order*. This requirement shall take precedence over any other mobile station requirement specifying entry to the *System Access State*.

10. *Maintenance Required Order*: The mobile station shall record the reason for the *Maintenance Required Order* in the mobile station's semi-permanent memory ($MAINTRSN_{S-p}$ equals the least significant four bits of $ORDQ_R$). The mobile station shall remain in the unlocked condition. The mobile station should notify the user of the maintenance required condition.

11. *Registration Accepted Order*: The mobile station shall perform the procedures as specified in 2.6.11.1.

12. *Registration Rejected Order*: This order indicates that normal service is not available on this system. The mobile station shall disable the full-TMSI timer. If the received order specifies to delete the TMSI ($ORDQ = '00000100'$), the mobile station shall set all the bits of the $TMSI_CODE_{S-p}$ to '1'. The mobile station shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a registration rejected indication (see 2.6.1.1).

13. *Retry Order*: The mobile station shall process the message as follows:

- If $RETRY_TYPE_R$ is equal to '000', the mobile station shall set $RETRY_DELAY_S[RETRY_TYPE]$ to 0, where $RETRY_TYPE$ is equal to '001', '010', '011', '100, or '101'.
- If $RETRY_TYPE_R$ is equal to '001', '100', or '101', the mobile station shall perform the following:
 - If $RETRY_DELAY_R$ is equal to '00000000', then the mobile station shall set $RETRY_DELAY_S[RETRY_TYPE_R]$ to 0.
 - If $RETRY_DELAY_R$ is not equal to '00000000', the mobile station shall set $RETRY_DELAY_S[RETRY_TYPE_R]$ as follows:
 - + If the most significant bit of the $RETRY_DELAY_R$ is '0', set $RETRY_DELAY_UNIT_S$ to 1000ms. If the most significant bit of the $RETRY_DELAY_R$ is '1', set $RETRY_DELAY_UNIT_S$ to 60000ms.

- 1 + The mobile station shall set $RETRY_DELAY_VALUE_S$ to the seven least
2 significant bits of $RETRY_DELAY_T$.
- 3 + The mobile station shall store the next system time 80 ms boundary +
4 $RETRY_DELAY_VALUE_S \times RETRY_DELAY_UNIT_S$ ms as
5 $RETRY_DELAY_S[RETRY_TYPE_T]$.
- 6 14. *Security Mode Command Message*: The mobile station shall perform the procedures
7 as specified in 2.6.11.4.
- 8 15. *Service Redirection Message*: The mobile station shall process the message as
9 follows:
- 10 • If the mobile station is directed to an unsupported operation mode or band
11 class, the mobile station shall respond with a *Mobile Station Reject Order* with
12 ORDQ equal to '00000110' (message requires a capability that is not supported
13 by the mobile station).
- 14 • If $DELETE_TMSI_T$ is equal to '1', the mobile station shall set all the bits of
15 $TMSI_CODE_{S-p}$ to '1'. The mobile station shall disable the full-TMSI timer.
- 16 • The mobile station shall set $RETURN_IF_FAIL_S = RETURN_IF_FAIL_T$.
- 17 • If $RECORD_TYPE_T$ is equal to '00000000', the mobile station shall enter the
18 *System Determination Substate* of the *Mobile Station Initialization State* with an
19 NDSS off indication (see 2.6.1.1); otherwise, the mobile station shall store the
20 redirection record received in the message as $REDIRECT_REC_S$ and shall enter
21 the *System Determination Substate* of the *Mobile Station Initialization State* with a
22 redirection indication (see 2.6.1.1).
- 23 16. *SSD Update Message*: The mobile station shall respond to the message as specified
24 in 2.3.12.1.5.
- 25 17. *Status Request Message*: The mobile station shall disable the *System Access State*
26 timer and respond to the message. If $P_REV_IN_USE_S$ is less than or equal to
27 three, the mobile station shall respond with a *Status Response Message*. If
28 $P_REV_IN_USE_S$ is greater than three, the mobile station shall respond with an
29 *Extended Status Response Message*. If the message does not specify any
30 qualification information ($QUAL_INFO_TYPE_T$ is equal to '00000000'), the mobile
31 station shall include the requested information records in the response. If the
32 message specifies a band class ($QUAL_INFO_TYPE_T$ is equal to '00000001'), the
33 mobile station shall only include the requested information records for the
34 specified band class ($BAND_CLASS_T$) in the response. If the message specifies a
35 band class and an operating mode ($QUAL_INFO_TYPE_T$ is equal to '00000010'), the
36 mobile station shall only include the requested information records for the
37 specified band class ($BAND_CLASS_T$) and operating mode (OP_MODE_T) in the
38 response. If the message specifies a band class or a band class and an operating
39 mode which is not supported by the mobile station, the mobile station shall send a
40 *Mobile Station Reject Order* with ORDQ set to '00000110' (message requires a
41 capability that is not supported by the mobile station). If the response to this
42 message exceeds the allowable length, the mobile station shall send a *Mobile*

1 *Station Reject Order* with ORDQ set to '00001000' (response message would exceed
 2 the allowable length). If the message specifies an information record which is not
 3 supported by the mobile station for the specified band class and operating mode,
 4 the mobile station shall send a *Mobile Station Reject Order* with ORDQ set to
 5 '00001001' (information record is not supported for the specified band class and
 6 operating mode).

7 18. *TMSI Assignment Message*: The mobile station shall store the TMSI zone and code
 8 as follows:

- 9 • The mobile station shall store the length of the TMSI zone field by setting
 10 ASSIGNING_TMSI_ZONE_LEN_{s-p} to TMSI_ZONE_LEN_r,
- 11 • The mobile station shall store the assigning TMSI zone number by setting the
 12 ASSIGNING_TMSI_ZONE_LEN_{s-p} least significant octets of
 13 ASSIGNING_TMSI_ZONE_{s-p} to TMSI_ZONE_r, and
- 14 • The mobile station shall store the TMSI code by setting TMSI_CODE_{s-p} to
 15 TMSI_CODE_r.

16 The mobile station shall set the TMSI expiration time by setting TMSI_EXP_TIME_{s-p}
 17 to TMSI_EXP_TIME_r. The mobile station shall disable the full-TMSI timer. The
 18 mobile station shall then respond with a *TMSI Assignment Completion Message*
 19 within T_{56m} seconds.

20 19. *User Zone Reject Message*

21 20. *Any other message*: If the mobile station receives any other message specified in
 22 Table 3.7.2.3-1, it shall ignore all Layer 3 fields. The mobile station shall ignore all
 23 other messages.

24 2.6.3.5 Mobile Station Origination Attempt Substate

25 In this substate, the mobile station sends an *Origination Message*, *Call Recovery Request*
 26 *Message* or a *Reconnect Message*. If the mobile station sends a *Reconnect Message*, it shall
 27 set the ORIG_IND field of the message to '1'.

28 If directed by the user to transmit a Short Data Burst (see [30]) and the mobile station
 29 sends a *Reconnect Message* in assured mode in this substate, the mobile station may
 30 include a Short Data Burst in the *Reconnect Message* by setting the SDB_INCL field to '1', if
 31 all of the following conditions are true:

- 32 • SDB_SUPPORTED_s and SDB_IN_RCNM_IND_s are equal to '1', and
- 33 • ACCT is not enabled for the service option number associated with the Short Data
 34 Burst as follows:
 - 35 - The service option number associated with the Short Data Burst is not equal to
 36 any ACCT_SO entry in ACCT_SO_LIST, and
 - 37 - The service option group number of the service option associated with the Short
 38 Data Burst is not equal to any ACCT_SO_GRP entry in ACCT_SO_GRP_LIST.

39 The mobile station shall not send the *Reconnect Message* if RECONNECT_MSG_IND_s equals
 40 '0', if this message is not being sent to reconnect a dormant packet data service instance,

1 or the information that needs to be conveyed to the base station for the dormant packet
 2 data reconnection (PREV_SID, PREV_NID, PREV_PZID. See [42] for details) can not be
 3 carried in a *Reconnect Message*.

4 The mobile station shall not send the *Call Recovery Request Message* if CRRM_MSG_IND_S
 5 equals '0'.

6 If P_REV_IN_USE_S is greater than or equal to 11 and the *Origination Message* is being sent
 7 to perform packet data dormant handoff, the mobile station shall include all dormant
 8 packet data service instances (see [42]) up to the limit specified by
 9 MAX_ADD_SERV_INSTANCE_S.

10 If the base station responds to the *Origination Message*, *Call Recovery Request Message* or
 11 the *Reconnect Message* with an authentication request, the mobile station responds in this
 12 substate.

13 If a message received from the base station requires a Layer 2 acknowledgment and does
 14 not require a Layer 3 response, Layer 3 shall indicate to Layer 2 that no response is
 15 outstanding (see [4]).

16 If a message received from the base station requires a Layer 2 acknowledgment and also a
 17 Layer 3 response, Layer 3 shall indicate to Layer 2 that a response is outstanding (see [4]).

18 When transmitting a response to a message received from the base station, Layer 3 shall
 19 indicate to Layer 2 that the type of the message is a response (see [4]).

20 When transmitting an autonomous message (i.e., a message that is not sent as a response
 21 to a message received from the base station), Layer 3 shall indicate to Layer 2 that the type
 22 of the message is a request other than a registration request or a message transmission
 23 request (see [4]).

24 Upon entering the *Mobile Station Origination Attempt Substate*, the mobile station shall set
 25 RL_GAIN_ADJ_S to '0000', and perform the following:

- 26 • If P_REV_IN_USE_S is less than 11, set PLCM_TYPE_S to '0000'; otherwise set
 27 PLCM_TYPE_S to '0100'.
- 28 • The mobile station shall exit the *Mobile Station Origination Attempt Substate*, shall
 29 enter either the *Mobile Station Idle State* or the *System Determination Substate* with
 30 an ACCT blocked indication, and should indicate to the user that the call has
 31 terminated if all of the following conditions are true:
 - 32 - P_REV_IN_USE_S is greater than six,
 - 33 - ACCT_INCL_EMG_S is equal to '1' or the mobile station determines that the call is
 34 not an emergency call,
 - 35 - ACCT is enabled for the requested service option number, due to either of the
 36 following two conditions:
 - 37 + the requested service option number is equal to an ACCT_SO entry in
 38 ACCT_SO_LIST, or
 - 39 + the service option group number of the requested service option is equal to
 40 an ACCT_SO_GRP entry in ACCT_SO_GRP_LIST.

- 1 • If the substate was entered with an origination indication, the mobile station shall
2 send the *Origination Message*, *Call Recovery Request Message* or the *Reconnect*
3 *Message* as an r-csch request.
- 4 • If the substate was entered with a PACA response indication, the mobile station
5 shall send the *Origination Message* as an r-csch response using the access
6 procedures specified in 2.6.3.1. The mobile station shall include the dialed digits (if
7 any) from the previous origination attempt in the *Origination Message*.
- 8 • If the origination is a result of NDSS_ORIG_s being equal to enabled, the mobile
9 station shall include in the *Origination Message* the dialed digits (if any) recorded
10 from the previous origination attempt.
- 11 • If the mobile station has a stored service configuration (that is, parameters
12 conveyed by both the Service Configuration information record and the Non-
13 negotiable Service Configuration information record) and corresponding SYNC_ID
14 with associated SID and NID that are equal to the SID_s and NID_s respectively, and
15 USE_SYNC_ID_s is equal to '1', the mobile station may include the SYNC_ID field in
16 the *Origination Message* or the *Reconnect Message* and, if included, shall perform
17 the following:
- 18 - The mobile station shall set it to the SYNC_ID corresponding to the stored
19 service configuration. The mobile station shall store the value of the SYNC_ID
20 field in SYNC_ID_s.
- 21 - The mobile station shall set the SR_ID field of the *Origination Message* or the
22 *Reconnect Message* as follows:
- 23 + If the mobile station requests the restoration of a single service option
24 connection from the stored service configuration, the mobile station shall set
25 this field to the corresponding service reference identifier.
- 26 + Otherwise (that is, the mobile station requests the restoration of all the
27 service option connections from the stored service configuration), the mobile
28 station shall set this field to '111'.
- 29 • The mobile station shall include in the *Origination Message* as many of the dialed
30 digits as possible without exceeding the message capsule size. When calculating
31 the number of dialed digits to be included in the *Origination Message*, the mobile
32 station shall assume the following if P_REV_IN_USE_s is greater than three:
- 33 - The number of additional reported pilots (NUM_ADD_PILOTS) is equal to five
34 (see 2.6.3.1.7 and 2.7.1.3.1.3) so that up to five additional pilots may be
35 reported in any access probe, and
- 36 - The number of alternative service option numbers (NUM_ALT_SO) is less than or
37 equal to the maximum alternative service option numbers
38 (MAX_NUM_ALT_SO_s).
- 39 • If PACA_s is equal to enabled, the mobile station shall set the PACA_REORIG field of
40 the *Origination Message* to '1'; otherwise, the mobile station shall set the field to '0'.

1 While in this substate, the mobile station shall monitor the Paging Channel or the Forward
2 Common Control Channel. The mobile station may perform an access probe handoff or an
3 access handoff as described in 2.6.3.1.3.2 and 2.6.3.1.3.3. If the mobile station declares a
4 loss of the Paging Channel or the Forward Common Control Channel (see 2.6.3.1.8) during
5 an access attempt, the mobile station may perform an access probe handoff; otherwise, it
6 shall declare an access attempt failure and shall perform the following:

- 7 • If the mobile station is monitoring the Paging Channel, the mobile station shall set
8 SYS_PAR_MSG_SEQ_s and ACC_MSG_SEQ_s to NULL.
- 9 • If the mobile station is monitoring the Forward Common Control Channel, the
10 mobile station shall set MC_RR_PAR_MSG_SEQ_s and ACC_MSG_SEQ_s to NULL.
- 11 • If PACA_s is equal to enabled, the mobile station shall set PACA_s to disabled and
12 PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to the
13 user that the PACA call has been canceled.
- 14 • If NDSS_ORIG_s is equal to enabled, the mobile station shall set NDSS_ORIG_s to
15 disabled, and should indicate to the user that the call origination is canceled.
- 16 • The mobile station shall update its registration variables as specified in 2.6.5.5.3.2.
- 17 • The mobile station shall disable its transmitter and enter the *Mobile Station Idle*
18 *State*.

19 If the mobile station receives confirmation of delivery of any message sent by the mobile
20 station in this substate, the mobile station shall perform an access handoff if all of the
21 following conditions hold:

- 22 • The mobile station declares a loss of the Paging Channel or the Forward Common
23 Control Channel,
- 24 • The mobile station is permitted to perform an access handoff (see 2.6.3.1.3.2) and
25 there are pilots other than the active pilot in the access handoff list (see
26 2.6.3.1.3.2).

27 If the mobile station declares a loss of the Paging Channel or the Forward Common Control
28 Channel and does not perform an access handoff, the mobile station shall perform the
29 following:

- 30 • If the mobile station is monitoring the Paging Channel, the mobile station shall set
31 SYS_PAR_MSG_SEQ_s and ACC_MSG_SEQ_s to NULL.
- 32 • If the mobile station is monitoring the Forward Common Control Channel, the
33 mobile station shall set MC_RR_PAR_MSG_SEQ_s and ACC_MSG_SEQ_s to NULL.
- 34 • If PACA_s is equal to enabled, the mobile station shall set PACA_s to disabled and
35 PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to the
36 user that the PACA call has been canceled.
- 37 • If NDSS_ORIG_s is equal to enabled, the mobile station shall set NDSS_ORIG_s to
38 disabled and should indicate to the user that the call origination is canceled.
- 39 • The mobile station shall disable its transmitter and enter the *Mobile Station Idle*
40 *State*.

1 If the mobile station receives confirmation of delivery of the *Origination Message*, *Call*
 2 *Recovery Request Message* or the *Reconnect Message*, the mobile station shall update its
 3 registration variables with respect to the base station to which the first access probe was
 4 transmitted after entering the *System Access State* as specified in 2.6.5.5.3.1.

5 The mobile station shall set and disable the *System Access State* timer as follows:

- 6 • The mobile station shall disable the timer whenever it begins an access attempt.
- 7 • The mobile station shall set the timer to T_{42m} seconds whenever it ends an access
 8 attempt.
- 9 • The mobile station shall disable the timer whenever it exits the *System Access State*.

10 If the *System Access State* timer expires while in this substate, the mobile station shall
 11 perform the following:

- 12 • If $PACA_S$ is equal to enabled, the mobile station shall set $PACA_S$ to disabled and
 13 $PACA_CANCEL$ to '0', shall disable the PACA state timer, and should indicate to the
 14 user that the PACA call has been canceled.
- 15 • If $NDSS_ORIG_S$ is equal to enabled, the mobile station shall set $NDSS_ORIG_S$ to
 16 disabled, and should indicate to the user that the call origination is canceled.
- 17 • If the mobile station is monitoring the Paging Channel, the mobile station shall set
 18 $SYS_PAR_MSG_SEQ_S$ and $ACC_MSG_SEQ_S$ to NULL and enter the *Mobile Station*
 19 *Idle State*.
- 20 • If the mobile station is monitoring the Forward Common Control Channel, the
 21 mobile station shall set $MC_RR_PAR_MSG_SEQ_S$ and $ACC_MSG_SEQ_S$ to NULL and
 22 enter the *Mobile Station Idle State*.

23 If the mobile station is directed by the user to disconnect the call, the mobile station shall
 24 perform the following actions:

- 25 • Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any
 26 access attempt in progress.
- 27 • The mobile station shall send the *Release Order* (normal release) in assured mode
 28 requiring confirmation of delivery.
- 29 • After receiving confirmation of delivery of the *Release Order*, the mobile station shall
 30 enter the *Mobile Station Idle State* (see 2.6.2.2) or the *System Determination Substate*
 31 of the *Mobile Station Initialization State* with a release indication (see 2.6.1.1).

32 If the mobile station is directed by the user to power off, the mobile station shall perform
 33 the following actions:

- 34 • Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any
 35 access attempt in progress.
- 36 • The mobile station shall send the *Release Order* (with power-down indication) in
 37 assured mode requiring confirmation of delivery.
- 38 • After receiving confirmation of delivery of the *Release Order*, the mobile station shall
 39 perform power-down registration procedures (see 2.6.5.1.2).

- 1 • The mobile station may power off.

2 If the mobile station receives a *Channel Assignment Message* or the *Extended Channel*
 3 *Assignment Message*, Layer 3 shall send a *dedicated channel assignment* indication to Layer
 4 2 (see [4]). If the mobile station has not received confirmation of delivery of the *Origination*
 5 *Message*, *Call Recovery Request Message* or the *Reconnect Message* before receiving the
 6 *Channel Assignment Message* or the *Extended Channel Assignment Message*, the mobile
 7 station shall update its registration variables with respect to the base station to which the
 8 first access probe was transmitted after entering the *System Access State*, as specified in
 9 2.6.5.5.3.1.

10 If the mobile station is to exit the *System Access State* as a result of processing Layer 3
 11 fields of a message requiring an acknowledgment, the mobile station shall exit the *System*
 12 *Access State* after Layer 3 receives an indication from Layer 2 that the acknowledgment to
 13 the message has been sent and acknowledged.

14 If Layer 3 receives a message other than messages listed below:

- 15 • a *Channel Assignment Message*, or
 16 • *Extended Channel Assignment Message* with either DIRECT_CH_ASSIGN_IND field
 17 not included, or DIRECT_CH_ASSIGN_IND field included and set to '0'
 18 with an indication from Layer 2 that an access attempt for a message being transmitted
 19 was not terminated as a result of processing the Layer 2 fields of the received message, the
 20 mobile station shall ignore the received message.

21 The following directed messages and orders can be received. If any field value of the
 22 message or order is outside its permissible range, the mobile station may send a *Mobile*
 23 *Station Reject Order* with ORDQ equal to '00000100' (message field not in valid range).

- 24 1. *Authentication Challenge Message*: The mobile station shall respond to the message
 25 as specified in 2.3.12.1.4, regardless of the value of AUTH_S.
- 26 2. *Authentication Request Message*: The mobile station shall process the message and
 27 shall respond as specified in 2.3.12.5.2.
- 28 3. *Base Station Challenge Confirmation Order*: The mobile station shall respond to the
 29 message as specified in 2.3.12.1.5.
- 30 4. *Base Station Reject Order*: The mobile station shall perform the procedures as
 31 specified in 2.6.11.5.
- 32 5. *Channel Assignment Message*: The mobile station shall process the message as
 33 follows:
- 34 • If ASSIGN_MODE_T equals '000', the mobile station shall perform the following
 35 actions:
- 36 - The mobile station shall set CH_IND_S to '01'.
- 37 - The mobile station shall store the frame offset (FRAME_OFFSET_S =
 38 FRAME_OFFSET_T), the message encryption mode indicator
 39 (ENCRYPT_MODE_S = ENCRYPT_MODE_T), and, if FREQ_INCL_T equals '1', the
 40 Frequency Assignment (CDMACH_S = CDMA_FREQ_T).

- 1 - If $PACA_S$ is equal to enabled, the mobile station shall set $PACA_S$ to disabled
2 and $PACA_CANCEL$ to '0', shall disable the PACA state timer, and should
3 indicate to the user that the PACA call is proceeding.
- 4 - If the mobile station is currently monitoring the Paging Channel, the mobile
5 station shall set $IDLE_BCCH_CHAN$ to '0'; otherwise, the mobile station shall
6 set $IDLE_BCCH_CHAN$ to '1'. The mobile station shall set
7 $IDLE_CDMA_CHAN$ to $CDMACH_S$, $IDLE_CDMABAND$ to $CDMABAND_S$,
8 $IDLE_SID$ to SID_S , $IDLE_NID$ to NID_S , and $IDLE_P_REV$ to P_REV_S .
- 9 - The mobile station shall initialize the $CODE_CHAN_LIST$ as described in
10 2.6.8, shall set $SERV_NEG_S$ to disabled, and shall enter the *Traffic Channel*
11 *Initialization Substate* of the *Mobile Station Control on the Traffic Channel*
12 *State*.
- 13 • If $ASSIGN_MODE_r$ equals '001', the mobile station shall perform the following
14 actions:
- 15 - If the message requires acknowledgment, the mobile station shall wait until
16 Layer 3 receives an indication from Layer 2 that the acknowledgment to the
17 message has been sent and acknowledged.
- 18 - If a CDMA channel ($CDMA_FREQ$) is specified in the assignment, the mobile
19 station shall set $CDMACH_S = CDMA_FREQ_r$, tune to the new Frequency
20 Assignment, and measure the strength of each pilot listed in the assignment
21 using the Neighbor Set search procedures specified in 2.6.6.2.1 and
22 2.6.6.2.2.
- 23 - The mobile station shall set $CONFIG_MSG_SEQ_S$ and $ACC_MSG_SEQ_S$ to
24 NULL (see 2.6.2.2) and shall set $PILOT_PN_S$ to the pilot PN sequence offset of
25 the strongest pilot in the list.
- 26 - If the mobile station has not stored configuration parameters for the Primary
27 Paging Channel of the new base station, or if the stored information is not
28 current (see 2.6.2.2), the mobile station shall set $SYS_PAR_MSG_SEQ_S$,
29 $NGHBR_LST_MSG_SEQ_S$, $EXT_NGHBR_LST_MSG_SEQ_S$,
30 $GEN_NGHBR_LST_MSG_SEQ_S$, $CHAN_LST_MSG_SEQ_S$,
31 $EXT_CHAN_LST_MSG_SEQ_S$, $FD_CHAN_LST_MSG_SEQ_S$,
32 $EXT_SYS_PAR_MSG_SEQ_S$, $USER_ZONE_ID_MSG_SEQ_S$,
33 $PRI_NGHBR_LST_MSG_SEQ_S$, $GLOB_SERV_REDIR_MSG_SEQ_S$,
34 $AP_PILOT_INFO_MSG_SEQ_S$, $AP_IDT_MSG_SEQ_S$, $AP_ID_TEXT_MSG_SEQ_S$,
35 $GOI_MSG_SEQ_S$, $FREQ_GOI_MSG_SEQ_S$, $ATIM_MSG_SEQ_S$ and
36 $EXT_GLOB_SERV_REDIR_MSG_SEQ_S$ to NULL.
- 37 - The mobile station shall set $PAGE_CHAN_S$ to '1' and $PAGECH_S$ to the
38 Primary Paging Channel. The mobile station shall then begin monitoring the
39 Primary Paging Channel of the selected base station.
- 40 - If $RESPOND_r$ is equal to '1', the mobile station shall enter the *Update*
41 *Overhead Information Substate* with an origination indication.

- 1 • If ASSIGN_MODE_R equals '100', the mobile station shall perform the following
2 actions:
- 3 - The mobile station shall set CH_IND_S to '01'.
- 4 - If GRANTED_MODE_R equals '00', and the multiplex option or radio
5 configuration specified in the DEFAULT_CONFIG field is not supported by
6 the mobile station, the mobile station shall send a *Mobile Station Reject Order*
7 with ORDQ field set to '00000110' (capability not supported by the mobile
8 station) and remain in *Mobile Station Origination Attempt Substate*.
- 9 - If FREQ_INCL_R equals '0', the mobile station shall perform the following
10 actions:
- 11 + The mobile station shall store the frame offset (FRAME_OFFSET_S =
12 FRAME_OFFSET_R), the message encryption mode indicator
13 (ENCRYPT_MODE_S = ENCRYPT_MODE_R), the granted mode
14 (GRANTED_MODE_S = GRANTED_MODE_R), and the default configuration
15 (DEFAULT_CONFIG_S = DEFAULT_CONFIG_R).
- 16 + The mobile station shall set SERV_NEG_S to enabled.
- 17 + If PACA_S is equal to enabled, the mobile station shall set PACA_S equal to
18 disabled and PACA_CANCEL to '0', shall disable the PACA state timer,
19 and should indicate to the user that the PACA call is proceeding.
- 20 + The mobile station shall initialize CODE_CHAN_LIST as described in
21 2.6.8.
- 22 + If the mobile station is currently monitoring the Paging Channel, the
23 mobile station shall set IDLE_BCCH_CHAN to '0'; otherwise, the mobile
24 station shall set IDLE_BCCH_CHAN to '1'. The mobile station shall set
25 IDLE_CDMA_CHAN to CDMACH_S, IDLE_CDMABAND to CDMABAND_S,
26 IDLE_SID to SID_S, IDLE_NID to NID_S, and IDLE_P_REV to P_REV_S.
- 27 + The mobile station shall then enter the *Traffic Channel Initialization*
28 *Substate* of the *Mobile Station Control on the Traffic Channel State*.
- 29 - If FREQ_INCL_R equals '1', the mobile station shall perform the following
30 actions:
- 31 + If the band class is not supported by the mobile station, the mobile
32 station shall send a *Mobile Station Reject Order* with ORDQ field set to
33 '00000110' (capability not supported by the mobile station) and remain
34 in the *Mobile Station Origination Attempt Substate*.
- 35 + If the band class is supported by the mobile station, the mobile station
36 shall perform the following actions:

- 1 ○ The mobile station shall store the frame offset ($FRAME_OFFSET_S =$
2 $FRAME_OFFSET_T$), the message encryption mode indicator
3 ($ENCRYPT_MODE_S = ENCRYPT_MODE_T$), the granted mode
4 ($GRANTED_MODE_S = GRANTED_MODE_T$), the default configuration
5 ($DEFAULT_CONFIG_S = DEFAULT_CONFIG_T$), the idle Frequency
6 Assignment ($IDLE_CDMA_CHAN = CDMACH_S$), the idle band class
7 ($IDLE_CDMABAND = CDMABAND_S$), the band class ($CDMABAND_S =$
8 $BAND_CLASS_T$), and the Frequency Assignment
9 ($CDMACH_S = CDMA_FREQ_T$).
- 10 ○ The mobile station shall set $SERV_NEG_S$ to enabled.
- 11 ○ If $PACA_S$ is equal to enabled, the mobile station shall set $PACA_S$ to
12 disabled and $PACA_CANCEL$ to '0', shall disable the $PACA$ state
13 timer, and should indicate to the user that the $PACA$ call is
14 proceeding.
- 15 ○ The mobile station shall initialize the $CODE_CHAN_LIST$ as described
16 in 2.6.8.
- 17 ○ If the mobile station is currently monitoring the Paging Channel, the
18 mobile station shall set $IDLE_BCCH_CHAN$ to '0'; otherwise, the
19 mobile station shall set $IDLE_BCCH_CHAN$ to '1'. The mobile station
20 shall set $IDLE_SID$ to SID_S , $IDLE_NID$ to NID_S , and $IDLE_P_REV$ to
21 P_REV_S .
- 22 ○ The mobile station shall then tune to the new Frequency Assignment
23 and enter the *Traffic Channel Initialization Substate* of the *Mobile*
24 *Station Control on the Traffic Channel State*.
- 25 • If $ASSIGN_MODE_T$ equals '101', the mobile station shall perform the following
26 actions:
- 27 - If $FREQ_INCL_T$ equals '0', the mobile station shall perform the following
28 actions:
- 29 + If the message requires acknowledgment, the mobile station shall wait
30 until Layer 3 receives an indication from Layer 2 that the
31 acknowledgment to the message has been sent and acknowledged.
- 32 + The mobile station shall set $CONFIG_MSG_SEQ_S$ and $ACC_MSG_SEQ_S$ to
33 NULL (see 2.6.2.2) and shall set $PILOT_PN_S$ to the pilot PN sequence
34 offset of the strongest pilot in the list ($PILOT_PN_T$).

- 1 + If the mobile station has not stored configuration parameters for the
2 Primary Paging Channel of the new base station, or if the stored
3 information is not current (see 2.6.2.2), the mobile station shall set
4 SYS_PAR_MSG_SEQ_s, NGHBR_LST_MSG_SEQ_s,
5 EXT_NGHBR_LST_MSG_SEQ_s, GEN_NGHBR_LST_MSG_SEQ_s,
6 CHAN_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
7 FD_CHAN_LST_MSG_SEQ_s, EXT_SYS_PAR_MSG_SEQ_s,
8 USER_ZONE_ID_MSG_SEQ_s, PRI_NGHBR_LST_MSG_SEQ_s,
9 GLOB_SERV_REDIR_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s,
10 AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s,
11 FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s and
12 EXT_GLOB_SERV_REDIR_MSG_SEQ_s to NULL.
- 13 + The mobile station shall set PAGE_CHAN_s to '1' and PAGECH_s to the
14 Primary Paging Channel. The mobile station shall then begin monitoring
15 the Primary Paging Channel of the selected base station.
- 16 + If RESPOND_r is equal to '1', the mobile station shall perform the
17 following:
- 18 ○ If the *Channel Assignment Message* does not require an
19 acknowledgment, the mobile station shall enter the *Update Overhead*
20 *Information Substate* with an origination indication within T_{34m}
21 seconds after receiving the *Channel Assignment Message*.
- 22 ○ If the *Channel Assignment Message* requires an acknowledgment, the
23 mobile station shall enter the *Update Overhead Information Substate*
24 with a page response retransmission indication within T_{34m} seconds
25 after Layer 3 receives an indication from Layer 2 that the
26 acknowledgment to the *Channel Assignment Message* has been sent
27 and acknowledged.
- 28 + If RESPOND_r is equal to '0', the mobile station shall perform the
29 following:
- 30 ○ If the *Channel Assignment Message* does not require an
31 acknowledgment, the mobile station shall enter the *Mobile Station Idle*
32 *State* within T_{34m} seconds after receiving the *Channel Assignment*
33 *Message*.
- 34 ○ If the *Channel Assignment Message* requires an acknowledgment, the
35 mobile station shall enter the *Mobile Station Idle State* within T_{34m}
36 seconds after Layer 3 receives an indication from Layer 2 that the
37 acknowledgment to the *Channel Assignment Message* has been sent
38 and acknowledged.
- 39 - If FREQ_INCL_r equals '1', the mobile station shall perform the following
40 actions:

- 1 + If the band class is not supported by the mobile station, the mobile
2 station shall send a *Mobile Station Reject Order* with ORDQ field set to
3 '00000110' (capability not supported by the mobile station) and remain
4 in the *Mobile Station Origination Attempt Substate*.
- 5 + If the band class is supported by the mobile station, the mobile station
6 shall perform the following actions:
- 7 ○ If the message requires acknowledgment, the mobile station shall
8 wait until Layer 3 receives an indication from Layer 2 that the
9 acknowledgment to the message has been sent and acknowledged.
 - 10 ○ The mobile station shall set CDMACH_s to CDMA_FREQ_r and
11 CDMABAND_s to BAND_CLASS_r. Then the mobile station shall tune
12 to the new Frequency Assignment, measure the strength of each pilot
13 listed in the assignment using the Neighbor Set search procedures
14 specified in 2.6.6.2.1 and 2.6.6.2.2, set PILOT_PN_s to the pilot PN
15 sequence offset of the strongest pilot in the list (PILOT_PN_r), and set
16 CONFIG_MSG_SEQ_s and ACC_MSG_SEQ_s to NULL (see 2.6.2.2).
 - 17 ○ If the mobile station has not stored configuration parameters for the
18 Primary Paging Channel of the new base station, or if the stored
19 information is not current (see 2.6.2.2), the mobile station shall set
20 SYS_PAR_MSG_SEQ_s, NGHBR_LST_MSG_SEQ_s,
21 EXT_NGHBR_LST_MSG_SEQ_s, GEN_NGHBR_LST_MSG_SEQ_s,
22 CHAN_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
23 FD_CHAN_LST_MSG_SEQ_s, EXT_SYS_PAR_MSG_SEQ_s,
24 USER_ZONE_ID_MSG_SEQ_s, PRI_NGHBR_LST_MSG_SEQ_s,
25 GLOB_SERV_REDIR_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s,
26 AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s,
27 FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s and
28 EXT_GLOB_SERV_REDIR_MSG_SEQ_s to NULL.
 - 29 ○ The mobile station shall set PAGE_CHAN_s to '1' and PAGECH_s to the
30 Primary Paging Channel. The mobile station shall then begin
31 monitoring the Primary Paging Channel of the selected base station.
 - 32 ○ If RESPOND_r is equal to '1', the mobile station shall perform the
33 following:
 - 34 ◇ If the *Channel Assignment Message* does not require an
35 acknowledgment, the mobile station shall enter the *Update*
36 *Overhead Information Substate* with a page response
37 retransmission indication within T_{34m} seconds after receiving the
38 *Channel Assignment Message*.

- 1 ◇ If the *Channel Assignment Message* requires an acknowledgment,
 2 the mobile station shall enter the *Update Overhead Information*
 3 *Substate* with a page response retransmission indication within
 4 T_{34m} seconds after Layer 3 receives an indication from Layer 2
 5 that the acknowledgment to the *Channel Assignment Message* has
 6 been sent and acknowledged.
- 7 ○ If $RESPOND_r$ is equal to '0', the mobile station shall perform the
 8 following:
- 9 ◇ If the *Channel Assignment Message* does not require an
 10 acknowledgment, the mobile station shall enter the *Mobile Station*
 11 *Idle State* within T_{34m} seconds after receiving the *Channel*
 12 *Assignment Message*.
- 13 ◇ If the *Channel Assignment Message* requires an acknowledgment,
 14 the mobile station shall enter the *Mobile Station Idle State* within
 15 T_{34m} seconds after Layer 3 receives an indication from Layer 2
 16 that the acknowledgment to the *Channel Assignment Message* has
 17 been sent and acknowledged.

18 6. Data Burst Message

- 19 7. *Extended Channel Assignment Message*: If $P_REV_IN_USE_s$ is greater than or equal
 20 to 11, and $DIRECT_CH_ASSIGN_IND_r$ equals '1', the mobile station shall ignore the
 21 message. Otherwise, the mobile station shall process the message as follows:
- 22 • The mobile station shall set $RTC_NOM_PWR_USE_IND$ to '0'.
 - 23 • The mobile station shall set $DIRECT_CH_ASSIGN_RECOVER_IND_s$ to '0'.
 - 24 • If $ASSIGN_MODE_r$ equals '000', the mobile station shall perform the following
 25 actions:
 - 26 - If $PACA_s$ is equal to enabled, the mobile station shall set $PACA_s$ to disabled
 27 and $PACA_CANCEL$ to '0', shall disable the PACA state timer, and should
 28 indicate to the user that the PACA call has been canceled.
 - 29 - If $GRANTED_MODE_r$ equals '00', and the multiplex option and radio
 30 configuration specified in the $DEFAULT_CONFIG$ field are not supported by
 31 the mobile station, the mobile station shall send a *Mobile Station Reject Order*
 32 with $ORDQ$ field set to '00000110' (capability not supported by the mobile
 33 station) and shall remain in the *Mobile Station Origination Attempt Substate*.
 - 34 - If $GRANTED_MODE_r$ is equal to '00' and $DEFAULT_CONFIG_r$ is not equal to
 35 '100', the mobile station shall send a *Mobile Station Reject Order* with $ORDQ$
 36 field set to '00001110' (RC does not match with $DEFAULT_CONFIG_r$) and
 37 shall remain in the *Mobile Station Origination Attempt Substate* if any of the
 38 following conditions is true:
 - 39 + $FOR_FCH_RC_r$ is not equal to the RC associated with
 40 $DEFAULT_CONFIG_r$ (see Table 3.7.2.3.2.21-2).

- 1 + REV_FCH_RC_T is not equal to the RC associated with
 2 DEFAULT_CONFIG_T (see Table 3.7.2.3.2.21-2).
- 3 - If the mobile station does not support either of the Fundamental
 4 Channel Radio Configurations (FOR_FCH_RC or REV_FCH_RC), the
 5 mobile shall send a *Mobile Station Reject Order* with the ORDQ field set to
 6 '00000110' (capability not supported by the mobile station) and remain
 7 in the *Mobile Station Origination Attempt Substate*.
- 8 - If PLCM_TYPE_T equals '0010' and IMSI_O is derived from IMSI_T, or if
 9 PLCM_TYPE_T equals '0011' and IMSI_O is derived from IMSI_M, the
 10 mobile station shall send a *Mobile Station Reject Order* with the ORDQ
 11 field set to '00011100' (PLCM_TYPE mismatch) and remain in the *Mobile
 12 Station Origination Attempt Substate*.
- 13 - The mobile station shall set CH_IND_S to '01'.
- 14 - If P_REV_IN_USE_S is equal to or greater than six, the mobile station shall
 15 store the Forward Fundamental Channel Radio Configuration
 16 (FOR_FCH_RC_S = FOR_FCH_RC_T) and the Reverse Fundamental Channel
 17 Radio Configuration (REV_FCH_RC_S = REV_FCH_RC_T)
- 18 - If FREQ_INCL_T equals '0', the mobile station shall perform the following
 19 actions:
- 20 + The mobile station shall store the frame offset (FRAME_OFFSET_S =
 21 FRAME_OFFSET_T), the message encryption mode indicator
 22 (ENCRYPT_MODE_S = ENCRYPT_MODE_T), the bypass indicator
 23 (BYPASS_ALERT_ANSWER_S = BYPASS_ALERT_ANSWER_T), the
 24 granted mode (GRANTED_MODE_S = GRANTED_MODE_T), the default
 25 configuration (DEFAULT_CONFIG_S = DEFAULT_CONFIG_T), and the
 26 occurrences of PILOT_PN and PWR_COMB for each included member
 27 of the Active Set.
- 28 + If C_SIG_ENCRYPT_MODE is included, the mobile station shall set
 29 C_SIG_ENCRYPT_MODE_S to C_SIG_ENCRYPT_MODE_T.
- 30 + The mobile station shall perform the procedures in 2.6.11.2.
- 31 + The mobile station shall set SERV_NEG_S to enabled.
- 32 + If PACA_S is equal to enabled, the mobile station shall set PACA_S equal
 33 to disabled and PACA_CANCEL to '0', shall disable the PACA state
 34 timer, and should indicate to the user that the PACA call is
 35 proceeding.
- 36 + The mobile station shall initialize CODE_CHAN_LIST as described in
 37 2.6.8.

- 1 + The mobile station shall set FPC_FCH_INIT_SETPT_S to
2 FPC_FCH_INIT_SETPT_R, FPC_FCH_CURR_SETPT_S to
3 FPC_FCH_INIT_SETPT_S, FPC_FCH_FER_S to FPC_FCH_FER_R,
4 FPC_FCH_MIN_SETPT_S to FPC_FCH_MIN_SETPT_R,
5 FPC_FCH_MAX_SETPT_S to FPC_FCH_MAX_SETPT_R, and
6 FPC_PRI_CHAN_S to '0' if the mobile station supports any Radio
7 Configuration greater than 2.
8 + The mobile station shall set FPC_SUBCHAN_GAIN_S to
9 FPC_SUBCHAN_GAIN_R.
- 10 + The mobile station shall set REV_FCH_GATING_MODE_S to
11 REV_FCH_GATING_MODE_R.
- 12 + The mobile station shall set REV_PWR_CNTL_DELAY_S to
13 REV_PWR_CNTL_DELAY_R if REV_PWR_CNTL_DELAY_INCL_R is equal
14 to '1'.
15 + The mobile station shall set RLGAIN_ADJ_S to RLGAIN_ADJ_R.
- 16 + The mobile station shall set PLCM_TYPE_S to PLCM_TYPE_R if
17 PLCM_TYPE_INCL_R is equal to '1'; otherwise, the mobile station shall
18 set PLCM_TYPE_S as follows:
- 19 ○ If P_REV_IN_USE_S is less than 11, set PLCM_TYPE_S to '0000';
20 otherwise set PLCM_TYPE_S to '0100'.
21 + The mobile station shall set PLCM_39_S to PLCM_39_R if PLCM_TYPE_R
22 is equal to '0001'.
- 23 + If the mobile station is currently monitoring the Paging Channel, the
24 mobile station shall set IDLE_BCCH_CHAN to '0'; otherwise, the
25 mobile station shall set IDLE_BCCH_CHAN to '1'. The mobile station
26 shall set IDLE_CDMA_CHAN to CDMACH_S, IDLE_CDMABAND to
27 CDMABAND_S, IDLE_SID to SID_S, IDLE_NID to NID_S, and
28 IDLE_P_REV to P_REV_S.
- 29 + The mobile station shall then enter the *Traffic Channel Initialization*
30 *Substate* of the *Mobile Station Control on the Traffic Channel State*.
- 31 - If FREQ_INCL_R equals '1', the mobile station shall perform the following
32 actions:
- 33 + If the band class is not supported by the mobile station, the mobile
34 station shall send a *Mobile Station Reject Order* with ORDQ field set to
35 '00000110' (capability not supported by the mobile station) and
36 remain in the *Mobile Station Origination Attempt Substate*.
- 37 + If the band class is supported by the mobile station, the mobile
38 station shall perform the following actions:
- 39 ○ The mobile station shall store the frame offset (FRAME_OFFSET_S
40 = FRAME_OFFSET_R); the message encryption mode indicator
41 (ENCRYPT_MODE_S = ENCRYPT_MODE_R); the bypass indicator

- 1 (BYPASS_ALERT_ANSWER_s = BYPASS_ALERT_ANSWER_r); the
 2 granted mode (GRANTED_MODE_s = GRANTED_MODE_r); the
 3 default configuration (DEFAULT_CONFIG_s =
 4 DEFAULT_CONFIG_r); the idle Frequency Assignment
 5 (IDLE_CDMA_CHAN = CDMACH_s); the idle band class
 6 (IDLE_CDMABAND = CDMABAND_s); the band class
 7 (CDMABAND_s = BAND_CLASS_r); the Frequency Assignment
 8 (CDMACH_s = CDMA_FREQ_r); and the occurrences of PILOT_PN
 9 and PWR_COMB_IND for each included member of the Active Set.
- 10 ○ The mobile station shall perform the procedures in 2.6.11.2.
 - 11 ○ The mobile station shall set SERV_NEG_s to enabled.
 - 12 ○ The mobile station shall initialize CODE_CHAN_LIST as described
 13 in 2.6.8.
 - 14 ○ The mobile station shall set FPC_FCH_INIT_SETPT_s to
 15 FPC_FCH_INIT_SETPT_r, FPC_FCH_CURR_SETPT_s to
 16 FPC_FCH_INIT_SETPT_s, FPC_FCH_FER_s to FPC_FCH_FER_r,
 17 FPC_FCH_MIN_SETPT_s to FPC_FCH_MIN_SETPT_r,
 18 FPC_FCH_MAX_SETPT_s to FPC_FCH_MAX_SETPT_r, and
 19 FPC_PRI_CHAN_s to '0' if the mobile station supports any Radio
 20 Configuration greater than 2.
 - 21 ○ The mobile station shall set FPC_SUBCHAN_GAIN_s to
 22 FPC_SUBCHAN_GAIN_r.
 - 23 ○ The mobile station shall set RLGAIN_ADJ_s to RLGAIN_ADJ_r.
 - 24 ○ The mobile station shall set REV_FCH_GATING_MODE_s to
 25 REV_FCH_GATING_MODE_r.
 - 26 ○ The mobile station shall set REV_PWR_CNTL_DELAY_s to
 27 REV_PWR_CNTL_DELAY_r if REV_PWR_CNTL_DELAY_INCL_r is
 28 equal to '1'.
 - 29 ○ The mobile station shall set PLCM_TYPE_s to PLCM_TYPE_r if
 30 PLCM_TYPE_INCL_r is equal to '1'; otherwise, the mobile station
 31 shall set PLCM_TYPE_s as follows:
 - 32 ○ If P_REV_IN_USE_s is less than 11, set PLCM_TYPE_s to '0000';
 33 otherwise set PLCM_TYPE_s to '0100'.
 - 34 ○ The mobile station shall set PLCM_39_s to PLCM_39_r if
 35 PLCM_TYPE_r is equal to '0001'.
 - 36 ○ If the mobile station is currently monitoring the Paging Channel,
 37 the mobile station shall set IDLE_BCCH_CHAN to '0'; otherwise,
 38 the mobile station shall set IDLE_BCCH_CHAN to '1'. The mobile
 39 station shall set IDLE_SID to SID_s, IDLE_NID to NID_s,
 40 IDLE_P_REV to P_REV_s.

- 1 ○ The mobile station shall then tune to the new Frequency
2 Assignment and enter the *Traffic Channel Initialization Substate* of
3 the *Mobile Station Control on the Traffic Channel State*.
- 4 • If ASSIGN_MODE_r equals '001', the mobile station shall perform the following
5 actions:
- 6 - If FREQ_INCL_r equals '0', the mobile station shall perform the following
7 actions:
- 8 + If the message requires acknowledgment, the mobile station shall wait
9 until Layer 3 receives an indication from Layer 2 that the
10 acknowledgment to the message has been sent and acknowledged.
- 11 + The mobile station shall set CONFIG_MSG_SEQ_s and ACC_MSG_SEQ_s to
12 NULL (see 2.6.2.2) and shall set PILOT_PN_s to the pilot PN sequence
13 offset of the strongest pilot in the list (PILOT_PN_r).
- 14 + If the mobile station has not stored configuration parameters for the
15 Primary Paging Channel of the new base station, or if the stored
16 information is not current (see 2.6.2.2), the mobile station shall set
17 SYS_PAR_MSG_SEQ_s, NGHBR_LST_MSG_SEQ_s,
18 EXT_NGHBR_LST_MSG_SEQ_s, GEN_NGHBR_LST_MSG_SEQ_s,
19 CHAN_LST_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
20 FD_CHAN_LST_MSG_SEQ_s, EXT_SYS_PAR_MSG_SEQ_s,
21 USER_ZONE_ID_MSG_SEQ_s, PRI_NGHBR_LST_MSG_SEQ_s,
22 GLOB_SERV_REDIR_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s,
23 AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s,
24 FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s and
25 EXT_GLOB_SERV_REDIR_MSG_SEQ_s to NULL.
- 26 + The mobile station shall set PAGE_CHAN_s to '1' and PAGECH_s to the
27 Primary Paging Channel. If the mobile station was monitoring Forward
28 Common Control Channel, the mobile station shall set the PRAT_s to '00'.
29 The mobile station shall then begin monitoring the Primary Paging
30 Channel of the selected base station.
- 31 + If RESPOND_r is equal to '1', the mobile station shall perform the
32 following:
- 33 ○ If the *Extended Channel Assignment Message* does not require an
34 acknowledgment, the mobile station shall enter the *Update Overhead*
35 *Information Substate* with an origination indication within T_{34m}
36 seconds after receiving the *Extended Channel Assignment Message*.
- 37 ○ If the *Extended Channel Assignment Message* requires an
38 acknowledgment, the mobile station shall enter the *Update Overhead*
39 *Information Substate* with an origination indication within T_{34m}
40 seconds after Layer 3 receives an indication from Layer 2 that the
41 acknowledgment to the *Extended Channel Assignment Message* has
42 been sent and acknowledged.

- 1 - If $FREQ_INCL_r$ equals '1', the mobile station shall perform the following
2 actions:
- 3 + If the band class is not supported by the mobile station, the mobile
4 station shall send a *Mobile Station Reject Order* with $ORDQ$ field set to
5 '00000110' (capability not supported by the mobile station) and remain
6 in the *Mobile Station Origination Attempt Substate*.
- 7 + If the band class is supported by the mobile station, the mobile station
8 shall perform the following actions:
- 9 ○ If the message requires acknowledgment, the mobile station shall
10 wait until Layer 3 receives an indication from Layer 2 that the
11 acknowledgment to the message has been sent and acknowledged.
- 12 ○ The mobile station shall set $CDMACH_s$ to $CDMA_FREQ_r$ and
13 $CDMABAND_s$ to $BAND_CLASS_r$. Then the mobile station shall tune
14 to the new Frequency Assignment, measure the strength of each pilot
15 listed in the assignment using the Neighbor Set search procedures
16 specified in 2.6.6.2.1 and 2.6.6.2.2, set $PILOT_PN_s$ to the pilot PN
17 sequence offset of the strongest pilot in the list ($PILOT_PN_r$), and set
18 $CONFIG_MSG_SEQ_s$ and $ACC_MSG_SEQ_s$ to NULL (see 2.6.2.2).
- 19 ○ If the mobile station has not stored configuration parameters for the
20 Primary Paging Channel of the new base station, or if the stored
21 information is not current (see 2.6.2.2), the mobile station shall set
22 $SYS_PAR_MSG_SEQ_s$, $NGHBR_LST_MSG_SEQ_s$,
23 $EXT_NGHBR_LST_MSG_SEQ_s$, $GEN_NGHBR_LST_MSG_SEQ_s$,
24 $CHAN_LST_MSG_SEQ_s$, $EXT_CHAN_LST_MSG_SEQ_s$,
25 $FD_CHAN_LST_MSG_SEQ_s$, $EXT_SYS_PAR_MSG_SEQ_s$,
26 $USER_ZONE_ID_MSG_SEQ_s$, $PRI_NGHBR_LST_MSG_SEQ_s$,
27 $GLOB_SERV_REDIR_MSG_SEQ_s$, $AP_PILOT_INFO_MSG_SEQ_s$,
28 $AP_IDT_MSG_SEQ_s$, $AP_ID_TEXT_MSG_SEQ_s$, $GOI_MSG_SEQ_s$,
29 $FREQ_GOI_MSG_SEQ_s$, $ATIM_MSG_SEQ_s$ and
30 $EXT_GLOB_SERV_REDIR_MSG_SEQ_s$ to NULL.
- 31 ○ The mobile station shall set $PAGE_CHAN_s$ to '1' and $PAGECH_s$ to the
32 Primary Paging Channel. If the mobile station was monitoring
33 Forward Common Control Channel, the mobile station shall set the
34 $PRAT_s$ to '00'. The mobile station shall then begin monitoring the
35 Primary Paging Channel of the selected base station.
- 36 ○ If $RESPOND_r$ is equal to '1', the mobile station shall perform the
37 following:
- 38 ◇ If the *Extended Channel Assignment Message* does not require an
39 acknowledgment, the mobile station shall enter the *Update*
40 *Overhead Information Substate* with an origination indication
41 within T_{34m} seconds after receiving the *Extended Channel*
42 *Assignment Message*.

- 1 ◇ If the *Extended Channel Assignment Message* requires an
2 acknowledgment, the mobile station shall enter the *Update*
3 *Overhead Information Substate* with an origination indication
4 within T_{34m} seconds after Layer 3 receives an indication from
5 Layer 2 that the acknowledgment to the *Extended Channel*
6 *Assignment Message* has been sent and acknowledged.
- 7 • If ASSIGN_MODE_r equals '100', the mobile station shall perform the following
8 actions:
 - 9 - If PACA_s is equal to enabled, the mobile station shall set PACA_s to disabled
10 and PACA_CANCEL to '0', shall disable the PACA state timer, and should
11 indicate to the user that the PACA call has been canceled.
 - 12 - If GRANTED_MODE_r equals '00' and the multiplex option and radio
13 configuration specified in the DEFAULT_CONFIG_r field are not supported by
14 the mobile station, the mobile station shall send a *Mobile Station Reject Order*
15 with ORDQ field set to '00000110' (capability not supported by the mobile
16 station) and shall remain in the *Mobile Station Origination Attempt Substate*.
 - 17 - If GRANTED_MODE_r equals '11', P_REV_IN_USE_s is less than 11, and the
18 mobile station did not include a SYNC_ID field in the *Origination Message* or
19 the *Reconnect Message* that was transmitted in this substate, the mobile
20 station shall send a *Mobile Station Reject Order* with ORDQ field set to
21 '00000110' (capability not supported by the mobile station) and shall remain
22 in the *Mobile Station Origination Attempt Substate*.
 - 23 - If SYNC_ID_INCL_r is included and equals '1' and the mobile station does not
24 have stored service configuration corresponding to SYNC_ID_r for the current
25 SID_s and NID_s pair, the mobile station shall send a *Mobile Station Reject*
26 *Order* with ORDQ field set to '00011011' (Requested stored service
27 configuration is not available) and shall remain in the *Mobile Station*
28 *Origination Attempt Substate*.
 - 29 - If GRANTED_MODE_r equals '11', SR_ID_RESTORE_r is not equal to '111',
30 and a service option connection record corresponding to SR_ID_RESTORE_r
31 is not contained in the stored service configuration, the mobile station shall
32 send a *Mobile Station Reject Order* with ORDQ field set to '00000110'
33 (capability not supported by the mobile station) and shall remain in the
34 *Mobile Station Origination Attempt Substate*.
 - 35 - If GRANTED_MODE_r equals '00' and DEFAULT_CONFIG_r is not equal to
36 '100', the mobile station shall send a *Mobile Station Reject Order* with ORDQ
37 field set to '00001110' (RC does not match with DEFAULT_CONFIG) and
38 shall remain in the *Mobile Station Origination Attempt Substate* if one of the
39 following conditions is true:
 - 40 + FOR_RC_r is not equal to the Radio Configuration associated with
41 DEFAULT_CONFIG_r as specified in Table 3.7.2.3.2.21-2.

- 1 + REV_RC_r is not equal to the Radio Configuration associated with
 2 DEFAULT_CONFIG_r as specified in Table 3.7.2.3.2.21-2.
- 3 - If the mobile station does not support either of the Radio Configurations
 4 (FOR_RC or REV_RC), the mobile station shall send a *Mobile Station Reject*
 5 *Order* with the ORDQ field set to '00000110' (capability not supported by the
 6 mobile station) and remain in the *Mobile Station Origination Attempt Substate*.
- 7 - If CH_IND_r = '01' and the mobile station does not support the Fundamental
 8 Channel, the mobile station shall send a *Mobile Station Reject Order* with the
 9 ORDQ field set to '00000110' (capability not supported by the mobile
 10 station) and remain in the *Mobile Station Origination Attempt Substate*.
- 11 - If CH_IND_r = '10' and the mobile station does not support the Dedicated
 12 Control Channel, the mobile station shall send a *Mobile Station Reject Order*
 13 with the ORDQ field set to '00000110' (capability not supported by the
 14 mobile station) and remain in the *Mobile Station Origination Attempt Substate*.
- 15 - If CH_IND_r = '11' and the mobile station does not support the Dedicated
 16 Control Channel and Fundamental Channel concurrently, the mobile station
 17 shall send a *Mobile Station Reject Order* with the ORDQ field set to
 18 '00000110' (capability not supported by the mobile station) and remain in
 19 the *Mobile Station Origination Attempt Substate*.
- 20 - If FREQ_INCL_r equals '1' and if the band class (BAND_CLASS_r) is not
 21 supported by the mobile station, the mobile station shall send a *Mobile*
 22 *Station Reject Order* with ORDQ field set to '00000110' (capability not
 23 supported by the mobile station) and remain in the *Mobile Station Origination*
 24 *Attempt Substate*.
- 25 - If PLCM_TYPE_r equals '0010' and IMSI_O is derived from IMSI_T, or if
 26 PLCM_TYPE_r equals '0011' and IMSI_O is derived from IMSI_M, the mobile
 27 station shall send a *Mobile Station Reject Order* with the ORDQ field set to
 28 '00011100' (PLCM_TYPE mismatch) and remain in the *Mobile Station*
 29 *Origination Attempt Substate*.
- 30 - If FUNDICATED_BCNC_IND_r is included and set to 1, and the mobile
 31 station does not support the BCNC reception on the Forward Fundicated
 32 Channels assigned in this message, the mobile station shall send a *Mobile*
 33 *Station Reject Order* with the ORDQ field set to '00000110' (capability not
 34 supported by the mobile station) and remain in the *Mobile Station Origination*
 35 *Attempt Substate*.
- 36 - If the mobile station does not send a Mobile Station Reject Order as specified
 37 above, it shall continue to perform the actions specified below.
- 38 - The mobile station shall set
- 39 + IDLE_CDMABAND = CDMABAND_s
- 40 + IDLE_CDMACH = CDMACH_s
- 41 - If FREQ_INCL_r equals '1', the mobile station shall set

- 1 + CDMABAND_S = BAND_CLASS_T
- 2 + CDMACH_S = CDMA_FREQ_T
- 3 - The mobile station shall store the bypass indicator
4 (BYPASS_ALERT_ANSWER_S = BYPASS_ALERT_ANSWER_T).
- 5 - The mobile station shall store granted mode (GRANTED_MODE_S =
6 GRANTED_MODE_T). If GRANTED_MODE_T equals '11', the mobile station
7 shall perform the following:
- 8 + The mobile station shall store service reference identifier to be restored
9 (SR_ID_RESTORE_S = SR_ID_RESTORE_T).
- 10 + If SR_ID_RESTORE_T equals '000', the mobile station shall store bitmap of
11 service reference identifiers to be restored (SR_ID_RESTORE_BITMAP_S =
12 SR_ID_RESTORE_BITMAP_T).
- 13 - If SYNC_ID_INCL_T is included and equals '1', the mobile station shall store
14 the service configuration synchronization identifier (SYNC_ID_S = SYNC_ID_T).
- 15 - The mobile station shall store the default configuration (DEFAULT_CONFIG_S
16 = DEFAULT_CONFIG_T).
- 17 - The mobile station shall store the Forward Traffic Channel Radio
18 Configuration (FOR_RC_S = FOR_RC_T) and the Reverse Traffic Channel Radio
19 Configuration (REV_RC_S = REV_RC_T).
- 20 - The mobile station shall store the frame offset (FRAME_OFFSET_S =
21 FRAME_OFFSET_T).
- 22 - The mobile station shall store the message encryption mode indicator
23 (ENCRYPT_MODE_S = ENCRYPT_MODE_T).
- 24 - The mobile station shall perform the procedures in 2.6.11.2.
- 25 - The mobile station shall store the Forward power control subchannel relative
26 gain (FPC_SUBCHAN_GAIN_S = FPC_SUBCHAN_GAIN_T).
- 27 - The mobile station shall set RLGAIN_ADJ_S to RLGAIN_ADJ_T.
- 28 - The mobile station shall set REV_FCH_GATING_MODE_S to
29 REV_FCH_GATING_MODE_T.
- 30 - The mobile station shall set REV_PWR_CNTL_DELAY_S to
31 REV_PWR_CNTL_DELAY_T if REV_PWR_CNTL_DELAY_INCL_T is equal to '1'.
- 32 - If 3XFL_1XRL_INCL_T is equal to '1', the mobile station shall set
33 1XRL_FREQ_OFFSET_S to 1XRL_FREQ_OFFSET_T.
- 34 - The mobile station shall set PLCM_TYPE_S to PLCM_TYPE_T if
35 PLCM_TYPE_INCL_T is equal to '1'; otherwise, the mobile station shall set
36 PLCM_TYPE_S as follows:
- 37 + If P_REV_IN_USE_S is less than 11, set PLCM_TYPE_S to '0000'; otherwise
38 set PLCM_TYPE_S to '0100'.

- 1 - The mobile station shall set $PLCM_{39s}$ to $PLCM_{39r}$ if $PLCM_TYPE_r$ is equal
2 to '0001'.
- 3 - The mobile station shall set $EARLY_RL_TRANSMIT_IND_s$ to
4 $EARLY_RL_TRANSMIT_IND_r$.
- 5 - If $FIXED_PREAMBLE_TRANSMIT_IND_r$ is included, the mobile station shall
6 set $FIXED_PREAMBLE_TRANSMIT_IND_s$ to
7 $FIXED_PREAMBLE_TRANSMIT_IND_r$; otherwise, the mobile station shall set
8 $FIXED_PREAMBLE_TRANSMIT_IND_s$ to '0'. If
9 $FIXED_PREAMBLE_TRANSMIT_IND_s$ equals '1', the mobile station shall set
10 $FIXED_NUM_PREAMBLE_s$ to $FIXED_NUM_PREAMBLE_r$.
- 11 - If $TX_PWR_LIMIT_INCL_r$ is set to '1', the mobile station shall perform the
12 following:
- 13 + If the mobile station is being assigned to operate in the 1915MHz –
14 1920MHz block of the PCS band, the mobile station shall store the
15 transmit power limit $TX_PWR_LIMIT_s = (TX_PWR_LIMIT_r - 30dB)$;
- 16 + Otherwise, the mobile station shall set $TX_PWR_LIMIT_s$ to the limit
17 defined in [11] for the target base station.
- 18 - The mobile station shall store the channel indicator ($CH_IND_s = CH_IND_r$)
19 and the mobile station shall perform the following actions:
- 20 + If CH_IND_r equals '01', the mobile station shall set
21 $FPC_FCH_INIT_SETPT_s$ to $FPC_FCH_INIT_SETPT_r$,
22 $FPC_FCH_CURR_SETPT_s$ to $FPC_FCH_INIT_SETPT_s$, $FPC_FCH_FER_s$ to
23 $FPC_FCH_FER_r$, $FPC_FCH_MIN_SETPT_s$ to $FPC_FCH_MIN_SETPT_r$,
24 $FPC_FCH_MAX_SETPT_s$ to $FPC_FCH_MAX_SETPT_r$, and $FPC_PRI_CHAN_s$
25 to '0' if the mobile station supports any Radio Configuration greater than
26 2. Then for each included member of the Active Set, the mobile station
27 shall store the following:
- 28 ○ Set the $PILOT_PN$ field to $PILOT_PN_r$.
- 29 ○ Set the $ADD_PILOT_REC_INCL$ field to $ADD_PILOT_REC_INCL_r$. If
30 $ADD_PILOT_REC_INCL_r$ equals '1', the mobile station shall store the
31 following:
- 32 ◇ Set the $PILOT_REC_TYPE$ field of $PILOT_REC$ to
33 $PILOT_REC_TYPE_r$.
- 34 ◇ If $PILOT_REC_TYPE_r$ equals '000', the mobile station shall set the
35 TD_POWER_LEVEL field of $PILOT_REC$ to $TD_POWER_LEVEL_r$
36 and set the TD_MODE field of $PILOT_REC$ to TD_MODE_r .
- 37 ◇ If $PILOT_REC_TYPE_r$ is equal to '001', the mobile station shall
38 – Set the AUX_PILOT_QOF field of $PILOT_REC$ to QOF_r .

- 1 — If ADD_INFO_INCL_{2r} is equal to '1', set the AUX_PILOT_QOF2
- 2 field of PILOT_REC to QOF_{2r} and set the
- 3 AUX_PILOT_WALSH_CODE₂ field of PILOT_REC to
- 4 AUX_PILOT_WALSH_{2r} with the Walsh Code length specified
- 5 by WALSH_LENGTH_{2r}; otherwise, set the AUX_PILOT_QOF2
- 6 field of PILOT_REC to QOF_r and set the
- 7 AUX_PILOT_WALSH_CODE₂ field of PILOT_REC to
- 8 AUX_PILOT_WALSH_r with the Walsh Code length specified by
- 9 WALSH_LENGTH_r.
- 10 ○ Set the PWR_COMB_IND field to PWR_COMB_IND_r.
- 11 ○ Set the CODE_CHAN_FCH field to CODE_CHAN_FCH_r.
- 12 ○ Set the QOF_MASK_ID_FCH field to QOF_MASK_ID_FCH_r.
- 13 + If CH_IND_r equals '01' and 3X_FCH_INFO_INCL_r equals '1', for each
- 14 included member of the Active Set, the mobile station store the following:
- 15 ○ If 3X_FCH_LOW_INCL_r equals '1', set the QOF_MASK_ID_FCH_LOW
- 16 field to QOF_MASK_ID_FCH_LOW_r and the CODE_CHAN_FCH_LOW
- 17 field to CODE_CHAN_FCH_LOW_r. Otherwise, set the
- 18 QOF_MASK_ID_FCH_LOW field to QOF_MASK_ID_FCH_r and the
- 19 CODE_CHAN_FCH_LOW to CODE_CHAN_FCH_r.
- 20 ○ If 3X_FCH_HIGH_INCL_r equals '1', set the QOF_MASK_ID_FCH_HIGH
- 21 field to QOF_MASK_ID_FCH_HIGH_r and the
- 22 CODE_CHAN_FCH_HIGH field to CODE_CHAN_FCH_HIGH_r.
- 23 Otherwise, set the QOF_MASK_ID_FCH_HIGH field to
- 24 QOF_MASK_ID_FCH_r and the CODE_CHAN_FCH_HIGH to
- 25 CODE_CHAN_FCH_r.
- 26 + If CH_IND_r equals '10', the mobile station shall set
- 27 FPC_DCCH_INIT_SETPT_s to FPC_DCCH_INIT_SETPT_r,
- 28 FPC_DCCH_CURR_SETPT_s to FPC_DCCH_CURR_SETPT_r,
- 29 FPC_DCCH_FER_s to FPC_DCCH_FER_r, FPC_DCCH_MIN_SETPT_s to
- 30 FPC_DCCH_MIN_SETPT_r, FPC_DCCH_MAX_SETPT_s to
- 31 FPC_DCCH_MAX_SETPT_r, FUNDICATED_BCNC_IND_s to
- 32 FUNDICATED_BCNC_IND_r, and FPC_PRI_CHAN_s to '1' if the mobile
- 33 station supports any Radio Configuration greater than 2. Then for each
- 34 included member of the Active Set, the mobile station shall store the
- 35 following:
- 36 ○ Set the PILOT_PN to PILOT_PN_r.
- 37 ○ Set the ADD_PILOT_REC_INCL field to ADD_PILOT_REC_INCL. If
- 38 ADD_PILOT_REC_INCL is equal to '1', the mobile station shall store
- 39 the following:
- 40 ◇ Set the PILOT_REC_TYPE field of PILOT_REC to
- 41 PILOT_REC_TYPE_r.

- 1 ◇ If PILOT_REC_TYPE_r equals '000', the mobile station shall set the
2 TD_POWER_LEVEL field of PILOT_REC to TD_POWER_LEVEL_r
3 and set the TD_MODE field of PILOT_REC to TD_MODE_r.
- 4 ◇ If PILOT_REC_TYPE_r is equal to '001', the mobile station shall
5 — Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
6 — Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
7 AUX_PILOT_WALSH_r with the Walsh Code length specified by
8 WALSH_LENGTH_r.
- 9 ◇ If PILOT_REC_TYPE_r is equal to '010', the mobile station shall:
10 — Set the AUX_PILOT_TD_QOF field of PILOT_REC to QOF_r.
11 — Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
12 AUX_WALSH_r with the Walsh Code length specified by
13 WALSH_LENGTH_r.
14 — Set the AUX_TD_POWER_LEVEL field of PILOT_REC to
15 AUX_TD_POWER_LEVEL_r.
16 — Set the TD_MODE field of PILOT_REC to TD_MODE_r.
- 17 ◇ If PILOT_REC_TYPE_r is equal to '011', the mobile station shall:
18 — Set the SR3_PRIMARY_PILOT field of PILOT_REC to
19 SR3_PRIMARY_PILOT_r.
20 — Set the SR3_PILOT_POWER1 field of PILOT_REC to
21 SR3_PILOT_POWER1_r.
22 — Set the SR3_PILOT_POWER2 field of PILOT_REC to
23 SR3_PILOT_POWER2_r.
- 24 ◇ If PILOT_REC_TYPE_r is equal to '100', the mobile station shall:
25 — Set the SR3_PRIMARY_PILOT field of PILOT_REC to
26 SR3_PRIMARY_PILOT_r.
27 — Set the SR3_PILOT_POWER1 field of PILOT_REC to
28 SR3_PILOT_POWER1_r.
29 — Set the SR3_PILOT_POWER2 field of PILOT_REC to
30 SR3_PILOT_POWER2_r.
31 — Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
32 — Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
33 AUX_PILOT_WALSH_r with the Walsh Code length specified by
34 WALSH_LENGTH_r.

- 1 + If CH_IND_r equals '10', and FUNDICATED_BCNC_IND_r equals '1', for
2 each included member of the Active Set, the mobile station shall store
3 the following:
- 4 ○ Set FOR_CPCCH_WALSH_s to FOR_CPCCH_WALSH_r.
 - 5 ○ Set FOR_CPCSCH_s to FOR_CPCSCH_r.
- 6 + If CH_IND_r equals '11', the mobile station shall set
7 FPC_FCCH_INIT_SETPT_s to FPC_FCH_INIT_SETPT_r,
8 FPC_FCH_CURR_SETPT_s to FPC_FCH_INIT_SETPT_s, FPC_FCH_FER_s to
9 FPC_FCH_FER_r, FPC_FCH_MIN_SETPT_s to FPC_FCH_MIN_SETPT_r,
10 FPC_FCH_MAX_SETPT_s to FPC_FCH_MAX_SETPT_r,
11 FPC_DCCH_INIT_SETPT_s to FPC_DCCH_INIT_SETPT_r,
12 FPC_DCCH_CURR_SETPT_s to FPC_DCCH_INIT_SETPT_s,
13 FPC_DCCH_FER_s to FPC_DCCH_FER_r, FPC_DCCH_MIN_SETPT_s to
14 FPC_DCCH_MIN_SETPT_r, FPC_DCCH_MAX_SETPT_s to
15 FPC_DCCH_MAX_SETPT_r, FPC_PRI_CHAN_s to FPC_PRI_CHAN_r, and
16 FUNDICATED_BCNC_IND_s to FUNDICATED_BCNC_IND_r. Then for each
17 included member of the Active Set, the mobile station shall store the
18 following:
- 19 ○ Set the PILOT_PN to PILOT_PN_r.
 - 20 ○ Set the ADD_PILOT_REC_INCL field to ADD_PILOT_REC. If
21 ADD_PILOT_REC_INCL is equal to '1', the mobile station shall store
22 the following:
 - 23 ◇ Set the PILOT_REC_TYPE field of PILOT_REC to
24 PILOT_REC_TYPE_r.
 - 25 ◇ If PILOT_REC_TYPE_r equals '000', the mobile station shall set the
26 TD_POWER_LEVEL field of PILOT_REC to TD_POWER_LEVEL_r
27 and set the TD_MODE field of PILOT_REC to TD_MODE_r.
 - 28 ◇ If PILOT_REC_TYPE_r is equal to '001', the mobile station shall
 - 29 — Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
 - 30 — Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
31 AUX_PILOT_WALSH_r with the Walsh Code length specified by
32 WALSH_LENGTH_r.
 - 33 ◇ If PILOT_REC_TYPE_r is equal to '010', the mobile station shall:
 - 34 — Set the AUX_PILOT_TD_QOF field of PILOT_REC to QOF_r.
 - 35 — Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
36 AUX_WALSH_r with the Walsh Code length specified by
37 WALSH_LENGTH_r.
 - 38 — Set the AUX_TD_POWER_LEVEL field of PILOT_REC to
39 AUX_TD_POWER_LEVEL_r.

- 1 – Set the TD_MODE field of PILOT_REC to TD_MODE_r.
- 2 ◇ If PILOT_REC_TYPE_r is equal to ‘011’, the mobile station shall:
 - 3 – Set the SR3_PRIMARY_PILOT field of PILOT_REC to
 - 4 SR3_PRIMARY_PILOT_r.
 - 5 – Set the SR3_PILOT_POWER1 field of PILOT_REC to
 - 6 SR3_PILOT_POWER1_r.
 - 7 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
 - 8 SR3_PILOT_POWER2_r.
 - 9 ◇ If PILOT_REC_TYPE_r is equal to ‘100’, the mobile station shall:
 - 10 – Set the SR3_PRIMARY_PILOT field of PILOT_REC to
 - 11 SR3_PRIMARY_PILOT_r.
 - 12 – Set the SR3_PILOT_POWER1 field of PILOT_REC to
 - 13 SR3_PILOT_POWER1_r.
 - 14 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
 - 15 SR3_PILOT_POWER2_r.
 - 16 – Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
 - 17 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
 - 18 AUX_PILOT_WALSH_r with the Walsh Code length specified by
 - 19 WALSH_LENGTH_r.
 - 20 – If ADD_INFO_INCL1_r is equal to ‘1’, set the AUX_PILOT_QOF1
 - 21 field of PILOT_REC to QOF1_r and set the
 - 22 AUX_PILOT_WALSH_CODE1 field of PILOT_REC to
 - 23 AUX_PILOT_WALSH1_r with the Walsh Code length specified
 - 24 by WALSH_LENGTH1_r; otherwise, set the AUX_PILOT_QOF1
 - 25 field of PILOT_REC to QOF_r and set the
 - 26 AUX_PILOT_WALSH_CODE1 field of PILOT_REC to
 - 27 AUX_PILOT_WALSH_r with the Walsh Code length specified by
 - 28 WALSH_LENGTH_r.
 - 29 – If ADD_INFO_INCL2_r is equal to ‘1’, set the AUX_PILOT_QOF2
 - 30 field of PILOT_REC to QOF2_r and set the
 - 31 AUX_PILOT_WALSH_CODE2 field of PILOT_REC to
 - 32 AUX_PILOT_WALSH2_r with the Walsh Code length specified
 - 33 by WALSH_LENGTH2_r; otherwise, set the AUX_PILOT_QOF2
 - 34 field of PILOT_REC to QOF_r and set the
 - 35 AUX_PILOT_WALSH_CODE2 field of PILOT_REC to
 - 36 AUX_PILOT_WALSH_r with the Walsh Code length specified by
 - 37 WALSH_LENGTH_r.
 - 38 ○ Set the PWR_COMB_IND field to PWR_COMB_IND_r
 - 39 ○ Set the CODE_CHAN_FCH field to CODE_CHAN_FCH_r.

- 1 ○ Set the QOF_MASK_ID_FCH field to QOF_MASK_ID_FCH_r.
- 2 ○ Set the CODE_CHAN_DCCH field to CODE_CHAN_DCCH_r.
- 3 ○ Set the QOF_MASK_ID_DCCH field to QOF_MASK_ID_DCCH_r.
- 4 + If CH_IND_r equals '11' and 3X_FCH_INFO_INCL_r equals '1', for each
- 5 included member of the Active Set, the mobile station store the following:
- 6 ○ If 3X_FCH_LOW_INCL_r equals '1', set the QOF_MASK_ID_FCH_LOW
- 7 field to QOF_MASK_ID_FCH_LOW_r and the CODE_CHAN_FCH_LOW
- 8 field to CODE_CHAN_FCH_LOW_r. Otherwise, set the
- 9 QOF_MASK_ID_FCH_LOW field to QOF_MASK_ID_FCH_r and the
- 10 CODE_CHAN_FCH_LOW to CODE_CHAN_FCH_r.
- 11 ○ If 3X_FCH_HIGH_INCL_r equals '1', set the QOF_MASK_ID_FCH_HIGH
- 12 field to QOF_MASK_ID_FCH_HIGH_r and the
- 13 CODE_CHAN_FCH_HIGH field to CODE_CHAN_FCH_HIGH_r.
- 14 Otherwise, set the QOF_MASK_ID_FCH_HIGH field to
- 15 QOF_MASK_ID_FCH_r and the CODE_CHAN_FCH_HIGH to
- 16 CODE_CHAN_FCH_r.
- 17 + If CH_IND_r equals '11' and FUNDICATED_BCNC_IND_r equals '1', the
- 18 mobile station shall:
- 19 ○ Set REV_FCH_ASSIGNED_s to REV_FCH_ASSIGNED_r.
- 20 + If CH_IND_r equals '11' and FUNDICATED_BCNC_IND_r equals '1', the
- 21 mobile station shall set FCH_BCNC_IND to '1'; otherwise, the mobile
- 22 station shall set FCH_BCNC_IND to '0'.
- 23 + If CH_IND_r equals '11', FUNDICATED_BCNC_IND_r equals '1', and
- 24 FOR_CPCCH_INFO_INCL_r is included and is set to '1', for each included
- 25 member of the Active Set, the mobile station shall store the following:
- 26 ○ Set FOR_CPCCH_WALSH_s to FOR_CPCCH_WALSH_r.
- 27 ○ Set FOR_CPCSCH_s to FOR_CPCSCH_r.
- 28 + If CH_IND_r equals '11', FUNDICATED_BCNC_IND_r equals '1', and
- 29 ADD_PLCM_FOR_FCH_INCL_r is included and is set to '1', the mobile
- 30 station shall store the following:
- 31 ○ Set ADD_PLCM_FOR_FCH_TYPE_s to ADD_PLCM_FOR_FCH_TYPE_r.
- 32 ○ Set ADD_PLCM_FOR_FCH_39_s to ADD_PLCM_FOR_FCH_39_r if
- 33 ADD_PLCM_FOR_FCH_TYPE_r is equal to '1'.
- 34 + If CH_IND_r equals '11' and 3X_DCCH_INFO_INCL_r equals '1', for each
- 35 included member of the Active Set, the mobile station store the following:

- 1 ○ If 3X_DCCH_LOW_INCL_T equals '1', set the
2 QOF_MASK_ID_DCCH_LOW field to QOF_MASK_ID_DCCH_LOW_T
3 and the CODE_CHAN_DCCH_LOW field to
4 CODE_CHAN_DCCH_LOW_T. Otherwise, set the
5 QOF_MASK_ID_DCCH_LOW field to QOF_MASK_ID_FCH_T and the
6 CODE_CHAN_DCCH_LOW to CODE_CHAN_FCH_T.
- 7 ○ If 3X_DCCH_HIGH_INCL_T equals '1', set the
8 QOF_MASK_ID_DCCH_HIGH field to QOF_MASK_ID_DCCH_HIGH_T
9 and the CODE_CHAN_DCCH_HIGH field to
10 CODE_CHAN_DCCH_HIGH_T. Otherwise, set the
11 QOF_MASK_ID_DCCH_HIGH field to QOF_MASK_ID_FCH_T and the
12 CODE_CHAN_DCCH_HIGH to CODE_CHAN_FCH_T.
- 13 - The mobile station shall initialize CODE_CHAN_LIST as described in 2.6.8,
14 and shall set SERV_NEG_S to enabled.
- 15 - If the mobile station is currently monitoring the Paging Channel, the mobile
16 station shall set IDLE_BCCH_CHAN to '0'; otherwise, the mobile station shall
17 set IDLE_BCCH_CHAN to '1'. The mobile station shall set IDLE_SID to SID_S,
18 IDLE_NID to NID_S, and IDLE_P_REV to P_REV_S.
- 19 - If FREQ_INCL_T equals '1', the mobile station shall then tune to the new
20 frequency assignment.
- 21 - The mobile station shall then enter the *Traffic Channel Initialization Substate*
22 of the *Mobile Station Control on the Traffic Channel State*.
- 23 • If ASSIGN_MODE_T equals '101', the mobile station shall perform the following
24 actions:
- 25 - If PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled
26 and PACA_CANCEL to '0', shall disable the PACA state timer, and should
27 indicate to the user that the PACA call has been canceled.
- 28 - If GRANTED_MODE_T equals '11', P_REV_IN_USE_S is less than 11, and the
29 mobile station did not include a SYNC_ID field in the *Origination Message* or
30 the *Reconnect Message* that was transmitted in this substate, the mobile
31 station shall send a *Mobile Station Reject Order* with ORDQ field set to
32 '0000110' (capability not supported by the mobile station) and shall remain
33 in the *Mobile Station Origination Attempt Substate*.
- 34 - If SYNC_ID_INCL_T is included and equals '1' and the mobile station does not
35 have stored service configuration corresponding to SYNC_ID_T for the current
36 SID_S and NID_S pair, the mobile station shall send a *Mobile Station Reject*
37 *Order* with ORDQ field set to '00011011' (Requested stored service
38 configuration is not available) and shall remain in the *Mobile Station*
39 *Origination Attempt Substate*.
- 40 - If GRANTED_MODE_T equals '11', SR_ID_RESTORE_T is not equal to '111', and
41 a service option connection record corresponding to SR_ID_RESTORE_T is not
42 contained in the stored service configuration, the mobile station shall send a

- 1 *Mobile Station Reject Order* with ORDQ field set to '00000110' (capability not
 2 supported by the mobile station) and shall remain in the *Mobile Station*
 3 *Origination Attempt Substate*.
- 4 - If the mobile station does not support any of the specified Radio
 5 Configurations (FOR_PDCH_RC, FOR_FCH_DCCH_RC or
 6 REV_FCH_DCCH_RC), the mobile station shall send a *Mobile Station Reject*
 7 *Order* with the ORDQ field set to '00000110' (capability not supported by the
 8 mobile station) and remain in the *Mobile Station Origination Attempt Substate*.
- 9 - If EXT_CH_IND_r signals the allocation of a F-FCH or R-FCH and the mobile
 10 station does not support Fundamental Channel, the mobile station shall
 11 send a *Mobile Station Reject Order* with the ORDQ field set to '00000110'
 12 (capability not supported by the mobile station) and remain in the *Mobile*
 13 *Station Origination Attempt Substate*.
- 14 - If EXT_CH_IND_r signals the allocation of a F-DCCH or R-DCCH and the
 15 mobile station does not support the Dedicated Control Channel, the mobile
 16 station shall send a *Mobile Station Reject Order* with the ORDQ field set to
 17 '00000110' (capability not supported by the mobile station) and remain in
 18 the *Mobile Station Origination Attempt Substate*.
- 19 - If FREQ_INCL_r equals '1' and if the band class (BAND_CLASS_r) is not
 20 supported by the mobile station, the mobile station shall send a *Mobile*
 21 *Station Reject Order* with ORDQ field set to '00000110' (capability not
 22 supported by the mobile station) and remain in the *Mobile Station Origination*
 23 *Attempt Substate*.
- 24 - If PLCM_TYPE_r equals '0010' and IMSI_O is derived from IMSI_T, or if
 25 PLCM_TYPE_r equals '0011' and IMSI_O is derived from IMSI_M, the mobile
 26 station shall send a *Mobile Station Reject Order* with the ORDQ field set to
 27 '00011100' (PLCM_TYPE mismatch) and remain in the *Mobile Station*
 28 *Origination Attempt Substate*.
- 29 - If FUNDICATED_BCNC_IND_r is included and set to 1, and the mobile
 30 station does not support BCNC reception on the Forward Fundicated
 31 Channels assigned in this message, the mobile station shall send a *Mobile*
 32 *Station Reject Order* with the ORDQ field set to '00000110' (capability not
 33 supported by the mobile station) and remain in the *Mobile Station Origination*
 34 *Attempt Substate*.
- 35 - If the mobile station does not send a *Mobile Station Reject Order* as specified
 36 above, it shall continue to perform the actions specified below.
- 37 - Layer 3 shall send SIG-HandoffPDCH.Indication (handoff_type = ASSIGN) to
 38 the MAC layer.
- 39 - If FREQ_INCL_r equals '1', the mobile station shall set
 40 + CDMABAND_s = BAND_CLASS_r
 41 + CDMACH_s = CDMA_FREQ_r

- 1 - The mobile station shall store the bypass indicator
2 (BYPASS_ALERT_ANSWER_S = BYPASS_ALERT_ANSWER_T).
- 3 - The mobile station shall store the granted mode indicator
4 (GRANTED_MODE_S = GRANTED_MODE_T). If GRANTED_MODE_T equals '11',
5 the mobile station shall perform the following:
- 6 + The mobile station shall store the service reference identifier to be
7 restored (SR_ID_RESTORE_S = SR_ID_RESTORE_T).
- 8 + If SR_ID_RESTORE_T equals '000', the mobile station shall store bitmap of
9 service reference identifiers to be restored (SR_ID_RESTORE_BITMAP_S =
10 SR_ID_RESTORE_BITMAP_T).
- 11 + If SYNC_ID_INCL_T is included and equals '1', the mobile station shall
12 store the service configuration synchronization identifier (SYNC_ID_S =
13 SYNC_ID_T).
- 14 - The mobile station shall store the frame offset (FRAME_OFFSET_S =
15 FRAME_OFFSET_T).
- 16 - The mobile station shall store the message encryption mode indicator
17 (ENCRYPT_MODE_S = ENCRYPT_MODE_T).
- 18 - The mobile station shall perform the following procedures in the order listed
19 below:
- 20 + If D_SIG_ENCRYPT_MODE_T is included, the mobile station shall perform
21 the following:
- 22 o If D_SIG_ENCRYPT_MODE_T is equal to '000', the mobile station shall
23 set D_SIG_ENCRYPT_MODE_S to C_SIG_ENCRYPT_MODE_S;
24 otherwise, the mobile station shall set D_SIG_ENCRYPT_MODE_S to
25 D_SIG_ENCRYPT_MODE_T, ENC_KEY_S to the most recently generated
26 CMEAKEY in the mobile station associated with AUTHR of the
27 *Origination Message*, and EXT_ENCRYPT_SEQ[0] and
28 EXT_ENCRYPT_SEQ[1] to 256 × ENC_SEQ_H (the ENC_SEQ_H field
29 in the *Origination Message*).
- 30 + If ENC_KEY_SIZE_T is included, the mobile station shall set
31 ENC_KEY_SIZE_S to ENC_KEY_SIZE_T.
- 32 + If C_SIG_ENCRYPT_MODE is included, the mobile station shall set
33 C_SIG_ENCRYPT_MODE_S to C_SIG_ENCRYPT_MODE_T.
- 34 - The mobile station shall set EXT_CH_IND_S to EXT_CH_IND_T.
- 35 - The mobile station shall set CH_IND_S to '00'.
- 36 - If EXT_CH_IND_T signals the allocation of a F-FCH or a F-DCCH, the mobile
37 station shall store the Forward power control subchannel relative gain
38 [FPC_SUBCHAN_GAIN_S = FPC_SUBCHAN_GAIN_T].
- 39 - The mobile station shall set RLGAIN_ADJ_S to RLGAIN_ADJ_T.

- 1 - The mobile station shall set $PLCM_TYPE_S$ to $PLCM_TYPE_R$ if
2 $PLCM_TYPE_INCL_R$ is equal to '1'; otherwise, the mobile station shall set
3 $PLCM_TYPE_S$ as follows:
- 4 + If $P_REV_IN_USE_S$ is less than 11, set $PLCM_TYPE_S$ to '0000'; otherwise
5 set $PLCM_TYPE_S$ to '0100'.
- 6 - The mobile station shall set $PLCM_39_S$ to $PLCM_39_R$ if $PLCM_TYPE_R$ is equal
7 to '0001'.
- 8 - The mobile station shall set $FUNDICATED_BCMC_IND_S$ to
9 $FUNDICATED_BCMC_IND_R$. If $FUNDICATED_BCMC_IND_R$ equals '1' and the
10 $EXT_CH_IND_R$ signals the allocation of a F-FCH, the mobile station shall set
11 FCH_BCMC_IND to '1'; otherwise, the mobile station shall set
12 FCH_BCMC_IND to '0'.
- 13 - If $FUNDICATED_BCMC_IND_R$ equals '1' and $ADD_PLCM_FOR_FCH_INCL_R$ is
14 included and is set to '1', the mobile station shall store the following:
- 15 + Set $ADD_PLCM_FOR_FCH_TYPE_S$ to $ADD_PLCM_FOR_FCH_TYPE_R$.
- 16 + Set $ADD_PLCM_FOR_FCH_39_S$ to $ADD_PLCM_FOR_FCH_39_R$ if
17 $ADD_PLCM_FOR_FCH_TYPE_R$ is equal to '1'.
- 18 - The mobile station shall set $REV_FCH_GATING_MODE_S$ to
19 $REV_FCH_GATING_MODE_R$.
- 20 - The mobile station shall set $REV_PWR_CNTL_DELAY_S$ to
21 $REV_PWR_CNTL_DELAY_R$ if $REV_PWR_CNTL_DELAY_INCL_R$ is equal to '1'.
- 22 - The mobile station shall set $FULL_CI_FEEDBACK_IND_S$ to
23 $FULL_CI_FEEDBACK_IND_R$.
- 24 - If $EXT_CH_IND_R$ equals '01000', the mobile station shall set
25 $FOR_CPCCH_RATE_S$ to $FOR_CPCCH_RATE_R$, and
26 $FOR_CPCCH_UPDATE_RATE_S$ to $FOR_CPCCH_UPDATE_RATE_R$; otherwise,
27 the mobile station shall set $FOR_CPCCH_RATE_S$ to '00', and
28 $FOR_CPCCH_UPDATE_RATE_S$ to '00'.
- 29 - The mobile station shall set $REV_CQICH_FRAME_OFFSET_S$ to
30 $REV_CQICH_FRAME_OFFSET_R$.
- 31 - The mobile station shall set $REV_CQICH_REPS_S$ to $REV_CQICH_REPS_R$.
- 32 - The mobile station shall set $REV_ACKCH_REPS_S$ to $REV_ACKCH_REPS_R$.
- 33 - The mobile station shall set $FOR_PDCH_RC_S$ to $FOR_PDCH_RC_R$.
- 34 - If $EXT_CH_IND_R$ signals the allocation of a R-PDCH, the mobile station shall
35 set $REV_PDCH_RC_S$ to $REV_PDCH_RC_R$.
- 36 - If $EXT_CH_IND_R$ signals the allocation of a F-FCH, the mobile station shall
37 set $FOR_FCH_RC_S$ to $FOR_FCH_DCCH_RC_R$.
- 38 - If $EXT_CH_IND_R$ signals the allocation of a F-DCCH, the mobile station shall
39 set $FOR_DCCH_RC_S$ to $FOR_FCH_DCCH_RC_R$.

- 1 - If EXT_CH_IND_r signals the allocation of a R-FCH, the mobile station shall
2 set REV_FCH_RC_s to REV_FCH_DCCH_RC_r.
- 3 - If EXT_CH_IND_r signals the allocation of a R-DCCH, the mobile station shall
4 set REV_DCCH_RC_s to REV_FCH_DCCH_RC_r.
- 5 - If EXT_CH_IND_r signals the allocation of a F-FCH and a F-DCCH, the mobile
6 station shall set FPC_PRI_CHAN_s to FPC_PRI_CHAN_r.
- 7 - If EXT_CH_IND_r signals the allocation of a F-FCH, the mobile station shall
8 set FPC_FCH_INIT_SETPT_s to FPC_FCH_INIT_SETPT_r,
9 FPC_FCH_CURR_SETPT_s to FPC_FCH_INIT_SETPT_s, FPC_FCH_FER_s to
10 FPC_FCH_FER_r, FPC_FCH_MIN_SETPT_s to FPC_FCH_MIN_SETPT_r,
11 FPC_FCH_MAX_SETPT_s to FPC_FCH_MAX_SETPT_r.
- 12 - If EXT_CH_IND_r signals the allocation of a F-DCCH, the mobile station shall
13 set FPC_DCCH_INIT_SETPT_s to FPC_DCCH_INIT_SETPT_r,
14 FPC_DCCH_CURR_SETPT_s to FPC_DCCH_INIT_SETPT_s, FPC_DCCH_FER_s to
15 FPC_DCCH_FER_r, FPC_DCCH_MIN_SETPT_s to FPC_DCCH_MIN_SETPT_r,
16 FPC_DCCH_MAX_SETPT_s to FPC_DCCH_MAX_SETPT_r.
- 17 - If EARLY_RL_TRANSMIT_IND_r is included, the mobile station shall set
18 EARLY_RL_TRANSMIT_IND_s to EARLY_RL_TRANSMIT_IND_r; otherwise, the
19 mobile station shall set EARLY_RL_TRANSMIT_IND_s to '0'.
- 20 - If FIXED_PREAMBLE_TRANSMIT_IND_r is included, the mobile station shall
21 set FIXED_PREAMBLE_TRANSMIT_IND_s to
22 FIXED_PREAMBLE_TRANSMIT_IND_r; otherwise, the mobile station shall set
23 FIXED_PREAMBLE_TRANSMIT_IND_s to '0'. If
24 FIXED_PREAMBLE_TRANSMIT_IND_s equals '1', the mobile station shall set
25 FIXED_NUM_PREAMBLE_s to FIXED_NUM_PREAMBLE_r.
- 26 - If TX_PWR_LIMIT_INCL_r is set to '1', the mobile station shall perform the
27 following:
- 28 + If the mobile station is being assigned to operate in the 1915MHz –
29 1920MHz block of the PCS band, the mobile station shall store the
30 transmit power limit TX_PWR_LIMIT_s = (TX_PWR_LIMIT_r - 30dB);
- 31 + Otherwise, the mobile station shall set TX_PWR_LIMIT_s to the limit
32 defined in [11] for the target base station.
- 33 - If FOR_PDCH_PARAMS_INCL_r is equal to '1', the mobile station shall set
34 FOR_PDCH_COMMON_PARAMS_s = '0'; otherwise, if
35 FOR_PDCH_COMMON_PARAMS_s is equal to '0', the mobile station shall send
36 a *Mobile Station Reject Order* with ORDQ equal to '00000011' (message
37 structure not acceptable) and remain in the current state.
- 38 - If FOR_PDCH_RLGAIN_INCL_r is included and equal to '1', the mobile station
39 shall set RLGAIN_ACKCH_PILOT_s to RLGAIN_ACKCH_PILOT_r, and
40 RLGAIN_CQICH_PILOT_s to RLGAIN_CQICH_PILOT_r.

- 1 - If FOR_PDCH_PARMS_INCL_r is equal to '1', the mobile station shall set
2 NUM_SOFT_SWITCHING_FRAMES_s to NUM_SOFT_SWITCHING_FRAMES_r +
3 1, and NUM_SOFTER_SWITCHING_FRAMES_s to
4 NUM_SOFTER_SWITCHING_FRAMES_r + 1.
- 5 - If CHM_SWITCHING_PARMS_INCL_r is included and equal to '1', the mobile
6 station shall set NUM_SOFT_SWITCHING_FRAMES_CHM_s to
7 NUM_SOFT_SWITCHING_FRAMES_CHM_r + 1, and
8 NUM_SOFTER_SWITCHING_FRAMES_CHM_s to
9 NUM_SOFTER_SWITCHING_FRAMES_CHM_r + 1.
- 10 - If CHM_SWITCHING_PARMS_INCL_r is included and equal to '0', the mobile
11 station shall set NUM_SOFT_SWITCHING_FRAMES_CHM_s to
12 NUM_SOFT_SWITCHING_FRAMES_r + 1, and
13 NUM_SOFTER_SWITCHING_FRAMES_CHM_s to
14 NUM_SOFTER_SWITCHING_FRAMES_r + 1.
- 15 - If FOR_PDCH_PARMS_INCL_r is equal to '1', the mobile station shall set
16 NUM_SOFT_SWITCHING_SLOTS_s according to Table 3.7.2.3.2.21-9 based on
17 the value of NUM_SOFT_SWITCHING_SLOTS_r.
- 18 - If FOR_PDCH_PARMS_INCL_r is equal to '1', the mobile station shall set
19 NUM_SOFTER_SWITCHING_SLOTS_s according to Table 3.7.2.3.2.21-9 based
20 on the value of NUM_SOFTER_SWITCHING_SLOTS_r.
- 21 - If CHM_SWITCHING_PARMS_INCL_r is included and equal to '1', the mobile
22 station shall:
- 23 + Set NUM_SOFT_SWITCHING_SLOTS_CHM_s according to Table
24 3.7.2.3.2.21-9 based on the value of
25 NUM_SOFT_SWITCHING_SLOTS_CHM_r.
- 26 + Set NUM_SOFTER_SWITCHING_SLOTS_CHM_s according to Table
27 3.7.2.3.2.21-9 based on the value of
28 NUM_SOFTER_SWITCHING_SLOTS_CHM_r.
- 29 - If CHM_SWITCHING_PARMS_INCL_r is included and equal to '0', the mobile
30 station shall:
- 31 + Set NUM_SOFT_SWITCHING_SLOTS_CHM_s according to Table
32 3.7.2.3.2.21-9 based on the value of NUM_SOFT_SWITCHING_SLOTS_r.
- 33 + Set NUM_SOFTER_SWITCHING_SLOTS_CHM_s according to Table
34 3.7.2.3.2.21-9 based on the value of
35 NUM_SOFTER_SWITCHING_SLOTS_r.
- 36 - If FOR_PDCH_PARMS_INCL_r is equal to '1', the mobile station shall set
37 PDCH_SOFT_SWITCHING_DELAY_s to PDCH_SOFT_SWITCHING_DELAY_r +
38 1, and PDCH_SOFTER_SWITCHING_DELAY_s to
39 PDCH_SOFTER_SWITCHING_DELAY_r + 1.
- 40 - If TX_DISABLED_TIMER_INCL_r is equal to '1', the mobile station shall set
41 TX_DISABLED_TIMER_s to TX_DISABLED_TIMER_r; otherwise, the mobile
42 station shall set TX_DISABLED_TIMER_s to T_{81m}.

- 1 - If EXT_CH_IND_r signals the allocation of a R-PDCH, the mobile station shall:
- 2 + Set FOR_GCH_ASSIGNED_s to FOR_GCH_ASSIGNED_r.
- 3 + Set FOR_RCCH_ASSIGNED_s to FOR_RCCH_ASSIGNED_r.
- 4 + If FOR_RCCH_ASSIGNED_s is equal to '1', the mobile station shall:
- 5 ○ Set FOR_RCCH_DRC_MODE_s to FOR_RCCH_DRC_MODE_r.
- 6 ○ Set FOR_RCCH_REPETITION_s to FOR_RCCH_REPETITION_r.
- 7 ○ Set FOR_RCCH_UPDATE_RATE_s to FOR_RCCH_UPDATE_RATE_r.
- 8 + If FOR_ACKCH_ASSIGNED_r is equal to '1', the mobile station shall set
- 9 FOR_ACKCH_MODE_s to FOR_ACKCH_MODE_r.
- 10 + If FOR_ACKCH_COMB_SEL_r is included, the mobile station shall set
- 11 FOR_ACKCH_COMB_SEL_s to FOR_ACKCH_COMB_SEL_r; otherwise, the
- 12 mobile station shall set FOR_ACKCH_COMB_SEL_s to '0'.
- 13 + If REV_PDCH_RLGAIN_INCL_r is included and equal to '1', the mobile
- 14 station shall perform the following:
- 15 ○ The mobile station shall set RLGAIN_SPICH_PILOT_s to
- 16 RLGAIN_SPICH_PILOT_r.
- 17 ○ The mobile station shall set RLGAIN_REQCH_PILOT_s to
- 18 RLGAIN_REQCH_PILOT_r.
- 19 ○ The mobile station shall set RLGAIN_PDCCH_PILOT_s to
- 20 RLGAIN_PDCCH_PILOT_r.
- 21 + If REV_PDCH_PARAMS_1_INCL_r is included and equal to '1', the mobile
- 22 station shall perform the following:
- 23 ○ The mobile station shall set REV_PDCH_TABLE_SEL_s to
- 24 REV_PDCH_TABLE_SEL_r.
- 25 ○ The mobile station shall set REV_PDCH_MAX_AUTO_TPR_s to
- 26 REV_PDCH_MAX_AUTO_TPR_r.
- 27 - Otherwise, the mobile station shall:
- 28 + Set FOR_GCH_ASSIGNED_s to NULL.
- 29 + Set FOR_RCCH_ASSIGNED_s to NULL.
- 30 - For each included member of the Active Set, the mobile station shall store
- 31 the following:
- 32 + Set the PILOT_PN field to PILOT_PN_r.
- 33 + Set the ADD_PILOT_REC_INCL field to ADD_PILOT_REC_INCL_r. If
- 34 ADD_PILOT_REC_INCL_r equals '1', the mobile station shall store the
- 35 following:
- 36 ○ Set the PILOT_REC_TYPE field of PILOT_REC to PILOT_REC_TYPE_r.

- 1 ○ If PILOT_REC_TYPE_r equals '000', the mobile station shall set the
2 TD_POWER_LEVEL field of PILOT_REC to TD_POWER_LEVEL_r and
3 set the TD_MODE field of PILOT_REC to TD_MODE_r.
- 4 ○ If PILOT_REC_TYPE_r is equal to '001', the mobile station shall.
5 Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
6 Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
7 AUX_PILOT_WALSH_r with the Walsh Code length specified by
8 WALSH_LENGTH_r.
- 9 ○ If PILOT_REC_TYPE_r is equal to '010', the mobile station shall:
10 Set the AUX_PILOT_TD_QOF field of PILOT_REC to QOF_r.
11 Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
12 AUX_WALSH_r with the Walsh Code length specified by
13 WALSH_LENGTH_r.
14 Set the AUX_TD_POWER_LEVEL field of PILOT_REC to
15 AUX_TD_POWER_LEVEL_r.
16 Set the TD_MODE field of NGHBR_PILOT_REC to TD_MODE_r.
- 17 ○ Set FOR_PDCH_INCL_s to FOR_PDCH_INCL_r.
- 18 ○ If FOR_PDCH_INCL_r is equal to '1', the mobile station shall perform
19 the following:
20 ◇ If FOR_PDCH_PARMS_INCL_r is equal to '1', the mobile station
21 shall store the following parameters:
22 — The mobile station shall set WALSH_TABLE_ID_s to
23 WALSH_TABLE_ID_r.
24 — The mobile station shall set NUM_PDCCH_s to NUM_PDCCH_r.
25 — The mobile station shall set FOR_PDCCH_WALSH_s[i] to the ith
26 occurrence of FOR_PDCCH_WALSH_r.
27 ◇ The mobile station shall set MAC_ID_s to MAC_ID_r.
28 ◇ The mobile station shall set REV_CQICH_COVER_s to
29 REV_CQICH_COVER_r.
30 ◇ If EXT_CH_IND_r signals the allocation of a F-CPCCH, the mobile
31 station shall set FOR_CPCCH_WALSH_s to
32 FOR_CPCCH_WALSH_r, and FOR_CPCSCH_s to FOR_CPCSCH_r.
33 ◇ The mobile station shall store FOR_PDCCH_WALSH_s[i] to the ith
34 occurrence of FOR_PDCCH_WALSH_r.
35 ○ The mobile station shall set PWR_COMB_IND_s to PWR_COMB_IND_r.
- 36 ○ If PDCH_GROUP_IND_INCL_r is equal to '1', the mobile station shall
37 set PDCH_GROUP_IDENTIFIER_s as follows:

- 1 ◇ If this is the first pilot in the list that has a F-PDCH assignment,
2 the mobile station shall perform the following:
- 3 — The mobile station shall set PDCH_GROUP_IDENTIFIERS_s to
4 '000';
- 5 ◇ Otherwise, the mobile station shall perform the following:
- 6 — If PDCH_GROUP_IND_r is set to '1', the mobile station shall set
7 PDCH_GROUP_IDENTIFIERS_s to the same value as that of the
8 previous pilot in the list that has a F-PDCH assigned;
9 otherwise, the mobile station shall set
10 PDCH_GROUP_IDENTIFIERS_s to the value one greater than
11 that of the previous pilot in the list that has a F-PDCH
12 assigned.
- 13 ○ Otherwise, the mobile station shall perform the following:
- 14 ◇ If this is the first pilot in the list that has a F-PDCH assignment,
15 the mobile station shall perform the following:
- 16 — The mobile station shall set PDCH_GROUP_IDENTIFIERS_s to
17 '000';
- 18 ◇ Otherwise, the mobile station shall perform the following:
- 19 — If F-PDCH is assigned for this pilot, the mobile station shall
20 perform the following:
- 21 a. If PWR_COMB_IND_r is set to '1', and there are no pilots
22 between this pilot and the previous pilot in the list that
23 has a F-PDCH assigned, the mobile station shall set
24 PDCH_GROUP_IDENTIFIERS_s to the same value as that of
25 the previous pilot in the list that has a F-PDCH assigned.
- 26 b. If PWR_COMB_IND_r is set to '1', and all pilots between
27 this pilot and the previous pilot in the list that has a F-
28 PDCH assigned have PWR_COMB_IND set to '1', the
29 mobile station shall set PDCH_GROUP_IDENTIFIERS_s to
30 the same value as that of the previous pilot in the list that
31 has a F-PDCH assigned.
- 32 c. Otherwise, the mobile station shall set
33 PDCH_GROUP_IDENTIFIERS_s to the value one greater than
34 that of the previous pilot in the list.
- 35 — Otherwise, the mobile station shall set
36 PDCH_GROUP_IDENTIFIERS_s to NULL.
- 37 ○ If EXT_CH_IND_r signals the allocation of a F-FCH, the mobile station
38 shall set CODE_CHAN_FCH_s to CODE_CHAN_FCH_r, and
39 QOF_MASK_ID_FCH_s to QOF_MASK_ID_FCH_r.

- 1 ○ If EXT_CH_IND_r signals the allocation of a F-DCCH, the mobile
2 station shall set CODE_CHAN_DCCH_s to CODE_CHAN_DCCH_r, and
3 QOF_MASK_ID_DCCH_s to QOF_MASK_ID_DCCH_r.
- 4 ○ If FOR_PDCH_INCL_r is equal to '1', EXT_CH_IND_r signals the
5 allocation of a R-PDCH, and FOR_ACKCH_ASSIGNED_r is equal to '1',
6 the mobile station shall set FOR_ACKCH_WALSH_INDEX_s to
7 FOR_ACKCH_WALSH_INDEX_r, and FOR_ACKSCH_INDEX_s to
8 FOR_ACKSCH_INDEX_r.
- 9 ○ If FOR_RCCH_INCL_r is included and set to '1', the mobile station
10 shall do the following:
- 11 ◇ Set FOR_RCCH_WALSH_INDEX_s to FOR_RCCH_WALSH_INDEX_r.
- 12 ◇ Set FOR_RCSCH_INDEX_s to FOR_RCSCH_INDEX_r.
- 13 ○ If FOR_PDCH_INCL_r is equal to '1', and if FOR_GCH_ASSIGNED_r is
14 included and set to '1', the mobile station shall perform the following;
- 15 ◇ Set NUM_FOR_GCH_s to NUM_FOR_GCH_r, and
- 16 ◇ For each of the NUM_FOR_GCH_s occurrences of
17 FOR_GCH_WALSH_INDEX_r, the mobile station shall set
18 FOR_GCH_WALSH_INDEX_s[j] to FOR_GCH_WALSH_INDEX_r[j].
- 19 ○ Otherwise, the mobile station shall perform the following:
- 20 ◇ Set NUM_FOR_GCH_s to 0, and
- 21 ◇ Set FOR_GCH_WALSH_INDEX_s to NULL.
- 22 - The mobile station shall initialize CODE_CHAN_LIST as described in 2.6.8,
23 and shall set SERV_NEG_s to enabled.
- 24 - If FREQ_INCL_r equals '1', the mobile station shall then tune to the new
25 frequency assignment.
- 26 - The mobile station shall then enter the *Traffic Channel Initialization Substate*
27 of the *Mobile Station Control on the Traffic Channel State*.
- 28 8. *Feature Notification Message*: If RELEASE_r is equal to '1', the mobile station shall
29 enter the *Mobile Station Idle State* or the *System Determination Substate* of the *Mobile*
30 *Station Initialization State* with a release indication (see 2.6.1.1).
- 31 9. *Intercept Order*: The mobile station shall enter the *Mobile Station Idle State*.
- 32 10. *Local Control Order*
- 33 11. *Lock Until Power-Cycled Order*: The mobile station shall disable its transmitter and
34 record the reason for the *Lock Until Power-Cycled Order* in the mobile station's semi-
35 permanent memory (LCKRSN_P_{s-p} equals the least significant four bits of ORDQ_r).
36 The mobile station should notify the user of the locked condition. The mobile
37 station shall enter the *System Determination Substate* of the *Mobile Station*
38 *Initialization State* with a lock indication (see 2.6.1.1), and shall not enter the *System*
39 *Access State* again until after the next mobile station power-up or until it has

- 1 received an *Unlock Order*. This requirement shall take precedence over any other
2 mobile station requirement specifying entry to the *System Access State*.
- 3 12. *Maintenance Required Order*: The mobile station shall record the reason for the
4 *Maintenance Required Order* in the mobile station's semi-permanent memory
5 (MAINTRSN_{s-p} equals the least significant four bits of ORDQ_r). The mobile station
6 shall remain in the unlocked condition. The mobile station should notify the user of
7 the maintenance required condition.
- 8 13. *PACA Message*: If P_REV_IN_USE_s is less than or equal to four and the mobile
9 station does not support PACA capability, the mobile station shall send a *Mobile*
10 *Station Reject Order* with the ORDQ field set to '00000110' (message requires a
11 capability that is not supported by the mobile station); otherwise, the mobile station
12 shall process the message as follows:
- 13 • If PACA_s is equal to disabled, the mobile station shall perform the following
14 actions:
 - 15 - If the purpose of the message is to respond to an *Origination Message*
16 (PURPOSE_r is equal to '0000'), the mobile station shall perform the following
17 actions:
 - 18 + The mobile station shall set PACA_s to enabled and shall set PACA_SID_s
19 to SID_s.
 - 20 + The mobile station shall set the PACA state timer to the duration shown
21 in Table 3.7.2.3.2.20-2 corresponding to the value of PACA_TIMEOUT_s.
 - 22 + The mobile station should indicate to the user that the call has been
23 queued as a PACA call, and should indicate the current queue position
24 (Q_POS_r) of the call.
 - 25 + The mobile station shall enter the *Mobile Station Idle State*.
 - 26 - If the purpose of the message is to cancel the PACA call (PURPOSE_r is equal
27 to '0011'), the mobile station shall perform the following actions:
 - 28 + The mobile station shall set PACA_s to disabled and PACA_CANCEL to '0',
29 shall disable the PACA state timer, and should indicate to the user that
30 the PACA call has been canceled.
 - 31 + The mobile station shall enter the *Mobile Station Idle State*.
 - 32 - If the purpose of the message is anything else (PURPOSE_r is not equal to
33 '0000' or '0011'), the mobile station shall ignore the message. The mobile
34 station shall remain in the *Mobile Station Origination Attempt Substate*.
 - 35 • If PACA_s is equal to enabled, the mobile station shall perform the following
36 actions:
 - 37 - If the purpose of the message is to respond to an *Origination Message*
38 (PURPOSE_r is equal to '0000'), the mobile station shall perform the following
39 actions:

- 1 + The mobile station should indicate to the user that the PACA call is still
2 queued, and should indicate to the user the current queue position
3 (Q_POS_r) of the call.
- 4 + The mobile station shall set the PACA state timer to the duration shown
5 in Table 3.7.2.3.2.20-2 corresponding to the value of PACA_TIMEOUT_s.
- 6 + The mobile station shall enter the *Mobile Station Idle State*.
- 7 - If the purpose of the message is to provide the queue position of the PACA
8 call (PURPOSE_r is equal to '0001'), the mobile station shall perform the
9 following actions:
- 10 + The mobile station should indicate to the user that the PACA call is still
11 queued, and should indicate the current queue position (Q_POS_r) of the
12 call.
- 13 + The mobile station shall set the PACA state timer to the duration shown
14 in Table 3.7.2.3.2.20-2 corresponding to the value of PACA_TIMEOUT_s.
- 15 + The mobile station shall enter the *Mobile Station Idle State*.
- 16 - If the purpose of the message is to instruct the mobile station to re-originate
17 the PACA call (PURPOSE_r is equal to '0010'), the mobile station shall remain
18 in the *Mobile Station Origination Attempt Substate*.
- 19 - If the purpose of the message is to cancel the PACA call (PURPOSE_r is equal
20 to '0011'), the mobile station shall perform the following actions:
- 21 + The mobile station shall set PACA_s to disabled, shall disable the PACA
22 state timer, and should indicate to the user that the PACA call has been
23 canceled.
- 24 + The mobile station shall enter the *Mobile Station Idle State*.
- 25 14. *Registration Accepted Order*: The mobile station shall perform the procedures as
26 specified in 2.6.11.1.
- 27 15. *Registration Rejected Order*: This order indicates that normal service is not available
28 on this system. The mobile station shall disable the full-TMSI timer. If the received
29 order specifies to delete the TMSI (ORDQ = '00000100'), the mobile station shall set
30 all the bits of the TMSI_CODE_{s-p} to '1'. The mobile station shall enter the *System*
31 *Determination Substate* of the *Mobile Station Initialization State* with a registration
32 rejected indication (see 2.6.1.1).
- 33 16. *Release Order* or *Service Status Order*: If NDSS_ORIG_s is equal to enabled, the
34 mobile station shall set NDSS_ORIG_s to disabled, and should indicate to the user
35 that the call origination has been canceled. The mobile station shall enter the
36 *Mobile Station Idle State* or the *System Determination Substate* of the *Mobile Station*
37 *Initialization State* with a release indication (see 2.6.1.1). If the mobile station enters
38 the *Mobile Station Idle State*, and if PACA_s is equal to enabled, the mobile station
39 shall set PACA_s to disabled and PACA_CANCEL to '0', shall disable the PACA state
40 timer, and should indicate to the user that the PACA call has been canceled.

- 1 17. *Reorder Order*: If NDSS_ORIG_S is equal to enabled, the mobile station shall set
 2 NDSS_ORIG_S to disabled, and should indicate to the user that the call origination
 3 has been canceled. If PACA_S is equal to enabled, the mobile station shall set PACA_S
 4 to disabled and PACA_CANCEL to '0', shall disable the PACA state timer, and
 5 should indicate to the user that the PACA call has been canceled. The mobile
 6 station shall enter the *Mobile Station Idle State*.
- 7 18. *Retry Order*: The mobile station shall process the order as follows:
- 8 • If RETRY_TYPE_R is equal to '000', the mobile station shall set
 9 RETRY_DELAY_S[RETRY_TYPE] to 0, where RETRY_TYPE is equal to '001', '010',
 10 '011', '100', or '101'.
 - 11 • If RETRY_TYPE_R is equal to '001', '100', or '101', then the mobile station shall
 12 perform the following:
 - 13 - If RETRY_DELAY_R is equal to '00000000', then the mobile station shall set
 14 RETRY_DELAY_S[RETRY_TYPE_R] to 0.
 - 15 - If RETRY_DELAY_R is not equal to '00000000', the mobile station shall set
 16 RETRY_DELAY_S as follows:
 - 17 + If the most significant bit of the RETRY_DELAY_R is '0', set
 18 RETRY_DELAY_UNIT_S to 1000ms. If the most significant bit of the
 19 RETRY_DELAY_R is '1', set RETRY_DELAY_UNIT_S to 60000ms.
 - 20 + The mobile station shall set RETRY_DELAY_VALUE_S to the seven least
 21 significant bits of RETRY_DELAY_R.
 - 22 + The mobile station shall store the next system time 80 ms boundary +
 23 RETRY_DELAY_VALUE_S × RETRY_DELAY_UNIT_S ms as
 24 RETRY_DELAY_S[RETRY_TYPE_R].
 - 25 + If RETRY_TYPE_R is equal to '001' or '101', and NDSS_ORIG_S is equal to
 26 enabled, the mobile station shall set NDSS_ORIG_S to disabled and
 27 should indicate to the user that the call origination has been canceled. If
 28 PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled
 29 and PACA_CANCEL to '0', shall disable the PACA state timer, and should
 30 indicate to the user that the PACA call has been canceled.
 - 31 + If RETRY_TYPE_R is equal to '001' or '101', the mobile station shall enter
 32 the *Mobile Station Idle State*.
- 33 19. *Security Mode Command Message*: The mobile station shall perform the procedures
 34 as specified in 2.6.11.4.
- 35 20. *Service Redirection Message*: The mobile station shall process the message as
 36 follows:
- 37 • If the mobile station is directed to an unsupported operation mode or band
 38 class, the mobile station shall respond with a *Mobile Station Reject Order* with
 39 ORDQ equal to '00000110' (message requires a capability that is not supported
 40 by the mobile station).

- 1 • If DELETE TMSI_r is equal to '1', the mobile station shall set all the bits of
2 TMSI_CODE_{s-p} to '1'.
- 3 • The mobile station shall disable the full-TMSI timer.
- 4 • The mobile station shall set RETURN_IF_FAIL_s = RETURN_IF_FAIL_r.
- 5 • If RECORD_TYPE_r is '00000000', the mobile station shall set RETURN_IF_FAIL_s
6 = RETURN_IF_FAIL_r, and enter the *System Determination Substate* of the *Mobile*
7 *Station Initialization State* with an NDSS off indication (see 2.6.1.1); otherwise:
- 8 - if REDIRECT_TYPE_r is '0', the mobile station shall store the redirection
9 record received in the message as REDIRECT_REC_s and shall enter the
10 System Determination Substate of the *Mobile Station Initialization State* with
11 a redirection indication (see 2.6.1.1).
- 12 - if REDIRECT_TYPE_r is '1', the mobile station shall store the redirection
13 record received in the message as REDIRECT_REC_s and shall enable
14 NDSS_ORIG_s, and shall record the dialed digits (if any). The mobile station
15 shall enter the System Determination Substate of the *Mobile Station*
16 *Initialization State* with a redirection indication (see 2.6.1.1).
- 17 21. *SSD Update Message*: The mobile station shall respond to the message as specified
18 in 2.3.12.1.5.
- 19 22. *Status Request Message*: The mobile station shall disable the *System Access State*
20 timer and respond to the message. If P_REV_IN_USE_s is less than or equal to three,
21 the mobile station shall respond with a *Status Response Message*. If
22 P_REV_IN_USE_s is greater than three, the mobile station shall respond with an
23 *Extended Status Response Message*. If the message does not specify any
24 qualification information (QUAL_INFO_TYPE_r is equal to '00000000'), the mobile
25 station shall include the requested information records in the response. If the
26 message specifies a band class (QUAL_INFO_TYPE_r is equal to '00000001'), the
27 mobile station shall only include the requested information records for the specified
28 band class (BAND_CLASS_r) in the response. If the message specifies a band class
29 and an operating mode (QUAL_INFO_TYPE_r is equal to '00000010'), the mobile
30 station shall only include the requested information records for the specified band
31 class (BAND_CLASS_r) and operating mode (OP_MODE_r) in the response. If the
32 message specifies a band class or a band class and an operating mode which are
33 not supported by the mobile station, the mobile station shall send a *Mobile Station*
34 *Reject Order* with ORDQ set to '00000110' (message requires a capability that is not
35 supported by the mobile station). If the response to this message exceeds the
36 allowable length, the mobile station shall send a *Mobile Station Reject Order* with
37 ORDQ set to '00001000' (response message would exceed the allowable length). If
38 the message specifies an information record which is not supported by the mobile
39 station for the specified band class and operating mode, the mobile station shall
40 send a *Mobile Station Reject Order* with ORDQ set to '00001001' (information record
41 is not supported for the specified band class and operating mode).

1 23. *TMSI Assignment Message*: The mobile station shall store the TMSI zone and code
2 as follows:

- 3 • The mobile station shall store the length of the TMSI zone field by setting
4 ASSIGNING_TMSI_ZONE_LEN_{s-p} to TMSI_ZONE_LEN_r,
- 5 • The mobile station shall store the assigning TMSI zone number by setting the
6 ASSIGNING_TMSI_ZONE_LEN_{s-p} least significant octets of
7 ASSIGNING_TMSI_ZONE_{s-p} to TMSI_ZONE_r, and
- 8 • The mobile station shall store the TMSI code by setting TMSI_CODE_{s-p} to
9 TMSI_CODE_r.

10 The mobile station shall set the TMSI expiration time by setting TMSI_EXP_TIME_{s-p}
11 to TMSI_EXP_TIME_r. The mobile station shall disable the full-TMSI timer. The
12 mobile station shall then respond with a *TMSI Assignment Completion Message*
13 within T_{56m} seconds.

14 24. *User Zone Reject Message*

15 25. *BCMC Order*: The mobile station shall process this message as follows:

- 16 • If ORDQ_r is set to '00000000', the mobile station shall perform the following for
17 each of the BCMC flows that the base station is responding to:
 - 18 - If CLEAR_ALL_RETRY_DELAY_r equals '1', the mobile station shall delete the
19 currently stored BCMC Retry Delay List.
 - 20 - If CLEAR_RETRY_DELAY_r equals '1', the mobile station shall delete the entry
21 in the BCMC_RETRY_DELAY_LIST_s[i] corresponding to BCMC_FLOW_ID
22 (See section 2.6.13.11) in this message.
 - 23 - If ALL_BCMC_REASON_r or BCMC_REASON_r equals '0000', Layer 3 shall
24 send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result=FAILURE, cause=*
25 *FLOW_NOT_AVAILABLE, reason_ind=CURRENT_SYS)* for each of the
26 corresponding BCMC_FLOW_ID to the BCMC Service Layer.
 - 27 - If ALL_BCMC_REASON_r or BCMC_REASON_r equals '0001', Layer 3 shall
28 send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result=FAILURE, cause=*
29 *FLOW_NOT_TRANSMITTED, reason_ind=CURRENT_SYS)* for each of the
30 corresponding BCMC_FLOW_ID to the BCMC Service Layer.
 - 31 - If BCMC_REASON_r equals '0010' for any of the flows or
32 ALL_BCMC_REASON_r equals '0010', the mobile station shall enable the
33 BCMC wait timer with a value of BSPM_WAIT_TIME seconds, shall enter the
34 *Mobile Station Idle State* and shall wait for an updated *BCMC Service*
35 *Parameters Message* as specified in 2.6.13.1.
 - 36 - If ALL_BCMC_REASON_r or BCMC_REASON_r equals '0011', Layer 3 shall
37 send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result = SUCCESS, cause =*
38 *REGISTRATION_ACCEPTED, reason_ind = CURRENT_SYS)* for each of the
39 corresponding BCMC_FLOW_ID to the BCMC Service Layer.

- 1 - If ALL_BCMC_REASON_r or BCMC_REASON_r equals '0100', Layer 3 shall
2 send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result = FAILURE, cause=*
3 *AUTHORIZATION_FAILURE, reason_ind = CURRENT_SYS)* for each of the
4 corresponding BCMC_FLOW_ID to the BCMC Service Layer.
- 5 - If ALL_BCMC_REASON_r or BCMC_REASON_r equals '0101', the mobile
6 station shall perform the following:
- 7 + Layer 3 shall send a *BCMC-Monitor.Response(BCMC_FLOW_ID,*
8 *result=FAILURE, cause= RETRY_DELAY, reason_ind=CURRENT_SYS)* for
9 each of the corresponding BCMC_FLOW_ID to the BCMC Service Layer.
- 10 + For each of the corresponding BCMC_FLOW_ID, if there is a
11 BCMC_RETRY_DELAY_LIST_s[i].BCMC_FLOW_ID which is same as
12 BCMC_FLOW_ID (See section 2.6.13.11), the mobile station shall set
13 BCMC_RETRY_DELAY_LIST_s[i].RETRY_DELAY to current system time
14 plus ALL_BCMC_RETRY_DELAY_r/BCMC_RETRY_DELAY_r; otherwise, the
15 mobile station shall add new BCMC_RETRY_DELAY_LIST_s[i] to the
16 BCMC Retry Delay List and shall set
17 BCMC_RETRY_DELAY_LIST_s[i].BCMC_FLOW_ID to the BCMC_FLOW_ID,
18 BCMC_RETRY_DELAY_LIST_s[i].RETRY_DELAY to current system time
19 plus ALL_BCMC_RETRY_DELAY_r/BCMC_RETRY_DELAY_r.
- 20 - If the base station indicates BCMC_REASON (indicated via
21 ALL_BCMC_REASON_r/BCMC_REASON_r) of '0000', '0001', '0011', '0100', or
22 '0101' for all of the flows requested, the mobile station shall enter the *Mobile*
23 *Station Idle State*.

24 26. General Extension Message: The mobile station shall process this message as
25 specified in section 2.6.18.

26 27. *Any other message*: If the mobile station receives any other message specified in
27 Table 3.7.2.3-1, it shall ignore all Layer 3 fields. The mobile station shall ignore all
28 other messages.

29 If the mobile station performs an access probe handoff or access handoff and receives any
30 of the following messages, it shall process the message as specified in 2.6.3.1.3:

- 31 • If the mobile station is currently monitoring the Paging Channel:
- 32 1. *System Parameters Message*
- 33 2. *Access Parameters Message*
- 34 3. *Neighbor List Message*
- 35 4. *Extended System Parameters Message*
- 36 5. *Extended Neighbor List Message*
- 37 6. *General Neighbor List Message*
- 38 7. *Global Service Redirection Message*
- 39 8. *Extended Global Service Redirection Message*

- 1 • If the mobile station is currently monitoring the Primary Broadcast Control
2 Channel:
- 3 1. *ANSI-41 System Parameters Message*
- 4 2. *Enhanced Access Parameters Message*
- 5 3. *Universal Neighbor List Message*
- 6 4. *MC-RR Parameters Message*
- 7 5. *Extended Global Service Redirection Message*

8 2.6.3.6 Registration Access Substate

9 In this substate, the mobile station sends a *Registration Message*. If the base station
10 responds with an authentication request, the mobile station responds in this substate.

11 Upon entering the *Registration Access Substate*, the mobile station shall send the
12 *Registration Message*.

13 If a message received from the base station requires a Layer 2 acknowledgment and does
14 not require a Layer 3 response, Layer 3 shall indicate to Layer 2 that no response is
15 outstanding (see [4]).

16 If a message received from the base station requires a Layer 2 acknowledgment and also a
17 Layer 3 response, Layer 3 shall indicate to Layer 2 that a response is outstanding (see [4]).

18 When transmitting a response to a message received from the base station, Layer 3 shall
19 indicate to Layer 2 that the type of the message is a response (see [4]).

20 When transmitting an autonomous message (i.e., a message that is not sent as a response
21 to a message received from the base station) other than the *Registration Message*, Layer 3
22 shall indicate to Layer 2 that the type of the message is a request other than a registration
23 request or a message transmission request (see [4]).

24 When transmitting an autonomous *Registration Message* (i.e., it is not sent as a response to
25 a *Registration Request Order* received from the base station), Layer 3 shall indicate to Layer
26 2 that the type of the message is a request that is a registration (see [4]).

27 While in this substate, the mobile station shall monitor the Paging Channel or the Forward
28 Common Control Channel. If the mobile station declares a loss of the Paging Channel or
29 the Forward Common Control Channel (see 2.6.3.1.8), the mobile station shall perform the
30 following:

- 31 • If $PACA_S$ is equal to enabled, the mobile station shall set $PACA_S$ to disabled and
32 $PACA_CANCEL$ to '0', shall disable the PACA state timer, and should indicate to the
33 user that the PACA call has been canceled.
- 34 • The mobile station shall declare an access attempt failure and update its
35 registration variables as specified in 2.6.5.5.3.2.
- 36 • The mobile station shall disable its transmitter and enter the *Mobile Station Idle*
37 *State*.

1 If the mobile station receives confirmation of delivery of any message sent by the mobile
2 station in this substate, it shall then enter the *Mobile Station Idle State* unless:

- 3 • If the registration access was initiated due to a user direction to power down, the
4 mobile station shall update registration variables as specified in 2.6.5.5.3.3 and
5 may power down.
- 6 • If the mobile station has included the ENC_SEQ_H field in the *Registration Message*.
- 7 • If a message received from the base station requires a response, the mobile station
8 shall send a response to the message in this substate.

9 If the mobile station receives confirmation of delivery of the *Registration Message*, the
10 mobile station shall update its registration variables as specified in 2.6.5.5.3.1.

11 If the mobile station is directed by the user to originate a call, the mobile station may
12 process the origination request as follows:

- 13 • Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any
14 access attempt in progress.
- 15 • If PACA_S is equal to enabled, the mobile station shall set PACA_S to disabled and
16 PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to the
17 user that the PACA call has been canceled.
- 18 • The mobile station shall enter the *Mobile Station Origination Attempt Substate* with
19 an origination indication.

20 If PACA_S is equal to enabled, the mobile station shall set PACA_CANCEL to '1' when the
21 user directs the mobile station to cancel a PACA call.

22 If the mobile station is to exit the *System Access State* as a result of processing Layer 3
23 fields of a message requiring an acknowledgment, the mobile station shall exit the *System*
24 *Access State* after Layer 3 receives an indication from Layer 2 that the acknowledgment to
25 the message has been sent and acknowledged.

26 If Layer 3 receives a message other than message listed below:

- 27 • *Extended Channel Assignment Message* with DIRECT_CH_ASSIGN_IND field
28 included and set to '1'

29 with an indication from Layer 2 that an access attempt for a message being transmitted
30 was not terminated as a result of processing the Layer 2 fields of the received message, the
31 mobile station shall ignore the received message.

32 The following directed messages and orders can be received. If any field value of the
33 message or order is outside its permissible range, the mobile station may send a *Mobile*
34 *Station Reject Order* with ORDQ equal to '00000100' (message field not in valid range).

- 35 1. *Authentication Challenge Message*: If the registration access was initiated due to a
36 user direction to power down, the mobile station shall ignore the message;
37 otherwise, the mobile station shall respond to the message as specified in
38 2.3.12.1.4, regardless of the value of AUTH_S.

- 1 2. *Authentication Request Message*: The mobile station shall process the message and
2 shall respond as specified in 2.3.12.5.2.
- 3 3. *Base Station Challenge Confirmation Order*: If the registration access was initiated
4 due to a user direction to power down, the mobile station shall ignore the message;
5 otherwise, the mobile station shall respond to the message as specified in
6 2.3.12.1.5.
- 7 4. *Base Station Reject Order*: The mobile station shall perform the procedures as
8 specified in 2.6.11.5.
- 9 5. *Data Burst Message*
- 10 6. *Feature Notification Message*
- 11 7. *Local Control Order*
- 12 8. *Lock Until Power-Cycled Order*: The mobile station shall disable its transmitter and
13 record the reason for the *Lock Until Power-Cycled Order* in the mobile station's semi-
14 permanent memory (LCKRSN_{P-s-p} equals the least significant four bits of ORDQ_r).
15 The mobile station should notify the user of the locked condition. The mobile
16 station shall enter the *System Determination Substate* of the *Mobile Station*
17 *Initialization State* with a lock indication (see 2.6.1.1), and shall not enter the *System*
18 *Access State* again until after the next mobile station power-up or until it has
19 received an *Unlock Order*. This requirement shall take precedence over any other
20 mobile station requirement specifying entry to the *System Access State*.
- 21 9. *Maintenance Required Order*: The mobile station shall record the reason for the
22 *Maintenance Required Order* in the mobile station's semi-permanent memory
23 (MAINTRSN_{S-p} equals the least significant four bits of ORDQ_r). The mobile station
24 shall remain in the unlocked condition. The mobile station should notify the user of
25 the maintenance required condition.
- 26 10. *PACA Message*: If P_REV_IN_USE_s is less than or equal to four and the mobile
27 station does not support PACA capability, the mobile station shall send a *Mobile*
28 *Station Reject Order* with the ORDQ field set to '00000110' (message requires a
29 capability that is not supported by the mobile station); otherwise, the mobile station
30 shall process the message as follows:
- 31 If PACA_s is equal to disabled, the mobile station shall send a *Mobile Station Reject*
32 *Order* with the ORDQ field set to '00000010' (message not accepted in this state).
- 33 If PACA_s is equal to enabled, the mobile station shall perform the following:
- 34 • If the purpose of the message is to respond to an *Origination Message*
35 (PURPOSE_r is equal to '0000'), the mobile station shall send a *Mobile Station*
36 *Reject Order* with the ORDQ field set to '00000010' (message not accepted in this
37 state).
 - 38 • If the purpose of the message is to provide the queue position of the PACA call
39 (PURPOSE_r is equal to '0001'), the mobile station shall set the PACA state timer
40 to the duration shown in Table 3.7.2.3.2.20-2 corresponding to the value of

- 1 PACA_TIMEOUT_s, should indicate to the user that the PACA call is still queued,
2 and should indicate to the user the current queue position (Q_POS_r) of the call.
- 3 • If the purpose of the message is to instruct the mobile station to re-originate the
4 PACA call (PURPOSE_r is equal to '0010'), Layer 3 shall send an L2-
5 Supervision.Request primitive to Layer 2 to abort any access attempt in
6 progress, shall set the PACA state timer to the duration shown in Table
7 3.7.2.3.2.20-2 corresponding to the value of PACA_TIMEOUT_s, and shall enter
8 the *Mobile Station Origination Attempt Substate* with a PACA response indication.
 - 9 • If the purpose of the message is to cancel the PACA call (PURPOSE_r is equal to
10 '0011'), the mobile station shall set PACA_s to disabled and PACA_CANCEL to '0',
11 shall disable the PACA state timer, and should indicate to the user that the
12 PACA call has been canceled.
- 13 11. *Registration Accepted Order*: The mobile station shall perform the procedures
14 specified in 2.6.11.1
- 15 12. *Registration Rejected Order*: This order indicates that normal service is not available
16 on this system. The mobile station shall disable the full-TMSI timer. If the received
17 order specifies to delete the TMSI (ORDQ = '00000100'), the mobile station shall set
18 all the bits of the TMSI_CODE_{s-p} to '1'. The mobile station shall enter the *System*
19 *Determination Substate* of the *Mobile Station Initialization State* with a registration
20 rejected indication (see 2.6.1.1).
- 21 13. *Release Order*: If NDSS_ORIG_s is equal to enabled, the mobile station shall set
22 NDSS_ORIG_s to disabled, and should indicate to the user that the call origination
23 has been canceled. The mobile station shall enter the *Mobile Station Idle State* or
24 the *System Determination Substate* of the *Mobile Station Initialization State* with a
25 release indication (see 2.6.1.1). If the mobile station enters the *Mobile Station Idle*
26 *State*, and if PACA_s is equal to enabled, the mobile station shall set PACA_s to
27 disabled and PACA_CANCEL to '0', shall disable the PACA state timer, and should
28 indicate to the user that the PACA call has been canceled.
- 29 14. *Retry Order*: The mobile station shall process the message as follows:
- 30 • If RETRY_TYPE_r is equal to '000', the mobile station shall set
31 RETRY_DELAY_s[RETRY_TYPE] to 0, where RETRY_TYPE is equal to '001', '010',
32 '011', '100', or '101'.
 - 33 • If RETRY_TYPE_r is equal to '001', '100', or '101', the mobile station shall perform
34 the following:
 - 35 - If RETRY_DELAY_r is equal to '00000000', then the mobile station shall set
36 RETRY_DELAY_s[RETRY_TYPE_r] to 0.
 - 37 - If RETRY_DELAY_r is not equal to '00000000', the mobile station shall set
38 RETRY_DELAY_s[RETRY_TYPE_r] as follows:
 - 39 + If the most significant bit of the RETRY_DELAY_r is '0', set
40 RETRY_DELAY_UNIT_s to 1000ms. If the most significant bit of the
41 RETRY_DELAY_r is '1', set RETRY_DELAY_UNIT_s to 60000ms.

- 1 + The mobile station shall set $RETRY_DELAY_VALUE_S$ to the seven least
2 significant bits of $RETRY_DELAY_T$.
- 3 + The mobile station shall store the next system time 80 ms boundary +
4 $RETRY_DELAY_VALUE_S \times RETRY_DELAY_UNIT_S$ ms as
5 $RETRY_DELAY_S[RETRY_TYPE_T]$.
- 6 15. *Security Mode Command Message*: The mobile station shall perform the procedures
7 as specified in 2.6.11.4.
- 8 16. *Service Redirection Message*: The mobile station shall process the message as
9 follows:
- 10 • If the mobile station is directed to an unsupported operation mode or band
11 class, the mobile station shall respond with a *Mobile Station Reject Order* with
12 ORDQ equal to '00000110' (message requires a capability that is not supported
13 by the mobile station).
- 14 • If $DELETE_TMSI_T$ is equal to '1', the mobile station shall set all the bits of
15 $TMSI_CODE_{S-p}$ to '1'. The mobile station shall disable the full-TMSI timer.
- 16 • The mobile station shall set $RETURN_IF_FAIL_S = RETURN_IF_FAIL_T$.
- 17 • If $RECORD_TYPE_T$ is equal to '00000000', the mobile station shall enter the
18 *System Determination Substate* of the *Mobile Station Initialization State* with an
19 NDSS off indication (see 2.6.1.1); otherwise, the mobile station shall store the
20 redirection record received in the message as $REDIRECT_REC_S$ and shall enter
21 the *System Determination Substate* of the *Mobile Station Initialization State* with a
22 redirection indication (see 2.6.1.1).
- 23 17. *SSD Update Message*: If the registration access was initiated due to a user direction
24 to power down, the mobile station shall ignore the message. Otherwise, the mobile
25 station shall respond to the message as specified in 2.3.12.1.5.
- 26 18. *Status Request Message*: The mobile station shall disable the *System Access State*
27 timer and respond to the message. If $P_REV_IN_USE_S$ is less than or equal to three,
28 the mobile station shall respond with a *Status Response Message*. If
29 $P_REV_IN_USE_S$ is greater than three, the mobile station shall respond with an
30 *Extended Status Response Message*. If the message does not specify any
31 qualification information ($QUAL_INFO_TYPE_T$ is equal to '00000000'), the mobile
32 station shall include the requested information records in the response. If the
33 message specifies a band class ($QUAL_INFO_TYPE_T$ is equal to '00000001'), the
34 mobile station shall only include the requested information records for the specified
35 band class ($BAND_CLASS_T$) in the response. If the message specifies a band class
36 and an operating mode ($QUAL_INFO_TYPE_T$ is equal to '00000010'), the mobile
37 station shall only include the requested information records for the specified band
38 class ($BAND_CLASS_T$) and operating mode (OP_MODE_T) in the response.
- 39 If the message specifies a band class or a band class and an operating mode which
40 are not supported by the mobile station, the mobile station shall send a *Mobile*
41 *Station Reject Order* with ORDQ set to '00000110' (message requires a capability
42 that is not supported by the mobile station). If the response to this message

1 exceeds the allowable length, the mobile station shall send a *Mobile Station Reject*
 2 *Order* with ORDQ set to '00001000' (response message would exceed the allowable
 3 length). If the message specifies an information record which is not supported by
 4 the mobile station for the specified band class and operating mode, the mobile
 5 station shall send a *Mobile Station Reject Order* with ORDQ set to '00001001'
 6 (information record is not supported for the specified band class and operating
 7 mode).

8 19. *TMSI Assignment Message*: The mobile station shall store the TMSI zone and code
 9 as follows:

- 10 • The mobile station shall store the length of the TMSI zone field by setting
 11 ASSIGNING_TMSI_ZONE_LEN_{s-p} to TMSI_ZONE_LEN_r;
- 12 • The mobile station shall store the assigning TMSI zone number by setting the
 13 ASSIGNING_TMSI_ZONE_LEN_{s-p} least significant octets of
 14 ASSIGNING_TMSI_ZONE_{s-p} to TMSI_ZONE_r, and
- 15 • The mobile station shall store the TMSI code by setting TMSI_CODE_{s-p} to
 16 TMSI_CODE_r.

17 The mobile station shall set the TMSI expiration time by setting TMSI_EXP_TIME_{s-p}
 18 to TMSI_EXP_TIME_r. The mobile station shall disable the full-TMSI timer. The
 19 mobile station shall then respond with a *TMSI Assignment Completion Message*
 20 within T_{56m} seconds.

21 20. *User Zone Reject Message*

22 21. *General Page Message* or *Universal Page Message*: If the mobile station receives a
 23 mobile-station-addressed page, the mobile station may determine if there is a page
 24 match (see 2.6.2.3). If a match is declared, the mobile station shall perform the
 25 following:

- 26 • Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any
 27 access attempt in progress.
- 28 • The mobile station shall enter the *Page Response Substate*.

29 22. *Extended Channel Assignment Message*: If the DIRECT_CH_ASSIGN_IND_r is
 30 included and is set to '1', the mobile station shall perform the following:

- 31 • Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any
 32 access attempt in progress.
- 33 • The mobile station shall process the message as specified in section 2.6.3.3.

34 Otherwise, the mobile station shall ignore this message.

35 23. *Fast Call Setup Order*

- 36 • If ORDQ_r is equal to '00000000', the mobile station shall process the message
 37 and respond with a *Fast Call Setup Order* as specified in 2.6.12.1.
- 38 • If ORDQ_r is equal to '00000001', the mobile station shall process the message
 39 as specified in 2.6.12.1.

1 24. General Extension Message: The mobile station shall process this message as
2 specified in section 2.6.18.

3 25. *Any other message*: If the mobile station receives any other message specified in
4 Table 3.7.2.3-1, it shall ignore all Layer 3 fields. The mobile station shall ignore all
5 other messages.

6 2.6.3.7 Mobile Station Message Transmission Substate

7 In this substate, the mobile station sends a *Data Burst Message*, a *Device Information*
8 *Message*, a *Radio Environment Message*, or a *Fast Call Setup Order*. If the base station
9 responds with an authentication request, the mobile station responds in this substate.

10 Support of this substate is optional.

11 If a message received from the base station requires a Layer 2 acknowledgment and does
12 not require a Layer 3 response, Layer 3 shall indicate to Layer 2 that no response is
13 outstanding (see [4]).

14 If a message received from the base station requires a Layer 2 acknowledgment and also a
15 Layer 3 response, Layer 3 shall indicate to Layer 2 that a response is outstanding (see [4]).

16 When transmitting a response to a message received from the base station, Layer 3 shall
17 indicate to Layer 2 that the type of the message is a response (see [4]).

18 When transmitting an autonomous message (i.e., a message that is not sent as a response
19 to a message received from the base station) other than the *Data Burst Message*, Layer 3
20 shall indicate to Layer 2 that the message is a request other than a registration request or
21 a message transmission request (see [4]).

22 When transmitting an autonomous *Data Burst Message*, Layer 3 shall indicate to Layer 2
23 that the type of the message is a request that is a message transmission (see [4]).

24 The mobile station shall not send any Short Data Burst (see [30], [42]) until the maximum
25 of the system time stored in $RETRY_DELAY_s[100]$ and $RETRY_DELAY_s[101]$.

26 Upon entering the *Mobile Station Message Transmission Substate*, the mobile station shall
27 transmit the message as follows:

- 28 • The mobile station shall exit the *Mobile Station Message Transmission Substate*,
29 shall enter either the *Mobile Station Idle State* or the *System Determination Substate*
30 with an ACCT blocked indication, and should indicate to the user that the message
31 transmission has terminated if all of the following conditions are true:
 - 32 - $P_REV_IN_USE_s$ is greater than six,
 - 33 - ACCT is enabled for the service option number associated with the *Data Burst*
34 *Message*, due to either of the following two conditions:
 - 35 + The service option number associated with the *Data Burst Message* is equal
36 to an ACCT_SO entry in ACCT_SO_LIST, or
 - 37 + The service option group number of the service option associated with the
38 *Data Burst Message* is equal to an ACCT_SO_GRP entry in
39 ACCT_SO_GRP_LIST.

- 1 • If the mobile station entered this substate with a message transmission indication,
2 the mobile station shall transmit the *Data Burst Message* to the base station.
- 3 • If the mobile station entered this substate with a hook status indication, the mobile
4 station shall set the autonomous message timer equal to AUTO_MSG_INTERVAL_s
5 and shall start the timer. The mobile station shall transmit the Device Information
6 Message to the base station, with the RECORD_TYPE field of the message set to
7 00100000 and the Hook Indicator field set to the current hook status.
- 8 • If the mobile station entered this substate with a radio environment report
9 indication, the mobile station shall transmit the *Radio Environment Message* to the
10 base station in assured mode, and increment RER_COUNT upon receiving
11 confirmation of delivery. If, after incrementing, RER_COUNT is equal to
12 RER_MAX_NUM_MSG_s, the mobile station shall set RER_MODE_ENABLED to NO. If
13 RER_MODE_ENABLED is set to NO and TKZ_MODE_PENDING is equal to YES, the
14 mobile station shall perform the following:
- 15 - Set TKZ_MODE_ENABLED to YES and TKZ_MODE_PENDING to NO.
- 16 - If TKZ_SID_s is equal to SID_s, TKZ_NID_s is equal to NID_s, and
17 TKZ_MODE_SUPPORTED_s is equal to '1', initialize the tracking zone list
18 (TKZ_LIST) to contain TKZ_ID_s; otherwise, initialize the tracking zone list to
19 NULL.
- 20 - Enable the tracking zone update timer with an initial value of infinity if
21 TKZ_UPDATE_PRD_s is equal to '1111'; otherwise, the mobile station shall enable
22 the tracking zone update timer with an initial value of $2^{TKZ_UPDATE_PRD_s} + 6$
23 seconds.
- 24 • If the mobile station entered this substate with a tracking zone indication, the
25 mobile station shall perform the following:
- 26 - The mobile station shall transmit the *Radio Environment Message* to the base
27 station.
- 28 - If the mobile station receives confirmation of delivery of *Radio Environment*
29 *Message*, the mobile station shall add TKZ_ID_s to TKZ_LIST. For all entries of
30 TKZ_LIST whose TKZ timer is not active, other than TKZ_ID_s, enable the TKZ
31 timer with the duration specified by TKZ_TIMER_s. If TKZ_LIST contains more
32 than TKZ_LIST_LEN_s + 1 entries, the entry with active TKZ timer with smallest
33 remaining TKZ timer value shall be removed from the list before adding the new
34 entry.
- 35 - The mobile station shall increment TKZ_COUNT upon receiving confirmation of
36 delivery. If, after incrementing, TKZ_COUNT is equal to TKZ_MAX_NUM_MSG_s,
37 the mobile station shall disable the tracking zone update timer and set
38 TKZ_MODE_ENABLED to NO.
- 39 • If the mobile station entered this substate with a fast call setup indication, the
40 mobile station shall transmit the *Fast Call Setup Order* (ORDQ = '00000000') to the
41 base station as follows:

- 1 - If the mobile station requests operation in the reduced slot cycle mode, the
2 mobile station shall set the RSC_MODE_IND field to '1' and perform the
3 following:
4 + Set RSC_MODE_ENABLED to YES.
5 + Set the RSC_END_TIME_UNIT and RSC_END_TIME_VALUE fields as
6 specified in 2.7.3.6, and store the system time specified by these fields as
7 RSC_END_TIME.
8 + Set the RSCI field as specified in 2.7.3.6 and store it as RSCI_s; if RSCI_s is
9 equal to '0111', set SLOTTED_s to NO.
10 + Set IGNORE_QPCH_s to '1'.
- 11 - Otherwise, the mobile station shall set the RSC_MODE_IND field to '0'.
- 12 • While in this substate, the mobile station shall monitor the Paging Channel or the
13 Forward Common Control Channel. If the mobile station declares a loss of the
14 Paging Channel or the Forward Common Control Channel (see 2.6.3.1.8), the
15 mobile station shall perform the following:
- 16 - If PACA_s is equal to enabled, the mobile station shall set PACA_s to disabled and
17 PACA_CANCEL to '0', shall disable the PACA state timer, and should indicate to
18 the user that the PACA call has been canceled.
- 19 - The mobile station shall declare an access attempt failure and update its
20 registration variables as specified in 2.6.5.5.3.2.
- 21 - The mobile station shall disable its transmitter and enter the *Mobile Station Idle*
22 *State*.

23 If the mobile station receives confirmation of any message sent by the mobile station in this
24 substate, it shall send a response in this substate if required and shall then enter the
25 *Mobile Station Idle State*.

26 If PACA_s is equal to enabled, the mobile station shall set PACA_CANCEL to '1' when the
27 user directs the mobile station to cancel a PACA call.

28 If the mobile station is to exit the *System Access State* as a result of processing Layer 3
29 fields of a message requiring an acknowledgment, the mobile station shall exit the *System*
30 *Access State* after Layer 3 receives an indication from Layer 2 that the acknowledgment to
31 the message has been sent and acknowledged.

32 If Layer 3 receives a message other than message listed below:

- 33 • *Extended Channel Assignment Message* with DIRECT_CH_ASSIGN_IND field
34 included and set to '1'

35 with an indication from Layer 2 that an access attempt for a message being transmitted
36 was not terminated as a result of processing the Layer 2 fields of the received message, the
37 mobile station shall ignore the received message.

38 The following directed messages and orders can be received. If any field value of the
39 message or order is outside its permissible range, the mobile station may send a *Mobile*
40 *Station Reject Order* with ORDQ equal to '00000100' (message field not in valid range).

- 1 1. *Authentication Challenge Message*: The mobile station shall respond to the message
2 as specified in 2.3.12.1.4, regardless of the value of AUTH_S.
- 3 2. *Authentication Request Message*: The mobile station shall process the message and
4 shall respond as specified in 2.3.12.5.2.
- 5 3. *Base Station Challenge Confirmation Order*: The mobile station shall respond to the
6 message as specified in 2.3.12.1.5.
- 7 4. *Base Station Reject Order*: The mobile station shall perform the procedures as
8 specified in 2.6.11.5.
- 9 5. *Data Burst Message*
- 10 6. *Local Control Order*
- 11 7. *Lock Until Power-Cycled Order*: The mobile station shall disable its transmitter and
12 record the reason for the *Lock Until Power-Cycled Order* in the mobile station's semi-
13 permanent memory (LCKRSN_{P_{s-p}} equals the least significant four bits of ORDQ_T).
14 The mobile station should notify the user of the locked condition. The mobile
15 station shall enter the *System Determination Substate* of the *Mobile Station*
16 *Initialization State* with a lock indication (see 2.6.1.1), and shall not enter the *System*
17 *Access State* again until after the next mobile station power-up or until it has
18 received an *Unlock Order*. This requirement shall take precedence over any other
19 mobile station requirement specifying entry to the *System Access State*.
- 20 8. *Maintenance Required Order*: The mobile station shall record the reason for the
21 *Maintenance Required Order* in the mobile station's semi-permanent memory
22 (MAINTRSN_{S-p} equals the least significant four bits of ORDQ_T). The mobile station
23 shall remain in the unlocked condition. The mobile station should notify the user of
24 the maintenance required condition.
- 25 9. *PACA Message*: If P_REV_IN_USE_S is less than or equal to four and the mobile
26 station does not support PACA capability, the mobile station shall send a *Mobile*
27 *Station Reject Order* with the ORDQ field set to '00000110' (message requires a
28 capability that is not supported by the mobile station); otherwise, the mobile station
29 shall process the message as follows:
- 30 If PACA_S is equal to disabled, the mobile station shall send a *Mobile Station Reject*
31 *Order* with the ORDQ field set to '00000010' (message not accepted in this state).
32 If PACA_S is equal to enabled, the mobile station shall perform the following:
- 33 • If the purpose of the message is to respond to an *Origination Message*
34 (PURPOSE_T is equal to '0000'), the mobile station shall send a *Mobile Station*
35 *Reject Order* with the ORDQ field set to '00000010' (message not accepted in this
36 state).
 - 37 • If the purpose of the message is to provide the queue position of the PACA call
38 (PURPOSE_T is equal to '0001'), the mobile station shall set the PACA state timer
39 to the duration shown in Table 3.7.2.3.2.20-2 corresponding to the value of
40 PACA_TIMEOUT_S, should indicate to the user that the PACA call is still queued,
41 and should indicate to the user the current queue position (Q_POS_T) of the call.

- 1 • If the purpose of the message is to instruct the mobile station to re-originate the
2 PACA call (PURPOSE_R is equal to '0010'), Layer 3 shall send an L2-
3 Supervision.Request primitive to Layer 2 to abort any access attempt in
4 progress, shall set the PACA state timer to the duration shown in Table
5 3.7.2.3.2.20-2 corresponding to the value of PACA_TIMEOUT_S, and shall enter
6 the *Mobile Station Origination Attempt Substate* with a PACA response indication.
- 7 • If the purpose of the message is to cancel the PACA call (PURPOSE_R is equal to
8 '0011'), the mobile station shall set PACA_S to disabled and PACA_CANCEL to '0',
9 shall disable the PACA state timer, and should indicate to the user that the
10 PACA call has been canceled.
- 11 10. *Registration Accepted Order*: The mobile station shall perform the procedures as
12 specified in 2.6.11.1.
- 13 11. *Registration Rejected Order*: This order indicates that normal service is not available
14 on this system. The mobile station shall disable the full-TMSI timer. If the received
15 order specifies to delete the TMSI (ORDQ = '00000100'), the mobile station shall set
16 all the bits of the TMSI_CODE_{S-p} to '1'. The mobile station shall enter the *System*
17 *Determination Substate* of the *Mobile Station Initialization State* with a registration
18 rejected indication (see 2.6.1.1).
- 19 12. *Retry Order*: The mobile station shall process the message as follows:
- 20 • If RETRY_TYPE_R is equal to '000', the mobile station shall set
21 RETRY_DELAY_S[RETRY_TYPE] to 0, where RETRY_TYPE is equal to '001', '010',
22 '011', '100', or '101'.
- 23 • If RETRY_TYPE_R is equal to '001', '100', or '101', the mobile station shall perform
24 the following:
- 25 - If RETRY_DELAY_R is equal to '00000000', then the mobile station shall set
26 RETRY_DELAY_S[RETRY_TYPE_R] to 0.
- 27 - If RETRY_DELAY_R is not equal to '00000000', the mobile station shall set
28 RETRY_DELAY_S[RETRY_TYPE_R] as follows:
- 29 + If the most significant bit of the RETRY_DELAY_R is '0', set
30 RETRY_DELAY_UNIT_S to 1000ms. If the most significant bit of the
31 RETRY_DELAY_R is '1', set RETRY_DELAY_UNIT_S to 60000ms.
- 32 + The mobile station shall set RETRY_DELAY_VALUE_S to the seven least
33 significant bits of RETRY_DELAY_R.
- 34 + The mobile station shall store the next system time 80 ms boundary +
35 RETRY_DELAY_VALUE_S × RETRY_DELAY_UNIT_S ms as
36 RETRY_DELAY_S[RETRY_TYPE_R].
- 37 13. *Security Mode Command Message*: The mobile station shall perform the procedures
38 as specified in 2.6.11.4.
- 39 14. *Service Redirection Message*: The mobile station shall process the message as
40 follows:

- 1 • If the mobile station is directed to an unsupported operation mode or band
2 class, the mobile station shall respond with a *Mobile Station Reject Order* with
3 ORDQ equal to '00000110' (message requires a capability that is not supported
4 by the mobile station).
- 5 • If DELETE_TMSI_r is equal to '1', the mobile station shall set all the bits of
6 TMSI_CODE_{s-p} to '1'. The mobile station shall disable the full-TMSI timer.
- 7 • The mobile station shall set RETURN_IF_FAIL_s = RETURN_IF_FAIL_r.
- 8 • If RECORD_TYPE_r is equal to '00000000', the mobile station shall enter the
9 *System Determination Substate* of the *Mobile Station Initialization State* with an
10 NDSS off indication (see 2.6.1.1); otherwise, the mobile station shall store the
11 redirection record received in the message as REDIRECT_REC_s and shall enter
12 the *System Determination Substate* of the *Mobile Station Initialization State* with a
13 redirection indication (see 2.6.1.1).
- 14 15. *SSD Update Message*: The mobile station shall respond to the message as specified
15 in 2.3.12.1.5.
- 16 16. *Status Request Message*: The mobile station shall disable the *System Access State*
17 timer and respond to the message. If P_REV_IN_USE_s is less than or equal to three,
18 the mobile station shall respond with a *Status Response Message*. If
19 P_REV_IN_USE_s is greater than three, the mobile station shall respond with an
20 *Extended Status Response Message*. If the message does not specify any
21 qualification information (QUAL_INFO_TYPE_r is equal to '00000000'), the mobile
22 station shall include the requested information records in the response. If the
23 message specifies a band class (QUAL_INFO_TYPE_r is equal to '00000001'), the
24 mobile station shall only include the requested information records for the specified
25 band class (BAND_CLASS_r) in the response. If the message specifies a band class
26 and an operating mode (QUAL_INFO_TYPE_r is equal to '00000010'), the mobile
27 station shall only include the requested information records for the specified band
28 class (BAND_CLASS_r) and operating mode (OP_MODE_r) in the response.
- 29 If the message specifies a band class or a band class and an operating mode which
30 is not supported by the mobile station, the mobile station shall send a *Mobile*
31 *Station Reject Order* with ORDQ set to '00000110' (message requires a capability
32 that is not supported by the mobile station). If the response to this message
33 exceeds the allowable length, the mobile station shall send a *Mobile Station Reject*
34 *Order* with ORDQ set to '00001000' (response message would exceed the allowable
35 length). If the message specifies an information record which is not supported by
36 the mobile station for the specified band class and operating mode, the mobile
37 station shall send a *Mobile Station Reject Order* with ORDQ set to '00001001'
38 (information record is not supported for the specified band class and operating
39 mode).
- 40 17. *TMSI Assignment Message*: The mobile station shall store the TMSI zone and code
41 as follows:

- 1 • The mobile station shall store the length of the TMSI zone field by setting
2 ASSIGNING_TMSI_ZONE_LEN_{s-p} to TMSI_ZONE_LEN_r,
- 3 • The mobile station shall store the assigning TMSI zone number by setting the
4 ASSIGNING_TMSI_ZONE_LEN_{s-p} least significant octets of
5 ASSIGNING_TMSI_ZONE_{s-p} to TMSI_ZONE_r, and
- 6 • The mobile station shall store the TMSI code by setting TMSI_CODE_{s-p} to
7 TMSI_CODE_r.

8 The mobile station shall set the TMSI expiration time by setting TMSI_EXP_TIME_{s-p}
9 to TMSI_EXP_TIME_r. The mobile station shall disable the full-TMSI timer. The
10 mobile station shall then respond with a *TMSI Assignment Completion Message*
11 within T_{56m} seconds.

12 18. *General Page Message* or *Universal Page Message*: If the mobile station receives a
13 mobile-station-addressed page, the mobile station may determine whether there is a
14 page match (see 2.6.2.3). If a match is declared, the mobile station shall perform
15 the following:

- 16 • Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any
17 access attempt in progress.
- 18 • If the mobile station entered this substate with a message transmission
19 indication, the mobile station may store the *Data Burst Message* for later
20 transmission.
- 21 • The mobile station shall enter the *Page Response Substate*.

22 19. *Extended Channel Assignment Message*: If the DIRECT_CH_ASSIGN_IND_r is
23 included and is set to '1', the mobile station shall perform the following:

- 24 • If the mobile station entered this substate with a message transmission
25 indication, the mobile station may store the *Data Burst Message* for later
26 transmission.
- 27 • Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any
28 access attempt in progress.
- 29 • The mobile station shall process the message as specified in section 2.6.3.3.

30 Otherwise, the mobile station shall ignore this message.

31 20. *Fast Call Setup Order*:

- 32 • If ORDQ_r is equal to '00000000', the mobile station shall process the message
33 and respond with a *Fast Call Setup Order* as specified in 2.6.12.1.
- 34 • If ORDQ_r is equal to '00000001', the mobile station shall process the message
35 as specified in 2.6.12.1.

36 21. *General Extension Message*: The mobile station shall process this message as
37 specified in section 2.6.18.

1 22. *Any other message*: If the mobile station receives any other message specified in
2 Table 3.7.2.3-1, it shall ignore all Layer 3 fields. The mobile station shall ignore all
3 other messages.

4 2.6.3.8 PACA Cancel Substate

5 In this substate, the mobile station sends a *PACA Cancel Message*. If the base station
6 responds with an authentication request, the mobile station responds in this substate.

7 Upon entering the *PACA Cancel Substate*, the mobile station shall transmit the *PACA*
8 *Cancel Message*.

9 If a message received from the base station requires a Layer 2 acknowledgment and does
10 not require a Layer 3 response, Layer 3 shall indicate to Layer 2 that no response is
11 outstanding (see [4]).

12 If a message received from the base station requires a Layer 2 acknowledgment and also a
13 Layer 3 response, Layer 3 shall indicate to Layer 2 that a response is outstanding (see [4]).

14 When transmitting a response to a message received from the base station, Layer 3 shall
15 indicate to Layer 2 that the type of the message is a response (see [4]).

16 When transmitting an autonomous message (i.e., a message that is not sent as a response
17 to a message received from the base station), Layer 3 shall indicate to Layer 2 that the type
18 of the message is a request other than a registration request or a message transmission
19 request (see [4]).

20 While in this substate, the mobile station shall monitor the Paging Channel or the Forward
21 Common Control Channel. If the mobile station declares a loss of the Paging Channel or
22 the Forward Common Control Channel (see 2.6.3.1.8), it shall declare an access attempt
23 failure and update its registration variables as specified in 2.6.5.5.3.2, disable its
24 transmitter and enter the *Mobile Station Idle State*. If the mobile station receives
25 confirmation of any message sent by the mobile station in this substate, it shall send a
26 response in this substate if required and shall then enter the *Mobile Station Idle State*.

27 If the mobile station is to exit the *System Access State* as a result of processing Layer 3
28 fields of a message requiring an acknowledgment, the mobile station shall exit the *System*
29 *Access State* after Layer 3 receives an indication from Layer 2 that the acknowledgment to
30 the message has been sent and acknowledged.

31 If Layer 3 receives a message other than message listed below:

- 32 • *Extended Channel Assignment Message* with DIRECT_CH_ASSIGN_IND field
33 included and set to '1'

34 with an indication from Layer 2 that an access attempt for a message being transmitted
35 was not terminated as a result of processing the Layer 2 fields of the received message, the
36 mobile station shall ignore the received message.

37 The following directed messages and orders can be received. If any field value of the
38 message or order is outside its permissible range, the mobile station may send a *Mobile*
39 *Station Reject Order* with ORDQ equal to '0000100' (message field not in valid range).

- 1 1. *Authentication Challenge Message*: The mobile station shall respond to the message
2 as specified in 2.3.12.1.4, regardless of the value of AUTH_S.
- 3 2. *Authentication Request Message*: The mobile station shall process the message and
4 shall respond as specified in 2.3.12.5.2.
- 5 3. *Base Station Challenge Confirmation Order*: The mobile station shall respond to the
6 message as specified in 2.3.12.1.5.
- 7 4. *Base Station Reject Order*: The mobile station shall perform the procedures as
8 specified in 2.6.11.5.
- 9 5. *Data Burst Message*
- 10 6. *Local Control Order*
- 11 7. *Lock Until Power-Cycled Order*: The mobile station shall disable its transmitter and
12 record the reason for the *Lock Until Power-Cycled Order* in the mobile station's semi-
13 permanent memory (LCKRSN_{P_{s-p}} equals the least significant four bits of ORDQ_R).
14 The mobile station should notify the user of the locked condition. The mobile
15 station shall enter the *System Determination Substate* of the *Mobile Station*
16 *Initialization State* with a lock indication (see 2.6.1.1), and shall not enter the *System*
17 *Access State* again until after the next mobile station power-up or until it has
18 received an *Unlock Order*. This requirement shall take precedence over any other
19 mobile station requirement specifying entry to the *System Access State*.
- 20 8. *Maintenance Required Order*: The mobile station shall record the reason for the
21 *Maintenance Required Order* in the mobile station's semi-permanent memory
22 (MAINTRSN_{S-p} equals the least significant four bits of ORDQ_R). The mobile station
23 shall remain in the unlocked condition. The mobile station should notify the user of
24 the maintenance required condition.
- 25 9. *PACA Message*: The mobile station shall send a *Mobile Station Reject Order* with the
26 ORDQ field set to '0000010' (message not accepted in this state).
- 27 10. *Registration Accepted Order*: The mobile station shall perform the procedures as
28 specified in 2.6.11.1.
- 29 11. *Registration Rejected Order*: This order indicates that normal service is not available
30 on this system. The mobile station shall disable the full-TMSI timer. If the received
31 order specifies to delete the TMSI (ORDQ = '00000100'), the mobile station shall set
32 all the bits of the TMSI_CODE_{S-p} to '1'. The mobile station shall enter the *System*
33 *Determination Substate* of the *Mobile Station Initialization State* with a registration
34 rejected indication (see 2.6.1.1).
- 35 12. *Retry Order*: The mobile station shall process the message as follows:
 - 36 • If RETRY_TYPE_R is equal to '000', the mobile station shall set
37 RETRY_DELAY_S[RETRY_TYPE] to 0, where RETRY_TYPE is equal to '001', '010',
38 '011', '100', or '101'.
 - 39 • If RETRY_TYPE_R is equal to '001', '100', or '101', the mobile station shall perform
40 the following:

- 1 - If $RETRY_DELAY_r$ is equal to '00000000', then the mobile station shall set
2 $RETRY_DELAY_s[RETRY_TYPE_r]$ to 0.
- 3 - If $RETRY_DELAY_r$ is not equal to '00000000', the mobile station shall set
4 $RETRY_DELAY_s[RETRY_TYPE_r]$ as follows:
- 5 + If the most significant bit of the $RETRY_DELAY_r$ is '0', set
6 $RETRY_DELAY_UNIT_s$ to 1000ms. If the most significant bit of the
7 $RETRY_DELAY_r$ is '1', set $RETRY_DELAY_UNIT_s$ to 60000ms.
- 8 + The mobile station shall set $RETRY_DELAY_VALUE_s$ to the seven least
9 significant bits of $RETRY_DELAY_r$.
- 10 + The mobile station shall store the next system time 80 ms boundary +
11 $RETRY_DELAY_VALUE_s \times RETRY_DELAY_UNIT_s$ ms as
12 $RETRY_DELAY_s[RETRY_TYPE_r]$.
- 13 13. *Security Mode Command Message*: The mobile station shall perform the procedures
14 as specified in 2.6.11.4.
- 15 14. *Service Redirection Message*: The mobile station shall process the message as
16 follows:
- 17 • If the mobile station is directed to an unsupported operation mode or band
18 class, the mobile station shall respond with a *Mobile Station Reject Order* with
19 ORDQ equal to '00000110' (message requires a capability that is not supported
20 by the mobile station).
- 21 • If $DELETE_TMSI_r$ is equal to '1', the mobile station shall set all the bits of
22 $TMSI_CODE_{s-p}$ to '1'. The mobile station shall disable the full-TMSI timer.
- 23 • The mobile station shall set $RETURN_IF_FAIL_s = RETURN_IF_FAIL_r$.
- 24 • If $RECORD_TYPE_r$ is equal to '00000000', the mobile station shall enter the
25 *System Determination Substate* of the *Mobile Station Initialization State* with an
26 NDSS off indication (see 2.6.1.1); otherwise, the mobile station shall store the
27 redirection record received in the message as $REDIRECT_REC_s$ and shall enter
28 the *System Determination Substate* of the *Mobile Station Initialization State* with a
29 redirection indication (see 2.6.1.1).
- 30 15. *SSD Update Message*: The mobile station shall respond to the message as specified
31 in 2.3.12.1.5.
- 32 16. *Status Request Message*: The mobile station shall disable the *System Access State*
33 timer and respond to the message. If $P_REV_IN_USE_s$ is less than or equal to three,
34 the mobile station shall respond with a *Status Response Message*. If
35 $P_REV_IN_USE_s$ is greater than three, the mobile station shall respond with an
36 *Extended Status Response Message*. If the message does not specify any
37 qualification information ($QUAL_INFO_TYPE_r$ is equal to '00000000'), the mobile
38 station shall include the requested information records in the response. If the
39 message specifies a band class ($QUAL_INFO_TYPE_r$ is equal to '00000001'), the
40 mobile station shall only include the requested information records for the specified
41 band class ($BAND_CLASS_r$) in the response. If the message specifies a band class

1 and an operating mode ($QUAL_INFO_TYPE_r$ is equal to '00000010'), the mobile
 2 station shall only include the requested information records for the specified band
 3 class ($BAND_CLASS_r$) and operating mode (OP_MODE_r) in the *Status Response*
 4 *Message*.

5 If the message specifies a band class or a band class and an operating mode which
 6 is not supported by the mobile station, the mobile station shall send a *Mobile*
 7 *Station Reject Order* with ORDQ set to '00000110' (message requires a capability
 8 that is not supported by the mobile station). If the response to this message
 9 exceeds the allowable length, the mobile station shall send a *Mobile Station Reject*
 10 *Order* with ORDQ set to '00001000' (response message would exceed the allowable
 11 length). If the message specifies an information record which is not supported by
 12 the mobile station for the specified band class and operating mode, the mobile
 13 station shall send a *Mobile Station Reject Order* with ORDQ set to '00001001'
 14 (information record is not supported for the specified band class and operating
 15 mode).

16 17. *TMSI Assignment Message*: The mobile station shall store the TMSI zone and code
 17 as follows:

- 18 • The mobile station shall store the length of the TMSI zone field by setting
 19 $ASSIGNING_TMSI_ZONE_LEN_{s-p}$ to $TMSI_ZONE_LEN_r$,
- 20 • The mobile station shall store the assigning TMSI zone number by setting the
 21 $ASSIGNING_TMSI_ZONE_LEN_{s-p}$ least significant octets of
 22 $ASSIGNING_TMSI_ZONE_{s-p}$ to $TMSI_ZONE_r$, and
- 23 • The mobile station shall store the TMSI code by setting $TMSI_CODE_{s-p}$ to
 24 $TMSI_CODE_r$.

25 The mobile station shall set the TMSI expiration time by setting $TMSI_EXP_TIME_{s-p}$
 26 to $TMSI_EXP_TIME_r$. The mobile station shall disable the full-TMSI timer. The
 27 mobile station shall then respond with a *TMSI Assignment Completion Message*
 28 within T_{56m} seconds.

29 18. *General Page Message or Universal Page Message*: If the mobile station receives a
 30 mobile-station-addressed page, the mobile station may determine whether there is a
 31 page match (see 2.6.2.3). If a match is declared, the mobile station shall perform
 32 the following:

- 33 • Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any
 34 access attempt in progress.
- 35 • The mobile station shall enter the *Page Response Substate*.

36 19. *Extended Channel Assignment Message*: If the $DIRECT_CH_ASSIGN_IND_r$ is
 37 included and is set to '1', the mobile station shall perform the following:

- 38 • Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any
 39 access attempt in progress.
- 40 • The mobile station shall process the message as specified in section 2.6.3.3.

1 Otherwise, the mobile station shall ignore this message.

2 20. *Fast Call Setup Order*:

- 3 • If $ORDQ_R$ is equal to '00000000', the mobile station shall process the message
4 and respond with a *Fast Call Setup Order* as specified in 2.6.12.1.
- 5 • If $ORDQ_R$ is equal to '00000001', the mobile station shall process the message
6 as specified in 2.6.12.1.

7 21. *General Extension Message*: The mobile station shall process this message as
8 specified in section 2.6.18.

9 22. *Any other message*: If the mobile station receives any other message specified in
10 Table 3.7.2.3-1, it shall ignore all Layer 3 fields. The mobile station shall ignore all
11 other messages.

12 2.6.4 Mobile Station Control on the Traffic Channel State

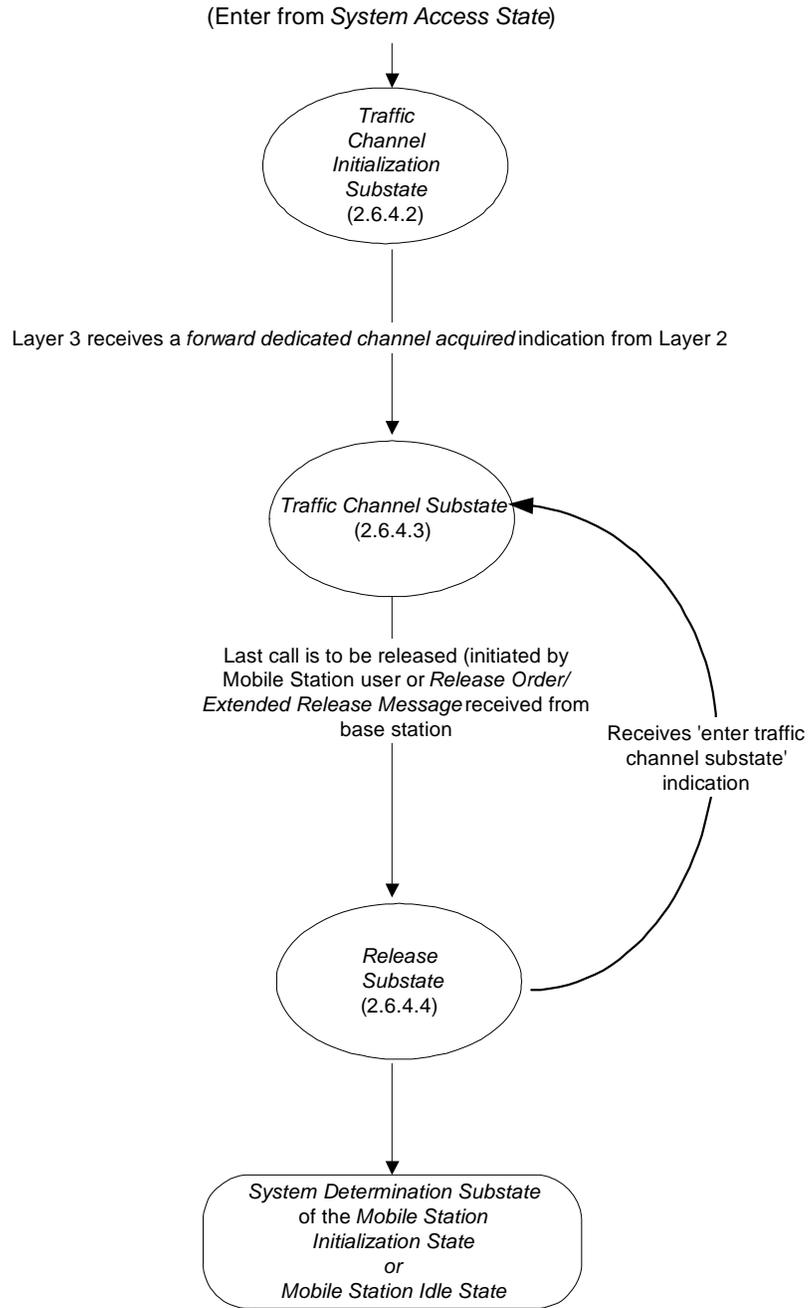

13 In this state, the mobile station communicates with the base station using the Forward and
14 Reverse Traffic Channels.

15 As illustrated in Figure 2.6.4-1, the *Mobile Station Control on the Traffic Channel State*
16 consists of the following substates:

- 17 • *Traffic Channel Initialization Substate* - In this substate, the mobile station verifies
18 that it can receive the Forward Traffic Channel and begins transmitting on the
19 Reverse Traffic Channel.
- 20 • *Traffic Channel Substate* - In this substate, the mobile station exchanges Traffic
21 Channel frames with the base station in accordance with the current service
22 configuration. The mobile station may perform the gating operation of Reverse Pilot
23 Channel. While in this substate, one or more Call Control instances can be
24 activated (see 2.6.10).
- 25 • *Release Substate* - In this substate, the mobile station disconnects the calls and the
26 physical channels.

27

28

1
2
3

Figure 2.6.4-1. Mobile Station Control on the Traffic Channel State

1 2.6.4.1 Special Functions and Actions

2 The mobile station performs special functions and actions in one or more of the substates
3 of the *Mobile Station Control on the Traffic Channel State*.

4 2.6.4.1.1 Forward Traffic Channel Power Control

5 The mobile station uses FPC_MODE_NO_SCH_s as FPC_MODE_s except during the forward
6 Supplemental Channel assignment interval. During the forward Supplemental Channel
7 assignment interval, the mobile station uses FPC_MODE_SCH_s as FPC_MODE_s.

8 To support Forward Traffic Channel power control, the mobile station reports frame error
9 rate statistics to the base station. If the base station enables periodic reporting, the mobile
10 station reports frame error rate statistics at specified intervals. If the base station enables
11 threshold reporting, the mobile station reports frame error rate statistics when the frame
12 error rate reaches a specified threshold.⁵⁷

13 The mobile station shall maintain the following frame counters:

- 14 • A counter (TOT_FRAMES_s) for the total number of frames received on the Forward
15 Fundamental Channel.
- 16 • A counter (BAD_FRAMES_s) for the number of bad frames detected on the Forward
17 Fundamental Channel.
- 18 • A counter (DCCH_TOT_FRAMES_s) for the total number of frames received on the
19 Forward Dedicated Control Channel, when the Dedicated Control Channel is
20 assigned.
- 21 • A counter (DCCH_BAD_FRAMES_s) for the total number of bad frames received on
22 the Forward Dedicated Control Channel, when the Dedicated Control Channel is
23 assigned.

24 The mobile station shall maintain the following counters for each Supplemental Channel
25 assigned, if FOR_SCH_FER_REP_s is equal to '1':

- 26 • A counter (SCH_TOT_FRAMES_s) for the number of frames received on the assigned
27 Supplemental Channel.
- 28 • A counter (SCH_BAD_FRAMES_s) for the number of bad frames received on the
29 assigned Supplemental Channel.

30 The mobile station shall increment the counter by 1 at every 20 ms interval if a 20ms frame
31 or at least one 5ms frame is received from the Forward Fundamental Channel or Dedicated
32 Control Channel:

- 33 • If the received frame is from the Fundamental Channel and if any of the following
34 conditions is true

⁵⁷ Periodic reporting and threshold reporting may be independently enabled or disabled by the base station.

- 1 - RC 11 or RC 12 is not assigned on the forward fundamental channel
2 - or if RC 11 or RC 12 is assigned on the forward fundamental channel and this is
3 a guaranteed transmission frame,
4 then the mobile station shall perform the following:
- 5 - Increment TOT_FRAMES_S by 1.
6 - If the received 20ms frame is bad or one of the 5ms frames is bad, the mobile
7 station shall increment BAD_FRAMES_S by 1.
8 • If the received frame is from the Forward Dedicated Control Channel, the mobile
9 station shall perform the following:
- 10 - Increment DCCH_TOT_FRAMES_S by 1.
11 - If the received 20ms frame is bad or one of the 5ms frames is bad, the mobile
12 station shall increment DCCH_BAD_FRAMES_S by 1.
13 • If either of the following conditions is true:
- 14 - PWR_THRESH_ENABLE_S is equal to '1' and if one of the following conditions is
15 true:
16 + If the mobile station is to perform the primary inner loop estimation on the
17 received Forward Fundamental Channel [FPC_PRI_CHAN_S = '0'], and
18 BAD_FRAMES_S is equal to PWR_REP_THRESH_S or
19 + If the mobile station is to perform the primary inner loop estimation on the
20 received Forward Dedicated Control Channel [FPC_PRI_CHAN_S = '1'], and
21 DCCH_BAD_FRAMES_S is equal to PWR_REP_THRESH_S.
- 22 or
- 23 - PWR_PERIOD_ENABLE_S is equal to '1' and if one of the following conditions is
24 true:
25 + If the mobile station is to perform the primary inner loop estimation on the
26 received Forward Fundamental Channel [FPC_PRI_CHAN_S = '0'], and
27 TOT_FRAMES_S is equal to $\lfloor (2^{(PWR_REP_FRAMES_S/2)} \times 5) \rfloor$, or
28 + If the mobile station is to perform the primary inner loop estimation on the
29 received Forward Dedicated Control Channel [FPC_PRI_CHAN_S = '1'], and
30 DCCH_TOT_FRAMES_S is equal to $\lfloor (2^{(PWR_REP_FRAMES_S/2)} \times 5) \rfloor$,
- 31 then the mobile station shall send a *Power Measurement Report Message* to the base
32 station. The mobile station should send the *Power Measurement Report Message* in
33 unassured mode. After sending a *Power Measurement Report Message*, the mobile
34 station shall set TOT_FRAMES_S, BAD_FRAMES_S to zero, and if the Dedicated
35 Control Channel is assigned, shall set DCCH_TOT_FRAMES_S and
36 DCCH_BAD_FRAMES_S to zero. The mobile station shall not increment the counters
37 for a period of PWR_REP_DELAY_S × 4 frames following the first transmission of the
38 message.

- 1 • If $FPC_PRI_CHAN_S$ is equal to '0' and TOT_FRAMES_S is equal to
2 $\lfloor (2(PWR_REP_FRAMES_S/2) \times 5) \rfloor$, the mobile station shall perform the following:
- 3 - Set TOT_FRAMES_S and BAD_FRAMES_S to zero.
- 4 - Set $DCCH_TOT_FRAMES_S$ and $DCCH_BAD_FRAMES_S$ to zero, if the Dedicated
5 Control Channel is assigned.
- 6 • If $FPC_PRI_CHAN_S$ is equal to '1' and $DCCH_TOT_FRAMES_S$ is equal to
7 $\lfloor (2(PWR_REP_FRAMES_S/2) \times 5) \rfloor$, the mobile station shall set
8 TOT_FRAMES_S , BAD_FRAMES_S , $DCCH_TOT_FRAMES_S$, and $DCCH_BAD_FRAMES_S$
9 to zero.

10 For each received frame from an assigned Supplemental Channel, the mobile station shall
11 perform the following, if $FOR_SCH_FER_REP_S$ is equal to '1':

- 12 • Increment $SCH_TOT_FRAMES_S$ by 1.
- 13 • If the received frame is bad, increment $SCH_BAD_FRAMES_S$ by 1.

14 At the end of a burst on each assigned Supplemental Channel, if $FOR_SCH_FER_REP_S$ is
15 equal to '1', the mobile station shall report the total number of frames received on this
16 Supplemental Channel ($SCH_TOT_FRAMES_S$) and the bad frames detected
17 ($SCH_BAD_FRAMES_S$) with the fields $SCH_PWR_MEAS_FRAMES$ and
18 $SCH_ERRORS_DETECTED$ in the *Power Measurement Report Message* respectively. After
19 sending the *Power Measurement Report Message* for the Supplemental Channel, the mobile
20 station shall set $SCH_TOTAL_FRAMES_S$ and $SCH_BAD_FRAMES_S$ of the reported SCH to
21 zero.

22 If both Forward Fundamental Channel and the Forward Dedicated Control Channel are
23 assigned to the mobile station, the mobile station shall perform the following:

- 24 • The mobile station shall set $FPC_DELTA_SETPT_S$ to $(FPC_FCH_CURR_SETPT_S -$
25 $FPC_DCCH_CURR_SETPT_S)$.
- 26 • For each received frame, if $|FPC_FCH_CURR_SETPT_S - FPC_DCCH_CURR_SETPT_S$
27 $- FPC_DELTA_SETPT_S|$ is equal to or greater than its assigned threshold
28 $FPC_SETPT_THRESH_S$, the mobile station shall send the *Outer Loop Report Message*
29 requiring acknowledgment to the base station, and the mobile station shall then set
30 $FPC_DELTA_SETPT_S$ to $(FPC_FCH_CURR_SETPT_S - FPC_DCCH_CURR_SETPT_S)$.

31 For each of the supplemental channels assigned to the mobile station and FPC_MODE_S is
32 set to '000', the mobile station shall perform the following:

- 33 • The mobile station shall set $FPC_DELTA_SCH_SETPT_S$ to
34 $(FPC_FCH_CURR_SETPT_S - FPC_SCH_CURR_SETPT_S)$ if $FPC_PRI_CHAN_S$ is equal to
35 '0'.
- 36 • The mobile station shall set $FPC_DELTA_SCH_SETPT_S$ to
37 $(FPC_DCCH_CURR_SETPT_S - FPC_SCH_CURR_SETPT_S)$ if $FPC_PRI_CHAN_S$ is equal
38 to '1'.

- 1 • For each received frame, if $FPC_PRI_CHAN_s$ is equal to '0' and
 2 $|FPC_FCH_CURR_SETPT_s - FPC_SCH_CURR_SETPT_s -$
 3 $FPC_DELTA_SCH_SETPT_s|$ is equal to or greater than its assigned threshold
 4 $FPC_SETPT_THRESH_SCH_s$, the mobile station shall send the *Outer Loop Report*
 5 *Message* in assured mode, and the mobile station shall then set
 6 $FPC_DELTA_SCH_SETPT_s$ to $(FPC_FCH_CURR_SETPT_s - FPC_SCH_CURR_SETPT_s)$.
- 7 • For each received frame, if $FPC_PRI_CHAN_s$ is equal to '1' and
 8 $|FPC_DCCH_CURR_SETPT_s - FPC_SCH_CURR_SETPT_s -$
 9 $FPC_DELTA_SCH_SETPT_s|$ is equal to or greater than its assigned threshold
 10 $FPC_SETPT_THRESH_SCH_s$, the mobile station shall send the *Outer Loop Report*
 11 *Message* in assured mode, and the mobile station shall then set
 12 $FPC_DELTA_SCH_SETPT_s$ to $(FPC_DCCH_CURR_SETPT_s -$
 13 $FPC_SCH_CURR_SETPT_s)$.

14 If the Supplemental channels are assigned to the mobile station and FPC_MODE_s is set to
 15 '001', '010', '101', or '110', for each additional Forward Supplemental Channel other than
 16 the Forward Supplemental Channel specified by $FPC_SEC_CHAN_s$, the mobile station shall
 17 perform the following:

- 18 • The mobile station shall set $FPC_DELTA_SCH_SETPT_s$ to
 19 $(FPC_SCH_CURR_SETPT_s[FPC_SEC_CHAN_s] - FPC_SCH_CURR_SETPT_s)$ for the
 20 Supplemental Channel.
- 21 • For each received frame, if $|FPC_SCH_CURR_SETPT_s[FPC_SEC_CHAN_s] -$
 22 $FPC_SCH_CURR_SETPT_s - FPC_DELTA_SCH_SETPT_s|$ is equal to or greater than
 23 its assigned threshold $FPC_SETPT_THRESH_SCH_s$, the mobile station shall send
 24 the *Outer Loop Report Message* in assured mode, and the mobile station shall then
 25 set $FPC_DELTA_SCH_SETPT_s$ to $(FPC_SCH_CURR_SETPT_s[FPC_SEC_CHAN_s] -$
 26 $FPC_SCH_CURR_SETPT_s)$.

27 2.6.4.1.1.1 Forward Traffic Channel Power Control Initialization

28 To initialize Forward Traffic Channel power control, the mobile station shall set
 29 TOT_FRAMES_s , BAD_FRAMES_s , $DCCH_TOT_FRAMES_s$, and $DCCH_BAD_FRAMES_s$ to zero.
 30 The mobile station shall initialize the frame counters $SCH_TOT_FRAMES_s$ and
 31 $SCH_BAD_FRAMES_s$ for each assigned Supplemental Channel to zero. The mobile station
 32 shall initialize $FOR_SCH_FER_REP_s$ to zero.

33 2.6.4.1.1.2 Processing the Power Control Parameters Message

34 The mobile station shall store the following parameters from the *Power Control Parameters*
 35 *Message*:

- 36 • Power control reporting threshold ($PWR_REP_THRESH_s = PWR_REP_THRESH_r$)
 37 • Power control reporting frame count ($PWR_REP_FRAMES_s = PWR_REP_FRAMES_r$)
 38 • Threshold report mode indicator
 39 ($PWR_THRESH_ENABLE_s = PWR_THRESH_ENABLE_r$)

- 1 • Periodic report mode indicator
2 (PWR_PERIOD_ENABLE_S = PWR_PERIOD_ENABLE_T)
- 3 • Power report delay (PWR_REP_DELAY_S = PWR_REP_DELAY_T)

4 The mobile station shall set TOT_FRAMES_S and BAD_FRAMES_S to zero if FCH is assigned.
5 The mobile station shall set DCCH_TOT_FRAMES_S and DCCH_BAD_FRAMES_S to zero if
6 DCCH is assigned.

7 2.6.4.1.1.3 Processing the Power Control Message

8 The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to
9 '00000110' (message requires a capability that is not supported by the mobile station) if
10 any of the following conditions are detected:

- 11 • If the mobile station does not support any Radio Configuration greater than 2 and
12 FPC_MODE_T is not supported by the mobile station.
- 13 • If the mobile station does not support Supplemental Channel and FPC_MODE_T is
14 set to the '001', '010', '101', or '110'.
- 15 • If PWR_CNTL_STEP_T corresponds to a power control step size (see [2]) is not
16 supported by the mobile station.

17 The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to
18 '00000111' (message cannot be handled by the current mobile station configuration) if any
19 of the following conditions are detected:

- 20 • FPC_PRI_CHAN_T is set to '1' and only the Fundamental Channel is assigned.
- 21 • FPC_PRI_CHAN_T is set to '0' and only the Dedicated Control Channel is assigned.

22 If none of the above conditions are true, the mobile station shall process the message as
23 follows at the action time (see 2.6.4.1.5) specified in the message:

- 24 • The mobile station shall store the power control step size (PWR_CNTL_STEP_S =
25 PWR_CNTL_STEP_T).
- 26 • If FPC_INCL_T is equal to '1', the mobile station shall perform the following:
 - 27 - The mobile station shall set FPC_MODE_NO_SCH_S = FPC_MODE_T.
 - 28 - The mobile station shall set FPC_MODE_S = FPC_MODE_NO_SCH_S if there is no
29 forward Supplemental Channel burst in progress (see 2.6.6.2.5.1.1).
 - 30 - The mobile station shall set FPC_PRI_CHAN_S to FPC_PRI_CHAN_T
 - 31 - If FPC_OLPC_FCH_INCL is equal to '1', the mobile station shall:
 - 32 + Set FPC_FCH_FER_S to FPC_FCH_FER_T.
 - 33 + If FPC_FCH_MIN_SETPT_T is not equal to '11111111', set
34 FPC_FCH_MIN_SETPT_S to FPC_FCH_MIN_SETPT_T; otherwise, set
35 FPC_FCH_MIN_SETPT_S to FPC_FCH_CURR_SETPT_S.

- 1 + If FPC_FCH_MAX_SETPT_T is not equal to '11111111', set
2 FPC_FCH_MAX_SETPT_S to FPC_FCH_MAX_SETPT_T; otherwise, set
3 FPC_FCH_MAX_SETPT_S to FPC_FCH_CURR_SETPT_S.
- 4 - If FPC_OLPC_DCCH_INCL is equal to '1', the mobile station shall:
- 5 + Set FPC_DCCH_FER_S to FPC_DCCH_FER_T.
- 6 + If FPC_DCCH_MIN_SETPT_T is not equal to '11111111', set
7 FPC_DCCH_MIN_SETPT_S to FPC_DCCH_MIN_SETPT_T; otherwise, set
8 FPC_DCCH_MIN_SETPT_S to FPC_DCCH_CURR_SETPT_S.
- 9 + If FPC_DCCH_MAX_SETPT_T is not equal to '11111111', set
10 FPC_DCCH_MAX_SETPT_S to FPC_DCCH_MAX_SETPT_T; otherwise, set
11 FPC_DCCH_MAX_SETPT_S to FPC_DCCH_CURR_SETPT_S.
- 12 - If FPC_INCL is equal to '1' and FPC_MODE is equal to '001', '010', '101', or '110',
13 the mobile station shall:
- 14 + Set FPC_SEC_CHAN_S to FPC_SEC_CHAN_T.
- 15 + Set FPC_BCMC_CHAN_S to FPC_BCMC_CHAN_T.
- 16 - If NUM_SUP_T is not equal to '00', for each Supplemental Channel included in the
17 message, the mobile station shall:
- 18 + Set SCH_ID_S to SCH_ID_T.
- 19 + Set FPC_SCH_FER_S[SCH_ID_S] to FPC_SCH_FER_T.
- 20 + If FPC_SCH_MIN_SETPT_T is not equal to '11111111', set
21 FPC_SCH_MIN_SETPT_S[SCH_ID_S] to FPC_SCH_MIN_SETPT_T; otherwise, set
22 FPC_SCH_MIN_SETPT_S[SCH_ID_S] to FPC_SCH_CURR_SETPT_S.
- 23 + If FPC_SCH_MAX_SETPT_T is not equal to '11111111', set
24 FPC_SCH_MAX_SETPT_S[SCH_ID_S] to FPC_SCH_MAX_SETPT_T; otherwise, set
25 FPC_SCH_MAX_SETPT_S[SCH_ID_S] to FPC_SCH_CURR_SETPT_S.
- 26 - If FPC_THRESH_INCL is equal to '1', the mobile station shall set
27 FPC_SETPT_THRESH_S to FPC_SETPT_THRESH_T.
- 28 - If FPC_THRESH_SCH_INCL is equal to '1', the mobile station shall set
29 FPC_SETPT_THRESH_SCH_S to FPC_SETPT_THRESH_SCH_T.
- 30 • If RPC_INCL_T is equal to '1' and the mobile station supports any Radio
31 Configuration greater than 2, the mobile station shall perform the following:
- 32 - If RPC_ADJ_REC_TYPE is equal to '0000', the mobile station shall update the
33 Reverse Channel Adjustment Gain Table (see [2]) containing an offset relative to
34 the Reverse Pilot Channel power for each reverse link code channel received in
35 this message.
- 36 - If RPC_ADJ_REC_TYPE is equal to '0001' or '0010', the mobile station shall
37 update the Reverse Link Attribute Adjustment Gain Table (see [2]) containing an
38 offset relative to the Reverse Pilot Channel power for each transmission rate,
39 frame length, coding type received in this message.

- 1 - If `RPC_ADJ_REC_TYPE` is equal to '0011', at the action time of the message, the
2 mobile station shall update the Reverse Link Attribute Adjustment Gain Table
3 (see [2]) containing an offset relative to the Reverse Pilot Channel power for the
4 R-CQICH.
- 5 - If `RPC_ADJ_REC_TYPE` is equal to '0100', the mobile station shall perform the
6 following:
- 7 + At the first R-PDCH frame boundary at or after the action time of the
8 message, the mobile station shall update the Reverse Link Attribute
9 Adjustment Gain Table (see [2]) containing an offset relative to the Reverse
10 Pilot Channel power for any combination of the following channels:
- 11 o R-REQCH,
12 o R-SPICH,
13 o R-PDCCH possibly for each encoder packet size, or for the boosted and
14 non boosted modes
15 o R-PDCH possibly for each encoder packet size, or for the boosted and
16 non boosted modes, or for each encoder packet size and transmission
17 round.
- 18 + At the action time of the message, the mobile station shall update the
19 Reverse Link Attribute Adjustment Gain Table (see [2]) containing an offset
20 relative to the Reverse Pilot Channel power for the R-ACKCH.
- 21 + If `REV_SPICH_ADJ_INCLT` is equal to '1', the mobile station shall set
22 `REV_SPICH_EP_SIZES` to `REV_SPICH_EP_SIZET+1`.
- 23 + If `REV_PDCH_PARAMS_INCLT` is equal to '1', the mobile station shall set
24 `REV_PDCH_NUM_ARQ_ROUNDS_NORMALS` to
25 `REV_PDCH_NUM_ARQ_ROUNDS_NORMALT+1`, and
26 `REV_PDCH_NUM_ARQ_ROUNDS_BOOSTS` to
27 `REV_PDCH_NUM_ARQ_ROUNDS_BOOSTT+1`.

28 2.6.4.1.1.4 Processing the Rate Change Message

29 The mobile station shall process this message as follows at the action time (see 2.6.4.1.5)
30 specified in the message:

- 31 • The mobile station shall set `FULL_CI_FEEDBACK_INDS` to
32 `FULL_CI_FEEDBACK_INDT`.
- 33 • If `REV_CQICH_RATE_CHANGE_INCLT` is equal to '1', the mobile station shall set
34 `REV_CQICH_REPSS` to `REV_CQICH_REPST`. In addition, if
35 `RL_CQICH_ATT_ADJ_GAIN_INCLT` is equal to '1', the mobile station shall update the
36 Reverse Link Attribute Adjustment Gain Table (see [2]) containing the offsets
37 relative to the Reverse Pilot Channel power for the corresponding transmission
38 power level (HIGH or LOW).
- 39 • If `SWITCHING_PARAMS_INCLT` is included and equal to '1', the mobile station shall
40 set `NUM_SOFT_SWITCHING_FRAMESS` to `NUM_SOFT_SWITCHING_FRAMEST + 1`,

- 1 and, NUM_SOFTER_SWITCHING_FRAMES_s to
2 NUM_SOFTER_SWITCHING_FRAMES_r + 1.
- 3 • If CHM_SWITCHING_PARMES_INCL is included and equal to '1', the mobile station
4 shall set NUM_SOFT_SWITCHING_FRAMES_CHM_s to
5 NUM_SOFT_SWITCHING_FRAMES_CHM_r + 1, and
6 NUM_SOFTER_SWITCHING_FRAMES_CHM_s to
7 NUM_SOFTER_SWITCHING_FRAMES_CHM_r + 1.
 - 8 • If CHM_SWITCHING_PARMES_INCL is included and equal to '0', the mobile station
9 shall set NUM_SOFT_SWITCHING_FRAMES_CHM_s to
10 NUM_SOFT_SWITCHING_FRAMES_r + 1, and
11 NUM_SOFTER_SWITCHING_FRAMES_CHM_s to
12 NUM_SOFTER_SWITCHING_FRAMES_r + 1.
 - 13 • If REV_ACKCH_RATE_CHANGE_INCL_r is equal to '1', the mobile station shall set
14 REV_ACKCH_REPS_s to REV_ACKCH_REPS_r.
 - 15 • If REV_PDCH_MAX_PARMES_INCL_r is equal to '1', the base station shall set
16 REV_PDCH_MAX_AUTO_TPR_s to REV_PDCH_MAX_AUTO_TPR_r, and
17 REV_PDCH_MAX_SIZE_ALLOWED_ENCODER_PACKET_s to
18 REV_PDCH_MAX_SIZE_ALLOWED_ENCODER_PACKET_r+1.
 - 19 • If REV_PDCH_PARMES_INCL_r is equal to '1', the mobile station shall set
20 REV_PDCH_NUM_ARQ_ROUNDS_NORMAL_s to
21 REV_PDCH_NUM_ARQ_ROUNDS_NORMAL_r+1, and
22 REV_PDCH_NUM_ARQ_ROUNDS_BOOST_s to
23 REV_PDCH_NUM_ARQ_ROUNDS_BOOST_r+1.
- 24
25

2.6.4.1.2 Service Configuration and Negotiation

During Traffic Channel operation, the mobile station and base station communicate through the exchange of Forward and Reverse Traffic Channel frames. The mobile station and base station use a common set of attributes for building and interpreting Traffic Channel frames. This set of attributes, referred to as a service configuration, consists of both negotiable and non-negotiable parameters.

The set of negotiable service configuration parameters consists of the following:

1. *Forward and Reverse Multiplex Options:* These control the way in which the information bits of the Forward and Reverse Traffic Channel frames, respectively, are divided into various types of traffic, such as signaling traffic, primary traffic and secondary traffic. A multiplex option together with a radio configuration specifies the frame structures and transmission rates (see [3]). The multiplex options which support Supplemental Code Channel transmission and Supplemental Channel transmission on the Forward and Reverse Traffic Channels are included in [3]. Multiplex Options 3 through 16 also indicate the capability for supporting Supplemental Code Channel transmission on the Forward and Reverse Traffic Channels. Invocation of Supplemental Code Channel operation on the Forward or Reverse Traffic Channels occurs by the *Supplemental Channel Request Message*, the *Supplemental Channel Assignment Message*, and the *General Handoff Direction Message*. Invocation of Supplemental Channel operation on the Forward or Reverse Traffic Channels occurs by the *Supplemental Channel Request Mini Message*, the *Extended Supplemental Channel Assignment Message*, the *Forward Supplemental Channel Assignment Mini Message*, *Universal Handoff Direction Message*, and the *Reverse Supplemental Channel Assignment Mini Message*. The multiplex option used for the Forward Traffic Channel can be the same as that used for the Reverse Traffic Channel, or it can be different.
2. *Forward and Reverse Traffic Channel Configurations:* These include the Radio Configurations and other necessary attributes for the Forward and Reverse Traffic Channels. The Traffic Channel Configuration used can be different for the Forward and Reverse Traffic Channels or it can be the same.
3. *Forward and Reverse Traffic Channel Transmission Rates:* These are the transmission rates actually used for the Forward and Reverse Traffic Channels respectively. The transmission rates for the Forward Traffic Channel can include all of the transmission rates supported by the radio configuration associated with the Forward Traffic Channel multiplex option, or a subset of the supported rates. Similarly, the transmission rates used for the Reverse Traffic Channel can include all rates supported by the radio configuration associated with the Reverse Traffic Channel multiplex option, or a subset of the supported rates. The transmission rates used for the Forward Traffic Channel can be the same as those used for the Reverse Traffic Channel, or they can be different.
4. *Service Option Connections:* These are the services in use on the Traffic Channel. There can be multiple service option connections. It is also possible that there is no service option connection, in which case the mobile station uses the Reverse

1 Traffic Channel as follows:

- 2 • Sends null traffic on the Reverse Fundamental Channel, if the Fundamental
3 Channel is present.
- 4 • Sends signaling traffic on the Reverse Traffic Channel where r-dsch is mapped
5 to.

6 Associated with each service option connection are a service option, a Forward
7 Traffic Channel traffic type, a Reverse Traffic Channel traffic type, and a service
8 option connection reference. The associated service option formally defines the way
9 in which traffic bits are processed by the mobile station and base station. The
10 associated Forward and Reverse Traffic Channel traffic types specify the types of
11 traffic used to support the service option. A service option can require the use of a
12 particular type of traffic, such as primary or secondary, or it can accept more than
13 one traffic type. A service option can be one-way, in which case it can be supported
14 on the Forward Traffic Channel only or the Reverse Traffic Channel only.

15 Alternatively, a service option can be two-way, in which case it can be supported on
16 the Forward and Reverse Traffic Channels simultaneously. Connected service
17 options can also invoke operation on Supplemental Code Channels in either one or
18 both of the Forward and Reverse Traffic Channels by negotiating a multiplex option
19 that supports operation on Supplemental Code Channels (see [3] for Multiplex
20 options applicable to Supplemental Code Channels), and by using the appropriate
21 Supplemental Code Channel related messages (i.e., the *Supplemental Channel*
22 *Request Message*, the *Supplemental Channel Assignment Message*, and the *General*
23 *Handoff Direction Message*). After Supplemental Code Channels have been assigned
24 by the base station, the connected service option can transmit primary and/or
25 secondary traffic on Supplemental Code Channels. Connected service options can
26 also invoke operation on Supplemental Channels in either one or both of the
27 Forward and Reverse Traffic Channels by negotiating a multiplex option that
28 supports operation on Supplemental Channels (see [3] for Multiplex Options
29 applicable to Supplemental Channel) and by using the appropriate Supplemental
30 Channel related messages (i.e., the *Supplemental Channel Request Mini Message*, the
31 *Extended Supplemental Channel Assignment Message*, the *Forward Supplemental*
32 *Channel Assignment Mini Message*, the *Reverse Supplemental Channel Assignment*
33 *Mini Message*, and the *Universal Handoff Direction Message*). After Supplemental
34 Channels have been assigned by the base station, the connected service option can
35 transmit primary and/or secondary traffic on Supplemental Channels. The
36 associated service option connection reference provides a means for uniquely
37 identifying the service option connection. The reference serves to resolve ambiguity
38 when there are multiple service option connections in use.

39 The non-negotiable service configuration parameters are sent from the base station to the
40 mobile stations only, and consists of the following:

- 41 1. *Reverse Pilot Gating Rate*: This controls the way in which the reverse pilot is gated
42 on the Reverse Pilot Channel. The base station specifies the reverse pilot gating
43 rate to be used in the *Service Connect Message*, the *General Handoff Direction*
44 *Message*, and the *Universal Handoff Direction Message*.

- 1 2. *Forward and Reverse Power Control Parameters:* These consist of forward power
2 control operation mode, outer loop power control parameters (e.g. target frame error
3 rate, minimum E_b/N_t setpoint, and maximum E_b/N_t setpoint) for the Forward
4 Fundamental Channel and Forward Dedicated Control Channel, and Power Control
5 Subchannel indicator which indicates where the mobile station is to perform the
6 primary inner loop estimation and the base station is to multiplex the Power Control
7 Subchannel.
- 8 3. *Logical to Physical Mapping:* This is a table of logical to physical mapping entries,
9 consisting of service reference identifier, logical resource, physical resource, forward
10 flag, reverse flag, and priority.

11 The mobile station can request a default service configuration associated with a service
12 option at call origination, and can request new service configurations during Traffic
13 Channel operation. A requested service configuration can differ greatly from its
14 predecessor or can be very similar. For example, the mobile station can request a service
15 configuration in which all of the service option connections are different from those of the
16 existing configuration; or the mobile station can request a service configuration in which
17 the existing service option connections are maintained with only minor changes, such as a
18 different set of transmission rates or a different mapping of service option connections to
19 Forward and Reverse Traffic Channel traffic types.

20 If the mobile station requests a service configuration that is acceptable to the base station,
21 they both begin using the new service configuration. If the mobile station requests a
22 service configuration that is not acceptable to the base station, the base station can reject
23 the requested service configuration or propose an alternative service configuration. If the
24 base station proposes an alternative service configuration, the mobile station can accept or
25 reject the base station's proposed service configuration, or propose yet another service
26 configuration. This process, called service negotiation, ends when the mobile station and
27 the base station find a mutually acceptable service configuration, or when either the mobile
28 station or the base station rejects a service configuration proposed by the other.

29 It is also possible for the base station to request a default service configuration associated
30 with a service option when paging the mobile station and to request new service
31 configurations during Traffic Channel operation. The service negotiation proceeds as
32 described above, but with the roles of the mobile station and base station reversed.

33 For CDMA mode operation in Band Class 0, the mobile station and base station can also
34 use an alternative method for negotiating a service configuration known as service option
35 negotiation. Service option negotiation is similar to service negotiation, but offers less
36 flexibility for specifying the attributes of the service configuration. During service option
37 negotiation, the base station or the mobile station specifies only which service option is to
38 be used. There is no facility for explicitly specifying the multiplex options, traffic types or
39 transmission rates to be used on the Forward and Reverse Traffic Channels in conjunction
40 with the service option. Instead, implicit service configuration attributes are assumed. In
41 particular, the Forward and Reverse multiplex options and transmission rates are assumed
42 to be the default multiplex options and transmission rates associated with the requested
43 service option, and the traffic type for both the Forward and Reverse Traffic Channels is

1 assumed to be primary traffic; furthermore, a service configuration established using
2 service option negotiation is restricted to having only a single service option connection.

3 At mobile station origination and termination, the type of negotiation to use, either service
4 negotiation or service option negotiation, is indicated in the *Channel Assignment Message*.
5 Service negotiation is always used after the mobile station receives an *Extended Channel*
6 *Assignment Message*. If a CDMA-to-CDMA hard handoff occurs during the call, the type of
7 negotiation to use following the handoff is indicated in the *Extended Handoff Direction*
8 *Message*, the *General Handoff Direction Message*, or the *Universal Handoff Direction*
9 *Message*.

10 For CDMA mode operation in band classes other than Band Class 0, only service
11 negotiation is to be used.

12 The following messages are used to support service negotiation:

- 13 1. *Service Request Message*: The mobile station can use this message to propose a
14 service configuration, or to accept or reject a service configuration proposed in a
15 *Service Response Message*. The base station can use this message to propose a
16 service configuration, or to reject a service configuration proposed in a *Service*
17 *Response Message*.
- 18 2. *Service Response Message*: The mobile station can use this message to accept or
19 reject a service configuration proposed in a *Service Request Message*, or to propose
20 an alternative service configuration. The base station can use this message to reject
21 a service configuration proposed in a *Service Request Message*, or to propose an
22 alternative service configuration.
- 23 3. *Service Connect Message*: The base station can use this message to accept a service
24 configuration proposed in a *Service Request Message* or *Service Response Message*,
25 and to instruct the mobile station to begin using the service configuration.
- 26 4. *Service Connect Completion Message*: The mobile station can use this message to
27 acknowledge the transition to a new service configuration.
- 28 5. *Service Option Control Message*: The mobile station and base station can use this
29 message to invoke service-option-specific functions.
- 30 6. *Extended Channel Assignment Message*: The base station can use this message to
31 accept or reject the initial service configuration proposed by the mobile station in an
32 *Origination Message* or a *Page Response Message*.

33 The following messages are used to support service option negotiation:

- 34 1. *Service Option Request Order*: The mobile station and base station can use this
35 message either to request a service option or to suggest an alternative service
36 option.
- 37 2. *Service Option Response Order*: The mobile station and base station can use this
38 message to accept or to reject a service option request.
- 39 3. *Service Option Control Order*: The mobile station and base station can use this
40 message to invoke service option specific functions.

1 The following messages are used to support both service negotiation and service option
2 negotiation:

- 3 1. *Origination Message*: The mobile station can use this message to propose an initial
4 service configuration.
- 5 2. *Channel Assignment Message*: The base station can use this message to accept or
6 to reject the initial service configuration proposed by the mobile station in an
7 *Origination Message* or a *Page Response Message* and to indicate which type of
8 negotiation, either service negotiation or service option negotiation, is to be used
9 during the call.
- 10 3. *Extended Handoff Direction Message*: The base station can use this message to
11 indicate which type of negotiation, either service negotiation or service option
12 negotiation, is to be used following a CDMA-to-CDMA hard handoff.
- 13 4. *General Handoff Direction Message*: The base station can use this message to
14 indicate which type of negotiation, either service negotiation or service option
15 negotiation, is to be used following a CDMA-to-CDMA hard handoff. The base
16 station can use this message to accept a service configuration proposed in a *Service*
17 *Request Message* or *Service Response Message*. The base station can also use this
18 message to instruct the mobile station to begin using the service configuration.
- 19 5. *General Page Message* or *Universal Page Message*: The base station can use a
20 mobile-station-addressed page in a *General Page Message* or in a *Universal Page*
21 *Message* to propose an initial service configuration.
- 22 6. *Page Response Message*: The mobile station can use this message to accept or to
23 reject the initial service configuration proposed by the base station in a mobile-
24 station-addressed page, or to propose an alternative initial service configuration.
- 25 7. *Status Request Message*: The base station can use this message to request service
26 capability information from the mobile station.
- 27 8. *Status Response Message*: The mobile station can use this message to return the
28 service capability information requested by the base station in a *Status Request*
29 *Message*.
- 30 9. *Extended Status Response Message*: The mobile station can use this message to
31 return the service capability information requested by the base station in a *Status*
32 *Request Message*.
- 33 10. *Universal Handoff Direction Message*: The base station can use this message to
34 indicate which type of negotiation, either service negotiation or service option
35 negotiation, is to be used following a CDMA-to-CDMA hard handoff. The base
36 station can use this message to accept a service configuration proposed in a *Service*
37 *Request Message* or *Service Response Message*. The base station can also use this
38 message to instruct the mobile station to begin using the service configuration.
- 39 11. *General Extension Message*: The mobile station shall process this message as
40 specified in section 2.6.18.

1 2.6.4.1.2.1 Use of Variables

2 2.6.4.1.2.1.1 Maintaining the Service Request Sequence Number

3 The mobile station shall maintain a service request sequence number variable,
4 $SERV_REQ_NUM_S$ for use with service negotiation. Upon entering the *Mobile Station*
5 *Control On the Traffic Channel State*, the mobile station shall set $SERV_REQ_NUM_S$ to 0.

6 Each time the mobile station sends a new *Service Request Message*, it shall set the
7 $SERV_REQ_SEQ$ field of the message to the current value of $SERV_REQ_NUM_S$, and shall
8 then set $SERV_REQ_NUM_S$ equal to $(SERV_REQ_NUM_S + 1)$ modulo 8.

9 2.6.4.1.2.1.2 Maintaining the Service Negotiation Indicator Variable

10 The mobile station shall maintain a service negotiation indicator variable, $SERV_NEG_S$, to
11 indicate which type of negotiation to use, either service negotiation or service option
12 negotiation. The mobile station shall set $SERV_NEG_S$ to enabled whenever service
13 negotiation is to be used, and shall set $SERV_NEG_S$ to disabled whenever service option
14 negotiation is to be used. The precise rules for setting $SERV_NEG_S$ are specified in 2.6.4.2
15 and 2.6.6.2.5.1.

16 For CDMA operation in band classes other than Band Class 0, the mobile station shall set
17 $SERV_NEG_S$ to enabled.

18 2.6.4.1.2.1.3 Maintaining the Service Option Request Number

19 The mobile station shall maintain a service option request number variable, SO_REQ_S , for
20 use with service option negotiation. The mobile station shall set SO_REQ_S to a special
21 value, NULL, if the mobile station does not have an outstanding service option request. If
22 the mobile station has an outstanding service option request, the mobile station shall set
23 SO_REQ_S to the number of the service option associated with the outstanding request.

24 2.6.4.1.2.1.4 Stored Service Configuration and Reconnection

25 This section provides an overview of how the mobile station and the base station may store
26 the service configuration and how the stored service configuration may be restored upon
27 re-establishing dedicated channels.

28 Upon establishing a call and entering the *Mobile Station Control on the Traffic Channel State*,
29 service negotiation procedures are performed as specified in 2.6.4.1.2.2 to establish a
30 mutually acceptable service configuration between the mobile station and the base station.
31 The service configuration consists of parameters specified via the Service Configuration
32 information record (see 3.7.5.7) and Non-Negotiable Service Configuration information
33 record (see 3.7.5.20). The mobile station and the base station may store the established
34 service configuration. This is done so that when the call is re-established, the stored service
35 configuration may be restored and without performing the service negotiation procedures.
36 In order to ensure that the service configuration restored at the mobile station and the base
37 station are identical (that is, the values of the service configuration parameters are
38 identical), a service configuration synchronization identifier (called $SYNC_ID$) is associated
39 with each stored service configuration. $SYNC_ID$ is a variable length identifier assigned by
40 the base station corresponding to a particular Service Configuration information record and

1 Non-negotiable Service Configuration information record. The SYNC_ID value is used by
 2 the base station to determine whether these two information records may be omitted from
 3 the *Service Connect Message*.

4 When P_REV_IN_USE_s is less than or equal to six, there is no requirement on storing the
 5 established service configuration for future use. In this case, when a call is re-established
 6 and the mobile station enters the *Mobile Station Control on the Traffic Channel State*, service
 7 configuration must be re-established by performing service negotiation procedures again.

8 When P_REV_IN_USE_s is greater than six, based on the value of SYNC_ID included by the
 9 mobile station in the *Origination Message*, *Page Response Message*, or *Enhanced Origination*
 10 *Message* the base station may not send the Service Configuration information record and
 11 the Non-negotiable Service Configuration information record over the air and instructs the
 12 mobile station to start using the stored information records corresponding to the SYNC_ID
 13 reported by the mobile station.

14 When P_REV_IN_USE_s is equal to or greater than nine, the mobile station is required to
 15 store minimum of four service configurations. Also, the stored service configuration can be
 16 restored incrementally as well. That is, if N service option connections are contained in the
 17 stored service configuration, then the mobile station can request to restore one of these
 18 service option connections upon establishing dedicated channels. This is achieved via the
 19 SR_ID field of the *Origination Message* or *Reconnect Message*. Once operating on the
 20 dedicated channels, the mobile station can request to restore additional service option
 21 connections via the *Enhanced Origination Message*. The base station in turn can grant the
 22 mobile station request via *Extended Channel Assignment Message*, *Service Connect*
 23 *Message*, or *Call Assignment Message*. If the base station uses *Extended Channel*
 24 *Assignment Message* to grant the mobile station request, then the base station is not
 25 required to send a *Service Connect Message*. During traffic channel operation, service
 26 option connections are to be restored only from the SYNC_ID that is currently in use (if
 27 any).

28 When P_REV_IN_USE_s is equal to or greater than 11, the base station can autonomously
 29 order the mobile station to restore a stored service configuration via the *Extended Channel*
 30 *Assignment Message* or *Service Connect Message* even when the mobile station has not
 31 requested to restore a service configuration, or when the mobile station has requested to
 32 restore a different service configuration. Additionally, the base station can signal the
 33 SYNC_ID value corresponding to the currently used service configuration using the
 34 *Universal Handoff Direction Message*.

35 2.6.4.1.2.2 Service Subfunctions

36 As illustrated in Figure 2.6.4.1.2.2-1, the mobile station supports service configuration and
 37 negotiation by performing the following set of service subfunctions:

- 38 • *Normal Service Subfunction* - While this subfunction is active, the mobile station
 39 processes service configuration requests from the user and from the base station.
- 40 • *Waiting for Service Request Message Subfunction* - While this subfunction is active,
 41 the mobile station waits to receive a *Service Request Message*.

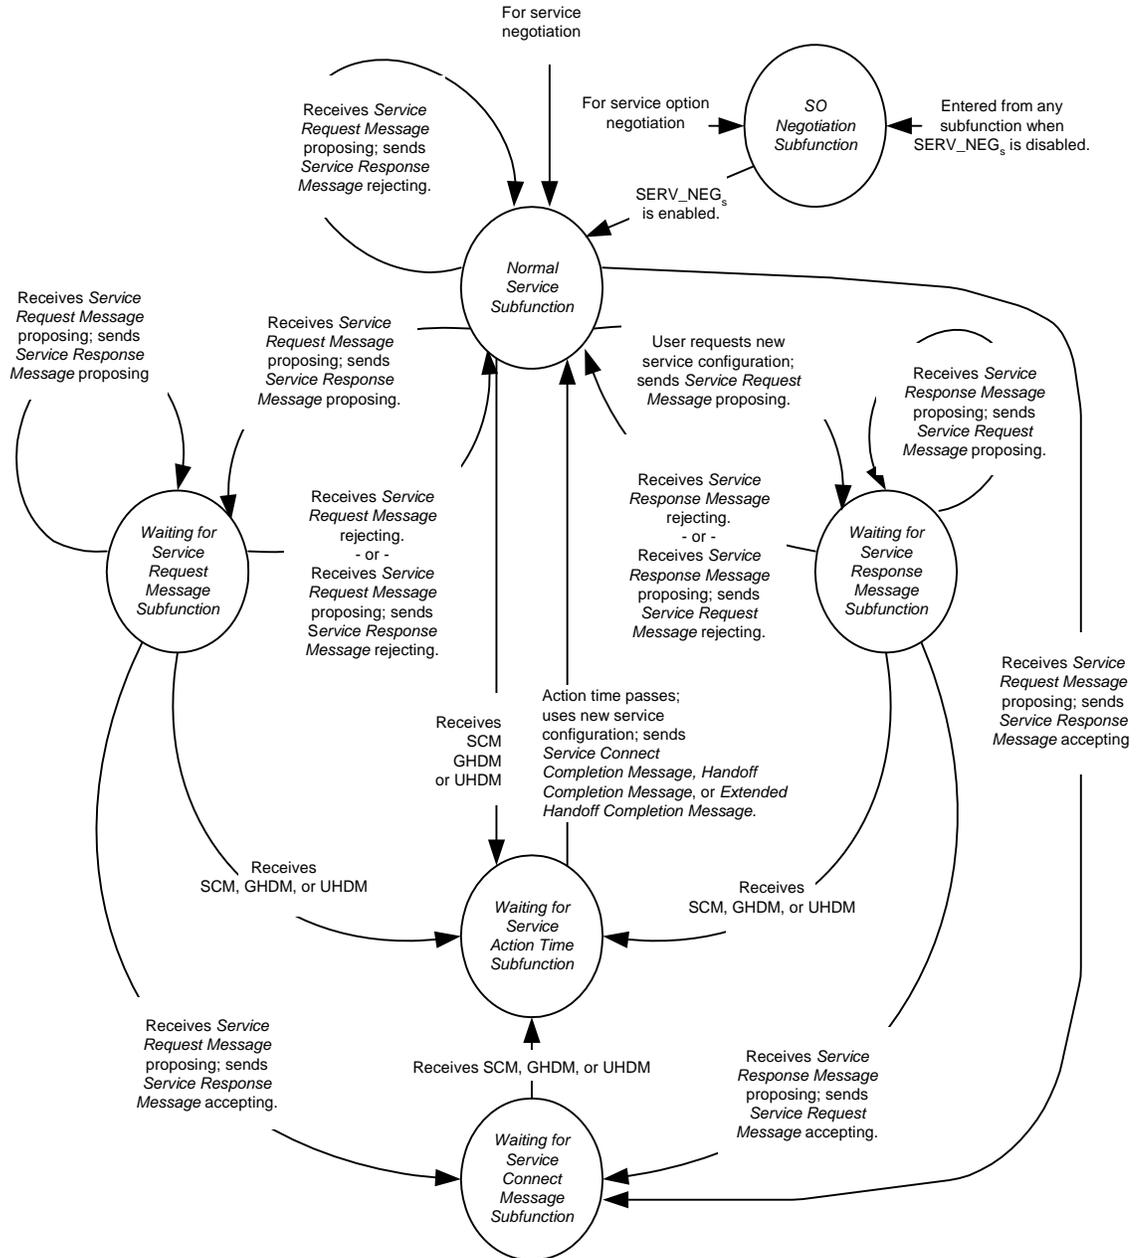

- 1 • *Waiting for Service Response Message Subfunction* - While this subfunction is active,
2 the mobile station waits to receive a *Service Response Message*.
- 3 • *Waiting for Service Connect Message Subfunction* - While this subfunction is active,
4 the mobile station waits to receive a *Service Connect Message*, a *General Handoff*
5 *Direction Message*, or a *Universal Handoff Direction Message* containing a service
6 configuration record.
- 7 • *Waiting for Service Action Time Subfunction* - While this subfunction is active, the
8 mobile station waits for the action time associated with a new service configuration
9 and then sends a *Service Connect Completion Message*, a *Handoff Completion*
10 *Message*, or an *Extended Handoff Completion Message*.
- 11 • *SO Negotiation Subfunction* - While this subfunction is active, the mobile station
12 supports service option negotiation with the base station. This subfunction is only
13 used while operating in Band Class 0.

14 The *SO Negotiation Subfunction* supports service option negotiation. All of the other service
15 subfunctions support service negotiation.

16 At any given time during Traffic Channel operation, only one of the service subfunctions is
17 active. For example, when the mobile station first enters the *Traffic Channel Initialization*
18 *Substate* of the *Mobile Station Control on the Traffic Channel State*, the *Normal Service*
19 *Subfunction*, the *Waiting for Service Connect Message Subfunction* or the *SO Negotiation*
20 *Subfunction* is active. Each of the other service subfunctions may become active in
21 response to various events which occur during the Traffic Channel substates. Typically,
22 the mobile station processes events pertaining to service configuration and negotiation in
23 accordance with the requirements for the active service subfunction, however, some Traffic
24 Channel substates do not allow for the processing of certain events pertaining to service
25 configuration and negotiation, or specify requirements for processing such events which
26 supersede the requirements of the active service subfunction.

27

28

- Notes:
- SCM stands for *Service Connect Message*.
 - GHDM stands for *General Handoff Direction Message*.
 - UHDM stands for *Universal Handoff Direction Message*.
 - Processing for special cases, such as timeouts and errors, is not shown in this diagram.

Figure 2.6.4.1.2.2-1. Mobile Station Service Subfunctions

1 2.6.4.1.2.2.1 Normal Service Subfunction

2 While this subfunction is active, the mobile station processes service configuration
3 requests from the user and from the base station.

4 While the *Normal Service Subfunction* is active, the mobile station shall perform the
5 following:

- 6 • The mobile station shall process Forward and Reverse Traffic Channel frames in
7 accordance with the current service configuration. The mobile station shall discard
8 any Forward Traffic Channel frame which has a format that is not supported by the
9 mobile station. The mobile station may discard any type of Forward Traffic Channel
10 traffic that is not signaling traffic and is not part of the current service
11 configuration.
- 12 • To initiate service negotiation for a new service configuration, the mobile station
13 shall send a *Service Request Message* to propose the new service configuration. The
14 mobile station shall activate the *Waiting for Service Response Message Subfunction*.
- 15 • For any service option connection that is part of the current service configuration,
16 the mobile station may send a *Service Option Control Message* to invoke a service
17 option specific function in accordance with the requirements for the associated
18 service option.
- 19 • If $SERV_NEG_s$ changes from enabled to disabled (see 2.6.6.2.5.1), the mobile
20 station shall activate the *SO Negotiation Subfunction*.
- 21 • If the mobile station receives one of the following service negotiation messages, the
22 mobile station shall process the message according to the specified requirements:
 - 23 1. *Service Connect Message*: The mobile station shall perform the following:
 - 24 - If $USE_OLD_SERV_CONFIG_r$ equals '01' or '10', and if the mobile station
25 entered the *Mobile Station Control on the Traffic Channel State* due to
26 receiving an *Extended Channel Assignment Message* with
27 $GRANTED_MODE$ set to '11', the mobile station shall send a *Mobile*
28 *Station Reject Order* with the $ORDQ$ field set to '00010100' (stored
29 configuration already restored at channel assignment) within T_{56m}
30 seconds and shall not perform the rest of the procedures below.
 - 31 - If $USE_OLD_SERV_CONFIG_r$ equals '00', the mobile station shall
32 perform the following: If the mobile station accepts the service
33 configuration specified in the message, the mobile station shall activate
34 the *Waiting for Service Action Time Subfunction*; otherwise, the mobile
35 station shall send a *Mobile Station Reject Order* ($ORDQ = '00000111'$)
36 within T_{56m} seconds.
 - 37 - If $USE_OLD_SERV_CONFIG_r$ equals '01', the mobile station shall
38 perform the following: If the mobile station accepts the service
39 configuration currently stored at the mobile station, the mobile station
40 shall activate the *Waiting for Service Action Time Subfunction*; otherwise,

- 1 the mobile station shall send a Mobile Station Reject Order (ORDQ =
2 '00000111') within T_{56m} seconds.
- 3 - If USE_OLD_SERV_CONFIG_r equals '10', the mobile station shall
4 perform the following: If the mobile station accepts the service
5 configuration resulting from updating the stored service configuration
6 with the service configuration received in this message, the mobile
7 station shall activate the Waiting for Service Action Time Subfunction;
8 otherwise, the mobile station shall send a Mobile Station Reject Order
9 (ORDQ = '00000111') within T_{56m} seconds.
- 10 - If USE_OLD_SERV_CONFIG_r equals '11', the mobile station shall
11 perform the following: if the mobile station accepts the service
12 configuration resulting from restoring the indicated service option
13 connection records from the stored service configuration and releasing
14 the indicated service option connection records from the current service
15 configuration, the mobile station shall activate the Waiting for Service
16 Action Time Subfunction; otherwise, the mobile station shall send a
17 *Mobile Station Reject Order* (ORDQ = '00000111') within T_{56m} seconds.
- 18 2. *Service Option Control Message*: If the service option connection specified by the
19 message is part of the current service configuration, and the service option
20 specified by the message is the same as the service option associated with the
21 service option connection, the mobile station shall interpret the action time of
22 the message as specified in 2.6.4.1.5, and shall process the message in
23 accordance with the requirements for the service option; otherwise, the mobile
24 station shall send a *Mobile Station Reject Order* (ORDQ = '00000111') within
25 T_{56m} seconds.
- 26 3. *Service Request Message*: The mobile station shall process the message as
27 follows:
- 28 - If the purpose of the message is to reject a proposed service configuration,
29 the mobile station shall send a *Mobile Station Reject Order* (ORDQ =
30 '00000010') within T_{56m} seconds.
- 31 - If the purpose of the message is to propose a service configuration, the
32 mobile station shall process the message as follows:
- 33 + If the mobile station accepts the proposed service configuration, the
34 mobile station shall send a *Service Response Message* to accept the
35 proposed service configuration within T_{59m} seconds. The mobile station
36 shall activate the *Waiting for Service Connect Message Subfunction*.
- 37 + If the mobile station does not accept the proposed service configuration
38 and does not have an alternative service configuration to propose, the
39 mobile station shall send a *Service Response Message* to reject the
40 proposed service configuration within T_{59m} seconds.

- 1 + If the mobile station does not accept the proposed service configuration
2 and has an alternative service configuration to propose, the mobile
3 station shall send a *Service Response Message* to propose the alternative
4 service configuration within T_{59m} seconds. The mobile station shall
5 activate the *Waiting for Service Request Message Subfunction*.
- 6 4. *Service Response Message*: The mobile station shall send a *Mobile Station Reject*
7 *Order* (ORDQ = '00000010') within T_{56m} seconds.
- 8 5. *General Handoff Direction Message*: If the SCR_INCLUDED field is included in
9 this message and is set to '1':
10 If the mobile station has not rejected this message, the mobile station shall
11 activate the *Waiting for Service Action Time Subfunction*.
- 12 6. *Universal Handoff Direction Message*: If the SCR_INCLUDED field is included
13 in this message and is set to '1':
14 If the mobile station has not rejected this message, the mobile station shall
15 activate the *Waiting for Service Action Time Subfunction*.
- 16 • If the mobile station receives one of the following service option negotiation
17 messages, the mobile station shall send a *Mobile Station Reject Order* (ORDQ =
18 '00000010') within T_{56m} seconds:
19 1. *Service Option Request Order*
20 2. *Service Option Response Order*
21 3. *Service Option Control Order*

22 2.6.4.1.2.2.2 Waiting for Service Request Message Subfunction

23 While this subfunction is active, the mobile station waits to receive a *Service Request*
24 *Message*.

25 Upon activation of the *Waiting for Service Request Message Subfunction*, the mobile station
26 shall set the subfunction timer for T_{68m} seconds.

27 While the *Waiting for Service Request Message Subfunction* is active, the mobile station shall
28 perform the following:

- 29 • If the subfunction timer expires, the mobile station shall activate the *Normal Service*
30 *Subfunction*.
- 31 • The mobile station shall process Forward and Reverse Traffic Channel frames in
32 accordance with the current service configuration. The mobile station shall discard
33 any Forward Traffic Channel frame which has a format that is not supported by the
34 mobile station. The mobile station may discard any type of Forward Traffic Channel
35 traffic that is not signaling traffic and is not part of the current service
36 configuration.
- 37 • The mobile station shall not initiate service negotiation for a new service
38 configuration.

- 1 • For any service option connection that is part of the current service configuration,
2 the mobile station may send a *Service Option Control Message* to invoke a service
3 option specific function in accordance with the requirements for the associated
4 service option.
- 5 • If $SERV_NEG_S$ changes from enabled to disabled (see 2.6.6.2.5.1), the mobile
6 station shall activate the *SO Negotiation Subfunction*.
- 7 • If the mobile station receives one of the following service negotiation messages, the
8 mobile station shall process the message according to the specified requirements:
- 9 1. *Service Connect Message*: The mobile station shall perform the following:
- 10 - If $USE_OLD_SERV_CONFIG_r$ equals '01' or '10', and if the mobile station
11 entered the *Mobile Station Control on the Traffic Channel State* due to
12 receiving an *Extended Channel Assignment Message* with $GRANTED_MODE$
13 set to '11', the mobile station shall send a *Mobile Station Reject Order* with
14 the $ORDQ$ field set to '00010100' (stored configuration already restored at
15 channel assignment) within T_{56m} seconds, and shall activate the *Normal*
16 *Service Subfunction*.
- 17 - If $USE_OLD_SERV_CONFIG_r$ equals '00', the mobile station shall perform
18 the following: If the mobile station accepts the service configuration specified
19 in the message, the mobile station shall activate the *Waiting for Service*
20 *Action Time Subfunction*; otherwise, the mobile station shall send a *Mobile*
21 *Station Reject Order* ($ORDQ = '00000111'$) within T_{56m} seconds and shall
22 activate the *Normal Service Subfunction*.
- 23 - If $USE_OLD_SERV_CONFIG_r$ equals '01', the mobile station shall perform
24 the following: If the mobile station accepts the service configuration
25 currently stored at the mobile station, the mobile station shall activate the
26 *Waiting for Service Action Time Subfunction*; otherwise, the mobile station
27 shall send a *Mobile Station Reject Order* ($ORDQ = '00000111'$) within T_{56m}
28 seconds and shall activate the *Normal Service Subfunction*.
- 29 - If $USE_OLD_SERV_CONFIG_r$ equals '10', the mobile station shall perform
30 the following: If the mobile station accepts the service configuration resulting
31 from updating the stored service configuration with the service configuration
32 received in this message, the mobile station shall activate the *Waiting for*
33 *Service Action Time Subfunction*; otherwise, the mobile station shall send a
34 *Mobile Station Reject Order* ($ORDQ = '00000111'$) within T_{56m} seconds and
35 shall activate the *Normal Service Subfunction*.
- 36 - If $USE_OLD_SERV_CONFIG_r$ equals '11', the mobile station shall perform
37 the following: if the mobile station accepts the service configuration resulting
38 from restoring the indicated service option connection records from the
39 stored service configuration and releasing the indicated service option
40 connection records from the current service configuration, the mobile station
41 shall activate the *Waiting for Service Action Time Subfunction*; otherwise,
42 the mobile station shall send a *Mobile Station Reject Order* ($ORDQ =$

- 1 ‘00000111’) within T_{56m} seconds and shall activate the *Normal Service*
2 *Subfunction*.
- 3 2. *Service Option Control Message*: If the service option connection specified by the
4 message is part of the current service configuration, and the service option
5 specified by the message is the same as the service option associated with the
6 service option connection, the mobile station shall interpret the action time of
7 the message as specified in 2.6.4.1.5, and shall process the message in
8 accordance with the requirements for the service option; otherwise, the mobile
9 station shall send a *Mobile Station Reject Order* (ORDQ = ‘00000111’) within
10 T_{56m} seconds.
- 11 3. *Service Request Message*: The mobile station shall process the message as
12 follows:
- 13 - If the purpose of the message is to reject a proposed service configuration,
14 the mobile station shall activate the *Normal Service Subfunction*.
 - 15 - If the purpose of the message is to propose a service configuration, the
16 mobile station shall process the message as follows:
 - 17 + If the mobile station accepts the proposed service configuration, the
18 mobile station shall send a *Service Response Message* to accept the
19 proposed service configuration within T_{59m} seconds. The mobile station
20 shall activate the *Waiting for Service Connect Message Subfunction*.
 - 21 + If the mobile station does not accept the proposed service configuration
22 and does not have an alternative service configuration to propose, the
23 mobile station shall send a *Service Response Message* to reject the
24 proposed service configuration within T_{59m} seconds. The mobile station
25 shall activate the *Normal Service Subfunction*.
 - 26 + If the mobile station does not accept the proposed service configuration
27 and has an alternative service configuration to propose, the mobile
28 station shall send a *Service Response Message* to propose the alternative
29 service configuration within T_{59m} seconds. The mobile station shall
30 reset the subfunction timer for T_{68m} seconds.
- 31 4. *Service Response Message*: The mobile station shall send a *Mobile Station Reject*
32 *Order* (ORDQ = ‘00000010’) within T_{56m} seconds.
- 33 5. *General Handoff Direction Message*: If the SCR_INCLUDED field is included in
34 this message and is set to ‘1’:
35 If the mobile station has not rejected this message, the mobile station shall
36 activate the *Waiting for Service Action Time Subfunction*; otherwise, the mobile
37 station shall activate the *Normal Service Subfunction*.
- 38 6. *Universal Handoff Direction Message*: If the SCR_INCLUDED field is included in
39 this message and is set to ‘1’:

1 If the mobile station has not rejected this message, the mobile station shall
 2 activate the *Waiting for Service Action Time Subfunction*; otherwise, the mobile
 3 station shall activate the *Normal Service Subfunction*.

- 4 • If the mobile station receives one of the following service option negotiation
 5 messages, the mobile station shall send a *Mobile Station Reject Order* (ORDQ =
 6 ‘00000010’) within T_{56m} seconds:
 - 7 1. *Service Option Request Order*
 - 8 2. *Service Option Response Order*
 - 9 3. *Service Option Control Order*

10 2.6.4.1.2.2.3 Waiting for Service Response Message Subfunction

11 While this subfunction is active, the mobile station waits to receive a *Service Response*
 12 *Message*.

13 Upon activation of the *Waiting for Service Response Message Subfunction*, the mobile station
 14 shall set the subfunction timer for T_{68m} seconds.

15 While the *Waiting for Service Response Message Subfunction* is active, the mobile station
 16 shall perform the following:

- 17 • If the subfunction timer expires, the mobile station shall activate the *Normal Service*
 18 *Subfunction*.
- 19 • The mobile station shall process Forward and Reverse Traffic Channel frames in
 20 accordance with the current service configuration. The mobile station shall discard
 21 any Forward Traffic Channel frame which has a format that is not supported by the
 22 mobile station. The mobile station may discard any type of Forward Traffic Channel
 23 traffic that is not signaling traffic and is not part of the current service
 24 configuration.
- 25 • The mobile station shall not initiate service negotiation for a new service
 26 configuration.
- 27 • For any service option connection that is part of the current service configuration,
 28 the mobile station may send a *Service Option Control Message* to invoke a service
 29 option specific function in accordance with the requirements for the associated
 30 service option.
- 31 • If SERV_NEG_s changes from enabled to disabled (see 2.6.6.2.5.1), the mobile
 32 station shall activate the *SO Negotiation Subfunction*.
- 33 • If the mobile station receives one of the following service negotiation messages, the
 34 mobile station shall process the message according to the specified requirements:
 - 35 1. *Service Connect Message*: The mobile station shall perform the following:
 - 36 - If USE_OLD_SERV_CONFIG_r equals ‘01’ or ‘10’, and if the mobile station
 37 entered the *Mobile Station Control on the Traffic Channel State* due to
 38 receiving an *Extended Channel Assignment Message* with GRANTED_MODE
 39 set to ‘11’, the mobile station shall send a *Mobile Station Reject Order* with

- 1 the ORDQ field set to '00010100' (stored configuration already restored at
 2 channel assignment) within T_{56m} seconds, and shall activate the *Normal*
 3 *Service Subfunction*.
- 4 - If USE_OLD_SERV_CONFIG_r equals '00', the mobile station shall perform
 5 the following: If the mobile station accepts the service configuration specified
 6 in the message, the mobile station shall activate the *Waiting for Service*
 7 *Action Time Subfunction*; otherwise, the mobile station shall send a *Mobile*
 8 *Station Reject Order* (ORDQ = '00000111') within T_{56m} seconds and shall
 9 activate the *Normal Service Subfunction*.
- 10 - If USE_OLD_SERV_CONFIG_r equals '01', the mobile station shall perform
 11 the following: If the mobile station accepts the service configuration
 12 currently stored at the mobile station, the mobile station shall activate the
 13 *Waiting for Service Action Time Subfunction*; otherwise, the mobile station
 14 shall send a *Mobile Station Reject Order* (ORDQ = '00000111') within T_{56m}
 15 seconds and shall activate the *Normal Service Subfunction*.
- 16 - If USE_OLD_SERV_CONFIG_r equals '10', the mobile station shall perform
 17 the following: If the mobile station accepts the service configuration resulting
 18 from updating the stored service configuration with the service configuration
 19 received in this message, the mobile station shall activate the *Waiting for*
 20 *Service Action Time Subfunction*; otherwise, the mobile station shall send a
 21 *Mobile Station Reject Order* (ORDQ = '00000111') within T_{56m} seconds and
 22 shall activate the *Normal Service Subfunction*.
- 23 - If USE_OLD_SERV_CONFIG_r equals '11', the mobile station shall perform
 24 the following: if the mobile station accepts the service configuration resulting
 25 from restoring the indicated service option connection records from the
 26 stored service configuration and releasing the indicated service option
 27 connection records from the current service configuration, the mobile station
 28 shall activate the *Waiting for Service Action Time Subfunction*; otherwise,
 29 the mobile station shall send a *Mobile Station Reject Order* (ORDQ =
 30 '00000111') within T_{56m} seconds and shall activate the *Normal Service*
 31 *Subfunction*.
- 32 2. *Service Option Control Message*: If the service option connection specified by the
 33 message is part of the current service configuration, and the service option
 34 specified by the message is the same as the service option associated with the
 35 service option connection, the mobile station shall interpret the action time of
 36 the message as specified in 2.6.4.1.5, and shall process the message in
 37 accordance with the requirements for the service option; otherwise, the mobile
 38 station shall send a *Mobile Station Reject Order* (ORDQ = '00000111') within
 39 T_{56m} seconds.
- 40 3. *Service Request Message*: The mobile station shall process the message as
 41 follows:

- 1 - If the purpose of the message is to reject a proposed service configuration,
2 the mobile station shall send a *Mobile Station Reject Order* (ORDQ =
3 '00000010') within T_{56m} seconds.
- 4 - If the purpose of the message is to propose a service configuration, the
5 mobile station shall discontinue processing the service configuration
6 requested by the user and shall process the message as follows:
7 + If the mobile station accepts the proposed service configuration, the
8 mobile station shall send a *Service Response Message* to accept the
9 proposed service configuration within T_{59m} seconds. The mobile station
10 shall activate the *Waiting for Service Connect Message Subfunction*.
11 + If the mobile station does not accept the proposed service configuration
12 and does not have an alternative service configuration to propose, the
13 mobile station shall send a *Service Response Message* to reject the
14 proposed service configuration within T_{59m} seconds. The mobile station
15 shall activate the *Normal Service Subfunction*.
16 + If the mobile station does not accept the proposed service configuration
17 and has an alternative service configuration to propose, the mobile
18 station shall send a *Service Response Message* to propose the alternative
19 service configuration within T_{59m} seconds. The mobile station shall
20 activate the *Waiting for Service Request Message Subfunction*.
- 21 4. *Service Response Message*: The mobile station shall process the message as
22 follows:
23 - If the service request sequence number (SERV_REQ_SEQ_r) from the message
24 does not match the sequence number of the *Service Request Message* for
25 which the mobile station is expecting a response, the mobile station shall
26 not process the other Layer 3 fields of the message.
27 - If the purpose of the message is to reject the service configuration proposed
28 in the corresponding *Service Request Message*, the mobile station shall
29 activate the *Normal Service Subfunction*. The mobile station may indicate to
30 the user that the requested service configuration has been rejected.
31 - If the purpose of the message is to propose a service configuration, the
32 mobile station shall process the message as follows:
33 + If the mobile station accepts the proposed service configuration, the
34 mobile station shall send a *Service Request Message* to accept the
35 proposed service configuration within T_{59m} seconds. The mobile station
36 shall activate the *Waiting for Service Connect Message Subfunction*.
37 + If the mobile station does not accept the proposed service configuration
38 and does not have an alternative service configuration to propose, the
39 mobile station shall send a *Service Request Message* to reject the
40 proposed service configuration within T_{59m} seconds. The mobile station
41 shall activate the *Normal Service Subfunction*.

- 1 + If the mobile station does not accept the proposed service configuration
2 and has an alternative service configuration to propose, the mobile
3 station shall send a *Service Request Message* to propose the alternative
4 service configuration within T_{59m} seconds. The mobile station shall
5 reset the subfunction timer for T_{68m} seconds.
- 6 5. *General Handoff Direction Message*: If the SCR_INCLUDED field is included in
7 this message and is set to '1':
8 If the mobile station has not rejected this message, the mobile station shall
9 activate the *Waiting for Service Action Time Subfunction*; otherwise, the mobile
10 station shall activate the *Normal Service Subfunction*.
- 11 6. *Universal Handoff Direction Message*: If the SCR_INCLUDED field is included in
12 this message and is set to '1':
13 If the mobile station has not rejected this message, the mobile station shall
14 activate the *Waiting for Service Action Time Subfunction*; otherwise, the mobile
15 station shall activate the *Normal Service Subfunction*.
- 16 • If the mobile station receives one of the following service option negotiation
17 messages, the mobile station shall send a *Mobile Station Reject Order* (ORDQ =
18 '00000010') within T_{56m} seconds:
- 19 1. *Service Option Request Order*
20 2. *Service Option Response Order*
21 3. *Service Option Control Order*

22 2.6.4.1.2.2.4 Waiting for Service Connect Message Subfunction

23 While this subfunction is active, the mobile station waits to receive a *Service Connect*
24 *Message*, a *General Handoff Direction Message*, or a *Universal Handoff Direction Message*
25 containing a service configuration record.

26 Upon activation of the *Waiting for Service Connect Message Subfunction*, the mobile station
27 shall set the subfunction timer for T_{65m} seconds.

28 While the *Waiting for Service Connect Message Subfunction* is active, the mobile station shall
29 perform the following:

- 30 • If the subfunction timer expires, the mobile station shall activate the *Normal Service*
31 *Subfunction*.
- 32 • The mobile station shall process Forward and Reverse Traffic Channel frames in
33 accordance with the current service configuration. The mobile station shall discard
34 any Forward Traffic Channel frame which has a format that is not supported by the
35 mobile station. The mobile station may discard any type of Forward Traffic Channel
36 traffic that is not signaling traffic and is not part of the current service
37 configuration.
- 38 • The mobile station shall not initiate service negotiation for a new service
39 configuration.

- 1 • For any service option connection that is part of the current service configuration,
2 the mobile station may send a *Service Option Control Message* to invoke a service
3 option specific function in accordance with the requirements for the associated
4 service option.
- 5 • If $SERV_NEG_S$ changes from enabled to disabled (see 2.6.6.2.5.1), the mobile
6 station shall activate the *SO Negotiation Subfunction*.
- 7 • If the mobile station receives one of the following service negotiation messages, the
8 mobile station shall process the message according to the specified requirements:
- 9 1. *Service Connect Message*: The mobile station shall perform the following:
- 10 - If $USE_OLD_SERV_CONFIG_r$ equals '01' or '10', and if the mobile station
11 entered the *Mobile Station Control on the Traffic Channel State* due to
12 receiving an *Extended Channel Assignment Message* with $GRANTED_MODE$
13 set to '11', the mobile station shall send a *Mobile Station Reject Order* with
14 the $ORDQ$ field set to '00010100' (stored configuration already restored at
15 channel assignment) within T_{56m} seconds, and shall activate the *Normal*
16 *Service Subfunction*.
- 17 - If $USE_OLD_SERV_CONFIG_r$ equals '00', the mobile station shall perform
18 the following: If the mobile station accepts the service configuration specified
19 in the message, the mobile station shall activate the *Waiting for Service*
20 *Action Time Subfunction*; otherwise, the mobile station shall send a *Mobile*
21 *Station Reject Order* ($ORDQ = '00000111'$) within T_{56m} seconds and shall
22 activate the *Normal Service Subfunction*.
- 23 - If $USE_OLD_SERV_CONFIG_r$ equals '01', the mobile station shall perform
24 the following: If the mobile station accepts the service configuration
25 currently stored at the mobile station, the mobile station shall activate the
26 *Waiting for Service Action Time Subfunction*; otherwise, the mobile station
27 shall send a *Mobile Station Reject Order* ($ORDQ = '00000111'$) within T_{56m}
28 seconds, and shall activate the *Normal Service Subfunction*.
- 29 - If $USE_OLD_SERV_CONFIG_r$ equals '10', the mobile station shall perform
30 the following: If the mobile station accepts the service configuration resulting
31 from updating the stored service configuration with the service configuration
32 received in this message, the mobile station shall activate the *Waiting for*
33 *Service Action Time Subfunction*; otherwise, the mobile station shall send a
34 *Mobile Station Reject Order* ($ORDQ = '00000111'$) within T_{56m} seconds, and
35 shall activate the *Normal Service Subfunction*.
- 36 - If $USE_OLD_SERV_CONFIG_r$ equals '11', the mobile station shall perform
37 the following: if the mobile station accepts the service configuration resulting
38 from restoring the indicated service option connection records from the
39 stored service configuration and releasing the indicated service option
40 connection records from the current service configuration, the mobile station
41 shall activate the *Waiting for Service Action Time Subfunction*; otherwise,
42 the mobile station shall send a *Mobile Station Reject Order* ($ORDQ =$

- 1 ‘00000111’) within T_{56m} seconds, and shall activate the *Normal Service*
2 *Subfunction*.
- 3 2. *Service Option Control Message*: If the service option connection specified by the
4 message is part of the current service configuration, and the service option
5 specified by the message is the same as the service option associated with the
6 service option connection, the mobile station shall interpret the action time of
7 the message as specified in 2.6.4.1.5, and shall process the message in
8 accordance with the requirements for the service option; otherwise, the mobile
9 station shall send a *Mobile Station Reject Order* (ORDQ = ‘00000111’) within
10 T_{56m} seconds.
- 11 3. *Service Request Message*: The mobile station shall process the message as
12 follows:
- 13 - If the purpose of the message is to reject a proposed service configuration,
14 the mobile station shall send a *Mobile Station Reject Order* (ORDQ =
15 ‘00000010’) within T_{56m} seconds.
- 16 - If the purpose of the message is to propose a service configuration, the
17 mobile station shall process the message as follows:
- 18 + If the mobile station accepts the proposed service configuration, the
19 mobile station shall send a *Service Response Message* to accept the
20 proposed service configuration within T_{59m} seconds. The mobile station
21 shall reset the subfunction timer for T_{65m} seconds.
- 22 + If the mobile station does not accept the proposed service configuration
23 and does not have an alternative service configuration to propose, the
24 mobile station shall send a *Service Response Message* to reject the
25 proposed service configuration within T_{59m} seconds. The mobile station
26 shall activate the *Normal Service Subfunction*.
- 27 + If the mobile station does not accept the proposed service configuration
28 and has an alternative service configuration to propose, the mobile
29 station shall send a *Service Response Message* to propose the alternative
30 service configuration within T_{59m} seconds. The mobile station shall
31 activate the *Waiting for Service Request Message Subfunction*.
- 32 4. *Service Response Message*: The mobile station shall send a *Mobile Station Reject*
33 *Order* (ORDQ = ‘00000010’) within T_{56m} seconds.
- 34 5. *General Handoff Direction Message*: If the SCR_INCLUDED field is included in
35 this message and is set to ‘1’:
36 If the mobile station has not rejected this message, the mobile station shall
37 activate the *Waiting for Service Action Time Subfunction*; otherwise, the mobile
38 station shall activate the *Normal Service Subfunction*.
- 39 6. *Universal Handoff Direction Message*: If the SCR_INCLUDED field is included in
40 this message and is set to ‘1’:

1 If the mobile station has not rejected this message, the mobile station shall
 2 activate *the Waiting for Service Action Time Subfunction*; otherwise, the mobile
 3 station shall activate the *Normal Service Subfunction*.

- 4 • If the mobile station receives one of the following service option negotiation
 5 messages, the mobile station shall send a *Mobile Station Reject Order* (ORDQ =
 6 ‘00000010’) within T_{56m} seconds:
 - 7 1. *Service Option Request Order*
 - 8 2. *Service Option Response Order*
 - 9 3. *Service Option Control Order*

10 2.6.4.1.2.2.5 Waiting for Service Action Time Subfunction

11 While this subfunction is active, the mobile station waits for the action time associated with
 12 a new service configuration. If the action time was specified by a *Service Connect Message*,
 13 the mobile station shall send the *Service Connect Completion Message* at the action time.

14 While the *Waiting for Service Action Time Subfunction* is active, the mobile station shall
 15 perform the following:

- 16 • Prior to the action time associated with the *Service Connect Message*, *General*
 17 *Handoff Direction Message* (containing a service configuration record), or *Universal*
 18 *Handoff Direction Message* (containing a service configuration record), the mobile
 19 station shall process Forward and Reverse Traffic Channel frames in accordance
 20 with the current service configuration. The mobile station shall discard any
 21 Forward Traffic Channel frame which has a format that is not supported by the
 22 mobile station. The mobile station may discard any type of Forward Traffic Channel
 23 traffic that is not signaling traffic and is not part of the current service
 24 configuration.
- 25 • At the action time associated with the *Service Connect Message*, *General Handoff*
 26 *Direction Message* (containing a service configuration record) or *Universal Handoff*
 27 *Direction Message* (containing a service configuration record), the mobile station
 28 shall perform the following⁵⁸:
 - 29 - If this is a *Service Connect Message* and $USE_TYPE0_PLCM_r$ equals ‘1’, the
 30 mobile station shall perform the following:

⁵⁸ Note that these procedures that take place at the action time may not occur for this message if a GHDM/UHDM with SCR_INCLUDED equal to ‘1’ is received before the action time of this message. In this case, these procedures take place for the new message. One exception is that the call assignments from this message take effect at the action time of this message regardless of the call assignments from the new message.

- 1 + If P_REV_IN_USE_S is less than 11, set PLCM_TYPE_S to '0000'; otherwise set
2 PLCM_TYPE_S to '0100'.
- 3 + The mobile station shall use the Public Long Code Mask derived from
4 PLCM_TYPE_S as specified in 2.3.6.
- 5 - If this is a *Service Connect Message* with USE_OLD_SERV_CONFIG_R equals '01',
6 the mobile station shall perform the following:
- 7 + If SYNC_ID_INCL_R is included and set to '1', the SYNC_ID_R indicates the
8 stored service configuration to be restored; otherwise, the SYNC_ID conveyed
9 by the mobile station indicates the stored service configuration to be
10 restored.
- 11 + The Call Control instance identified by NULL shall also be identified by the
12 connection reference assigned to the first service option connection in the
13 stored Service Configuration information record.
- 14 + For each service option connection (with corresponding connection reference
15 CON_REF_j) in the stored service configuration record, if any, except for the
16 first one, Layer 3 shall instantiate a Call Control instance (as specified in
17 2.6.10) with a 'restore indication'. The mobile station shall identify each of
18 these Call Control instances by the corresponding CON_REF_i.
- 19 + The mobile station shall begin to use the stored service configuration
20 corresponding to this SYNC_ID as the current service configuration as
21 specified in 2.6.4.1.2.2.5.2 and shall begin to process Forward and Reverse
22 Traffic Channel frames accordingly. The mobile station shall send a *Service*
23 *Connect Completion Message* within T_{56m} seconds after the action time.
- 24 + The mobile station shall store the synchronization identifier corresponding to
25 the stored service configuration as SYNC_ID_S.
- 26 + The mobile station shall exit this subfunction and activate the *Normal*
27 *Service Subfunction*.
- 28 - If this is a *Service Connect Message* with USE_OLD_SERV_CONFIG_R equals '10',
29 the mobile station shall perform the following:
- 30 + If SYNC_ID_INCL_R is included and set to '1' and
31 SYNC_ID_BS_INITIATED_IND_R is set to '1', the SYNC_ID_R indicates the stored
32 service configuration to be restored; otherwise, the SYNC_ID conveyed by the
33 mobile station indicates the stored service configuration to be restored.
- 34 + The mobile station shall update the stored service configuration with the
35 received service configuration as follows:
- 36 ○ The mobile station shall restore the stored service configuration as
37 specified in 2.6.4.1.2.2.5.2.
- 38 ○ The mobile station shall process the received Service Configuration
39 Record as specified in 2.6.4.1.12.

- 1 ○ The mobile station shall process the received Non-negotiable Service
2 Configuration Record as specified in 2.6.4.1.13.
- 3 + For each service option connection (with corresponding connection reference
4 CON_REF_i) in the stored service configuration record, if any, except for the
5 first one, Layer 3 shall instantiate a Call Control instance (as specified in
6 2.6.10) with a 'restore indication'. The mobile station shall identify each of
7 these Call Control instances by the corresponding CON_REF_i.
- 8 + The mobile station shall begin to use the updated service configuration as
9 the current service configuration and shall begin to process Forward and
10 Reverse Traffic Channel frames accordingly. The mobile station shall send a
11 *Service Connect Completion Message* within T_{56m} seconds after the action
12 time.
- 13 + If SYNC_ID_INCL_r is set to '1' and SYNC_ID_BS_INITIATED_IND_r is set to '0',
14 the mobile station shall perform the following::
- 15 ○ The mobile station shall store the synchronization identifier received
16 from the base station (SYNC_ID_s = SYNC_ID_r).
- 17 ○ The mobile station shall store the new service configuration
18 corresponding to SYNC_ID_s as specified in 2.6.4.1.2.2.5.1.
19 Otherwise, the mobile station shall set SYNC_ID_s to NULL.
- 20 + The mobile station shall exit this subfunction and activate the *Normal*
21 *Service Subfunction*.
- 22 - If this is a *Service Connect Message* with USE_OLD_SERV_CONFIG_r equals '11',
23 the mobile station shall perform the following:
- 24 + If the SYNC_ID_INCL field is included in this message and set to '1', the
25 SYNC_ID included in this message indicates the stored service configuration
26 to be restored; otherwise, the SYNC_ID conveyed by the mobile station
27 indicates the stored service configuration to be restored.
- 28 ○ Prior to this message, if an *Extended Channel Assignment Message* with
29 GRANTED_MODE set to '11' was not received and a *Service Connect*
30 *Message*, *General Handoff Direction Message* (with service configuration),
31 or *Universal Handoff Direction Message* (with service configuration) was
32 not successfully received or accepted by the mobile station since entering
33 the *Traffic Channel Substate*, the mobile station shall perform the
34 following:
- 35 ◇ The mobile station shall begin to use the service configuration which
36 was stored by the mobile station when it left the *Mobile Station*
37 *Control on the Traffic Channel State* as the current service
38 configuration as specified in 2.6.4.1.2.2.5.2 where only the service
39 option connection record corresponding to SR_ID_r received in the
40 *Service Connect Message* shall be restored.

- 1 ◇ The Call Control instance identified by NULL shall also be identified
2 by the connection reference assigned to the restored service option
3 connection.
- 4 ◇ The mobile station shall begin to process Forward and Reverse Traffic
5 Channel frames accordingly with the restored service configuration.
6 The mobile station shall send a *Service Connect Completion Message*
7 within T_{56m} seconds after the action time.
- 8 ◇ The mobile station shall store the synchronization identifier
9 corresponding to the stored service configuration as $SYNC_ID_S$.
- 10 ◇ The mobile station shall exit this subfunction and activate the *Normal*
11 *Service Subfunction*.
- 12 ○ Otherwise, the mobile station shall perform the following at the action
13 time of this message:
- 14 ◇ The mobile station shall restore the indicated service option
15 connection record(s) from the stored service configuration as
16 specified in 2.6.4.1.2.2.5.2, where the service option connection
17 records to be restored are determined as follows:
- 18 — If SR_ID_T equals '111', the mobile station shall restore all
19 remaining service option connection records. Otherwise, if SR_ID_T
20 equals '000', the mobile station shall restore service option
21 connection records corresponding to SR_ID_S indicated by
22 $SR_ID_RESTORE_BITMAP_T$ received in this message; otherwise
23 the mobile station shall restore the service option connection
24 record corresponding to the SR_ID_T received in this message.
- 25 — Layer 3 shall instantiate a Call Control instance (as specified in
26 2.6.10) for each of the restored service option connections with a
27 'restore indication' and Layer 3 shall identify each of these Call
28 Control instances by the value of the CON_REF field
29 corresponding to the restored service option connection.
- 30 — The mobile station shall perform the following:
- 31 a. If SR_ID_T equals '111', the mobile station shall disable the
32 enhanced origination timers corresponding to each *Enhanced*
33 *Origination Message* sent with $SYNC_ID_INCL$ field set to '1'
34 and shall remove the corresponding TAG value from the list
35 $TAG_OUTSTANDING_LIST$.
- 36 b. Otherwise, the mobile station shall disable the enhanced
37 origination timer corresponding to the *Enhanced Origination*
38 *Message* with SR_ID field set to either '111' or to the SR_ID_T
39 value received in this message and shall remove the

- 1 + If P_REV_IN_USE_s is greater than six, the Non-Negotiable Service
2 Configuration information record is not included in this message, and the
3 value of SR_ID corresponding to the logical resource of '0000' in the
4 LOGICAL_TO_PHYSICAL_MAPPING_TABLE is NULL, the mobile station shall
5 set this SR_ID field to the value specified in the Service Configuration
6 information record.
- 7 + If CC_INFO_INCL_r equals '1', then for each of the NUM_CALLS_ASSIGN_r
8 occurrences of the call control parameters included in the message, the
9 mobile station shall perform the following:
- 10 ○ If RESPONSE_IND_r equals '1', and TAG_r matches any of the TAG values
11 contained in the list TAG_OUTSTANDING_LIST, the Layer 3 shall
12 instantiate a Call Control instance (as specified in 2.6.10). The mobile
13 station shall identify this Call Control instance by CON_REF_r. The mobile
14 station shall disable the enhanced origination timer associated with
15 TAG_r and remove the TAG value specified by TAG_r from the list
16 TAG_OUTSTANDING_LIST.
- 17 ○ If RESPONSE_IND_r equals '0', the mobile station shall store the bypass
18 indicator (BYPASS_ALERT_ANSWER_s = BYPASS_ALERT_ANSWER_r) and
19 the Layer 3 shall instantiate a Call Control instance (as specified in
20 2.6.10). The mobile station shall identify this Call Control instance by
21 CON_REF_r.
- 22 + The mobile station shall exit this subfunction and activate the *Normal*
23 *Service Subfunction*.
- 24 • The mobile station shall not initiate service negotiation for a new service
25 configuration.
- 26 • For any service option connection that is part of the current or pending service
27 configuration, the mobile station may send a *Service Option Control Message* to
28 invoke a service option specific function in accordance with the requirements for the
29 associated service option.
- 30 • If SERV_NEG_s changes from enabled to disabled (see 2.6.6.2.5.1), the mobile
31 station shall activate the *SO Negotiation Subfunction*.
- 32 • If the mobile station receives one of the following service negotiation messages, the
33 mobile station shall process the message according to the specified requirements:
- 34 1. *Service Connect Message*: The mobile station shall send a *Mobile Station Reject*
35 *Order* (ORDQ = '00000010') within T_{56m} seconds.
- 36 2. *Service Option Control Message*: If the service option connection specified by the
37 message is part of the current or pending service configuration, and the service
38 option specified by the message is the same as the service option associated
39 with the service option connection, the mobile station shall interpret the action
40 time of the message as specified in 2.6.4.1.5, and shall process the message in
41 accordance with the requirements for the service option; otherwise, the mobile

- 1 station shall send a *Mobile Station Reject Order* (ORDQ = '00000111') within
 2 T_{56m} seconds.
- 3 3. *Service Request Message*: The mobile station shall send a *Mobile Station Reject*
 4 *Order* (ORDQ = '00000010') within T_{56m} seconds.
- 5 4. *Service Response Message*: The mobile station shall send a *Mobile Station Reject*
 6 *Order* (ORDQ = '00000010') within T_{56m} seconds.
- 7 5. *General Handoff Direction Message*: If the SCR_INCLUDED field is included in
 8 this message and is set to '1':
 9 If the mobile station has not rejected this message, the mobile station shall
 10 remain in this subfunction until the action time specified in the message, and
 11 shall perform the following:
- 12 - The mobile station shall not perform the above procedures for the previous
 13 message. But the call assignments from the previous message (if any) shall
 14 take effect at the action time of the previous message.
 - 15 - The mobile station shall perform the above procedures for this message (that
 16 is, begin to use the service configuration specified by the *General Handoff*
 17 *Direction Message*) at the action time of this message.
- 18 6. *Universal Handoff Direction Message*: If the SCR_INCLUDED field is included in
 19 this message and is set to '1':
 20 If the mobile station has not rejected this message, the mobile station shall
 21 remain in this subfunction until the action time specified in the message, and
 22 shall perform the following:
- 23 - The mobile station shall not perform the above procedures for the previous
 24 message. But the call assignments from the previous message (if any) shall
 25 take effect at the action time of the previous message.
 - 26 - The mobile station shall perform the above procedures for this message (that
 27 is, begin to use the service configuration and call assignments (if any)
 28 specified by the *Universal Handoff Direction Message*) at the action time of
 29 this message.
- 30 • If the mobile station receives one of the following service option negotiation
 31 messages, the mobile station shall send a *Mobile Station Reject Order* (ORDQ =
 32 '00000010') within T_{56m} seconds:
 - 33 1. *Service Option Request Order*
 - 34 2. *Service Option Response Order*
 - 35 3. *Service Option Control Order*

36 2.6.4.1.2.2.5.1 Storing a Service Configuration with SYNC_ID

37 The mobile station shall set NUM_SYNC_ID_SUPPORTED as follows:

- 1 • If the mobile station has not reported the Capability Information information record
2 with the ADD_NUM_SYNC_ID field, the mobile station shall set
3 NUM_SYNC_ID_SUPPORTED to four.
- 4 • If the mobile station has reported the Capability Information information record
5 with the ADD_NUM_SYNC_ID field, the mobile station shall set
6 NUM_SYNC_ID_SUPPORTED to five plus the value of the ADD_NUM_SYNC_ID field
7 included in the Capability Information information record.

8 The mobile station shall be capable of storing a minimum of NUM_SYNC_ID_SUPPORTED
9 service configurations along with their corresponding SYNC_ID, SID and NID.

10 Two SYNC_IDs are considered to be equal if and only if both the length and value of the
11 SYNC_IDs is equal.

12 The mobile station shall use the following procedure in the order listed below to store the
13 current service configuration when it is associated with a SYNC_ID:

- 14 • If the mobile station has a stored service configuration associated with SID_s, NID_s
15 and SYNC_ID_s, then the mobile station shall delete the stored service configuration.
- 16 • If the number of stored service configurations is NUM_SYNC_ID_SUPPORTED or
17 more, the mobile station shall not delete the (NUM_SYNC_ID_SUPPORTED - 1)
18 most recently used⁵⁹ service configuration(s) and corresponding synchronization
19 identifier(s), SID(s), NID(s).
- 20 • The mobile station shall store the current service configuration (that is, parameters
21 conveyed by both the Service Configuration information record and the Non-
22 negotiable Service Configuration information record) and the SYNC_ID_s
23 corresponding to the current service configuration along with SID_s and NID_s.

24 2.6.4.1.2.2.5.2 Restoring a stored Service Configuration based on SYNC_ID

25 When restoring a stored service configuration based on SYNC_ID, the mobile station shall
26 restore only those parameters defined in the current P_REV_IN_USE_s.

27 2.6.4.1.2.2.6 SO Negotiation Subfunction

28 The *SO Negotiation Subfunction* is only supported for mobile stations operating in Band
29 Class 0.

30 Service option negotiation is not supported for P_REV_IN_USE_s greater than six.

31 Upon activation of the *SO Negotiation Subfunction*, the mobile station shall delete from the
32 current service configuration any service option connection which does not use primary
33 traffic on both the Forward and Reverse Traffic Channels and the Layer 3 shall terminate
34 the corresponding Call Control instances. The Call Control instance corresponding to the
35 service option connection which uses primary traffic, if any, shall be identified by NULL.

⁵⁹ The stored service configuration is considered used when it is stored for the first time or when it is used again during a call using the SYNC_ID feature.

1 While the *SO Negotiation Subfunction* is active, the mobile station shall perform the
2 following:

- 3 • If the current service configuration includes a service option connection, the mobile
4 station shall process the received primary traffic bits in accordance with the
5 requirements for the service option associated with the service option connection;
6 otherwise, the mobile station shall discard the received primary traffic bits.
- 7 • If the current service configuration includes a service option connection, the mobile
8 station shall transmit primary traffic bits in accordance with the requirements for
9 the service option associated with the service option connection; otherwise, the
10 mobile station shall transmit null traffic on the Reverse Fundamental Channel, if
11 the Fundamental Channel is present or transmit power control bits on the Reverse
12 Pilot Channel, if only the Dedicated Control Channel is present.
- 13 • If the current service configuration includes a service option connection, the mobile
14 station may send a *Service Option Control Order* to invoke a service option specific
15 function in accordance with the requirements for the service option associated with
16 the service option connection.
- 17 • To initiate service option negotiation, the mobile station shall set SO_REQ_s to the
18 number of the requested service option and shall send a *Service Option Request*
19 *Order* containing the requested service option number.
- 20 • If $SERV_NEG_s$ changes from disabled to enabled (see 2.6.6.2.5.1), the mobile
21 station shall set SO_REQ_s to NULL and shall activate the *Normal Service*
22 *Subfunction*.
- 23 • If the mobile station receives a *Service Option Request Order*, it shall process the
24 order as follows:
 - 25 - If the mobile station accepts the requested service option, the mobile station
26 shall set SO_REQ_s to NULL and shall send a *Service Option Response Order*
27 accepting the requested service option within T_{58m} seconds. The mobile station
28 shall interpret the message action time of the *Service Option Request Order* in
29 accordance with the requirements for the requested service option and the
30 mobile station shall begin using the service configuration implied by the
31 requested service option in accordance with those requirements. The implied
32 service configuration shall include the default Forward and Reverse multiplex
33 options and radio configurations associated with the requested service option,
34 and shall include one service option connection for which the service option
35 connection reference is 1, the service option is the requested service option, and
36 the Forward and Reverse Traffic Channel types are both primary traffic. If a Call
37 Control instance currently exists, the Layer 3 shall use this Call Control
38 instance for a new service option connection; otherwise, the Layer 3 shall
39 instantiate a Call Control instance (as specified in 2.6.10) and this Call Control
40 instance shall be identified by both a connection reference with a value of 1 and
41 a default identifier with a value of NULL.
 - 42 - If the mobile station does not accept the requested service option and has an
43 alternative service option to request, the mobile station shall set SO_REQ_s to the

- 1 alternative service option number and shall send a *Service Option Request Order*
2 requesting the alternative service option within T_{58m} seconds.
- 3 - If the mobile station does not accept the requested service option and does not
4 have an alternative service option to request, the mobile station shall set
5 SO_REQ_s to NULL and shall send a *Service Option Response Order* to reject the
6 request within T_{58m} seconds. The mobile station shall continue to use the
7 current service configuration.
- 8 • If the mobile station receives a *Service Option Response Order*, it shall process the
9 order as follows:
- 10 - If the service option number specified in the order is equal to SO_REQ_s , the
11 mobile station shall set SO_REQ_s to NULL. The mobile station shall interpret
12 the message action time of the *Service Option Response Order* in accordance with
13 the requirements for the specified service option, and the mobile station shall
14 begin using the service configuration implied by the specified service option in
15 accordance with those requirements. The implied service configuration shall
16 include the default Forward and Reverse multiplex options and radio
17 configurations associated with the specified service option, and shall include
18 one service option connection for which the service option connection reference
19 is 1, the service option is the specified service option, and the Forward and
20 Reverse Traffic Channel types are both primary traffic. If a Call Control instance
21 currently exists, the Layer 3 shall use this Call Control instance for a new
22 service option connection; otherwise, the Layer 3 shall instantiate a Call Control
23 instance (as specified in 2.6.10) and this Call Control instance shall be identified
24 by both a connection reference with a value of 1 and a default identifier with a
25 value of NULL.
- 26 - If the order indicates a service option rejection, the mobile station shall set
27 SO_REQ_s to NULL. The mobile station shall continue to use the current service
28 configuration.
- 29 - If the order does not indicate a service option rejection and the service option
30 specified in the order is not equal to SO_REQ_s , the mobile station shall set
31 SO_REQ_s to NULL and shall send a *Mobile Station Reject Order* (ORDQ =
32 '00000100') within T_{58m} seconds. The mobile station shall continue to use the
33 current service configuration.
- 34 • If the mobile station receives a *Service Option Control Order*, it shall process the
35 order as follows:
- 36 - If the current service configuration includes a service option connection, the
37 mobile station shall interpret the message action time of the *Service Option*
38 *Control Order* in accordance with the requirements for the service option
39 associated with the service option connection and the mobile station shall
40 process the *Service Option Control Order* in accordance with those requirements;
- 41 - otherwise, the mobile station shall send a *Mobile Station Reject Order* (ORDQ =
42 '00000001') within T_{56m} seconds.

- 1 • If the mobile station receives one of the following service negotiation messages, the
2 mobile station shall send a *Mobile Station Reject Order* (ORDQ = '00000010') within
3 T_{56m} seconds:

- 4 1. *Service Connect Message*
5 2. *Service Option Control Message*
6 3. *Service Request Message*
7 4. *Service Response Message*

8 2.6.4.1.3 Ordering of Messages

9 The Layer 2 protocol does not guarantee delivery of messages in any order. If the mobile
10 station requires that the base station receive a set of messages in a certain order, the
11 mobile station shall send each message in assured mode requiring confirmation of delivery
12 and shall wait for the confirmation of delivery of each message before transmitting the next
13 message in the set.

14 2.6.4.1.4 Processing the In-Traffic System Parameters Message

15 The mobile station shall store the following parameters from the *In-Traffic System*
16 *Parameters Message*:

- 17 • System identification (SID_s = SID_r)
18 • Network identification (NID_s = NID_r)
19 • Search window size for the Active Set and the Candidate Set
20 (SRCH_WIN_A_s = SRCH_WIN_A_r)
21 • Search window size for the Neighbor Set (SRCH_WIN_N_s = SRCH_WIN_N_r)
22 • Search window size for the Remaining Set (SRCH_WIN_R_s = SRCH_WIN_R_r)
23 • Pilot detection threshold (T_ADD_s = T_ADD_r)
24 • Pilot drop threshold (T_DROP_s = T_DROP_r)
25 • Active Set versus Candidate Set comparison threshold (T_COMP_s = T_COMP_r)
26 • Drop timer value (T_TDROPS = T_TDROPR)
27 • Drop timer range value (T_TDROPRANGE_s = T_TDROPRANGE_r) if
28 T_TDROPRANGE_INCL_r is equal to '1'; otherwise, (T_TDROPRANGE_s = '0000')
29 • Forward Packet Data Channel supported indicator (FOR_PDCH_SUPPORTED_s =
30 FOR_PDCH_SUPPORTED_r)
31 • Short Data Burst supported indicator (SDB_SUPPORTED_s = SDB_SUPPORTED_r)
32 • If included, permission for the mobile station to request QoS settings in the
33 *Origination Message, Origination Continuation Message, or Enhanced Origination*
34 *Message* (MOB_QOS_s = MOB_QOS_r)
35 • Mobile station initiated position location determination supported indicator
36 (MS_INIT_POS_LOC_SUP_IND_s = MS_INIT_POS_LOC_SUP_IND_r).

- 1 • PDCH Control Hold Mode supported indicator ($PDCH_CHM_SUPPORTED_S =$
2 $PDCH_CHM_SUPPORTED_T$) if included; otherwise, set $PDCH_CHM_SUPPORTED_S$ to
3 '0'.
- 4 • Reverse Packet Data Channel supported indicator ($REV_PDCH_SUPPORTED_S =$
5 $REV_PDCH_SUPPORTED_T$) if included; otherwise, set $REV_PDCH_SUPPORTED_S$ to
6 '0'.
- 7 • Channel configuration request allowed indicator ($USE_CH_CFG_RRM_S =$
8 $USE_CH_CFG_RRM_T$) if included; otherwise, set $USE_CH_CFG_RRM_S$ to '0'.
- 9 • Maximum age for retention of Neighbor Set members
10 ($NGHBR_MAX_AGE_S = NGHBR_MAX_AGE_T$)
- 11 • Protocol revision level ($P_REV_S = P_REV_T$), and protocol revision level currently in
12 use ($P_REV_IN_USE_S = \min(P_REV_S, MOB_P_REV_P$ of the current band class)
- 13 • Slope of the handoff add/drop criterion ($SOFT_SLOPE_S = SOFT_SLOPE_T$)
- 14 • Intercept of the handoff add criterion ($ADD_INTERCEPT_S = ADD_INTERCEPT_T$)
- 15 • Intercept of the handoff drop criterion ($DROP_INTERCEPT_S = DROP_INTERCEPT_T$)
- 16 • If included, neighbor pilot strength measurement threshold offset ($T_MULCHAN_S =$
17 $T_MULCHAN_T$)
- 18 • If included, Reverse Supplemental Code Channel beginning of transmission
19 preamble length ($BEGIN_PREAMBLE_S = BEGIN_PREAMBLE_T$)
- 20 • If included, Reverse Supplemental Code Channel discontinuous transmission
21 resumption preamble length ($RESUME_PREAMBLE_S = RESUME_PREAMBLE_T$)
- 22 • If included, Slotted Timer ($T_SLOTTED_S = T_SLOTTED_T$)
- 23 • If the mobile station supports packet data service options, the mobile station shall
24 store the packet data services zone identifier ($PACKET_ZONE_ID_S =$
25 $PACKET_ZONE_ID_T$).
- 26 • If the mobile station supports packet data service options and the
27 $PZ_HYST_ENABLED$ field is included, the mobile station shall store the packet zone
28 hysteresis enabled indicator ($PZ_HYST_ENABLED_S = PZ_HYST_ENABLED_T$);
29 otherwise, the mobile station shall set $PZ_HYST_ENABLED_S$ to '1'.
- 30 • If the $PZ_HYST_LIST_LEN$ field is included, the mobile station shall store the packet
31 zone hysteresis list length ($PZ_HYST_LIST_LEN_S = PZ_HYST_LIST_LEN_T$); otherwise,
32 the mobile station shall set $PZ_HYST_LIST_LEN_S$ to 4.
- 33 • If the $PZ_HYST_ACT_TIMER$ field is included, the mobile station shall store the
34 packet zone hysteresis activation timer ($PZ_HYST_ACT_TIMER_S =$
35 $PZ_HYST_ACT_TIMER_T$); otherwise, the mobile station shall set
36 $PZ_HYST_ACT_TIMER_S$ to 30 seconds.
- 37 • If the $PZ_HYST_TIMER_MUL$ field and the $PZ_HYST_TIMER_EXP$ field are included,
38 the mobile station shall store the packet zone hysteresis timer ($PZ_HYST_TIMER_S =$

- 1 PZ_HYST_TIMER_MUL_r × 8 ^ PZ_HYST_TIMER_EXPr); otherwise, the mobile station
 2 shall set PZ_HYST_TIMERs to 60 seconds.
- 3 • If ENC_SUPPORTED_r is equal to '1', the mobile station shall store:
 - 4 - Signaling encryption supported indicator (SIG_ENCRYPT_SUP_s =
 5 SIG_ENCRYPT_SUP_r)
 - 6 - User information encryption supported indicator (UI_ENCRYPT_SUP_s =
 7 UI_ENCRYPT_SUP_r)
 - 8 • Concurrent services supported indicator (CS_SUPPORTED_s = CS_SUPPORTED_r).
 - 9 • Maximum number of additional service reference identifiers allowed in origination
 10 (MAX_ADD_SERV_INSTANCES_s = MAX_ADD_SERV_INSTANCE_r), if included;
 11 otherwise, the mobile station shall set MAX_ADD_SERV_INSTANCES_s to 0.
 - 12 • Control Hold Mode supported indicator (CHM_SUPPORTED_s = CHM_SUPPORTED_r)
 13 if included; otherwise, the mobile station shall perform the following:
 - 14 - If P_REV_IN_USE_s is less than six, set CHM_SUPPORTED_s to '0'.
 - 15 - Otherwise, set CHM_SUPPORTED_s to '1'.
 - 16 • CDMA off time report supported indicator
 17 (CDMA_OFF_TIME_REP_SUP_IND_s = CDMA_OFF_TIME_REP_SUP_IND_r).
 - 18 • If CDMA_OFF_TIME_REP_SUP_IND_r is equal to '1', the mobile station shall store
 19 CDMA off time report threshold (CDMA_OFF_TIME_REP_THRESHOLD_s =
 20 CDMA_OFF_TIME_REP_THRESHOLD_r in units specified by
 21 CDMA_OFF_TIME_REP_UNIT_r).
 - 22 • The mobile station shall set BCMC_ON_TRAFFIC_SUP_s to
 23 BCMC_ON_TRAFFIC_SUP_r. If BCMC_ON_TRAFFIC_SUP_r is set to '1', the mobile
 24 station shall store AUTO_REQ_TRAF_ALLOWED_IND_s =
 25 AUTO_REQ_TRAF_ALLOWED_IND_r.

26 The mobile station shall determine its roaming status (see 2.6.5.3). The mobile station
 27 should indicate to the user whether the mobile station is roaming.

28 2.6.4.1.5 Message Action Times

29 A Forward Traffic Channel message without a USE_TIME field or with a USE_TIME field set
 30 to '0' has an implicit action time. A message that has its USE_TIME field set to '1' has an
 31 explicit action time that is specified in the ACTION_TIME field of the message.

32 A message with an explicit action time is called a pending message.

33 Unless otherwise specified, a message having an implicit action time shall take effect no
 34 later than the first 80 ms boundary (relative to System Time plus FRAME_OFFSET_s × 1.25
 35 ms) occurring at least 80 ms after the end of the frame containing the last bit of the
 36 message. A message with an explicit action time, except for a *Power Up Function Message*,
 37 shall take effect when System Time minus FRAME_OFFSET_s × 1.25 ms (in 80 ms units)
 38 modulo 64 becomes equal to the message's ACTION_TIME field. A *Power Up Function*
 39 *Message* shall take effect ACTION_TIME_FRAME frames after the time when System Time

1 minus $\text{FRAME_OFFSET}_s \times 1.25 \text{ ms}$ (in 80 ms units) modulo 64 becomes equal to the
 2 message's ACTION_TIME field. The difference in time between ACTION_TIME and the end
 3 of the frame containing the last bit of the message shall be at least 80 ms.

4 The mobile station shall support two pending messages at any given time, not including
 5 pending *Service Option Control Orders* or *Service Option Control Messages*. The number of
 6 pending *Service Option Control Orders* or *Service Option Control Messages* that the mobile
 7 station is required to support is specific to the service option (see the relevant service
 8 option description). In addition, the mobile station shall support one pending *Power Up*
 9 *Function Message*.

10 2.6.4.1.6 Long Code Transition Request Processing

11 The mobile station performs these procedures upon receiving a *Long Code Transition*
 12 *Request Order*.

13 If the *Long Code Transition Request Order* requests a transition to the private long code, and
 14 the mobile station is able to generate the private long code (see 2.3.12.3), and the mobile
 15 station accepts the request, the mobile station shall send a *Long Code Transition Response*
 16 *Order* (ORDQ = '00000011') within T_{56m} seconds. The mobile station shall use the private
 17 long code on both the Forward Traffic Channel and the Reverse Traffic Channel. The
 18 mobile station shall store the public long code mask and PLCM_TYPE_s currently in use and
 19 begin using the private long code at the explicit action time (see 2.6.4.1.5) specified in the
 20 message. At the action time of the message, the mobile station should indicate to the user
 21 that the voice privacy mode is active. If the *Long Code Transition Request Order* requests a
 22 private long code transition, and the mobile station is not able to generate the private long
 23 code or the mobile station does not accept the request, the mobile station shall send a *Long*
 24 *Code Transition Response Order* (ORDQ = '00000010') within T_{56m} seconds.

25 If the *Long Code Transition Request Order* requests a transition to the public long code and
 26 the mobile station accepts the request, the mobile station shall send a *Long Code Transition*
 27 *Response Order* (ORDQ = '00000010') within T_{56m} seconds. The mobile station shall use
 28 the public long code on both the Forward Traffic Channel and the Reverse Traffic Channel.
 29 The mobile station shall begin using the public long code that is stored previously, derived
 30 from PLCM_TYPE_s as specified in 2.3.6, at the explicit action time (see 2.6.4.1.5) specified
 31 in the message. At the action time of the message, the mobile station should indicate to
 32 the user that the voice privacy mode is inactive. If the *Long Code Transition Request Order*
 33 requests a public long code transition, and the mobile station does not accept the request,
 34 the mobile station shall send a *Long Code Transition Response Order* (ORDQ = '00000011')
 35 within T_{56m} seconds.

36 2.6.4.1.7 Power Up Function (PUF)

37 Figure 2.6.4.1.7-1 illustrates the general structure of a PUF attempt. A PUF pulse is the
 38 interval during which the mobile station transmits at the specified power level while
 39 executing the Power Up Function.

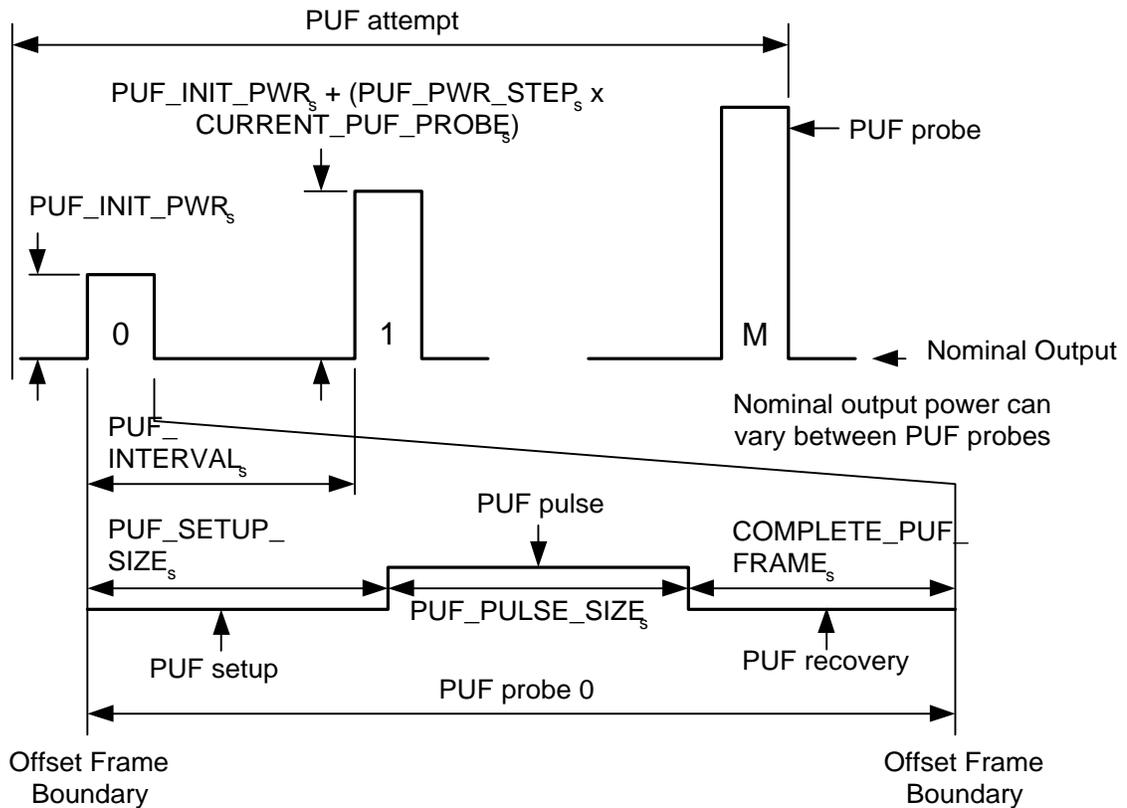

40 A PUF probe is one or more consecutive Traffic Channel frames. A PUF probe consists of
 41 three parts: PUF setup, PUF pulse, and PUF recovery. PUF_SETUP_SIZE is the duration of
 42 the PUF setup part, in power control groups. PUF_PULSE_SIZE is the duration of the PUF

1 pulse, in power control groups. The PUF recovery period occupies the remainder of the last
 2 frame of the PUF probe.

3 A PUF attempt is a sequence of PUF probes sent by the mobile station in response to a
 4 *Power Up Function Message*. A PUF attempt begins at an offset frame boundary within 80
 5 ms of the ACTION_TIME specified in the *Power Up Function Message*. A PUF attempt can
 6 be terminated in one of four ways:

- 7 • The mobile station receives a *Power Up Function Completion Message*.
- 8 • The mobile station has transmitted the maximum number of PUF probes specified
 9 in the *Power Up Function Message*.
- 10 • The mobile station has transmitted the maximum number of probes allowed at its
 11 maximum output power.
- 12 • The mobile station receives a new *Power Up Function Message*.

13

14

15

Figure 2.6.4.1.7-1. Structure of PUF Attempt

1

2 2.6.4.1.7.1 Processing the Power Up Function Message

3 The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to
4 '0000110' (message requires a capability that is not supported by the mobile station) if
5 any of the following conditions are detected:

- 6 • PUF_FREQ_INCL_T is set to '1' and PUF_BAND_CLASS_T is not supported by the
7 mobile station.
- 8 • PUF_FREQ_INCL_T is set to '1' and the mobile station is unable to re-tune to the PUF
9 Target Frequency during (PUF_SETUP_SIZE_T + 1) power control groups.
- 10 • MOB_P_REV_P is not equal to five and the mobile station does not support the Power
11 Up Function.

12 The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to
13 '00001100' (invalid Frequency Assignment), if the Frequency Assignment specified in the
14 message is the same as the Serving Frequency (PUF_FREQ_INCL_T is equal to '1',
15 PUF_BAND_CLASS_T is equal to CDMABAND_S and PUF_CDMA_FREQ_T is equal to
16 CDMACH_S).

17 If the mobile station is processing a PUF probe, the mobile station shall wait for the PUF
18 probe to complete. It shall then terminate the current PUF attempt. The mobile station
19 shall store the following parameters:

- 20 • Maximum number of PUF probes transmitted at full power level (MAX_PWR_PUF_S =
21 MAX_PWR_PUF_T + 1)
- 22 • Total number of PUF probes (TOTAL_PUF_PROBES_S = TOTAL_PUF_PROBES_T + 1)
- 23 • PUF interval (PUF_INTERVAL_S = PUF_INTERVAL_T)
- 24 • Number of PUF setup power control groups (PUF_SETUP_SIZE_S =
25 PUF_SETUP_SIZE_T + 1)
- 26 • Number of PUF pulse power control groups (PUF_PULSE_SIZE_S =
27 PUF_PULSE_SIZE_T + 1)
- 28 • Power increase of initial PUF pulse (PUF_INIT_PWR_S = PUF_INIT_PWR_T)
- 29 • Power increase for each successive PUF pulse (PUF_PWR_STEP_S = PUF_PWR_STEP_T)
- 30 • Frequency included indicator (PUF_FREQ_INCL_S = PUF_FREQ_INCL_T)

31 If PUF_FREQ_INCL_S equals '1', the mobile station shall store the following:

- 32 • PUF probe Target Frequency CDMA Channel number (PUF_TF_CDMACH_S =
33 PUF_CDMA_FREQ_T)
- 34 • PUF probe Target Frequency CDMA band class (PUF_TF_CDMABAND_S =
35 PUF_BAND_CLASS_T)

36 The mobile station shall set CURRENT_PUF_PROBE_S equal to 0.

37 The mobile station shall then begin the PUF attempt at the time specified in 2.6.4.1.7.2.

1 2.6.4.1.7.2 Power Up Function Procedures

2 The mobile station shall process the initial PUF probe beginning at the start of the frame
 3 which starts $ACTION_TIME_FRAME_T \times 20 \text{ ms} + FRAME_OFFSET_S \times 1.25 \text{ ms}$ after the
 4 System Time specified by $ACTION_TIME_T$. The mobile station shall process additional PUF
 5 probes beginning at intervals of $PUF_INTERVAL_S$ frames from the beginning of the initial
 6 PUF probe.

7 The mobile station shall transmit the PUF probes as described in 2.6.4.1.7.2.1 and
 8 2.6.4.1.7.2.2.

9 2.6.4.1.7.2.1 PUF Probe On Serving Frequency

10 The mobile station shall process each PUF probe as follows:

- 11 • The mobile station shall use closed loop power control procedures as specified in
 12 [2].
- 13 • The mobile station shall use the gated output procedures specified in [2].
- 14 • The mobile station shall control its mean output power as specified in [2].
- 15 • The mobile station shall monitor its output power during the PUF pulse, and should
 16 monitor its output power at least once during each power control group of the PUF
 17 pulse. If the mobile station detects that the transmit power level specified in [2] is
 18 equal to or greater than the maximum power output of the mobile station at any
 19 time during a PUF pulse, the mobile station shall decrement $MAX_PWR_PUF_S$ by
 20 one for that PUF pulse.
- 21 • The mobile station shall transmit the traffic channel preamble for the duration of
 22 the PUF probe on the Reverse Fundamental Channel.

23 After the processing of each PUF probe, the mobile station shall increment
 24 $CURRENT_PUF_PROBE_S$ by 1. If $MAX_PWR_PUF_S$ is equal to 0, the mobile station shall
 25 terminate the PUF attempt. If $CURRENT_PUF_PROBE_S$ equal to $TOTAL_PUF_PROBE_S$, the
 26 mobile station shall terminate the PUF attempt.

27 2.6.4.1.7.2.2 PUF Probe On PUF Target Frequency

28 The mobile station shall process each PUF probe as follows:

- 29 • The mobile station shall use closed loop power control procedures as specified in
 30 [2].
- 31 • The mobile station shall use the gated output procedures specified in [2].
- 32 • The mobile station shall control its mean output power as specified in [2].
- 33 • The mobile station shall store the following Serving Frequency parameters from its
 34 current configuration:
 - 35 - CDMA Band Class ($PUF_SF_CDMABAND_S = CDMABAND_S$)
 - 36 - Frequency assignment ($PUF_SF_CDMACH_S = CDMACH_S$)

- 1 • The mobile station shall monitor its output power during the PUF pulse, and should
2 monitor its output power at least once during each power control group of PUF
3 pulse. If the mobile station detects that the transmit power level specified in [2] is
4 equal to or greater than the maximum power output of the mobile station at any
5 time during a PUF pulse, the mobile station shall decrement the $MAX_PWR_PUF_S$
6 by one for that PUF pulse.
- 7 • At the beginning of the PUF probe, the mobile station shall disable its transmitter,
8 stop processing the Forward Supplemental Code Channel (if any), or the Forward
9 Supplemental Channel (if any), disable all corrections to the mobile station time
10 reference (see [2]), tune to the CDMA channel specified by $PUF_TF_CDMACH_S$, and
11 $PUF_TF_CDMABAND_S$ and re-enable its transmitter.
- 12 • The mobile station shall transmit the traffic channel preamble on the Reverse
13 Fundamental Channel during the PUF pulse at $PUF_TX_PWR_S$.
- 14 • The mobile station should disable its transmitter immediately after the end of the
15 PUF pulse, and shall disable its transmitter before the end of the first power control
16 group after the PUF pulse. It shall then tune to its assigned CDMA channel as
17 given by $CDMACH_S$ and $CDMABAND_S$.
- 18 • If the interval between the time that the mobile station tunes to the PUF Target
19 Frequency and the time that it re-tunes to the Serving Frequency is equal to or
20 greater than $(N_{2m} \times 0.02)$ seconds, the mobile station shall wait to receive a period
21 of $(N_{3m} \times 20)$ ms with sufficient signal quality on the physical channel
22 corresponding to $FPC_PRI_CHAN_S$.
- 23 • The mobile station shall then re-enable its transmitter and re-enable any
24 adjustments to the mobile station time reference.
- 25 • If the Forward Supplemental Code Channel assignment has not expired while the
26 mobile station has tuned to the PUF Target Frequency, then the mobile station shall
27 resume processing the Forward Supplemental Code Channels after re-tuning to the
28 Serving Frequency.
- 29 • If the Forward Supplemental Channel assignment has not expired while the mobile
30 station has tuned to the PUF Target Frequency, then the mobile station shall
31 resume processing the Forward Supplemental Channels after re-tuning to the
32 Serving Frequency.
- 33 • If the Reverse Supplemental Code Channel assignment has not expired while the
34 mobile station has tuned to the PUF Target Frequency, then the mobile station may
35 resume transmitting the Reverse Supplemental Code Channels after re-tuning to
36 the Serving Frequency.
- 37 • If the Reverse Supplemental Channel assignment has not expired while the mobile
38 station has tuned to the PUF Target Frequency, then the mobile station may resume
39 transmitting the Reverse Supplemental Code Channels after re-tuning to the
40 Serving Frequency.

41 After the processing of each PUF probe, the mobile station shall increment
42 $CURRENT_PUF_PROBE_S$ by one. If $MAX_PWR_PUF_S$ is equal to 0, the mobile station shall

1 terminate the PUF attempt. If $CURRENT_PUF_PROBE_S$ is equal to $TOTAL_PUF_PROBE_S$,
 2 the mobile station shall terminate the PUF attempt.

3 2.6.4.1.7.3 Processing the Power Up Function Completion Message

4 The mobile station shall terminate any PUF attempt no later than the completion of the
 5 current probe in progress and shall discard any pending *Power Up Function Message*. If
 6 LOC_IND_T is equal to '1', the mobile station may store the following parameters:

- 7 • Mobile Station Latitude ($MS_LAT_S = MS_LAT_T$)
- 8 • Mobile Station Longitude ($MS_LONG_S = MS_LONG_T$)
- 9 • Time stamp ($MS_LOC_TSTAMP_S = MS_LOC_TSTAMP_T$)

10 2.6.4.1.8 Forward Traffic Channel Supervision

11 When in the *Mobile Station Control on the Traffic Channel State*, the mobile station shall
 12 continuously monitor the Forward Channel, except:

- 13 • During a PUF probe in which it transmits on a PUF target frequency (see 2.6.4.1.7),
- 14 • During a search of pilots on a CDMA Candidate Frequency (see 2.6.6.2.8.3),

15 When a Forward Common Power Control Channel is not assigned, the mobile station shall
 16 perform the procedure described in 2.6.4.1.8.1. When a Forward Forward Common Power
 17 Control Channel is assigned, the mobile station shall perform the procedure described in
 18 2.6.4.1.8.2.

19 2.6.4.1.8.1 Forward Traffic Channel Supervision when a Forward Common Power Control 20 Channel is not assigned

21 The mobile station shall monitor the physical channel corresponding to $FPC_PRI_CHAN_S$ as
 22 follows:

- 23 • If $RESQ_ENABLED_S$ is equal to '1' and $FPC_PRI_CHAN_S$ is equal to '0', the mobile
 24 station shall perform the following:
 - 25 - While the mobile station's transmitter is enabled:
 - 26 + If the rescue attempt timer is not enabled and the mobile station detects a
 27 'forward link error' trigger as specified in 2.6.4.1.8.1.1, then the mobile
 28 station shall perform the following:
 - 29 ○ disable its transmitter, and
 - 30 ○ enable the rescue delay timer with an initial value of
 31 $(RESQ_DELAY_TIME_S \times 80)$ ms.
 - 32 + If the rescue attempt timer is enabled and the mobile station detects a 'good
 33 forward link' trigger as specified in 2.6.4.1.8.1.1, then the mobile station
 34 shall disable the rescue attempt timer, and shall resume Forward and
 35 Reverse Traffic Channel power control as specified in 2.6.4.1.1 and
 36 2.6.6.2.7.2, respectively.
 - 37 - While the mobile station's transmitter is disabled:

- 1 + If the mobile station did not disable its transmitter due to an
 2 acknowledgment failure and the mobile station detects a ‘good forward link’
 3 trigger as specified in 2.6.4.1.8.1.1, then the mobile station should re-enable
 4 its transmitter, and shall also perform the following:
- 5 ○ disable the rescue delay timer or rescue allowed timer, if either is
 6 enabled.
 - 7 ○ send a *Call Rescue Cancel Order* in assured mode, if the mobile station is
 8 not otherwise required to send an *Extended Pilot Strength Measurement*
 9 *Message*.
- 10 • Otherwise, the mobile station shall perform the following:
 - 11 - If the mobile station detects a ‘forward link error’ trigger as specified in
 12 2.6.4.1.8.1.1, it shall disable its transmitter.
 - 13 - Thereafter, if the mobile station detects a ‘good forward link’ trigger as specified
 14 in 2.6.4.1.8.1.1, then the mobile station should re-enable its transmitter.

15 The mobile station shall establish a Forward Traffic Channel fade timer. The timer shall be
 16 enabled when the mobile station first enables its transmitter when in the *Traffic Channel*
 17 *Initialization Substate* of the *Mobile Station Control on the Traffic Channel State*. The fade
 18 timer shall be reset for T_{5m} seconds whenever the mobile station detects a ‘good forward
 19 link’ trigger as specified in 2.6.4.1.8.1.1. The mobile station shall disable the fade timer
 20 when it tunes to a PUF target frequency, and shall re-enable the fade timer at the end of
 21 the PUF probe. If the timer expires, the mobile station shall disable its transmitter and
 22 declare a loss of the Forward Traffic Channel. If $CRRM_MSG_IND_s$ equals ‘1’ and if no other
 23 access channel message is transmitted after loss of the Forward Traffic Channel, the mobile
 24 station may enter the *Update Overhead Information Substate* of the *System Access State* (see
 25 2.6.3) with an origination indication, within 20 seconds of the loss of the Forward Traffic
 26 Channel, to transmit the *Call Recovery Request Message*.

27 The mobile station also enables, disables, and resets the fade timer as described in
 28 2.6.6.2.8 and 2.6.6.2.10 when it performs a hard handoff or a periodic search.

29 2.6.4.1.8.1.1 Triggers

30 The mobile station shall detect ‘good forward link’ trigger as specified below:

- 31 • If RC11 or RC12 is used on Forward Link and blanking is enabled (i.e.
 32 FOR_FCH_BLANKING_DUTYCYCLE is set to value other than ‘000’), then the mobile
 33 station shall detect ‘good forward link’ trigger when any one of the following
 34 condition is met:
 - 35 - Mobile station receives a period of $(N_{3m} \times 20)$ ms with sufficient signal quality
 36 on the physical channel corresponding to FPC_PRI_CHAN_s.
 - 37 - Mobile station receives a N_{3m} consecutive guaranteed transmission frames with
 38 sufficient signal quality on the physical channel corresponding to
 39 FPC_PRI_CHAN_s.

- 1 • Otherwise, the mobile station shall detect ‘good forward link’ trigger when it receives
2 a period of $(N_{3m} \times 20)$ ms with sufficient signal quality on the physical channel
3 corresponding to $FPC_PRI_CHAN_S$.

4 The mobile station shall detect ‘forward link error’ trigger as specified below:

- 5 • If RC11 or RC12 is used on Forward Link and blanking is enabled (i.e.
6 $FOR_FCH_BLANKING_DUTYCYCLE$ is set to value other than ‘000’), then the mobile
7 station shall detect ‘forward link error’ trigger when it receives $FOR_N2M_IND_S$
8 consecutive guaranteed transmission frames with insufficient signal quality on the
9 physical channel corresponding to $FPC_PRI_CHAN_S$.
- 10 • Otherwise, the mobile station shall detect ‘forward link error’ trigger when it
11 receives a period of $(N_{2m} \times 20)$ ms with insufficient signal quality on the physical
12 channel corresponding to $FPC_PRI_CHAN_S$.

13 2.6.4.1.8.2 Forward Traffic Channel Supervision when a Forward Common Power Control 14 Channel is assigned

15 The mobile station shall monitor the Forward Common Power Control Channel as follows:

- 16 • If the mobile station receives a period of $(N_{16m} \times 1.25)$ ms with insufficient signal
17 quality on the Forward Common Power Control Subchannels assigned to this
18 mobile, it shall disable its transmitter.
- 19 • Thereafter, if the mobile station receives a period of $(N_{17m} \times 1.25)$ ms with
20 sufficient signal quality on the Forward Common Power Control Subchannels
21 assigned to this mobile, then the mobile station should re-enable its transmitter.

22 The mobile station shall establish a Forward Traffic Channel fade timer. The timer shall be
23 enabled when the mobile station first enables its transmitter when in the *Traffic Channel*
24 *Initialization Substate* of the *Mobile Station Control on the Traffic Channel State*. The fade
25 timer shall be reset for T_{5m} seconds whenever the mobile station receives a period of $(N_{17m}$
26 $\times 1.25)$ ms with sufficient signal quality on the Forward Common Power Control
27 Subchannels assigned to this mobile. If the timer expires, the mobile station shall disable
28 its transmitter and declare a loss of the Forward Traffic Channel. If $CRRM_MSG_IND_S$
29 equals ‘1’ and if no other access channel message is transmitted after loss of the Forward
30 Traffic Channel, the mobile station may enter the *Update Overhead Information Substate* of
31 the *System Access State* (see 2.6.3) with an origination indication, within 20 seconds of the
32 loss of the Forward Traffic Channel, to transmit the *Call Recovery Request Message*.

33 The mobile station also enables, disables, and resets the fade timer as described in
34 2.6.6.2.7, 2.6.6.2.8 and 2.6.6.2.10 when it performs a soft handoff, a hard handoff or a
35 periodic search.

36 Additionally, the mobile station shall perform a ping as follows:

- 37 • The mobile station shall establish a Forward Traffic Channel ping timer as follows:
- 38 - When the mobile station first enables its transmitter in the *Traffic Channel*
39 *Initialization Substate* of the *Mobile Station Control on the Traffic Channel State*,
40 the mobile station shall enable the Forward Traffic Channel ping timer and set it

1 to T_{78m} seconds.

- 2 - When the mobile station receives a message that assigns a F-CPCCH, the mobile
3 station shall enable the Forward Traffic Channel ping timer and set it to T_{78m}
4 seconds.
- 5 • When the mobile station receives a Physical Layer SDU destined for this mobile
6 station on the F-PDCH or on the shared F-DCCH (See [3]), the Forward Traffic
7 Channel ping timer shall be reset for T_{78m} seconds.
- 8 • When the Forward Traffic Channel ping timer expires, the mobile station shall send
9 a *L2 Acknowledgment Order* in assured mode if there is no other Layer 3 message to
10 be sent in assured mode available for transmission.

11 2.6.4.1.9 Processing the Extended Release Message and the Extended Release Mini 12 Message

- 13 • Upon receiving the *Extended Release Message* or the *Extended Release Mini*
14 *Message*, the mobile station shall process the message as follows:
 - 15 - If $USE_EXT_CH_IND_r$ is equal to '1', then the mobile station shall set
16 $USE_EXT_CH_IND_s$ to $USE_EXT_CH_IND_r$; otherwise, the mobile station shall
17 set $USE_EXT_CH_IND_s$ to '0'.
 - 18 - If the mobile station determines that the configuration specified by CH_IND_r or
19 $EXT_CH_IND_r$ is not valid (see Tables 3.7.3.3.2.34-1, and 3.7.3.3.2.34-3), the
20 mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to
21 '0000111' (message can not be handled by the current mobile station
22 configuration) and the mobile station shall not perform the remaining
23 procedures in this section.
 - 24 - If $USE_EXT_CH_IND_s$ is equal to '0' and CH_IND_r is equal to '111' or the
25 physical channels indicated by the two least significant bits of CH_IND_r includes
26 all the physical channels (FCH, DCCH, or both) currently being processed by the
27 mobile station, the Layer 3 shall send a "release indication" to all Call Control
28 instances and shall perform the following:
 - 29 + The mobile station shall set $TBR_RAND_SUPPR_ENABLE_s =$
30 $TBR_RAND_SUPPR_ENABLE_r$.
 - 31 + The mobile station shall set $TBR_RAND_WINDOW_s$ to
32 $TBR_RAND_WINDOW_r$.
 - 33 + Enter the *Release Substate* with a base station extended release indication if
34 the message is the *Extended Release Message*.
 - 35 + Enter the *Release Substate* with a base station extended release mini
36 message indication if the message is the *Extended Release Mini Message*.
 - 37 - Otherwise, the mobile station shall perform the following:
 - 38 + If the received message is the *Extended Release Message*, the mobile station
39 shall send an *Extended Release Response Message* to the base station. If the
40 received message is the *Extended Release Mini Message*, the mobile station

- 1 shall send an *Extended Release Response Mini Message* to the base station.
- 2 + If $USE_EXT_CH_IND_S$ is equal to '1', then the mobile station shall perform
- 3 the following:
- 4 ○ If $SWITCHING_PARMS_INCL_T$ is included and equal to '1', the mobile
- 5 station shall set $NUM_SOFT_SWITCHING_FRAMES_CHM_S$ to
- 6 $NUM_SOFT_SWITCHING_FRAMES_CHM_T + 1$, and
- 7 $NUM_SOFTER_SWITCHING_FRAMES_CHM_S$ to
- 8 $NUM_SOFTER_SWITCHING_FRAMES_CHM_T + 1$.
- 9 ○ If $EXT_CH_IND_T$ indicates that F-DCCH is assigned and F-FCH is not
- 10 assigned, the mobile station shall set $FPC_PRI_CHAN_S$ to '1' at the action
- 11 time of the message.
- 12 ○ If $EXT_CH_IND_T$ indicates that F-FCH is assigned and F-DCCH is not
- 13 assigned, the mobile station shall set $FPC_PRI_CHAN_S$ to '0' at the action
- 14 time of the message.
- 15 ○ If $EXT_CH_IND_T$ indicates that an R-FCH is to be released, then the
- 16 mobile station shall stop transmitting on R-FCH at the action time
- 17 specified by the message. If $EXT_CH_IND_T$ indicates that an F-FCH is to
- 18 be released, then the mobile station shall stop processing F-FCH at the
- 19 action time specified by the message.
- 20 ○ If $EXT_CH_IND_T$ indicates that an R-DCCH is to be released, then the
- 21 mobile station shall stop transmitting on R-DCCH at the action time
- 22 specified by the message. If $EXT_CH_IND_T$ indicates that an F-DCCH is
- 23 to be released, then the mobile station shall stop processing F-DCCH at
- 24 the action time specified by the message.
- 25 ○ If $EXT_CH_IND_T$ indicates that an R-PDCH is to be released, then the
- 26 mobile station shall stop transmitting on R-PDCH at the action time
- 27 specified by the message.
- 28 ○ If $GATING_RATE_INCL_T$ is equal to '1', the mobile station shall set
- 29 $PILOT_GATING_RATE_S = PILOT_GATING_RATE_T$ at the action time of the
- 30 message.
- 31 ○ If $PDCH_CONTROL_HOLD_T$ is equal to '1', the mobile station shall
- 32 perform the following:
- 33 ◇ Set $PILOT_GATING_USE_RATE$ to '1' and start the reverse pilot
- 34 gating and R-CQICH gating at $PILOT_GATING_RATE_S$ at the action
- 35 time of the message.
- 36 ◇ The mobile station shall cancel the forward and reverse supplemental
- 37 channel assignment, if any, at the action time of the message.

- 1 ○ The mobile station shall set $EXT_CH_IND_S$ to $EXT_CH_IND_R$.
- 2 + Otherwise ($USE_EXT_CH_IND_S$ is equal to '0'), the mobile station shall
- 3 perform the following:
- 4 ○ The mobile station shall update CH_IND_S as follows: If the least
- 5 significant bit of CH_IND_R equals '1', the mobile station shall set
- 6 $CH_IND_S = '10'$. If the second most significant bit of CH_IND_R equals '1',
- 7 the mobile station shall set $CH_IND_S = '01'$.
- 8 ○ If CH_IND_R is equal to '001' or '101', the mobile station shall set
- 9 $FPC_PRI_CHAN_S$ to '1' at the action time of the message.
- 10 ○ If CH_IND_R is equal to '010', the mobile station shall set $FPC_PRI_CHAN_S$
- 11 to '0' at the action time of the message.
- 12 ○ If the least significant bit of CH_IND_R equals '1', then the mobile station
- 13 shall stop transmitting on R-FCH and stop processing F-FCH, if
- 14 assigned, at the action time specified by the message.
- 15 ○ If the second most significant bit of CH_IND_R equals '1', then the mobile
- 16 station shall stop transmitting on R-DCCH and stop processing F-DCCH,
- 17 if assigned, at the action time specified by the message.
- 18 ○ If $GATING_RATE_INCL_R$ equals '1', the mobile station shall set
- 19 $PILOT_GATING_RATE_S = PILOT_GATING_RATE_R$ at the action time of the
- 20 message.
- 21 ○ If the most significant bit of CH_IND_R equals '1', the mobile station shall
- 22 set $PILOT_GATING_USE_RATE$ to '1'. The mobile station shall start the
- 23 reverse pilot gating at $PILOT_GATING_RATE_S$ at the action time of the
- 24 message. Furthermore, if the least significant bit of CH_IND_R equals '1'
- 25 (that is, the Fundamental Channel is being released), the mobile station
- 26 shall store the configuration used for the Fundamental Channel. The
- 27 mobile station shall cancel the forward and reverse supplemental
- 28 channel assignment, if any, at the action time of the message.
- 29 ○ If a Forward Packet Data Channel is assigned, the mobile station shall
- 30 perform the following:
- 31 ◇ Stop processing the Forward Packet Data Channel at the action time
- 32 specified by the message.
- 33 ◇ If a Reverse Packet Data Channel is assigned, the mobile station
- 34 shall stop transmitting on the Reverse Packet Data Channel at the
- 35 action time specified by the message.
- 36 ◇ If the two least significant bits of CH_IND_R is equal to '00', the mobile
- 37 station shall perform the following:

- 1 – If EXT_CH_IND_S signals the allocation of F-FCH and R-FCH, and
 2 does not signal allocation of F-DCCH nor R-DCCH, the mobile
 3 station shall set CH_IND_S = '01' at the action time specified by the
 4 message.
- 5 – If EXT_CH_IND_S signals the allocation of F-DCCH and R-DCCH,
 6 and does not signal allocation of F-FCH nor R-FCH, the mobile
 7 station shall set CH_IND_S = '10' at the action time specified by the
 8 message.
- 9 – If EXT_CH_IND_S signals the allocation of F-FCH, R-FCH, F-DCCH
 10 and R-DCCH, the mobile station shall set CH_IND_S = '11' at the
 11 action time specified by the message.

12 2.6.4.1.10 Processing the Resource Allocation Message and Resource Allocation Mini 13 Message

14 The mobile station shall process the *Resource Allocation Message* and the *Resource*
 15 *Allocation Mini Message* as follows:

- 16 • The mobile station shall set FPC_PRI_CHAN_S = FPC_PRI_CHAN_T at the action time
 17 of the message.
- 18 • If a F-PDCH is not assigned and the Fundamental Channel was previously
 19 established prior to transitioning to the *Control Hold Mode*, the mobile station shall
 20 start processing F-FCH and start transmitting on R-FCH at the action time of the
 21 message. The mobile station shall establish the Fundamental Channel with the
 22 same configuration as previously used, and shall set CH_IND_S to '11'.
- 23 • The mobile station shall set PILOT_GATING_USE_RATE to '0' and shall start the
 24 continuous reverse pilot at the action time of the message and, if a F-PDCH is
 25 assigned, the mobile station shall start the continuous R-CQICH as defined in [3].

26 2.6.4.1.11 Reserved

27 2.6.4.1.12 Processing the Service Configuration Record

28 The mobile station shall update the Service Configuration information record currently in
 29 use as follows:

- 30 • If P_REV_IN_USE_S is less than eight, the mobile station shall update the multiplex
 31 option information as follows:
 - 32 – The mobile station shall store the forward Fundamental Channel multiplex
 33 option [FOR_FCH_MUX_OPTION_S = FOR_MUX_OPTION_T].
 - 34 – The mobile station shall store the reverse Fundamental Channel multiplex
 35 option [REV_FCH_MUX_OPTION_S = REV_MUX_OPTION_T].
 - 36 – The mobile station shall store the forward Dedicated Control Channel multiplex
 37 option [FOR_DCCH_MUX_OPTION_S = FOR_MUX_OPTION_T].

- 1 - The mobile station shall store the reverse Dedicated Control Channel multiplex
2 option [REV_DCCH_MUX_OPTION_S = REV_MUX_OPTION_r].
- 3 • If P_REV_IN_USE_S is greater than or equal to eight, the mobile station shall update
4 the multiplex option information as follows:
- 5 - If FCH_DCCH_MUX_OPTION_IND is equal to '00':
- 6 + The mobile station shall store the forward Fundamental Channel multiplex
7 option (FOR_FCH_MUX_OPTION_S = FOR_MUX_OPTION_r).
- 8 + The mobile station shall store the forward Dedicated Control Channel
9 multiplex option (FOR_DCCH_MUX_OPTION_S = FOR_MUX_OPTION_r).
- 10 + The mobile station shall store the reverse Fundamental Channel multiplex
11 option (REV_FCH_MUX_OPTION_S = REV_MUX_OPTION_r).
- 12 + The mobile station shall store the reverse Dedicated Control Channel
13 multiplex option (REV_DCCH_MUX_OPTION_S = REV_MUX_OPTION_r).
- 14 - If FCH_DCCH_MUX_OPTION_IND is equal to '01':
- 15 + The mobile station shall store the forward Fundamental Channel multiplex
16 option (FOR_FCH_MUX_OPTION_S = FOR_MUX_OPTION_r).
- 17 + The mobile station shall store the reverse Fundamental Channel multiplex
18 option (REV_FCH_MUX_OPTION_S = REV_MUX_OPTION_r).
- 19 - If FCH_DCCH_MUX_OPTION_IND is equal to '10':
- 20 + The mobile station shall store the forward Dedicated Control Channel
21 multiplex option (FOR_DCCH_MUX_OPTION_S = FOR_MUX_OPTION_r).
- 22 + The mobile station shall store the reverse Dedicated Control Channel
23 multiplex option (REV_DCCH_MUX_OPTION_S = REV_MUX_OPTION_r).
- 24 - If FCH_DCCH_MUX_OPTION_IND is equal to '11':
- 25 + The mobile station shall store the forward Fundamental Channel multiplex
26 option (FOR_FCH_MUX_OPTION_S = FOR_MUX_OPTION_r).
- 27 + The mobile station shall store the reverse Fundamental Channel multiplex
28 option (REV_FCH_MUX_OPTION_S = REV_MUX_OPTION_r).
- 29 + The mobile station shall store the forward Dedicated Control Channel
30 multiplex option (FOR_DCCH_MUX_OPTION_S = FOR_DCCH_MUX_OPTION_r).
- 31 + The mobile station shall store the reverse Dedicated Control Channel
32 multiplex option (REV_DCCH_MUX_OPTION_S = REV_DCCH_MUX_OPTION_r).
- 33 • The mobile station shall store the set of number of bits per frame of the forward
34 Fundamental Channel and Dedicated Control Channel [FOR_NUM_BITS_S =
35 FOR_NUM_BITS_r].
- 36 • The mobile station shall store the set of number of bits per frame of the reverse
37 Fundamental Channel and Dedicated Control Channel [REV_NUM_BITS_S =
38 REV_NUM_BITS_r].

- 1 • If a service option connection has been omitted from the service option connection
2 records, the Layer 3 shall terminate the call control instance (currently existing or
3 pending instantiation) identified by the connection reference corresponding to the
4 omitted service option connection.
- 5 • If this is the first Service Configuration Record received from the base station in a
6 *Service Connect Message*, *General Handoff Direction Message*, or *Universal Handoff*
7 *Direction Message* and accepted by the mobile station since entering the *Traffic*
8 *Channel substate*, the mobile station shall also identify the Call Control instance
9 currently identified by NULL by the connection reference assigned to the first
10 service option connection, CON_REF_r; otherwise, the mobile station shall identify
11 the Call Control instance corresponding to the first service option connection listed
12 in this Service Configuration information record by the NULL identifier.
- 13 • The mobile station shall delete all instances of current service option connection
14 records. For each of the NUM_CON_REC_r occurrences of the service option
15 connection record (SO_CON_REC[i]), the mobile station shall perform the following:
- 16 - The mobile station shall store the service option connection reference
17 (SO_CON_REC_s[i].CON_REF = CON_REF_r).
- 18 - The mobile station shall store the service option
19 (SO_CON_REC_s[i].SERVICE_OPTION = SERVICE_OPTION_r).
- 20 - The mobile station shall store the forward traffic channel traffic type
21 (SO_CON_REC_s[i].FOR_TRAFFIC = FOR_TRAFFIC_r).
- 22 - The mobile station shall store the reverse traffic channel traffic type
23 (SO_CON_REC_s[i].REV_TRAFFIC = REV_TRAFFIC_r).
- 24 - The mobile station shall store the encryption mode indicator for user
25 information privacy (SO_CON_REC_s[i].UI_ENCRYPT_MODE =
26 UI_ENCRYPT_MODE_r).
- 27 - The mobile station shall store the service reference identifier
28 (SO_CON_REC_s[i].SR_ID = SR_ID_r).
- 29 - If RLP_INFO_INCL_r equals '1', the mobile station shall store the Radio Link
30 Protocol block of bits (SO_CON_REC_s[i].RLP_BLOB = RLP_BLOB_r).
- 31 - If QOS_PARAMS_INCL_r equals '1', the mobile station shall store the QoS
32 parameters block (SO_CON_REC_s[i].QOS_PARAMS = QOS_PARAMS_r).
- 33 • If FCH_CC_INCL_r equals '1', the mobile station shall perform the following:
- 34 - The mobile station shall store the indicator for 5ms frames on Fundamental
35 Channel as follows: if FCH_FRAME_SIZE_r equals '1', the mobile station shall set
36 FCH_5MS_FRAMES_s = '1'; otherwise, it is set to '0'.

- 1 - The mobile station shall store the Forward Fundamental Channel Radio
2 Configuration (FOR_FCH_RC_s = FOR_FCH_RC_r).
- 3 - The mobile station shall store the Reverse Fundamental Channel Radio
4 Configuration (REV_FCH_RC_s = REV_FCH_RC_r).
- 5 • If DCCH_CC_INCL_r equals '1', the mobile station shall perform the following:
- 6 - The mobile station shall store the indicator for 5ms frames on Dedicated Control
7 Channel as follows: If DCCH_FRAME_SIZE_r equals '10' or '11', the mobile
8 station shall set DCCH_5MS_FRAMES_s = '1'; otherwise, it is set to '0'.
- 9 - The mobile station shall store the Forward Dedicated Control Channel Radio
10 Configuration (FOR_DCCH_RC_s = FOR_DCCH_RC_r).
- 11 - The mobile station shall store the Reverse Dedicated Control Channel Radio
12 Configuration (REV_DCCH_RC_s = REV_DCCH_RC_r).
- 13 • If FOR_SCH_CC_INCL_r equals '1', the mobile station shall store the
14 NUM_FOR_SCH_r occurrences of the Forward Supplemental Channel channel
15 configuration records as follows:
- 16 - The mobile station shall store the Forward Supplemental Channel Identification
17 (FOR_SCH_ID[FOR_SCH_ID_r]_s = FOR_SCH_ID_r).
- 18 - The mobile station shall store the Forward Supplemental Channel Multiplex
19 Option (FOR_SCH_MUX[FOR_SCH_ID_r]_s = FOR_SCH_MUX_r).
- 20 - The mobile station shall store the Forward Supplemental Channel Radio
21 Configuration (FOR_SCH_RC[FOR_SCH_ID_r]_s = SCH_RC_r).
- 22 - The mobile station shall store the Forward Supplemental Channel Coding Type
23 (FOR_SCH_CODING[FOR_SCH_ID_r]_s = CODING_r).
- 24 + If FRAME_40_USED_r and FRAME_80_USED_r are both equal to '0', the
25 mobile station shall set FOR_SCH_FRAME_LENGTH_s[FOR_SCH_ID_r] to '00'
26 (i.e., 20 ms frame length).
- 27 - If FRAME_40_USED_r is equal to '1', the mobile station shall set
28 FOR_SCH_FRAME_LENGTH_s[FOR_SCH_ID_r] to '01' (i.e., 40 ms frame length).
- 29 - If FRAME_80_USED_r is equal to '1', the mobile station shall set
30 FOR_SCH_FRAME_LENGTH_s[FOR_SCH_ID_r] to '10' (i.e., 80 ms frame length).
- 31 - F_MAX_RATE_IDX_s[FOR_SCH_ID_r] = MAX_RATE_r.
- 32 • If REV_SCH_CC_INCL_r equals '1', the mobile station shall store the NUM_REV_SCH_r
33 occurrences of the Reverse Supplemental Channel channel configuration records as
34 follows:
- 35 - The mobile station shall store the Reverse Supplemental Channel Identification
36 (REV_SCH_ID[REV_SCH_ID_r]_s = REV_SCH_ID_r).
- 37 - The mobile station shall store the Reverse Supplemental Channel Multiplex
38 Option (REV_SCH_MUX[REV_SCH_ID_r]_s = REV_SCH_MUX_r).

- 1 - The mobile station shall store the Reverse Supplemental Channel Radio
2 Configuration (REV_SCH_RC[REV_SCH_ID_r]_s = SCH_RC_r).
- 3 - The mobile station shall store the Reverse Supplemental Channel Coding Type
4 (REV_SCH_CODING[REV_SCH_ID_r]_s = CODING_r).
- 5 - If FRAME_40_USED_r and FRAME_80_USED_r are both equal to '0', the mobile
6 station shall set REV_SCH_FRAME_LENGTH_s[REV_SCH_ID_r] to '00' (i.e., 20 ms
7 frame length).
- 8 - If FRAME_40_USED_r is equal to '1', the mobile station shall set
9 REV_SCH_FRAME_LENGTH_s[REV_SCH_ID_r] to '01' (i.e., 40 ms frame length).
- 10 - If FRAME_80_USED_r is equal to '1', the mobile station shall set
11 REV_SCH_FRAME_LENGTH_s[REV_SCH_ID_r] to '10' (i.e., 80 ms frame length).
- 12 - R_MAX_RATE_IDX_s[REV_SCH_ID_r] = MAX_RATE_r.
- 13 • If FOR_PDCH_CC_INCL_r equals '1', the mobile station shall perform the following:
- 14 - The mobile station shall store the Forward Packet Data Channel multiplex
15 option (FOR_PDCH_MUX_OPTION_s = FOR_PDCH_MUX_OPTION_r).
- 16 - The mobile station shall store the Forward Packet Data Channel Radio
17 Configuration (FOR_PDCH_RC_s = FOR_PDCH_RC_r).
- 18 • If REV_PDCH_CC_INCL_r equals '1', the mobile station shall store the following:
- 19 - The Reverse Packet Data Channel multiplex option for the higher data rates
20 (REV_PDCH_MUX_OPTION_HIGH_RATE_s =
21 REV_PDCH_MUX_OPTION_HIGH_RATE_r).
- 22 - The Reverse Packet Data Channel multiplex option for the lower data rates
23 (REV_PDCH_MUX_OPTION_LOW_RATE_s =
24 REV_PDCH_MUX_OPTION_LOW_RATE_r).
- 25 - The Reverse Packet Data Channel Radio Configuration (REV_PDCH_RC_s =
26 REV_PDCH_RC_r).

27 2.6.4.1.13 Processing the Non-Negotiable Service Configuration Record

28 The mobile station shall update the Non-Negotiable Service Configuration information
29 record currently in use as follows:

- 30 • If FPC_INCL_r equals '1', the mobile station shall perform the following:
- 31 - The mobile station shall store the Power Control Subchannel indicator
32 (FPC_PRI_CHAN_s = FPC_PRI_CHAN_r).
- 33 - The mobile station shall store the forward power control operation mode
34 (FPC_MODE_NO_SCH_s = FPC_MODE_r).
- 35 - The mobile station shall set FPC_MODE_s = FPC_MODE_NO_SCH_s if there is no
36 forward Supplemental Channel assignment in progress (see 2.6.6.2.5.1.1).
- 37 - If FPC_OLPC_FCH_INCL_r equals '1', the mobile station shall perform the
38 following:

- 1 + The mobile station shall store the Fundamental Channel target Frame Error
2 Rate ($FPC_FCH_FER_s = FPC_FCH_FER_r$).
- 3 + The mobile station shall store the minimum Fundamental Channel Outer
4 Loop E_b/N_t setpoint ($FPC_FCH_MIN_SETPT_s = FPC_FCH_MIN_SETPT_r$).
- 5 + The mobile station shall store the maximum Fundamental Channel Outer
6 Loop E_b/N_t setpoint ($FPC_FCH_MAX_SETPT_s = FPC_FCH_MAX_SETPT_r$).
- 7 - If $FPC_OLPC_DCCH_INCL_r$ equals '1', the mobile station shall perform the
8 following:
- 9 + The mobile station shall store the Dedicated Control Channel target Frame
10 Error Rate ($FPC_DCCH_FER_s = FPC_DCCH_FER_r$).
- 11 + The mobile station shall store the minimum Dedicated Control Channel
12 Outer Loop E_b/N_t setpoint ($FPC_DCCH_MIN_SETPT_s =$
13 $FPC_DCCH_MIN_SETPT_r$).
- 14 + The mobile station shall store the maximum Dedicated Control Channel
15 Outer Loop E_b/N_t setpoint ($FPC_DCCH_MAX_SETPT_s =$
16 $FPC_DCCH_MAX_SETPT_r$).
- 17 • If $GATING_RATE_INCL_r$ equals '1', the mobile station shall store the Reverse Pilot
18 Channel gating rate ($PILOT_GATING_RATE_s = PILOT_GATING_RATE_r$).
- 19 - If $FOR_SCH_INCL_r$ equals '1', the mobile station shall store the $NUM_FOR_SCH_r$
20 occurrences of the Forward Supplemental Channel information as follows:
- 21 - The mobile station shall store the Forward Supplemental Channel Multiframe
22 Offset ($FOR_SCH_FRAME_OFFSET[FOR_SCH_ID_r]_s =$
23 $FOR_SCH_FRAME_OFFSET_r$).
- 24 • If $REV_SCH_CC_INCL_r$ equals '1', the mobile station shall store the $NUM_REV_SCH_r$
25 occurrences of the Reverse Supplemental Channel information as follows:
- 26 - The mobile station shall store the Reverse Supplemental Channel Multiframe
27 Offset ($REV_SCH_FRAME_OFFSET[REV_SCH_ID_r]_s =$
28 $REV_SCH_FRAME_OFFSET_r$).
- 29 • The mobile station shall determine the Logical-to-Physical Mapping to be used as
30 follows:
- 31 - If LPM_IND_r equals '00' and an F-PDCH is assigned, the mobile station shall
32 reset the Logical-to-Physical Mapping to their default values as specified in
33 Table 2.6.4.2-2 but with the following modification for requirement 1 stated in
34 Table 2.6.4.2-2:
- 35 + The mobile station shall set the SR_ID field to the value specified in the
36 Service Configuration information record.

- 1 - If LPM_IND_r equals '00' and P_REV_IN_USE_s is greater than six and an F-PDCH
2 is not assigned, the mobile station shall reset the Logical-to-Physical Mapping to
3 their default values as specified in Table 2.6.4.2-1 but with the following
4 modification for requirement 1 stated in Table 2.6.4.2-1:
- 5 + The mobile station shall set the SR_ID field to the value specified in the
6 Service Configuration information record.
- 7 - If LPM_IND_r equals '00' and P_REV_IN_USE_s is equal to or less than six, the
8 mobile station shall reset the Logical-to-Physical Mapping to their default values
9 as follows:
- 10 + Default number of Logical-to-Physical Mapping entries
11 (NUM_LPM_ENTRIES_s = '0100').
- 12 + Default Table(0) Logical-to-Physical Mapping service reference identifier
13 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].SR_ID_s = '000').
- 14 + Default Table(0) Logical-to-Physical Mapping logical resource identifier
15 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].LOGICAL_RESOURCE_s =
16 '0001'].
- 17 + Default Table(0) Logical-to-Physical Mapping physical resource identifier:
- 18 ○ If CH_IND_s is equal to '01' or '11', the mobile station shall set
19 LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].PHYSICAL_RESOURCE_s to
20 '0000'.
- 21 ○ If CH_IND_s is equal to '10', the mobile station shall set
22 LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].PHYSICAL_RESOURCE_s to
23 '0001'.
- 24 + Default Table(0) Logical-to-Physical Mapping forward mapping indicator
25 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].FORWARD_FLAG_s = '1').
- 26 + Default Table(0) Logical-to-Physical Mapping reverse mapping indicator
27 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].REVERSE_FLAG_s = '1').
- 28 + Default Table(0) Logical-to-Physical Mapping priority
29 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].PRIORITY_s = '0000').
- 30 + Default Table(1) Logical-to-Physical Mapping service reference identifier
31 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].SR_ID_s = '001').
- 32 + Default Table(1) Logical-to-Physical Mapping logical resource identifier
33 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].LOGICAL_RESOURCE_s =
34 '0000').
- 35 + Default Table(1) Logical-to-Physical Mapping physical resource identifier:
- 36 ○ If CH_IND_s is equal to '01' or '11', the mobile station shall set
37 LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].PHYSICAL_RESOURCE_s to
38 '0000'.

- 1 ○ If CH_IND_s is equal to '10', the mobile station shall set
2 LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].PHYSICAL_RESOURCE_s to
3 '0001'.
- 4 + Default Table(1) Logical-to-Physical Mapping forward mapping indicator
5 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].FORWARD_FLAG_s = '1').
- 6 + Default Table(1) Logical-to-Physical Mapping reverse mapping indicator
7 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].REVERSE_FLAG_s = '1').
- 8 + Default Table(1) Logical-to-Physical Mapping priority
9 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].PRIORITY_s = '0000').
- 10 + Default Table(2) Logical-to-Physical Mapping service reference identifier
11 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[2].SR_ID_s = '001').
- 12 + Default Table(2) Logical-to-Physical Mapping logical resource identifier
13 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[2].LOGICAL_RESOURCE_s =
14 '0000').
- 15 + Default Table(2) Logical-to-Physical Mapping physical resource identifier
16 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[2].PHYSICAL_RESOURCE_s to
17 '0010').
- 18 + Default Table(2) Logical-to-Physical Mapping forward mapping indicator
19 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[2].FORWARD_FLAG_s = '1').
- 20 + Default Table(2) Logical-to-Physical Mapping reverse mapping indicator
21 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[2].REVERSE_FLAG_s = '1').
- 22 + Default Table(2) Logical-to-Physical Mapping priority
23 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[2].PRIORITY_s = '0000').
- 24 + Default Table(3) Logical-to-Physical Mapping service reference identifier
25 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[3].SR_ID_s = '001').
- 26 + Default Table(3) Logical-to-Physical Mapping logical resource identifier
27 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[3].LOGICAL_RESOURCE_s =
28 '0000').
- 29 + Default Table(3) Logical-to-Physical Mapping physical resource identifier
30 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[3].PHYSICAL_RESOURCE_s to
31 '0011').
- 32 + Default Table(3) Logical-to-Physical Mapping forward mapping indicator
33 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[3].FORWARD_FLAG_s = '1').
- 34 + Default Table(3) Logical-to-Physical Mapping reverse mapping indicator
35 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[3].REVERSE_FLAG_s = '1').
- 36 + Default Table(3) Logical-to-Physical Mapping priority
37 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[3].PRIORITY_s = '0000').

- 1 - If LPM_IND_r equals '01', the mobile station shall use the Logical-to-Physical
2 Mapping included in this Non-Negotiable Service Configuration Record. The
3 mobile station shall perform the following: The mobile station shall delete the
4 Logical-to-Physical Mapping currently in use. The mobile station shall store the
5 number of Logical-to-Physical Mapping entries (NUM_LPM_ENTRIES_s =
6 NUM_LPM_ENTRIES_r). For each ith record of the NUM_LPM_ENTRIES_r Logical-
7 to-Physical Mapping records included in the received Non-Negotiable Service
8 Configuration Record:
- 9 + The mobile station shall store the Logical-to-Physical Mapping service
10 reference identifier (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].SR_ID_s =
11 SR_ID_r).
- 12 + The mobile station shall store the Logical-to-Physical Mapping logical
13 resource identifier
14 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].LOGICAL_RESOURCE_s =
15 LOGICAL_RESOURCE_r).
- 16 + The mobile station shall store the Logical-to-Physical Mapping Physical
17 Channel
18 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].PHYSICAL_RESOURCE_s =
19 PHYSICAL_RESOURCE_r).
- 20 + The mobile station shall store the Logical-to-Physical Mapping forward
21 mapping indicator
22 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].FORWARD_FLAG_s =
23 FORWARD_FLAG_r).
- 24 + The mobile station shall store the Logical-to-Physical Mapping reverse
25 mapping indicator
26 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].REVERSE_FLAG_s =
27 REVERSE_FLAG_r).
- 28 + The mobile station shall store the Logical-to-Physical Mapping priority
29 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].PRIORITY_s = PRIORITY_r).
- 30 - If LPM_IND_r equals '10', the mobile station shall use the Logical-to-Physical
31 Mapping currently in use.
- 32 • For each of the NUM_REC_r occurrences of the service-specific records included in
33 the Non-negotiable Service Configuration Record, the mobile station shall perform
34 the following:
- 35 - The mobile station shall store the Short Data Burst service option number
36 omitted indicator (SDB_SO_OMIT_s [SR_ID_r] = SDB_SO_OMIT_r).
- 37 • The mobile station shall store the following:
- 38 - USE_FLEX_NUM_BITS_s = USE_FLEX_NUM_BITS_r
- 39 - USE_VAR_RATE_s = USE_VAR_RATE_r

- 1 - If USE_VAR_RATE_r is equal to '1', then the mobile station shall store the
2 following:
3 + R_INC_RATE_ALLOWED_s = R_INC_RATE_ALLOWED_r
4 + F_INC_RATE_ALLOWED_s = F_INC_RATE_ALLOWED_r
- 5 - If USE_FLEX_NUM_BITS_r or USE_VAR_RATE_r is equal to '1', then the mobile
6 station shall store the following:
7 + USE_ERAM_s = USE_ERAM_r
- 8 • If NUM_BITS_TABLES_INCL_r is included and is equal to '1', the mobile station shall
9 store NUM_BITS_TABLES_COUNT+1 instances of the Flexible Rate Table
10 (NUM_RECS triplets of (NUM_BITS_IDX, NUM_BITS, CRC_LEN_IDX) corresponding
11 to each NUM_BITS_TABLE_ID) as follows:
- 12 - For each of the NUM_RECS occurrences of the three field record consisting of
13 NUM_BITS_IDX, NUM_BITS, and CRC_LEN_IDX the mobile station shall store
14 the following
15 + NUM_BITS_s[NUM_BITS_TABLE_ID_r][NUM_BITS_IDX_r] = NUM_BITS_r;
16 + CRC_LEN_IDX_s[NUM_BITS_TABLE_ID_r][NUM_BITS_IDX_r] = CRC_LEN_IDX_r;
- 17 • If USE_OLD_FLEX_MAPPING_r is included and equal to '0', the mobile station shall
18 store the following:
- 19 - FFCH_NBIT_TABLE_ID_s = FFCH_NBIT_TABLE_ID_r.
20 - RFCH_NBIT_TABLE_ID_s = RFCH_NBIT_TABLE_ID_r.
21 - FSCH_NBIT_TABLE_ID_s[1] = FSCH0_NBIT_TABLE_ID_r.
22 - FSCH_NBIT_TABLE_ID_s[2] = FSCH1_NBIT_TABLE_ID_r.
23 - RSCH_NBIT_TABLE_ID_s[1] = RSCH0_NBIT_TABLE_ID_r.
24 - RSCH_NBIT_TABLE_ID_s[2] = RSCH1_NBIT_TABLE_ID_r.
25 - FDCCH_NBIT_TABLE_ID_s = FDCCH_NBIT_TABLE_ID_r.
26 - If FDCCH_NBIT_TABLE_ID_s is not equal to '0000', then the mobile station shall
27 store FDCCH_NBITS_IDX_s = FDCCH_NBITS_IDX_r.
28 - RDCCH_NBIT_TABLE_ID_s = RDCCH_NBIT_TABLE_ID_r.
29 - If RDCCH_NBIT_TABLE_ID_s is not equal to '0000', then the mobile station shall
30 store RDCCH_NBITS_IDX_s = RDCCH_NBITS_IDX_r.
- 31 • Otherwise, the mobile station shall use the previously stored values for the above
32 variables.
- 33 • If USE_FLEX_NUM_BITS_r is equal to '0', the mobile station shall store the following:
- 34 - FFCH_NBIT_TABLE_ID_s = '0000'.
35 - RFCH_NBIT_TABLE_ID_s = '0000'.
36 - FSCH_NBIT_TABLE_ID_s[1] = '0000'.

- 1 - FSCH_NBIT_TABLE_IDS[2] = '0000'.
- 2 - RSCH_NBIT_TABLE_IDS[1] = '0000'.
- 3 - RSCH_NBIT_TABLE_IDS[2] = '0000'.
- 4 - FDCCH_NBIT_TABLE_IDS = '0000'.
- 5 - FDCCH_NBITS_IDX_S = '0000'.
- 6 - RDCCH_NBIT_TABLE_IDS = '0000'.
- 7 - FDCCH_NBITS_IDX_S = '0000'.
- 8 • If VAR_TABLES_INCL_r is included and is equal to '1', the mobile station shall store
- 9 VAR_RATE_TABLES_COUNT+1 instances of the Variable Rate Mask Table
- 10 (NUM_RECS pairs of (NUM_BITS_IDX, MASK) corresponding to each
- 11 VAR_RATE_TABLE_ID) as follows:
- 12 - For each of the NUM_RECS + 1 occurrences of the two-field record consisting of
- 13 NUM_BITS_IDX and MASK the mobile station shall store the following:
- 14 + MASK_s[VAR_RATE_TABLE_ID_r][NUM_BITS_IDX_r] = MASK_r;
- 15 - If FSCH_VAR_TABLE_IDS[1] is not equal to '000', then the mobile station shall
- 16 store the following:
- 17 + For row=1, ..., 15
- 18 ○ For i=1, ..., row,
- 19 If the *i*th bit position in MASK_s[FSCH_VAR_TABLE_IDS[1]][row] is equal to
- 20 '1', then the mobile station shall set
- 21 VAR_FSCH_RATE_OFFSET_s[1][row][i] to i,
- 22 otherwise, the mobile shall set VAR_FSCH_RATE_OFFSET_s[1][row][i] to
- 23 '0'.
- 24 - If FSCH_VAR_TABLE_IDS[2] is not equal to '000', then the mobile station shall
- 25 store the following:
- 26 + For row=1, ..., 15
- 27 ○ For i=1, ..., row,
- 28 If the *i*th bit position in MASK_s[FSCH_VAR_TABLE_IDS[2]][row] is equal to
- 29 '1', then the mobile station shall set
- 30 VAR_FSCH_RATE_OFFSET_s[2][row][i] to i,
- 31 otherwise, the mobile shall set VAR_FSCH_RATE_OFFSET_s[2][row][i] to
- 32 '0'.
- 33 - If RSCH_VAR_TABLE_IDS[1] is not equal to '000', then the mobile station shall
- 34 store the following:
- 35 + For row=1, ..., 15
- 36 ○ For i=1, ..., row,

- 1 If the i^{th} bit position in $\text{MASK}_s[\text{RSCH_VAR_TABLE_ID}_s[1]][\text{row}]$ is equal to
2 '1', then the mobile station shall set
3 $\text{VAR_RSCH_RATE_OFFSET}_s[1][\text{row}][i]$ to i ,
4 otherwise, the mobile shall set $\text{VAR_RSCH_RATE_OFFSET}_s[1][\text{row}][i]$ to
5 '0'.
- 6 - If $\text{RSCH_VAR_TABLE_ID}_s[2]$ is not equal to '000', then the mobile station shall
7 store the following:
8 + For $\text{row}=1, \dots, 15$
9 o For $i=1, \dots, \text{row}$,
- 10 If the i^{th} bit position in $\text{MASK}_s[\text{RSCH_VAR_TABLE_ID}_s[2]][\text{row}]$ is equal to
11 '1', then the mobile station shall set
12 $\text{VAR_RSCH_RATE_OFFSET}_s[2][\text{row}][i]$ to i ,
13 otherwise, the mobile shall set $\text{VAR_RSCH_RATE_OFFSET}_s[2][\text{row}][i]$ to
14 '0'.
- 15 • If $\text{USE_OLD_VAR_MAPPING}_r$ is included and equal to '0', the mobile station shall
16 store the following:
17 - $\text{FSCH_VAR_TABLE_ID}_s[1] = \text{FSCH0_VAR_TABLE_ID}_r$.
18 - $\text{FSCH_VAR_TABLE_ID}_s[2] = \text{FSCH1_VAR_TABLE_ID}_r$.
19 - $\text{RSCH_VAR_TABLE_ID}_s[1] = \text{RSCH0_VAR_TABLE_ID}_r$.
20 - $\text{RSCH_VAR_TABLE_ID}_s[2] = \text{RSCH1_VAR_TABLE_ID}_r$.
21 • Otherwise, use the previously stored values for the above four variables.
 - 22 • If USE_VAR_RATE_r is equal to '0', the mobile station shall store the following:
23 - $\text{FSCH_VAR_TABLE_ID}_s[1] = \text{'000'}$.
24 - $\text{FSCH_VAR_TABLE_ID}_s[2] = \text{'000'}$.
25 - $\text{RSCH_VAR_TABLE_ID}_s[1] = \text{'000'}$.
26 - $\text{RSCH_VAR_TABLE_ID}_s[2] = \text{'000'}$.
 - 27 • If LTU_TABLES_INCL_r is included and is equal to '1', then the mobile station shall
28 store $\text{NUM_LTU_TABLES} + 1$ instances of the LTU Table which determines the
29 number of LTUs per frame for convolutionally encoded supplemental channels for
30 each number of bits per frame. Each LTU Table is identified by its LTU_TABLE_ID .
31 - For each of the $\text{NUM_ROWS} + 1$ rows of the LTU Table, the mobile station shall
32 store the following:
33 + $\text{LTU_TAB}_s[\text{LTU_TABLE_ID}_r][\text{NBITS_IDX}_r] = \text{NUM_LTUS}_r$
 - 34 • If $\text{USE_OLD_LTU_MAPPING}_r$ is included and is equal to '0', then the mobile station
35 shall store the following:
36 - $\text{FSCH_LTU_TAB_ID}_s[1] = \text{FSCH0_LTU_TAB_ID}_r$

- 1 - FSCH_LTU_TAB_IDS[2] = FSCH1_LTU_TAB_ID_r
- 2 - RSCH_LTU_TAB_IDS[1] = RSCH0_LTU_TAB_ID_r
- 3 - RSCH_LTU_TAB_IDS[2] = RSCH1_LTU_TAB_ID_r
- 4 • Else (if USE_OLD_LTU_MAPPING_r is included and is equal to '1'), the mobile station
- 5 shall use the previously stored values for the above four variables.
- 6 • If LTU_INFO_INCL_r is equal to '0', then the mobile station shall store the following:
- 7 - FSCH_LTU_TAB_IDS[1] = '000'
- 8 - FSCH_LTU_TAB_IDS[2] = '000'
- 9 - RSCH_LTU_TAB_IDS[1] = '000'
- 10 - RSCH_LTU_TAB_IDS[2] = '000'
- 11 • If PARTITION_TABLES_INCL_r is included and is equal to '1', then the mobile station
- 12 shall store NUM_PARTITION_TABLES + 1 instances of the Partition Table which
- 13 determines the number of bits allocated to each service per FCH or DCCH frame as
- 14 follows. Each Partition Table is identified by its PARTITION_TABLE_ID.
- 15 - For each of the NUM_ROWS+1 rows of the Partition Table, the mobile station
- 16 shall store the following:
- 17 + PART_TAB_s[PARTITION_TABLE_ID_r][CATEGORY_r].MUX_HEADER_LEN =
- 18 MUX_HEADER_LEN_r
- 19 + PART_TAB_s[PARTITION_TABLE_ID_r][CATEGORY_r].MUX_HEADER =
- 20 MUX_HEADER_r
- 21 + PART_TAB_s[PARTITION_TABLE_ID_r][CATEGORY_r]. NUM_PARTITIONS =
- 22 NUM_PARTITIONS_r
- 23 + For i=1, ..., NUM_PARTITIONS+1; the mobile station shall store the
- 24 following:
- 25 ○ PART_TAB_s[PARTITION_TABLE_ID_r][CATEGORY_r]. PARTITION_SR_ID[i] =
- 26 SR_ID_r
- 27 ○ PART_TAB_s[PARTITION_TABLE_ID_r][CATEGORY_r]. PARTITION_NBITS[i] =
- 28 SRV_NUM_BITS_r
- 29 • Else (if PARTITION_TABLES_INCL_r is included and is equal to '0'), the mobile
- 30 station shall use the previously stored values for the PART_TAB_s.
- 31 • If USE_OLD_PART_MAPPING_r is included and is equal to '0', then the mobile station
- 32 shall store the following:
- 33 - FFCH_PART_TAB_IDS = FFCH_PART_TAB_ID_r
- 34 - RFCH_PART_TAB_IDS = RFCH_PART_TAB_ID_r
- 35 - FDCCH_PART_TAB_IDS = FDCCH_PART_TAB_ID_r
- 36 - RDCCH_PART_TAB_IDS = RDCCH_PART_TAB_ID_r

- 1 • If USE_FLEX_NUM_BITS_S is equal to '0', then the mobile station shall store the
2 following:
- 3 - FFCH_PART_TAB_ID_S = '000'
- 4 - RFCH_PART_TAB_ID_S = '000'
- 5 - FDCCH_PART_TAB_ID_S = '000'
- 6 - RDCCH_PART_TAB_ID_S = '000'
- 7 • If SWITCHING_PARAMS_INCL_T is included and equal to '1', set
8 NUM_SOFT_SWITCHING_FRAMES_CHM_S to
9 NUM_SOFT_SWITCHING_FRAMES_CHM_T + 1, and
10 NUM_SOFT_SWITCHING_FRAMES_CHM_S to
11 NUM_SOFT_SWITCHING_FRAMES_CHM_T + 1.
- 12 • If RPC_INCL_T is equal to '1' and the mobile station supports any Radio
13 Configuration greater than 2, the mobile station shall perform the following:
- 14 - If RPC_ADJ_REC_TYPE is equal to '0000', the mobile station shall update the
15 Reverse Channel Adjustment Gain Table (see [2]) containing an offset relative to
16 the Reverse Pilot Channel power for each reverse link code channel received in
17 this message.
- 18 - If RPC_ADJ_REC_TYPE is equal to '0001' or '0010', the mobile station shall
19 update the Reverse Link Attribute Adjustment Gain Table (see [2]) containing an
20 offset relative to the Reverse Pilot Channel power for each transmission rate,
21 frame length, coding type received in this message.
- 22 - If RPC_ADJ_REC_TYPE is equal to '0011', at the action time of the message, the
23 mobile station shall update the Reverse Link Attribute Adjustment Gain Table
24 (see [2]) containing an offset relative to the Reverse Pilot Channel power for the
25 R-CQICH.
- 26 - If RPC_ADJ_REC_TYPE is equal to '0100', the mobile station shall do the
27 following:
- 28 + At the first R-PDCH frame boundary at or after the action time of the
29 message, the mobile station shall update the Reverse Link Attribute
30 Adjustment Gain Table (see [2]) containing an offset relative to the Reverse
31 Pilot Channel power for any combination of the following channels:
- 32 ○ R-REQCH
- 33 ○ R-SPICH
- 34 ○ R-PDCCH possibly for each encoder packet size, or for the boosted and
35 non boosted modes
- 36 ○ R-PDCH possibly for each encoder packet size, or for the boosted and
37 non boosted modes, or for each encoder packet size and transmission
38 round

- 1 + At the action time of the message, the mobile station shall update the
2 Reverse Link Attribute Adjustment Gain Table (see [2]) containing an offset
3 relative to the Reverse Pilot Channel power for the R-ACKCH.
- 4 + If REV_SPICH_ADJ_INCL_T is equal to '1', the mobile station shall set
5 REV_SPICH_EP_SIZE_S to REV_SPICH_EP_SIZE_T+1.
- 6 • The mobile station shall determine the BCMC Logical-to-Physical Mapping to be
7 used as follows:
- 8 - If BCMC_LPM_INCL_T equals '0', the mobile station shall delete the BCMC
9 Logical-to-Physical Mapping currently in use.
- 10 - If BCMC_LPM_IND_T is included and equals '01', the mobile station shall use the
11 BCMC Logical-to-Physical Mapping included in this Non-Negotiable Service
12 Configuration Record. The mobile station shall perform the following:
- 13 + The mobile station shall delete the BCMC Logical-to-Physical Mapping
14 currently in use.
- 15 + The mobile station shall store the BCMC Logical-to-Physical Mapping entry
16 for each BCMC_FLOW_ID (see 2.6.13.11) included in NNSCR.

17 For each *i*th record of the BCMC Logical-to-Physical Mapping records included in
18 the received Non-Negotiable Service Configuration Record:

- 19 + The mobile station shall store the BCMC Logical-to-Physical Mapping BCMC
20 flow identifier
21 (BCMC_LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].BCMC_FLOW_ID_S = *i*th
22 occurrence of BCMC_FLOW_ID (BCMC flow identifier). See section
23 2.6.13.11).
- 24 + The mobile station shall store the BCMC Logical-to-Physical Mapping
25 Physical Channel
26 (BCMC_LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].PHYSICAL_RESOURCE
27 E_S = PHYSICAL_RESOURCE_T).
- 28 + The mobile station shall store the BCMC Logical-to-Physical Mapping
29 forward mapping indicator
30 (BCMC_LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].FORWARD_FLAG_S =
31 FORWARD_FLAG_T).
- 32 + The mobile station shall store the BCMC Logical-to-Physical Mapping reverse
33 mapping indicator
34 (BCMC_LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].REVERSE_FLAG_S =
35 REVERSE_FLAG_T).
- 36 + The mobile station shall store the BCMC Logical-to-Physical Mapping
37 BSR_ID included indicator
38 (BCMC_LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].BSR_ID_INCL_S =
39 BSR_ID_INCL_T).

- 1 + If the BSR_ID_INCL_r is set to '1', the mobile station shall store the following:
- 2 ○ BCMC Logical-to-Physical Mapping BSR_ID
- 3 (BCMC_LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].BSR_ID_s =
- 4 BSR_ID_r).
- 5 + If the BSR_ID_INCL_r is set to '0', the mobile station shall store the following:
- 6 ○ BCMC Logical-to-Physical Mapping Forward Traffic Channel traffic type
- 7 (BCMC_LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].FOR_TRAFFIC_s =
- 8 FOR_TRAFFIC_r).
- 9 ○ BCMC Logical-to-Physical Mapping Reverse Traffic Channel traffic type
- 10 (BCMC_LOGICAL_TO_PHYSICAL_MAPPING_TABLE[i].REV_TRAFFIC_s =
- 11 REV_TRAFFIC_r).
- 12 - If BCMC_LPM_IND_r is included and equals '10', the mobile station shall use the
- 13 BCMC Logical-to-Physical Mapping currently in use.
- 14 • If a BCMC_FLOW_ID (See 2.6.13.11) has been omitted from the BCMC Logical-to-
- 15 Physical Mapping, the mobile station shall perform the following:
- 16 - Layer 3 shall send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result=FAILURE,*
- 17 *cause= FLOW_NOT_AVAILABLE, reason_ind)* to the BCMC Service Layer, where
- 18 reason_ind is set to CALL_RELEASE.
- 19 - Layer 3 shall terminate the call control instance identified by the
- 20 BCMC_FLOW_ID corresponding to the omitted BCMC flow
- 21 • If a BCMC_FLOW_ID (See 2.6.13.11) has been added to the BCMC Logical-to-
- 22 Physical Mapping, the mobile station shall perform the following:
- 23 - Layer 3 shall send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result=SUCCESS)*
- 24 to the BCMC Service Layer.
- 25 - Layer 3 shall instantiate a call control instance and identify it by the
- 26 BCMC_FLOW_ID corresponding to the this BCMC flow
- 27 • If REV_PDCH_PARMS_INCL_r is equal to '1', then the mobile station shall store the
- 28 following:
- 29 - If REV_PDCH_PARMS_1_INCL_r is equal to '1', the base station shall set:
- 30 + REV_PDCH_MAX_AUTO_TPR_s to REV_PDCH_MAX_AUTO_TPR_r, and
- 31 + REV_PDCH_NUM_ARQ_ROUNDS_NORMAL_s to
- 32 REV_PDCH_NUM_ARQ_ROUNDS_NORMAL_r+1.
- 33 - If REV_PDCH_OPER_PARMS_INCL_r is equal to '1', the mobile station shall set:
- 34 + REV_PDCH_MAX_SIZE_ALLOWED_ENCODER_PACKET_s =
- 35 REV_PDCH_MAX_SIZE_ALLOWED_ENCODER_PACKET_r+1,
- 36 + REV_PDCH_DEFAULT_PERSISTENCE_s =
- 37 REV_PDCH_DEFAULT_PERSISTENCE_r,
- 38 + REV_PDCH_RESET_PERSISTENCE_s = REV_PDCH_RESET_PERSISTENCE_r,

- 1 + REV_PDCH_GRANT_PRECEDENCE_S = REV_PDCH_GRANT_PRECEDENCE_T.
- 2 + REV_PDCH_ALWAYS_ACK_FINAL_ROUND_S =
- 3 REV_PDCH_ALWAYS_ACK_FINAL_ROUND_T.
- 4 + REV_PDCH_MSIB_SUPPORTED_S = REV_PDCH_MSIB_SUPPORTED_T, and
- 5 + REV_PDCH_SOFT_SWITCHING_RESET_IND_S =
- 6 REV_PDCH_SOFT_SWITCHING_RESET_IND_T.
- 7 - REV_PDCH_BOOST_PARAMS_INCL_S to REV_PDCH_BOOST_PARAMS_INCL_T.
- 8 - If REV_PDCH_BOOST_PARAMS_INCL_S is equal to '1', the base station shall set
- 9 REV_PDCH_NUM_ARQ_ROUNDS_BOOST_S to
- 10 REV_PDCH_NUM_ARQ_ROUNDS_BOOST_T+1, and
- 11 REV_PDCH_BOOST_OVERSHOOT_S to REV_PDCH_BOOST_OVERSHOOT_T.
- 12 - REV_REQCH_ENABLED_S to REV_REQCH_ENABLED_T.
- 13 - If REV_REQCH_ENABLED_S is equal to '0', the mobile station shall set
- 14 REV_PDCH_REQCH_TRIGGER_S to NULL.
- 15 - If REV_REQCH_ENABLED_S is equal to '1', the mobile station shall set
- 16 REV_REQCH_PARAMS_INCL_S to REV_REQCH_PARAMS_INCL_T; otherwise, the
- 17 mobile station shall set REV_REQCH_PARAMS_INCL_S to '0'.
- 18 - If REV_REQCH_PARAMS_INCL_S is equal to '1', the mobile station shall store the
- 19 following:
- 20 + REV_REQCH_QUICK_REPEAT_ALLOWED_S to
- 21 REV_REQCH_QUICK_REPEAT_ALLOWED_T.
- 22 + REV_REQCH_POWER_REPORTS_PARAMS_INCL_S to
- 23 REV_REQCH_POWER_REPORTS_PARAMS_INCL_T.
- 24 + If REV_REQCH_POWER_REPORTS_PARAMS_INCL_S is equal to '1', the mobile
- 25 station shall store the following:
- 26 ○ REV_REQCH_POWER_HEADROOM_INCREASE_S to
- 27 REV_REQCH_POWER_HEADROOM_INCREASE_T.
- 28 ○ REV_REQCH_POWER_HEADROOM_DECREASE_S to
- 29 REV_REQCH_POWER_HEADROOM_DECREASE_T.
- 30 ○ REV_REQCH_HEADROOM_DURATION_S to
- 31 REV_REQCH_HEADROOM_DURATION_T.
- 32 ○ REV_REQCH_MAX_POWER_UPDATE_DURATION_S to
- 33 REV_REQCH_MAX_POWER_UPDATE_DURATION_T.
- 34 - REV_PDCH_CRC_PARAMS_INCL_S to REV_PDCH_CRC_PARAMS_INCL_T.
- 35 - If REV_PDCH_CRC_PARAMS_INCL_S is equal to '1', the mobile station shall store
- 36 the following:
- 37 + REV_PDCH_INIT_TARGET_TPR_S to REV_PDCH_INIT_TARGET_TPR_T.

- 1 + REV_PDCH_MAX_TARGET_TPR_s to REV_PDCH_MAX_TARGET_TPR_r.
- 2 + REV_PDCH_QUICK_START_THRESH_s to
- 3 REV_PDCH_QUICK_START_THRESH_r.
- 4 + The mobile station shall set (k = 0).
- 5 + For i = 1 to (11 × (REV_PDCH_EP_MAP_LEN_r + 1)), if
- 6 REV_PDCH_EP_MAP_r[i]=1, the mobile station shall set:
- 7 o (k = k+1),
- 8 o REV_PDCH_STEP_UP_s[i] to (the kth occurrence of
- 9 REV_PDCH_STEP_UP_r)/32, and
- 10 o REV_PDCH_STEP_DOWN_s[i] to (the kth occurrence of
- 11 REV_PDCH_STEP_UP_r)/32.
- 12 - The mobile station shall set (k = 0).
- 13 - For i = 0 to 6, the mobile station shall perform the following:
- 14 + If REV_PDCH_SR_ID_MAP_r[i]=0, the mobile station shall set
- 15 o REV_PDCH_BOOST_ALLOWED_s[i] to NULL , and
- 16 o REV_PDCH_AUTO_ALLOWED_s[i] to NULL
- 17 + Otherwise, the mobile station shall perform the following:
- 18 o The mobile station shall set (k = k+1)
- 19 o REV_PDCH_BOOST_ALLOWED_s[i] to the kth occurrence of
- 20 REV_PDCH_BOOST_ALLOWED_r, and
- 21 o REV_PDCH_AUTO_ALLOWED_s[i] to the kth occurrence of
- 22 REV_PDCH_AUTO_ALLOWED_r
- 23 - If REV_REQCH_PARAMS_INCL_s is equal to '1', for i = 0 to 6, if
- 24 REV_PDCH_SR_ID_MAP_r[i]= '0', the mobile station shall set:
- 25 + REV_REQCH_USE_DEFAULT_TAB_s[i] to NULL,
- 26 + REV_PDCH_BUFFER_SIZE_s[i] to NULL,
- 27 + REV_REQCH_BUF_QUANT_PARM_1_s[i] to NULL,
- 28 + REV_REQCH_BUF_QUANT_PARM_2_s[i] to NULL,
- 29 + REV_PDCH_REQCH_TRIGGER_s[i].REV_REQCH_MIN_DURATION to NULL,
- 30 + REV_PDCH_REQCH_TRIGGER_s[i]. REV_REQCH_USE_POWER_REPORTS to
- 31 NULL,
- 32 + REV_PDCH_REQCH_TRIGGER_s[i].REV_REQCH_USE_BUFFER_REPORTS to
- 33 NULL,

- 1 + REV_PDCH_REQCH_TRIGGER_s[i].REV_REQCH_USE_WATERMARKS to
2 NULL,
- 3 - The mobile station shall set (k = 0).
- 4 - If REV_REQCH_PARAMS_INCL_s is equal to '1', the mobile station shall perform
5 the following:
- 6 + For i = 0 to 7, if either of the following conditions is true:
- 7 ○ i < 7, and REV_PDCH_SR_ID_MAP[i]='1', or
- 8 ○ i=7,
- 9 the mobile station shall perform the following:
- 10 ○ The mobile station shall set (k = k+1).
- 11 ○ The mobile station shall set
12 REV_PDCH_REQCH_TRIGGER_s[i].REV_REQCH_MIN_DURATION to
13 REV_REQCH_MIN_DURATION_r × 16, using the kth occurrence of
14 REV_REQCH_MIN_DURATION_r;
- 15 ○ The mobile station shall set REV_PDCH_REQCH_TRIGGER_s[i].
16 REV_REQCH_USE_POWER_REPORTS to the kth occurrence of
17 REV_REQCH_USE_POWER_REPORTS_r;
- 18 ○ The mobile station shall set
19 REV_PDCH_REQCH_TRIGGER_s[i].REV_REQCH_USE_BUFFER_REPORT
20 S to the kth occurrence of REV_REQCH_USE_BUFFER_REPORTS_r;
- 21 ○ The mobile station shall set
22 REV_PDCH_REQCH_TRIGGER_s[i].REV_REQCH_USE_WATERMARKS to
23 the kth occurrence of REV_REQCH_USE_WATERMARKS_r;
- 24 ○ If any of the following conditions are true,
- 25 ◇ REV_PDCH_REQCH_TRIGGER_s[i].
26 REV_REQCH_USE_BUFFER_REPORTS is equal to '1'.
- 27 ◇ REV_PDCH_REQCH_TRIGGER_s[i].
28 REV_REQCH_USE_POWER_REPORTS is equal to '1'.
- 29 ◇ REV_PDCH_REQCH_TRIGGER_s[i].REV_REQCH_USE_WATERMARKS
30 is equal to '1'.
- 31 The mobile station shall perform the following:
- 32 ◇ The mobile station shall set REV_REQCH_USE_DEFAULT_TAB_s[i] to
33 the kth occurrence of REV_REQCH_USE_DEFAULT_TAB_r.

- 1 ◇ If REV_REQCH_USE_DEFAULT_TAB_s[i] is equal to '000', then, for j =
2 1 to 13, the mobile station shall set REV_PDCH_BUFFER_SIZE_s[i][j]
3 to
4 $2 \times \text{REV_REQCH_BUF_QUANT_PARAM_1}_r \times j^2 +$
5 $\text{REV_REQCH_BUF_QUANT_PARAM_2}_r \times j,$
6 using the kth occurrences of REV_REQCH_BUF_QUANT_PARAM_1_r,
7 and REV_REQCH_BUF_QUANT_PARAM_2_r.
- 8 ◇ If REV_REQCH_USE_DEFAULT_TAB_s[i] is not equal to '000', then, for
9 j = 1 to 13, the mobile station shall set
10 REV_PDCH_BUFFER_SIZE_s[i][j] to the buffer size value specified in
11 the jth row of the buffer size table corresponding to
12 REV_REQCH_USE_DEFAULT_TAB_s[i].
- 13 ○ If REV_PDCH_REQCH_TRIGGER_s[i].REV_REQCH_USE_WATERMARKS is
14 equal to '1', the mobile station shall store the following:
- 15 ◇ REV_PDCH_REQCH_TRIGGER_s[i].REV_REQCH_HIGH_WATERMARK
16 to $\text{REV_REQCH_HIGH_WATERMARK_1}_r \times$
17 $8^{\text{REV_REQCH_HIGH_WATERMARK_2}_r}$, using the kth occurrences of
18 REV_REQCH_HIGH_WATERMARK_1_r and
19 REV_REQCH_HIGH_WATERMARK_2_r.
- 20 ◇ REV_PDCH_REQCH_TRIGGER_s[i].REV_REQCH_LOW_WATERMARK
21 to $\text{REV_REQCH_LOW_WATERMARK_1}_r \times$
22 $8^{\text{REV_REQCH_LOW_WATERMARK_2}_r}$, using the kth occurrences of
23 REV_REQCH_LOW_WATERMARK_1_r and
24 REV_REQCH_LOW_WATERMARK_2_r.
- 25 ◇ REV_PDCH_REQCH_TRIGGER_s[i].REV_REQCH_CEILING to
26 $\text{REV_REQCH_CEILING_1}_r \times 8^{\text{REV_REQCH_CEILING_2}_r}$,
27 using the kth occurrences of REV_REQCH_CEILING_1_r and
28 REV_REQCH_CEILING_2_r.
- 29 ◇ REV_PDCH_REQCH_TRIGGER_s[i].REV_REQCH_FLOOR_s[i] to
30 $\text{REV_REQCH_FLOOR_1}_r \times 8^{\text{REV_REQCH_FLOOR_2}_r}$,
31 using the kth occurrences of REV_REQCH_FLOOR_1_r, and
32 REV_REQCH_FLOOR_2_r.

33 2.6.4.1.14 Processing the Security Mode Command Message

34 The mobile station shall process the received *Security Mode Command Message* as follows:

- 35 • The mobile station shall set D_SIG_ENCRYPT_MODE_s to D_SIG_ENCRYPT_MODE_r.
- 36 • If MSG_INTEGRITY_SUP is set to '0', the mobile station shall perform the following:
- 37 - If D_SIG_ENCRYPT_MODE_r is not equal to '000', the mobile station shall
38 perform the following:
- 39 + Set ENCRYPT_MODE_s to '11'

- 1 + Form a 128-bit pattern by concatenating the CMEAKEY with a copy of itself
2 (the CMEAKEY is associated with the AUTHR of the *Origination Message* or
3 *Page Response Message*, or the CMEAKEY associated with the AUTHU
4 generated during Unique Challenge-Response procedure as described in
5 2.3.12.1.4).
- 6 + Set ENC_KEY[KEY_ID] to the 128-bit pattern.
- 7 + Set TX_EXT_SSEQ[0][KEY_ID], TX_EXT_SSEQ[1][KEY_ID],
8 RX_EXT_SSEQ[0][KEY_ID], and RX_EXT_SSEQ[1][KEY_ID] to $1 + 256 \times$
9 NEW_SSEQ_H if either of the following conditions is true:
- 10 ○ The NEW_SSEQ_H field is included in the last *Origination Message* or
11 *Page Response Message* and TX_EXT_SSEQ[0][KEY_ID] and
12 TX_EXT_SSEQ[1][KEY_ID] have not been initialized by the last *Channel*
13 *Assignment Message*, *Extended Channel Assignment Message*, or an
14 earlier f-dsch *Security Mode Command Message* (see 2.3.12.4.1.3).
- 15 ○ This message is a response to a *Security Mode Request Message* (see
16 2.3.12.4.1.3) that includes an NEW_SSEQ_H field.
- 17 • If MSG_INTEGRITY_SUP is set to '1' and CHANGE_KEYS_r is set to '1', the mobile
18 station shall perform the following:
- 19 - Set KEY_ID to SDU_KEY_ID provided by the LAC Layer (see [4]).
- 20 - Set ENCRYPT_MODE_s to '11'.
- 21 - If KEY_ID is equal to '00' or '01', the mobile station shall perform the following:
22 + Set TX_EXT_SSEQ[0][KEY_ID], TX_EXT_SSEQ[1][KEY_ID],
23 RX_EXT_SSEQ[0][KEY_ID], and RX_EXT_SSEQ[1][KEY_ID] to $1 + 256 \times$
24 NEW_SSEQ_H included in the *Origination Message*, *Page Response Message*,
25 or *Security Mode Request Message*).
- 26 + Form a 128-bit pattern by concatenating the CMEAKEY with a copy of itself
27 (the CMEAKEY is associated with the AUTHR of the *Origination Message* or
28 *Page Response Message*, or the CMEAKEY associated with the AUTHU
29 generated during the Unique Challenge-Response procedure as described in
30 2.3.12.1.4).
- 31 + Set ENC_KEY[KEY_ID] to the 128-bit pattern.
- 32 + Set INT_KEY[KEY_ID] to the 128-bit pattern.
- 33 + Set LAST_2G_KEY_ID_s to KEY_ID.
- 34 - If KEY_ID is equal to '10' or '11', the mobile station shall perform the following:
35 + Set TX_EXT_SSEQ[0][KEY_ID][0], TX_EXT_SSEQ[1][KEY_ID],
36 RX_EXT_SSEQ[0][KEY_ID][0], and RX_EXT_SSEQ[1][KEY_ID] to $1 + 256 \times$
37 NEW_SSEQ_H included in the *Authentication Response Message* or *Security*
38 *Mode Request Message*).
- 39 + Set ENC_KEY[KEY_ID] to the latest CK generated by AKA.

- 1 + Set INT_KEY[KEY_ID] to the latest IK generated by AKA.
- 2 + Set LAST_3G_KEY_ID_s to KEY_ID.
- 3 + If the mobile station supports R-UIM, then the mobile shall set USE_UAK_s to
- 4 USE_UAK_r; otherwise, the mobile station shall perform the following:
- 5 ○ Set USE_UAK_s to '0'.
- 6 ○ If USE_UAK_r is equal to '1', then the mobile station shall send a *Mobile*
- 7 *Station Reject Order* with ORDQ equal to '00010100' (UAK not
- 8 supported).
- 9 - Send a *Security Mode Completion Order*.
- 10 • For each of the service option connections specified by the CON_REF field included
- 11 in this message, the mobile station shall set the user information encryption mode
- 12 in the corresponding service option connection record (SO_CON_REC_s[i]) to
- 13 UI_ENCRYPT_MODE_r) (i.e., set SO_CON_REC_s[i].UI_ENCRYPT_MODE to
- 14 UI_ENCRYPT_MODE_r where SO_CON_REC_s[i].CON_REF = CON_REF_r).
- 15 • For each of the service option connections specified by the CON_REF field included
- 16 in this message, at the action time of the message the mobile station shall start
- 17 encrypting user information (e.g., voice and data) using the encryption algorithm
- 18 specified by SO_CON_REC_s[i].UI_ENCRYPT_MODE where
- 19 SO_CON_REC_s[i].CON_REF = CON_REF_r (see Table 3.7.4.5-1).
- 20 • If ENC_KEY_SIZE_r is included, the mobile station shall set ENC_KEY_SIZE_s to
- 21 ENC_KEY_SIZE_r.
- 22 • If ENC_KEY_SIZE_r is included and not set to reserved value and if current key
- 23 strength is greater than the desired key strength specified by ENC_KEY_SIZE_r
- 24 according to table 3.7.4.5-2, mobile station shall perform the key strength reduction
- 25 algorithm procedures to reduce the key strength of ENC_KEY[KEY_ID] according to
- 26 ENC_KEY_SIZE_r as described in 2.3.12.5.4. The current key strength is 64 bit if
- 27 KEY_ID is equal to '00' or '01' and is 128 bit if KEY_ID is equal to '10' or '11'.
- 28 • If C_SIG_ENCRYPT_MODE is included, the mobile station shall set
- 29 C_SIG_ENCRYPT_MODE_s to C_SIG_ENCRYPT_MODE_r.

30 2.6.4.1.15 Processing the Handoff Supplementary Information Solicit Message

31 If the mobile station receives a *Handoff Supplementary Information Solicit Message* from the

32 base station, it shall transmit a *Handoff Supplementary Information Notification Message* to

33 the base station. If the mobile station is capable of obtaining Overhead Messages of

34 neighboring sectors while in traffic channel state and if supplementary information for a

35 pilot requested in the *Handoff Supplementary Information Solicit Message* is available, then

36 the mobile station should include the supplementary information for this pilot.

37 2.6.4.2 Traffic Channel Initialization Substate

38 In this substate, the mobile station verifies that it can receive the Forward Traffic Channel

39 and begins transmitting on the Reverse Traffic Channel.

1 If this substate is entered from the *Traffic Channel Substate* of the *Mobile Station Control* on
 2 the *Traffic Channel State* with an Initialization Failure indication, the mobile station shall
 3 perform the procedures as specified in 2.6.4.2.1, and shall not perform any of the
 4 remaining procedures in this section.

5 Otherwise, upon entering the *Traffic Channel Initialization Substate*, the mobile station shall
 6 perform the following:

- 7 • The mobile station shall perform registration initialization as specified in
 8 2.6.5.5.4.1.
- 9 • Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to reset the
 10 acknowledgment procedures as specified in [4].
- 11 • The mobile station shall initialize Forward Traffic Channel power control as
 12 specified in 2.6.4.1.1.1.
- 13 • The mobile station shall initialize the list TAG_OUTSTANDING_LIST to be empty.
- 14 • If P_REV_IN_USE_s is less than seven, the mobile station shall set CS_SUPPORTED_s
 15 to '0'.
- 16 • If P_REV_IN_USE_s is less than nine, the mobile station shall set
 17 FOR_PDCH_SUPPORTED_s to '0'.
- 18 • The mobile station shall set USE_ERAM_s to '0'.
- 19 • The mobile station shall set the following variables to their initial default values
 20 given below:
 - 21 - If the mobile station had included the FOR_PDCH Capability Type-specific fields
 22 in the *Origination Message* or *Page Response Message*, the mobile station shall
 23 store one plus the value included in the ACK_DELAY field of the message as
 24 ACK_DELAY and the value included in the NUM_ARQ_CHAN field of the
 25 message as NUM_ARQ_CHAN.
 - 26 - Default power control step size
 27 (PWR_CNTL_STEP_s = '000')
 - 28 - Default Reverse Supplemental Channel power offset adjustment relative to
 29 Reverse Pilot Channel power
 30 + RLGAIN_SCH_PILOT_s [0]= '000000'
 - 31 + RLGAIN_SCH_PILOT_s [1]= '000000'
 - 32 - Default Reverse Discontinuous Transmission Duration on Reverse
 33 Supplemental Code Channel (REV_DTX_DURATION_s = '0000')
 - 34 - Default Reverse Discontinuous Transmission Duration on Reverse
 35 Supplemental Channel (REV_SCH_DTX_DURATION_s = '0000')
 - 36 - Default channel on which the mobile station is to perform the primary inner
 37 loop estimation and the base station is to multiplex the Power Control
 38 Subchannel:

- 1 + If CH_IND_S is equal to '01' or if EXT_CH_IND_S indicates that F-FCH is
2 assigned and F-DCCH is not assigned, the mobile station shall set
3 FPC_PRI_CHAN_S to '0'.
- 4 + If CH_IND_S is equal to '10' or if EXT_CH_IND_S indicates that F-DCCH is
5 assigned and F-FCH is not assigned, the mobile station shall set
6 FPC_PRI_CHAN_S to '1'.
- 7 + If EXT_CH_IND_S indicates that neither F-FCH nor F-DCCH is assigned, the
8 mobile station shall set FPC_PRI_CHAN_S to NULL.
- 9 - Default forward power control operation mode used except during the forward
10 Supplemental Channel interval
11 (FPC_MODE_NO_SCH_S = '000')
- 12 - Default forward power control operation mode used during the forward
13 Supplemental Channel interval [set as follows:](#)
14 [If RC 8 is assigned on the reverse fundamental channel, or RC 11 or RC 12 is](#)
15 [assigned on the forward fundamental channel,](#)
16 [set \(FPC_MODE_SCH_S = '010'\)](#)
- 17 [Otherwise](#)
18 [set \(FPC_MODE_SCH_S = '000'\)](#)
- 19 - Default forward power control operation mode
20 (FPC_MODE_S = '000')
- 21 - Slotted timer (T_SLOTTED_S = T_{74m})
- 22 - Reduced slot cycle mode enabled indicator (RSC_MODE_ENABLED = NO).
- 23 - Radio environment reporting mode enabled indicator (RER_MODE_ENABLED =
24 NO).
- 25 - Tracking zone mode enabled indicator (TKZ_MODE_ENABLED = NO).
- 26 - Tracking zone mode pending indicator (TKZ_MODE_PENDING = NO).
- 27 - Default Reverse Pilot Channel gating (PILOT_GATING_USE_RATE='0')
- 28 - Default begin preamble for Reverse Supplemental Code Channels
29 (BEGIN_PREAMBLE_S = '000')
- 30 - Default resume preamble for Reverse Supplemental Code Channels
31 (RESUME_PREAMBLE_S = '000')
- 32 - Default start time for Reverse Supplemental Code Channel assignment
33 (REV_START_TIME_S = NULL)
- 34 - Default retry delays:
- 35 + RETRY_DELAY_S[010] = 0
- 36 + RETRY_DELAY_S[011] = 0

- 1 - Default neighbor pilot strength measurement threshold offset
2 (T_MULCHAN_S = '000')
- 3 - Default start time for forward Supplemental Code Channel Assignment
4 (FOR_START_TIME_S = NULL)
- 5 - Default number of Reverse Supplemental Code Channels
6 (NUM_REV_CODES_S = '000')
- 7 - Default reverse use T_ADD abort indicator
8 (USE_T_ADD_ABORT_S = '0')
- 9 - Default *Supplemental Channel Request Message* sequence number
10 (SCRM_SEQ_NUM_S = NULL)
- 11 - Default indicator to ignore reverse Supplemental Code Channel assignment
12 (IGNORE_SCAM_S = '0')
- 13 - Default indicator to ignore reverse Supplemental Channel assignment
14 (IGNORE_ESCAM_S = '0')
- 15 - Default search period for the candidate search
16 (SEARCH_PERIOD_S = '1111')
- 17 - Default search window size for the Candidate Frequency Search Set
18 (CF_SRCH_WIN_N_S = SRCH_WIN_N_S)
- 19 - Default search window size for the Remaining Set on the CDMA Candidate
20 Frequency (CF_SRCH_WIN_R_S = SRCH_WIN_R_S)
- 21 - Default pilot PN sequence offset increment for the CDMA Candidate Frequency
22 (CF_PILOT_INC_S = PILOT_INC_S)
- 23 - Default Candidate Frequency search priorities included indicator
24 (CF_SEARCH_PRIORITY_INCL_S = '0')
- 25 - Default Candidate Frequency search window size included indicator
26 (CF_SRCH_WIN_NGHBR_INCL_S = '0')
- 27 - Default Candidate Frequency search window offset included indicator
28 (CF_SRCH_OFFSET_INCL_S = '0')
- 29 - Default periodic search indicator
30 (PERIODIC_SEARCH_S = '0')
- 31 - Default return-if-handoff-fail indicator
32 (RETURN_IF_HANDOFF_FAIL_S = '0')
- 33 - Default total pilot E_C/I₀ threshold
34 (MIN_TOTAL_PILOT_EC_IO_S = '00000')
- 35 - Default total pilot E_C threshold
36 (SF_TOTAL_EC_THRESH_S = '11111')
- 37 - Default total pilot E_C/I₀ threshold
38 (SF_TOTAL_EC_IO_THRESH_S = '11111')

- 1 - Default received power difference threshold
- 2 (DIFF_RX_PWR_THRESHS = '00000')

- 3 - Default maximum wait time on the CDMA Target Frequency
- 4 (TF_WAIT_TIMES = '1111')
- 5 - Default Candidate Frequency Search Set
- 6 (Candidate Frequency Search Set is empty)

- 7 - Default Candidate Frequency CDMA band
- 8 (CF_CDMABANDS = NULL)

- 9 - Default Candidate Frequency CDMA channel
- 10 (CF_CDMACHS = NULL)

- 11 - Default indicator for 5ms frames on Fundamental Channel
- 12 (FCH_5MS_FRAMES_S = '0')

- 13 - Default indicator for 5ms frames on Dedicated Control Channel
- 14 (DCCH_5MS_FRAMES_S = '0')

- 15 - Default start time unit for Supplemental Channel
- 16 (START_TIME_UNITS = '000')

- 17 - Default Forward Supplemental Channel FER report indicator
- 18 (FOR_SCH_FER_REPS = '0')

- 19 - Default Forward Supplemental Channel Configuration parameters:
- 20 + Set the Forward Supplemental Channel frame length
- 21 FOR_SCH_FRAME_LENGTHS[0] to NULL.
- 22 + Set the Forward Supplemental Channel Multiplex Option FOR_SCH_MUXS[0]
- 23 to NULL.
- 24 + Set the Forward Supplemental Channel Radio Configuration
- 25 FOR_SCH_RCS[0] to NULL.
- 26 + Set the Forward Supplemental Channel Coding Type FOR_SCH_CODINGS[0]
- 27 to NULL.
- 28 + Set QOF_IDS[0][SCCL_INDEX_S][i] to NULL, for all integer values of i from 0 to
- 29 15.
- 30 + Set FOR_SCH_CC_INDEX_S [0][SCCL_INDEX_S][i] to NULL, for all integer
- 31 values of i from 0 to 15.
- 32 + Set the Forward Supplemental Channel frame length
- 33 FOR_SCH_FRAME_LENGTHS[1] to NULL.
- 34 + Set the Forward Supplemental Channel Multiplex Option FOR_SCH_MUXS[1]
- 35 to NULL.
- 36 + Set the Forward Supplemental Channel Radio Configuration
- 37 FOR_SCH_RCS[1] to NULL.

- 1 + Set the Forward Supplemental Channel Coding Type FOR_SCH_CODING_s[1]
2 to NULL.
- 3 + Set QOF_IDS_s[1][SCCL_INDEX_s][i] to NULL, for all integer values of i from 0 to
4 15.
- 5 + Set FOR_SCH_CC_INDEX_s [1][SCCL_INDEX_s][i] to NULL, for all integer
6 values of i from 0 to 15.
- 7 - Call Origination Transaction Identifier
8 (TAG_s = '0000').
- 9 - Default Reverse Supplemental Channel Configuration parameters:
10 + REV_WALSH_IDS_s[0][0000] = 1
11 + REV_WALSH_IDS_s[0][0001] = 1
12 + REV_WALSH_IDS_s[0][0010] = 1
13 + REV_WALSH_IDS_s[0][0011] = 1
14 + REV_WALSH_IDS_s[0][0100] = 0
15 + REV_WALSH_IDS_s[0][0101] = 0
16 + REV_WALSH_IDS_s[0][0110] = 0
17 + REV_WALSH_IDS_s[1][0000] = 1
18 + REV_WALSH_IDS_s[1][0001] = 1
19 + REV_WALSH_IDS_s[1][0010] = 1
20 + REV_WALSH_IDS_s[1][0011] = 0
21 + REV_WALSH_IDS_s[1][0100] = 0
22 + REV_WALSH_IDS_s[1][0101] = 0
23 + REV_WALSH_IDS_s[1][0110] = 0
24 + Set the Reverse Supplemental Channel frame length
25 REV_SCH_FRAME_LENGTH_s[0] to NULL.
26 + Set the Reverse Supplemental Channel Multiplex Option REV_SCH_MUX_s[0]
27 to NULL.
28 + Set the Reverse Supplemental Channel Radio Configuration
29 REV_SCH_RC_s[0] to NULL.
30 + Set the Reverse Supplemental Channel Coding Type REV_SCH_CODING_s[0]
31 to NULL.
32 + Set the Reverse Supplemental Channel frame length
33 REV_SCH_FRAME_LENGTH_s[1] to NULL.
34 + Set the Reverse Supplemental Channel Multiplex Option REV_SCH_MUX_s[1]
35 to NULL.

- 1 + Set the Reverse Supplemental Channel Radio Configuration
2 REV_SCH_RC_S[1] to NULL.
- 3 + Set the Reverse Supplemental Channel Coding Type REV_SCH_CODING_S[1]
4 to NULL.
- 5 • If P_REV_IN_USE_S is greater than six and the ASSIGN_MODE_R field of the *Channel*
6 *Assignment Message* or *Extended Channel Assignment Message* is equal to '000' or
7 '100', then the mobile station shall initialize the logical to physical mapping table
8 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE) according to the requirements in Table
9 2.6.4.2-1:

10

11 **Table 2.6.4.2-1. Default Logical to Physical Mapping Table, ASSIGN_MODE_R equal to**
12 **'000' or '100'**

SR_ID	LOGICAL_RESOURCE	PHYSICAL_RESOURCE	FORWARD_FLAG	REVERSE_FLAG	PRIORITY
000	0001	(shall be set according to requirement 2)	1	1	0000
(shall be set according to requirement 1)	0000	(shall be set according to requirement 3)	1	1	0000

13 Where requirement 1 is as follows:

- 14 + The SR_ID field shall be set to NULL.

15 Requirement 2 is as follows:

- 16 + If CH_IND_S is equal to '01', the PHYSICAL_RESOURCE field shall be set to
17 '0000'.
- 18 + If CH_IND_S is equal to '10', the PHYSICAL_RESOURCE field shall be set to
19 '0001'.
- 20 + If CH_IND_S is equal to '11', there shall be two entries in the default LPM
21 table where the PHYSICAL_RESOURCE field shall be set to '0000' and '0001'
22 respectively.

23 Requirement 3 is as follows:

- 24 + If CH_IND_S is equal to '01':

- 1 ○ If the Radio Configuration in use is less than three, the
2 PHYSICAL_RESOURCE field shall be set to '0000'; otherwise, there shall
3 be three entries in the default LPM table where the
4 PHYSICAL_RESOURCE field shall be set to '0000', '0010', and '0011'
5 respectively.
- 6 + If CH_IND_s is equal to '10':
 - 7 ○ There shall be three entries in the default LPM table where the
8 PHYSICAL_RESOURCE field shall be set to '0001', '0010', and '0011'
9 respectively.
- 10 + If CH_IND_s is equal to '11':
 - 11 ○ There shall be four entries in the default LPM table where the
12 PHYSICAL_RESOURCE field shall be set to '0000', '0001', '0010', and
13 '0011' respectively.
- 14 • If the ASSIGN_MODE_r field of the *Extended Channel Assignment Message* is equal to
15 '101', then the mobile station shall initialize the logical to physical mapping table
16 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE) according to the requirements in Table
17 2.6.4.2-2:

18 **Table 2.6.4.2-2. Default Logical to Physical Mapping Table, ASSIGN_MODE_r equal to**
19 **'101'**

SR_ID	LOGICAL_RESOURCE	PHYSICAL_RESOURCE	FORWARD_FLAG	REVERSE_FLAG	PRIORITY
000	0001	(shall be set according to requirement 2)	(shall be set according to requirement 2)	(shall be set according to requirement 2)	0000
(shall be set according to requirement 1)	0000	(shall be set according to requirement 3)	(shall be set according to requirement 3)	(shall be set according to requirement 3)	0000

20 Where requirement 1 is as follows:

- 21 + The SR_ID field shall be set to NULL.

22 Requirement 2 is as follows:

- 23 + If EXT_CH_IND_s is equal to '00001', then there shall be two entries in the
24 default LPM table where the mobile station shall set:
 - 25 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
26 REVERSE_FLAG to '0' for the first entry, and
 - 27 ○ PHYSICAL_RESOURCE to '0000', FORWARD_FLAG to '0', and
28 REVERSE_FLAG to '1' for the second entry.

- 1 + If EXT_CH_IND_s is equal to '00010', then there shall be two entries in the
2 default LPM table where the mobile station shall set:
- 3 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
4 REVERSE_FLAG to '0' for the first entry, and
- 5 ○ PHYSICAL_RESOURCE to '0001', FORWARD_FLAG to '0', and
6 REVERSE_FLAG to '1' for the second entry.
- 7 + If EXT_CH_IND_s is equal to '00011', then the mobile station shall set
8 PHYSICAL_RESOURCE to '0000', FORWARD_FLAG to '1', and
9 REVERSE_FLAG to '1'.
- 10 + If EXT_CH_IND_s is equal to '00100', then the mobile station shall set
11 PHYSICAL_RESOURCE to '0001', FORWARD_FLAG to '1', and
12 REVERSE_FLAG to '1'.
- 13 + If EXT_CH_IND_s is equal to '00101', then there shall be two entries in the
14 default LPM table where the mobile station shall set:
- 15 ○ PHYSICAL_RESOURCE to '0000', FORWARD_FLAG to '1', and
16 REVERSE_FLAG to '1' for the first entry, and
- 17 ○ PHYSICAL_RESOURCE to '0001', FORWARD_FLAG to '0', and
18 REVERSE_FLAG to '1' for the second entry.
- 19 + If EXT_CH_IND_s is equal to '00110', then there shall be two entries in the
20 default LPM table where the mobile station shall set:
- 21 ○ PHYSICAL_RESOURCE to '0000', FORWARD_FLAG to '1', and
22 REVERSE_FLAG to '1' for the first entry, and
- 23 ○ PHYSICAL_RESOURCE to '0001', FORWARD_FLAG to '1', and
24 REVERSE_FLAG to '1' for the second entry.
- 25 + If EXT_CH_IND_s is equal to '01000', then the mobile station shall set
26 PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
27 REVERSE_FLAG to '1'.
- 28 + If EXT_CH_IND_s is equal to '01001', then there shall be two entries in the
29 default LPM table where the mobile station shall set:
- 30 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
31 REVERSE_FLAG to '1' for the first entry, and
- 32 ○ PHYSICAL_RESOURCE to '0000', FORWARD_FLAG to '0', and
33 REVERSE_FLAG to '1' for the second entry.
- 34 + If EXT_CH_IND_s is equal to '01010', then there shall be two entries in the
35 default LPM table where the mobile station shall set:
- 36 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
37 REVERSE_FLAG to '1' for the first entry, and
- 38 ○ PHYSICAL_RESOURCE to '0001', FORWARD_FLAG to '0', and
39 REVERSE_FLAG to '1' for the second entry.

- 1 + If EXT_CH_IND_s is equal to '01011', then there shall be two entries in the
2 default LPM table where the mobile station shall set:
- 3 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '0', and
4 REVERSE_FLAG to '1' for the first entry, and
- 5 ○ PHYSICAL_RESOURCE to '0000', FORWARD_FLAG to '1', and
6 REVERSE_FLAG to '1' for the second entry.
- 7 + If EXT_CH_IND_s is equal to '01100', then there shall be two entries in the
8 default LPM table where the mobile station shall set:
- 9 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '0', and
10 REVERSE_FLAG to '1' for the first entry, and
- 11 ○ PHYSICAL_RESOURCE to '0001', FORWARD_FLAG to '1', and
12 REVERSE_FLAG to '1' for the second entry.
- 13 + If EXT_CH_IND_s is equal to '01101', then there shall be three entries in the
14 default LPM table where the mobile station shall set:
- 15 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '0', and
16 REVERSE_FLAG to '1' for the first entry, and
- 17 ○ PHYSICAL_RESOURCE to '0000', FORWARD_FLAG to '1', and
18 REVERSE_FLAG to '1' for the second entry, and
- 19 ○ PHYSICAL_RESOURCE to '0001', FORWARD_FLAG to '0', and
20 REVERSE_FLAG to '1' for the third entry.
- 21 + If EXT_CH_IND_s is equal to '01110', then there shall be three entries in the
22 default LPM table where the mobile station shall set:
- 23 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '0', and
24 REVERSE_FLAG to '1' for the first entry, and
- 25 ○ PHYSICAL_RESOURCE to '0000', FORWARD_FLAG to '1', and
26 REVERSE_FLAG to '1' for the second entry, and
- 27 ○ PHYSICAL_RESOURCE to '0001', FORWARD_FLAG to '1', and
28 REVERSE_FLAG to '1' for the third entry.

29 Requirement 3 is as follows:

- 30 + If EXT_CH_IND_s is equal to '00001', then there shall be four entries in the
31 default LPM table where the mobile station shall set:
- 32 ○ PHYSICAL_RESOURCE to '0000', FORWARD_FLAG to '0', and
33 REVERSE_FLAG to '1' for the first entry,
- 34 ○ PHYSICAL_RESOURCE to '0010', FORWARD_FLAG to '0', and
35 REVERSE_FLAG to '1' for the second entry,
- 36 ○ PHYSICAL_RESOURCE to '0011', FORWARD_FLAG to '0', and
37 REVERSE_FLAG to '1' for the third entry, and

- 1 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
2 REVERSE_FLAG to '0' for the fourth entry.
- 3 + If EXT_CH_IND_s is equal to '00010', then there shall be four entries in the
4 default LPM table where the mobile station shall set:
- 5 ○ PHYSICAL_RESOURCE to '0001', FORWARD_FLAG to '0', and
6 REVERSE_FLAG to '1' for the first entry,
- 7 ○ PHYSICAL_RESOURCE to '0010', FORWARD_FLAG to '0', and
8 REVERSE_FLAG to '1' for the second entry,
- 9 ○ PHYSICAL_RESOURCE to '0011', FORWARD_FLAG to '0', and
10 REVERSE_FLAG to '1' for the third entry, and
- 11 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
12 REVERSE_FLAG to '0' for the fourth entry.
- 13 + If EXT_CH_IND_s is equal to '00011', then there shall be four entries in the
14 default LPM table where the mobile station shall set:
- 15 ○ PHYSICAL_RESOURCE to '0000', FORWARD_FLAG to '1', and
16 REVERSE_FLAG to '1' for the first entry,
- 17 ○ PHYSICAL_RESOURCE to '0010', FORWARD_FLAG to '1', and
18 REVERSE_FLAG to '1' for the second entry,
- 19 ○ PHYSICAL_RESOURCE to '0011', FORWARD_FLAG to '1', and
20 REVERSE_FLAG to '1' for the third entry, and
- 21 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
22 REVERSE_FLAG to '0' for the fourth entry.
- 23 + If EXT_CH_IND_s is equal to '00100', then there shall be four entries in the
24 default LPM table where the mobile station shall set:
- 25 ○ PHYSICAL_RESOURCE to '0001', FORWARD_FLAG to '1', and
26 REVERSE_FLAG to '1' for the first entry,
- 27 ○ PHYSICAL_RESOURCE to '0010', FORWARD_FLAG to '1', and
28 REVERSE_FLAG to '1' for the second entry,
- 29 ○ PHYSICAL_RESOURCE to '0011', FORWARD_FLAG to '1', and
30 REVERSE_FLAG to '1' for the third entry, and
- 31 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
32 REVERSE_FLAG to '0' for the fourth entry.
- 33 + If EXT_CH_IND_s is equal to '00101', then there shall be five entries in the
34 default LPM table where the mobile station shall set:
- 35 ○ PHYSICAL_RESOURCE to '0000', FORWARD_FLAG to '1', and
36 REVERSE_FLAG to '1' for the first entry,
- 37 ○ PHYSICAL_RESOURCE to '0001', FORWARD_FLAG to '0', and
38 REVERSE_FLAG to '1' for the second entry,

- 1 ○ PHYSICAL_RESOURCE to '0010', FORWARD_FLAG to '1', and
- 2 REVERSE_FLAG to '1' for the third entry,
- 3 ○ PHYSICAL_RESOURCE to '0011', FORWARD_FLAG to '1', and
- 4 REVERSE_FLAG to '1' for the fourth entry, and
- 5 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
- 6 REVERSE_FLAG to '0' for the fifth entry.
- 7 + If EXT_CH_IND_s is equal to '00110', then there shall be five entries in the
- 8 default LPM table where the mobile station shall set:
- 9 ○ PHYSICAL_RESOURCE to '0000', FORWARD_FLAG to '1', and
- 10 REVERSE_FLAG to '1' for the first entry,
- 11 ○ PHYSICAL_RESOURCE to '0001', FORWARD_FLAG to '1', and
- 12 REVERSE_FLAG to '1' for the second entry,
- 13 ○ PHYSICAL_RESOURCE to '0010', FORWARD_FLAG to '1', and
- 14 REVERSE_FLAG to '1' for the third entry,
- 15 ○ PHYSICAL_RESOURCE to '0011', FORWARD_FLAG to '1', and
- 16 REVERSE_FLAG to '1' for the fourth entry, and
- 17 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
- 18 REVERSE_FLAG to '0' for the fifth entry.
- 19 + If EXT_CH_IND_s is equal to '01000', then there shall be one entry in the
- 20 default LPM table where the mobile station shall set:
- 21 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
- 22 REVERSE_FLAG to '1' for the third entry:
- 23 + If EXT_CH_IND_s is equal to '01001', then there shall be two entries in the
- 24 default LPM table where the mobile station shall set:
- 25 ○ PHYSICAL_RESOURCE to '0000', FORWARD_FLAG to '0', and
- 26 REVERSE_FLAG to '1' for the first entry,
- 27 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
- 28 REVERSE_FLAG to '1' for the fourth entry.
- 29 + If EXT_CH_IND_s is equal to '01010', then there shall be four entries in the
- 30 default LPM table where the mobile station shall set:
- 31 ○ PHYSICAL_RESOURCE to '0001', FORWARD_FLAG to '0', and
- 32 REVERSE_FLAG to '1' for the first entry,
- 33 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
- 34 REVERSE_FLAG to '1' for the fourth entry.
- 35 + If EXT_CH_IND_s is equal to '01011', then there shall be four entries in the
- 36 default LPM table where the mobile station shall set:
- 37 ○ PHYSICAL_RESOURCE to '0000', FORWARD_FLAG to '1', and
- 38 REVERSE_FLAG to '1' for the first entry,

- 1 ○ PHYSICAL_RESOURCE to '0010', FORWARD_FLAG to '1', and
2 REVERSE_FLAG to '0' for the second entry,
- 3 ○ PHYSICAL_RESOURCE to '0011', FORWARD_FLAG to '1', and
4 REVERSE_FLAG to '0' for the third entry, and
- 5 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
6 REVERSE_FLAG to '1' for the fourth entry.
- 7 + If EXT_CH_IND_s is equal to '01100', then there shall be four entries in the
8 default LPM table where the mobile station shall set:
- 9 ○ PHYSICAL_RESOURCE to '0001', FORWARD_FLAG to '1', and
10 REVERSE_FLAG to '1' for the first entry,
- 11 ○ PHYSICAL_RESOURCE to '0010', FORWARD_FLAG to '1', and
12 REVERSE_FLAG to '0' for the second entry,
- 13 ○ PHYSICAL_RESOURCE to '0011', FORWARD_FLAG to '1', and
14 REVERSE_FLAG to '0' for the third entry, and
- 15 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
16 REVERSE_FLAG to '1' for the fourth entry.
- 17 + If EXT_CH_IND_s is equal to '01101', then there shall be five entries in the
18 default LPM table where the mobile station shall set:
- 19 ○ PHYSICAL_RESOURCE to '0000', FORWARD_FLAG to '1', and
20 REVERSE_FLAG to '1' for the first entry,
- 21 ○ PHYSICAL_RESOURCE to '0001', FORWARD_FLAG to '0', and
22 REVERSE_FLAG to '1' for the second entry,
- 23 ○ PHYSICAL_RESOURCE to '0010', FORWARD_FLAG to '1', and
24 REVERSE_FLAG to '0' for the third entry,
- 25 ○ PHYSICAL_RESOURCE to '0011', FORWARD_FLAG to '1', and
26 REVERSE_FLAG to '0' for the fourth entry, and
- 27 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
28 REVERSE_FLAG to '1' for the fifth entry.
- 29 + If EXT_CH_IND_s is equal to '01110', then there shall be five entries in the
30 default LPM table where the mobile station shall set:
- 31 ○ PHYSICAL_RESOURCE to '0000', FORWARD_FLAG to '1', and
32 REVERSE_FLAG to '1' for the first entry,
- 33 ○ PHYSICAL_RESOURCE to '0001', FORWARD_FLAG to '1', and
34 REVERSE_FLAG to '1' for the second entry,
- 35 ○ PHYSICAL_RESOURCE to '0010', FORWARD_FLAG to '1', and
36 REVERSE_FLAG to '0' for the third entry,
- 37 ○ PHYSICAL_RESOURCE to '0011', FORWARD_FLAG to '1', and
38 REVERSE_FLAG to '0' for the fourth entry, and

- 1 ○ PHYSICAL_RESOURCE to '0100', FORWARD_FLAG to '1', and
2 REVERSE_FLAG to '1' for the fifth entry.
- 3 • If P_REV_IN_USE_s is equal to or less than six, the mobile station shall initialize the
4 logical to physical mapping table (LOGICAL_TO_PHYSICAL_MAPPING_TABLE) as
5 follows:
- 6 - Default number of Logical-to-Physical Mapping entries
7 (NUM_LPM_ENTRIES_s = '0100')
- 8 - Default Table(0) Logical-to-Physical Mapping service reference identifier
9 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].SR_ID_s = '000')
- 10 - Default Table(0) Logical-to-Physical Mapping logical resource identifier
11 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].LOGICAL_RESOURCE_s = '0001')
- 12 - Default Table(0) Logical-to-Physical Mapping physical resource identifier:
13 + If CH_IND_s is equal to '01' or '11', the mobile station shall set
14 LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].PHYSICAL_RESOURCE_s to
15 '0000'.
16 + If CH_IND_s is equal to '10', the mobile station shall set
17 LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].PHYSICAL_RESOURCE_s to
18 '0001'.
- 19 - Default Table(0) Logical-to-Physical Mapping forward mapping indicator
20 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].FORWARD_FLAG_s = '1')
- 21 - Default Table(0) Logical-to-Physical Mapping reverse mapping indicator
22 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].REVERSE_FLAG_s = '1')
- 23 - Default Table(0) Logical-to-Physical Mapping priority
24 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[0].PRIORITY_s = '0000')
- 25 - Default Table(1) Logical-to-Physical Mapping service reference identifier
26 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].SR_ID_s = '001')
- 27 - Default Table(1) Logical-to-Physical Mapping logical resource identifier
28 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].LOGICAL_RESOURCE_s = '0000')
- 29 - Default Table(1) Logical-to-Physical Mapping physical resource identifier:
30 + If CH_IND_s is equal to '01' or '11', the mobile station shall set
31 LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].PHYSICAL_RESOURCE_s to
32 '0000'.
33 + If CH_IND_s is equal to '10', the mobile station shall set
34 LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].PHYSICAL_RESOURCE_s to
35 '0001'.
- 36 - Default Table(1) Logical-to-Physical Mapping forward mapping indicator
37 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].FORWARD_FLAG_s = '1')

- 1 - Default Table(1) Logical-to-Physical Mapping reverse mapping indicator
2 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].REVERSE_FLAG_s = '1')
- 3 - Default Table(1) Logical-to-Physical Mapping priority
4 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[1].PRIORITY_s = '0000')
- 5 - Default Table(2) Logical-to-Physical Mapping service reference identifier
6 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[2].SR_ID_s = '001')
- 7 - Default Table(2) Logical-to-Physical Mapping logical resource identifier
8 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[2].LOGICAL_RESOURCE_s = '0000')
- 9 - Default Table(2) Logical-to-Physical Mapping physical resource identifier
10 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[2].PHYSICAL_RESOURCE_s to
11 '0010').
- 12 - Default Table(2) Logical-to-Physical Mapping forward mapping indicator
13 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[2].FORWARD_FLAG_s = '1')
- 14 - Default Table(2) Logical-to-Physical Mapping reverse mapping indicator
15 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[2].REVERSE_FLAG_s = '1')
- 16 - Default Table(2) Logical-to-Physical Mapping priority
17 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[2].PRIORITY_s = '0000')
- 18 - Default Table(3) Logical-to-Physical Mapping service reference identifier
19 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[3].SR_ID_s = '001')
- 20 - Default Table(3) Logical-to-Physical Mapping logical resource identifier
21 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[3].LOGICAL_RESOURCE_s = '0000')
- 22 - Default Table(3) Logical-to-Physical Mapping physical resource identifier
23 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[2].PHYSICAL_RESOURCE_s to
24 '0011').
- 25 - Default Table(3) Logical-to-Physical Mapping forward mapping indicator
26 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[3].FORWARD_FLAG_s = '1')
- 27 - Default Table(3) Logical-to-Physical Mapping reverse mapping indicator
28 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[3].REVERSE_FLAG_s = '1')
- 29 - Default Table(3) Logical-to-Physical Mapping priority
30 (LOGICAL_TO_PHYSICAL_MAPPING_TABLE[3].PRIORITY_s = '0000')
- 31 • If BCMC_ON_TRAFFIC_SUP_s is set to '1', the mobile station shall set
32 AUTO_REQ_TRAF_ALLOWED_IND_s to '1'.
- 33 • The mobile station shall disable the T_{MS_Slotted} timer, and set SLOTTED_s to YES.
- 34 • The mobile station shall set REV_SPICH_EP_SIZE_s to 5.
- 35 • If FOR_PDCH_PARAMS_INCL_s is equal to '0', the mobile station shall perform the
36 following:
- 37 - The mobile station shall set RLGAIN_ACKCH_PILOT_s to 0.
- 38 - The mobile station shall set RLGAIN_CQICH_PILOT_s to 0.

- 1 • If REV_PDCH_PARMS_INCL_s is equal to '0', the mobile station shall perform the
2 following:
- 3 - The mobile station shall set RLGAIN_SPICH_PILOT_s to 0.
4 - The mobile station shall set RLGAIN_REQCH_PILOT_s to 0.
5 - The mobile station shall set RLGAIN_PDCCH_PILOT_s to 0.
6 - The mobile station shall set REV_PDCH_MAX_AUTO_TPR_s to 8 (1dB).
7 - The mobile station shall set
8 REV_PDCH_MAX_SIZE_ALLOWED_ENCODER_PACKET_s to 9.
9 - The mobile station shall set REV_PDCH_DEFAULT_PERSISTENCE_s to '0'.
10 - The mobile station shall set REV_PDCH_RESET_PERSISTENCE_s to '0'.
11 - The mobile station shall set REV_PDCH_NUM_ARQ_ROUNDS_NORMAL_s to 3.
12 - The mobile station shall set REV_PDCH_NUM_ARQ_ROUNDS_BOOST_s to 3.
13 - The mobile station shall set REV_PDCH_MSIB_SUPPORTED_s to '0'.
14 - The mobile station shall set REV_PDCH_SOFT_SWITCHING_RESET_IND_s to '0'.
15 - The mobile station shall set REV_PDCH_TABLE_SEL_s to '0'.
16 • The mobile station shall set REV_PDCH_BUFFER_SIZE_s to NULL.
17 • For i = 0 to 7, the mobile station shall set_s to
18 REV_REQCH_BUF_QUANT_PARM_1_s[i] to NULL and
19 REV_REQCH_BUF_QUANT_PARM_2_s[i] to NULL.
20 • The mobile station shall set REV_REQCH_POWER_HEADROOM_INCREASE_s to
21 NULL.
22 • The mobile station shall set REV_REQCH_USE_POWER_REPORTS_s to NULL.
23 • The mobile station shall set REV_REQCH_POWER_HEADROOM_DECREASE_s to
24 NULL.
25 • The mobile station shall set REV_REQCH_HEADROOM_DURATION_s to NULL.
26 • The mobile station shall set REV_REQCH_MAX_POWER_UPDATE_DURATION_s to
27 NULL.
28 • The mobile station shall set REV_PDCH_INIT_TARGET_TPR_s to 0 (0dB).
29 • The mobile station shall set REV_PDCH_MAX_TARGET_TPR_s to 0 (0dB).
30 • The mobile station shall set REV_PDCH_QUICK_START_THRESH_s to 72 (9dB).
31 • The mobile station shall set REV_REQCH_QUICK_REPEAT_ALLOWED_s to NULL.
32 • The mobile station shall set REV_PDCH_GRANT_PRECEDENCE_s to '1'.
33 • The mobile station shall set REV_PDCH_ALWAYS_ACK_FINAL_ROUND_s to '0'.
34 • For i = 1 to (11 × (REV_PDCH_EP_MAP_LEN_r + 1)), the mobile station shall perform
35 the following:

- 1 - If $i \leq 11$, the mobile station shall perform the following:
- 2 + The mobile station shall set $REV_PDCH_STEP_UP_S[i]$ and
- 3 $REV_PDCH_STEP_DOWN_S[i]$ as specified on the i^{th} row of Table 2.6.4.2-3.
- 4 - Otherwise, the mobile station shall set $REV_PDCH_STEP_UP_S[i]$ to 0, and it shall
- 5 set $REV_PDCH_STEP_DOWN_S[i]$ to 0.
- 6 • For $i = 0$ to 6, the mobile station shall perform the following:
- 7 - $REV_PDCH_BOOST_ALLOWED[i]_S$ to '0'.
- 8 - $REV_PDCH_AUTO_ALLOWED[i]_S$ to '1'.
- 9 • The mobile station shall set $REV_REQCH_ENABLED_S$ to '0'.
- 10 • The mobile station shall set $REV_PDCH_REQCH_TRIGGER_S$ to NULL.
- 11 • The mobile station shall set $REV_PDCH_BOOST_OVERSHOOT_S$ to 0.

12 **Table 2.6.4.2-3. Default REV_PDCH_STEP_UP and REV_PDCH_STEP_DOWN tables**

EP_SIZE	REV_PDCH_STEP_UP	REV_PDCH_STEP_DOWN
192	3	0
408	1.75	0.0625
792	0.9375	0.09375
1560	0.5	0.125
3096	0.28125	0.15625
4632	0.15625	0.1875
6168	0.125	0.21875
9240	0.0625	0.28125
12312	0.03125	0.375
15384	0.03125	0.59375
18456	0	0.875

- 13 • The mobile station shall set $USE_CH_CFG_RRM_S$ to '0'.
- 14 • If the $ASSIGN_MODE_R$ field from the *Channel Assignment Message* equals '000', the
- 15 mobile station shall set $SERV_NEG_S$ to disabled.
- 16 • If the $ASSIGN_MODE_R$ field from the *Channel Assignment Message* equals '100', the
- 17 mobile station shall set $SERV_NEG_S$ to enabled.
- 18 • [If RC 8 is assigned on the reverse fundamental channel, or RC 11 or RC 12 is](#)
- 19 [assigned on the forward fundamental channel,](#) the mobile station shall initialize
- 20 RC parameters as described in section 2.6.16.
- 21 • The mobile station shall determine the service configuration as follows:
- 22 - If $SERV_NEG_S$ equals disabled, the initial service configuration shall include
- 23 Multiplex Option 1 and Radio Configuration 1 for both the Forward and Reverse
- 24 Traffic Channels, and shall include no service option connections.

- 1 - If $SERV_NEG_S$ equals enabled, and if $GRANTED_MODE_S$ equals '00', the initial
2 service configuration shall include the multiplex option and radio configuration
3 for the Forward and Reverse Traffic Channels as specified by
4 $DEFAULT_CONFIG_S$, and shall include no service option connections.
- 5 - If $SERV_NEG_S$ equals enabled and $GRANTED_MODE_S$ equals '01' or '10':
- 6 + If the mobile station enters the *Traffic Channel Initialization Substate* because
7 of receiving the *Channel Assignment Message*, the initial service
8 configuration shall include the default Forward and Reverse Traffic Channel
9 multiplex options and transmission rates corresponding to the service option
10 requested by the mobile station in the *Origination Message*, in the case of a
11 mobile station originated call, or the *Page Response Message*, in the case of
12 a mobile station terminated, and shall include no service option connections.
- 13 + If the mobile station enters the *Traffic Channel Initialization Substate* because
14 of receiving the *Extended Channel Assignment Message*, the initial service
15 configuration shall include the default Forward and Reverse Traffic Channel
16 multiplex options that are derived from the radio configurations
17 corresponding to the Table 3.7.2.3.2.21-7, and shall include no service
18 option connections.
- 19 - If $SERV_NEG_S$ equals enabled and $GRANTED_MODE_S$ equals '11', the mobile
20 station shall begin to use the stored service configuration corresponding to
21 $SYNC_ID_S$ as the current service configuration and shall begin to process
22 Forward and Reverse Traffic Channel frames accordingly. The set of service
23 option connections to be restored are determined as follows:
- 24 + If $SR_ID_RESTORE_S$ equals '111', the mobile station shall restore all the
25 service option connections from the stored service configuration.
- 26 + If $SR_ID_RESTORE_S$ equals '000', the mobile station shall restore the service
27 option connections indicated by $SR_ID_RESTORE_BITMAP_S$ from the stored
28 service configuration.
- 29 + Otherwise, the mobile station shall restore the service option connection
30 corresponding to $SR_ID_RESTORE_S$ from the stored service configuration.
- 31 - If $SERV_NEG_S$ equals disabled, the mobile station shall perform the following:
- 32 + If the call is mobile station originated and the *Origination Message* requests a
33 special service option, the mobile station shall set SO_REQ_S to the special
34 service option number.
- 35 + If the call is mobile station originated and the *Origination Message* does not
36 request a special service option, the mobile station shall set SO_REQ_S to 1
37 (the default service option number).
- 38 + If the call is mobile station terminated, the mobile station shall set SO_REQ_S
39 to the service option number requested in the *Page Response Message*.

40 While in the *Traffic Channel Initialization Substate*, the mobile station shall perform the
41 following:

- 1 • The mobile station shall monitor Forward Traffic Channels associated with one or
2 more pilots in the Active Set.
- 3 • The mobile station shall perform pilot strength measurements as specified in
4 2.6.6.2.2, but shall not send *Pilot Strength Measurement Messages* or *Extended Pilot*
5 *Strength Measurement Messages*.
- 6 • The mobile station shall perform registration timer maintenance as specified in
7 2.6.5.5.4.2.
- 8 • If the bits of TMSI_CODE_{s-p} are not all equal to '1' and if System Time (in 80 ms
9 units) exceeds TMSI_EXP_TIME_{s-p} × 2¹², the mobile station shall set all the bits of
10 TMSI_CODE_{s-p} to '1' within T_{66m} seconds.
- 11 • If the full-TMSI timer expires or has expired, the mobile station shall set all the bits
12 of TMSI_CODE_{s-p} to '1'. The mobile station shall update the registration variables
13 as described in 2.6.5.5.2.5.
- 14 • If the Forward Packet Data Channel is assigned, whenever the mobile station
15 transmitter is disabled, the MS shall set FPDCH_DTX_INDICATOR_s to '1'.
- 16 • If the Forward Packet Data Channel is assigned, whenever the mobile station
17 transmitter is enabled, the mobile station shall perform the following procedures:
18 - The MS shall set FPDCH_DTX_INDICATOR_s to '0'.
19 - If the mobile station transmitter has been disabled for at least
20 TX_DISABLED_TIMER_s, the mobile station shall send SIG-
21 HandoffPDCH.Indication (handoff_type = ASSIGN) primitive to the MAC layer.

22 If the mobile station does not support the assigned CDMA Channel (see [2]) or all of the
23 assigned Forward Traffic code channels (see [2]), the mobile station shall enter the *System*
24 *Determination Substate* of the *Mobile Station Initialization State* with an error indication (see
25 2.6.1.1).

26 If the mobile station supports the assigned CDMA Channel and the assigned Forward
27 Traffic code channels, the mobile station shall perform the following:

- 28 • The mobile station shall tune to the assigned CDMA Channel.
- 29 • The mobile station shall set its code channel for the assigned Forward Traffic code
30 channel.
- 31 • The mobile station shall set its Forward and Reverse Traffic Channel frame offsets
32 to the assigned frame offset as determined by FRAME_OFFSET_s.
- 33 • The mobile station shall set its Forward and Reverse Traffic Channel long code
34 masks to the public long code mask (see [2]).

35 If all of the following conditions are true:

- 36 • F-CPCCH is assigned, and
- 37 • EARLY_RL_TRANSMIT_IND_s equals '1',

38 the mobile station shall perform the following:

- 1 • The mobile station shall adjust its transmit power as specified in [2].
- 2 • The mobile station shall transmit the Traffic Channel preamble as specified in [2]
- 3 and Layer 3 shall send an *acquiring dedicated channel* indication to Layer 2 (see [4]).
- 4 • If CH_IND_s equals '00', the mobile station shall commence R-CQICH reporting as
- 5 specified in [2].
- 6 • If the mobile station receives a period of (N_{18m} × 1.25) ms with sufficient signal
- 7 quality on the Forward Common Power Control Subchannel assigned to this mobile
- 8 station within T_{79m} seconds after entering this substate, the mobile station shall
- 9 perform the following additional functions while it remains in the *Traffic Channel*
- 10 *Initialization Substate*:
- 11 - The mobile station shall perform Forward Traffic Channel supervision as
- 12 specified in 2.6.4.1.8. If a loss of the Forward Traffic Channel is declared, the
- 13 mobile station shall enter the *System Determination Substate* of the *Mobile*
- 14 *Station Initialization State* with a system lost indication (see 2.6.1.1).
- 15 - The mobile station shall process Forward Traffic Channel signaling traffic and
- 16 shall discard other types of Forward Traffic Channel traffic.
- 17 • If the mobile station does not receive a period of (N_{18m} × 1.25) ms with sufficient
- 18 signal quality on the Forward Common Power Control Subchannel assigned to this
- 19 mobile station within T_{79m} seconds after entering this substate, the mobile station
- 20 shall perform the following:
- 21 - The mobile station shall disable its transmitter.
- 22 - The mobile station shall discard any messages queued for transmission, and
- 23 those messages received and pending processing.
- 24 - The mobile station shall remain in this substate and perform the procedures
- 25 below.

26 If all of the following conditions are true:

- 27 • F-CPCCH is assigned, and
- 28 • EARLY_RL_TRANSMIT_IND_s equals '0', or EARLY_RL_TRANSMIT_IND_s equals '1'
- 29 and the T_{79m} timer has expired,.

30 the mobile station shall perform the following:

- 31 • If the mobile station receives a period of (N_{18m} × 1.25) ms with sufficient signal
- 32 quality on the Forward Common Power Control Subchannel assigned to this mobile
- 33 station within T_{50m} seconds after entering this substate, the mobile station shall
- 34 perform the following additional functions while it remains in the *Traffic Channel*
- 35 *Initialization Substate*:
- 36 - The mobile station shall perform Forward Traffic Channel supervision as
- 37 specified in 2.6.4.1.8. If a loss of the Forward Traffic Channel is declared, the
- 38 mobile station shall enter the *System Determination Substate* of the *Mobile*
- 39 *Station Initialization State* with a system lost indication (see 2.6.1.1).

- 1 - The mobile station shall adjust its transmit power as specified in [2].
- 2 - The mobile station shall transmit the Traffic Channel preamble as specified in
3 [2], and Layer 3 shall send an *acquiring dedicated channel* indication to Layer 2
4 (see [4]).
- 5 - If CH_IND_s equals '00', the mobile station shall commence R-CQICH reporting
6 as specified in [2].
- 7 - The mobile station shall process Forward Traffic Channel signaling traffic and
8 shall discard other types of Forward Traffic Channel traffic.
- 9 - If Layer 3 receives a L2-Condition.Notification primitive from Layer 2 indicating
10 an acknowledgment failure, the mobile station shall perform the following:
- 11 + If the Direct Channel Assignment call setup procedure was used and
12 DIRECT_CH_ASSIGN_RECOVER_IND_s is set to '1', the mobile station shall
13 perform the following:
- 14 o If any of the following conditions is met:
- 15 ◇ The mobile station is able to select the last pilot mobile station was
16 monitoring before entering *Mobile Station Control on the Traffic*
17 *Channel State* and the pilot has sufficient signal strength, or
- 18 ◇ The mobile station is able to select a pilot with sufficient signal
19 strength that is listed in NGHBR_REC_LIST, the ACCESS_ENTRY_HO
20 field of the NGHBR_REC corresponding to the selected pilot is equal
21 to '1' and the mobile station has sufficient information to monitor
22 BCCH or PCH from base station corresponding to the selected pilot.
- 23 Then the mobile station shall enter the Update Overhead Information
24 Substate of the System Access State with a direct channel assignment
25 failure indication on the selected pilot.
- 26 o Otherwise, the mobile station shall enter the System Determination
27 Substate of the Mobile Station Initialization State with a system lost
28 indication (see 2.6.1.1).
- 29 + Otherwise, the mobile station shall disable its transmitter and enter the
30 *System Determination Substate* of the *Mobile Station Initialization State* with a
31 system lost indication (see 2.6.1.1).
- 32 • If the mobile station does not receive a period of ($N_{18m} \times 1.25$) ms with sufficient
33 signal quality on the Forward Common Power Control Subchannel assigned to this
34 mobile station within T_{50m} seconds after entering this substate, the mobile station
35 shall perform the following:
- 36 • If the Direct Channel Assignment call setup procedure was used and
37 DIRECT_CH_ASSIGN_RECOVER_IND_s is set to '1', the mobile station shall perform
38 the following:
- 39 - If any of the following conditions is met:

- 1 + The mobile station is able to select the last pilot mobile station was
2 monitoring before entering *Mobile Station Control on the Traffic Channel State*
3 and the pilot has sufficient signal strength, or
- 4 + The mobile station is able to select a pilot with sufficient signal strength that
5 is listed in NGHBR_REC_LIST, and the ACCESS_ENTRY_HO field of the
6 NGHBR_REC corresponding to the selected pilot is equal to '1' and the
7 mobile station has sufficient information to monitor BCCH or PCH from base
8 station corresponding to the selected pilot.

9 Then the mobile station shall enter the *Update Overhead Information Substate* of
10 the *System Access State* with a direct channel assignment failure indication on
11 the selected pilot.

- 12 - Otherwise, the mobile station shall enter the *System Determination Substate* of
13 the *Mobile Station Initialization State* with a system lost indication (see 2.6.1.1).
- 14 • Otherwise, the mobile station shall enter the *System Determination Substate* of the
15 *Mobile Station Initialization State* with a system lost indication (see 2.6.1.1).

16 If all of the following conditions are true:

- 17 • F-CPCCH is not assigned, and
18 • EARLY_RL_TRANSMIT_IND_S equals '1',

19 the mobile station shall perform the following:

- 20 • The mobile station shall adjust its transmit power as specified in [2].
- 21 • The mobile station shall transmit the Traffic Channel preamble as specified in [2],
22 and Layer 3 shall send an acquiring dedicated channel indication to Layer 2 (see
23 [4]).
- 24 • If CH_INDs equals '00', the mobile station shall commence R-CQICH reporting as
25 specified in [2].
- 26 • If the mobile station receives a period of ($N_{5m} \times 20$) ms with sufficient signal quality
27 on the physical channel corresponding to FPC_PRI_CHAN_S within T_{79m} seconds
28 after entering this substate, the mobile station shall perform the following additional
29 functions while it remains in the *Traffic Channel Initialization Substate*:
- 30 - The mobile station shall perform Forward Traffic Channel supervision as
31 specified in 2.6.4.1.8. If a loss of the Forward Traffic Channel is declared, the
32 mobile station shall enter the *System Determination Substate* of the *Mobile*
33 *Station Initialization State* with a system lost indication (see 2.6.1.1).
- 34 - The mobile station shall process Forward Traffic Channel signaling traffic and
35 shall discard other types of Forward Traffic Channel traffic.
- 36 • If the mobile station does not receive a period of ($N_{5m} \times 20$) ms with sufficient signal
37 quality on the physical channel corresponding to FPC_PRI_CHAN_S within T_{79m}
38 seconds after entering this substate, the mobile station shall perform the following:
- 39 - The mobile station shall disable its transmitter.

- 1 - The mobile station shall discard any messages queued for transmission, and
2 those messages received and pending processing.
- 3 - The mobile station shall remain in this substate and perform the procedures
4 below.

5 If all of the following conditions are true:

- 6 • F-CPCCH is not assigned, and
7 • EARLY_RL_TRANSMIT_IND_s equals '0', or EARLY_RL_TRANSMIT_IND_s equals '1'
8 and the T_{79m} timer has expired,

9 the mobile station shall perform the following:

- 10 • If the mobile station receives a period of (N_{5m} × 20) ms with sufficient signal quality
11 on the physical channel corresponding to FPC_PRI_CHAN_s within T_{50m} seconds
12 after entering this substate, the mobile station shall perform the following additional
13 functions while it remains in the *Traffic Channel Initialization Substate*:
- 14 - The mobile station shall perform Forward Traffic Channel supervision as
15 specified in 2.6.4.1.8. If a loss of the Forward Traffic Channel is declared, the
16 mobile station shall enter the *System Determination Substate* of the *Mobile
17 Station Initialization State* with a system lost indication (see 2.6.1.1).
- 18 - The mobile station shall adjust its transmit power as specified in [2].
- 19 - The mobile station shall transmit the Traffic Channel preamble as specified in
20 [2], and Layer 3 shall send an *acquiring dedicated channel* indication to Layer 2
21 (see [4]).
- 22 - If CH_IND_s equals '00', the mobile station shall commence R-CQICH reporting
23 as specified in [2].
- 24 - The mobile station shall process Forward Traffic Channel signaling traffic and
25 shall discard other types of Forward Traffic Channel traffic.
- 26 - If Layer 3 receives a L2-Condition.Notification primitive from Layer 2 indicating
27 an acknowledgment failure, the mobile station shall perform the following:
- 28 + If the Direct Channel Assignment call setup procedure was used and
29 DIRECT_CH_ASSIGN_RECOVER_IND_s is set to '1', the mobile station shall
30 perform the following:
- 31 ○ If any of the following conditions is met:
- 32 ◇ The mobile station is able to select the last pilot mobile station was
33 monitoring before entering *Mobile Station Control on the Traffic
34 Channel State* and the pilot has sufficient signal strength, or

- 1 ◇ The mobile station is able to select a pilot with sufficient signal
2 strength that is listed in NGHBR_REC_LIST, and the
3 ACCESS_ENTRY_HO field of the NGHBR_REC corresponding to the
4 selected pilot is equal to '1' and the mobile station has sufficient
5 information to monitor BCCH or PCH from base station
6 corresponding to the selected pilot.

7 Then the mobile station shall enter the *Update Overhead Information*
8 *Substate* of the *System Access State* with a direct channel assignment
9 failure indication on the selected pilot.

- 10 ○ Otherwise, the mobile station shall enter the *System Determination*
11 *Substate* of the *Mobile Station Initialization State* with a system lost
12 indication (see 2.6.1.1).

13 + Otherwise, the mobile station shall disable its transmitter and enter the
14 *System Determination Substate* of the *Mobile Station Initialization State* with a
15 system lost indication (see 2.6.1.1).

- 16 • If the mobile station does not receive a period of $(N_{5m} \times 20)$ ms with sufficient
17 signal quality on the physical channel corresponding to FPC_PRI_CHAN_s within
18 T_{50m} seconds after entering this substate, the mobile station shall perform the
19 following:

- 20 • If the Direct Channel Assignment call setup procedure was used and
21 DIRECT_CH_ASSIGN_RECOVER_IND_s is set to '1', the mobile station shall perform
22 the following:

23 - If all of the following conditions are met:

24 + The mobile station is able to select the last pilot mobile station was
25 monitoring before entering *Mobile Station Control on the Traffic Channel State*
26 and the pilot has sufficient signal strength, or

27 + The mobile station is able to select a pilot with sufficient signal strength that
28 is listed in NGHBR_REC_LIST, and the ACCESS_ENTRY_HO field of the
29 NGHBR_REC corresponding to the selected pilot is equal to '1' and the
30 mobile station has sufficient information to monitor BCCH or PCH from base
31 station corresponding to the selected pilot.

32 Then the mobile station shall enter the *Update Overhead Information*
33 *Substate* of the *System Access State* with a direct channel assignment failure
34 indication on the selected pilot.

35 - Otherwise, the mobile station shall enter the *System Determination Substate* of
36 the *Mobile Station Initialization State* with a system lost indication (see 2.6.1.1).

- 37 • Otherwise, the mobile station shall enter the *System Determination Substate* of the
38 *Mobile Station Initialization State* with a system lost indication (see 2.6.1.1).

39 The mobile station shall then perform the procedures specified in 2.6.4.2.2.

1 2.6.4.2.1 Return to Traffic Channel Initialization Substate with Initialization Failure
2 Indication

3 If F-CPCCH is assigned, the mobile station shall perform the following:

- 4 • The mobile station shall perform the following functions while it remains in the
5 *Traffic Channel Initialization Substate*:
 - 6 - The mobile station shall perform Forward Traffic Channel supervision as
7 specified in 2.6.4.1.8. If a loss of the Forward Traffic Channel is declared, the
8 mobile station shall enter the *System Determination Substate* of the *Mobile*
9 *Station Initialization State* with a system lost indication (see 2.6.1.1).
 - 10 - The mobile station shall continue transmitting the Traffic Channel preamble as
11 specified in [2], the mobile station shall continue R-CQICH reporting as specified
12 in [2], and Layer 3 shall send an *acquiring dedicated channel* indication to Layer
13 2 (see [4]).
 - 14 - The mobile station shall process Forward Traffic Channel signaling traffic and
15 shall discard other types of Forward Traffic Channel traffic.
 - 16 - If Layer 3 receives a L2-Condition.Notification primitive from Layer 2 indicating
17 an acknowledgment failure, the mobile station shall perform the following:
 - 18 + If the Direct Channel Assignment call setup procedure was used and
19 DIRECT_CH_ASSIGN_RECOVER_IND_s is set to '1', the mobile station shall
20 perform the following:
 - 21 ○ If any of the following conditions is met:
 - 22 ◇ The mobile station is able to select the last pilot mobile station was
23 monitoring before entering *Mobile Station Control on the Traffic*
24 *Channel State* and the pilot has sufficient signal strength, or
 - 25 ◇ The mobile station is able to select a pilot with sufficient signal
26 strength that is listed in NGHBR_REC_LIST, and the
27 ACCESS_ENTRY_HO field of the NGHBR_REC corresponding to the
28 selected pilot is equal to '1' and the mobile station has sufficient
29 information to monitor BCCH or PCH from base station
30 corresponding to the selected pilot.
 - 31 Then the mobile station shall enter the *Update Overhead Information*
32 *Substate* of the *System Access State* with a direct channel assignment
33 failure indication on the selected pilot.
 - 34 ○ Otherwise, the mobile station shall enter the *System Determination*
35 *Substate* of the *Mobile Station Initialization State* with a system lost
36 indication (see 2.6.1.1).
 - 37 + Otherwise, the mobile station shall disable its transmitter and enter the
38 *System Determination Substate* of the *Mobile Station Initialization State* with a
39 system lost indication (see 2.6.1.1).

40 If F-CPCCH is not assigned, the mobile station shall perform the following:

- 1 • The mobile station shall perform the following functions while it remains in the
2 *Traffic Channel Initialization Substate*:
- 3 - The mobile station shall perform Forward Traffic Channel supervision as
4 specified in 2.6.4.1.8. If a loss of the Forward Traffic Channel is declared, the
5 mobile station shall enter the *System Determination Substate* of the *Mobile*
6 *Station Initialization State* with a system lost indication (see 2.6.1.1).
- 7 - The mobile station shall continue transmitting the Traffic Channel preamble as
8 specified in [2], and Layer 3 shall send an *acquiring dedicated channel* indication
9 to Layer 2 (see [4]). Furthermore, if CH_IND_s equals '00', the mobile station
10 shall continue R-CQICH reporting as specified in [2].
- 11 - The mobile station shall process Forward Traffic Channel signaling traffic and
12 shall discard other types of Forward Traffic Channel traffic.
- 13 - If Layer 3 receives a L2-Condition.Notification primitive from Layer 2 indicating
14 an acknowledgment failure, the mobile station shall perform the following:
- 15 + If the Direct Channel Assignment call setup procedure was used and
16 DIRECT_CH_ASSIGN_RECOVER_IND_s is set to '1', the mobile station shall
17 perform the following:
- 18 ○ If any of the following conditions is met:
- 19 ◇ The mobile station is able to select the last pilot mobile station was
20 monitoring before entering *Mobile Station Control on the Traffic*
21 *Channel State* and the pilot has sufficient signal strength, or
- 22 ◇ The mobile station is able to select a pilot with sufficient signal
23 strength that is listed in NGHBR_REC_LIST, and the
24 ACCESS_ENTRY_HO field of the NGHBR_REC corresponding to the
25 selected pilot is equal to '1' and the mobile station has sufficient
26 information to monitor BCCH or PCH from base station
27 corresponding to the selected pilot.
- 28 Then the mobile station shall enter the *Update Overhead Information*
29 *Substate* of the *System Access State* with a direct channel assignment
30 failure indication on the selected pilot.
- 31 ○ Otherwise, the mobile station shall enter the *System Determination*
32 *Substate* of the *Mobile Station Initialization State* with a system lost
33 indication (see 2.6.1.1).
- 34 + Otherwise, the mobile station shall disable its transmitter and enter the
35 *System Determination Substate* of the *Mobile Station Initialization State* with a
36 system lost indication (see 2.6.1.1).
- 37 The mobile station shall then perform the procedures specified in 2.6.4.2.2.

2.6.4.2.2 Exiting the Traffic Channel Initialization Substate

The mobile station should provide diversity combining of the Forward Fundicated Channels associated with pilots in the Active Set if the mobile station receives multiple pilots in the *Extended Channel Assignment Message*.

If Layer 3 does not receive a *forward dedicated channel acquired* indication from Layer 2 (see [4]) within T_{51m} seconds after the transmitter was last enabled, the mobile station shall perform the following:

- If the Direct Channel Assignment call setup procedure was used and $DIRECT_CH_ASSIGN_RECOVER_IND_S$ is set to '1', the mobile station shall perform the following:
 - If any of the following conditions is met:
 - + The mobile station is able to select the last pilot mobile station was monitoring before entering *Mobile Station Control on the Traffic Channel State* and the pilot has sufficient signal strength, or
 - + The mobile station is able to select a pilot with sufficient signal strength that is listed in $NGHBR_REC_LIST$, and the $ACCESS_ENTRY_HO$ field of the $NGHBR_REC$ corresponding to the selected pilot is equal to '1' and the mobile station has sufficient information to monitor BCCH or PCH from base station corresponding to the selected pilot.

Then the mobile station shall enter the *Update Overhead Information Substate* of the *System Access State* with a direct channel assignment failure indication on the selected pilot.

- Otherwise, the mobile station shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a system lost indication (see 2.6.1.1).
- Otherwise, the mobile station shall disable its transmitter and enter the *System Determination Substate* of the *Mobile Station Initialization State* with a system lost indication (see 2.6.1.1).

After the first occurrence of receiving a period of $(N_{5m} \times 20)$ ms with sufficient signal quality on the physical channel corresponding to $FPC_PRI_CHAN_S$ or a period of $(N_{18m} \times 1.25)$ ms with sufficient signal quality on the Forward Common Power Control Subchannel assigned to this mobile station, if one of the following conditions is met:

- Layer 3 has received a *forward dedicated channel acquired* indication from Layer 2 within T_{51m} seconds after the transmitter was last enabled, or
- The mobile station supports transmission of fixed Traffic Channel preamble, and $FIXED_PREAMBLE_TRANSMIT_IND_S$ equals '1', and the mobile station has transmitted the Traffic Channel preamble for the duration corresponding to $FIXED_NUM_PREAMBLE_S$ as specified by the Table 3.7.2.3.2.21-13

the mobile station shall perform the following:

- If CH_IND_S is equal to '01', the mobile station shall begin transmitting on the Reverse Fundamental Channel.

- 1 • If CH_IND_s is equal to '11' and FUNDICATED_BCMC_IND_s equals '0', or if CH_IND_s
2 is equal to '11' and FUNDICATED_BCMC_IND_s equals '1' and
3 REV_FCH_ASSIGNED_s is equal to '1', the mobile station shall begin transmitting on
4 the Reverse Fundamental Channel.
- 5 • If CH_IND_s is equal to '10' or '11', the mobile station shall begin transmitting on the
6 Reverse Dedicated Control Channel when the mobile station has user data or
7 signaling traffic to send on the Reverse Dedicated Control Channel.
- 8 • If CH_IND_s equals '00', the mobile station shall perform the following:
- 9 - If EXT_CH_IND_s signals the allocation of a R-FCH, the mobile station shall
10 begin transmitting on the Reverse Fundamental Channel.
- 11 - If EXT_CH_IND_s signals the allocation of a R-DCCH, the mobile station shall
12 begin transmitting on the Reverse Dedicated Control Channel when the mobile
13 station has user data or signaling traffic to send on the Reverse Dedicated
14 Control Channel.
- 15 - If EXT_CH_IND_s signals the allocation of a R-PDCH, the mobile station shall
16 begin transmitting on the Reverse Packet Data Channel when the mobile station
17 has user data or signaling traffic to send on the Reverse Packet Data Channel.
- 18 • If SERV_NEG_s equals disabled, the mobile station shall activate the *SO Negotiation*
19 *Subfunction*.
- 20 • If SERV_NEG_s equals enabled and the GRANTED_MODE_s is '00', '01', or '11', the
21 mobile station shall activate the *Normal Service Subfunction*.
- 22 • If SERV_NEG_s equals enabled and the GRANTED_MODE_s is '10', the mobile station
23 shall activate the *Waiting for Service Connect Message Subfunction*.
- 24 • The mobile station shall perform the following:
- 25 - If SERV_NEG_s equals enabled and GRANTED_MODE_s is equal to '11', the
26 mobile station shall perform the following:
- 27 + The mobile station shall restore the stored service configuration as specified
28 in 2.6.4.1.2.2.5.2.
- 29 + For the first service option connection (with corresponding connection
30 reference CON_REF_j) listed in this stored Service Configuration information
31 record, Layer 3 shall instantiate a Call Control instance (as specified in
32 2.6.10) with the received BYPASS_ALERT_ANSWER_s. The mobile station
33 shall identify this Call Control instances by the corresponding CON_REF_j
34 and also identify this Call Control instance by the NULL identifier.

- 1 + For each of the remaining service option connection (with corresponding
2 connection reference CON_REF_i) that will be restored from the stored service
3 configuration record, Layer 3 shall instantiate a Call Control instance (as
4 specified in 2.6.10) with a 'restore indication'. The mobile station shall
5 identify each of these Call Control instances by the corresponding
6 CON_REF_i.
- 7 + The mobile station shall store the synchronization identifier corresponding to
8 the restored service configuration as SYNC_ID_S.
- 9 - Otherwise, the mobile station shall perform the following:
- 10 + If the BCMC_ORIG_ONLY_IND field is not included or is included and set to
11 '0' in the *Origination Message*, *Page Response Message*, or *Reconnect*
12 *Message*, the Layer 3 shall instantiate a Call Control instance (as specified in
13 2.6.10) for each service instance being initiated.
- 14 + The Layer 3 shall assign a default identifier of NULL to the Call Control
15 instance corresponding to the SR_ID field of the *Origination Message*, *Page*
16 *Response Message*, or *Reconnect Message*.
- 17 + If P_REV_IN_USE_S is greater than or equal to 11, the mobile station shall set
18 a call control timer to a value of T_{42m} seconds.
- 19 • The Layer 3 shall enter the *Traffic Channel Substate*.

20 2.6.4.3 Traffic Channel Substate

21 In this substate, the mobile station may exchange Traffic Channel frames with the base
22 station in accordance with the current service configuration. The mobile station may
23 perform the gating operation of Reverse Pilot Channel.

24 The mobile station can be in the *Active Mode* or *Control Hold Mode* while in this substate.

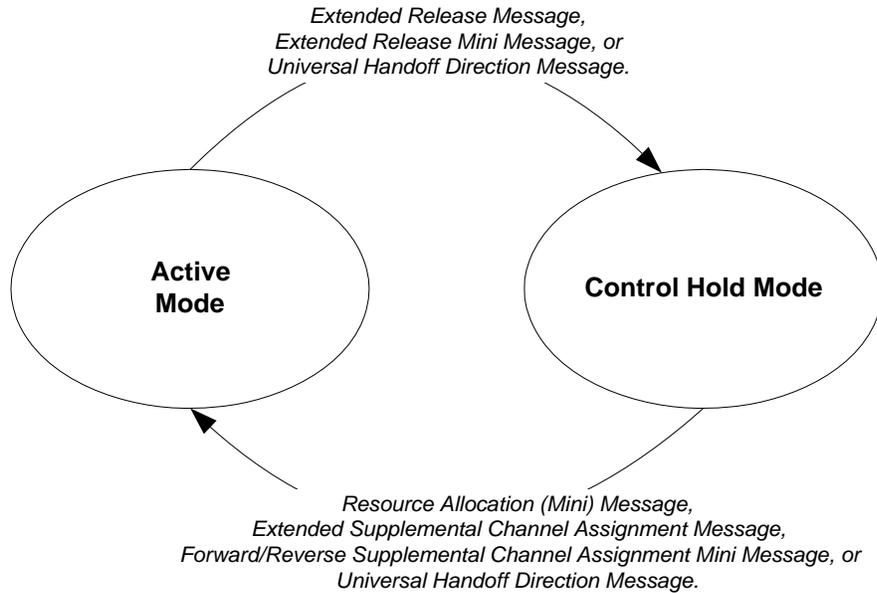

25 The following are the attributes when the mobile station is in the *Active Mode* of *Traffic*
26 *Channel Substate*:

- 27 • PILOT_GATING_USE_RATE is set to '0' (i.e., the reverse pilot (r-pich) is not gated).
28 • Flow of data traffic is permitted by the Multiplex Sublayer.

29 The following are the attributes when the mobile station is in the *Control Hold Mode* of
30 *Traffic Channel Substate*:

- 31 • PILOT_GATING_USE_RATE is set to '1'.
32 • The reverse pilot (r-pich) may be gated (if PILOT_GATING_RATE_S is not equal to
33 '00').
34 • If a Forward Packet Data Channel is not assigned, then the flow of data traffic is
35 blocked by the Multiplex Sublayer.
36 • If a Forward Packet Data Channel is assigned, then the flow of both data traffic and
37 signaling traffic is blocked by the Multiplex Sublayer.

- 1 Figure 2.6.4.3-1 shows the valid transitions between the modes of a *Traffic Channel Substate*
- 2 when a F-PDCH is not assigned in Control Hold Mode and the over-the-air Upper
- 3 Layer Signaling Messages that trigger transitions between these modes.

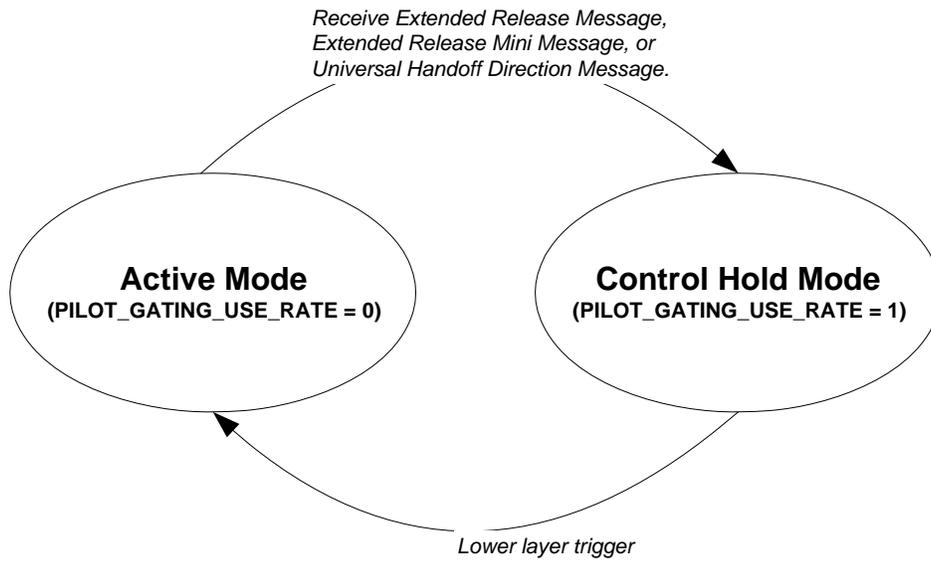

Note: The mode transition occurs when the fields are set appropriately

4

5 **Figure 2.6.4.3-1. Mobile Station Modes When a F-PDCH is not Assigned in Control**
6 **Hold Mode**

6

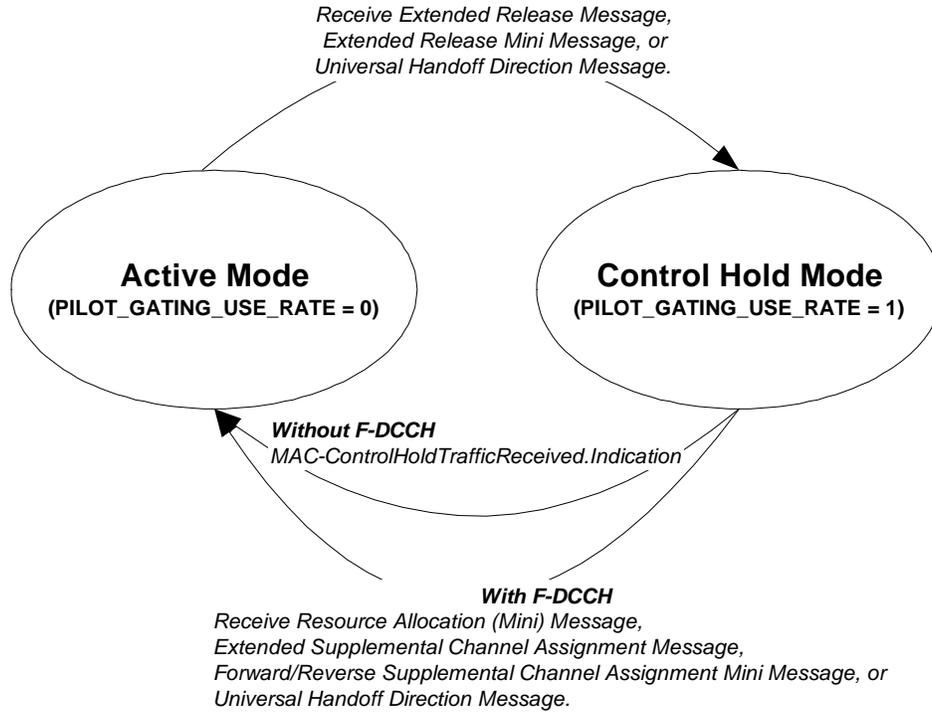

- 7 Figures 2.6.4.3-2 and 2.6.4.3-3 show the valid transitions between the modes of a *Traffic*
- 8 *Channel Substate* when a F-PDCH is assigned in Control Hold Mode and the triggers that
- 9 cause transitions between these modes.

Note: The mode transition occurs when the fields are set appropriately

Figure 2.6.4.3-2. Mobile Station Modes When a F-PDCH is Assigned in Control Hold Mode: Mobile Station Initiated Exit from Control Hold.

Note: The mode transition occurs when the fields are set appropriately

Figure 2.6.4.3-3. Mobile Station Modes when a F-PDCH is Assigned in Control Hold: Base Station Initiated Exit from Control Hold.

Upon entering the *Traffic Channel Substate*, the mobile station shall perform the following:

- If $SERV_NEG_s$ equals enabled, the call is mobile station originated, and $GRANTED_MODE_s$ is equal to '00' or '01', the mobile station should initiate service negotiation to request a service configuration in accordance with the requirements for the active service subfunction (see 2.6.4.1.2.2).

While in the *Traffic Channel Substate*, the mobile station shall perform the following:

- If $FIXED_PREAMBLE_TRANSMIT_IND_s$ equals '1' and Layer 3 does not receive a *forward dedicated channel acquired* indication from Layer 2 (see [4]) within T_{80m} seconds after entering the *Traffic Channel Substate* of the *Mobile Station Control on the Traffic Channel State*, the mobile station shall set $FIXED_PREAMBLE_TRANSMIT_IND_s$ to '0' and re-enter the *Traffic Channel Initialization Substate* of the *Mobile Station Control on the Traffic Channel State* with an Initialization Failure indication.
- If the call control timer expires, the mobile station shall perform the following for each call control instance without associated CON_REF:
 - The mobile station shall terminate the call control instance.
 - The mobile station shall send an indication to the affected service instance indicating that the call control instance has been terminated.

- 1 • The mobile station shall perform Forward Traffic Channel supervision as specified
2 in 2.6.4.1.8. If a loss of the Forward Traffic Channel is declared, the Layer 3 shall
3 terminate all Call Control instances, and shall enter the *System Determination*
4 *Substate* of the *Mobile Station Initialization State* with a system lost indication (see
5 2.6.1.1).
- 6 • The mobile station may send a *Pilot Strength Measurement Mini Message* to report
7 pilot strength order change information, periodic pilot strength information, or
8 threshold based pilot strength information, as specified in the *Mobile Assisted Burst*
9 *Operation Parameters Message* (see 2.6.6.2.5.2).
- 10 • The mobile station shall adjust its transmit power as specified in [2].
- 11 • The mobile station shall perform Forward Traffic Channel power control as specified
12 in 2.6.4.1.1.
- 13 • The mobile station shall perform handoff processing as specified in 2.6.6.
- 14 • The mobile station shall process Forward and Reverse Traffic Channel frames in
15 accordance with requirements for the active service subfunction (see 2.6.4.1.2.2).
- 16 • The mobile station shall perform registration timer maintenance as specified in
17 2.6.5.5.4.2.
- 18 • If the mobile station is directed to send a *Data Burst Message*, the mobile station
19 shall send a *Data Burst Message*. If PILOT_GATING_USE_RATE is set to '1', the
20 mobile station may request to transition to the *Active Mode*
21 (PILOT_GATING_USE_RATE set to '0') prior to sending the *Data Burst Message*.
- 22 • If a Forward Packet Data Channel is not assigned and the mobile station has user
23 data to send and PILOT_GATING_USE_RATE is equal to '1', then the mobile station
24 may send a *Resource Request Message*, *Resource Request Mini Message*,
25 *Supplemental Channel Request Message*, or *Supplemental Channel Request Mini*
26 *Message* to request for continuous reverse pilot transmission and user traffic
27 transmission.
- 28 • When a Forward Packet Data Channel is assigned, PILOT_GATING_USE_RATE is
29 equal to '1', and the mobile station has data or signaling messages to send, the
30 mobile station shall set PILOT_GATING_USE_RATE to '0'.
- 31 • When a Forward Packet Data Channel is assigned, PILOT_GATING_USE_RATE is
32 equal to '1', and the mobile station receives MAC-
33 ControlHoldTrafficReceived.Indication, the mobile station shall set
34 PILOT_GATING_USE_RATE to '0' at the *transition_time* indicated in MAC-
35 ControlHoldTrafficReceived.Indication.
- 36 • If the mobile station receives SIG-RemoveFPDCHLeg.Request(*index*), then, at the
37 first 20 ms boundary (relative to System Time plus FRAME_OFFSET_s × 1.25 ms)
38 occurring at least 20 ms after the reception of this indication, for the specified
39 member of the F-PDCH reduced active set indicated by *index*, where *index* is the
40 index of the member in the F-PDCH reduced active set, the mobile station shall
41 perform the following procedures:

- 1 - the mobile station shall set FOR_PDCH_INCL_s to '0', and remove this pilot from
2 the F-PDCH reduced active set, and
- 3 - if this is the last pilot in the F-PDCH reduced active set, Layer 3 shall send SIG-
4 HandoffPDCH.Indication (handoff_type = ASSIGN) to the MAC layer.
- 5 • If the mobile station is directed by the user to request a new service configuration,
6 the mobile station shall initiate service negotiation or service option negotiation in
7 accordance with the requirements for the active service subfunction (see
8 2.6.4.1.2.2).
- 9 • The mobile station may send a *Service Option Control Message* or *Service Option*
10 *Control Order* to invoke a service option specific function in accordance with the
11 requirements for the active service subfunction (see 2.6.4.1.2.2).
- 12 • If the mobile station is directed by the user to request a private long code transition
13 and has the long code mask (see 2.3.12.3), the mobile station shall send a *Long*
14 *Code Transition Request Order* (ORDQ = '00000001') in assured mode.
- 15 • If the mobile station is directed by the user to request a public long code transition,
16 the mobile station shall send a *Long Code Transition Request Order* (ORDQ =
17 '00000000') in assured mode.
- 18 • If the mobile station supports BCMC operation, it shall perform the procedures as
19 specified in 2.6.13.
- 20 • If the mobile station is directed by the user to originate a call or if the mobile station
21 is to monitor BCMC on traffic channel, the mobile station shall perform the
22 following:
- 23 - If this is an emergency call origination, the mobile station shall perform the
24 following:
- 25 + If it can be indicated to the base station within an existing Call Control
26 instance, the mobile station shall send an indication to this Call Control
27 instance that the user has originated an emergency call.
- 28 + Otherwise, the mobile station shall perform the following:
- 29 ○ For each service instance being initiated in the *Enhanced Origination*
30 *Message*, the mobile station shall perform the following:
- 31 ◇ increment the stored value of TAG_s to the next unused integer value,
32 ◇ add TAG_s to the list TAG_OUTSTANDING_LIST,
33 ◇ associate the TAG_s value to the corresponding service instance. and
34 ◇ set an enhanced origination timer associated with TAG_s to a value of
35 T_{42m} seconds.
- 36 ○ The mobile station shall send an *Enhanced Origination Message* to the
37 base station, with the TAG or ADD_TAG field of each call included in the
38 message set to its associated TAG_s.

- 1 ○ Upon sending the *Enhanced Origination Message* and prior to receiving a
2 Layer 3 response from the base station, if the mobile station is directed
3 by the user to cancel this call, the mobile station shall perform the
4 following:
- 5 ◇ The mobile station shall send a *Call Cancel Message* to the base
6 station, with each TAG or ADD_TAG field included in the message set
7 to the TAG value in the list TAG_OUTSTANDING_LIST corresponding
8 to the call(s) being cancelled.
- 9 ◇ The mobile station shall remove the TAG field corresponding to each
10 call being cancelled from the list TAG_OUTSTANDING_LIST.
- 11 + If the enhanced origination timer expires, the mobile station shall remove
12 the associated TAG field corresponding to this call from
13 TAG_OUTSTANDING_LIST.
- 14 - Otherwise, the mobile station shall perform the following:
- 15 + If this is a packet data call origination⁶⁰, the mobile station shall first
16 determine the following conditions:
- 17 ○ If RETRY_DELAY_s[001] is not 0, the mobile station shall not send the
18 *Enhanced Origination Message* until after the system time stored in
19 RETRY_DELAY_s[001].
- 20 ○ If RETRY_DELAY_s[101] is not 0, the mobile station shall not send the
21 *Enhanced Origination Message* until after the system time stored in
22 RETRY_DELAY_s[101].
- 23 + If this contains BCMC origination, the mobile station shall determine the
24 following conditions:
- 25 ○ If BCMC_RETRY_DELAY_LISTs[i].RETRY_DELAY is not zero for the
26 BCMC flow corresponding to
27 BCMC_RETRY_DELAY_LISTs[i].BCMC_FLOW_ID, the mobile station shall
28 not include the BCMC flow (See section 2.6.13.11) in the *Enhanced*
29 *Origination Message* until after the system time stored in
30 BCMC_RETRY_DELAY_LISTs[i].RETRY_DELAY.
- 31 + If the above conditions do not prohibit the mobile station from sending an
32 *Enhanced Origination Message* at this time, the mobile station shall perform
33 the following:

⁶⁰ Packet data origination refers to origination with SO 60, SO 61 or any service option in Service Option Group 4 and 5 in [30]

- 1 ○ If P_REV_IN_USE_S is greater than or equal to 11 and the *Enhanced*
2 *Origination Message* is being sent to perform packet data dormant
3 handoff, the mobile station shall include all dormant packet data service
4 instances (see [42]) up to the limit specified by
5 MAX_ADD_SERV_INSTANCE_S.
- 6 ○ For each service instance being initiated in the *Enhanced Origination*
7 *Message*, the mobile station shall perform the following:
- 8 ◇ increment the stored value of TAG_S to the next unused integer value,
9 ◇ add TAG_S to the list TAG_OUTSTANDING_LIST,
10 ◇ associate the TAG_S value to the corresponding service instance, and
11 ◇ set an enhanced origination timer associated with TAG_S to a value of
12 T_{42m} seconds.
- 13 ○ The mobile station shall send an *Enhanced Origination Message* to the
14 base station, with the TAG or ADD_TAG field of each call included in the
15 message set to its associated TAG_S.
- 16 + Upon sending the *Enhanced Origination Message* and prior to receiving a
17 Layer 3 response from the base station, if the mobile station is directed by
18 the user to cancel this call, the mobile station shall perform the following:
- 19 ○ The mobile station shall send a *Call Cancel Message* to the base station,
20 with each TAG or ADD_TAG field included in the message set to the TAG
21 value in the list TAG_OUTSTANDING_LIST corresponding to the call(s)
22 being cancelled.
- 23 ○ The mobile station shall disable the enhanced origination timer and shall
24 remove the TAG field corresponding to each call being cancelled from the
25 list TAG_OUTSTANDING_LIST.
- 26 + If the enhanced origination timer expires, the mobile station shall remove
27 the associated TAG field from TAG_OUTSTANDING_LIST.
- 28 • If the Layer 3 receives a “call release request” from a Call Control instance, Layer 3
29 shall perform the following:
- 30 • If there are no other active or pending calls, the Layer 3 shall enter the *Release*
31 *Substate* with a mobile station release indication (see 2.6.4.4).
- 32 - Otherwise, the mobile station shall perform the following:
- 33 + The mobile station shall send a Service Request Message, Resource Release
34 *Request Message*, or a *Resource Release Request Mini Message* to the base
35 station requesting to release the service option connection.
- 36 + If the mobile station sends a Resource Release Request Message or a
37 *Resource Release Request Mini Message*, it shall set the purge service
38 indicator field to ‘0’.

- 1 • If the Layer 3 receives a request to release a BCMC call [*BCMC-Stop-*
2 *Monitor.Request(BCMC_FLOW_ID)*] from Upper Layer, Layer 3 shall perform the
3 following:
- 4 - If there are no other active or pending calls, the Layer 3 shall enter the *Release*
5 *Substate* with a mobile station release indication (see 2.6.4.4).
- 6 - Otherwise, the mobile station shall send a *Resource Release Request Message* to
7 the base station requesting to release the BCMC flow (See section 2.6.13.11).
- 8 • If the Layer 3 receives a “call inactive indication” from a Call Control instance, Layer
9 3 shall perform the following:
- 10 - If there are no other active or pending calls, the Layer 3 shall enter the *Release*
11 *Substate* with a service inactive indication (see 2.6.4.4).
- 12 - Otherwise, the mobile station shall perform the following:
- 13 + The mobile station shall send a Service Request Message, Resource Release
14 Request Message, or a Resource Release Request Mini Message to the base
15 station requesting to release the service option connection and purge the
16 service.
- 17 + If the mobile station sends a Resource Release Request Message or a
18 Resource Release Request Mini Message, it shall set the purge service
19 indicator field to ‘1’.
- 20 • If the mobile station is directed by the user to power down, the Layer 3 shall send a
21 “release indication” to all Call Control instances, and shall enter the *Release*
22 *Substate* with a power-down indication (see 2.6.4.4).
- 23 • If Layer 3 receives a L2-Condition.Notification primitive from Layer 2 indicating an
24 acknowledgment failure, then:
- 25 - If $RESQ_ENABLED_S$ is equal to ‘1’ and $FPC_PRI_CHAN_S$ is equal to ‘0’, the
26 mobile station shall perform the following:
27 + disable its transmitter, and
28 + enable the rescue delay timer with an initial value of $(RESQ_DELAY_TIME_S \times$
29 80) ms.
- 30 - Otherwise, the layer 3 shall terminate all Call Control instances, and the mobile
31 station shall disable its transmitter and shall enter the *System Determination*
32 *Substate* of the *Mobile Station Initialization State* with a system lost indication (see
33 2.6.1.1).
- 34 • The mobile station shall perform the following:
- 35 - The mobile station may send the *Resource Request Message* or *Resource Request*
36 *Mini Message* in accordance with requirements for the currently connected
37 service option whenever $RETRY_DELAY_S[RETRY_TYPE]$ is equal to 0, where,
38 $RETRY_TYPE$ is equal to ‘010’.

- 1 - The mobile station shall not send the *Resource Request Message* or *Resource*
2 *Request Mini Message* whenever $\text{RETRY_DELAY}_s[\text{RETRY_TYPE}]$ is set to *infinity*,
3 where, RETRY_TYPE is equal to '010'.
- 4 - If USE_CH_CFG_RRM_s is equal to '0', the mobile station shall set CH_IND_INCL
5 to '0' in the *Resource Request Message* and *Resource Request Mini Message*;
6 otherwise, the mobile station may request a channel configuration in the
7 *Resource Request Message* or *Resource Request Mini Message*.
- 8 - If $\text{RETRY_DELAY}_s[\text{RETRY_TYPE}]$ is not 0 or *infinity*, the mobile station shall not
9 send the *Resource Request Message* or *Resource Request Mini Message* until
10 after the system time stored in $\text{RETRY_DELAY}_s[\text{RETRY_TYPE}]$, where,
11 RETRY_TYPE is equal to '010'.
- 12 - The mobile station may send the *Supplemental Channel Request Message* or
13 *Supplemental Channel Request Mini Message* whenever
14 $\text{RETRY_DELAY}_s[\text{RETRY_TYPE}]$ is set to '0', where, RETRY_TYPE is equal to '011'.
- 15 - The mobile station shall not send the *Supplemental Channel Request Message* or
16 *Supplemental Channel Request Mini Message* whenever
17 $\text{RETRY_DELAY}_s[\text{RETRY_TYPE}]$ is set to *infinity*, where, RETRY_TYPE is equal to
18 '011'.
- 19 • If $\text{RETRY_DELAY}_s[\text{RETRY_TYPE}]$ is not 0 or *infinity*, the mobile station shall not
20 send the *Supplemental Channel Request Message* or *Supplemental Channel Request*
21 *Mini Message* until after the system time stored in $\text{RETRY_DELAY}_s[\text{RETRY_TYPE}]$,
22 where, RETRY_TYPE is equal to '011'.
- 23 • The mobile station shall not send a Short Data Burst (see [30], [42]) whenever
24 $\text{RETRY_DELAY}_s[\text{RETRY_TYPE}]$ is set to *infinity*, where, RETRY_TYPE is equal to
25 '100' or '101'.
- 26 • If $\text{RETRY_DELAY}_s[\text{RETRY_TYPE}]$ is not 0 or *infinity*, where, RETRY_TYPE is equal to
27 '100' or '101', the mobile station shall not send a Short Data Burst (see [30], [42])
28 until the maximum of the system time stored in $\text{RETRY_DELAY}_s[100]$ and
29 $\text{RETRY_DELAY}_s[101]$.
- 30 – At the system time stored in $\text{RETRY_DELAY}_s[\text{RETRY_TYPE}]$, the mobile station
31 shall reset $\text{RETRY_DELAY}_s[\text{RETRY_TYPE}]$ to 0, where RETRY_TYPE is equal to
32 '001', '010', '011', '100' or '101'.
- 33 • The mobile station may send a *Resource Release Request Message* or a *Resource*
34 *Release Request Mini Message* to request for reverse pilot gating operation to be
35 performed or to request a service option connection to be disconnected. The mobile
36 station may send a *Resource Release Request Message* to request one or more
37 BCMC flows to be disconnected.
- 38 • The mobile station may send a *Shared Channel Configuration Order* ($\text{ORDQ} =$
39 '00000000') to request for R-FCH assignment. The mobile station may send a
40 *Shared Channel Configuration Order* ($\text{ORDQ} =$ '00000001') to request release of the
41 R-FCH.

- 1 • When the Reverse Packet Data Channel is assigned, the mobile station shall not
2 send a *Supplemental Channel Request Message* or *Supplemental Channel Request*
3 *Mini Message* containing a request for Reverse Supplemental Channel assignment.
- 4 • The mobile station may enter the *Release Substate* with a service inactive indication
5 (see 2.6.4.4) if the service corresponding to the packet data service option instance
6 is inactive at the mobile station.
- 7 • If Layer 3 receives a “substate timer expired indication” from a Call Control
8 instance, the Layer 3 shall perform the following:
 - 9 - If there are no other active or pending calls, the Layer 3 shall terminate this Call
10 Control instance; and the mobile station shall disable its transmitter and enter
11 the *System Determination Substate* of the *Mobile Station Initialization State* with a
12 system lost indication (see 2.6.1.1).
 - 13 - Otherwise, the mobile station shall send a *Service Request Message*, *Resource*
14 *Release Request Message*, or a *Resource Release Request Mini Message*.
- 15 • If there are no active or pending calls, the Layer 3 shall enter the *Release Substate*
16 with a mobile station release indication.
- 17 • If Layer 3 receives a ‘message rejected indication’ from a Call Control instance,
18 mobile station shall send a *Mobile Station Reject Order* (ORDQ set to the applicable
19 reason code as determined from Table 2.7.3-1) within T_{56m} seconds as follows:
 - 20 - If $P_REV_IN_USE_s$ is equal to or greater than seven, the mobile station shall
21 include the CON_REF_INCL field with this message and shall perform the
22 following: if the corresponding Call Control instance is identified by NULL, the
23 mobile station shall either set the CON_REF_INCL field of the message to ‘0’ or
24 set the CON_REF_INCL field to ‘1’ and set the CON_REF field to the connection
25 reference of the service option connection corresponding to this Call Control
26 instance; otherwise, the mobile station shall set the CON_REF_INCL field of the
27 message to ‘1’ and the CON_REF field of the message to the connection
28 reference of the service option connection corresponding to this Call Control
29 instance.
- 30 • If Layer 3 is requested by the upper layers to query base station identification
31 number, SID, NID, and LAT/LONG related information for one or more pilots, and
32 $PILOT_INFO_REQ_SUPPORTED_s$ equals ‘1’, mobile station shall send a *Base Station*
33 *Status Request Message* with a “Pilot Information” record type to the base station.
- 34 • If the mobile station needs to suspend its CDMA Traffic Channel processing for
35 applications other than a PUF probe, hard handoff, or periodic search, then, prior to
36 suspending its CDMA Traffic Channel processing, the mobile station shall perform
37 the following:
 - 38 - If $CDMA_OFF_TIME_REP_SUP_IND_s$ is equal to ‘1’ and the total time it needs to
39 suspend processing the CDMA Traffic Channel is longer than
40 $CDMA_OFF_TIME_REP_THRESHOLD_s$, the mobile station shall send a *CDMA*

1 *Off Time Report Message*. Otherwise, the mobile shall not send a *CDMA Off Time*
2 *Report Message*.

- 3 • The mobile station may send a *CDMA Off Time Report Message* with
4 CDMA_OFF_TIME_ENABLE set to '0' to cancel a previously reported CDMA Traffic
5 Channel processing suspension.
- 6 • The mobile station shall update RC_PARAMS_RECORD_s as described in section
7 2.6.17.
- 8 • If the mobile station performs a hard handoff, it shall initialize RC parameters as
9 described in section 2.6.16.
- 10 • If the mobile station receives R-SCH burst assignment with RC08, then the mobile
11 station shall perform the following:
 - 12 - Set REV_FCH_BLANKING_DUTYCYCLE_IN_USE to '000' at the start time of the
13 burst assignment.
 - 14 - Set REV_FCH_BLANKING_DUTYCYCLE_IN_USE to
15 REV_FCH_BLANKING_DUTYCYCLE_s at the end of the burst assignment.
- 16 • If the mobile station receives a message which is included in the following list and
17 every message field value is within its permissible range, the mobile station shall
18 process the message as described below and in accordance with the message's
19 action time (see 2.6.4.1.5).
 - 20 1. *Alert With Information Message*: If P_REV_IN_USE_s is less than seven, the Layer
21 3 shall deliver this message to the Call Control instance; otherwise, the Layer 3
22 shall deliver this message to the Call Control instance identified by NULL.
 - 23 2. *Reserved*
 - 24 3. *Audit Order*
 - 25 4. *Authentication Challenge Message*: The Layer 3 shall send a "reset waiting for
26 order substate timer indication" to all Call Control instances. The mobile
27 station shall process the message and shall respond as specified in 2.3.12.1.4
28 within T_{32m} seconds, regardless of the value of AUTH_s.
 - 29 5. *Authentication Request Message*: The mobile station shall process the message
30 and shall respond as specified in 2.3.12.5.2.
 - 31 6. *Base Station Challenge Confirmation Order*: The Layer 3 shall send a "reset
32 waiting for order substate timer indication" to all Call Control instances. The
33 mobile station shall process the message and shall respond with an *SSD*
34 *Update Confirmation Order* or *SSD Update Rejection Order* as specified in
35 2.3.12.1.5 within T_{32m} seconds.
 - 36 7. *Base Station Status Response Message*: The Layer 3 shall deliver the
37 information contained in this message to the Upper Layer entity that requested
38 for this information.
 - 39 8. *Call Assignment Message*: The mobile station shall process this message as

1 follows:

- 2 - If RESPONSE_IND_r equals '1', then for each of the TAG_r or ADD_TAG_r fields
 3 that matches any of the TAG values contained in the list
 4 TAG_OUTSTANDING_LIST, the mobile station shall perform the following:
- 5 + If ACCEPT_IND_r or ADD_ACCEPT_IND_r associated with the TAG_r or
 6 ADD_TAG_r equals '0', the mobile station shall disable the enhanced
 7 origination timer associated with TAG_r and shall remove the TAG value
 8 specified by TAG_r from the list TAG_OUTSTANDING_LIST.
- 9 + If ACCEPT_IND_r or ADD_ACCEPT_IND_r associated with the TAG_r or
 10 ADD_TAG_r equals '1' and USE_OLD_SERV_CONFIG_r field associated
 11 with this TAG is not set to '1', the mobile station shall perform the
 12 following:
- 13 ○ If there already exists or currently pending instantiation a Call
 14 Control instance identified by CON_REF_r or ADD_CON_REF_r
 15 associated with the TAG_r or ADD_TAG_r, the mobile station shall send
 16 a *Mobile Station Reject Order* with ORDQ field set to '00010010' (a call
 17 control instance is already present with the specified identifier), with
 18 the CON_REF field of the order set to the CON_REF_r or
 19 ADD_CON_REF_r.
- 20 ○ Otherwise, Layer 3 shall instantiate a Call Control instance (as
 21 specified in 2.6.10) at the action time of the message. The mobile
 22 station shall identify this Call Control instance by CON_REF_r or
 23 ADD_CON_REF_r associated with the TAG_r or ADD_TAG_r. If a service
 24 option connection corresponding to this call has not been
 25 established, the mobile station should wait for the base station to
 26 initiate service negotiation to establish the service option connection.
- 27 ○ The mobile station shall disable the enhanced origination timer
 28 corresponding to this TAG and shall remove the TAG value from the
 29 list TAG_OUTSTANDING_LIST.
- 30 + If ACCEPT_IND_r equals '1' and USE_OLD_SERV_CONFIG_r field is
 31 included and is set to '1', the mobile station shall perform the following:
- 32 ○ At the action time of this message, the mobile station shall restore
 33 the indicated service option connection record(s) from the stored
 34 service configuration, where the service option connection records to
 35 be restored are determined as follows:
- 36 ○ If SR_ID_r equals '111', the mobile station shall restore all remaining
 37 service option connection records from the stored service
 38 configuration; otherwise, the mobile station shall restore the service
 39 option connection record corresponding to the SR_ID_r received in this
 40 message.

- 1 ○ Layer 3 shall instantiate a Call Control instance (as specified in
2 2.6.10) for each of the restored service option connections with a
3 ‘restore indication’ and Layer 3 shall identify each of these Call
4 Control instances by the value of the CON_REF field corresponding to
5 the restored service option connection.
- 6 ○ The mobile station shall disable the enhanced origination timer
7 corresponding to TAG_r and shall remove the TAG value specified by
8 TAG_r from the list TAG_OUTSTANDING_LIST.
- 9 - If RESPONSE_IND_r equals ‘1’, then for each of the and TAG_r or ADD_TAG_r
10 fields that does not match with any of the TAG values contained in the list
11 TAG_OUTSTANDING_LIST, the mobile station shall send a *Mobile Station*
12 *Reject Order* with ORDQ field set to ‘00010011’ (TAG received does not
13 match TAG stored), with the TAG field of the order set to the TAG_r or
14 ADD_TAG_r, and the CON_REF field of the order set to CON_REF_r or
15 ADD_CON_REF_r.
- 16 - If RESPONSE_IND_r equals ‘0’ and USE_OLD_SERV_CONFIG_r field is not
17 included or is included and is set to ‘0’, the mobile station shall perform the
18 following for each of the CON_REF_r or ADD_CON_REF_r:
- 19 + If there already exists or currently pending instantiation a Call Control
20 instance identified by CON_REF_r or ADD_CON_REF_r, the mobile station
21 shall send a *Mobile Station Reject Order* with ORDQ field set to
22 ‘00010010’ (a call control instance is already present with the specified
23 identifier), with the CON_REF field of the order set to the CON_REF_r or
24 ADD_CON_REF_r.
- 25 + Otherwise, if the mobile station does not accept this call assignment, the
26 mobile station shall send a *Mobile Station Reject Order* with ORDQ field
27 set to ‘00010000’ (call assignment not accepted), with the CON_REF field
28 of the order set to the CON_REF_r or ADD_CON_REF_r.
- 29 + Otherwise, at the action time of the message, the mobile station shall
30 store the bypass indicator (BYPASS_ALERT_ANSWER_s =
31 BYPASS_ALERT_ANSWER_r) and the Layer 3 shall instantiate a Call
32 Control instance (as specified in 2.6.10). The mobile station shall
33 identify this Call Control instance by the CON_REF_r or ADD_CON_REF_r.
34 If a service option connection corresponding to this call has not been
35 established, the mobile station should wait for the base station to initiate
36 service negotiation to establish the service option connection.
- 37 - If RESPONSE_IND_r equals ‘0’ and USE_OLD_SERV_CONFIG_r field is
38 included and is set to ‘1’, the mobile station shall perform the following:
- 39 + At the action time of this message, the mobile station shall restore the
40 indicated service option connection record(s) from the stored service
41 configuration, where the service option connection records to be restored
42 are determined as follows:

- 1 ○ If SR_ID_r equals '111', the mobile station shall restore all remaining
2 service option connection records from the stored service
3 configuration; otherwise, the mobile station shall restore the service
4 option connection record corresponding to the SR_ID_r received in this
5 message.
- 6 + If SR_ID_r equals '111', the mobile station shall perform the following:
- 7 ○ For the first remaining service option connection (with corresponding
8 connection reference CON_REF_i) listed in this stored Service
9 Configuration information record, Layer 3 shall instantiate a Call
10 Control instance (as specified in 2.6.10) with the received
11 BYPASS_ALERT_ANSWER_s. The mobile station shall identify this Call
12 Control instances by the corresponding CON_REF_i.
- 13 ○ For each of the remaining service option connections, Layer 3 shall
14 instantiate a Call Control instance (as specified in 2.6.10) for each of
15 the restored service option connections with a 'restore indication' and
16 Layer 3 shall identify each of these Call Control instances by the
17 value of the CON_REF field corresponding to the restored service
18 option connection.
- 19 + If SR_ID_r is not equal to '111', Layer 3 shall instantiate a Call Control
20 instance (as specified in 2.6.10) with the received
21 BYPASS_ALERT_ANSWER_s for the service option connection record
22 corresponding to the SR_ID_r received in this message.
- 23 9. *Candidate Frequency Search Control Message:* The mobile station shall process
24 the message as specified in 2.6.6.2.5.1.
- 25 10. *Candidate Frequency Search Request Message:* The mobile station shall process
26 the message as specified in 2.6.6.2.5.1.
- 27 11. *Continuous DTMF Tone Order:* Support of this order by the mobile station is
28 optional. If P_REV_IN_USE_s is less than seven, the Layer 3 shall deliver this
29 message to the Call Control instance; otherwise, the Layer 3 shall perform the
30 following: if CON_REF_INCL_r equals '0', the Layer 3 shall deliver this message
31 to the Call Control instance identified by NULL; otherwise, the Layer 3 shall
32 deliver this message to the Call Control instance identified by CON_REF_r.
- 33 12. *Data Burst Message*
- 34 13. *Extended Alert With Information Message:* The mobile station shall perform the
35 following: If CON_REF_INCL_r equals '0', the Layer 3 shall deliver this message
36 to the Call Control instance identified by NULL; otherwise, the Layer 3 shall
37 deliver this message to the Call Control instance identified by CON_REF_r.
- 38 14. *Extended Flash With Information Message:* The mobile station shall perform the
39 following: If CON_REF_INCL_r equals '0', the Layer 3 shall deliver this message
40 to the Call Control instance identified by NULL; otherwise, the Layer 3 shall
41 deliver this message to the Call Control instance identified by CON_REF_r.

- 1 28. *Maintenance Required Order*: The mobile station shall record the reason for the
2 *Maintenance Required Order* in the mobile station's semi-permanent memory
3 (MAINTRSN_{s-p} equals the least-significant four bits of ORDQ_r). The mobile
4 station shall remain in the unlocked condition. The mobile station should
5 notify the user of the maintenance required condition.
- 6 29. *Message Encryption Mode Order*: The mobile station shall process the message
7 as specified in 2.3.12.2.
- 8 30. *Mobile Station Registered Message*: The mobile station shall process the
9 message as specified in 2.6.5.5.4.3.
- 10 31. *Mobile Assisted Burst Operation Parameters Message*: The mobile station shall
11 process the message as specified in 2.6.6.2.5.1.
- 12 32. *Neighbor List Update Message*: The mobile station shall process the message as
13 specified in 2.6.6.2.5.1.
- 14 33. *Outer Loop Report Request Order*: The mobile station shall send the *Outer Loop*
15 *Report Message* in assured mode to the base station.
- 16 34. *Parameter Update Order*: The Layer 3 shall send a "reset waiting for order
17 substate timer indication" to all Call Control instances. The mobile station
18 shall increment COUNT_{s-p} (see 2.3.12.1.3). The mobile station shall send a
19 *Parameter Update Confirmation Order* within T_{56m} seconds. The mobile station
20 shall set the ORDQ field of the *Parameter Update Confirmation Order* to the
21 same value as the ORDQ field of the *Parameter Update Order*.
- 22 35. *Periodic Pilot Measurement Request Order*: The mobile station shall process the
23 order as specified in 2.6.6.2.5.1.
- 24 36. *Pilot Measurement Request Order*: The mobile station shall process the order as
25 specified in 2.6.6.2.5.1.
- 26 37. *Power Control Message*: The mobile station shall process the message as
27 specified in 2.6.4.1.1.3.
- 28 38. *Power Control Parameters Message*: The mobile station shall process the
29 message as specified in 2.6.4.1.1.2.
- 30 39. *Power Up Function Message*: The mobile station shall process the message as
31 specified in 2.6.4.1.7.1.
- 32 40. *Power Up Function Completion Message*: The mobile station shall process the
33 message as specified in 2.6.4.1.7.3.
- 34 41. *Rate Change Message*: The mobile station shall process the message as
35 specified in 2.6.4.1.1.4.
- 36 42. *Release Order*: The Layer 3 shall send a "release indication" to all Call Control
37 instances, and shall enter the *Release Substate* with a base station release
38 indication (see 2.6.4.4).
- 39 43. *Resource Allocation Message*: The mobile station shall process the message as
40 specified in 2.6.4.1.10.

- 1 44. *Resource Allocation Mini Message*: The mobile station shall process the message
2 as specified in 2.6.4.1.10.
- 3 45. *Retrieve Parameters Message*: The mobile station shall send, within T_{56m}
4 seconds, a *Parameters Response Message*.
- 5 46. *Retry Order*: The mobile station shall process the order as follows:
- 6 - If $RETRY_TYPE_R$ is equal to '000', the mobile station shall set
7 $RETRY_DELAY_S[RETRY_TYPE]$ to 0, where $RETRY_TYPE$ is equal to '001',
8 '010', '011', '100', or '101'.
 - 9 - If $RETRY_TYPE_R$ is equal to '001', '100', or '101', then the mobile station
10 shall perform the following:
 - 11 + If $RETRY_DELAY_R$ is equal to '00000000', then the mobile station shall
12 set $RETRY_DELAY_S [RETRY_TYPE_R]$ to 0.
 - 13 + If $RETRY_DELAY_R$ is not equal to '00000000', the mobile station shall set
14 $RETRY_DELAY_S[RETRY_TYPE_R]$ as follows:
 - 15 o If the most significant bit of the $RETRY_DELAY_R$ is 0, set
16 $RETRY_DELAY_UNIT_S$ to 1000ms. If the most significant bit of the
17 $RETRY_DELAY_R$ is '1', set $RETRY_DELAY_UNIT_S$ to 60000ms.
 - 18 o The mobile station shall set $RETRY_DELAY_VALUE_S$ to the seven
19 least significant bits of $RETRY_DELAY_R$.
 - 20 o The mobile station shall store the next system time 80 ms boundary
21 + $RETRY_DELAY_VALUE_S \times RETRY_DELAY_UNIT_S$ ms as
22 $RETRY_DELAY_S[RETRY_TYPE_R]$.
 - 23 - If $RETRY_TYPE_R$ is equal to '010' or '011', the mobile station shall perform
24 the following:
 - 25 + If $RETRY_DELAY_R[RETRY_TYPE_R]$ is '00000000', then the mobile station
26 shall set $RETRY_DELAY_S [RETRY_TYPE_R]$ to 0.
 - 27 + If $RETRY_DELAY_R[RETRY_TYPE_R]$ is '11111111', then the mobile station
28 shall set $RETRY_DELAY_S[RETRY_TYPE_R]$ to *infinity*.
 - 29 + If $RETRY_DELAY_R[RETRY_TYPE_R]$ is not equal to '00000000' or
30 '11111111', the mobile station shall store the next system time 80 ms
31 boundary + $RETRY_DELAY_R[RETRY_TYPE_R] \times 320$ ms as
32 $RETRY_DELAY_S[RETRY_TYPE_R]$.
- 33 47. *Reverse Supplemental Channel Assignment Mini Message*: The mobile station
34 shall process the message as specified in 2.6.6.2.5.1.
- 35 48. *Security Mode Command Message*: The mobile station shall process the
36 message as specified in 2.6.4.1.14.
- 37 49. *Send Burst DTMF Message*: Support of this message by the mobile station is
38 optional. If $P_REV_IN_USE_S$ is less than seven, the Layer 3 shall deliver this
39 message to the Call Control instance; otherwise, the Layer 3 shall perform the

- 1 following: if CON_REF_INCL_r equals '0', the Layer 3 shall deliver this message
 2 to the Call Control instance identified by NULL; otherwise, the Layer 3 shall
 3 deliver this message to the Call Control instance identified by CON_REF_r.
- 4 50. *Service Connect Message*: The mobile station shall process the message in
 5 accordance with the requirements for the active service subfunction (see
 6 2.6.4.1.2.2) if the message is not rejected due to the following conditions:
- 7 - If the CC_INFO_INCL field is included in this message and is set to '1', the
 8 mobile station shall perform the following for each of the
 9 NUM_CALLS_ASSIGN call assignments included in this message:
 - 10 + If there already exists or currently pending instantiation a Call Control
 11 instance identified by CON_REF_r, the mobile station shall send a *Mobile*
 12 *Station Reject Order* with ORDQ field set to '00010010' (a call control
 13 instance is already present with the specified identifier), with the CON_REF
 14 field of the order set to CON_REF_r.
 - 15 + If RESPONSE_IND_r equals '1' and TAG_r does not match any of the TAG
 16 values contained in the list TAG_OUTSTANDING_LIST, the mobile station
 17 shall send a *Mobile Station Reject Order* with ORDQ field set to '00010011'
 18 (TAG received does not match TAG stored), with the TAG field of the order
 19 set to TAG_r, and the CON_REF field of the order set to CON_REF_r.
 - 20 + If the mobile station does not accept this call assignment, the mobile station
 21 shall send a *Mobile Station Reject Order* with ORDQ field set to '00010000'
 22 (call assignment not accepted), with the CON_REF field of the order set to
 23 CON_REF_r.
- 24 51. *Service Option Control Message*: The mobile station shall process the message
 25 in accordance with the requirements for the active service subfunction (see
 26 2.6.4.1.2.2).
- 27 52. *Service Option Control Order*: The mobile station shall process the message in
 28 accordance with the requirements for the active service subfunction (see
 29 2.6.4.1.2.2).
- 30 53. *Service Option Request Order*: The mobile station shall process the message in
 31 accordance with the requirements for the active service subfunction (see
 32 2.6.4.1.2.2).
- 33 54. *Service Option Response Order*: The mobile station shall process the message in
 34 accordance with the requirements for the active service subfunction (see
 35 2.6.4.1.2.2).
- 36 55. *Service Redirection Message*: The mobile station shall process the message as
 37 follows:
 38 If RECORD_TYPE_r is equal to '00000000', the mobile station shall perform the
 39 following:
 40 - The mobile station shall set RETURN_IF_FAIL_s = RETURN_IF_FAIL_r.

- 1 - If DELETE_TMSI_r is equal to '1', the mobile station shall set all the bits of
2 TMSI_CODE_{s-p} to '1'.
- 3 - The mobile station shall disable the full-TMSI timer.
- 4 - The Layer 3 shall send a "release indication" to all Call Control instances,
5 and shall enter the Release Substate with an NDSS off indication (see
6 2.6.4.4).
- 7 If RECORD_TYPE_r is not equal to '00000000', REDIRECT_TYPE_r is '1', and the
8 mobile station supports the band class and operating mode specified in the
9 message, the mobile station shall perform the following:
- 10 - The mobile station shall store the redirection record received in the message
11 as REDIRECT_REC_s.
- 12 - The mobile station shall enable NDSS_ORIG_s and shall record the dialed
13 digits (if any) corresponding to the last MS originated call.
- 14 - The mobile station shall set RETURN_IF_FAIL_s = RETURN_IF_FAIL_r.
- 15 - If DELETE_TMSI_r is equal to '1', the mobile station shall set all the bits of
16 TMSI_CODE_{s-p} to '1'.
- 17 - The mobile station shall disable the full-TMSI timer.
- 18 - The Layer 3 shall send a "release indication" to all Call Control instances,
19 and shall enter the *Release Substate* with a redirection indication (see
20 2.6.4.4). Otherwise, the mobile station shall discard the message and send a
21 *Mobile Station Reject Order* (ORDQ set to the applicable reason code as
22 determined from Table 2.7.3-1) within T_{56m} seconds.
- 23 56. *Service Request Message*: The mobile station shall process the message in
24 accordance with the requirements for the active service subfunction (see
25 2.6.4.1.2.2).
- 26 57. *Service Response Message*: The mobile station shall process the message in
27 accordance with the requirements for the active service subfunction (see
28 2.6.4.1.2.2).
- 29 58. *Set Parameters Message*: If the mobile station can set all of the parameters
30 specified by the PARAMETER_ID fields in the message, the mobile station shall
31 set them; otherwise, the mobile station shall send, within T_{56m} seconds, a
32 *Mobile Station Reject Order*.
- 33 59. *SSD Update Message*: The Layer 3 shall send a "reset waiting for order substate
34 timer indication" to all Call Control instances. The mobile station shall process
35 the message and respond with a *Base Station Challenge Order* as specified in
36 2.3.12.1.5 within T_{32m} seconds.
- 37 60. *Status Request Message*: The mobile station shall send, within T_{56m} seconds, a
38 *Status Response Message*. If the message does not specify any qualification
39 information (QUAL_INFO_TYPE_r is equal to '00000000'), the mobile station

1 shall include the requested information records in the *Status Response*
 2 *Message*. If the message specifies a band class (QUAL_INFO_TYPE_r is equal to
 3 '0000001'), the mobile station shall only include the requested information
 4 records for the specified band class (BAND_CLASS_r) in the *Status Response*
 5 *Message*. If the message specifies a band class and an operating mode
 6 (QUAL_INFO_TYPE_r is equal to '0000010'), the mobile station shall only
 7 include the requested information records for the specified band class
 8 (BAND_CLASS_r) and operating mode (OP_MODE_r) in the *Status Response*
 9 *Message*.

10 If the message specifies a band class or a band class and an operating mode
 11 which is not supported by the mobile station, the mobile station shall send a
 12 *Mobile Station Reject Order* with ORDQ set to '0000110' (message requires a
 13 capability that is not supported by the mobile station).

14 If the response to this message exceeds the allowable length, the mobile station
 15 shall send a *Mobile Station Reject Order* with ORDQ set to '00001000' (response
 16 message would exceed the allowable length).

17 If the message specifies an information record which is not supported by the
 18 mobile station for the specified band class and operating mode, the mobile
 19 station shall send a *Mobile Station Reject Order* with ORDQ set to '00001001'
 20 (information record is not supported for the specified band class and operating
 21 mode).

22 61. *Status Request Order*: If CDMABAND_s is equal to '00000', the mobile station
 23 shall send a *Status Message* within T_{56m} seconds. The mobile station shall
 24 respond with information corresponding to the current band class and
 25 operating mode.

26 62. *Supplemental Channel Assignment Message*: The mobile station shall process
 27 the message as specified in 2.6.6.2.5.1.

28 63. *TMSI Assignment Message*: The mobile station shall store the TMSI zone and
 29 code as follows:

- 30 - The mobile station shall store the length of the TMSI zone field by setting
 31 ASSIGNING_TMSI_ZONE_LEN_{s-p} to TMSI_ZONE_LEN_r,
- 32 - The mobile station shall store the assigning TMSI zone number by setting
 33 the ASSIGNING_TMSI_ZONE_LEN_{s-p} least significant octets of
 34 ASSIGNING_TMSI_ZONE_{s-p} to TMSI_ZONE_r, and
- 35 - The mobile station shall store the TMSI code by setting TMSI_CODE_{s-p} to
 36 TMSI_CODE_r.

37 The mobile station shall set the TMSI expiration time by setting
 38 TMSI_EXP_TIME_{s-p} to TMSI_EXP_TIME_r. The mobile station shall disable the
 39 full-TMSI timer. The mobile station shall then respond with a *TMSI Assignment*
 40 *Completion Message* within T_{56m} seconds.

41 64. *Universal Handoff Direction Message*: The Layer 3 shall send a "reset waiting for

- 1 order substate timer indication” to all Call Control instances. The mobile
2 station shall process the message as specified in 2.6.6.2.5.1.
- 3 65. *User Zone Reject Message*: The mobile station shall process this message as
4 specified in 2.6.9.2.2.
- 5 66. *User Zone Update Message*: The mobile station shall process this message as
6 specified in 2.6.9.2.2.
- 7 67. *BCMC Order*: The mobile station shall process this message as follows:
8 - If $ORDQ_r$ is set to ‘00000000’, the mobile station shall perform the following
9 for each of the BCMC flows that the base station is responding to:
10 + If $CLEAR_ALL_RETRY_DELAY_r$ equals ‘1’, the mobile station shall delete
11 the currently stored BCMC Retry Delay List.
12 + If $CLEAR_RETRY_DELAY_r$ equals ‘1’, the mobile station shall delete the
13 entry in the $BCMC_RETRY_DELAY_LIST_s[i]$ corresponding to
14 $BCMC_FLOW_ID$ (See section 2.6.13.11) in this message.
15 + If $ALL_BCMC_REASON_r$ or $BCMC_REASON_r$ equals ‘0000’, Layer 3 shall
16 send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result=FAILURE, cause=*
17 *FLOW_NOT_AVAILABLE, reason_ind=CURRENT_SYS)* for each of the
18 corresponding $BCMC_FLOW_ID$ to the BCMC Service Layer.
19 + If $ALL_BCMC_REASON_r$ or $BCMC_REASON_r$ equals ‘0001’, Layer 3 shall
20 send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result=FAILURE, cause=*
21 *FLOW_NOT_TRANSMITTED, reason_ind=CURRENT_SYS)* for each of the
22 corresponding $BCMC_FLOW_ID$ to the BCMC Service Layer.
23 + If $ALL_BCMC_REASON_r$ or $BCMC_REASON_r$ equals ‘0010’, Layer 3 shall
24 send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result=FAILURE, cause=*
25 *FLOW_TRANSMITTED_IN_IDLE, reason_ind=CURRENT_SYS)* for each of
26 the corresponding $BCMC_FLOW_ID$ to the BCMC Service Layer.
27 + If $ALL_BCMC_REASON_r$ or $BCMC_REASON_r$ equals ‘0011’, Layer 3 shall
28 send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result = SUCCESS,*
29 *cause = REGISTRATION_ACCEPTED, reason_ind = CURRENT_SYS)* for
30 each of the corresponding $BCMC_FLOW_ID$ to the BCMC Service Layer.
31 + If $ALL_BCMC_REASON_r$ or $BCMC_REASON_r$ equals ‘0100’, Layer 3 shall
32 send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result=FAILURE, cause=*
33 *AUTHORIZATION_FAILURE, reason_ind=CURRENT_SYS)* for each of the
34 corresponding $BCMC_FLOW_ID$ to the BCMC Service Layer.
35 + If $ALL_BCMC_REASON_r$ or $BCMC_REASON_r$ equals ‘0101’, the mobile
36 station shall perform the following:
37 ○ Layer 3 shall send a *BCMC-Monitor.Response(BCMC_FLOW_ID,*
38 *result=FAILURE, cause= RETRY_LATER, reason_ind=CURRENT_SYS)*
39 for each of the corresponding $BCMC_FLOW_ID$ to the BCMC Service
40 Layer.

- 1 ○ For each of the corresponding BCMC_FLOW_ID, if there is a
 2 BCMC_RETRY_DELAY_LIST_s[i].BCMC_FLOW_ID which is same as
 3 BCMC_FLOW_ID (See section 2.6.13.11), the mobile station shall set
 4 BCMC_RETRY_DELAY_LIST_s[i].RETRY_DELAY to current system
 5 time plus ALL_BCMC_RETRY_DELAY_r/BCMC_RETRY_DELAY;
 6 otherwise, the mobile station shall add new
 7 BCMC_RETRY_DELAY_LIST_s[i] to the BCMC Retry Delay List and
 8 shall set BCMC_RETRY_DELAY_LIST_s[i].BCMC_FLOW_ID to the
 9 BCMC_FLOW_ID, BCMC_RETRY_DELAY_LIST_s[i].RETRY_DELAY to
 10 current system time plus
 11 ALL_BCMC_RETRY_DELAY_r/BCMC_RETRY_DELAY_r.

12 68. *In-Traffic BCMC Service Parameters Message*: The mobile station shall process
 13 this message as follows:

14 The mobile station shall store the following parameters:

- 15 - Autonomous BCMC request on traffic channel allowed indicator
 16 (AUTO_REQ_TRAF_ALLOWED_IND_s = AUTO_REQ_TRAF_ALLOWED_IND_r).
- 17 - BCMC in idle state supported indicator
 18 (BCMC_ON_IDLE_SUP_IND_s = BCMC_ON_IDLE_SUP_IND_r).
- 19 - Only traffic state BCMC flows included indicator
 20 (BCMC_FLOWS_ON_TRAFFIC_ONLY_IND_s = BCMC_FLOWS_ON_TRAFFIC_
 21 ONLY_IND_r) if BCMC_FLOWS_ON_TRAFFIC_ONLY_IND_r is included;
 22 otherwise, BCMC_FLOWS_ON_TRAFFIC_ONLY_IND_s = '1'.
- 23 - Length of time stamp for use on r-csch
 24 (ACH_TIME_STAMP_SHORT_LENGTH_s = ACH_TIME_STAMP_SHORT_LEN
 25 GTH_r) if NON_DEFAULT_VALUE_INCLUDED_r equals '1'; otherwise,
 26 ACH_TIME_STAMP_SHORT_LENGTH_s shall be set to 10.
- 27 - Length of time stamp
 28 (TIME_STAMP_LONG_LENGTH_s = TIME_STAMP_LONG_LENGTH_r) if
 29 NON_DEFAULT_VALUE_INCLUDED_r equals '1'; otherwise,
 30 TIME_STAMP_LONG_LENGTH_s shall be set to 52.
- 31 - Unit for time stamp length (TIME_STAMP_UNIT_s = TIME_STAMP_UNIT_r) if
 32 NON_DEFAULT_VALUE_INCLUDED_r equals '1'; otherwise,
 33 TIME_STAMP_UNIT_s shall be set to 6.
- 34 - For i=1 to the number of flows included in this message, store the
 35 following:
- 36 + BCMC_FLOW_LIST_s[i].BCMC_FLOW_ID = ith occurrence of
 37 BCMC_FLOW_ID (BCMC flow identifier) . See section 2.6.13.11.

- 1 + If AUTH_SIGNATURE_REQUIRED_r equals '1',
2 BCMC_FLOW_LIST_s[i].AUTH_SIGNATURE_REQ_IND = ith occurrence
3 of AUTH_SIGNATURE_REQ_IND_r(Authorization signature required
4 indication).
- 5 + BCMC_FLOW_LIST_s[i].BCMC_FLOW_ON_TRAFFIC_IDLE_IND = ith
6 occurrence of BCMC_FLOW_ON_TRAFFIC_IDLE_IND_r (BCMC flow on
7 traffic state or idle state supported identifier) if
8 BCMC_FLOW_ON_TRAFFIC_IDLE_IND_r is included; otherwise,
9 BCMC_FLOW_LIST_s[i].BCMC_FLOW_ON_TRAFFIC_IDLE_IND = '01'.
- 10 69. *Shared Channel Configuration Order:* The mobile station shall process this
11 message as follows:
- 12 - If ORDQ_r is set to '00000000', the mobile station shall perform the following:
- 13 + The mobile station shall set REV_FCH_ASSIGNED_s to '1'.
- 14 + If CH_IND_s is equal to '11' , the mobile station shall begin transmitting
15 on the Reverse Fundamental Channel.
- 16 + If CH_IND_s is equal to '00' and EXT_CH_IND_s is equal to '01111',
17 '10001', '10011', or '10101', the mobile station shall begin transmitting
18 on the Reverse Fundamental Channel and do the following:
- 19 o If EXT_CH_IND_s is equal to '01111', store EXT_CH_IND_s = '00110'
20 o If EXT_CH_IND_s is equal to '10001', store EXT_CH_IND_s = '10010'
21 o If EXT_CH_IND_s is equal to '10011', store EXT_CH_IND_s = '01110'
22 o If EXT_CH_IND_s is equal to '10101', store EXT_CH_IND_s = '10110'
- 23 - If ORDQ_r is set to '00000001', the mobile station shall do the following:
- 24 + The mobile station shall set REV_FCH_ASSIGNED_s to '0'.
- 25 + If CH_IND_s is equal to '11' , the mobile station shall stop transmitting on
26 the Reverse Fundamental Channel.
- 27 + If CH_IND_s is equal to '00' and EXT_CH_IND_s is equal to '00110',
28 '10010', '01110', or '10110', the mobile station shall stop transmitting
29 on the Reverse Fundamental Channel and do the following:
- 30 o If EXT_CH_IND_s is equal to '00110', store EXT_CH_IND_s = '01111'
31 o If EXT_CH_IND_s is equal to '10010', store EXT_CH_IND_s = '10001'
32 o If EXT_CH_IND_s is equal to '01110', store EXT_CH_IND_s = '10011'
33 o If EXT_CH_IND_s is equal to '10110', store EXT_CH_IND_s = '10101'
- 34 70. *Service Status Order:* For each of the SERVICE_STATUS field included in this
35 message, the mobile station shall indicate the status to corresponding service
36 instance. For each of the SERVICE_STATUS field set to '001' (service request
37 rejected), the mobile station shall perform the following:

- 1 - The mobile station shall terminate the call control instance corresponding to
2 the SR_ID associated with this SERVICE_STATUS field.
- 3 - The mobile station shall send an indication to the affected service instance
4 indicating that the call control instance has been terminated.
- 5 - If a TAG is associated with the SR_ID corresponding to this
6 SERVICE_STATUS field, the mobile station shall remove the TAG value from
7 the TAG_OUTSTANDING_LIST and disable the corresponding enhanced
8 origination timer
- 9 71. *Radio Configuration Parameters Message:* If any of the field of the message is
10 set to an invalid value, then the mobile station shall send a *Mobile Station*
11 *Reject Order* with the ORDQ field set to '00000100' (message field not in valid
12 range). Otherwise, the mobile station shall perform the following:
- 13 - If FOR_FCH_ACK_MASK_RL_BLANKING_r is included, the mobile station
14 shall perform the following:
15 + Set FOR_FCH_ACK_MASK_RL_BLANKING_s to
16 FOR_FCH_ACK_MASK_RL_BLANKING_r.
- 17 - If FOR_FCH_ACK_MASK_NO_RL_BLANKING_r is included, the mobile station
18 shall perform the following:
19 + Set FOR_FCH_ACK_MASK_NO_RL_BLANKING_s to
20 FOR_FCH_ACK_MASK_NO_RL_BLANKING_r.
- 21 - If REV_FCH_ACK_MASK_r is included, the mobile station shall set
22 REV_FCH_ACK_MASK_s to REV_FCH_ACK_MASK_r.
- 23 - If FOR_SCH_ACK_MASK_RL_BLANKING_r is included, the mobile station
24 shall perform the following:
25 + Set FOR_SCH_ACK_MASK_RL_BLANKING_s to
26 FOR_SCH_ACK_MASK_RL_BLANKING_r.
- 27 - If FOR_SCH_ACK_MASK_NO_RL_BLANKING_r is included, the mobile station
28 shall perform the following:
29 + Set FOR_SCH_ACK_MASK_NO_RL_BLANKING_s to
30 FOR_SCH_ACK_MASK_NO_RL_BLANKING_r.
- 31 - If REV_SCH_ACK_MASK_r is included, the mobile station shall set
32 REV_SCH_ACK_MASK_s to REV_SCH_ACK_MASK_r.
- 33 - ~~If FOR_N2M_IND_r is included, t~~The mobile station shall set FOR_N2M_IND_s
34 to FOR_N2M_IND_r.
- 35 - The mobile station shall set FPC_MODE_NO_SCH_s to FPC_MODE_r.
- 36 - The mobile station shall set FPC_MODE_s = FPC_MODE_NO_SCH_s if there is
37 no forward Supplemental Channel burst in progress (see 2.6.6.2.5.1.1). ~~The~~
38 mobile station shall set FPC_MODE_s to FPC_MODE_r.

- 1 | - ~~If `RPC_MODEr` is included,~~ ~~t~~The mobile station shall set `RPC_MODEs` to
2 | `RPC_MODEr`.
- 3 | - ~~If `PWR_CNTL_STEPr` is included,~~ ~~t~~The mobile station shall set
4 | `PWR_CNTL_STEPs` to `PWR_CNTL_STEPr`.
- 5 | - ~~If `FOR_FCH_BLANKING_DUTYCYCLE` is included,~~ ~~t~~The mobile station shall
6 | set `FOR_FCH_BLANKING_DUTYCYCLEs` to
7 | `FOR_FCH_BLANKING_DUTYCYCLEr`.
- 8 | - ~~If `REV_FCH_BLANKING_DUTYCYCLE` is included,~~ ~~t~~The mobile station shall
9 | perform the following:
- 10 | - Set `REV_FCH_BLANKING_DUTYCYCLEs` to
11 | `REV_FCH_BLANKING_DUTYCYCLEr`.
- 12 | - If the mobile station does not have R-SCH burst assigned with RC08, then
13 | set `REV_FCH_BLANKING_DUTYCYCLE_IN_USE` to
14 | `REV_FCH_BLANKING_DUTYCYCLEr`.
- 15 | - If `REV_ACKCH_GAIN_ADJ_ACS1r` is included, the mobile station shall
16 | perform the following:
- 17 | + Set `REV_ACKCH_GAIN_ADJ_ACS1s` to `REV_ACKCH_GAIN_ADJ_ACS1r`.
- 18 | - If `REV_ACKCH_GAIN_ADJ_ACS2PLUSr` is included, the mobile station shall
19 | perform the following:
- 20 | + Set `REV_ACKCH_GAIN_ADJ_ACS2PLUSs` to
21 | `REV_ACKCH_GAIN_ADJ_ACS2PLUSr`.
- 22 | - If `NUM_RC_PARAMS_RECORDS` is set to non-zero value, the mobile station
23 | shall update `RC_PARAMS_RECORDs[i]` as follows:
- 24 | + If entry for `PILOT_PNr` exists then `RC_PARAMS_RECORDs[i]` is the
25 | existing entry, otherwise `RC_PARAMS_RECORDs[i]` is a new entry with
26 | `REV_SCH_ACK_CH_WALSH[00]`, `REV_SCH_ACK_BIT[00]`,
27 | `REV_SCH_ACK_CH_WALSH[01]`, and `REV_SCH_ACK_BIT[01]` fields set to
28 | NULL.
- 29 | + Set `RC_PARAMS_RECORDs[i].PILOT_PN` to `PILOT_PNr`.
- 30 | + Set `RC_PARAMS_RECORDs[i].QOF_SET_IN_USE` to `QOF_SET_IN_USEr`.
- 31 | + If `REV_SCH0_ACK_CH_WALSH` is included, the mobile station shall set
32 | `RC_PARAMS_RECORDs[i].REV_SCH_ACK_CH_WALSH[00]` to
33 | `REV_SCH0_ACK_CH_WALSHr`.
- 34 | + If `REV_SCH0_ACK_BIT` is included, the mobile station shall set
35 | `RC_PARAMS_RECORDs[i].REV_SCH_ACK_BIT[00]` to
36 | `REV_SCH0_ACK_BITr`.
- 37 | + If `REV_SCH1_ACK_CH_WALSH` is included, the mobile station shall set
38 | `RC_PARAMS_RECORDs[i].REV_SCH_ACK_CH_WALSH[01]` to
39 | `REV_SCH1_ACK_CH_WALSHr`.

- 1 + If REV_SCH1_ACK_BIT is included, the mobile station shall set
2 RC_PARAMS_RECORD_s[i].REV_SCH_ACK_BIT[01] to
3 REV_SCH1_ACK_BIT_r.
- 4 + Set RC_PARAMS_RECORD_s[i].FOR_FCH_CCSH_INTERLEAVER_TYPE to
5 FOR_FCH_CCSH_INTERLEAVER_TYPE_r.

6 *72. Alternative Technology Information Message:* The mobile shall store all the
7 Radio Interface records contained in the message.

8 *73. General Extension Message:* The mobile station shall process this message
9 as specified in section 2.6.18.

- 10 - If the mobile station receives a message that is not included in the above
11 list, cannot be processed, or requires a capability which is not supported,
12 the mobile station shall discard the message and send a *Mobile Station*
13 *Reject Order* (ORDQ set to the applicable reason code as determined from
14 Table 2.7.3-1) within T_{56m} seconds. If the mobile station receives a Call
15 Control message (see 2.6.10) which is directed to a Call Control instance
16 that does not exist, the mobile station shall send a *Mobile Station Reject*
17 *Order* with ORDQ field set to '00010001' (no call control instance present
18 with the specified identifier) to the base station within T_{56m} seconds.
- 19 - If the bits of TMSI_CODE_{s-p} are not all equal to '1', and if System Time (in
20 80 ms units) exceeds TMSI_EXP_TIME_{s-p} × 2¹², the mobile station shall set
21 all the bits of TMSI_CODE_{s-p} to '1' within T_{66m} seconds.
- 22 - If the full-TMSI timer expires or has expired, the mobile station shall set all
23 the bits of TMSI_CODE_{s-p} to '1'. The mobile station shall update the
24 registration variables as described in 2.6.5.5.2.5.
- 25 - If the Forward Packet Data Channel is assigned, whenever the mobile
26 station transmitter is disabled, the MS shall set FPDCH_DTX_INDICATOR_s
27 to '1'.
- 28 - If the Forward Packet Data Channel is assigned, whenever the mobile
29 station transmitter is enabled, the mobile station shall perform the
30 following procedures:
 - 31 + The MS shall set FPDCH_DTX_INDICATOR_s to '0'.
 - 32 + If the mobile station transmitter has been disabled for at least
33 TX_DISABLED_TIMER_s, the mobile station shall send SIG-
34 HandoffPDCH.Indication (handoff_type = ASSIGN) primitive to the MAC
35 layer.

36 2.6.4.4 Release Substate

37 In this substate, the mobile station confirms the disconnect of all calls and physical
38 channels.

- 1 Upon entering the *Release Substate*, the mobile station shall perform the following:
- 2 • The mobile station shall set the substate timer for T_{55m} seconds.
 - 3 • If the mobile station enters the *Release Substate* with a power-down indication, the
4 mobile station shall send a *Release Order* (ORDQ = '00000001'), and shall perform
5 power-down registration procedures (see 2.6.5.5.4.4). The Layer 3 shall terminate
6 all Call Control instances.
 - 7 • If the mobile station enters the *Release Substate* with a mobile station release
8 indication, the mobile station shall send a *Release Order* as follows:
 - 9 - If the mobile station supports operation in the reduced slot cycle mode following
10 release from the traffic channel, the mobile station shall set ORDQ to
11 '00000011', RETURN_CAUSE_s to '0000', and perform the following:
 - 12 + If T_SLOTTED_s is equal to 0, the mobile station shall perform the following:
 - 13 ○ Set the RSC_MODE_IND field as specified in 2.7.3.5. If RSC_MODE_IND
14 is set to '1', then:
 - 15 ◇ Set RSC_MODE_ENABLED to YES.
 - 16 ◇ Set the RSC_END_TIME_UNIT and RSC_END_TIME_VALUE fields as
17 specified in 2.7.3.5, and store the system time specified by these
18 fields as RSC_END_TIME.
 - 19 ◇ Set the RSCI field as specified in 2.7.3.5 and store it as RSCI_s; if
20 RSCI_s is equal to '0111', set SLOTTED_s to NO.
 - 21 ◇ Set IGNORE_QPCH_s to '1'.
 - 22 + Otherwise, the mobile station shall set the RSC_MODE_IND field to '0'.
 - 23 - Otherwise, the mobile station shall set ORDQ to '00000000', and set
24 RETURN_CAUSE_s to '0000'.
 - 25 • If the mobile station enters the *Release Substate* with a service inactive indication,
26 the mobile station shall send a *Release Order* (ORDQ = '00000010'), and set
27 RETURN_CAUSE_s to '0000'.
 - 28 • If the mobile station enters the *Release Substate* with a base station release
29 indication, the mobile station shall send a *Release Order* (ORDQ = '00000000'). The
30 Layer 3 shall terminate all Call Control instances. The mobile station shall disable
31 its transmitter, set RETURN_CAUSE_s to '0000', and shall perform the procedures as
32 specified in 2.6.4.4.1.
 - 33 • If the mobile station entered the *Release Substate* with a base station extended
34 release indication, the mobile station shall perform the following:
 - 35 - The mobile station shall send an *Extended Release Response Message* to the
36 base station as follows:
 - 37 + If the RSC_MODE_SUPPORTED field in the received *Extended Release*
38 *Message* was set to '1' and the mobile station requests operation in the

- 1 reduced slot cycle mode, the mobile station shall set the RSC_MODE_IND
2 field to '1' and perform the following:
- 3 ○ Set RSC_MODE_ENABLED to YES.
 - 4 ○ Set the RSC_END_TIME_UNIT and RSC_END_TIME_VALUE fields as
5 specified in 2.7.2.3.2.25, and store the system time specified by these
6 fields as RSC_END_TIME. The value of RSC_END_TIME shall be no later
7 than the system time specified by MAX_RSC_END_TIME_UNIT_r and
8 MAX_RSC_END_TIME_VALUE_r received in the *Extended Release*
9 *Message*.
 - 10 ○ Set the RSCI field as specified in 2.7.2.3.2.25 and store it as RSCI_s; if
11 RSCI_s is equal to '0111', set SLOTTED_s to NO.
 - 12 ○ Set IGNORE_QPCH_s to IGNORE_QPCH_r received in the *Extended Release*
13 *Message*.
- 14 + Otherwise, the mobile station shall set the RSC_MODE_IND field to '0'.
- 15 - The Layer 3 shall terminate all Call Control instances.
 - 16 - The mobile station shall disable its transmitter, set RETURN_CAUSE_s to '0000',
17 and shall perform the procedures as specified in 2.6.4.4.1.
 - 18 • If the mobile station entered the *Release Substate* with a base station extended
19 release with mini message indication, then the mobile station shall perform the
20 following:
 - 21 - The mobile station shall send an *Extended Release Response Mini Message* to
22 the base station.
 - 23 - The Layer 3 shall terminate all Call Control instances.
 - 24 - The mobile station shall disable its transmitter, set RETURN_CAUSE_s to '0000',
25 and shall perform the procedures as specified in 2.6.4.4.1.
 - 26 • If the mobile station enters the *Release Substate* with a redirection indication, the
27 mobile station shall send a *Release Order* (ORDQ = '00000000') and shall enter the
28 *System Determination Substate* of the *Mobile Station Initialization State* with a
29 redirection indication (see 2.6.1.1). The Layer 3 shall terminate all Call Control
30 instances.
 - 31 • If the mobile station enters the *Release Substate* with an NDSS off indication, the
32 mobile station shall send a *Release Order* (ORDQ = '00000000'), and shall enter the
33 *System Determination Substate* of the *Mobile Station Initialization State* with an NDSS
34 off indication (see 2.6.1.1). The Layer 3 shall terminate all Call Control instances.
 - 35 • While in the *Release Substate*, the mobile station shall perform the following:
 - 36 • If the substate timer expires, the Layer 3 shall terminate all Call Control instances,
37 and the mobile station shall disable its transmitter and shall enter the *System*
38 *Determination Substate* of the *Mobile Station Initialization State* with a release
39 indication (see 2.6.1.1).

- 1 • The mobile station shall perform Forward Traffic Channel supervision as specified
2 in 2.6.4.1.8. If a loss of the Forward Traffic Channel is declared, the Layer 3 shall
3 terminate all Call Control instances, and shall enter the *System Determination*
4 *Substate* of the *Mobile Station Initialization State* with a release indication (see
5 2.6.1.1).
- 6 • The mobile station shall adjust its transmit power as specified in [2].
- 7 • The mobile station shall perform Forward Traffic Channel power control as specified
8 in 2.6.4.1.1.
- 9 • The mobile station shall perform handoff processing as specified in 2.6.6.
- 10 • If the Fundamental Channel is present, the mobile station shall transmit null
11 traffic, except when transmitting signaling traffic, on the Reverse Fundamental
12 Channel.
- 13 • The mobile station shall process Forward Traffic Channel signaling traffic and shall
14 discard other types of Forward Traffic Channel traffic.
- 15 • The mobile station shall perform registration timer maintenance as specified in
16 2.6.5.5.4.2.
- 17 • If Layer 3 receives a L2-Condition.Notification primitive from Layer 2 indicating an
18 acknowledgment failure, the Layer 3 shall terminate all Call Control instances, and
19 the mobile station shall disable its transmitter and enter the *System Determination*
20 *Substate* of the *Mobile Station Initialization State* with a release indication (see
21 2.6.1.1).
- 22 • If the Layer 3 receives an “enter traffic channel substate indication” from a Call
23 Control instance, the Layer 3 shall enter the *Traffic Channel substate*.
- 24 • If Layer 3 receives a ‘message rejected indication’ from a Call Control instance,
25 mobile station shall send a *Mobile Station Reject Order* (ORDQ set to the applicable
26 reason code as determined from Table 2.7.3-1) within T_{56m} seconds as follows:
 - 27 - If P_REV_IN_USE_s is equal to or greater than seven, the mobile station shall
28 include the CON_REF_INCL field with this message and shall perform the
29 following: if the corresponding Call Control instance is identified by NULL, the
30 mobile station shall either set the CON_REF_INCL field of the message to ‘0’ or
31 set the CON_REF_INCL field to ‘1’ and set the CON_REF field to the connection
32 reference of the service option connection corresponding to this Call Control
33 instance; otherwise, the mobile station shall set the CON_REF_INCL field of the
34 message to ‘1’ and the CON_REF field of the message to the connection
35 reference of the service option connection corresponding to this Call Control
36 instance.
- 37 • If the mobile station receives a message which is included in the following list, and
38 if every message field value is within its permissible range, the mobile station shall
39 process the message as described below and in accordance with the message’s
40 action time (see 2.6.4.1.5):

- 1 1. *Alert With Information Message*: If P_REV_IN_USE_s is less than seven, the Layer
2 3 shall deliver this message to the Call Control instance; otherwise, the Layer 3
3 shall deliver this message to the Call Control instance identified by NULL.
- 4 2. *Authentication Request Message*: The mobile station shall process the message
5 and shall respond as specified in 2.3.12.5.2.
- 6 3. *Candidate Frequency Search Control Message*: The mobile station shall process
7 the message as specified in 2.6.6.2.5.1.
- 8 4. *Candidate Frequency Search Request Message*: The mobile station shall
9 process the message as specified in 2.6.6.2.5.1.
- 10 5. *Data Burst Message*
- 11 6. *Extended Alert With Information Message*: The mobile station shall perform the
12 following: If CON_REF_INCL_r equals '0', the Layer 3 shall deliver this message
13 to the Call Control instance identified by NULL; otherwise, the Layer 3 shall
14 deliver this message to the Call Control instance identified by CON_REF_r.
- 15 7. *Extended Handoff Direction Message*: The mobile station shall process the
16 message as specified in 2.6.6.2.5.1.
- 17 8. *Extended Neighbor List Update Message*: The mobile station shall process the
18 message as specified in 2.6.6.2.5.1.
- 19 9. *Extended Supplemental Channel Assignment Message*: The mobile station shall
20 process the message as specified in 2.6.6.2.5.1.
- 21 10. *General Handoff Direction Message*: The mobile station shall process the
22 message as specified in 2.6.6.2.5.1.
- 23 11. *In-Traffic System Parameters Message*: The mobile station shall process the
24 message as specified in 2.6.4.1.4.
- 25 12. *Local Control Order*
- 26 13. *Mobile Assisted Burst Operation Parameters Message*: The mobile station shall
27 process the message as specified in 2.6.6.2.5.1.
- 28 14. *Lock Until Power-Cycled Order*: The mobile station shall disable its transmitter
29 and record the reason for the *Lock Until Power-Cycled Order* in the mobile
30 station's semi-permanent memory (LCKRSN_P_{s-p} equals the least-significant
31 four bits of ORDQ_r). The mobile station should notify the user of the locked
32 condition. The Layer 3 shall terminate all Call Control instances. The Layer 3
33 shall enter the *System Determination Substate* of the *Mobile Station Initialization*
34 *State* with a lock indication (see 2.6.1.1), and shall not enter the *System Access*
35 *State* again until after the next mobile station power-up or until it has received
36 an *Unlock Order*. This requirement shall take precedence over any other mobile
37 station requirement specifying entry to the *System Access State*.
- 38 15. *Maintenance Required Order*: The mobile station shall record the reason for the
39 *Maintenance Required Order* in the mobile station's semi-permanent memory
40 (MAINTRSN_{s-p} equals the least-significant four bits of ORDQ_r). The mobile

- 1 station shall remain in the unlocked condition. The mobile station should
2 notify the user of the maintenance required condition.
- 3 16. *Mobile Station Registered Message*: The mobile station shall process the
4 message as specified in 2.6.5.5.4.3.
- 5 17. *Neighbor List Update Message*: The mobile station shall process the message as
6 specified in 2.6.6.2.5.1.
- 7 18. *Outer Loop Report Request Order*: The mobile station shall send the *Outer Loop*
8 *Report Message* in assured mode to the base station.
- 9 19. *Power Control Message*: The mobile station shall process the message as
10 specified in 2.6.4.1.1.3.
- 11 20. *Power Control Parameters Message*: The mobile station shall process the
12 message as specified in 2.6.4.1.1.2.
- 13 21. *Power Up Function Message*: The mobile station shall process the message as
14 specified in 2.6.4.1.7.1.
- 15 22. *Power Up Function Completion Message*: The mobile station shall process the
16 message as specified in 2.6.4.1.7.3.
- 17 23. *Rate Change Message*: The mobile station shall process the message as
18 specified in 2.6.4.1.1.4.
- 19 24. *Release Order*: The mobile station shall disable its transmitter. The Layer 3
20 shall terminate all Call Control instances. The mobile station shall set
21 RSC_MODE_ENABLED to NO. If the mobile station enters the *Release Substate*
22 with a power-down indication, the mobile station may power down; otherwise,
23 the mobile station shall perform the procedures as specified in 2.6.4.4.1.
- 24 25. *Retrieve Parameters Message*: The mobile station shall send, within T_{56m}
25 seconds, a *Parameters Response Message*.
- 26 26. *Retry Order*: The mobile station shall process the order as follows:
- 27 - If $RETRY_TYPE_R$ is equal to '000', the mobile station shall set
28 $RETRY_DELAY_S[RETRY_TYPE]$ to 0, where $RETRY_TYPE$ is equal to '001',
29 '010', '011', '100', or '101'.
 - 30 - If $RETRY_TYPE_R$ is equal to '001', '100', or '101', then the mobile station
31 shall perform the following:
 - 32 + If $RETRY_DELAY_R$ is equal to '00000000', then the mobile station shall
33 set $RETRY_DELAY_S [RETRY_TYPE_R]$ to 0.
 - 34 + If $RETRY_DELAY_R$ is not equal to '00000000', the mobile station shall set
35 $RETRY_DELAY_S[RETRY_TYPE_R]$ as follows:
 - 36 ○ If the most significant bit of the $RETRY_DELAY_R$ is 0, set
37 $RETRY_DELAY_UNIT_S$ to 1000ms. If the most significant bit of the
38 $RETRY_DELAY_R$ is '1', set $RETRY_DELAY_UNIT_S$ to 60000ms.

- 1 ○ The mobile station shall set $RETRY_DELAY_VALUE_S$ to the seven
2 least significant bits of $RETRY_DELAY_R$.
- 3 ○ The mobile station shall store the next system time 80 ms boundary
4 + $RETRY_DELAY_VALUE_S \times RETRY_DELAY_UNIT_S$ ms as
5 $RETRY_DELAY_S[RETRY_TYPE_R]$.
- 6 27. *Service Option Control Message*: The mobile station shall process the message
7 in accordance with the requirements for the active service subfunction (see
8 2.6.4.1.2.2).
- 9 28. *Service Option Control Order*: The mobile station shall process the message in
10 accordance with the requirements for the active service subfunction (see
11 2.6.4.1.2.2).
- 12 29. *Service Redirection Message*: The mobile station shall disable its transmitter. If
13 the mobile station enters the *Release Substate* with a power-down indication,
14 the mobile station may power down (if powering down, the Layer 3 shall
15 terminate all Call Control instances); otherwise, the mobile station shall
16 process the message as follows:
17 - If $RECORD_TYPE_R$ is '00000000', the mobile station shall perform the
18 following:
19 + The mobile station shall set $RETURN_IF_FAIL_S = RETURN_IF_FAIL_R$.
20 + If $DELETE_TMSI_R$ is equal to '1', the mobile station shall set all the
21 bits of $TMSI_CODE_{S-p}$ to '1'.
22 + The mobile station shall disable the full-TMSI timer.
23 + The Layer 3 shall terminate all Call Control instances, and shall
24 enter the *System Determination Substate of the Mobile Station*
25 *Initialization State* with an NDSS off indication (see 2.6.1.1).
26 - If $RECORD_TYPE$ is not equal to '00000000', $REDIRECT_TYPE_R$ is '1',
27 and the mobile station supports the band class and operating mode
28 specified in the message, the mobile station shall perform the following:
29 + The mobile station shall store the redirection record received in the
30 message as $REDIRECT_REC_S$.
31 + The mobile station shall set $RETURN_IF_FAIL_S = RETURN_IF_FAIL_R$.
32 + If $DELETE_TMSI_R$ is equal to '1', the mobile station shall set all the
33 bits of $TMSI_CODE_{S-p}$ to '1'.
34 + The mobile station shall disable the full-TMSI timer.
35 + The Layer 3 shall terminate all Call Control instances, and shall
36 enter the *System Determination Substate of the Mobile Station*
37 *Initialization State* with a redirection indication (see 2.6.1.1).

- 1 - Otherwise, the mobile station shall discard the message and send a
2 *Mobile Station Reject Order* (ORDQ set to the applicable reason code as
3 determined from Table 2.7.3-1) within T_{56m} seconds.
- 4 30. *Status Request Message*: The mobile station shall send, within T_{56m} seconds, a
5 Status Response Message. If the message does not specify any qualification
6 information (QUAL_INFO_TYPE_r is equal to '00000000'), the mobile station
7 shall include the requested information records in the *Status Response*
8 *Message*. If the message specifies a band class (QUAL_INFO_TYPE_r is equal to
9 '00000001'), the mobile station shall only include the requested information
10 records for the specified band class (BAND_CLASS_r) in the *Status Response*
11 *Message*. If the message specifies a band class and an operating mode
12 (QUAL_INFO_TYPE_r is equal to '00000010'), the mobile station shall only
13 include the requested information records for the specified band class
14 (BAND_CLASS_r) and operating mode (OP_MODE_r) in the *Status Response*
15 *Message*. If the message specifies a band class or a band class and an
16 operating mode which are not supported by the mobile station, the mobile
17 station shall send a *Mobile Station Reject Order* with ORDQ set to '00000110'
18 (message requires a capability that is not supported by the mobile station). If
19 the response to this message exceeds the allowable length, the mobile station
20 shall send a *Mobile Station Reject Order* with ORDQ set to '00001000' (response
21 message would exceed the allowable length). If the message specifies an
22 information record which is not supported by the mobile station for the
23 specified band class and operating mode, the mobile station shall send a *Mobile*
24 *Station Reject Order* with ORDQ set to '00001001' (information record is not
25 supported for the specified band class and operating mode).
- 26 31. *Status Request Order*: If CDMABAND_s is equal to '00000', the mobile station
27 shall send, a *Status Message* within T_{56m} seconds. The mobile station shall
28 respond with information corresponding to the current band class and
29 operating mode.
- 30 32. *Supplemental Channel Assignment Message*: The mobile station shall process
31 the message as specified in 2.6.6.2.5.1.
- 32 33. *TMSI Assignment Message*: The mobile station shall store the TMSI zone and
33 code as follows:
- 34 - The mobile station shall store the length of the TMSI zone field by setting
35 ASSIGNING_TMSI_ZONE_LEN_{s-p} to TMSI_ZONE_LEN_r;
 - 36 - The mobile station shall store the assigning TMSI zone number by setting
37 the ASSIGNING_TMSI_ZONE_LEN_{s-p} least significant octets of
38 ASSIGNING_TMSI_ZONE_{s-p} to TMSI_ZONE_r, and
 - 39 - The mobile station shall store the TMSI code by setting TMSI_CODE_{s-p} to
40 TMSI_CODE_r.

41 The mobile station shall set the TMSI expiration time by setting
42 TMSI_EXP_TIME_{s-p} to TMSI_EXP_TIME_r. The mobile station shall disable the

- 1 full-TMSI timer. The mobile station shall then respond with a *TMSI Assignment*
2 *Completion Message* within T_{56m} seconds.
- 3 34. *Universal Handoff Direction Message*: The mobile station shall process the
4 message as specified in 2.6.6.2.5.1.
- 5 35. *User Zone Reject Message*: The mobile station shall process this message as
6 specified in 2.6.9.2.2.
- 7 36. *User Zone Update Message*: The mobile station shall process this message as
8 specified in 2.6.9.2.2.
- 9 37. *Extended Release Message*:
- 10 - If USE_EXT_CH_IND is equal to '0' and CH_IND is equal to '111' or the
11 physical channels indicated by the two least significant bits of CH_IND
12 includes all the physical channels (FCH, DCCH, or both) currently being
13 processed by the mobile station, then the mobile station shall perform the
14 following:
- 15 + If the mobile station supports operation in the reduced slot cycle mode
16 following release of the traffic channel, the mobile station shall perform
17 the following:
- 18 o If RSC_MODE_ENABLED is equal to YES, the mobile station shall
19 perform the following:
- 20 ◇ If RSC_MODE_SUPPORTED_r is equal to '1', the mobile station
21 shall perform the following:
- 22 - Set RSC_END_TIME to the earlier of the current value of
23 RSC_END_TIME, and the system time specified by
24 MAX_RSC_END_TIME_UNIT_r and
25 MAX_RSC_END_TIME_VALUE_r.
- 26 - Set IGNORE_QPCH_s to IGNORE_QPCH_r.
- 27 ◇ If RSC_MODE_SUPPORTED_r is equal to '0', the mobile station
28 shall set RSC_MODE_ENABLED to NO.
- 29 o If RSC_MODE_ENABLED is equal to NO, the mobile station shall
30 perform the following:
- 31 ◇ If REQ_RSCI_INCL_r is included and set to '1', and the mobile
32 station sent a *Release Order* with ORDQ equal to '0000011', the
33 mobile station shall send an *Extended Release Response Message*
34 with the RSC_MODE_IND field set to '1', and perform the
35 following:
- 36 - Set RSC_MODE_ENABLED to YES.
- 37 - Set the RSC_END_TIME_UNIT and RSC_END_TIME_VALUE
38 fields as specified in 2.7.2.3.2.25, and store the system time

- 1 specified by these fields as RSC_END_TIME. The value of
 2 RSC_END_TIME shall be no later than the system time
 3 specified by MAX_RSC_END_TIME_UNIT_r and
 4 MAX_RSC_END_TIME_VALUE_r received in the *Extended*
 5 *Release Message*.
- 6 – Set the RSCI field as specified in 2.7.2.3.2.25 and store it as
 7 RSCI_s; if RSCI_s is equal to '0111', set SLOTTED_s to NO.
 - 8 – Set IGNORE_QPCH_s to IGNORE_QPCH_r.
- 9 + The mobile station shall disable its transmitter.
 - 10 + The Layer 3 shall terminate all Call Control instances.
 - 11 + If the mobile station enters the *Release Substate* with a power-down
 12 indication, the mobile station may power down; otherwise, the mobile
 13 station shall perform the procedures as specified in 2.6.4.4.1.
- 14 - Otherwise, the mobile station shall discard the *Extended Release Message*
 15 and send a *Mobile Station Reject Order* with ORDQ field set to '0000010'
 16 (message not accepted in this state) within T_{56m} seconds.
 - 17 - If the mobile station receives a message that is not included in the above list
 18 or cannot be processed, the mobile station shall discard the message and
 19 send a *Mobile Station Reject Order* (ORDQ set to the applicable reason code
 20 as determined from Table 2.7.3-1) within T_{56m} seconds. If the mobile
 21 station receives a Call Control message (see 2.6.10) which is directed to a
 22 Call Control instance that does not exist, the mobile station shall send a
 23 *Mobile Station Reject Order* with ORDQ field set to '00010001' (no call control
 24 instance present with the specified identifier) to the base station within T_{56m}
 25 seconds.
 - 26 - If the bits of TMSI_CODE_{s-p} are not all equal to '1', and if System Time (in
 27 80 ms units) exceeds TMSI_EXP_TIME_{s-p} × 2¹², the mobile station shall set
 28 all the bits of TMSI_CODE_{s-p} to '1' within T_{66m} seconds.
 - 29 - If the full-TMSI timer expires or has expired, the mobile station shall set all
 30 the bits of TMSI_CODE_{s-p} to '1'. The mobile station shall update the
 31 registration variables as described in 2.6.5.5.2.5.

32 2.6.4.4.1 Procedures for Exiting the Release Substate

33 The mobile station shall perform the following procedures in the order listed below.

34 If the mobile station received an *Extended Release Message* with the
 35 RER_MODE_ENABLED field set to '1', then the mobile station shall set
 36 RER_MODE_ENABLED to YES, RER_COUNT to 0, and shall perform the following:

- 37 • The mobile station shall store the following:
 - 38 - Maximum number of *Radio Environment Messages* that the mobile station is
 39 permitted to transmit while in radio environment reporting mode

- 1 (RER_MAX_NUM_MSG_s = *infinity*, if RER_MAX_NUM_MSG_IDX_r is equal to
2 '111'; otherwise, RER_MAX_NUM_MSG_s = 2^{RER_MAX_NUM_MSG_IDX_r}).
- 3 - Maximum number of pilots to maintain in RER_PILOT_LIST
4 (MAX_RER_PILOT_LIST_SIZE_s = MAX_RER_PILOT_LIST_SIZE_r).
- 5 - System identification for radio environment reporting mode (RER_SID_s = SID_s).
- 6 - Network identification for radio environment reporting mode (RER_NID_s = NID_s).
- 7 • The mobile station shall initialize the radio environment report pilot list
8 (RER_PILOT_LIST) to contain the set of pilots that made up the Active Set on the
9 Traffic Channel.
- 10 • The mobile station shall enable the radio environment report timer with an initial
11 value of *infinity* if RER_TIME_r is equal to '111'; otherwise, the mobile station shall
12 enable the radio environment report timer with an initial value of 2^{RER_TIME_r}
13 seconds if RER_TIME_UNIT_r is equal to '00', or 2^{RER_TIME_r} minutes if
14 RER_TIME_UNIT_r is equal to '01', or 2^{RER_TIME_r} hours if RER_TIME_UNIT_r is equal
15 to '10'.

16 If the mobile station received an *Extended Release Message* with the TKZ_MODE_ENABLED
17 field set to '1', then the mobile station shall set TKZ_COUNT to 0, and shall perform the
18 following:

- 19 • The mobile station shall store the following:
- 20 - Tracking zone identifier (TKZ_ID_s = TKZ_ID_r).
- 21 - Tracking zone list length (TKZ_LIST_LEN_s = TKZ_LIST_LEN_r).
- 22 - TKZ timer (TKZ_TIMER_s = TKZ_TIMER_r).
- 23 - Maximum number of *Radio Environment Messages* that the mobile station is
24 permitted to transmit while in tracking zone mode (TKZ_MAX_NUM_MSG_s =
25 *infinity*, if TKZ_MAX_NUM_MSG_IDX_r is equal to '111'; otherwise,
26 TKZ_MAX_NUM_MSG_s = 2^{TKZ_MAX_NUM_MSG_IDX_r}).
- 27 - System identification for tracking zone mode (TKZ_SID_s = SID_s).
- 28 - Network identification for tracking zone mode (TKZ_NID_s = NID_s).
- 29 - Tracking zone update period (TKZ_UPDATE_PRD_s = TKZ_UPDATE_PRD_r).
- 30 • If RER_MODE_ENABLED is equal to NO, the mobile station shall set
31 TKZ_MODE_ENABLED to YES; otherwise, the mobile station shall set
32 TKZ_MODE_PENDING to YES.
- 33 • If TKZ_MODE_ENABLED is equal to YES, the mobile station shall perform the
34 following:
- 35 - Initialize the tracking zone list (TKZ_LIST) to contain TKZ_ID_s.

- 1 - Enable the tracking zone update timer with an initial value of infinity if
2 TKZ_UPDATE_PRD_s is equal to '1111'; otherwise, the mobile station shall enable
3 the tracking zone update timer with an initial value of $2^{TKZ_UPDATE_PRD_s} + 6$
4 seconds.

5 The mobile station shall perform the following procedures to determine whether to enter
6 the *Mobile Station Idle State* or *System Determination Substate* of the *Mobile Station*
7 *Initialization State*.

8 If the mobile station received an *Extended Release Message* with
9 DIRECT_TO_IDLE_INFO_INCL field equal to '1' and RELEASE_TYPE_r equal to '011', the
10 mobile station shall enter the *System Determination Substate* of the *Mobile Station*
11 *Initialization Substate* with a release indication (see 2.6.1.1).

12 If the mobile station received an *Extended Release Message* with
13 DIRECT_TO_IDLE_INFO_INCL field equal to '1', RELEASE_TYPE_r equal to a value other
14 than '011', and all the following conditions are met:

- 15 • The system indicated by this message is a preferred system according to system
16 selection process of the mobile station, and
- 17 • If the BAND_CLASS field is included in this message, the mobile station supports
18 the band class capability specified by this field, and
- 19 • If the SR1_TD_MODE field is included in this message, the mobile station supports
20 the transmit diversity capability specified by this field, and
- 21 • The mobile station is able to select one of the pilots in the DIRECT TO IDLE record
22 of the *Extended Release Message* with sufficient signal strength to enter *Mobile*
23 *Station Idle State*.

24 then, the mobile station shall perform the following:

- 25 • If RELEASE_TYPE_r equals '000', the mobile station shall perform the following:
 - 26 - If FREQ_INCL_r equals '1', the mobile station shall set CDMABAND_s to
27 BAND_CLASS_r and CDMACH_s to CDMA_FREQ_r.
 - 28 - The mobile station shall store the following:
 - 29 + PAGECH_s = PAGE_CH_r
 - 30 + PRAT_s = PRAT_r
 - 31 - The mobile station shall then perform the following:
 - 32 + Set its code channel to PAGECH_s,
 - 33 + Set the Paging Channel data rate as determined by PRAT_s,
 - 34 + The mobile station shall enter the *Mobile Station Idle State* on the CDMA
35 Channel specified by CDMABAND_s and CDMACH_s and acquire the specified
36 Paging Channel. If BCMC_INFO_INCL_r is included and is equal to '1', the
37 mobile station may start monitoring the BCMC flows corresponding to the
38 BCMC_FLOW_IDS (See section 2.6.13.11) included in this message after
39 entering the *Mobile Station Idle State* as specified in section 2.6.13, using the

- 1 BCMC flow information included in this message.
- 2 • If $RELEASE_TYPE_T$ equals '001', the mobile station shall perform the following:
- 3 - If $FREQ_INCL_T$ equals '1', the mobile station shall set $CDMABAND_S$ to
- 4 $BAND_CLASS_T$ and $CDMACH_S$ to $CDMA_FREQ_T$.
- 5 - The mobile station shall store the following:
- 6 + $BCCH_S = SR1_BCCH_CODE_CHAN_NON_TD_T$
- 7 + $BCCH_CODE_RATE_S = SR1_CRAT_NON_TD_T$
- 8 + $BRAT_S = SR1_BRAT_NON_TD_T$
- 9 - The mobile station shall then perform the following:
- 10 + Set its Primary Broadcast Control Channel code channel to $BCCH_S$,
- 11 + Set the Primary Broadcast Control Channel data rate as determined by
- 12 $BRAT_S$,
- 13 + Set the Primary Broadcast Control Channel code rate as determined by
- 14 $BCCH_CODE_RATE_S$,
- 15 + The mobile station shall enter the *Mobile Station Idle State* on the CDMA
- 16 Channel specified by $CDMABAND_S$ and $CDMACH_S$ and acquire the specified
- 17 Primary Broadcast Control Channel. If $BCMC_INFO_INCL_T$ is included and is
- 18 equal to '1', the mobile station may start monitoring the BCMC flows
- 19 corresponding to the $BCMC_FLOW_IDs$ (See section 2.6.13.11) included in
- 20 this message after entering the *Mobile Station Idle State* as specified in
- 21 section 2.6.13, using the BCMC flow information included in this message.
- 22 • If $RELEASE_TYPE_T$ equals '010', the mobile station shall perform the following:
- 23 - If $FREQ_INCL_T$ equals '1', the mobile station shall set $CDMABAND_S$ to
- 24 $BAND_CLASS_T$ and $CDMACH_S$ to $CDMA_FREQ_T$.
- 25 - The mobile station shall store the following:
- 26 + $BCCH_S = SR1_BCCH_CODE_CHAN_TD_T$
- 27 + $BCCH_CODE_RATE_S = SR1_CRAT_TD_T$
- 28 + $BRAT_S = SR1_BRAT_TD_T$
- 29 - The mobile station shall then perform the following:
- 30 + Set its Primary Broadcast Control Channel code channel to $BCCH_S$,
- 31 + Set the Primary Broadcast Control Channel data rate as determined by
- 32 $BRAT_S$,
- 33 + Set the Primary Broadcast Control Channel code rate as determined by
- 34 $BCCH_CODE_RATE_S$,
- 35 + The mobile station shall enter the *Mobile Station Idle State* on the CDMA
- 36 Channel specified by $CDMABAND_S$ and $CDMACH_S$ and acquire the specified
- 37 Primary Broadcast Control Channel that supports Transmit Diversity. If

1 BCMC_INFO_INCL_T is included and is equal to '1', the mobile station may
 2 start monitoring the BCMC flows corresponding to the BCMC_FLOW_IDs
 3 (See section 2.6.13.11) included in this message after entering the *Mobile*
 4 *Station Idle State* as specified in section 2.6.13, using the BCMC flow
 5 information included in this message.

6 Otherwise, the mobile station shall perform the following:

- 7 • If RELEASE_TO_IDLE_INDs is equal to '0', the mobile station shall enter the System
 8 Determination Substate of the Mobile Station Initialization State with a release
 9 indication (see 2.6.1.1).
- 10 • If RELEASE_TO_IDLE_IND_S is equal to '1', the mobile station shall perform the
 11 following:
 - 12 – If the mobile station has stored BCCH information (BCCH Walsh Code, BCCH
 13 data rate, and BCCH code rate) for a base station which has sufficient pilot
 14 strength, the mobile station shall restore the BCCH information to BCCH_S,
 15 BRAT_S and BCCH_CODE_RATE_S, and then perform the following:
 - 16 + Set its Primary Broadcast Control Channel code channel to BCCH_S,
 - 17 + Set the Primary Broadcast Control Channel data rate as determined by
 18 BRAT_S,
 - 19 + Set the Primary Broadcast Control Channel code rate as determined by
 20 BCCH_CODE_RATE_S,
 - 21 + The mobile station shall enter the *Mobile Station Idle State*.
 - 22 – Otherwise, the mobile station shall perform the following:
 - 23 + If the mobile station has stored PCH information (PCH number and PCH
 24 data rate) for a base station which has sufficient pilot strength, the mobile
 25 station shall restore the PCH information to PAGECH_S and PRAT_S, and then
 26 perform the following:
 - 27 o Set its code channel to PAGECH_S,
 - 28 o Set the Paging Channel data rate as determined by PRAT_S,
 - 29 o The mobile station shall enter the *Mobile Station Idle State*,
 - 30 + Otherwise, the mobile station shall perform the following:
 - 31 o If IDLE_SID is equal to SID_S, IDLE_CDMABAND is equal to
 32 CDMABAND_S, IDLE_NID is equal to NID_S, and IDLE_P_REV is equal to
 33 P_REV_S, and the mobile station decides to enter the *Mobile Station Idle*
 34 *State*, the mobile station shall perform the following:
 - 35 ◇ The mobile station shall set CDMACH_S to IDLE_CDMA_CHAN.
 - 36 ◇ If IDLE_BCCH_CHAN is equal to '1', the mobile station shall perform
 37 the following:
 - 38 – Set its Primary Broadcast Control Channel code channel to

- 1 BCCH_s,
- 2 – Set the Primary Broadcast Control Channel data rate as
- 3 determined by BRAT_s,
- 4 – Set the Primary Broadcast Control Channel code rate as
- 5 determined by BCCH_CODE_RATE_s,
- 6 – The mobile station shall enter the *Mobile Station Idle State*.
- 7 ◇ If IDLE_BCCH_CHAN is equal to '0', the mobile station shall perform
- 8 the following:
- 9 – Set its code channel to PAGECH_s,
- 10 – Set the Paging Channel data rate as determined by PRAT_s,
- 11 – The mobile station shall enter the *Mobile Station Idle State*.
- 12 o Otherwise, the mobile station shall enter the *System Determination*
- 13 *Substate* of the *Mobile Station Initialization State* with a release indication
- 14 (see 2.6.1.1).

15 2.6.5 Registration

16 2.6.5.1 Forms of Registration

17 Registration is the process by which the mobile station notifies the base station of its

18 location, status, identification, slot cycle, and other characteristics. The mobile station

19 informs the base station of its location and status so that the base station can efficiently

20 page the mobile station when establishing a mobile station terminated call. For operation

21 in the slotted mode, the mobile station supplies the SLOT_CYCLE_INDEX parameter so

22 that the base station can determine which slots the mobile station is monitoring. The

23 mobile station supplies the station class mark and the protocol revision number so that the

24 base station knows the capabilities of the mobile station.

25 The CDMA system supports 12 different forms of registration:

- 26 1. Power-up registration. The mobile station registers when it powers on, switches
- 27 from using a different frequency block designator, switches from using a different
- 28 band class, switches from using an alternative operating mode, or upon the
- 29 insertion of an R-UIM into a powered-on ME.
- 30 2. Power-down registration. The mobile station registers when it powers off if
- 31 previously registered in the current serving system.
- 32 3. Timer-based registration. The mobile station registers when a timer expires.
- 33 4. Distance-based registration. The mobile station registers when the distance
- 34 between the current base station and the base station in which it last registered
- 35 exceeds a threshold.
- 36 5. Zone-based registration. The mobile station registers when it enters a new zone.
- 37 6. Parameter-change registration. The mobile station registers when certain of its
- 38 stored parameters change or when it enters a new system.

- 1 7. Ordered registration. The mobile station registers when the base station requests it.
- 2 8. Implicit registration. When a mobile station successfully sends an *Origination*
3 *Message, Reconnect Message, Call Recovery Request Message, or Page Response*
4 *Message*, the base station can infer the mobile station's location. This is considered
5 an implicit registration.
- 6 9. Traffic Channel registration. Whenever the base station has registration information
7 for a mobile station that has been assigned to a Traffic Channel, the base station
8 can notify the mobile station that it is registered.
- 9 10. User Zone Registration. The mobile station registers when it selects an active User
10 Zone (see 2.6.9.1.2).
- 11 11. Encryption/Message Integrity re-sync required registration. The mobile station
12 registers when extended encryption is turned on and the mobile station determines
13 that it can not decrypt any messages from the base station (see 2.3.12.4.1.3) or the
14 mobile station registers when message integrity is supported and the mobile station
15 determines that it can not validate the MACI of any messages from the base station.
- 16 12. BCMC registration. BCMC registration is performed by a mobile station currently
17 monitoring or desiring to monitor a BCMC flow.

18 The first five forms of registration, User Zone Registration, and Encryption/Message
19 Integrity re-sync required registration, as a group, are called autonomous registration and
20 are enabled by roaming status (see 2.6.5.3). Parameter-change registration is independent
21 of roaming status. Ordered registration is initiated by the base station through an *Order*
22 *Message*. Implicit registration does not involve the exchange of any registration messages
23 between the base station and the mobile station. The base station can obtain registration
24 information by sending the *Status Request Message* to the mobile station on either the f-
25 csch or the f-dsch. The base station can obtain limited registration information by sending
26 the *Status Request Order* to the mobile station on the f-dsch. The mobile station can be
27 notified that it is registered through the *Mobile Station Registered Message*.

28 Any of the various forms of autonomous registration and parameter-change registration
29 can be enabled or disabled. The forms of registration that are enabled and the
30 corresponding registration parameters are communicated in the *System Parameters*
31 *Message* on the Paging Channel, or the *ANSI-41 System Parameters Message* on the Primary
32 Broadcast Control Channel.

33 In addition, the mobile station may enable or disable autonomous registration for each type
34 of roaming described in 2.6.5.3.

35 2.6.5.1.1 Power-Up Registration

36 Power-up registration is performed when the mobile station is turned on. To prevent
37 multiple registrations when power is quickly turned on and off, or when the R-UIM is
38 quickly inserted and removed, the mobile station delays T_{57m} seconds before registering,
39 after entering the *Mobile Station Idle State*.

1 The mobile station shall maintain a power-up/initialization timer. While the power-
 2 up/initialization timer is active, the mobile station shall not make registration access
 3 attempts.

4 Power-up registration is performed when the mobile station changes to a different operating
 5 mode (see 2.6.5.5.1.1), or as indicated by [40]. A power-up registration is also performed
 6 when the mobile station changes band classes, serving system, or frequency block
 7 designator if the conditions stated in 2.6.5.5.1.1 are met.

8 2.6.5.1.2 Power-Down Registration

9 Power-down registration is performed when the user directs the mobile station to power off.
 10 If power-down registration is performed, the mobile station does not power off until after
 11 completing the registration attempt.

12 The mobile station does not perform power-down registration if it has not previously
 13 registered in the system that corresponds to the current SID_s and NID_s (see 2.6.5.5.2.4).

14 2.6.5.1.3 Timer-Based Registration

15 Timer-based registration causes the mobile station to register at regular intervals. Its use
 16 also allows the system to automatically deregister mobile stations that did not perform a
 17 successful power-down registration. Timer-based registration uses a Paging Channel or a
 18 Forward Common Control Channel slot counter (equivalent to a timer with time increments
 19 of 80 ms). Timer-based registration is performed when the counter reaches a maximum
 20 value (REG_COUNT_MAX_s) that is controlled by the base station via the REG_PRD field of
 21 the *System Parameters Message* or *ANSI-41 System Parameters Message*. The base station
 22 disables timer-based registration by setting REG_PRD to zero.

23 The mobile station shall maintain a timer-based registration counter (REG_COUNT_s). The
 24 mobile station shall compute and store the timer expiration count (REG_COUNT_MAX_s) as

$$25 \text{REG_COUNT_MAX}_s = \lfloor 2^{\text{REG_PRD}/4} \rfloor.$$

26 The mobile station shall maintain an indicator of timer-based registration timer enable
 27 status (COUNTER_ENABLED_s).

28 The counter is reset after each successful registration.

29 Whenever the mobile station changes COUNTER_ENABLED_s from NO to YES, it shall set
 30 REG_COUNT_s as follows:

31 If the mobile station supports the procedure described in section 2.6.5.1.3.1 and the
 32 conditions for suppression of randomization of timer-based registration are met, the mobile
 33 station shall set REG_COUNT_s to 0; otherwise, the mobile station shall set REG_COUNT_s
 34 based upon the value of TBR_RAND_WINDOW_s as shown in Table 2.6.5.1.3-1. When
 35 setting REG_COUNT_s to a pseudorandom value, the mobile station shall use the
 36 pseudorandom number generator specified in 2.6.7.2.

1 **Table 2.6.5.1.3-1. Percentage of Randomization for Timer-based registration**

Value of TBR_RAND_WINDOW (binary)	Meaning	REG_COUNT _s
00	0% randomization	0
01	25% randomization	Pseudorandom value between 0 and ($\lfloor \text{REG_COUNT_MAX}_s / 4 \rfloor - 1$)
10	50% randomization	Pseudorandom value between 0 and ($\lfloor \text{REG_COUNT_MAX}_s / 2 \rfloor - 1$)
11	100% randomization	Pseudorandom value between 0 and ($\text{REG_COUNT_MAX}_s - 1$)

2 If the mobile station is operating in the non-slotted mode, it shall increment the timer-
3 based registration counter once per 80 ms whenever COUNTER_ENABLED_s equals YES. If
4 the mobile station is operating in slotted mode, it may increment the timer-based
5 registration counter when it begins to monitor the Paging Channel (see 2.6.2.1.1.3) or the
6 Forward Common Control Channel. A mobile station operating in the slotted mode shall
7 increment the counter by the same amount that the counter would have been incremented
8 if the mobile station had been operating in the non-slotted mode.⁶¹

9 2.6.5.1.3.1 Timer-Based Registration based on Frequency of Implicit Registrations

10 A mobile station may support a procedure to prevent unnecessary timer-based
11 registrations when implicit registrations are sent frequently.

12 If the mobile station supports this procedure, the mobile station shall set REG_COUNT_s to
13 0 when it changes COUNTER_ENABLED_s from NO to YES if all of the following conditions
14 for suppression of randomization of timer-based registrations are met:

- 15 • the mobile station has been powered on for the past $\lfloor 2^{\text{REG_PRD}/4} \rfloor \times 0.32$ seconds,
- 16 • in every period of $\lfloor 2^{\text{REG_PRD}/4} \rfloor \times 0.08$ consecutive seconds in the past
17 $\lfloor 2^{\text{REG_PRD}/4} \rfloor \times 0.32$ seconds the mobile station sent at least one *Origination*
18 *Message*, *Page Response Message*, or *Reconnect Message*, or the
19 mobile station was in the *Mobile Station Control on the Traffic Channel State* for at
20 least part of the period,
- 21 • TBR_RAND_SUPPR_ENABLE_s is equal to '1'.
- 22 • If either of the following two conditions are true:

⁶¹ For example, if the mobile station uses a 2.56 second slot cycle, then it may increment the counter by 32 every time it becomes active.

- 1 - the mobile station was not in the *Mobile Station Control on the Traffic Channel State* at any time during the past $\lfloor 2^{\text{REG_PRD}/4} \rfloor \times 0.32$ seconds, or
- 2
- 3 - the mobile station was in the *Mobile Station Control on the Traffic Channel State* during the past $\lfloor 2^{\text{REG_PRD}/4} \rfloor \times 0.32$ seconds, but it was not continuously in the *Mobile Station Control on the Traffic Channel State* for the entire duration of the past $\lfloor 2^{\text{REG_PRD}/4} \rfloor \times 0.32$ seconds.
- 4
- 5
- 6

7 2.6.5.1.4 Distance-Based Registration

8 Distance-based registration causes a mobile station to register when the distance between the current base station and the base station in which it last registered exceeds a threshold. The mobile station determines that it has moved a certain distance by computing a distance measure based on the difference in latitude and longitude between the current base station and the base station where the mobile station last registered. If this distance measure exceeds the threshold value, the mobile station registers.

9

10

11

12

13

14 The mobile station stores the base station latitude ($\text{BASE_LAT_REG}_{\text{s-p}}$), the base station longitude ($\text{BASE_LONG_REG}_{\text{s-p}}$) and the registration distance ($\text{REG_DIST_REG}_{\text{s-p}}$), of the base station to which the first access probe (for a *Registration Message, Origination Message, Reconnect Message, Call Recovery Request Message, or Page Response Message* sent on the r-csch) was transmitted after entering the *System Access State*. The mobile station shall compute the current base station's distance from the last registration point (DISTANCE) as:

15

16

17

18

19

20

$$21 \quad \text{DISTANCE} = \lfloor \frac{\sqrt{(\Delta\text{lat})^2 + (\Delta\text{long})^2}}{16} \rfloor,$$

22 where

$$23 \quad \Delta\text{lat} = \text{BASE_LAT}_{\text{s}} - \text{BASE_LAT_REG}_{\text{s-p}}$$

24 and

$$25 \quad \Delta\text{long} = (\text{BASE_LONG}_{\text{s}} - \text{BASE_LONG_REG}_{\text{s-p}}) \times \cos(\pi/180 \times \text{BASE_LAT_REG}_{\text{s-p}}/14400).$$

26 The mobile station shall compute DISTANCE with an error of no more than $\pm 5\%$ of its true value when $|\text{BASE_LAT_REG}_{\text{s-p}}/14400|$ is less than 60 and with an error of no more than $\pm 7\%$ of its true value when $|\text{BASE_LAT_REG}_{\text{s-p}}/14400|$ is between 60 and 70.⁶²

27

28

29 2.6.5.1.5 Zone-Based Registration

30 Registration zones are groups of base stations within a given system and network. A base station's zone assignment is identified by the REG_ZONE field of the *System Parameters Message, ANSI-41 System Parameters Message* or *Mobile Station Registered Message*.

31

32

⁶² BASE_LAT and BASE_LONG are given in units of 1/4 seconds. BASE_LAT/14400 and BASE_LONG/14400 are in units of degrees.

1 Zone-based registration causes a mobile station to register whenever it determines it is in a
2 new zone (see 2.6.5.5.2.1), not on its internally stored list of visited registration zones. A
3 zone is added to the list whenever a registration (including implicit registration) occurs, and
4 is deleted upon expiration of a timer. After a system access, timers are enabled for every
5 zone except one that was successfully registered by the access.

6 A mobile station can be registered in more than one zone. Zones are uniquely identified by
7 a zone number (REG_ZONE) plus the SID and NID of the zone.

8 The mobile station shall store a list of the zones in which the mobile station has registered
9 (ZONE_LIST_s). Each entry in ZONE_LIST_s shall include the zone number (REG_ZONE) and
10 the (SID, NID) pair for the zone. The mobile station shall be capable of storing at least N_{9M}
11 entries in ZONE_LIST_s. A base station shall be considered to be in ZONE_LIST_s only if the
12 base station's REG_ZONE, SID and NID are found in an entry in ZONE_LIST_s. The mobile
13 station provides storage for one entry of ZONE_LIST_s in semi-permanent memory,
14 ZONE_LIST_{s-p} (see 2.3.4).

15 The mobile station shall maintain a zone list entry timer for each entry in ZONE_LIST_s.
16 When an entry in ZONE_LIST_s is removed from the list, the corresponding zone list entry
17 timer shall be disabled. The timer duration shall be as determined from the stored value of
18 ZONE_TIMER_s using Table 3.7.2.3.2.1-1. The mobile station shall provide a means to
19 examine each timer's value while the timer is active, so that the age of list entries can be
20 compared.

21 If the mobile station supports one of more band classes that contain multiple frequency
22 block designators, the mobile station shall maintain an identifier of the frequency block
23 designator for each entry in ZONE_LIST_s (see [45]). When the mobile station adds a zone to
24 ZONE_LIST_s, the mobile station shall include the identifier for the frequency block
25 designator.⁶³

26 If the mobile station supports multiple band classes, the mobile station shall maintain an
27 identifier of the band class for each entry in ZONE_LIST_s (see [45]). When the mobile
28 station adds a zone to ZONE_LIST_s, the mobile station shall include the identifier for the
29 band class.

30 The base station controls the maximum number of zones in which a mobile station may be
31 considered registered, by means of the TOTAL_ZONES field of the *System Parameters*
32 *Message*, *ANSI-41 System Parameters Message* or *Mobile Station Registered Message*. When
33 an entry is added to the zone list, or if TOTAL_ZONES is decreased, the mobile station
34 removes entries from the zone list if there are more entries than allowed by the setting of
35 TOTAL_ZONES.

36 Whenever ZONE_LIST_s contains more than TOTAL_ZONES_s entries, the mobile station
37 shall delete the excess entries according to the following rules:

⁶³ The mobile station need not maintain a separate identifier for Band Class 0, as the least significant bit of the SID identifies the serving system.

- 1 • If TOTAL_ZONES_s is equal to zero, the mobile station shall delete all entries.
- 2 • If TOTAL_ZONES_s is not equal to zero, the mobile station shall delete those entries
- 3 having active zone list entry timers, starting with the oldest entry, as determined by
- 4 the timer values, and continuing in order of decreasing age until no more than
- 5 TOTAL_ZONES_s entries remain.

6 The mobile station shall store a list of the systems/networks in which the mobile station

7 has registered (SID_NID_LIST_s). Each entry in SID_NID_LIST_s shall include the (SID, NID)

8 pair for the system/network. The mobile station shall be capable of storing N_{10m} entries in

9 SID_NID_LIST_s. A base station shall be considered to be in the SID_NID_LIST_s only if the

10 base station's SID and NID are found in an entry in SID_NID_LIST_s. The mobile station

11 shall provide storage for one entry of SID_NID_LIST_s in semi-permanent memory

12 (SID_NID_LIST_{s-p}).

13 If the mobile station supports one or more band classes that contain multiple frequency

14 block designators, the mobile station shall maintain an identifier of the frequency block

15 designator for each entry in SID_NID_LIST_s (see [45]). When the mobile station adds an

16 entry to SID_NID_LIST_s, the mobile station shall include the identifier for the frequency

17 block designator.

18 If the mobile station supports multiple band classes, the mobile station shall maintain an

19 identifier of the band class for each entry in SID_NID_LIST_s (see [45]). When the mobile

20 station adds an entry to SID_NID_LIST_s, the mobile station shall include the identifier for

21 the band class.

22 The mobile station shall maintain a SID/NID list entry timer for each entry in

23 SID_NID_LIST_s. When an entry in SID_NID_LIST_s is removed from the list, the

24 corresponding SID/NID list entry timer shall be disabled. The timer duration shall be as

25 determined from the stored value of ZONE_TIMER_s using Table 3.7.2.3.2.1-1. The mobile

26 station shall provide a means to examine each timer's value while the timer is active, so

27 that the age of list entries can be compared.

28 Whenever SID_NID_LIST_s contains more than N_{10m} entries, the mobile station shall delete

29 the excess entries according to the following rule:

- 30 • The mobile station shall delete those entries having active SID/NID list entry timers,
- 31 starting with the oldest entry, as determined by the timer values, and continuing in
- 32 order of decreasing age.

33 Whenever MULT_SIDS_s is equal to '0' and SID_NID_LIST contains entries with different

34 SIDs, the mobile station shall delete the excess entries according to the following rules:

- 35 • If the SID/NID entry timer for any entry is disabled, the mobile station shall delete
- 36 all entries not having the same SID as the entry whose timer is disabled;
- 37 • Otherwise, the mobile station shall delete all entries not having the same SID as the
- 38 newest entry in SID_NID_LIST, as determined by the timer values.

39 Whenever MULT_NIDS_s is equal to '0', and SID_NID_LIST contains more than one entry for

40 any SID, the mobile station shall delete the excess entries for each SID according to the

41 following rules:

- 1 • If the SID/NID entry timer for any entry is disabled, the mobile station shall delete
2 all entries for that SID except the entry whose timer is disabled;
- 3 • For all other SIDs, the mobile station shall delete all entries for each SID except the
4 newest entry, as determined by the timer values.

5 2.6.5.1.6 Parameter-Change Registration

6 Parameter-change registration is performed when a mobile station modifies any of the
7 following stored parameters:

- 8 • The preferred slot cycle index (SLOT_CYCLE_INDEX_p)
- 9 • The station class mark (SCM_p)
- 10 • The call termination enabled indicators (MOB_TERM_HOME_p,
11 MOB_TERM_FOR_SID_p, and MOB_TERM_FOR_NID_p)

12 Parameter-change registration is also performed when any of the following capabilities
13 supported by the mobile station changes:

- 14 • The band classes
- 15 • The band subclasses
- 16 • The power classes
- 17 • The radio configurations
- 18 • The operating modes
- 19 • Transmit diversity (OTD or STS)
- 20 • Quick Paging Channel
- 21 • Spreading Rate 3 common channels support
- 22 • Encryption capability

23 Parameter-change registration is performed whenever there is no entry in the mobile
24 station's SID_NID_LIST_s that matches the base station's SID and NID.

25 Parameter-change registration is independent of the roaming status of the mobile station.⁶⁴

26 Whenever a parameter changes, the mobile station shall delete all entries from
27 SID_NID_LIST_s.

28 2.6.5.1.7 Ordered Registration

29 The base station can command the mobile station to register by sending a *Registration*
30 *Request Order*. Ordered registration is performed in the *Mobile Station Order and Message*
31 *Processing Operation* (2.6.2.4). Requirements are specified in 2.6.5.5.2.3.

⁶⁴ The indicator REG_ENABLED does not govern parameter-change registration.

2.6.5.1.8 Implicit Registration

Whenever an *Origination Message*, *Reconnect Message*, *Call Recovery Request Message*, or *Page Response Message* is sent, the base station can infer the location of the mobile station. This is considered an implicit registration. Requirements are specified in 2.6.5.5.3.

2.6.5.1.9 Traffic Channel Registration

While a mobile station is assigned a Traffic Channel, the mobile station is notified that it is registered through the *Mobile Station Registered Message*. Requirements are specified in 2.6.5.5.4.3.

2.6.5.1.10 User Zone Registration

User Zone registration is performed when the mobile station selects an active User Zone (see 2.6.9.2.1).

2.6.5.1.11 Encryption/Message Integrity Re-sync Required Registration

Encryption/Message Integrity re-sync required registration is performed when the mobile station determines that it can not decrypt any message or validate the MACI of any message from the base station (see 2.3.12.4.1.3). This type of registration is needed for the mobile station to recover from any encryption/message integrity out-of-sync scenario.

2.6.5.1.12 BCMC Registration

BCMC registration is performed when the mobile station is to monitor a BCMC flow that is being transmitted from a band class or frequency different than where the mobile station currently resides. The BCMC registration is also used when the mobile station desires to monitor a BCMC flow configured for transmission which is currently not being transmitted. Requirements are specified in 2.6.13.3.

BCMC registration is performed by a mobile station currently monitoring or desiring to monitor a BCMC flow; it is performed for the following reasons:

- 1) When the mobile station is to monitor a BCMC flow given by BCMC_FLOW_ID, if the band class or frequency where this BCMC flow is being transmitted is different from the band class or frequency where the mobile station currently resides, the mobile station performs a BCMC registration to inform the base station so that the base station can determine in which frequency to page the mobile station.
- 2) The BCMC registration is also used when the mobile station desires to monitor a BCMC flow configured for transmission which is currently not being transmitted, the mobile station performs a BCMC registration to request transmission of that flow.
- 3) When the mobile station is currently monitoring a BCMC flow and the base station turns on the registration required flag in the *BCMC Service Parameters Message*, the mobile station performs a BCMC registration. Requirements are specified in 2.6.13.3.

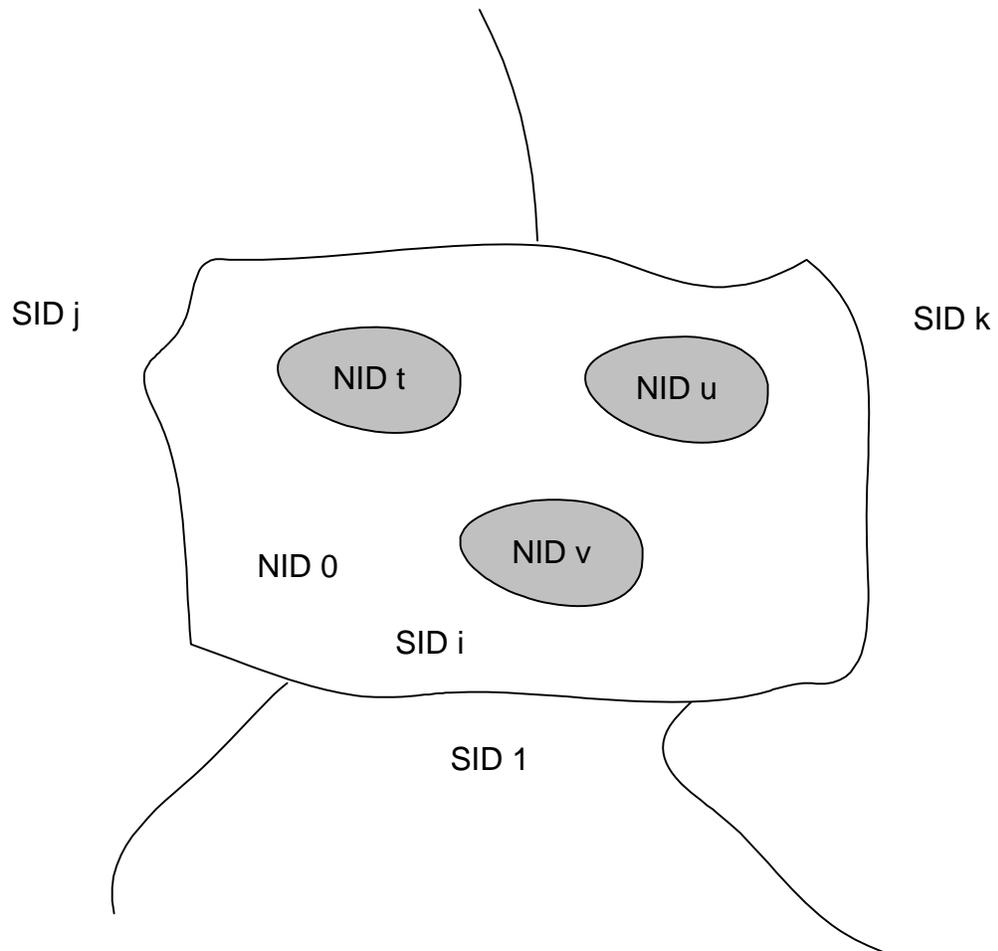

2.6.5.2 Systems and Networks

A base station is a member of a cellular or PCS system and a network. A network is a subset of a system.

1 Systems are labeled with an identification called the system identification or SID; networks
 2 within a system are given a network identification or NID. A network is uniquely identified
 3 by the pair (SID, NID). The SID number 0 is a reserved value. The NID number 0 is a
 4 reserved value indicating all base stations that are not included in a specific network. The
 5 NID number 65535 ($2^{16}-1$) is a reserved value the mobile station may use for roaming
 6 status determination (see 2.6.5.3) to indicate that the mobile station considers the entire
 7 SID (regardless of NID) as home (non-roaming).

8 Figure 2.6.5.2-1 shows an example of systems and networks. SID i contains three
 9 networks labeled t, u, and v. A base station in system i that is not in one of these three
 10 networks is in NID 0.

11

12

13 **Figure 2.6.5.2-1. Systems and Networks Example**

14 2.6.5.3 Roaming

15 The mobile station has a list of one or more home (non-roaming) (SID, NID) pairs. A mobile
 16 station is roaming if the stored (SID_s, NID_s) pair (received in the *System Parameters*

1 *Message* on the Paging Channel, or the *ANSI-41 System Parameters Message* on the Primary
 2 Broadcast Control Channel) does not match one of the mobile station's non-roaming (SID,
 3 NID) pairs. Two types of roaming are defined: A mobile station is a foreign NID roamer if
 4 the mobile station is roaming and there is some (SID, NID) pair in the mobile station's (SID,
 5 NID) list for which SID is equal to SID_s. A mobile station is a foreign SID roamer if there is
 6 no (SID, NID) pair in the mobile station's (SID, NID) list for which SID is equal to SID_s⁶⁵.
 7 The mobile station may use the special NID value 65535 to indicate that the mobile station
 8 considers all NIDs within a SID to be non-roaming (i.e., that the mobile station is not
 9 roaming when operating with any base station in that system).

10 The mobile station shall store three 1-bit parameters in its permanent memory (see 2.3.8).
 11 These parameters are MOB_TERM_HOME_p, MOB_TERM_FOR_SID_p, and MOB_TERM-
 12 _FOR_NID_p. The mobile station shall set MOB_TERM_HOME_p to '1' if the mobile station is
 13 configured to receive mobile station terminated calls when using a home (SID, NID) pair;
 14 otherwise, the mobile station shall set MOB_TERM_HOME_p to '0'. The mobile station shall
 15 set MOB_TERM_FOR_SID_p to '1' if the mobile station is configured to receive mobile station
 16 terminated calls when it is a foreign SID roamer; otherwise MOB_TERM_FOR_SID_p shall be
 17 set to '0'. The mobile station shall set MOB_TERM_FOR_NID_p to '1' if the mobile station is
 18 configured to receive mobile station terminated calls when it is a foreign NID roamer;
 19 otherwise the mobile station shall set MOB_TERM_FOR_NID_p to '0'.

20 The mobile station determines the registration status using these parameters and the
 21 HOME_REG, FOR_NID_REG, and FOR_SID_REG fields of the *System Parameters Message*
 22 or *ANSI-41 System Parameters Message*.

23 The mobile station shall store a mobile station call termination enabled indicator,
 24 MOB_TERM_s. The mobile station shall set MOB_TERM_s to YES if any of the following
 25 conditions is met:

- 26 • The mobile station is not roaming, and MOB_TERM_HOME_p is equal to '1'; or
- 27 • The mobile station is a foreign NID roamer and MOB_TERM_FOR_NID_p is equal to
 28 '1'; or
- 29 • The mobile station is a foreign SID roamer and MOB_TERM_FOR_SID_p is equal to
 30 '1'; otherwise the mobile station shall set MOB_TERM_s to NO.

31 The mobile station shall store a registration status indicator, REG_ENABLED_s. The mobile
 32 station shall set the indicator REG_ENABLED_s to YES if any of the following conditions is
 33 met for the mobile station:

⁶⁵ For example, suppose a mobile station has the following SID, NID list: (2, 3), (2, 0), (3, 1). If the base station (SID, NID) pair is (2, 3), then the mobile station is not roaming because the (SID, NID) pair is in the list. If the base station (SID, NID) pair is (2, 7), then the mobile station is a foreign NID roamer, because the SID 2 is in the list, but the (SID, NID) pair (2, 7) is not in the list. If the base station (SID, NID) pair is (4, 0), then the mobile station is a foreign SID roamer, because SID 4 is not in the list.

- 1 • The mobile station is not roaming, and both HOME_REG_S and MOB_TERM_HOME_P
- 2 are equal to '1'; or
- 3 • The mobile station is a foreign NID roamer and both FOR_NID_REG_S and
- 4 MOB_TERM_FOR_NID_P are equal to '1'; or
- 5 • The mobile station is a foreign SID roamer and both FOR_SID_REG_S and
- 6 MOB_TERM_FOR_SID_P are equal to '1'; otherwise the mobile station shall set
- 7 REG_ENABLED_S to NO.

8 The mobile station performs autonomous registrations if REG_ENABLED_S is YES.

9 2.6.5.4 Registration Timers and Indicators

10 The mobile station shall provide the following registration timers:

- 11 • Power-up/initialization timer (see 2.6.5.1.1).
- 12 • Timer-based registration timer (see 2.6.5.1.3).
- 13 • Zone list entry timers (see 2.6.5.1.5).
- 14 • SID/NID list entry timers (see 2.6.5.1.5).
- 15 • BCMC frequency registration timer (see 2.6.13).
- 16 • BCMC registration required timer (see 2.6.13).

17 The mobile station shall provide a means of enabling and disabling each timer. When a
18 timer is disabled, it shall not be considered expired. A timer that has been enabled is
19 referred to as active.

20 2.6.5.5 Registration Procedures

21 2.6.5.5.1 Actions in the Mobile Station Initialization State

22 2.6.5.5.1.1 Power-Up or Change to a Different Operating Mode, Band Class, Serving 23 System, Frequency Block Designator, or R-UIM Insertion.

24 Upon power-up, the mobile station shall perform the following actions:

- 25 • Delete all entries of ZONE_LIST_S.
- 26 • If ZONE_LIST_{S-P} contains an entry, copy the entry to ZONE_LIST_S and disable the
- 27 corresponding entry timer.
- 28 • Delete all entries of SID_NID_LIST_S.
- 29 • If SID_NID_LIST_{S-P} contains an entry, copy the entry to SID_NID_LIST_S and disable
- 30 the corresponding entry timer.
- 31 • Set the registered flag (REGISTERED_S) to NO.
- 32 • Set timer-based registration enable status (COUNTER_ENABLED_S) to NO.
- 33 • Set autonomous registration enable status (REG_ENABLED_S) to NO.
- 34 • Set RETURN_CAUSE_S to '0000'.
- 35 • Set KEY_ID, LAST_2G_KEY_ID_S, and LAST_3G_KEY_ID_S to '00'.

- 1 • Set ENC_KEY[i] and INT_KEY[i] to NULL, where i ranges from '00' to '11'.
- 2 • Set D_SIG_ENCRYPT_MODE_S and C_SIG_ENCRYPT_MODE_S to '000'.
- 3 • Set RESTORE_KEYS to '0'.
- 4 • If the UIM contains IK and CK, the mobile station shall set KEY_ID to '10',
- 5 RESTORE_KEYS to '1', INT_KEY[KEY_ID] to IK, ENC_KEY[KEY_ID] to CK,
- 6 TX_EXT_SSEQ[.][KEY_ID] and TX_EXT_SSEQ[.][KEY_ID] to any 24-bit value
- 7 multiplied by 256.

8 If any of the following conditions is true:

- 9 • BYPASS_REG_IND_S is equal to '00' and the mobile station has switched from using
- 10 CDMA
 - 11 – in a different band class, or
 - 12 – in a different serving system in a band class that supports multiple serving
 - 13 systems (e.g., Band Class 0), or
 - 14 – in a different frequency block designator in a band class that supports
 - 15 frequency block designator allocations (e.g. Band Class 1)
- 16 • BYPASS_REG_IND_S is equal to '01' and, for a reason other than processing the
- 17 *Extended CDMA Channel List Message*, the mobile station has switched from using
- 18 CDMA)
 - 19 – in a different band class, or
 - 20 – in a different serving system in a band class that supports multiple serving
 - 21 systems (e.g., Band Class 0), or
 - 22 – in a different frequency block designator in a band class that supports
 - 23 frequency block designator allocations (e.g. Band Class 1)
- 24 • BYPASS_REG_IND_S is equal to '10', SID_S is different than REG_SID_S and the mobile
- 25 station has switched from using CDMA
 - 26 – in a different band class, or
 - 27 – in a different serving system in a band class that supports multiple serving
 - 28 systems (e.g., Band Class 0), or
 - 29 – in a different frequency block designator in a band class that supports
 - 30 frequency block designator allocations (e.g. Band Class 1)

31 the mobile station shall perform the following actions:

- 32 • Set timer-based registration enable status (COUNTER_ENABLED_S) to NO.
- 33 • Set autonomous registration enable status (REG_ENABLED_S) to NO.
- 34 • Set RETURN_CAUSE_S to '0000'.
- 35 • Set the registered flag (REGISTERED_S) to NO.
- 36 • Set KEY_ID, LAST_2G_KEY_IDS, and LAST_3G_KEY_IDS to '00'.

- 1 • Set ENC_KEY[i] and INT_KEY[i] to NULL, where i ranges from '00' to '11'.
- 2 • Set RESTORE_KEYS to '0'.
- 3 • If the UIM contains IK and CK, the mobile station shall set KEY_ID to '10',
- 4 RESTORE_KEYS to '1', INT_KEY[KEY_ID] to IK, ENC_KEY[KEY_ID] to CK,
- 5 TX_EXT_SSEQ[.][KEY_ID] and TX_EXT_SSEQ[.][KEY_ID] to any 24-bit value
- 6 multiplied by 256.

7 2.6.5.5.1.2 Timer Maintenance

8 While in the *Mobile Station Initialization State*, the mobile station shall update all active
 9 registration timers (see 2.6.5.4). If any timer expires while in this state, the mobile station
 10 shall preserve the expiration status so that further action can be taken in the *Mobile Station*
 11 *Idle State*.

12 2.6.5.5.1.3 Entering the Mobile Station Idle State

13 Before entering the *Mobile Station Idle State* from the *Mobile Station Initialization State*, the
 14 mobile station shall perform the following action:

- 15 • If REGISTERED_s is equal to NO, enable the power-up/initialization timer with an
- 16 expiration time of T_{57m} seconds (see 2.6.5.1.1) only when the mobile station is
- 17 entering this state with a power-up indication.

18 2.6.5.5.2 Actions in the Mobile Station Idle State

19 Requirements in this section and its subsections apply only when the mobile station is in
 20 the *Mobile Station Idle State*.

21 2.6.5.5.2.1 Idle Registration Procedures

22 These procedures are performed whenever the mobile station is in the *Mobile Station Idle*
 23 *State* (see 2.6.2.1.3).

24 While in the *Mobile Station Idle State*, the mobile station shall update all active registration
 25 timers (see 2.6.5.4).

26 If the power-up/initialization timer has expired or is disabled, the mobile station shall
 27 perform the following actions in the order given. If any action necessitates a registration,
 28 the mobile station shall enter the *Update Overhead Information Substate* of the *System*
 29 *Access State* (see 2.6.3) with a registration indication.

- 30 1. The timer-based registration timer shall be enabled (COUNTER_ENABLED_s = YES)
- 31 and the timer count (REG_COUNT_s) shall be set to a pseudorandom number as
- 32 specified in 2.6.5.1.3, if the following conditions are met:
- 33 a. COUNTER_ENABLED_s is equal to NO; and
- 34 b. The stored configuration parameters are current (see 2.6.2.2); and
- 35 c. REG_ENABLED_s is equal to YES; and
- 36 d. REG_PRD_s is not equal to zero.

- 1 2. If any zone list entry timer (see 2.6.5.1.5) has expired, the mobile station shall
2 delete the corresponding entry from ZONE_LIST_s.
- 3 3. If any SID/NID list entry timer (see 2.6.5.1.5) has expired, the mobile station shall
4 delete the corresponding entry from SID_NID_LIST_s.
- 5 4. The mobile station shall perform power-up registration, as specified in 2.6.5.1.1, if
6 all the following conditions are met:
 - 7 a. POWER_UP_REG_s is equal to '1'; and
 - 8 b. The stored configuration parameters are current (see 2.6.2.2); and
 - 9 c. REGISTERED_s is equal to NO, and
 - 10 d. REG_ENABLED_s is equal to YES.
- 11 5. The mobile station shall perform parameter-change registration (see 2.6.5.1.6) if all
12 the following conditions are met:
 - 13 a. PARAMETER_REG_s is equal to '1'; and
 - 14 b. The stored configuration parameters are current (see 2.6.2.2); and
 - 15 c. There is no entry of SID_NID_LIST_s whose SID and NID fields match the stored
16 SID_s and NID_s.
- 17 6. The mobile station shall perform timer-based registration (see 2.6.5.1.3) if all the
18 following conditions are met:
 - 19 a. COUNTER_ENABLED_s is equal to YES; and
 - 20 b. The stored configuration parameters are current (see 2.6.2.2); and
 - 21 c. REG_ENABLED_s is equal to YES; and
 - 22 d. REG_COUNT_s is greater than or equal to REG_COUNT_MAX_s.
- 23 7. The mobile station shall perform distance-based registration (see 2.6.5.1.4) if all the
24 following conditions are met:
 - 25 a. REG_DIST_s is not equal to zero; and
 - 26 b. The stored configuration parameters are current (see 2.6.2.2); and
 - 27 c. REG_ENABLED_s is equal to YES; and
 - 28 d. The current base station's distance from the base station in which the mobile
29 station last registered (see 2.6.5.1.4) is greater than or equal to
30 REG_DIST_REG_{s-p}.
- 31 8. The mobile station shall perform zone-based registration (see 2.6.5.1.5) if all the
32 following conditions are met:
 - 33 a. TOTAL_ZONES_s is not equal to zero; and
 - 34 b. The stored configuration parameters are current (see 2.6.2.2); and
 - 35 c. REG_ENABLED_s is equal to YES; and

- 1 d. There is no entry of ZONE_LIST_s whose SID, NID and REG_ZONE fields match
2 the stored SID_s, NID_s and REG_ZONE_s.
- 3 9. The mobile station shall perform User Zone registration (see 2.6.2.5.1.10) if it
4 selects an active User Zone (see 2.6.9.1.2).
- 5 10. The mobile station shall perform encryption/message integrity re-sync required
6 registration (see 2.6.5.1.11) if all the following conditions are met:
- 7 a. REG_SECURITY_RESYNC is equal to YES or REGISTER_IN_IDLE_s is equal to '1';
8 and
- 9 b. None of the above registrations have been performed since the last entering of
10 the *Mobile Station Idle State*.

11 2.6.5.5.2.2 Processing the Registration Fields of the System Parameters Message and
12 ANSI-41 System Parameters Message

13 When the mobile station processes the *System Parameters Message* or *ANSI-41 System*
14 *Parameters Message*, it shall perform the following actions:

- 15 1. If REG_PRD_s is equal to zero, the mobile station shall set COUNTER_ENABLED_s to
16 NO.
- 17 2. If REG_PRD_s is not equal to zero, the mobile station shall set REG_COUNT_MAX_s as
18 specified in 2.6.5.1.3.
- 19 3. The mobile station shall update its roaming status and set REG_ENABLED_s as
20 specified in 2.6.5.3.
- 21 4. If ZONE_LIST_s contains more than TOTAL_ZONES_s entries, the mobile station shall
22 delete the excess entries according to the rules specified in 2.6.5.1.5.
- 23 5. If MULT_SIDS_s is equal to '0' and SID_NID_LIST contains entries with different
24 SIDs, delete the excess entries according to the rules specified in 2.6.5.1.5.
- 25 6. If MULT_NIDS_s is equal to '0' and SID_NID_LIST contains more than one entry for
26 any SID, delete the excess entries according to the rules specified in 2.6.5.1.5.

27 2.6.5.5.2.3 Ordered Registration

28 Ordered registration is performed after receiving a *Registration Request Order* while in the
29 *Mobile Station Order and Message Processing Operation* (see 2.6.2.4).

30 The mobile station shall enter the *Update Overhead Information Substate* of the *System*
31 *Access State* with a registration indication within T_{33m} seconds after the *Registration*
32 *Request Order* is received.

33 2.6.5.5.2.4 Power Off

34 These procedures are performed when the mobile station is directed by the user to power
35 off.

36 The mobile station shall perform the following actions:

- 1 • If an entry of ZONE_LIST_s does not have an active timer, copy that entry to
- 2 ZONE_LIST_{s-p}; otherwise, delete any entry in ZONE_LIST_{s-p}.
- 3 • If an entry of SID_NID_LIST_s does not have an active timer, copy that entry to
- 4 SID_NID_LIST_{s-p}; otherwise, delete any entry in SID_NID_LIST_{s-p}.

5 The mobile station shall perform power-down registration (see 2.6.5.1.2) by entering the
6 *System Access State* with a registration indication within T_{33m} seconds after the user
7 directs the mobile station to power off, if all the following conditions are true:

- 8 • REG_ENABLED_s equals YES; and
- 9 • POWER_DOWN_REG_s equals '1'; and
- 10 • There is an entry of SID_NID_LIST_s for which the SID and NID fields are equal to
11 SID_s and NID_s; and
- 12 • The power-up/initialization timer (see 2.6.5.1.1) is disabled or has expired.

13 2.6.5.5.2.5 Full-TMSI Timer Expiration

14 When the mobile station sets all the bits of TMSI_CODE_{s-p} to '1' upon expiration of the full-
15 TMSI timer (see 2.6.2), the mobile station shall delete all entries from SID_NID_LIST_s and
16 ZONE_LIST_s.

17 2.6.5.5.3 Actions in the System Access State

18 Requirements in this section and its subsections apply only when the mobile station is in
19 the *System Access State*.

20 2.6.5.5.3.1 Successful Access, Registration, or Implicit Registration

21 These procedures shall be performed after the mobile station receives confirmation of
22 delivery of a *Registration Message*, *Origination Message*, *Reconnect Message*, *Call Recovery*
23 *Request Message*, or *Page Response Message* sent on the r-csch (see 2.6.3.1.2).

- 24 • Disable the power-up/initialization timer (see 2.6.5.1.1).
- 25 • Set DIGITAL_REG_{s-p} to '00000001'.
- 26 • Set REG_COUNT_s to zero.
- 27 • Set REGISTERED_s to YES.
- 28 • If an explicit or implicit registration was sent, set SLOT_CYCLE_INDEX_REG to the
29 slot cycle index the mobile station included in the message.
- 30 • If BYPASS_REG_IND_s is equal to '00', the mobile station shall perform the following:
 - 31 - Delete all entries from ZONE_LIST_s belonging to a different band class (see [45])
32 than CDMABAND_s.
 - 33 - If CDMABAND_s contains multiple serving systems, delete all entries from
34 ZONE_LIST_s that have a SID from a different serving system than SERVSYS_s.

- 1 - If CDMABAND_s contains multiple frequency block designators, delete all entries
2 from ZONE_LIST_s belonging to a different frequency block designator (see [45])
3 than the frequency block designator associated with REG_SID_s.
- 4 • Add REG_REG_ZONE_s, REG_SID_s, and REG_NID_s to ZONE_LIST_s if not already in
5 the list. If required, include the band class identifier and block identifier for the
6 current band and frequency block designator as specified in 2.6.5.1.5.
- 7 • Disable the zone list entry timer for the entry of ZONE_LIST_s containing
8 REG_REG_ZONE_s, REG_SID_s, and REG_NID_s. For any other entry of ZONE_LIST_s
9 whose entry timer is not active, enable the entry timer with the duration specified
10 by REG_ZONE_TIMER_s (see 2.6.5.1.5).
- 11 • If ZONE_LIST_s contains more than TOTAL_ZONES_s entries, delete the excess
12 entries according to the rules specified in 2.6.5.1.5.
- 13 • If BYPASS_REG_IND_s is equal to '00', the mobile station shall perform the following:
- 14 - Delete all entries from SID_NID_LIST_s belonging to a different band class (see
15 [45]) than CDMABAND_s.
- 16 - If CDMABAND_s contains multiple serving systems, delete all entries from
17 SID_NID_LIST_s that have a SID from a different serving system than SERVSYS_s.
- 18 - If CDMABAND_s contains multiple frequency block designators, delete all entries
19 from SID_NID_LIST_s belonging to a different frequency block designator (see
20 [45]) than the frequency block designator associated with REG_SID_s.
- 21 • Add REG_SID_s and REG_NID_s to SID_NID_LIST_s if not already in the list. If
22 required, include the band class identifier and block identifier for the current band
23 and frequency block designator as specified in 2.6.5.1.5.
- 24 • Disable the SID/NID list entry timer for the entry of SID_NID_LIST_s containing
25 REG_SID_s, and REG_NID_s. For any other entry of SID_NID_LIST_s whose entry
26 timer is not active, enable the entry timer with the duration specified in 2.6.5.1.5.
- 27 • If SID_NID_LIST_s contains more than N_{10m} entries, delete the excess entries
28 according to the rules specified in 2.6.5.1.5.
- 29 • If MULT_SIDS_s is equal to '0' and SID_NID_LIST contains entries with different
30 REG_SID_s, delete the excess entries according to the rules specified in 2.6.5.1.5.
- 31 • If MULT_NIDS_s is equal to '0' and SID_NID_LIST contains more than one entry for
32 any SID, delete the excess entries according to the rules specified in 2.6.5.1.5.
- 33 • Set the stored location of last registration (BASE_LAT_REG_{s-p} and BASE_LONG-
34 _REG_{s-p}) to the current base station's location (BASE_LAT_s and BASE_LONG_s). Set
35 the stored registration distance (REG_DIST_REG_{s-p}) to the current base station's
36 registration distance (REG_DIST_s).
- 37 • Set REG_SECURITY_RESYNC to NO.
- 38 • Set REGISTER_IN_IDLE_s to '0'.

1 These procedures shall be performed after the mobile station receives confirmation of
 2 delivery of any other message:

- 3 • Set DIGITAL_REG_{s-p} to '00000001'.
- 4 • If BYPASS_REG_IND_s is equal to '00', the mobile station shall perform the following:
 - 5 - Delete all entries from ZONE_LIST_s belonging to a different band class (see [45])
 6 than CDMABAND_s.
 - 7 - If CDMABAND_s contains multiple serving systems, delete from ZONE_LIST_s all
 8 entries from ZONE_LIST_s that have a SID from a different serving system than
 9 SERVSYS_s.
 - 10 - If CDMABAND_s contains multiple frequency block designators, delete all entries
 11 from ZONE_LIST_s belonging to a different frequency block designator (see [45])
 12 than the frequency block designator associated with SID_s.
 - 13 • For any entry of ZONE_LIST_s not matching REG_ZONE_s, SID_s, and NID_s and not
 14 having an active entry timer, enable the entry timer with the duration specified by
 15 ZONE_TIMER_s (see 2.6.5.1.5).
 - 16 • If BYPASS_REG_IND_s is equal to '00', the mobile station shall perform the following:
 - 17 - Delete all entries from SID_NID_LIST_s belonging to a different band class (see
 18 [45]) than CDMABAND_s.
 - 19 - If CDMABAND_s contains multiple serving systems, delete from SID_NID_LIST_s
 20 all entries from SID_NID_LIST_s that have a SID from a different serving system
 21 than SERVSYS_s.
 - 22 - If CDMABAND_s contains multiple frequency block designators, delete all entries
 23 from SID_NID_LIST_s belonging to a different frequency block designator (see
 24 [45]) than the frequency block designator associated with SID_s.
 - 25 • For any entry of SID_NID_LIST_s not matching SID_s and NID_s and not having an
 26 active entry timer, enable the entry timer with the duration specified by
 27 ZONE_TIMER_s (see 2.6.5.1.5).

28 2.6.5.5.3.2 Unsuccessful Access

29 These procedures are performed when the mobile station declares an access attempt failure
 30 when in the *System Access State* (see 2.6.3).

31 The mobile station shall perform the following actions:

- 32 • Set DIGITAL_REG_{s-p} to '00000001'.
- 33 • If an explicit or implicit registration was sent, set SLOT_CYCLE_INDEX_REG to
 34 min(SLOT_CYCLE_INDEX_REG, slot cycle index the mobile station included in the
 35 message).
- 36 • If BYPASS_REG_IND_s is equal to '00', the mobile station shall perform the following:

- 1 - Delete all entries from ZONE_LIST_s belonging to a different band class (see [45])
2 than CDMABAND_s.
- 3 - If CDMABAND_s contains multiple serving systems, delete from ZONE_LIST_s all
4 entries from ZONE_LIST_s that have a SID from a different serving system than
5 SERVSYS_s.
- 6 - If CDMABAND_s contains multiple frequency block designators, delete all entries
7 from ZONE_LIST_s belonging to a different frequency block designator (see [45])
8 than the frequency block designator associated with SID_s.
- 9 • For any entry of ZONE_LIST_s not matching REG_ZONE_s, SID_s, and NID_s and not
10 having an active entry timer, enable the entry timer with the duration specified by
11 ZONE_TIMER_s (see 2.6.5.1.5).
- 12 • If BYPASS_REG_IND_s is equal to '00', the mobile station shall perform the following:
- 13 - Delete all entries from SID_NID_LIST_s belonging to a different band class (see
14 [45]) than CDMABAND_s.
- 15 - If CDMABAND_s contains multiple serving systems, delete from SID_NID_LIST_s
16 all entries from SID_NID_LIST_s that have a SID from a different serving system
17 than SERVSYS_s.
- 18 - If CDMABAND_s contains multiple frequency block designators, delete all entries
19 from SID_NID_LIST_s belonging to a different frequency block designator (see
20 [45]) than the frequency block designator associated with SID_s.
- 21 • For any entry of SID_NID_LIST_s not matching SID_s and NID_s and not having an
22 active entry timer, enable the entry timer with the duration specified by
23 ZONE_TIMER_s (see 2.6.5.1.5).

24 2.6.5.5.3.3 Power Off

25 These procedures are performed when the mobile station is directed by the user to power
26 off.

27 The mobile station shall perform the following actions:

- 28 • If an entry of ZONE_LIST_s does not have an active timer, copy that entry to
29 ZONE_LIST_{s-p}; otherwise, delete any entry in ZONE_LIST_{s-p}.
- 30 • If an entry of SID_NID_LIST_s does not have an active timer, copy that entry to
31 SID_NID_LIST_{s-p}; otherwise, delete any entry in SID_NID_LIST_{s-p}.

32 2.6.5.5.4 Actions in the Mobile Station Control on the Traffic Channel State

33 Requirements in this section and its subsections apply only when the mobile station is in
34 the *Mobile Station Control on the Traffic Channel State*.

35 2.6.5.5.4.1 Traffic Channel Initialization

36 Upon entering the *Traffic Channel Initialization Substate* of the *Mobile Station Control on the*
37 *Traffic Channel State*, the mobile station shall set COUNTER_ENABLED_s to NO, shall set
38 TBR_RAND_SUPPR_ENABLE_s to '0', and shall set TBR_RAND_WINDOW_s to '11'.

1 2.6.5.5.4.2 Timer Maintenance

2 While in the *Mobile Station Control on the Traffic Channel State*, the mobile station shall
3 update all active registration timers.

4 If a zone list entry timer expires, the mobile station shall delete the corresponding entry
5 from $ZONE_LIST_s$. If a SID/NID list entry timer expires, the mobile station shall delete the
6 corresponding entry from $SID_NID_LIST_s$.

7 2.6.5.5.4.3 Processing the Mobile Station Registered Message

8 The mobile station receives the *Mobile Station Registered Message* on the Forward Traffic
9 Channel when the mobile station is considered registered for the base station whose
10 location and other parameters are included in the message.

11 The mobile station shall store the following parameters:

- 12 • System identification ($SID_s = SID_r$)
- 13 • Network identification ($NID_s = NID_r$)
- 14 • Registration zone ($REG_ZONE_s = REG_ZONE_r$)
- 15 • Number of registration zones to be retained ($TOTAL_ZONES_s = TOTAL_ZONES_r$)
- 16 • Zone timer length ($ZONE_TIMER_s = ZONE_TIMER_r$)
- 17 • Multiple SID storage indicator ($MULT_SIDS_s = MULT_SIDS_r$)
- 18 • Multiple NID storage indicator ($MULT_NIDS_s = MULT_NIDS_r$)
- 19 • Base station latitude ($BASE_LAT_s = BASE_LAT_r$)
- 20 • Base station longitude ($BASE_LONG_s = BASE_LONG_r$)
- 21 • Registration distance ($REG_DIST_s = REG_DIST_r$)

22 The mobile station shall perform the following actions:

- 23 • Set $DIGITAL_REG_{s-p}$ to '00000001'.
- 24 • Add REG_ZONE_s , SID_s , and NID_s to $ZONE_LIST_s$ if not already in the list. If
25 required, include the band class identifier and block identifier for the current band
26 and frequency block designator as specified in 2.6.5.1.5.
- 27 • If $BYPASS_REG_IND_s$ is equal to '00', delete all entries from $ZONE_LIST_s$ belonging
28 to a different band class (see [45]) than $CDMABAND_s$.
- 29 • Disable the zone list entry timer for the entry of $ZONE_LIST_s$ containing
30 REG_ZONE_s , SID_s , and NID_s . For any other entry of $ZONE_LIST_s$ whose entry
31 timer is not active, enable the entry timer with the duration specified by
32 $ZONE_TIMER_s$ (see 2.6.5.1.5).
- 33 • If $ZONE_LIST_s$ contains more than $TOTAL_ZONES_s$ entries, delete the excess
34 entries according to the rules specified in 2.6.5.1.5.
- 35 • If $BYPASS_REG_IND_s$ is equal to '00', delete all entries from $SID_NID_LIST_s$
36 belonging to a different band class (see [45]) than $CDMABAND_s$.

- 1 • Add SID_s and NID_s to SID_NID_LIST_s if not already in the list. If required, include
- 2 the band class identifier and block identifier for the current band and frequency
- 3 block designator as specified in 2.6.5.1.5.
- 4 • Disable the SID/NID list entry timer for the entry of SID_NID_LIST_s containing
- 5 SID_s, and NID_s. For any other entry of SID_NID_LIST_s whose entry timer is not
- 6 active, enable the entry timer with the duration specified in 2.6.5.1.5.
- 7 • If SID_NID_LIST_s contains more than N_{10m} entries, delete the excess entries
- 8 according to the rules specified in 2.6.5.1.5.
- 9 • If MULT_SIDS_s is equal to '0' and SID_NID_LIST contains entries with different
- 10 SIDs, delete the excess entries according to the rules specified in 2.6.5.1.5.
- 11 • If MULT_NIDS_s is equal to '0' and SID_NID_LIST contains more than one entry for
- 12 any SID, delete the excess entries according to the rules specified in 2.6.5.1.5.
- 13 • Set the stored location of last registration (BASE_LAT_REG_{s-p} and BASE_LONG-
- 14 _REG_{s-p}) to the base station's location (BASE_LAT_s and BASE_LONG_s). Set the
- 15 stored registration distance (REG_DIST_REG_{s-p}) to the base station's registration
- 16 distance (REG_DIST_s).
- 17 • Update its roaming status and set MOB_TERM_s as specified in 2.6.5.3. The mobile
- 18 station should indicate to the user whether the mobile station is roaming.

19 2.6.5.5.4.4 Power Off

20 These procedures are performed when the mobile station is directed by the user to power
21 off.

22 The mobile station shall perform the following actions:

- 23 • If an entry of ZONE_LIST_s does not have an active timer, copy that entry to
- 24 ZONE_LIST_{s-p}; otherwise, delete the entry in ZONE_LIST_{s-p} if ZONE_LIST_{s-p}
- 25 contains an entry.
- 26 • If an entry of SID_NID_LIST_s does not have an active timer, copy that entry to
- 27 SID_NID_LIST_{s-p}; otherwise, delete the entry in SID_NID_LIST_{s-p} if SID_NID_LIST_{s-p}
- 28 contains an entry.

29 2.6.6 Handoff Procedures

30 This section presents an overview and mobile station requirements for handoffs occurring
31 while the mobile station is in the *Mobile Station Control on the Traffic Channel State* (see
32 2.6.4). Mobile station requirements for handoffs occurring while the mobile station is in
33 the *Mobile Station Idle State* are specified in 2.6.2.1.4.

34 2.6.6.1 Overview

35 2.6.6.1.1 Types of Handoff

36 The mobile station supports the following three handoff procedures while in the *Mobile*
37 *Station Control on the Traffic Channel State*:

- 1 • *Soft Handoff*: A handoff in which the mobile station commences communications
2 with a new base station without interrupting communications with the old base
3 station. Soft handoff can only be used between CDMA Channels having identical
4 Frequency Assignments. Soft handoff provides diversity of Forward Traffic
5 Channels and Reverse Traffic Channel paths on the boundaries between base
6 stations.
- 7 • *CDMA-to-CDMA Hard Handoff*: A handoff in which the mobile station is transitioned
8 between disjoint sets of base stations, different band classes, different Frequency
9 Assignments, or different frame offsets.

10 The mobile station shall support soft handoffs on the same Frequency Assignment (see
11 2.6.6.2.7). The mobile station shall support CDMA-to-CDMA hard handoffs between band
12 classes on which it supports CDMA operation (see 2.6.6.2.8).

13 2.6.6.1.2 Pilot Sets

14 Within section 2.6.6 the term pilot refers to a Pilot Channel identified by a pilot sequence
15 offset (see [2]), a Walsh function or a quasi-orthogonal function (see [2]), and a Frequency
16 Assignment (see [2]). A pilot is associated with the Forward Traffic Channels in the same
17 Forward CDMA Channel. All pilots in a pilot set have the same CDMA Frequency
18 Assignment.

19 The mobile station searches for pilots on the current CDMA Frequency Assignment to
20 detect the presence of CDMA Channels and to measure their strengths. When the mobile
21 station detects a pilot of sufficient strength that is not associated with any of the Forward
22 Traffic Channels assigned to it, it sends a *Pilot Strength Measurement Message* or an
23 *Extended Pilot Strength Measurement Message* to the base station⁶⁶. The base station can
24 then assign a Forward Traffic Channel associated with that pilot to the mobile station and
25 direct the mobile station to perform a handoff.

26 If the mobile station is capable of obtaining Overhead Messages of neighboring sectors
27 while in traffic channel state, then the mobile station may include pilots from the
28 PSMM_SIGNATURE field of the *Access Point Identification Message* in the *Pilot Strength*
29 *Measurement Message*.

30 The pilot search parameters and the rules for *Pilot Strength Measurement Message* or
31 *Extended Pilot Strength Measurement Message* transmission are expressed in terms of the
32 following sets of pilots:

- 33 • *Active Set*: The pilots associated with the Forward Traffic Channels assigned to the
34 mobile station.

⁶⁶ The mobile station may send a Handoff Supplementary Information Notification message to the base station if a message that mobile station is sending includes a Pilot for which the base station may require supplementary information. For example, the mobile station may send this message along with PSMM or EPSMM message.

- 1 • *Candidate Set*: The pilots that are not currently in the Active Set but have been
2 received by the mobile station with sufficient strength to indicate that the
3 associated Forward Traffic Channels could be successfully demodulated.
- 4 • *Neighbor Set*: The pilots that are not currently in the Active Set or the Candidate
5 Set and are likely candidates for handoff.
- 6 • *Remaining Set*: The set of all possible pilots in the current system on the current
7 CDMA Frequency Assignment, excluding the pilots in the Neighbor Set, the
8 Candidate Set, and the Active Set. This set of possible pilots consists of pilots
9 whose pilot PN sequence offset indices are integer multiples of $PILOT_INC_S$.

10 The base station may direct the mobile station to search for pilots on a different CDMA
11 frequency to detect the presence of CDMA Channels and to measure their strengths. The
12 mobile station reports the results of the search to the base station using the *Candidate*
13 *Frequency Search Report Message*. Depending upon the pilot strength measurements
14 reported in the *Candidate Frequency Search Report Message*, the base station can direct the
15 mobile station to perform an inter-frequency hard handoff.

16 The pilot search parameters are expressed in terms of the following sets of pilots on the
17 CDMA Candidate Frequency:

- 18 • *Candidate Frequency Neighbor Set*: A list of pilots on the CDMA Candidate
19 Frequency.
- 20 • *Candidate Frequency Search Set*: A subset of the Candidate Frequency Neighbor Set
21 that the base station may direct the mobile station to search.

22 2.6.6.2 Requirements

23 2.6.6.2.1 Pilot Search

24 For the pilot sets defined in 2.6.6.1.2, the base station sets the search window (range of PN
25 offsets) in which the mobile station is to search for usable multipath components (i.e.,
26 multipath components that the mobile station can use for demodulation of the associated
27 Forward Traffic Channel) of the pilots in the set.

28 Search performance criteria are defined in [11].

29 This search shall be governed by the following:

- 30 • *Active Set and Candidate Set*: The search procedures for pilots in the Active Set and
31 Candidate Set shall be identical. The search window size⁶⁷ for each pilot in the
32 Active Set and Candidate Set shall be the number of PN chips specified in Table
33 2.6.6.2.1-1 corresponding to $SRCH_WIN_A_S$. The mobile station should center the
34 search window for each pilot of the Active Set and Candidate Set around the earliest
35 arriving usable multipath component of the pilot. If the mobile station receives a

⁶⁷ The table defines the entire search range. For example, $SRCH_WIN_A_S = 6$ corresponds to a 28 PN chip search window or ± 14 PN chips around the search window center.

1 value greater than or equal to 13 for SRCH_WIN_A_r, it may store and use the value
 2 13 in SRCH_WIN_A_s.

3 **Table 2.6.6.2.1-1. Searcher Window Sizes**

SRCH_WIN_A SRCH_WIN_N SRCH_WIN_NGHR SRCH_WIN_R CF_SRCH_WIN_N	window_size (PN chips)	SRCH_WIN_A SRCH_WIN_N SRCH_WIN_NGHR R SRCH_WIN_R CF_SRCH_WIN_N	window_size (PN chips)
0	4	8	60
1	6	9	80
2	8	10	100
3	10	11	130
4	14	12	160
5	20	13	226
6	28	14	320
7	40	15	452

4

5 **Table 2.6.6.2.1-2. Search Window Offset**

SRCH_OFFSET_NGHR CF_SRCH_OFFSET_NGHR	Offset (PN chips)
0	0
1	window_size/2
2	window_size
3	$3 \times \text{window_size} / 2$
4	$-\text{window_size} / 2$
5	$-\text{window_size}$
6	$-3 \times \text{window_size} / 2$
7	Reserved

6

- 7
- 8 • *Neighbor Set*: If SRCH_WIN_NGHR_INCL_s is equal to '1', the search window size
 9 for each pilot in the Neighbor Set shall be the number of PN chips specified in Table
 10 2.6.6.2.1-1, corresponding to SRCH_WIN_NGHR_s associated with the pilot being
 11 searched. If SRCH_WIN_NGHR_INCL_s is equal to '0', the search window size for
 12 each pilot in the Neighbor Set shall be the number of PN chips specified in Table
 13 2.6.6.2.1-1 corresponding to SRCH_WIN_N_s. If SRCH_OFFSET_INCL_s is equal to
 14 '1', the search window offset for each pilot in the Neighbor Set shall be the number
 of PN chips specified in Table 2.6.6.2.1-2, corresponding to

1 SRCH_OFFSET_NGHBR_s associated with the pilot being searched. If
 2 SRCH_OFFSET_INCL_s is equal to '0', the search window offset for each pilot in the
 3 Neighbor Set shall be zero PN chip. The mobile station should center the search
 4 window for each pilot in the Neighbor Set around the pilot's PN sequence offset plus
 5 the corresponding search window offset, using timing defined by the mobile
 6 station's time reference (see [2]). If SEARCH_PRIORITY_INCL_s is equal to '1', the
 7 mobile station should use SEARCH_PRIORITY_s for the corresponding pilot to
 8 schedule its neighbor search. If the mobile station supports hopping pilot beacons
 9 and the TIMING_INCL field of the NGHBR_REC for the corresponding pilot is equal
 10 to '1', then the mobile station shall use the information included in the
 11 NGHBR_TX_OFFSET, NGHBR_TX_DURATION, and NGHBR_TX_PERIOD fields of
 12 the NGHBR_REC for the corresponding pilot to schedule the time for searching the
 13 neighbor. If ADD_PILOT_REC_INCL field of the NGHBR_REC for the corresponding
 14 pilot is equal to '1', the mobile station shall use the information included in the
 15 NGHBR_PILOT_REC field for searching the neighbor.

- 16 • *Remaining Set:* The search window size for each pilot in the Remaining Set shall be
 17 the number of PN chips specified in Table 2.6.6.2.1-1 corresponding to
 18 SRCH_WIN_R_s. The mobile station should center the search window for each pilot
 19 in the Remaining Set around the pilot's PN sequence offset, using timing defined by
 20 the mobile station's time reference (see [2]). The mobile station should only search
 21 for Remaining Set pilots whose pilot PN sequence offset indices are equal to integer
 22 multiples of PILOT_INC_s.
- 23 • *Candidate Frequency Search Set:* If CF_SRCH_WIN_NGHBR_INCL_s is equal to '1',
 24 the search window size for each pilot in the Candidate Frequency Search Set shall
 25 be the number of PN chips specified in Table 2.6.6.2.1-1, corresponding to
 26 SRCH_WIN_NGHBR_s associated with the pilot being searched. If
 27 CF_SRCH_WIN_NGHBR_INCL_s is equal to '0', the search window size for each pilot
 28 in the Candidate Frequency Search Set shall be the number of PN chips specified in
 29 Table 2.6.6.2.1-1 corresponding to CF_SRCH_WIN_N_s. If CF_SRCH_OFFSET_INCL_s
 30 is equal to '1', the search window offset for each pilot in the Candidate Frequency
 31 Search Set shall be the number of PN chips specified in Table 2.6.6.2.1-2,
 32 corresponding to SRCH_OFFSET_NGHBR_s associated with the pilot being searched.
 33 If CF_SRCH_OFFSET_INCL_s is equal to '0', the search window offset for each pilot in
 34 the Candidate Frequency Search Set shall be zero PN chips. The mobile station
 35 should center the search window for each pilot in the Candidate Frequency Search
 36 Set around the pilot's PN sequence offset plus the corresponding search window
 37 offset using timing defined by the mobile station's time reference (see [2]). If
 38 CF_SEARCH_PRIORITY_INCL_s is equal to '1', the mobile station should use
 39 SEARCH_PRIORITY_s associated with each pilot to schedule a search of its
 40 Candidate Frequency Search Set.

41 2.6.6.2.2 Pilot Strength Measurements

42 The mobile station assists the base station in the handoff process and in the Reverse
 43 Supplemental Code Channel operation and in the Reverse Supplemental Channel operation
 44 by measuring and reporting the strengths of received pilots.

1 For an SR1 pilot, the mobile station should use the searcher element (see [2]) to compute
 2 the strength of a pilot (PS) by adding the ratios of received pilot energy per chip, E_c , to total
 3 received spectral density (noise and signals), I_o , of at most k usable multipath components,
 4 where k is the number of demodulating elements (see [2]) supported by the mobile station.

5 For an SR3 pilot, the pilot strength is given by

$$6 \quad \frac{1}{3} \times \left(\left(\frac{E_c}{I_o} \right)_{\text{Primary}} + \frac{\left(\frac{E_c}{I_o} \right)_1}{\Delta_1} + \frac{\left(\frac{E_c}{I_o} \right)_2}{\Delta_2} \right) \text{ where:}$$

7 - $\left(\frac{E_c}{I_o} \right)_{\text{Primary}}$ is the pilot E_c/I_o measured on the Primary carrier (computed as
 8 specified above for SR1 pilots),

9 - $\left(\frac{E_c}{I_o} \right)_1$ is the pilot E_c/I_o measured on the pilot on the lower frequency of the two
 10 remaining SR3 frequencies (computed as specified above for SR1 pilots), and Δ_1 is
 11 the pilot power level on the lower frequency of the two remaining SR3 frequencies
 12 relative to that of the primary SR3 pilot, i.e. $\Delta_1 = 10^{(-\text{SR3_PILOT_POWER1}/10)}$.

13 - $\left(\frac{E_c}{I_o} \right)_2$ is the pilot E_c/I_o measured on the pilot on the higher frequency of the two
 14 remaining SR3 frequencies (computed as specified above for SR1 pilots), and Δ_2 is
 15 the pilot power level on the higher frequency of the two remaining SR3 frequencies
 16 relative to that of the primary SR3 pilot, i.e. $\Delta_2 = 10^{(-\text{SR3_PILOT_POWER2}/10)}$.

17 2.6.6.2.3 Handoff Drop Timer

18 The mobile station shall maintain a handoff drop timer for each pilot in the Active Set and
 19 Candidate Set.

20 If $P_REV_IN_USE_s$ is less than or equal to three or SOFT_SLOPE_s is equal to '000000', the
 21 mobile station shall perform the following:

- 22 • For the Candidate Set, the mobile station shall start the timer whenever the
 23 strength of the corresponding pilot becomes less than T_DROP_s . The mobile station
 24 shall reset and disable the timer if the strength of the corresponding pilot exceeds
 25 T_DROP_s .
- 26 • For the Active Set, the mobile station shall start the timer whenever the strength of
 27 the corresponding pilot becomes less than T_DROP_s . The mobile station shall reset
 28 and disable the timer if the strength of the corresponding pilot exceeds T_DROP_s .

1 If P_REV_IN_USE_s is greater than three and SOFT_SLOPE_s is not equal to '000000', the
 2 mobile station shall perform the following:

- 3 • For the Candidate Set, the mobile station shall start the timer whenever the
 4 strength of the corresponding pilot becomes less than T_DROP_s. The mobile station
 5 shall reset and disable the timer if the strength of the corresponding pilot exceeds
 6 T_DROP_s.
- 7 • For the Active Set, the mobile station shall sort the N_A pilots in the Active Set in
 8 order of increasing strengths, i.e., PS₁ < PS₂ < PS₃ < ... < PS_{N_A} where the strength
 9 PS is as defined in 2.6.6.2.2. The mobile station shall start the timer whenever the
 10 strength PS_i satisfies the following inequality:

$$11 \quad 10 \times \log_{10} PS_i < \max\left(\frac{\text{SOFT_SLOPE}_s \times 10 \times \log_{10} \sum_{j>1} PS_j + \frac{\text{DROP_INTERCEPT}_s}{2}}{8}, -\frac{T_DROP_s}{2}\right)$$

12 $i = 1, 2, \dots, PS_{N_A-1}$

12

13 For the Active Set, the mobile station shall start the timer even if the timer has previously
 14 expired. The mobile station shall reset and disable the timer whenever the above inequality
 15 is not satisfied for the corresponding pilot.

16 If T_TDROP_RANGE_s is equal to '0000' or if P_REV_IN_USE_s is less than 9, then the mobile
 17 station shall perform the following:

- 18 • If T_TDROP_s equals zero, the mobile station shall consider the timer expired within
 19 100 ms of enabling it.
- 20 • Otherwise, the mobile station shall consider the timer expired within 10% of the
 21 timer expiration value shown in Table 2.6.6.2.3-1 corresponding to T_TDROP_s. If
 22 T_TDROP_s changes, the mobile station shall begin using the new value for all
 23 handoff drop timers within 100 ms.

24

Table 2.6.6.2.3-1. Handoff Drop Timer Expiration Values

T_TDROP	Timer Expiration (seconds)	T_TDROP	Timer Expiration (seconds)
0	0.1	8	27
1	1	9	39
2	2	10	55
3	4	11	79
4	6	12	112
5	9	13	159
6	13	14	225
7	19	15	319

Otherwise, the mobile shall perform the following:

- The mobile station shall select the timer expiration value as follows:
 - The mobile station shall select the timer expiration value greater than or equal to the minimum drop timer value computed as:

$$\max (0.1 \text{ seconds, range-based minimum timer expiration value }),$$
 where the range-based minimum timer expiration value equals:

$$(\text{nominal timer expiration value}) - (\text{timer expiration range value}),$$
 where:
 - + the nominal timer expiration value is the timer expiration value in Table 2.6.6.2.3-1 corresponding to T_TDROP_S and,
 - + the timer expiration range value is the timer expiration range value in Table 2.6.6.2.3-2 corresponding to $T_TDROP_RANGE_S$.
 - The mobile station shall select the timer expiration value less than or equal to the maximum drop timer value which equals:

$$(\text{nominal timer expiration value}) + (\text{timer expiration range value}),$$
 where:
 - + the nominal timer expiration value is the timer expiration value in Table 2.6.6.2.3-1 corresponding to T_TDROP_S and,
 - + the timer expiration range value is the timer expiration range value in Table 2.6.6.2.3-2 corresponding to $T_TDROP_RANGE_S$.
- If the mobile station selected a timer expiration value of 0.1s then the mobile station shall consider the timer expired within 100 ms of enabling it.

Table 2.6.6.2.3-2. Handoff Drop Timer Expiration Range Values

T_TDROP_R ANGE [binary]	Timer Expiration Range (seconds)	T_TDROP _RANGE [binary]	Timer Expiration Range (seconds)
0000	0	1000	27
0001	1	1001	39
0010	2	1010	55
0011	4	1011	79
0100	6	1100	112
0101	9	1101	159
0110	13	1110	225
0111	19	1111	319

The mobile station shall indicate the status of the handoff drop timer for all pilots in the Active Set and Candidate Set when transmitting a *Pilot Strength Measurement Message* or an *Extended Pilot Strength Measurement Message*.

2.6.6.2.4 Pilot PN Phase

The mobile station shall measure the arrival time, PILOT_ARRIVAL, for each pilot reported to the base station. The pilot arrival time shall be the time of occurrence, as measured at the mobile station antenna connector, of the earliest arriving usable multipath component of the pilot (for SR3 pilots, it is based on the earliest arriving usable multipath component from all three carriers). The arrival time shall be measured relative to the mobile station's time reference (see [2]) in units of PN chips. The mobile station shall compute the reported pilot PN phase, PILOT_PN_PHASE, as

$$\text{PILOT_PN_PHASE} = (\text{PILOT_ARRIVAL} + (64 \times \text{PILOT_PN})) \bmod 2^{15},$$

where PILOT_PN is the PN sequence offset index of the pilot (see [2]).

2.6.6.2.5 Handoff Messages

2.6.6.2.5.1 Processing of Forward Traffic Channel Handoff Messages

If the mobile station receives any of the following messages, then the mobile station shall process the message as described.

1. *Pilot Measurement Request Order*: The mobile station shall send, within T_{56m} seconds, a *Pilot Strength Measurement Message* if $P_REV_IN_USE_s$ is less than seven or a *Extended Pilot Strength Measurement Message* if $P_REV_IN_USE_s$ is equal to or greater than seven.
2. Reserved
3. *Neighbor List Update Message*: If $P_REV_IN_USE_s$ is greater than or equal to eight, the mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set

1 to '0000010' (message not accepted in this state); otherwise, the mobile station
 2 shall process the message as specified in 2.6.6.2.6.3 and set
 3 SEARCH_PRIORITY_INCL_s, SRCH_WIN_NGHR_INCL_s, and SRCH_OFFSET_INCL_s
 4 to '0', and set TIMING_INCL for each of the neighboring base stations in the
 5 *Neighbor List Update Message* to '0'.

6 4. *Extended Handoff Direction Message*: The mobile station shall process the message as
 7 follows:

8 The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set
 9 to '00000110' (capability not supported), if the mobile station does not support the
 10 band class specified in the *Extended Handoff Direction Message*.

11 If the mobile station does not send a *Mobile Station Reject Order* in response to the
 12 *Extended Handoff Direction Message*, the mobile station shall perform the following at
 13 the action time of the message:

- 14 • The mobile station shall send a *Handoff Completion Message* or an *Extended*
 15 *Handoff Completion Message* as specified in 2.6.6.2.5.2. If the RC assigned on the
 16 reverse fundamental channel or supplemental channel is less than RC08 the mobile
 17 station shall set RC_BITMAP_CAPABILITY_EXT_ALLOWED_s to '0'.
- 18 • Update the Active Set, Candidate Set, and Neighbor Set in accordance with the
 19 *Extended Handoff Direction Message* processing (see 2.6.6.2.6.1, 2.6.6.2.6.2, and
 20 2.6.6.2.6.3).
- 21 • The mobile station shall delete all pilots that are not listed in the Active Set from the
 22 Active Set of the Supplemental Channel for the Forward Supplemental Channel
 23 Assignment (if any). If these deleted pilots include all pilots in the Active Set of the
 24 Supplemental Channel, the mobile station shall cancel the Forward Supplemental
 25 Channel Assignment.
- 26 • Discontinue use of all Forward Traffic Channels associated with pilots not listed in
 27 the *Extended Handoff Direction Message*.
- 28 • The mobile station shall update the Code Channel List, CODE_CHAN_LIST_s, as
 29 specified in 2.6.8.
- 30 • If the mobile station is currently processing Forward Supplemental Code Channels,
 31 then it shall continue processing the Forward Supplemental Code Channels using
 32 the updated Code Channel List, CODE_CHAN_LIST_s.
- 33 • The mobile station shall set IGNORE_SCAM_s and IGNORE_ESCAM_s to '0'.
- 34 • If HARD_INCLUDED is equal to '1', perform the following actions:
 - 35 – If FRAME_OFFSET_r is not equal to FRAME_OFFSET_s, change the frame
 36 offset on all of the code channels of the Forward Traffic Channel and of the
 37 Reverse Traffic Channel.

- 1 – If RESET_L2_r is equal to ‘1’, Layer 3 shall send a L2-Supervision.Request
2 primitive to Layer 2 to reset the acknowledgment procedures as specified in
3 [4]. The acknowledgment procedures shall be reset immediately after the
4 action time of the *Extended Handoff Direction Message*.
- 5 – If RESET_FPC_r is equal to ‘1’, initialize the Forward Traffic Channel power
6 control counters as specified in 2.6.4.1.1.1.
- 7 – If SERV_NEG_TYPE_r is equal to ‘1’, set SERV_NEG_s to enabled; otherwise set
8 SERV_NEG_s to disabled.
- 9 – Use the long code mask as follows:
- 10 + If PRIVATE_LCM_r equals ‘1’, the mobile station shall use the Private Long
11 Code Mask as specified in 2.3.6.
- 12 + If PRIVATE_LCM_r equals ‘0’, the mobile station shall use the Public Long
13 Code Mask derived from PLCM_TYPE_s as specified in 2.3.6.
- 14 + The mobile station shall indicate to the user the voice privacy mode
15 status.
- 16 – Process the ENCRYPT_MODE field as specified in 2.3.12.2.
- 17 • Store the following parameters from the current configuration:
- 18 – Serving Frequency Assignment (SF_CDMACH_s = CDMACH_s)
- 19 – Serving Frequency band class (SF_BAND_CLASS_s = BAND_CLASS_s)
- 20 – Serving Frequency frame offset (SF_FRAME_OFFSET_s = FRAME_OFFSET_s)
- 21 • If HARD_INCLUDED is not equal to ‘1’, set NUM_PREAMBLE_s = ‘000’.
- 22 • Store the following parameters from the *Extended Handoff Direction Message*:
- 23 – *Extended Handoff Direction Message* sequence number (HDM_SEQ_s =
24 HDM_SEQ_r)
- 25 – If SEARCH_INCLUDED is equal to ‘1’, then store the following:
- 26 + Search window size for the Active Set and Candidate Set
27 (SRCH_WIN_A_s = SRCH_WIN_A_r)
- 28 + Pilot detection threshold (T_ADD_s = T_ADD_r)
- 29 + Pilot drop threshold (T_DROP_s = T_DROP_r)
- 30 + Active Set versus Candidate Set comparison threshold
31 (T_COMP_s = T_COMP_r)
- 32 + Drop timer value (T_TDROPS = T_TDROPr)
- 33 – If HARD_INCLUDED is equal to ‘1’, then store the following:
- 34 + Frame offset (FRAME_OFFSET_s = FRAME_OFFSET_r)
- 35 + Nominal power setting of the target cell (NOM_PWR_s = NOM_PWR_r)

- 1 + Hard handoff traffic channel preamble count required before transmitting
2 *Handoff Completion Message* or *Extended Handoff Completion Message*
3 (NUM_PREAMBLE_S = NUM_PREAMBLE_T)
- 4 + CDMA band class (CDMABAND_S = BAND_CLASS_T)
- 5 + Frequency assignment (CDMACH_S = CDMA_FREQ_T)
- 6 + Nominal power setting of the target cell (If CDMABAND_S = '00000' or
7 CDMABAND_S = '00011', then NOM_PWR_EXT_S = '0'; otherwise,
8 NOM_PWR_EXT_S = NOM_PWR_EXT_T)
- 9 – One occurrence of PILOT_PN and PWR_COMB_IND for each included
10 member of the Active Set.
- 11 – If ADD_LENGTH is not equal to '000', then store the following:
12 + Protocol revision level (P_REV_S = P_REV_T)
13 + Protocol revision level currently in use (P_REV_IN_USE_S = the minimum
14 value of P_REV_S and MOB_P_REV_P of the current band class)
- 15 – Disable return on failure (RETURN_IF_HANDOFF_FAIL_S = '0')
- 16 • Perform a soft or hard handoff depending on the following conditions:
17 – If any of the following conditions is true, the mobile station shall perform a
18 hard handoff:
19 + HARD_INCLUDED is set to '1' and either BAND_CLASS_T is not equal to
20 SF_CDMABAND_S, CDMA_FREQ_T is not equal to SF_CDMACH_S, or
21 FRAME_OFFSET_T is not equal to SF_FRAME_OFFSET_S, or
22 + The set of pilots specified by the message is disjoint from the Active Set
23 prior to the action time of the message.
- 24 – If the mobile station performs a hard handoff, it shall perform the following:
25 + If a Periodic Serving Frequency Pilot Report Procedure is in progress, abort
26 the procedure (see 2.6.6.2.12).
27 + If a Candidate Frequency periodic search is in progress, abort the periodic
28 search (see 2.6.6.2.8.3.4 and 2.6.6.2.10.4) and set PERIODIC_SEARCH_S to
29 '0'.
30 + The mobile station shall cancel the Forward Supplemental Channel
31 assignment or the Reverse Supplemental Channel assignment (if any).
32 + Perform the actions specified in 2.6.6.2.8.1. If the message specifies more
33 than one pilot, the mobile station shall also perform the actions specified in
34 2.6.6.2.7.1 and 2.6.6.2.7.2.
- 35 – Otherwise, the mobile station shall perform a soft handoff as specified in
36 2.6.6.2.7.

37 5. *Candidate Frequency Search Request Message*: The mobile station shall process the
38 message as follows:

1 The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set
2 to '00000110' (capability not supported), if the following condition is true:

- 3 • SEARCH_MODE_r is not equal to '0000', and the mobile station does not support
4 the capability specified by SEARCH_MODE_r.

5 If none of the above conditions is true, the mobile station shall perform the actions
6 described in the remainder of this section to process the *Candidate Frequency*
7 *Search Request Message*.

8 If SEARCH_MODE_r is equal to '0000', the mobile station shall process the
9 *Candidate Frequency Search Request Message* as follows:

- 10 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
11 set to '00001100' (invalid Frequency Assignment), if the Frequency Assignment
12 specified in the message is the same as the Serving Frequency (BAND_CLASS_r is
13 equal to CDMABAND_s and CDMA_FREQ_r is equal to CDMACH_s).
- 14 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
15 set to '00001010' (search set not specified), if SEARCH_TYPE_r is equal to '01' or
16 '11', and one of the following conditions is true:
 - 17 – PILOT_UPDATE_r is equal to '0' and the Candidate Frequency Search Set
18 before the action time of the *Candidate Frequency Search Request Message* is
19 empty, or
 - 20 – PILOT_UPDATE_r is equal to '1' and the message specifies an empty search
21 set.
- 22 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
23 set to '00001101' (search period too short), if SEARCH_TYPE_r is equal to '11'
24 and *search_period* is less than $(\max(fwd_time, rev_time) + T_{71m})$ seconds, where
25 *search_period*, *fwd_time* and *rev_time* are defined below.

26 (In the following, if PILOT_UPDATE_r is equal to '1', *rec_search_set* is the set of
27 pilots specified in the *Candidate Frequency Search Request Message* with the
28 corresponding SEARCH_SET field set to '1'; otherwise, *rec_search_set* is the
29 Candidate Frequency Search Set before the action time of the *Candidate*
30 *Frequency Search Request Message*.)

31 *search_period* = time period corresponding to SEARCH_PERIOD_r shown in
32 Table 2.6.6.2.8.3.2-1

33 *fwd_time* = the mobile station's estimate of the total length of time, in
34 seconds, for which the mobile station will need to suspend its
35 current Forward Traffic Channel processing in order to tune
36 to the Candidate Frequency, to search *rec_search_set*, and to
37 re-tune to the Serving Frequency; if the mobile station
38 searches *rec_search_set* in multiple visits, *fwd_time* is the
39 total time for all visits to the Candidate Frequency in a search
40 period (see 2.6.6.2.8.3.2)

- 1 *rev_time* = the mobile station's estimate of the total length of time, in
 2 seconds, for which the mobile station will need to suspend its
 3 current Reverse Traffic Channel processing in order to tune to
 4 the Candidate Frequency, to search *rec_search_set*, and to re-
 5 tune to the Serving Frequency; if the mobile station searches
 6 *rec_search_set* in multiple visits, *rev_time* is the total time for
 7 all visits to the Candidate Frequency in a search period
- 8 • If the mobile station does not send a *Mobile Station Reject Order* in response to
 9 the *Candidate Frequency Search Request Message*, it shall perform the following:
 - 10 – The mobile station shall send a *Candidate Frequency Search Response*
 11 *Message* in assured mode, within T_{56m} seconds of receiving the *Candidate*
 12 *Frequency Search Request Message*. The mobile station shall set the fields of
 13 the *Candidate Frequency Search Response Message* as follows:
 - 14 + The mobile station shall set TOTAL_OFF_TIME_FWD and
 15 TOTAL_OFF_TIME_REV to its estimate of the total number of frames or
 16 power control groups for which it will need to suspend its current
 17 Forward Traffic Channel processing and Reverse Traffic Channel
 18 processing, respectively, in order to tune to the Candidate Frequency, to
 19 search *rec_search_set*, and to re-tune to the Serving Frequency (see
 20 2.6.6.2.8.3.2). If the mobile station searches *rec_search_set* in multiple
 21 visits to the Candidate Frequency, the mobile station shall report the
 22 total number of frames or power control groups in all visits in a search
 23 period for which it will need to suspend its current Forward Traffic
 24 Channel and the Reverse Traffic Channel processing.
 - 25 + The mobile station shall set MAX_OFF_TIME_FWD and
 26 MAX_OFF_TIME_REV to its estimate of the maximum number of frames
 27 or power control groups for which it will need to suspend its current
 28 Forward Traffic Channel processing and Reverse Traffic Channel
 29 processing, respectively, during any single visit to tune to the Candidate
 30 Frequency, to search a subset of *rec_search_set*, and to re-tune to the
 31 Serving Frequency.⁶⁸
 - 32 + The mobile station shall set PCG_OFF_TIMES to '1' if
 33 TOTAL_OFF_TIME_FWD, MAX_OFF_TIME_FWD, TOTAL_OFF_TIME_REV
 34 and MAX_OFF_TIME_REV are expressed in units of power control
 35 groups. If these time estimates are expressed in units of frames, the
 36 mobile station shall set PCG_OFF_TIMES to '0'. The mobile station shall
 37 not use power control groups as the unit of duration if P_REV_IN_USE_S
 38 is less than six.

⁶⁸ If the mobile station searches the entire Candidate Frequency Search Set in a single visit to the Candidate Frequency, TOTAL_OFF_TIME_FWD will be equal to MAX_OFF_TIME_FWD, and TOTAL_OFF_TIME_REV will be equal to MAX_OFF_TIME_REV.

- 1 + If ALIGN_TIMING_T is equal to '1', the mobile station shall set
2 ALIGN_TIMING_USED to '1' to indicate if it will align its search as
3 requested by the base station; otherwise, the mobile station shall set
4 ALIGN_TIMING_USED to '0'. If ALIGN_TIMING_USED is set to '1', the
5 mobile station shall set MAX_NUM_VISITS to the maximum number of
6 visits per search period minus one. If MAX_NUM_VISITS is not equal to
7 0, the mobile station shall set INTER_VISIT_TIME, in units of frames or
8 power control groups, to its estimate of the time between the beginning
9 of consecutive visits to the Candidate Frequency within the same search
10 period.
- 11 – When the message takes effect, the mobile station shall perform the
12 following actions:
- 13 + If any periodic search is in progress, the mobile station shall abort it (see
14 2.6.6.2.8.3.4 and 2.6.6.2.10.4).
- 15 + Store the following parameters from the *Candidate Frequency Search*
16 *Request Message*:
- 17 o *Candidate Frequency Search Request Message* sequence number
18 (CFSRM_SEQ_S = CFSRM_SEQ_T)
- 19 o Periodic search flag: If SEARCH_TYPE_T is equal to '11', the mobile
20 station shall set PERIODIC_SEARCH_S to '1'; otherwise, the mobile
21 station shall set PERIODIC_SEARCH_S to '0'.
- 22 o Search period on the Candidate Frequency
23 (SEARCH_PERIOD_S = SEARCH_PERIOD_T)
- 24 o Candidate Frequency search mode
25 (SEARCH_MODE_S = SEARCH_MODE_T)
- 26 o Band class for the Candidate Frequency
27 (CF_CDMABAND_S = BAND_CLASS_T)
- 28 o CDMA Channel number for the CDMA Candidate Frequency
29 (CF_CDMACH_S = CDMA_FREQ_T)
- 30 o Serving Frequency total pilot E_C threshold
31 (SF_TOTAL_EC_THRESH_S = SF_TOTAL_EC_THRESH_T)
- 32 o Serving Frequency total pilot E_C/I₀ threshold
33 (SF_TOTAL_EC_I0_THRESH_S = SF_TOTAL_EC_I0_THRESH_T)
- 34 o Received power difference threshold
35 (DIFF_RX_PWR_THRESH_S = DIFF_RX_PWR_THRESH_T)
- 36 o Candidate Frequency Total pilot E_C/I₀ threshold
37 (MIN_TOTAL_PILOT_EC_I0_S = MIN_TOTAL_PILOT_EC_I0_T)
- 38 o Pilot detection threshold on the CDMA Candidate Frequency
39 (CF_T_ADD_S = CF_T_ADD_T)

- 1 o Maximum time on the CDMA Target Frequency that the mobile
2 station may wait to receive a period of $(N_{11m} \times 20)$ ms with sufficient
3 signal quality on the physical channel corresponding to
4 FPC_PRI_CHAN_S
5 (TF_WAIT_TIME_S = TF_WAIT_TIME_T)
- 6 o Pilot PN sequence offset increment on the CDMA Candidate
7 Frequency (CF_PILOT_INC_S = CF_PILOT_INC_T)
- 8 o Search window for pilots in the Neighbor Set on the CDMA Candidate
9 Frequency (CF_SRCH_WIN_N_S = CF_SRCH_WIN_N_T)
- 10 o Search window for pilots in the Remaining Set on the CDMA
11 Candidate Frequency (CF_SRCH_WIN_R_S = CF_SRCH_WIN_R_T)
- 12 o If PILOT_UPDATE is equal to '1', the mobile station shall perform the
13 following:
- 14 ◇ Set CF_SEARCH_PRIORITY_INCL_S and
15 CF_SRCH_WIN_NGHBR_INCL_S to the values corresponding to
16 CF_NGHBR_SRCH_MODE shown in Table 2.6.6.2.5.1-1,
17 ◇ Set CF_SRCH_OFFSET_INCL_S to CF_SRCH_OFFSET_INCL_T.
- 18 o If PILOT_UPDATE is equal to '1', the mobile station shall replace the
19 Candidate Frequency Neighbor Set with all neighbor pilots specified
20 in the *Candidate Frequency Search Request Message*. Specifically,
21 the mobile station shall store the following:
- 22 ◇ Set the NGHBR_PN field of the Candidate Frequency Neighbor Set
23 Pilot Record to NGHBR_PN_T.
- 24 ◇ Set the ADD_PILOT_REC_INCL field of the Candidate Frequency
25 Neighbor Set Pilot Record to ADD_PILOT_REC_INCL_T. If
26 ADD_PILOT_REC_INCL_T is equal to '1', the mobile station shall
27 store the following:
- 28 – Set the NGHBR_PILOT_REC_TYPE field of the Candidate
29 Frequency Neighbor Set Pilot Record to
30 NGHBR_PILOT_REC_TYPE_T.
- 31 – If NGHBR_PILOT_REC_TYPE_T equals '000', the mobile station
32 shall set the TD_POWER_LEVEL and TD_MODE fields of the
33 Candidate Frequency Neighbor Set Pilot Record to
34 TD_POWER_LEVEL_T and TD_MODE_T, respectively.
- 35 – If NGHBR_PILOT_REC_TYPE_T is equal to '001', the mobile
36 station shall
- 37 + Set the AUX_PILOT_QOF field of the Candidate Frequency
38 Neighbor Set Pilot Record to QOF_T.

- 1 + Set the AUX_PILOT_WALSH_CODE field of the Candidate
2 Frequency Neighbor Set Pilot Record to
3 AUX_PILOT_WALSH_r with the Walsh Code length specified
4 by WALSH_LENGTH_r.
- 5 – If NGHBR_PILOT_REC_TYPE_r is equal to ‘010’, the mobile
6 station shall:
7 + Set the AUX_PILOT_TD_QOF field of the Candidate
8 Frequency Neighbor Set Pilot Record to QOF_r.
9 + Set the AUX_PILOT_WALSH_CODE field of the Candidate
10 Frequency Neighbor Set Pilot Record to AUX_WALSH_r with
11 the Walsh Code length specified by WALSH_LENGTH_r.
12 + Set the AUX_TD_POWER_LEVEL field of the Candidate
13 Frequency Neighbor Set Pilot Record to
14 AUX_TD_POWER_LEVEL_r.
15 + Set the TD_MODE field of the Candidate Frequency
16 Neighbor Set Pilot Record to TD_MODE_r.
- 17 – If NGHBR_PILOT_REC_TYPE_r is equal to ‘011’, the mobile
18 station shall:
19 + Set the SR3_PRIMARY_PILOT field of Candidate Frequency
20 Neighbor Set Pilot Record to SR3_PRIMARY_PILOT_r.
21 + Set the SR3_PILOT_POWER1 field of Candidate Frequency
22 Neighbor Set Pilot Record to SR3_PILOT_POWER1_r.
23 + Set the SR3_PILOT_POWER2 field of Candidate Frequency
24 Neighbor Set Pilot Record to SR3_PILOT_POWER2_r.
- 25 – If NGHBR_PILOT_REC_TYPE_r is equal to ‘100’, the mobile
26 station shall:
27 + Set the SR3_PRIMARY_PILOT field of Candidate Frequency
28 Neighbor Set Pilot Record to SR3_PRIMARY_PILOT_r.
29 + Set the SR3_PILOT_POWER1 field of Candidate Frequency
30 Neighbor Set Pilot Record to SR3_PILOT_POWER1_r.
31 + Set the SR3_PILOT_POWER2 field of Candidate Frequency
32 Neighbor Set Pilot Record to SR3_PILOT_POWER2_r.
33 + Set the AUX_PILOT_QOF field of Candidate Frequency
34 Neighbor Set Pilot Record to QOF_r.
35 + Set the AUX_PILOT_WALSH_CODE field of Candidate
36 Frequency Neighbor Set Pilot Record to
37 AUX_PILOT_WALSH_r with the Walsh Code length specified
38 by WALSH_LENGTH_r.

- 1 + If ADD_INFO_INCL1_r is equal to '1', set the
2 AUX_PILOT_QOF1 field of Candidate Frequency Neighbor
3 Set Pilot Record to QOF1_r and set the
4 AUX_PILOT_WALSH_CODE1 field of Candidate Frequency
5 Neighbor Set Pilot Record to AUX_PILOT_WALSH1_r with
6 the Walsh Code length specified by WALSH_LENGTH1_r;
7 otherwise, set the AUX_PILOT_QOF1 field of Candidate
8 Frequency Neighbor Set Pilot Record to QOF_r and set the
9 AUX_PILOT_WALSH_CODE1 field of Candidate Frequency
10 Neighbor Set Pilot Record to AUX_PILOT_WALSH_r with the
11 Walsh Code length specified by WALSH_LENGTH_r.
- 12 + If ADD_INFO_INCL2_r is equal to '1', set the
13 AUX_PILOT_QOF2 field of Candidate Frequency Neighbor
14 Set Pilot Record to QOF2_r and set the
15 AUX_PILOT_WALSH_CODE2 field of Candidate Frequency
16 Neighbor Set Pilot Record to AUX_PILOT_WALSH2_r with
17 the Walsh Code length specified by WALSH_LENGTH2_r;
18 otherwise, set the AUX_PILOT_QOF2 field of Candidate
19 Frequency Neighbor Set Pilot Record to QOF_r and set the
20 AUX_PILOT_WALSH_CODE2 field of Candidate Frequency
21 Neighbor Set Pilot Record to AUX_PILOT_WALSH_r with the
22 Walsh Code length specified by WALSH_LENGTH_r.
- 23 o If PILOT_UPDATE is equal to '1' and CF_SEARCH_PRIORITY_INCL_s is
24 equal to '1', the mobile station shall store the search priority
25 (SEARCH_PRIORITY_s = SEARCH_PRIORITY_r) associated with each of
26 the neighboring base stations contained in the Candidate Frequency
27 Neighbor Set.
- 28 o If PILOT_UPDATE is equal to '1' and CF_SRCH_WIN_NGHBR_INCL_s
29 is equal to '1', the mobile station shall perform the following:
- 30 ◇ Store the neighbor pilot channel search window size
31 (SRCH_WIN_NGHBR_s = SRCH_WIN_NGHBR_r) associated with
32 each of the neighboring base stations contained in the Candidate
33 Frequency Neighbor Set,
- 34 ◇ If CF_SRCH_OFFSET_INCL_r equals '1', store the neighbor pilot
35 channel search window offset (SRCH_OFFSET_NGHBR_s =
36 SRCH_OFFSET_NGHBR_r) associated with each of the neighboring
37 base stations contained in the Candidate Frequency Neighbor
38 Set.
- 39 o If PILOT_UPDATE is equal to '1', the mobile station shall replace the
40 Candidate Frequency Search Set with all flagged pilots (those with
41 the corresponding SEARCH_SET field set to '1') specified in the
42 *Candidate Frequency Search Request Message*.

- 1 + If ALIGN_TIMING_T is equal to '1' and the mobile station will align its
- 2 search as requested by the base station, the mobile station shall set
- 3 ALIGN_TIMING_USED_S to '1' and SEARCH_OFFSET_S to
- 4 SEARCH_OFFSET_T; otherwise, the mobile station shall set
- 5 ALIGN_TIMING_USED_S to '0' and SEARCH_OFFSET_S to '000000'.

- 6 + If the mobile station sets the PCG_OFF_TIMES field of the *Candidate*
- 7 *Frequency Search Response Message* to '1', it shall set
- 8 SEARCH_TIME_RESOLUTION_S to 0.00125; otherwise, it shall set
- 9 SEARCH_TIME_RESOLUTION_S to 0.02.

- 10 + If SEARCH_TYPE_T is equal to '01', the mobile station shall perform a
- 11 single search of the Candidate Frequency Search Set, as described in
- 12 2.6.6.2.8.3.1. If SEARCH_TYPE_T is equal to '11', the mobile station shall
- 13 perform the periodic search procedures, as described in 2.6.6.2.8.3.2.

Table 2.6.6.2.5.1-1. Search Parameter Settings

NGHBR_SRCH_ -MODE	SEARCH_ -PRIORITY_INCL	SRCH_WIN_ -NGHBR_INCL

6. *Candidate Frequency Search Control Message*: The mobile station shall process the message as follows:

If SEARCH_MODE_S is equal to '0000':

- The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00001010' (search set not specified), if SEARCH_TYPE_T is not equal to '00' and the Candidate Frequency Search Set is empty.
- The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00001011' (invalid search request), if SEARCH_TYPE_T is not equal to '00' and the Candidate Frequency is the same as the Serving Frequency (CF_CDMABAND_S is equal to CDMABAND_S and CF_CDMACH_S is equal to CDMACH_S).
- The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00001101' (search period too short), if SEARCH_TYPE_T is equal to '11' and *search_period* is less than (max (*fwd_time*, *rev_time*) + T_{71m}) seconds, where

1 *search_period* = time period corresponding to SEARCH_PERIOD_T shown in
2 Table 2.6.6.2.8.3.2-1,

3 *fwd_time* = the mobile station's estimate of the total length of time, in
4 seconds, for which the mobile station will need to suspend its
5 current Forward Traffic Channel processing in order to tune to
6 the Candidate Frequency, to search the Candidate Frequency
7 Search Set and to re-tune to the Serving Frequency; if the
8 mobile station searches the Candidate Frequency Search Set in
9 multiple visits, *fwd_time* is the total time for all visits to the
10 Candidate Frequency in a search period (see 2.6.6.2.8.3.2),

11 and

12 *rev_time* = the mobile station's estimate of the total length of time, in
13 seconds, for which the mobile station will need to suspend its
14 current Reverse Traffic Channel processing in order to tune to
15 the Candidate Frequency, to search the Candidate Frequency
16 Search Set and to re-tune to the Serving Frequency; if the
17 mobile station searches the Candidate Frequency Search Set in
18 multiple visits, *rev_time* is the total time for all visits to the
19 Candidate Frequency in a search period.

- 20 • If the mobile station does not reject the *Candidate Frequency Search Control*
21 *Message*, it shall perform the following actions when the message takes effect:
 - 22 – If any periodic search is in progress, the mobile station shall abort it (see
23 2.6.6.2.8.3.4 and 2.6.6.2.10.4).
 - 24 – If ALIGN_TIMING_T is equal to '1' and the mobile station will align its search
25 as requested by the base station, the mobile station shall set
26 ALIGN_TIMING_USED_S to '1'; otherwise, the mobile station shall set
27 ALIGN_TIMING_USED_S to '0' and SEARCH_OFFSET_S to '000000'.
 - 28 – If SEARCH_TYPE_T is equal to '00', the mobile station shall set
29 PERIODIC_SEARCH_S to '0'.
 - 30 – If SEARCH_TYPE_T is equal to '01':
 - 31 + The mobile station shall set PERIODIC_SEARCH_S to '0'.
 - 32 + The mobile station shall perform a single search of the Candidate
33 Frequency Search Set, as described in 2.6.6.2.8.3.1.
 - 34 – If SEARCH_TYPE_T is equal to '11':
 - 35 + The mobile station shall set PERIODIC_SEARCH_S to '1'.
 - 36 + The mobile station shall perform the periodic search procedures for the
37 Candidate Frequency Search Set, as described in 2.6.6.2.8.3.2.

38 7. *Extended Neighbor List Update Message*: The mobile station shall update its
39 neighbor set as specified in 2.6.6.2.6.3 and perform the following:

- 1 • If NGHBR_SRCH_MODE_T is equal to '01' or '11', the mobile station shall store
2 the search priority (SEARCH_PRIORITY_S = SEARCH_PRIORITY_T) associated with
3 each of the neighboring base stations contained in the *Extended Neighbor List*
4 *Update Message* which are in the mobile's neighbor set.
- 5 • If NGHBR_SRCH_MODE_T is equal to '01' or '00', the mobile station shall set the
6 SRCH_OFFSET_INCL_S field '0'.
- 7 • If NGHBR_SRCH_MODE_T is equal to '10' or '11', the mobile station shall perform
8 the following:
- 9 – Store the neighbor pilot channel search window size
10 (SRCH_WIN_NGHBR_S = SRCH_WIN_NGHBR_T) associated with each of the
11 neighboring base stations contained in the *Extended Neighbor List Updated*
12 *Message* which are in the mobile's neighbor set,
- 13 – If SRCH_OFFSET_INCL_T equals '1', set the SRCH_OFFSET_NGHBR field of
14 NGHBR_REC[i] to the ith occurrence of SRCH_OFFSET_NGHBR_T,
- 15 – Set SRCH_OFFSET_INCL_S to SRCH_OFFSET_INCL_T.
- 16 • The mobile station shall update the default search window size for its Neighbor
17 Set (SRCH_WIN_N_S = SRCH_WIN_N_T).
- 18 • The mobile station shall set SEARCH_PRIORITY_INCL_S and
19 SRCH_WIN_NGHBR_INCL_S to the value specified in Table 2.6.6.2.5.1-1
20 corresponding to NGHBR_SRCH_MODE_T.
- 21 • If USE_TIMING is equal to '1', the mobile station shall store the timing included
22 flag (TIMING_INCL) associated with each of the neighboring base stations
23 contained in the *Extended Neighbor List Update Message* which are in the mobile
24 station neighbor set; otherwise the mobile station shall set the timing included
25 flag (TIMING_INCL) associated with each of the neighboring base stations to '0'.
- 26 • If USE_TIMING is equal to '1' and TIMING_INCL_T is equal to '1', the mobile
27 station shall store the neighbor transmit time offset (NGHBR_TX_OFFSET =
28 NGHBR_TX_OFFSET_T) associated with each of the neighboring base stations
29 contained in the *Extended Neighbor List Update Message* which are in the mobile
30 station neighbor set.
- 31 • If USE_TIMING is equal to '1' and the TIMING_INCL is equal to '1', then the
32 mobile station shall perform the following:
- 33 – If the GLOBAL_TIMING_INCL field is equal to '1', then the mobile station
34 shall store the neighbor transmit time duration (NGHBR_TX_DURATION =
35 GLOBAL_TX_DURATION_T) and the neighbor transmit time duration
36 (NGHBR_TX_PERIOD = GLOBAL_TX_PERIOD_T) contained in the *Extended*
37 *Neighbor List Update Message*.

- 1 – If the GLOBAL_TIMING_INCL field is equal to ‘0’, then the mobile station
2 shall store the neighbor transmit time duration (NGHBR_TX_DURATION =
3 NGHBR_TX_DURATION_T) and the neighbor transmit time duration
4 (NGHBR_TX_PERIOD = NGHBR_TX_PERIOD_T) associated with each of the
5 neighboring base stations contained in the *Extended Neighbor List Update*
6 *Message* which are in the mobile station neighbor set.
- 7 • The mobile station shall set RESQ_ENABLED_S = RESQ_ENABLED_T. If
8 RESQ_ENABLED_S is equal to ‘1’, then the mobile station shall store:
- 9 – Call rescue delay timer value (RESQ_DELAY_TIME_S = RESQ_DELAY_TIME_T)
10 – Call rescue allowed timer value (RESQ_ALLOWED_TIME_S =
11 RESQ_ALLOWED_TIME_T)
12 – Call rescue attempt timer value (RESQ_ATTEMPT_TIME_S =
13 RESQ_ATTEMPT_TIME_T)
14 – Code channel index for call rescue (RESQ_CODE_CHAN_S =
15 RESQ_CODE_CHAN_T)
16 – Quasi-Orthogonal Function mask identifier for call rescue (RESQ_QOF_S =
17 RESQ_QOF_T)
18 – Minimum time between consecutive rescues (RESQ_MIN_PERIOD_S =
19 RESQ_MIN_PERIOD_T + 1) if RESQ_MIN_PERIOD_INCL_T is equal to ‘1’;
20 otherwise, RESQ_MIN_PERIOD_S = ‘00000’.
- 21 – The required number of transmissions of a regular PDU before declaring L2
22 Acknowledgment Failure when Call Rescue is enabled
23 (RESQ_NUM_TOT_TRANS_20MS_S = RESQ_NUM_TOT_TRANS_20MS_T) if
24 included.
- 25 – The required number of transmissions of a mini PDU before declaring L2
26 Acknowledgment Failure when Call Rescue is enabled
27 (RESQ_NUM_TOT_TRANS_5MS_S = RESQ_NUM_TOT_TRANS_5MS_T) if
28 included.
- 29 – The mobile station shall set the Traffic Channel preamble length for Call
30 Rescue Soft Handoff as follows:
- 31 + If the mobile station is operating in Radio Configuration 1 or 2, set
32 RESQ_NUM_PREAMBLE_RC1_RC2_S = RESQ_NUM_PREAMBLE_T;
33 + If the mobile station is operating in Radio Configuration greater 2, set
34 RESQ_NUM_PREAMBLE_S = RESQ_NUM_PREAMBLE_T.
- 35 – The power level adjustment to be applied to the last closed-loop power level
36 when re-enabling the transmitter for call rescue soft handoff
37 (RESQ_POWER_DELTA_S = RESQ_POWER_DELTA_T).
- 38 – Set the NGHBR_RESQ_CONFIGURED field of NGHBR_REC[i] to the ith
39 occurrence of NGHBR_RESQ_CONFIGURED_T.

- 1 • For each of the neighboring base stations contained in the *General Neighbor List*
2 *Message*, the mobile station shall set ADD_PILOT_REC_INCL field of
3 NGHBR_REC[i] to the ith occurrence of ADD_PILOT_REC_INCL_r. If
4 ADD_PILOT_REC_INCL_r equals '1', for each pilot, the mobile station shall also
5 perform the following:
- 6 – Set the NGHBR_PILOT_REC_TYPE field of NGHBR_PILOT_REC to
7 NGHBR_PILOT_REC_TYPE_r.
 - 8 – If NGHBR_PILOT_REC_TYPE_r is equal to '000'. The mobile station shall set
9 the TD_POWER_LEVEL field of NGHBR_PILOT_REC to TD_POWER_LEVEL_r
10 and set the TD_MODE field of NGHBR_PILOT_REC to TD_MODE_r.
 - 11 – If NGHBR_PILOT_REC_TYPE_r is equal to '001', the mobile station shall:
12 + Set the AUX_PILOT_QOF field of NGHBR_PILOT_REC to QOF_r
13 + Set the AUX_PILOT_WALSH_CODE field of NGHBR_PILOT_REC to
14 AUX_PILOT_WALSH_r with the Walsh Code length specified by
15 WALSH_LENGTH_r
 - 16 – If NGHBR_PILOT_REC_TYPE_r is equal to '010', the mobile station shall:
17 + Set the AUX_PILOT_TD_QOF field of NGHBR_PILOT_REC to QOF_r.
18 + Set the AUX_PILOT_WALSH_CODE field of NGHBR_PILOT_REC to
19 AUX_WALSH_r with the Walsh Code length specified by
20 WALSH_LENGTH_r.
21 + Set the AUX_TD_POWER_LEVEL field of NGHBR_PILOT_REC to
22 AUX_TD_POWER_LEVEL_r.
23 + Set the TD_MODE field of NGHBR_PILOT_REC to TD_MODE_r.
 - 24 – If NGHBR_PILOT_REC_TYPE_r is equal to '011', the mobile station shall:
25 + Set the SR3_PRIMARY_PILOT field of NGHBR_PILOT_REC to
26 SR3_PRIMARY_PILOT_r.
27 + Set the SR3_PILOT_POWER1 field of NGHBR_PILOT_REC to
28 SR3_PILOT_POWER1_r.
29 + Set the SR3_PILOT_POWER2 field of NGHBR_PILOT_REC to
30 SR3_PILOT_POWER2_r.
 - 31 – If NGHBR_PILOT_REC_TYPE_r is equal to '100', the mobile station shall:
32 + Set the SR3_PRIMARY_PILOT field of NGHBR_PILOT_REC to
33 SR3_PRIMARY_PILOT_r.
34 + Set the SR3_PILOT_POWER1 field of NGHBR_PILOT_REC to
35 SR3_PILOT_POWER1_r.
36 + Set the SR3_PILOT_POWER2 field of NGHBR_PILOT_REC to
37 SR3_PILOT_POWER2_r.
38 + Set the AUX_PILOT_QOF field of NGHBR_PILOT_REC to QOF_r.

- 1 + Set the AUX_PILOT_WALSH_CODE field of NGHBR_PILOT_REC to
2 AUX_PILOT_WALSH_r with the Walsh Code length specified by
3 WALSH_LENGTH_r.
- 4 + If ADD_INFO_INCL1_r is equal to '1', set the AUX_PILOT_QOF1 field of
5 NGHBR_PILOT_REC to QOF1_r and set the AUX_PILOT_WALSH_CODE1
6 field of NGHBR_PILOT_REC to AUX_PILOT_WALSH1_r with the Walsh
7 Code length specified by WALSH_LENGTH1_r; otherwise, set the
8 AUX_PILOT_QOF1 field of NGHBR_PILOT_REC to QOF_r and set the
9 AUX_PILOT_WALSH_CODE1 field of NGHBR_PILOT_REC to
10 AUX_PILOT_WALSH_r with the Walsh Code length specified by
11 WALSH_LENGTH_r.
- 12 + If ADD_INFO_INCL2_r is equal to '1', set the AUX_PILOT_QOF2 field of
13 NGHBR_PILOT_REC to QOF2_r and set the AUX_PILOT_WALSH_CODE2
14 field of NGHBR_PILOT_REC to AUX_PILOT_WALSH2_r with the Walsh
15 Code length specified by WALSH_LENGTH2_r; otherwise, set the
16 AUX_PILOT_QOF2 field of NGHBR_PILOT_REC to QOF_r and set the
17 AUX_PILOT_WALSH_CODE2 field of NGHBR_PILOT_REC to
18 AUX_PILOT_WALSH_r with the Walsh Code length specified by
19 WALSH_LENGTH_r.

20 8. *Supplemental Channel Assignment Message*: The mobile station shall process this
21 message as follows:

22 The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set
23 to the specified value if any of the following conditions is true, and shall not perform
24 any other action described in this section for processing the *Supplemental Channel*
25 *Assignment Message*:

- 26 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
27 set to '00000110' (capability not supported), if the number of forward or reverse
28 Supplemental Code Channels specified in the *Supplemental Channel Assignment*
29 *Message* is greater than the maximum number of Supplemental Code Channels
30 supported by the mobile station.
- 31 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
32 set to '00000011' (message structure not acceptable), if both
33 USE_REV_HDM_SEQ and EXPL_REV_START_TIME or both
34 USE_FOR_HDM_SEQ and EXPL_FOR_START_TIME specified in the
35 *Supplemental Channel Assignment Message* are set to '1'.
- 36 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
37 set to '00000100' (message field not in valid range), if PILOT_PN specified in the
38 *Supplemental Channel Assignment Message* is not in the Active Set and this
39 message is not linked with a *General Handoff Direction Message*.

40 If none of the above conditions is true, the mobile station shall perform the
41 following.

- 1 • The mobile station shall store the following parameters from the *Supplemental*
2 *Channel Assignment Message*:
- 3 – Use *General Handoff Direction Message* forward sequence number indicator
4 (USE_FOR_HDM_SEQ_s = USE_FOR_HDM_SEQ_r)
- 5 – If USE_FOR_HDM_SEQ_r is equal to ‘1’, then the mobile station shall store
6 the following:
- 7 + The sequence number of the *General Handoff Direction Message* to which
8 this message is linked for the Forward Supplemental Code Channel
9 assignment (FOR_LINKED_HDM_SEQ_s = FOR_LINKED_HDM_SEQ_r)
- 10 + The forward Supplemental Code Channel assignment order
11 (SCAM_FOR_ORDER_s = least significant bit of FOR_SUP_CONFIG_r)
- 12 + The forward duration assignment indicator
13 (SCAM_FOR_DURATION_MODE_s = USE_FOR_DURATION_r).
- 14 – Use *General Handoff Direction Message* reverse sequence number indicator
15 (USE_REV_HDM_SEQ_s = USE_REV_HDM_SEQ_r)
- 16 – If USE_REV_HDM_SEQ_r is equal to ‘1’, then the mobile station shall store
17 the following:
- 18 + The sequence number of the *General Handoff Direction Message* to which
19 this message is linked for the Reverse Supplemental Code Channel
20 assignment (REV_LINKED_HDM_SEQ_s = REV_LINKED_HDM_SEQ_r)
- 21 + The reverse duration assignment indicator
22 (SCAM_REV_DURATION_MODE_s = USE_REV_DURATION_r).
- 23 • If USE_RETRY_DELAY_r is ‘0’, then the mobile station shall store 0 as
24 RETRY_DELAY_s. The mobile station may send subsequent *Supplemental*
25 *Channel Request Messages* whenever RETRY_DELAY_s is set to 0.
- 26 • If USE_RETRY_DELAY_r is set to ‘1’, the mobile station shall interpret the
27 *Supplemental Channel Assignment Message* as an indication that the base
28 station has specified a *Supplemental Channel Request Message* retry delay in
29 RETRY_DELAY_r as follows:
- 30 – The mobile station shall store the next system time 80 ms boundary +
31 RETRY_DELAY_r × 320 ms as RETRY_DELAY_s. The mobile station shall not
32 send any subsequent *Supplemental Channel Request Message* until after the
33 system time stored in RETRY_DELAY_s. At the system time stored in
34 RETRY_DELAY_s, the mobile station shall reset RETRY_DELAY_s to 0.
- 35 – If RETRY_DELAY_r is ‘00000000’, then the mobile station shall store 0 as
36 RETRY_DELAY_s. The mobile station may send subsequent *Supplemental*
37 *Channel Request Messages* whenever RETRY_DELAY_s is set to 0.

- 1 – If $RETRY_DELAY_r$ is '11111111', then the mobile station shall store *infinity*
2 as $RETRY_DELAY_s$, and the mobile station shall not send any further
3 *Supplemental Channel Request Messages* until the mobile station receives a
4 new *Supplemental Channel Assignment Message* with no retry delay or a non-
5 infinite retry delay specified, or until the mobile station receives a *General*
6 *Handoff Direction Message* with a $CLEAR_RETRY_DELAY$ indication set.
- 7 • If $REV_INCLUDED_r$ is equal to '1', then the mobile station shall process Reverse
8 Supplemental Code Channel assignment information for the *Supplemental*
9 *Channel Assignment Message*. This information shall be processed as follows:
- 10 – The mobile station shall store $USE_T_ADD_ABORT_r$, the Reverse
11 Supplemental Code Channel assignment T_ADD abort indicator, as
12 $USE_T_ADD_ABORT_s$.
- 13 – The mobile station shall store $REV_DTX_DURATION_r$, Reverse Supplemental
14 Channel Discontinuous Transmission Duration, as $REV_DTX_DURATION_s$.
- 15 – If $REV_PARMS_INCLUDED_r$ is equal to '1', the mobile station shall store the
16 following:
17 + $T_MULCHAN_s = T_MULCHAN_r$
18 + $BEGIN_PREAMBLE_s = BEGIN_PREAMBLE_r$
19 + $RESUME_PREAMBLE_s = RESUME_PREAMBLE_r$
- 20 – If $IGNORE_SCAM_s$ is equal to '1' and $SCRM_SEQ_NUM_r$ is not present or is
21 present and is not equal to $SCRM_SEQ_NUM_s$, then the mobile station shall
22 not process the remaining Reverse Supplemental Code Channel assignment
23 information in this message.
- 24 – If $IGNORE_SCAM_s$ is equal to '1' and $SCRM_SEQ_NUM_r$ is present and is
25 equal to $SCRM_SEQ_NUM_s$, then the mobile station shall set
26 $IGNORE_SCAM_s$ to '0'.
- 27 – The mobile station shall set $REV_START_TIME_s$ as follows:
28 + If $EXPL_REV_START_TIME_r$ is equal to '1', the mobile station shall set
29 the $REV_START_TIME_s$ to $REV_START_TIME_r$.
- 30 + If $USE_REV_HDM_SEQ_r$ is equal to '1' and $REV_LINKED_HDM_SEQ_r$ is
31 not equal to HDM_SEQ_s , the mobile station shall set the
32 $REV_START_TIME_s$ to NULL.
- 33 + If $USE_REV_HDM_SEQ_r$ is equal to '1' and $REV_LINKED_HDM_SEQ_r$ is
34 equal to HDM_SEQ_s , then the mobile station shall set the
35 $REV_START_TIME_s$ to the action time of the *General Handoff Direction*
36 *Message* that is linked to the *Supplemental Channel Assignment Message*.
- 37 + If $EXPL_REV_START_TIME_r$ is equal to '0' and $USE_REV_HDM_SEQ_r$ is
38 equal to '0', the mobile station shall set the $REV_START_TIME_s$ to the
39 next 80 ms boundary following the action time of the *Supplemental*
40 *Channel Assignment Message*.

- 1 – The mobile station shall set NUM_REV_CODES_S to NUM_REV_CODES_R. If
2 REV_START_TIME_S is not equal to NULL, the mobile station shall perform the
3 following actions:
- 4 + If NUM_REV_CODES_R is equal to '000', the mobile station shall stop
5 transmitting the Reverse Supplemental Code Channels at the start time
6 specified by REV_START_TIME_S.
- 7 + If NUM_REV_CODES_R is not equal to '000', the mobile station shall set
8 PILOT_GATING_USE_RATE to '0' at the action time of the message and
9 the mobile station may start transmitting on NUM_REV_CODES_S Reverse
10 Supplemental Code Channels at the start time specified by
11 REV_START_TIME_S for a duration of time specified by the following rules:
- 12 o If USE_REV_DURATION_R is equal to '1', the mobile station shall set
13 REV_DURATION_S to REV_DURATION_R. The mobile station may
14 continue transmitting on the Reverse Supplemental Code Channels
15 for a period of (REV_DURATION_S × 80) ms, or until it receives the
16 action time of a subsequent *General Handoff Direction Message* or a
17 *Supplemental Channel Assignment Message* that specifies a different
18 Reverse Supplemental assignment duration or start time.
- 19 o If USE_REV_DURATION_R is equal to '0', the mobile station may
20 continue to transmit indefinitely on the Reverse Supplemental Code
21 Channels, or until it receives the action time of a subsequent *General*
22 *Handoff Direction Message* or a *Supplemental Channel Assignment*
23 *Message* that specifies a different Reverse Supplemental assignment
24 duration or start time.
- 25 • If FOR_INCLUDED is equal to '1', then the mobile station shall process Forward
26 Supplemental Code Channel assignment information as follows:
- 27 – The mobile station shall assign a value to FOR_START_TIME_S according to
28 the following rules:
- 29 + If EXPL_FOR_START_TIME is equal to '1', the mobile station shall set the
30 FOR_START_TIME_S to FOR_START_TIME_R.
- 31 + If USE_FOR_HDM_SEQ_R is equal to '1' and FOR_LINKED_HDM_SEQ_R is
32 not equal to HDM_SEQ_S, the mobile station shall set the
33 FOR_START_TIME_S to NULL.
- 34 + If USE_FOR_HDM_SEQ_R is equal to '1' and FOR_LINKED_HDM_SEQ_R is
35 equal to HDM_SEQ_S, then the mobile station shall set the
36 FOR_START_TIME_S to the action time of the *General Handoff Direction*
37 *Message* that is linked to the *Supplemental Channel Assignment Message*.
- 38 + If EXPL_FOR_START_TIME_R is equal to '0' and USE_FOR_HDM_SEQ_R
39 equals '0', the mobile station shall set the FOR_START_TIME_S to the
40 action time of the *Supplemental Channel Assignment Message*.

- 1 – If FOR_SUP_CONFIG_r is equal to ‘00’ and FOR_START_TIME_s is not equal to
2 NULL, the mobile station should stop processing the Forward Supplemental
3 Code Channels at the time specified by FOR_START_TIME_s.
- 4 – If FOR_SUP_CONFIG_r is equal to ‘01’ and FOR_START_TIME_s is not equal to
5 NULL, the mobile station shall set PILOT_GATING_USE_RATE to ‘0’ at the
6 action time of the message and start processing the Forward Supplemental
7 Code Channels in the CODE_CHAN_LIST_s at FOR_START_TIME_s for a period
8 of time specified by the following rules:
- 9 + If USE_FOR_DURATION is equal to ‘1’, the mobile station shall set
10 FOR_DURATION_s to FOR_DURATION_r. The mobile station shall
11 continue processing the Forward Supplemental Code Channels for a
12 period of (FOR_DURATION_s × 80) ms, or until it receives the action time
13 of a subsequent *Supplemental Channel Assignment Message* or a *General*
14 *Handoff Direction Message* that specifies a different Forward
15 Supplemental assignment duration or start time.
- 16 + If USE_FOR_DURATION_r is equal to ‘0’, the mobile station shall continue
17 processing the Forward Supplemental Code Channels until it receives
18 the action time of a subsequent *Supplemental Channel Assignment*
19 *Message* or a *General Handoff Direction Message* that specifies a different
20 Forward Supplemental assignment duration or start time.
- 21 – If FOR_SUP_CONFIG_r is equal to ‘10’, the mobile station shall perform the
22 following:
23 + The mobile station shall update the CODE_CHAN_LIST_s as specified in
24 2.6.8.
25 + If FOR_START_TIME_s is not equal to NULL the mobile station should
26 stop processing Forward Supplemental Code Channels at the time
27 specified by FOR_START_TIME_s.
- 28 – If FOR_SUP_CONFIG_r is equal to ‘11’, the mobile station shall perform the
29 following:
30 + The mobile station shall update the CODE_CHAN_LIST_s as specified in
31 2.6.8.
32 + If FOR_START_TIME_s is not equal to NULL, then the mobile station shall
33 set PILOT_GATING_USE_RATE to ‘0’ at the action time of the message
34 and start processing the Forward Supplemental Code Channels in the
35 CODE_CHAN_LIST_s at the time specified by FOR_START_TIME_s for a
36 period of time specified by the following rules:

- 1 o If USE_FOR_DURATION_r is equal to '1', the mobile station shall set
2 FOR_DURATION_s to FOR_DURATION_r. The mobile station shall
3 continue processing the Forward Supplemental Code Channels for
4 (FOR_DURATION_s × 80) ms, until it receives a subsequent
5 *Supplemental Channel Assignment Message* or a *General Handoff*
6 *Direction Message* that specifies a different Forward Supplemental
7 assignment duration or start time.
- 8 o If USE_FOR_DURATION_r is equal to '0', the mobile station shall
9 continue processing the Forward Supplemental Code Channels until
10 it receives a subsequent *Supplemental Channel Assignment Message*
11 or a *General Handoff Direction Message* that specifies a different
12 Forward Supplemental assignment duration or start time.

13 9. *General Handoff Direction Message*: The mobile station shall process the message
14 as follows:

15 In addition to the requirements in this section, if the SCR_INCLUDED field is
16 included in this message and is set to '1' the mobile station shall also process this
17 message in accordance with the requirements for the active service subfunction (see
18 2.6.4.1.2.2).

19 The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set
20 to the specified value if any of the following conditions is true, and shall not perform
21 any other action described in this section for processing the *General Handoff*
22 *Direction Message*:

- 23 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
24 set to '00000110' (capability not supported), if the mobile station does not
25 support the band class specified in the *General Handoff Direction Message*.
- 26 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
27 set to '00000110' (capability not supported), if the number of forward or reverse
28 Supplemental Code Channels specified in the *General Handoff Direction Message*
29 is greater than the maximum number of Supplemental Code Channels
30 supported by the mobile station.
- 31 • If the SCR_INCLUDED field is included in this message and is set to '1', the
32 mobile station shall perform the following:
 - 33 - The mobile station shall send a *Mobile Station Reject Order* with the ORDQ
34 field set to '00000111' (message cannot be handled by the current mobile
35 station configuration), if the mobile station does not support the service
36 configuration specified in the *General Handoff Direction Message*.
 - 37 - The mobile station shall send a *Mobile Station Reject Order* (ORDQ =
38 '00000111') within T_{56m} seconds, if the mobile station supports the service
39 configuration specified but does not accept the service configuration
40 specified in the *General Handoff Direction Message*.

- 1 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
2 set to '00000111' (message cannot be handled by the current mobile station
3 configuration), if the NNSCR_INCLUDED field is included and set to '1' and the
4 SCR_INCLUDED field is either not included or included but set to '0', and the
5 mobile station does not support the configuration specified in the non-
6 negotiable service configuration information record in the *General Handoff*
7 *Direction Message*.
- 8 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
9 set to '00001010' (search set not specified), if the PERIODIC_SEARCH field is
10 included in the *General Handoff Direction Message* and is set to '1', and the
11 Candidate Frequency Search Set is empty.
- 12 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
13 set to '00001101' (search period too short), if the PERIODIC_SEARCH field is
14 included in the *General Handoff Direction Message* and is set to '1', and
15 *search_period* is less than $(\max(fwd_time, rev_time) + T_{71m} \text{ seconds})$, where
16 *search_period* = time period corresponding to SEARCH_PERIOD_s shown in
17 Table 2.6.6.2.8.3.2-1,

18 *fwd_time* = the mobile station's estimate of the total length of time, in seconds,
19 for which the mobile station will need to suspend its current
20 Forward Traffic Channel processing in order to tune to the CDMA
21 Candidate Frequency, to search the Candidate Frequency Search
22 Set, and to re-tune to the Serving Frequency; if the mobile station
23 searches the Candidate Frequency Search Set in multiple visits,
24 *fwd_time* is the total time for all visits to the CDMA Candidate
25 Frequency in a search period (see 2.6.6.2.8.3.2),

26 and

27 *rev_time* = the mobile station's estimate of the total length of time, in seconds,
28 for which the mobile station will need to suspend its current Reverse
29 Traffic Channel processing in order to tune to the CDMA Candidate
30 Frequency, to search the Candidate Frequency Search Set, and to
31 re-tune to the Serving Frequency; if the mobile station searches the
32 Candidate Frequency Search Set in multiple visits, *rev_time* is the
33 total time for all visits to the CDMA Candidate Frequency in a
34 search period.

35 If none of the above conditions is true, the mobile station shall perform the actions
36 described in the remainder of this section to process the *General Handoff Direction*
37 *Message* at the action time of the message.

38 If EXTRA_PARMS is equal to '1', the mobile station shall store the return on failure
39 indicator from the *General Handoff Direction Message* (RETURN_IF_HANDOFF_FAIL_s
40 = RETURN_IF_HANDOFF_FAIL_r); otherwise the mobile station shall set
41 RETURN_IF_HANDOFF_FAIL_s to '0'.

1 The mobile station shall set RETURN_IF_HANDOFF_FAIL_S to '0' (disable return on
2 failure) if any of the following conditions is true:

- 3 • If P_REV_IN_USE_S is less than or equal to four and the mobile station does not
4 support hard handoff with return on failure, or
- 5 • At least one of the pilots specified by the message is also included in the Active
6 Set prior to the action time of the message, and one of the following conditions is
7 true:
 - 8 – EXTRA_PARMS is equal to '0', or
 - 9 – EXTRA_PARMS is equal to '1', the message specifies the same Frequency
10 Assignment as the Serving Frequency (BAND_CLASS_r is equal to
11 CDMABAND_S and CDMA_FREQ_r is equal to CDMACH_S), and
12 FRAME_OFFSET_r is equal to FRAME_OFFSET_S.

13 The mobile station shall store the following parameters from its current
14 configuration:

- 15 • CDMA band class (SF_CDMABAND_S = CDMABAND_S)
- 16 • Frequency assignment (SF_CDMACH_S = CDMACH_S)
- 17 • Frame Offset (SF_FRAME_OFFSET_S = FRAME_OFFSET_S)

18 If RETURN_IF_HANDOFF_FAIL_S is equal to '1', the mobile station shall also store
19 the following parameters from its current configuration:

- 20 • Protocol revision level
21 (SF_P_REV_S = P_REV_S)
- 22 • Protocol revision level in use on the Serving Frequency
23 (SF_P_REV_IN_USE_S = P_REV_IN_USE_S)
- 24 • Search window size for the Active Set and Candidate Set
25 (SF_SRCH_WIN_A_S = SRCH_WIN_A_S)
- 26 • Search window size for the Neighbor Set
27 (SF_SRCH_WIN_N_S = SRCH_WIN_N_S)
- 28 • Search window size for the Remainder Set
29 (SF_SRCH_WIN_R_S = SRCH_WIN_R_S)
- 30 • Pilot detection threshold
31 (SF_T_ADD_S = T_ADD_S)
- 32 • Pilot drop threshold
33 (SF_T_DROP_S = T_DROP_S)
- 34 • Active Set versus Candidate Set comparison threshold
35 (SF_T_COMP_S = T_COMP_S)
- 36 • Drop timer value
37 (SF_T_TDROPS = T_TDROPS)
- 38 • Drop timer range value (SF_T_TDROPS_RANGE_S = T_TDROPS_RANGE_S)

- 1 • Soft slope for the dynamic add and drop thresholds
2 (SF_SOFT_SLOPE_s = SOFT_SLOPE_s)
- 3 • Intercept for the dynamic add threshold
4 (SF_ADD_INTERCEPT_s = ADD_INTERCEPT_s)
- 5 • Intercept for the dynamic drop threshold
6 (SF_DROP_INTERCEPT_s = DROP_INTERCEPT_s)
- 7 • Private long code mask indicator: If the mobile station is using the private long
8 code mask on the Serving Frequency, it shall set SF_PRIVATE_LCM_s to '1';
9 otherwise, it shall set SF_PRIVATE_LCM_s to '0'.
- 10 • Private long code mask: If the mobile station is using the private long code mask
11 on the Serving Frequency, it shall set SF_PVTLCM_42_s to the PVTLCM_42.
- 12 • Public long code mask type: The mobile station shall set SF_PLCM_TYPE_s to
13 PLCM_TYPE_s. If PLCM_TYPE_s equals '0001', the mobile station shall set
14 SF_PLCM_39_s to PLCM_39_s.
- 15 • Service negotiation type
16 (SF_SERV_NEG_s = SERV_NEG_s)
- 17 • Service configuration:
18 Store the current service configuration (service configuration record and non-
19 negotiable service configuration record) in SF_SERVICE_CONFIG_s
- 20 • Call Information:
21 Store the list of current calls (Call Control instances, etc.) in SF_CALLS_s
- 22 • Message encryption mode: If message encryption is on, the mobile station shall
23 set SF_ENCRYPT_MODE_s to '1'; otherwise, the mobile station shall set
24 SF_ENCRYPT_MODE_s to '0'.
- 25 • Extended nominal power setting of the current cell
26 (SF_NOM_PWR_EXT_s = NOM_PWR_EXT_s)
- 27 • Nominal power setting of the current cell
28 (SF_NOM_PWR_s = NOM_PWR_s)
- 29 • Power control step
30 (SF_PWR_CNTL_STEP_s = PWR_CNTL_STEP_s)
- 31 • Serving Frequency Active Set (SF Active Set = (For each pilot in the current
32 Active Set: (PILOT_PN, PWR_COMB_IND)))
- 33 • Serving Frequency Code Channel List
34 (SF_CODE_CHAN_LIST_s = CODE_CHAN_LIST_s)

35 When the message takes effect, the mobile station shall perform the following actions:

- 36 • The mobile station shall send a *Handoff Completion Message* or an *Extended*
37 *Handoff Completion Message* as specified in 2.6.6.2.5.2. If the RC assigned on the
38 reverse fundamental channel or supplemental channel is less than RC08 the mobile
39 station shall set RC_BITMAP_CAPABILITY_EXT_ALLOWED_s to '0'.

- 1 • Update the Active Set, Candidate Set, and Neighbor Set in accordance with the
2 *General Handoff Direction Message* processing (see 2.6.6.2.6.1, 2.6.6.2.6.2, and
3 2.6.6.2.6.3).
- 4 • The mobile station shall delete all pilots that are not listed in the Active Set from
5 the Active Set of the Supplemental Channel for the Forward Supplemental
6 Channel Assignment (if any). If these deleted pilots include all pilots in the
7 Active Set of the Supplemental Channel, the mobile station shall cancel the
8 Forward Supplemental Channel Assignment.
- 9 • Discontinue use of all Forward Traffic Channels associated with pilots not listed
10 in the *General Handoff Direction Message*.
- 11 • If EXTRA_PARMS is equal to '1', perform the following actions:
- 12 – If FRAME_OFFSET_r is not equal to FRAME_OFFSET_s, change the frame
13 offset on all of the code channels of the Forward Traffic Channel and of the
14 Reverse Traffic Channel.
- 15 – If RESET_L2_r is equal to '1', and RETURN_IF_HANDOFF_FAIL_s is equal to
16 '0', Layer 3 shall send a L2-Supervision.Request primitive to Layer 2 to reset
17 the acknowledgment procedures, as specified in [4]. The mobile station shall
18 reset the acknowledgment procedures immediately after the action time of
19 the *General Handoff Direction Message*.
- 20 – If RESET_FPC_r is equal to '1' and RETURN_IF_HANDOFF_FAIL_s is equal to
21 '0', initialize the Forward Traffic Channel power control counters, as
22 specified in 2.6.4.1.1.1.
- 23 – If SERV_NEG_TYPE_r is equal to '1', set SERV_NEG_s to enabled; otherwise set
24 SERV_NEG_s to disabled.
- 25 – Use the long code mask as follows:
- 26 + If PRIVATE_LCM_r equals '1', the mobile station shall use the Private Long
27 Code Mask as specified in 2.3.6.
- 28 + If PRIVATE_LCM_r equals '0', the mobile station shall use the Public Long
29 Code Mask derived from PLCM_TYPE_s as specified in 2.3.6
- 30 + The mobile station shall indicate to the user the voice privacy mode
31 status.
- 32 – Process the ENCRYPT_MODE field, as specified in 2.3.12.2.
- 33 – Perform the procedures as specified in 2.6.11.3.
- 34 • If EXTRA_PARMS is equal to '0', set the following variables to the values
35 indicated:
- 36 – Hard handoff traffic channel preamble count required before transmitting a
37 *Handoff Completion Message* or an *Extended Handoff Completion Message*
38 (NUM_PREAMBLE_s = '000')
- 39 – Complete search flag (COMPLETE_SEARCH_s = '1')

- 1 – CDMA band class for the Target Frequency
2 (TF_CDMABAND_S = SF_CDMABAND_S)
- 3 – Frequency assignment for the Target Frequency
4 (TF_CDMACH_S = SF_CDMACH_S)
- 5 • Store the following parameters from the *General Handoff Direction Message*:
- 6 – *General Handoff Direction Message* sequence number
7 (HDM_SEQ_S = HDM_SEQ_T)
- 8 – Forward power control subchannel relative gain (FPC_SUBCHAN_GAIN_S =
9 FPC_SUBCHAN_GAIN_T).
- 10 – If the mobile station uses FPC_SUBCHAN_GAIN_S, the mobile station shall
11 perform the following:
- 12 + If PC_ACTION_TIME_T is received, the mobile station shall apply its usage
13 of the FPC_SUBCHAN_GAIN_S at the time specified by PC_ACTION_TIME_T.
- 14 + If PC_ACTION_TIME is not received and the explicit action time is
15 received, the mobile station shall apply its usage of the
16 FPC_SUBCHAN_GAIN_S at the action time.
- 17 + If neither PC_ACTION_TIME_T nor explicit action time is received, the
18 mobile station shall apply its usage of the FPC_SUBCHAN_GAIN_S at the
19 first 80ms boundary occurring at least 80ms after the end of the frame
20 containing the last bit of the *General Handoff Direction Message* sent to
21 the mobile station.
- 22 – Reverse Eighth Gating Mode (REV_FCH_GATING_MODE_S =
23 REV_FCH_GATING_MODE_T).
- 24 – Reverse Power Control Delay if REV_PWR_CNTL_DELAY_INCL_T is equal to '1'
25 (REV_PWR_CNTL_DELAY_S = REV_PWR_CNTL_DELAY_T).
- 26 – Concurrent services supported indicator (CS_SUPPORTED_S =
27 CS_SUPPORTED_T).
- 28 – Forward Packet Data Channel supported indicator
29 (FOR_PDCH_SUPPORTED_S = FOR_PDCH_SUPPORTED_T).
- 30 – Pilot information request supported indicator
31 (PILOT_INFO_REQ_SUPPORTED_S = PILOT_INFO_REQ_SUPPORTED_T).
- 32 – If SEARCH_INCLUDED is equal to '1', store the following:
- 33 + Search window size for the Active Set and Candidate Set
34 (SRCH_WIN_A_S = SRCH_WIN_A_T)
- 35 + Pilot detection threshold
36 (T_ADD_S = T_ADD_T)
- 37 + Pilot drop threshold
38 (T_DROP_S = T_DROP_T)

- 1 + Active Set versus Candidate Set comparison threshold
2 (T_COMP_S = T_COMP_T)
- 3 + Drop timer value
4 (T_TDROP_S = T_TDROP_T)
- 5 + Drop timer range value (T_TDROP_RANGE_S = T_TDROP_RANGE_T) if
6 T_TDROP_RANGE_INCL_T is equal to '1'; otherwise, (T_TDROP_RANGE_S =
7 '0000')
- 8 + Soft slope for the dynamic add and drop thresholds
9 (SOFT_SLOPE_S = SOFT_SLOPE_T)
- 10 + Intercept for the dynamic add threshold
11 (ADD_INTERCEPT_S = ADD_INTERCEPT_T)
- 12 + Intercept for the dynamic drop threshold
13 (DROP_INTERCEPT_S = DROP_INTERCEPT_T)
- 14 – If EXTRA_PARMS is equal to '1', store the following:
- 15 + Protocol revision level (P_REV_S = P_REV_T), and protocol revision level
16 currently in use (P_REV_IN_USE_S = min (P_REV_S, MOB_P_REV_P of the
17 current band class))
- 18 + If the mobile station supports packet data service options, the packet
19 data services zone identifier (PACKET_ZONE_ID_S = PACKET_ZONE_ID_T)
- 20 + Frame offset (FRAME_OFFSET_S = FRAME_OFFSET_T)
- 21 + Acknowledgment procedures reset indicator
22 (If RETURN_IF_HANDOFF_FAIL_S is equal to '1', set TF_RESET_L2_S to
23 RESET_L2_T)
- 24 + Indicator to initialize the Forward Traffic Channel power control counters
25 (If RETURN_IF_HANDOFF_FAIL_S is equal to '1', set TF_RESET_FPC_S to
26 RESET_FPC_T)
- 27 + Nominal power setting of the target cell (NOM_PWR_S = NOM_PWR_T)
- 28 + Extended nominal power setting of the target cell (If CDMABAND_S =
29 '00000' or CDMABAND_S = '00011', then NOM_PWR_EXT_S = '0';
30 otherwise, NOM_PWR_EXT_S = NOM_PWR_EXT_T)
- 31 + Hard handoff traffic channel preamble count required before
32 transmitting a *Handoff Completion Message* or an *Extended Handoff*
33 *Completion Message* (NUM_PREAMBLE_S = NUM_PREAMBLE_T)
- 34 + CDMA band class for the Target Frequency
35 (TF_CDMABAND_S = BAND_CLASS_T and CDMABAND_S = BAND_CLASS_T)
- 36 + Frequency assignment for the Target Frequency
37 (TF_CDMACH_S = CDMA_FREQ_T and CDMACH_S = CDMA_FREQ_T)
- 38 + Complete search flag (COMPLETE_SEARCH_S = COMPLETE_SEARCH_T)

- 1 + Periodic search flag ($PERIODIC_SEARCH_S = PERIODIC_SEARCH_T$)
- 2 + Nominal code channel output power offset relative to the Reverse Pilot
- 3 Channel power ($RLGAIN_TRAFFIC_PILOT_S = RLGAIN_TRAFFIC_PILOT_T$)
- 4 – If $EXTRA_PARMS$ is equal to '1' and $DEFAULT_RLAG$ is equal to '1', the
- 5 mobile station shall set each entry of the Reverse Link Attribute Adjustment
- 6 Gain Table and Reverse Channel Adjustment Gain Table (see [2]) to 0.
- 7 – If $REV_PARMS_INCLUDED$ is included and is equal to '1', the mobile station
- 8 shall store the following:
- 9 + Neighbor pilot strength measurement threshold offset ($T_MULCHAN_S =$
- 10 $T_MULCHAN_T$)
- 11 + Reverse Supplemental Code Channel beginning of transmission
- 12 preamble length ($BEGIN_PREAMBLE_S = BEGIN_PREAMBLE_T$)
- 13 + Reverse Supplemental Code Channel resumption of transmission
- 14 preamble length ($RESUME_PREAMBLE_S = RESUME_PREAMBLE_T$)
- 15 – For each pilot included in the message, the mobile station shall store the
- 16 following:
- 17 + $PILOT_PN$, the pilot PN sequence offset index
- 18 + PWR_COMB_IND , the power control symbol combining indicator
- 19 – If $USE_PWR_CNTL_STEP$ is equal to '1' and $PWR_CNTL_STEP_T$ corresponds
- 20 to a power control step size supported by the mobile station (see [2]), then
- 21 the mobile station shall set $PWR_CNTL_STEP_S$ to $PWR_CNTL_STEP_T$.
- 22 • Set the pilot detection threshold for the Target Frequency and the Candidate
- 23 Frequency:
- 24 – Set $TF_T_ADD_S$ to T_ADD_S .
- 25 – If the Target Frequency is the same as the Candidate Frequency
- 26 ($TF_CDMABAND_S$ is equal to $CF_CDMABAND_S$ and TF_CDMACH_S is equal to
- 27 CF_CDMACH_S), set $CF_T_ADD_S$ to T_ADD_S .
- 28 • If $FOR_INCLUDED$ is included and is equal to '0', the mobile station shall
- 29 perform the following:
- 30 – The mobile station shall update the Code Channel List, $CODE_CHAN_LIST_S$,
- 31 as specified in 2.6.8.
- 32 – If $USE_FOR_HDM_SEQ_S$ is equal to '1' and $FOR_LINKED_HDM_SEQ_S$ is
- 33 equal to HDM_SEQ_T (this indicates that there is pending Forward
- 34 Supplemental Code Channel assignment information, received in a
- 35 *Supplemental Channel Assignment Message*, linked to this *General Handoff*
- 36 *Direction Message*), then the mobile station shall perform the following
- 37 actions:
- 38 + The mobile station shall set $USE_FOR_HDM_SEQ_S$ to '0'.

- 1 + If SCAM_FOR_ORDER_S is equal to '0', the mobile station shall stop
2 processing all Forward Supplemental Code Channels at the action time
3 of the *General Handoff Direction Message*.
- 4 + If SCAM_FOR_ORDER_S is equal to '1', the mobile station shall start
5 processing the Forward Supplemental Code Channels specified in
6 CODE_CHAN_LIST_S at the action time of the *General Handoff Direction*
7 *Message*, for a period of time determined by the following rules:
- 8 o If SCAM_FOR_DURATION_MODE_S is equal to '1', the mobile station
9 shall continue processing the Forward Supplemental Code Channels
10 for a period of (FOR_DURATION_S × 80) ms, until it receives a
11 subsequent *General Handoff Direction Message* or a *Supplemental*
12 *Channel Assignment Message* that specifies a different Forward
13 Supplemental Code Channel assignment.
- 14 o If SCAM_FOR_DURATION_MODE_S is equal to '0', the mobile station
15 shall continue processing the Forward Supplemental Code Channels
16 until it receives a subsequent *Supplemental Channel Assignment*
17 *Message* or a *General Handoff Direction Message* that specifies a
18 different Forward Supplemental Code Channel assignment.
- 19 – If USE_FOR_HDM_SEQ_S is equal to '0' or FOR_LINKED_HDM_SEQ_S is not
20 equal to HDM_SEQ_R, and if the mobile station is currently processing
21 Forward Supplemental Code Channels, it shall continue processing the
22 Forward Supplemental Code Channels using the updated Code Channel
23 List, CODE_CHAN_LIST_S.
- 24 • If NNSCR_INCLUDED field is included and set to '1' and SCR_INCLUDED field is
25 either not included or included but set to '0', the mobile station shall process
26 the received Non-negotiable Service Configuration Record as specified in
27 2.6.4.1.13 at the action time of this message. If SYNC_ID_INCL_R is set to '1', the
28 mobile station shall perform the following:
- 29 – The mobile station shall store the synchronization identifier received from
30 the base station (SYNC_ID_S = SYNC_ID_R).
- 31 – The mobile station shall store the current service configuration as specified
32 in 2.6.4.1.2.2.5.1 at the action time of this message.
- 33 Otherwise, the mobile station shall set SYNC_ID_S to NULL.
- 34 • If FOR_INCLUDED is included and is equal to '1', then the mobile station shall
35 process the Forward Supplemental Code Channel assignment information as
36 follows:
- 37 – The mobile station shall set USE_FOR_HDM_SEQ_S to '0'.
- 38 – If FOR_START_TIME_S specifies a time which is after the action time of the
39 *General Handoff Direction Message*, the mobile station shall cancel any
40 pending Forward Supplemental Code Channel assignment and shall set
41 FOR_START_TIME_S to NULL.

- 1 – The mobile station shall update the Code Channel List,
2 CODE_CHAN_LIST_s, in accordance with the value of FOR_SUP_CONFIG, as
3 specified in 2.6.8.
- 4 – If FOR_SUP_CONFIG is equal to ‘00’ or ‘10’, the mobile station should stop
5 processing Forward Supplemental Code Channels, if any, when the message
6 takes effect.
- 7 – If FOR_SUP_CONFIG is equal to ‘01’ or ‘11’, the mobile station shall set
8 PILOT_GATING_USE_RATE to ‘0’ at the action time of the message and start
9 processing the Forward Supplemental Code Channels in the updated Code
10 Channel List, CODE_CHAN_LIST_s, at the action time of the message, for a
11 period of time determined by the following rules:
- 12 + If USE_FOR_DURATION is equal to ‘1’, the mobile station shall set
13 FOR_DURATION_s to FOR_DURATION_r. The mobile station shall
14 continue processing the Forward Supplemental Code Channels for a
15 period of (FOR_DURATION_s × 80) ms, until it receives a subsequent
16 *Supplemental Channel Assignment Message* or a *General Handoff*
17 *Direction Message* that specifies a different Forward Supplemental Code
18 Channel assignment.
- 19 + If USE_FOR_DURATION is equal to ‘0’, the mobile station shall continue
20 processing the Forward Supplemental Code Channels until it receives a
21 subsequent *Supplemental Channel Assignment Message* or a *General*
22 *Handoff Direction Message* that specifies a different Forward
23 Supplemental Code Channel assignment.
- 24 • If REV_INCLUDED is included and is equal to ‘0’, the mobile station shall
25 perform the following:
- 26 – If USE_REV_HDM_SEQ_s is equal to ‘1’ and REV_LINKED_HDM_SEQ_s is
27 equal to HDM_SEQ_r (this indicates that there is pending Reverse
28 Supplemental Code Channel assignment information, received in a
29 *Supplemental Channel Assignment Message*, linked to this *General Handoff*
30 *Direction Message*), the mobile station shall perform the following actions:
- 31 + If NUM_REV_CODES_s is equal to ‘000’, the mobile station shall stop
32 transmitting on all Reverse Supplemental Code Channels at the action
33 time of the message.
- 34 + If NUM_REV_CODES_s is not equal to ‘000’, the mobile station may start
35 transmitting on NUM_REV_CODES_s Reverse Supplemental Code
36 Channels at the action time of the message, for a duration of time
37 determined by the following rules:

- 1 o If SCAM_REV_DURATION_MODE_S is equal to '1', the mobile station
2 may continue transmitting on the Reverse Supplemental Code
3 Channels for a period of (REV_DURATION_S × 80) ms, until it receives
4 a subsequent *General Handoff Direction Message* or a *Supplemental*
5 *Channel Assignment Message* that specifies a different Reverse
6 Supplemental Code Channel assignment.
- 7 o If SCAM_REV_DURATION_MODE_S is equal to '0', the mobile station
8 may continue transmitting on the Reverse Supplemental Code
9 Channels until it receives a subsequent *General Handoff Direction*
10 *Message* or a *Supplemental Channel Assignment Message* that
11 specifies a different Reverse Supplemental Code Channel
12 assignment.
- 13 + The mobile station shall set USE_REV_HDM_SEQ_S to '0'.
- 14 – If USE_REV_HDM_SEQ_S is equal to '0' or REV_LINKED_HDM_SEQ_S is not
15 equal to HDM_SEQ_R, and if the previous Reverse Supplemental Code
16 Channel assignment is still valid, the mobile station may continue to
17 transmit on the Reverse Supplemental Code Channels according to the
18 previously specified Reverse Supplemental Code Channel assignment.
- 19 • If REV_INCLUDED is included and is equal to '1', then the mobile station shall
20 process the Reverse Supplemental Code Channel assignment information as
21 follows:
- 22 – The mobile station shall set REV_DTX_DURATION_S to
23 REV_DTX_DURATION_R.
- 24 – The mobile station shall set USE_REV_HDM_SEQ_S to '0'.
- 25 – If REV_START_TIME_S specifies a time which is after the action time of the
26 *General Handoff Direction Message*, the mobile station shall cancel any
27 pending Reverse Supplemental Code Channel assignment and shall set
28 REV_START_TIME_S to NULL.
- 29 – If CLEAR_RETRY_DELAY is equal to '1', the mobile station shall cancel any
30 previously indicated retry delay and shall set RETRY_DELAY_S⁶⁹ to 0;
31 otherwise, the mobile station shall continue to honor any previously active
32 retry delay stored in RETRY_DELAY_S.
- 33 – The mobile station shall set NUM_REV_CODES_S to NUM_REV_CODES_R, and
34 shall perform the following actions:

⁶⁹ The CLEAR_RETRY_DELAY field received in *General Handoff Direction Message* does not affect the RETRY_DELAY_S[RETRY_TYPE] values.

- 1 + If NUM_REV_CODES_S is equal to '000', the mobile station shall stop
2 transmitting on all Reverse Supplemental Code Channels at the action
3 time of the message.
- 4 + If NUM_REV_CODES_S is not equal to '000', the mobile station shall set
5 PILOT_GATING_USE_RATE to '0' at the action time of the message and
6 may start transmitting on NUM_REV_CODES_S Reverse Supplemental
7 Code Channels at the action time of the message, for a duration of time
8 determined by the following rules:
- 9 o If USE_REV_DURATION_T is equal to '1', the mobile station shall set
10 REV_DURATION_S to REV_DURATION_T. The mobile station may
11 continue transmitting on the Reverse Supplemental Code Channels
12 for a period of (REV_DURATION_S × 80) ms, until it receives a
13 subsequent *General Handoff Direction Message* or a *Supplemental*
14 *Channel Assignment Message* that specifies a different Reverse
15 Supplemental Code Channel assignment.
- 16 o If USE_REV_DURATION is equal to '0', the mobile station may
17 continue to transmit on the Reverse Supplemental Code Channels
18 until it receives a subsequent *General Handoff Direction Message* or a
19 *Supplemental Channel Assignment Message* that specifies a different
20 Reverse Supplemental Code Channel assignment.
- 21 – The mobile station shall store USE_T_ADD_ABORT_T, the Reverse
22 Supplemental Code Channel assignment T_ADD abort indicator, as
23 USE_T_ADD_ABORT_S.
- 24 • The mobile station shall set IGNORE_SCAM_S and IGNORE_ESCAM_S to '0'.
- 25 • If PERIODIC_SEARCH_S is equal to '0' and a periodic search is in progress, the
26 mobile station shall abort the periodic search (see 2.6.6.2.8.3.4 and
27 2.6.6.2.10.4).
- 28 • Perform a soft or hard handoff depending on the following conditions:
- 29 – If any of the following conditions is true, the mobile station shall perform a
30 hard handoff:
- 31 + EXTRA_PARAMS is set to '1' and either BAND_CLASS_T is not equal to
32 SF_CDMABAND_S, CDMA_FREQ_T is not equal to SF_CDMACH_S, or
33 FRAME_OFFSET_T is not equal to SF_FRAME_OFFSET_S, or
- 34 + The set of pilots specified by the message is disjoint from the Active
35 Set prior to the action time of the message.
- 36 – If the mobile station performs a hard handoff, it shall perform the following:
- 37 + If a Periodic Serving Frequency Pilot Report Procedure is in progress, the
38 mobile station shall abort the procedure (see 2.6.6.2.12).
- 39 + If a Candidate Frequency periodic search is in progress, the mobile station
40 shall abort the periodic search (see 2.6.6.2.8.3.4 and 2.6.6.2.10.4).

- 1 + The mobile station shall cancel the Forward Supplemental Channel
- 2 assignment or the Reverse Supplemental Channel assignment (if any).
- 3 + If RETURN_IF_HANDOFF_FAIL_S is equal to '0', the mobile station shall
- 4 perform actions specified in 2.6.6.2.8.1. If the message specifies more than
- 5 one pilot, the mobile station shall also perform actions specified in
- 6 2.6.6.2.7.1 and 2.6.6.2.7.2.
- 7 + If RETURN_IF_HANDOFF_FAIL_S is equal to '1', the mobile station shall
- 8 perform actions specified in 2.6.6.2.8.2. If the message specifies more than
- 9 one pilot, the mobile station shall also perform actions specified in
- 10 2.6.6.2.7.1 and 2.6.6.2.7.2.
- 11 – Otherwise, the mobile station shall perform a soft handoff as specified in
- 12 2.6.6.2.7.

13 10. *Periodic Pilot Measurement Request Order*: The mobile station shall perform the
14 following:

- 15 • If the PPSMM timer is enabled, disable it.
- 16 • If ORDQ is equal to '1111111', the mobile station shall send a *Periodic Pilot*
- 17 *Strength Measurement Message* to the base station within T_{56m} seconds.
- 18 • If ORDQ is not equal to '1111111', the mobile station shall perform the
- 19 following:
 - 20 – Set the MIN_PILOT_PWR_THRESH_S to MIN_PILOT_PWR_THRESH_T received
 - 21 from the *Periodic Pilot Strength Measurement Request Order*.
 - 22 – Set the MIN_PILOT_EC_IO_THRESH_S to MIN_PILOT_EC_IO_THRESH_T
 - 23 received from the *Periodic Pilot Strength Measurement Request Order*.
 - 24 – Set PPSMM_PERIOD_S equal to the larger value of ORDQ and the total length
 - 25 of time, in units of 80 ms, required by the mobile station to update the pilot
 - 26 strength measurement of each pilot in the Active Set and the Candidate Set.
 - 27 – Perform the Periodic Serving Frequency Pilot Report Procedure as specified
 - 28 in 2.6.6.2.12.
- 29 • If the mobile station sends the *Periodic Pilot Strength Measurement Message* and
- 30 if INCL_SETPT_T is equal to '1', the mobile station shall include outer loop E_b/N_t
- 31 setpoint information corresponding to the physical channel specified by
- 32 FPC_PRI_CHAN_S, and Supplemental Channel outer loop E_b/N_t setpoint
- 33 information if one or more Supplemental Channels are assigned, in the *Periodic*
- 34 *Pilot Strength Measurement Message*.

35 11. *Universal Handoff Direction Message*: The mobile station shall process the message
36 as follows:

37 In addition to the requirements in this section, if the SCR_INCLUDED field is
38 included in this message and is set to '1', the mobile station shall also process this
39 message in accordance with the requirements for the active service subfunction (see
40 2.6.4.1.2.2).

1 The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set
 2 to the specified value if any of the following conditions is true, and shall not perform
 3 any other action described in this section for processing the *Universal Handoff*
 4 *Direction Message*:

- 5 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
 6 set to '00000110' (capability not supported), if the mobile station does not
 7 support the band class specified in the *Universal Handoff Direction Message*.
- 8 • If the SCR_INCLUDED field is included in this message and is set to '1', the
 9 mobile station shall perform the following:
 - 10 - The mobile station shall send a *Mobile Station Reject Order* with the ORDQ
 11 field set to '00000111' (message cannot be handled by the current mobile
 12 station configuration), if the mobile station does not support the service
 13 configuration specified in the *Universal Handoff Direction Message*.
 - 14 - The mobile station shall send a *Mobile Station Reject Order* (ORDQ =
 15 '00000111') within T_{56m} seconds, if the mobile station supports the service
 16 configuration specified but does not accept the service configuration
 17 specified in the *Universal Handoff Direction Message*.
- 18 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
 19 set to '00000111' (message cannot be handled by the current mobile station
 20 configuration), if the NNSCR_INCLUDED field is included and set to '1' and the
 21 SCR_INCLUDED field is either not included or included but set to '0', and the
 22 mobile station does not support the configuration specified in the non-
 23 negotiable service configuration information record in the *Universal Handoff*
 24 *Direction Message*.
- 25 • If the CC_INFO_INCL field is included in this message and is set to '1', the
 26 mobile station shall perform the following for each of the NUM_CALLS_ASSIGN
 27 call assignments included in this message:
 - 28 - If there already exists or currently pending instantiation a Call Control
 29 instance identified by CON_REF_r, the mobile station shall send a *Mobile*
 30 *Station Reject Order* with ORDQ field set to '00010010' (a call control
 31 instance is already present with the specified identifier), with the CON_REF
 32 field of the order set to CON_REF_r.
 - 33 - If RESPONSE_IND_r equals '1' and TAG_r does not match any of the TAG
 34 values contained in the list TAG_OUTSTANDING_LIST, the mobile station
 35 shall send a *Mobile Station Reject Order* with ORDQ field set to '00010011'
 36 (TAG received does not match TAG stored), with the TAG field of the order
 37 set to TAG_r, and the CON_REF field of the order set to CON_REF_r.
 - 38 - If the mobile station does not accept this call assignment, the mobile station
 39 shall send a *Mobile Station Reject Order* with ORDQ field set to '00010000'
 40 (call assignment not accepted), with the CON_REF field of the order set to
 41 CON_REF_r.

- 1 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
2 set to '00001010' (search set not specified), if the PERIODIC_SEARCH field is
3 included in the *Universal Handoff Direction Message* and is set to '1' and the
4 Candidate Frequency Search Set is empty.
- 5 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
6 set to '00000011' (message structure not acceptable), if the message specifies
7 the Forward/Reverse Supplemental Channel assignment, the most significant
8 bit of CH_IND_r is equal to '0', and CH_IND_r is not equal to '000'.
- 9 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
10 set to '00000111' (message can not be handled by the current mobile station
11 configuration), if the message includes a reverse Supplemental Channel
12 assignment, and any of the following conditions are true:
- 13 – any of the mobile station's reverse supplemental channel configuration
14 parameter for the corresponding Supplemental Channel is NULL, or
- 15 – the message includes a Reverse Packet Data Channel assignment.
- 16 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
17 set to '00000111' (message can not be handled by the current mobile station
18 configuration), if the message includes a forward Supplemental Channel
19 assignment and any of the mobile station's forward supplemental channel
20 configuration parameters for the corresponding Supplemental Channel is NULL.
- 21 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set
22 to '00001101' (search period too short), if the PERIODIC_SEARCH field is included
23 in the *Universal Handoff Direction Message* and is set to '1', and *search_period* is
24 less than $(\max(fwd_time, rev_time) + T_{71m} \text{ seconds})$, where
- 25 $search_period =$ time period corresponding to SEARCH_PERIOD_s shown in
26 Table 2.6.6.2.8.3.2-1,
- 27 $fwd_time =$ the mobile station's estimate of the total length of time, in seconds,
28 for which the mobile station will need to suspend its current
29 Forward Traffic Channel processing in order to tune to the CDMA
30 Candidate Frequency, to search the Candidate Frequency Search
31 Set, and to re-tune to the Serving Frequency; if the mobile station
32 searches the Candidate Frequency Search Set in multiple visits,
33 fwd_time is the total time for all visits to the CDMA Candidate
34 Frequency in a search period (see 2.6.6.2.8.3.2),
- 35 and
- 36 $rev_time =$ the mobile station's estimate of the total length of time, in seconds,
37 for which the mobile station will need to suspend its current Reverse
38 Traffic Channel processing in order to tune to the CDMA Candidate
39 Frequency, to search the Candidate Frequency Search Set, and to re-
40 tune to the Serving Frequency; if the mobile station searches the
41 Candidate Frequency Search Set in multiple visits, rev_time is the

total time for all visits to the CDMA Candidate Frequency in a search period.

- The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '0000111' (message can not be handled by the current mobile station configuration), if CH_IND_r is equal to '000', and EXT_CH_IND_r is not defined in Table 3.7.2.3.2.4-11.
- The mobile shall send a *Mobile Station Reject Order* with the ORDQ field set to '00011100' (PLCM_TYPE mismatch) if PLCM_TYPE_r equals '0010' and IMSI_O is derived from IMSI_T or if PLCM_TYPE_r equals '0011' and IMSI_O is derived from IMSI_M.

If none of the above conditions is true, the mobile station shall perform the actions described in the remainder of this section to process the *Universal Handoff Direction Message* at the action time of the message.

If EXTRA_PARMS is equal to '1', the mobile station shall store the return on failure indicator from the *Universal Handoff Direction Message* (RETURN_IF_HANDOFF_FAIL_s = RETURN_IF_HANDOFF_FAIL_r); otherwise the mobile station shall set RETURN_IF_HANDOFF_FAIL_s to '0'.

The mobile station shall set RETURN_IF_HANDOFF_FAIL_s to '0' (disable return on failure) if any of the following conditions is true:

- If P_REV_IN_USE_s is less than or equal to four and the mobile station does not support hard handoff with return on failure, or
- At least one of the pilots specified by the message is also included in the Active Set prior to the action time of the message, and one of the following conditions is true:
 - EXTRA_PARMS is equal to '0', or
 - EXTRA_PARMS is equal to '1', the message specifies the same Frequency Assignment as the Serving Frequency (BAND_CLASS_r is equal to CDMABAND_s and CDMA_FREQ_r is equal to CDMACH_s), and FRAME_OFFSET_r is equal to FRAME_OFFSET_s.

The mobile station shall store the following parameters from its current configuration:

- CDMA band class (SF_CDMABAND_s = CDMABAND_s)
- Frequency assignment (SF_CDMACH_s = CDMACH_s)
- Frame Offset (SF_FRAME_OFFSET_s = FRAME_OFFSET_s)

If RETURN_IF_HANDOFF_FAIL_s is equal to '1', the mobile station shall also store the following parameters from its current configuration:

- Protocol revision level (SF_P_REV_s = P_REV_s)
- Protocol revision level in use on the Serving Frequency (SF_P_REV_IN_USE_s = P_REV_IN_USE_s)

- 1 • Search window size for the Active Set and Candidate Set (SF_SRCH_WIN_A_s =
2 SRCH_WIN_A_s)
- 3 • Search window size for the Neighbor Set
4 (SF_SRCH_WIN_N_s = SRCH_WIN_N_s),
- 5 • Search window size for the Remainder Set
6 (SF_SRCH_WIN_R_s = SRCH_WIN_R_s)
- 7 • Pilot detection threshold (SF_T_ADD_s = T_ADD_s)
- 8 • Pilot drop threshold (SF_T_DROP_s = T_DROP_s)
- 9 • Active Set versus Candidate Set comparison threshold
10 (SF_T_COMP_s = T_COMP_s)
- 11 • Drop timer value (SF_T_TDROP_s = T_TDROP_s)
- 12 • Drop timer range value (SF_T_TDROP_RANGE_s = T_TDROP_RANGE_s)
- 13 • Soft slope for the dynamic add and drop thresholds
14 (SF_SOFT_SLOPE_s = SOFT_SLOPE_s)
- 15 • Intercept for the dynamic add threshold
16 (SF_ADD_INTERCEPT_s = ADD_INTERCEPT_s)
- 17 • Intercept for the dynamic drop threshold
18 (SF_DROP_INTERCEPT_s = DROP_INTERCEPT_s)
- 19 • Private long code mask indicator: If the mobile station is using the private long
20 code mask on the Serving Frequency, it shall set SF_PRIVATE_LCM_s to '1';
21 otherwise, it shall set SF_PRIVATE_LCM_s to '0'.
- 22 • Private long code mask: If the mobile station is using the private long code mask
23 on the Serving Frequency, it shall set SF_PVTLCM_42_s to the PVTLCM_42.
- 24 • Public long code mask type: The mobile station shall set SF_PLCM_TYPE_s to
25 PLCM_TYPE_s. If PLCM_TYPE_s equals '0001', the mobile station shall set
26 SF_PLCM_39_s to PLCM_39_s.
- 27 • Service negotiation type (SF_SERV_NEG_s = SERV_NEG_s)
- 28 • Service configuration: Store the current service configuration (service
29 configuration record and non-negotiable service configuration record) in
30 SF_SERVICE_CONFIG_s
- 31 • Call Information:
32 Store the list of current calls (Call Control instances, etc.) in SF_CALLS_s
- 33 • Message encryption mode: If message encryption is on, the mobile station shall
34 set SF_ENCRYPT_MODE_s to '1'; otherwise, the mobile station shall set
35 SF_ENCRYPT_MODE_s to '0'.
- 36 • Extended nominal power setting of the current cell
37 (SF_NOM_PWR_EXT_s = NOM_PWR_EXT_s)
- 38 • Nominal power setting of the current cell (SF_NOM_PWR_s = NOM_PWR_s)

- 1 • Power control step ($SF_PWR_CNTL_STEP_s = PWR_CNTL_STEP_s$)
- 2 • Serving Frequency Active Set (SF Active Set = (For each pilot in the current
- 3 Active Set: (PILOT_PN, PWR_COMB_IND)))
- 4 • Serving Frequency Code Channel List
- 5 (SF_CODE_CHAN_LIST_s = CODE_CHAN_LIST_s)

6 If NNSCR_INCLUDED field is included and set to '1' and SCR_INCLUDED field is
 7 either not included or included but set to '0', the mobile station shall process the
 8 received Non-negotiable Service Configuration Record as specified in 2.6.4.1.13 at
 9 the action time of this message. If SYNC_ID_INCL_r is set to '1', the mobile station
 10 shall perform the following:

- 11 • The mobile station shall store (if included) the synchronization identifier
 12 received from the base station corresponding to this service configuration
 13 (SYNC_ID_s = SYNC_ID_r).
- 14 • The mobile station shall store the current service configuration as specified in
 15 2.6.4.1.2.2.5.1 at the action time of this message.

16 Otherwise, the mobile station shall set SYNC_ID_s to NULL.

17 If SYNC_ID_INCL_r is set to '1', NNSCR_INCLUDED field is not included or is
 18 included and set to '0', and SCR_INCLUDED is not included or is included and set
 19 to '0', the mobile station shall perform the following:

- 20 • The mobile station shall store the synchronization identifier received from the
 21 base station (SYNC_ID_s = SYNC_ID_r).
- 22 • If the currently used service configuration has a corresponding SYNC_ID, the
 23 mobile station shall perform one of the following:
 - 24 - If the current SID (if SID_r is included in the message then the current SID is
 25 SID_r; otherwise, the current SID is SID_s) or current NID (if NID_r is included
 26 in the message then the current NID is NID_r; otherwise, the current NID is
 27 NID_s) is not equal to the stored SID or NID corresponding to the currently
 28 used service configuration, the mobile station shall store the current service
 29 configuration as specified in 2.6.4.1.2.2.5.1 at the action time of this
 30 message.
 - 31 - Otherwise, the mobile station shall update the stored SYNC_ID value
 32 corresponding to the currently used service configuration with SYNC_ID_r.
- 33 • If the currently used service configuration does not have a corresponding
 34 SYNC_ID, the mobile station shall store the current service configuration as
 35 specified in 2.6.4.1.2.2.5.1 at the action time of this message.

36 When the message takes effect, the mobile station shall perform the following
 37 actions:

- 38 • The mobile station shall send a *Handoff Completion Message* or an *Extended*
 39 *Handoff Completion Message* as specified in 2.6.6.2.5.2. [. If the RC assigned on the](#)

reverse fundamental channel or supplemental channel is less than RC08 the mobile station shall set RC_BITMAP_CAPABILITY_EXT_ALLOWED_s to '0'.

- Update the Active Set, Candidate Set, and Neighbor Set in accordance with the *Universal Handoff Direction Message* processing (see 2.6.6.2.6.1, 2.6.6.2.6.2, and 2.6.6.2.6.3).
- Discontinue use of all Forward Traffic Channels associated with pilots not in the updated Active Set.
- The mobile station shall perform the following to determine the long code mask to use after the handoff:
 - If the PRIVATE_LCM field is not included and PLCM_TYPE_INCL_r equals '0', the mobile station shall continue to use the long code mask currently in use.
 - If the PRIVATE_LCM field is not included and PLCM_TYPE_INCL_r equals '1', the mobile station shall perform the following:
 - + The mobile station shall set PLCM_TYPE_s to PLCM_TYPE_r; if PLCM_TYPE_r equals '0001', the mobile station shall set PLCM_39_s to PLCM_39_r.
 - + The mobile station shall use the public long code mask derived from PLCM_TYPE_s as specified in 2.3.6.
 - If PRIVATE_LCM_r equals '1' and PLCM_TYPE_INCL_r equals '0', the mobile station shall perform the following:
 - + The mobile station shall use the private long code mask.
 - If PRIVATE_LCM_r equals '1' and PLCM_TYPE_INCL_r equals '1', the mobile station shall perform the following:
 - + The mobile station shall use the private long code mask.
 - + The mobile station shall set PLCM_TYPE_s to PLCM_TYPE_r; if PLCM_TYPE_r equals '0001', the mobile station shall set PLCM_39_s to PLCM_39_r.
 - If PRIVATE_LCM_r equals '0' and PLCM_TYPE_INCL_r equals '0', the mobile station shall perform the following:
 - + The mobile station shall use the public long code mask derived from PLCM_TYPE_s as specified in 2.3.6.
 - If PRIVATE_LCM_r equals '0' and PLCM_TYPE_INCL_r equals '1', the mobile station shall perform the following:
 - + The mobile station shall set PLCM_TYPE_s to PLCM_TYPE_r; if PLCM_TYPE_r equals '0001', the mobile station shall set PLCM_39_s to PLCM_39_r.
 - + The mobile station shall use the public long code mask derived from PLCM_TYPE_s as specified in 2.3.6.

- 1 – The mobile station shall indicate to the user the voice privacy mode status.
- 2 • If PARS_INCL is equal to '1', perform the following actions:
- 3 – Set protocol revision level ($P_REV_S = P_REV_T$), and protocol revision level
- 4 currently in use ($P_REV_IN_USE_S = \min(P_REV_S, MOB_P_REV_P$ of the
- 5 current band class)).
- 6 – If SERV_NEG_TYPE_T is equal to '1', set SERV_NEG_S to enabled; otherwise set
- 7 SERV_NEG_S to disabled.
- 8 • If EXTRA_PARS is equal to '1', perform the following actions:
- 9 – If FRAME_OFFSET_T is not equal to FRAME_OFFSET_S, change the frame
- 10 offset on all of the code channels of the Forward Traffic Channel and of the
- 11 Reverse Traffic Channel.
- 12 – If RESET_L2_T is equal to '1', and RETURN_IF_HANDOFF_FAIL_S is equal to
- 13 '0', Layer 3 shall send a L2-Supervision.Request primitive to Layer 2 to reset
- 14 the acknowledgment procedures, as specified in [4]. The mobile station shall
- 15 reset the acknowledgment procedures immediately after the action time of
- 16 the *Universal Handoff Direction Message*.
- 17 – If RESET_FPC_T is equal to '1' and RETURN_IF_HANDOFF_FAIL_S is equal to
- 18 '0', initialize the Forward Traffic Channel power control counters, as
- 19 specified in 2.6.4.1.1.1.
- 20 – Process the ENCRYPT_MODE field, as specified in 2.3.12.2.
- 21 – Perform the procedures as specified in 2.6.11.3.
- 22 • If EXTRA_PARS is equal to '0', set the following variables to the values
- 23 indicated:
- 24 – Hard handoff traffic channel preamble count required before transmitting a
- 25 *Handoff Completion Message* or an *Extended Handoff Completion Message*
- 26 (NUM_PREAMBLE_S = '000')
- 27 – Complete search flag (COMPLETE_SEARCH_S = '1')
- 28 – CDMA band class for the Target Frequency
- 29 (TF_CDMABAND_S = SF_CDMABAND_S)
- 30 – Frequency assignment for the Target Frequency
- 31 (TF_CDMACH_S = SF_CDMACH_S)
- 32 • Store the following parameters from the *Universal Handoff Direction Message*:
- 33 – *Universal Handoff Direction Message* sequence number
- 34 (HDM_SEQ_S = HDM_SEQ_T)
- 35 – Forward power control subchannel relative gain (FPC_SUBCHAN_GAIN_S =
- 36 FPC_SUBCHAN_GAIN_T).
- 37 – If the mobile station uses FPC_SUBCHAN_GAIN_S, the mobile station shall
- 38 perform the following:

- 1 + If PC_ACTION_TIME_T is received, the mobile station shall apply its usage
2 of the FPC_SUBCHAN_GAIN_S at the time specified by PC_ACTION_TIME_T.
- 3 + If PC_ACTION_TIME is not received and the explicit action time is
4 received, the mobile station shall apply its usage of the
5 FPC_SUBCHAN_GAIN_S at the action time.
- 6 + If neither PC_ACTION_TIME_T nor explicit action time is received, the
7 mobile station shall apply its usage of the FPC_SUBCHAN_GAIN_S at the
8 first 80ms boundary occurring at least 80ms after the end of the frame
9 containing the last bit of the *Universal Handoff Direction Message* sent to
10 the mobile station.
- 11 – Reverse Eighth Gating Mode (REV_FCH_GATING_MODE_S =
12 REV_FCH_GATING_MODE_T).
- 13 – Reverse Power Control Delay if REV_PWR_CNTL_DELAY_INCL_T is equal to ‘1’
14 (REV_PWR_CNTL_DELAY_S = REV_PWR_CNTL_DELAY_T).
- 15 – Concurrent services supported indicator (CS_SUPPORTED_S =
16 CS_SUPPORTED_T).
- 17 – Maximum number of additional service reference identifiers allowed in
18 origination (MAX_ADD_SERV_INSTANCE_S = MAX_ADD_SERV_INSTANCE_T),
19 if included; otherwise, the mobile station shall set
20 MAX_ADD_SERV_INSTANCE_S to 0.
- 21 – Control Hold Mode supported indicator (CHM_SUPPORTED_S =
22 CHM_SUPPORTED_T) if included; otherwise, the mobile station shall perform
23 the following:
- 24 + If P_REV_IN_USE_S is less than 6, set CHM_SUPPORTED_S to ‘0’.
- 25 + Otherwise, set CHM_SUPPORTED_S to ‘1’
- 26 – CDMA off time report supported indicator
27 (CDMA_OFF_TIME_REP_SUP_IND_S = CDMA_OFF_TIME_REP_SUP_IND_T).
- 28 – If CDMA_OFF_TIME_REP_SUP_IND_T is equal to ‘1’, the mobile station shall
29 store CDMA off time report threshold (CDMA_OFF_TIME_REP_THRESHOLD_S
30 = CDMA_OFF_TIME_REP_THRESHOLD_T in units specified by
31 CDMA_OFF_TIME_REP_UNIT_T).
- 32 – Forward Packet Data Channel supported indicator
33 (FOR_PDCH_SUPPORTED_S = FOR_PDCH_SUPPORTED_T).
- 34 – PDCH Control Hold Mode supported indicator (PDCH_CHM_SUPPORTED_S =
35 PDCH_CHM_SUPPORTED_T) if included; otherwise, set
36 PDCH_CHM_SUPPORTED_S to ‘0’.
- 37 – Reverse Packet Data Channel supported indicator
38 (REV_PDCH_SUPPORTED_S = REV_PDCH_SUPPORTED_T) if included;
39 otherwise, set REV_PDCH_SUPPORTED_S to ‘0’.

- 1 – Short Data Burst supported indicator ($SDB_SUPPORTED_S =$
2 $SDB_SUPPORTED_T$).
- 3 – Pilot information request supported indicator
4 ($PILOT_INFO_REQ_SUPPORTED_S = PILOT_INFO_REQ_SUPPORTED_T$).
- 5 – Release to Idle State allowed indicator ($RELEASE_TO_IDLE_IND_S =$
6 $RELEASE_TO_IDLE_IND_T$).
- 7 – If $SEARCH_INCLUDED$ is equal to '1', store the following:
- 8 + Search window size for the Active Set and Candidate Set
9 ($SRCH_WIN_A_S = SRCH_WIN_A_T$)
- 10 + Pilot detection threshold ($T_ADD_S = T_ADD_T$)
- 11 + Pilot drop threshold ($T_DROP_S = T_DROP_T$)
- 12 + Active Set versus Candidate Set comparison threshold
13 ($T_COMP_S = T_COMP_T$)
- 14 + Drop timer value ($T_TDROP_S = T_TDROP_T$)
- 15 + Drop timer range value ($T_TDROP_RANGE_S = T_TDROP_RANGE_T$) if
16 $T_TDROP_RANGE_INCL_T$ is equal to '1'; otherwise, ($T_TDROP_RANGE_S =$
17 '0000')
- 18 + Soft slope for the dynamic add and drop thresholds
19 ($SOFT_SLOPE_S = SOFT_SLOPE_T$)
- 20 + Intercept for the dynamic add threshold
21 ($ADD_INTERCEPT_S = ADD_INTERCEPT_T$)
- 22 + Intercept for the dynamic drop threshold
23 ($DROP_INTERCEPT_S = DROP_INTERCEPT_T$)
- 24 – If $EXTRA_PARMS$ is equal to '1', store the following:
- 25 + If the mobile station supports packet data service options, the packet
26 data services zone identifier ($PACKET_ZONE_ID_S = PACKET_ZONE_ID_T$).
- 27 + If the mobile station supports packet data service options and the
28 $PZ_HYST_ENABLED$ field is included, the mobile station shall store the
29 packet zone hysteresis enabled indicator ($PZ_HYST_ENABLED_S =$
30 $PZ_HYST_ENABLED_T$); otherwise, the mobile station shall set
31 $PZ_HYST_ENABLED_S$ to '1'.
- 32 + If the $PZ_HYST_LIST_LEN$ field is included, the mobile station shall store
33 the packet zone hysteresis list length ($PZ_HYST_LIST_LEN_S =$
34 $PZ_HYST_LIST_LEN_T$); otherwise, the mobile station shall set
35 $PZ_HYST_LIST_LEN_S$ to 4.
- 36 + If the $PZ_HYST_ACT_TIMER$ field is included, the mobile station shall
37 store the packet zone hysteresis activation timer ($PZ_HYST_ACT_TIMER_S =$
38 $PZ_HYST_ACT_TIMER_T$); otherwise, the mobile station shall set

- 1 PZ_HYST_ACT_TIMERS to 30 seconds.
- 2 + If the PZ_HYST_TIMER_MUL field and the PZ_HYST_TIMER_EXP field are
3 included, the mobile station shall store the packet zone hysteresis timer
4 ($PZ_HYST_TIMERS = PZ_HYST_TIMER_MUL_r \times 8 \wedge$
5 $PZ_HYST_TIMER_EXP_r$); otherwise, the mobile station shall set
6 PZ_HYST_TIMERS to 60 seconds.
- 7 + Frame offset ($FRAME_OFFSET_s = FRAME_OFFSET_r$)
- 8 + Acknowledgment procedures reset indicator
9 (If RETURN_IF_HANDOFF_FAIL_s is equal to '1', set TF_RESET_L2_s to
10 RESET_L2_r)
- 11 + Indicator to initialize the Forward Traffic Channel power control counters
12 (If RETURN_IF_HANDOFF_FAIL_s is equal to '1', set TF_RESET_FPC_s to
13 RESET_FPC_r)
- 14 + Nominal power setting of the target cell ($NOM_PWR_s = NOM_PWR_r$)
- 15 + Extended nominal power setting of the target cell (If CDMABAND_s =
16 '00000' or CDMABAND_s = '00011', then $NOM_PWR_EXT_s = '0'$;
17 otherwise, $NOM_PWR_EXT_s = NOM_PWR_EXT_r$)
- 18 + Hard handoff traffic channel preamble count required before
19 transmitting a *Handoff Completion Message* or an *Extended Handoff*
20 *Completion Message* ($NUM_PREAMBLE_s = NUM_PREAMBLE_r$)
- 21 + CDMA band class for the Target Frequency
22 ($TF_CDMABAND_s = BAND_CLASS_r$ and $CDMABAND_s = BAND_CLASS_r$)
- 23 + Frequency assignment for the Target Frequency
24 ($TF_CDMACH_s = CDMA_FREQ_r$ and $CDMACH_s = CDMA_FREQ_r$)
- 25 + Complete search flag ($COMPLETE_SEARCH_s = COMPLETE_SEARCH_r$)
- 26 + Periodic search flag ($PERIODIC_SEARCH_s = PERIODIC_SEARCH_r$)
- 27 + Nominal code channel output power offset relative to the Reverse Pilot
28 Channel power ($RLGAIN_TRAFFIC_PILOT_s = RLGAIN_TRAFFIC_PILOT_r$)
- 29 - If EXTRA_PARMS is equal to '1' and DEFAULT_RLAG is equal to '1', the
30 mobile station shall set each entry of the Reverse Link Attribute Adjustment
31 Gain Table and Reverse Channel Adjustment Gain Table (see [2]) to 0.
- 32 - If USE_PWR_CNTL_STEP is equal to '1' and PWR_CNTL_STEP_r corresponds
33 to a power control step size supported by the mobile station (see [2]), then
34 the mobile station shall set PWR_CNTL_STEP_s to PWR_CNTL_STEP_r.
- 35 - If CLEAR_RETRY_DELAY_r is equal to '1', the mobile station shall cancel any
36 previously indicated retry delay and shall set $RETRY_DELAY_s[RETRY_TYPE]$
37 to 0, where RETRY_TYPE is equal to '001', '010', '011', '100', or '101';
38 otherwise, the mobile station shall continue to honor any previously active
39 retry delay stored in RETRY_DELAY_s.

- 1 – If 3XFL_1XRL_INCL_T is equal to ‘1’, the mobile station shall set
2 1XRL_FREQ_OFFSET_S to 1XRL_FREQ_OFFSET_T.
- 3 – If SCH_INCL_T is equal to ‘1’ and NUM_FOR_ASSIGN_T is not equal to ‘00’, the
4 mobile station shall store the following information for each occurrence of
5 the record and process the Forward Supplemental Burst as specified in
6 2.6.6.2.5.1.1:
- 7 + FOR_SCH_START_TIME_INCL_S[FOR_SCH_ID_T] =
8 FOR_SCH_START_TIME_INCL_T
- 9 + If FOR_SCH_START_TIME_INCL_S[FOR_SCH_ID_T] is equal to ‘1’, set
10 FOR_SCH_START_TIME_S[FOR_SCH_ID_T] = FOR_SCH_START_TIME_T
- 11 + FOR_SCH_DURATION_S[FOR_SCH_ID_T] = FOR_SCH_DURATION_T
- 12 + SCCL_INDEX_S[FOR_SCH_ID_T] = SCCL_INDEX_T
- 13 + If SCH_BCMC_IND field is included the mobile station shall perform the
14 following:
- 15 o If SCH_BCMC_IND_T equals ‘1’ and USE_ADD_PLCM_FOR_SCH_T
16 equals ‘1’, set corresponding SCH_BCMC_IND[FOR_SCH_ID_T] to ‘1’;
17 otherwise, set SCH_BCMC_IND[FOR_SCH_ID_T] = ‘0’
- 18 + If SCH_BCMC_IND_T is included and equals ‘1’ and
19 ADD_PLCM_FOR_SCH_INCL_T is included and is set to ‘1’, the mobile
20 station shall store following fields:
- 21 o Set ADD_PLCM_FOR_SCH_TYPE_S to ADD_PLCM_FOR_SCH_TYPE_T.
- 22 o Set ADD_PLCM_FOR_SCH_35_S to ADD_PLCM_FOR_SCH_35_T if
23 ADD_PLCM_FOR_SCH_TYPE_T is equal to ‘1’.
- 24 + If SCH_BCMC_IND_T is included and equals ‘1’, the mobile station shall
25 store following fields:
- 26 o USE_ADD_PLCM_FOR_SCH_S[FOR_SCH_ID_T] =
27 USE_ADD_PLCM_FOR_SCH_T
- 28 o FSCH_OUTERCODE_INCL_S[FOR_SCH_ID_T] =
29 FSCH_OUTERCODE_INCL_T
- 30 o If FSCH_OUTERCODE_INCL_T equals ‘1’, the mobile station shall store
31 following fields:
- 32 o FSCH_OUTERCODE_RATE_S[FOR_SCH_ID_T] =
33 FSCH_OUTERCODE_RATE_T
- 34 o FSCH_OUTERCODE_OFFSET_S[FOR_SCH_ID_T] =
35 FSCH_OUTERCODE_OFFSET_T
- 36 – If SCH_INCL_T is equal to ‘1’ and NUM_REV_ASSIGN_T is not equal to ‘00’, the
37 mobile station shall store the following information for each occurrence of
38 the record and process the Reverse Supplemental Burst as specified in
39 2.6.6.2.5.1.2:

- 1 + REV_SCH_START_TIME_INCL_s[REV_SCH_ID_r] =
2 REV_SCH_START_TIME_INCL_r
- 3 + If REV_SCH_START_TIME_INCL_s[REV_SCH_ID_r] is equal to '1', set
4 REV_SCH_START_TIME_s[REV_SCH_ID_r] = REV_SCH_START_TIME_r
- 5 + REV_SCH_DURATION_s[REV_SCH_ID_r] = REV_SCH_DURATION_r
- 6 + REV_SCH_NUM_BITS_IDX_s[REV_SCH_ID_r] = REV_SCH_NUM_BITS_IDX_r
- 7 – The mobile station shall set BCMC_ON_TRAFFIC_SUP_s to
8 BCMC_ON_TRAFFIC_SUP_r. If BCMC_ON_TRAFFIC_SUP_r is set to '1', the
9 mobile station shall store AUTO_REQ_TRAF_ALLOWED_IND_s =
10 AUTO_REQ_TRAF_ALLOWED_IND_r
- 11 – If SID_INCL_r is equal to '1', the mobile station shall store the following:
12 + System identification (SID_s = SID_r)
- 13 – If NID_INCL_r is equal to '1', the mobile station shall store the following:
14 + Network identification (NID_s = NID_r)
- 15 – If ENC_SUPPORTED_r is equal to '1', the mobile station shall store:
16 + Signaling encryption supported indicator (SIG_ENCRYPT_SUP_s =
17 SIG_ENCRYPT_SUP_r)
- 18 + User information encryption supported indicator (UI_ENCRYPT_SUP_s =
19 UI_ENCRYPT_SUP_r)
- 20 – Sync ID supported indicator (USE_SYNC_ID_s = USE_SYNC_ID_r) if included.
- 21 – Channel configuration request allowed indicator (USE_CH_CFG_RRM_s =
22 USE_CH_CFG_RRM_r) if included; otherwise, set USE_CH_CFG_RRM_s to '0'.
- 23 – If TX_PWR_LIMIT_DEFAULT_r is included and set to '0', the mobile station
24 shall perform the following:
25 + If the mobile station is being assigned to operate in the 1915MHz –
26 1920MHz block of the PCS band, the mobile station shall store the
27 transmit power limit TX_PWR_LIMIT_s = (TX_PWR_LIMIT_r - 30dB);
28 + Otherwise, the mobile station shall set TX_PWR_LIMIT_s to the limit
29 defined in [11] for the target base station.
- 30 – If TX_PWR_LIMIT_DEFAULT_r is included and set to '1', the mobile station
31 shall store TX_PWR_LIMIT_s to the limit defined in [11] for the target base
32 station.
- 33 – Permission for the mobile station to request QoS settings in the *Origination*
34 *Message*, *Origination Continuation Message*, or *Enhanced Origination Message*
35 (MOB_QOS_s = MOB_QOS_r) if included.
- 36 – The mobile station initiated position location determination supported
37 indicator (MS_INIT_POS_LOC_SUP_IND_s = MS_INIT_POS_LOC_SUP_IND_r).

- 1 – If CH_IND_r is equal to ‘101’, the mobile station shall perform the following:
- 2 + The mobile station shall set CH_IND_s = ‘01’.
- 3 + If SCH_INCL_r is equal to ‘1’ and NUM_FOR_SCH is not equal to ‘00000’,
- 4 for all the NUM_FOR_SCH occurrences, the mobile station shall perform
- 5 the following:
- 6 o The mobile station shall determine,
- 7 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], the number of
- 8 information bits per Forward Supplemental Channel frame identified
- 9 by FOR_SCH_ID and corresponding to the index SCCL_INDEX
- 10 according to the following rules:
- 11 If FSCH_VAR_TABLE_ID_s[FOR_SCH_ID_r] is equal to ‘000’, then:
- 12 – If USE_FLEX_NUM_BITS_s is equal to ‘0’ or if
- 13 USE_FLEX_NUM_BITS_s is equal to ‘1’ and
- 14 FSCH_NBIT_TABLE_ID_s[FOR_SCH_ID_r] is equal to ‘0000’,
- 15 then the mobile station shall set the number of information
- 16 bits per frame,
- 17 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r] and
- 18 number of CRC bits per frame,
- 19 FSCH_CRC_LEN_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r],
- 20 according to Table 3.7.3.3.2.37-2 using
- 21 FOR_SCH_NUM_BITS_IDX_r as the index to the table.
- 22 – If USE_FLEX_NUM_BITS_s is equal to ‘1’ and
- 23 FSCH_NBIT_TABLE_ID_s[FOR_SCH_ID_r] is not equal to ‘0000’,
- 24 then the mobile station shall set the number of CRC bits per
- 25 frame, FSCH_CRC_LEN_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r],
- 26 using Table 3.7.5.20-1 and
- 27 CRC_LEN_IDX_s[FSCH_NBIT_TABLE_ID_s[FOR_SCH_ID_r]][FOR_
- 28 SCH_NUM_BITS_IDX_r] as the index to the table.
- 29 The mobile station shall also set the number of information
- 30 bits per frame corresponding to SCCL_INDEX_r,
- 31 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], to
- 32 NUM_BITS_s[FSCH_NBIT_TABLE_ID_s[FOR_SCH_ID_r]][FOR_SC
- 33 H_NUM_BITS_IDX_r].
- 34 If FSCH_VAR_TABLE_ID_s[FOR_SCH_ID_r] is not equal to ‘000’, then:
- 35 – The mobile station shall set
- 36 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r], the set of indices to
- 37 the number of information bits per frame as follows:
- 38 + If FOR_SCH_NUM_BITS_IDX_r is equal to ‘0000’, then
- 39 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r] = {
- 40 FOR_SCH_NUM_BITS_IDX_r },

- 1 + otherwise the mobile station shall set (initialize)
2 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r] =
3 {FOR_SCH_NUM_BITS_IDX_r} and for i=1, ...,
4 FOR_SCH_NUM_BITS_IDX_r the mobile station shall add
5 FOR_SCH_NUM_BITS_IDX_r -
6 VAR_FSCH_RATE_OFFSET_s[FOR_SCH_ID_r][FOR_SCH_NUM_BITS_IDX_r][i] to the set specified by
7 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r]
8
- 9
- 10 - If USE_FLEX_NUM_BITS_s is equal to '0' or if
11 USE_FLEX_NUM_BITS_s is equal to '1' and
12 FSCH_NBIT_TABLE_IDS_s[FOR_SCH_ID_r] is equal to '0000',
13 then the mobile station shall set
14 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], the set of
15 number of information bits per frame as follows.
16 The *i*th member of the set
17 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r] is
18 obtained using Table 3.7.3.3.2.37-2 and the *i*th member of the
19 set N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r] as the index to
20 the table.
- 21 - If USE_FLEX_NUM_BITS_s is equal to '1' and
22 FSCH_NBIT_TABLE_IDS_s[FOR_SCH_ID_r] is not equal to '0000',
23 then
- 24 + the mobile station shall set
25 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], the
26 set of number of information bits per frame as follows.
27 The *i*th member of the set
28 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r] is
29 equal to
30 NUM_BITS_s[FSCH_NBIT_TABLE_IDS_s[FOR_SCH_ID_r]]
31 [N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r][i]], where
32 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r][i] denotes the *i*th
33 member of the set
34 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r] and,

- 1 – Set the AUX_PILOT_TD_QOF field of PILOT_REC to QOF_r.
- 2 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
- 3 AUX_WALSH_r with the Walsh Code length specified by
- 4 WALSH_LENGTH_r.
- 5 – Set the AUX_TD_POWER_LEVEL field of PILOT_REC to
- 6 AUX_TD_POWER_LEVEL_r.
- 7 – Set the TD_MODE field of PILOT_REC to TD_MODE_r.

8 If PILOT_REC_TYPE_r is equal to '011', the mobile station shall:

- 9 – Set the SR3_PRIMARY_PILOT field of PILOT_REC to
- 10 SR3_PRIMARY_PILOT_r.
- 11 – Set the SR3_PILOT_POWER1 field of PILOT_REC to
- 12 SR3_PILOT_POWER1_r.
- 13 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
- 14 SR3_PILOT_POWER2_r.

15 If PILOT_REC_TYPE_r is equal to '100', the mobile station shall:

- 16 – Set the SR3_PRIMARY_PILOT field of PILOT_REC to
- 17 SR3_PRIMARY_PILOT_r.
- 18 – Set the SR3_PILOT_POWER1 field of PILOT_REC to
- 19 SR3_PILOT_POWER1_r.
- 20 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
- 21 SR3_PILOT_POWER2_r.
- 22 – Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.

- 23 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
- 24 AUX_PILOT_WALSH_r with the Walsh Code length specified by
- 25 WALSH_LENGTH_r.

- 26 – If ADD_INFO_INCL1_r is equal to '1', set the AUX_PILOT_QOF1
- 27 field of PILOT_REC to QOF1_r and set the
- 28 AUX_PILOT_WALSH_CODE1 field of PILOT_REC to
- 29 AUX_PILOT_WALSH1_r with the Walsh Code length specified
- 30 by WALSH_LENGTH1_r; otherwise, set the AUX_PILOT_QOF1
- 31 field of PILOT_REC to QOF_r and set the
- 32 AUX_PILOT_WALSH_CODE1 field of PILOT_REC to
- 33 AUX_PILOT_WALSH_r with the Walsh Code length specified by
- 34 WALSH_LENGTH_r.

- 1 o If $CCSH_ENCODER_ACTION_TIME_r$ is received, then the mobile
2 station shall set $CCSH_ENCODER_ACTION_TIME_s$ to
3 $CCSH_ENCODER_ACTION_TIME_r$, and the mobile station shall apply
4 each $CCSH_ENCODER_TYPE_s$ at the time specified by
5 $CCSH_ENCODER_ACTION_TIME_r$.
- 6 o If $CCSH_ENCODER_ACTION_TIME_r$ is not received, the mobile
7 station shall apply each $CCSH_ENCODER_TYPE_s$ at the action time
8 of the message.
- 9 + If $3X_FCH_INFO_INCL_r$ equals '1', for each included member of the
10 Active Set, the mobile station store the following:
- 11 o If $3X_FCH_LOW_INCL_r$ equals '1', set the $QOF_MASK_ID_FCH_LOW$
12 field to $QOF_MASK_ID_FCH_LOW_r$ and the $CODE_CHAN_FCH_LOW$
13 field to $CODE_CHAN_FCH_LOW_r$. Otherwise, set the
14 $QOF_MASK_ID_FCH_LOW$ field to $QOF_MASK_ID_FCH_r$ and the
15 $CODE_CHAN_FCH_LOW$ to $CODE_CHAN_FCH_r$.
- 16 o If $3X_FCH_HIGH_INCL_r$ equals '1', set the $QOF_MASK_ID_FCH_HIGH$
17 field to $QOF_MASK_ID_FCH_HIGH_r$ and the
18 $CODE_CHAN_FCH_HIGH$ field to $CODE_CHAN_FCH_HIGH_r$.
19 Otherwise, set the $QOF_MASK_ID_FCH_HIGH$ field to
20 $QOF_MASK_ID_FCH_r$ and the $CODE_CHAN_FCH_HIGH$ to
21 $CODE_CHAN_FCH_r$.
- 22 o If $3X_SCH_INFO_INCL_r$ equals '1', for each Supplemental Channel
23 included, the mobile station store the following:
- 24 If $3X_SCH_LOW_INCL_r$ equals '1', set the $QOF_ID_SCH_LOW_s$
25 $[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ to $QOF_MASK_ID_SCH_LOW_r$
26 and the
27 $FOR_SCH_CC_INDEX_LOW[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ field
28 to $CODE_CHAN_SCH_LOW_r$. Otherwise, set
29 $QOF_ID_SCH_LOW_s[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ to
30 $QOF_MASK_ID_SCH_r$, and
31 $FOR_SCH_CC_INDEX_LOW_s[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ to
32 $CODE_CHAN_SCH_r$.
- 33 If $3X_SCH_HIGH_INCL_r$ equals '1', set the $QOF_ID_SCH_HIGH_s$
34 $[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ to $QOF_MASK_ID_SCH_HIGH_r$
35 and the
36 $FOR_SCH_CC_INDEX_HIGH[FOR_SCH_ID_r][SCCL_INDEX_r][i]$
37 field to $CODE_CHAN_SCH_HIGH_r$. Otherwise, set
38 $QOF_ID_SCH_HIGH_s[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ to
39 $QOF_MASK_ID_SCH_r$, and
40 $FOR_SCH_CC_INDEX_HIGH_s[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ to
41 $CODE_CHAN_SCH_r$.

- 1 + The mobile station shall delete all pilots that are not listed in the
2 NUM_PILOTS field from the Active Set.
- 3 + The mobile station shall delete all pilots that are not listed in the Active
4 Set from the Active Set of the Supplemental Channel for the Forward
5 Supplemental Channel Assignment (if any). If these deleted pilots
6 include all pilots in the Active Set of the Supplemental Channel, the
7 mobile station shall cancel the Forward Supplemental Channel
8 Assignment.
- 9 – If CH_IND_T is equal to '010' or '110', the mobile station shall perform the
10 following:
- 11 + The mobile station shall set CH_IND_S = '10'.
- 12 + If SCH_INCL_T is equal to '1' and NUM_FOR_SCH is not equal to '00000',
13 for all the NUM_FOR_SCH occurrences, the mobile station shall perform
14 the following:
- 15 o The mobile station shall determine,
16 N_FSCH_BITS_SET_S[FOR_SCH_ID_T][SCCL_INDEX_T], the number of
17 information bits per Forward Supplemental Channel frame identified
18 by FOR_SCH_ID and corresponding to the index SCCL_INDEX
19 according to the following rules:
- 20 If FSCH_VAR_TABLE_ID_S[FOR_SCH_ID_T] is equal to '000', then:
- 21 – If USE_FLEX_NUM_BITS_S is equal to '0' or if
22 USE_FLEX_NUM_BITS_S is equal to '1' and
23 FSCH_NBIT_TABLE_ID_S[FOR_SCH_ID_T] is equal to '0000',
24 then the mobile station shall set the number of information
25 bits per frame,
26 N_FSCH_BITS_SET_S[FOR_SCH_ID_T][SCCL_INDEX_T] and
27 number of CRC bits per frame,
28 FSCH_CRC_LEN_SET_S[FOR_SCH_ID_T][SCCL_INDEX_T],
29 according to Table 3.7.3.3.2.37-2 using
30 FOR_SCH_NUM_BITS_IDX_T as the index to the table.
- 31 – If USE_FLEX_NUM_BITS_S is equal to '1' and
32 FSCH_NBIT_TABLE_ID_S[FOR_SCH_ID_T] is not equal to '0000',
33 then the mobile station shall set the number of CRC bits per
34 frame, FSCH_CRC_LEN_SET_S[FOR_SCH_ID_T][SCCL_INDEX_T],
35 using Table 3.7.5.20-1 and
36 CRC_LEN_IDX_S[FSCH_NBIT_TABLE_ID_S[FOR_SCH_ID_T]][FOR_
37 SCH_NUM_BITS_IDX_T] as the index to the table.
- 38 The mobile station shall also set the number of information
39 bits per frame corresponding to SCCL_INDEX_T,
40 N_FSCH_BITS_SET_S[FOR_SCH_ID_T][SCCL_INDEX_T], to
41 NUM_BITS_S[FSCH_NBIT_TABLE_ID_S[FOR_SCH_ID_T]][FOR_SC
42 H_NUM_BITS_IDX_T].

- 1 If FSCH_VAR_TABLE_IDS_s[FOR_SCH_ID_r] is not equal to '000', then:
- 2 - The mobile station shall set
- 3 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r], the set of indices to
- 4 the number of information bits per frame as follows:
- 5 + If FOR_SCH_NUM_BITS_IDX_r is equal to '0000', then
- 6 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r] = {
- 7 FOR_SCH_NUM_BITS_IDX_r },
- 8 + otherwise the mobile station shall set (initialize)
- 9 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r] =
- 10 {FOR_SCH_NUM_BITS_IDX_r} and for i=1, ...,
- 11 FOR_SCH_NUM_BITS_IDX_r the mobile station shall add
- 12 FOR_SCH_NUM_BITS_IDX_r -
- 13 VAR_FSCH_RATE_OFFSET_s[FOR_SCH_ID_r][FOR_SCH_NUM_BITS_IDX_r][i] to the set specified by
- 14 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r]
- 15
- 16 - If USE_FLEX_NUM_BITS_s is equal to '0' or if
- 17 USE_FLEX_NUM_BITS_s is equal to '1' and
- 18 FSCH_NBIT_TABLE_IDS_s[FOR_SCH_ID_r] is equal to '0000',
- 19 then the mobile station shall set
- 20 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], the set of
- 21 number of information bits per frame as follows.
- 22 The *i*th member of the set
- 23 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r] is
- 24 obtained using Table 3.7.3.3.2.37-2 and the *i*th member of the
- 25 set N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r] as the index to
- 26 the table.
- 27 - If USE_FLEX_NUM_BITS_s is equal to '1' and
- 28 FSCH_NBIT_TABLE_IDS_s[FOR_SCH_ID_r] is not equal to '0000',
- 29 then
- 30 + the mobile station shall set
- 31 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], the
- 32 set of number of information bits per frame as follows.
- 33 The *i*th member of the set
- 34 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r] is
- 35 equal to
- 36 NUM_BITS_s[FSCH_NBIT_TABLE_IDS_s[FOR_SCH_ID_r]]
- 37 [N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r][i]], where
- 38 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r][i] denotes the *i*th
- 39 member of the set
- 40 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r] and,

- 1 – Set the AUX_PILOT_TD_QOF field of PILOT_REC to QOF_r.
- 2 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
- 3 AUX_WALSH_r with the Walsh Code length specified by
- 4 WALSH_LENGTH_r.
- 5 – Set the AUX_TD_POWER_LEVEL field of PILOT_REC to
- 6 AUX_TD_POWER_LEVEL_r.
- 7 – Set the TD_MODE field of PILOT_REC to TD_MODE_r.
- 8 ◇ If PILOT_REC_TYPE_r is equal to ‘011’, the mobile station shall:
- 9 – Set the SR3_PRIMARY_PILOT field of PILOT_REC to
- 10 SR3_PRIMARY_PILOT_r.
- 11 – Set the SR3_PILOT_POWER1 field of PILOT_REC to
- 12 SR3_PILOT_POWER1_r.
- 13 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
- 14 SR3_PILOT_POWER2_r.
- 15 ◇ If PILOT_REC_TYPE_r is equal to ‘100’, the mobile station shall:
- 16 – Set the SR3_PRIMARY_PILOT field of PILOT_REC to
- 17 SR3_PRIMARY_PILOT_r.
- 18 – Set the SR3_PILOT_POWER1 field of PILOT_REC to
- 19 SR3_PILOT_POWER1_r.
- 20 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
- 21 SR3_PILOT_POWER2_r.
- 22 – Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
- 23 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
- 24 AUX_PILOT_WALSH_r with the Walsh Code length specified by
- 25 WALSH_LENGTH_r.
- 26 – If ADD_INFO_INCL1_r is equal to ‘1’, set the AUX_PILOT_QOF1
- 27 field of PILOT_REC to QOF1_r and set the
- 28 AUX_PILOT_WALSH_CODE1 field of PILOT_REC to
- 29 AUX_PILOT_WALSH1_r with the Walsh Code length specified
- 30 by WALSH_LENGTH1_r; otherwise, set the AUX_PILOT_QOF1
- 31 field of PILOT_REC to QOF_r and set the
- 32 AUX_PILOT_WALSH_CODE1 field of PILOT_REC to
- 33 AUX_PILOT_WALSH_r with the Walsh Code length specified by
- 34 WALSH_LENGTH_r.

- 1 o If $CCSH_ENCODER_ACTION_TIME_r$ is received, then the mobile
2 station shall set $CCSH_ENCODER_ACTION_TIME_s$ to
3 $CCSH_ENCODER_ACTION_TIME_r$, and the mobile station shall apply
4 each $CCSH_ENCODER_TYPE_s$ at the time specified by
5 $CCSH_ENCODER_ACTION_TIME_r$.
- 6 o If $CCSH_ENCODER_ACTION_TIME_r$ is not received, the mobile
7 station shall apply each $CCSH_ENCODER_TYPE_s$ at the action time
8 of the message.
- 9 + If $3X_DCCH_INFO_INCL_r$ equals '1', for each included member of the
10 Active Set, the mobile station store the following:
- 11 o If $3X_DCCH_LOW_INCL_r$ equals '1', set the
12 $QOF_MASK_ID_DCCH_LOW$ field to $QOF_MASK_ID_DCCH_LOW_r$
13 and the $CODE_CHAN_DCCH_LOW$ field to
14 $CODE_CHAN_DCCH_LOW_r$. Otherwise, set the
15 $QOF_MASK_ID_DCCH_LOW$ field to $QOF_MASK_ID_FCH_r$ and the
16 $CODE_CHAN_DCCH_LOW$ to $CODE_CHAN_FCH_r$.
- 17 o If $3X_DCCH_HIGH_INCL_r$ equals '1', set the
18 $QOF_MASK_ID_DCCH_HIGH$ field to $QOF_MASK_ID_DCCH_HIGH_r$
19 and the $CODE_CHAN_DCCH_HIGH$ field to
20 $CODE_CHAN_DCCH_HIGH_r$. Otherwise, set the
21 $QOF_MASK_ID_DCCH_HIGH$ field to $QOF_MASK_ID_FCH_r$ and the
22 $CODE_CHAN_DCCH_HIGH$ to $CODE_CHAN_FCH_r$.
- 23 o If $3X_SCH_INFO_INCL_r$ equals '1', for each Supplemental Channel
24 included, the mobile station store the following:
- 25 If $3X_SCH_LOW_INCL_r$ equals '1', set
26 $QOF_ID_SCH_LOW[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ to
27 $QOF_MASK_ID_SCH_LOW_r$ and
28 $FOR_SCH_CC_INDEX_LOW[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ field
29 to $CODE_CHAN_SCH_LOW_r$. Otherwise, set
30 $QOF_ID_SCH_LOW[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ to
31 $QOF_MASK_ID_SCH_r$, and
32 $FOR_SCH_CC_INDEX_LOW[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ to
33 $CODE_CHAN_SCH_r$.
- 34 If $3X_SCH_HIGH_INCL_r$ equals '1', set
35 $QOF_ID_SCH_HIGH[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ to
36 $QOF_MASK_ID_SCH_HIGH_r$ and the
37 $FOR_SCH_CC_INDEX_HIGH[FOR_SCH_ID_r][SCCL_INDEX_r][i]$
38 field to $CODE_CHAN_SCH_HIGH_r$. Otherwise, set
39 $QOF_ID_SCH_HIGH[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ to
40 $QOF_MASK_ID_SCH_r$, and
41 $FOR_SCH_CC_INDEX_HIGH[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ to
42 $CODE_CHAN_SCH_r$.

- 1 + The mobile station shall set FUNDICATED_BCMC_IND_S to
2 FUNDICATED_BCMC_IND_T.
- 3 + If FUNDICATED_BCMC_IND_T equals '1', for each included member of the
4 Active Set, the mobile station shall store the following:
- 5 o Set FOR_CPCCH_WALSH_S to FOR_CPCCH_WALSH_T.
- 6 o Set FOR_CPCSCH_S to FOR_CPCSCH_T.
- 7 + The mobile station shall delete all pilots that are not listed in the
8 NUM_PILOTS field from the Active Set.
- 9 + The mobile station shall delete all pilots that are not listed in the Active
10 Set from the Active Set of the Supplemental Channel for the Forward
11 Supplemental Channel Assignment (if any). If these deleted pilots
12 include all pilots in the Active Set of the Supplemental Channel, the
13 mobile station shall cancel the Forward Supplemental Channel
14 Assignment.
- 15 - If CH_IND_T is equal to '111', the mobile station shall perform the following:
- 16 + The mobile station shall set CH_IND_S = '11'.
- 17 + If SCH_INCL_T is equal to '1' and NUM_FOR_SCH is not equal to '00000',
18 for all the NUM_FOR_SCH occurrences, the mobile station shall perform
19 the following:
- 20 o The mobile station shall determine,
21 N_FSCH_BITS_SET_S[FOR_SCH_ID_T][SCCL_INDEX_T], the number of
22 information bits per Forward Supplemental Channel frame identified
23 by FOR_SCH_ID and corresponding to the index SCCL_INDEX
24 according to the following rules:
- 25 If FSCH_VAR_TABLE_ID_S[FOR_SCH_ID_T] is equal to '000', then:
- 26 - If USE_FLEX_NUM_BITS_S is equal to '0' or if
27 USE_FLEX_NUM_BITS_S is equal to '1' and
28 FSCH_NBIT_TABLE_ID_S[FOR_SCH_ID_T] is equal to '0000',
29 then the mobile station shall set the number of information
30 bits per frame,
31 N_FSCH_BITS_SET_S[FOR_SCH_ID_T][SCCL_INDEX_T] and
32 number of CRC bits per frame,
33 FSCH_CRC_LEN_SET_S[FOR_SCH_ID_T][SCCL_INDEX_T],
34 according to Table 3.7.3.3.2.37-2 using
35 FOR_SCH_NUM_BITS_IDX_T as the index to the table.

- 1 + the mobile station shall set
2 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], the
3 set of number of information bits per frame as follows.
4 The *i*th member of the set
5 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r] is
6 equal to
7 NUM_BITS_s[FSCH_NBIT_TABLE_ID_s[FOR_SCH_ID_r]]
8 [N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r][*i*]], where
9 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r][*i*] denotes the *i*th
10 member of the set
11 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r] and,
- 12 + the mobile station shall set
13 FSCH_CRC_LEN_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], the
14 set of number CRC bits per frame as follows.
15 The *i*th member of the set
16 FSCH_CRC_LEN_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r]
17 using Table 3.7.5.20-1 and
18 CRC_LEN_IDX_s[FSCH_NBIT_TABLE_ID_s[FOR_SCH_ID_r]][N
19 _FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r][*i*]] as the index to
20 the table, where
21 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r][*i*] denotes the *i*th
22 member of the set
23 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r].
- 24 + If SCH_INCL_r is equal to '1' and NUM_REV_SCH is not equal to '00000',
25 for all the NUM_REV_SCH occurrences, the mobile station shall perform
26 the following:
- 27 o Set REV_SCH_NUM_BITS_IDX_s[REV_SCH_ID_r] to
28 REV_SCH_NUM_BITS_IDX_r.
 - 29 o Set REV_WALSH_ID_s[REV_SCH_ID_r][REV_SCH_NUM_BITS_IDX_s] to
30 REV_WALSH_ID_r.
- 31 + For each member in the Active Set included in the message, the mobile
32 station shall perform the followings:
- 33 o Set PILOT_PN to PILOT_PN_r.
 - 34 o If SRCH_OFFSET_INCL_r equals '1', set the SRCH_OFFSET field of
35 PILOT_REC to SRCH_OFFSET_r; otherwise, set the SRCH_OFFSET
36 field of PILOT_REC to '000'.
 - 37 o Set ADD_PILOT_REC_INCL to ADD_PILOT_REC_INCL_r.
 - 38 o If ADD_PILOT_REC_INCL_r equals '1', the mobile station shall also
39 perform the following:
 - 40 ◇ Set the PILOT_REC_TYPE field of PILOT_REC to
41 PILOT_REC_TYPE_r.

- 1 ◇ If PILOT_REC_TYPE_r is equal to '000', the mobile station shall set
2 the TD_POWER_LEVEL field of PILOT_REC to
3 TD_POWER_LEVEL_r and set the TD_MODE field of PILOT_REC to
4 TD_MODE_r.
- 5 ◇ If PILOT_REC_TYPE_r is equal to '001', the mobile station shall:
6 – Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
7 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
8 AUX_PILOT_WALSH_r with the Walsh Code length specified by
9 WALSH_LENGTH_r.
- 10 ◇ If PILOT_REC_TYPE_r is equal to '010', the mobile station shall:
11 – Set the AUX_PILOT_TD_QOF field of PILOT_REC to QOF_r.
12 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
13 AUX_WALSH_r with the Walsh Code length specified by
14 WALSH_LENGTH_r.
15 – Set the AUX_TD_POWER_LEVEL field of PILOT_REC to
16 AUX_TD_POWER_LEVEL_r.
17 – Set the TD_MODE field of PILOT_REC to TD_MODE_r.
- 18 ◇ If PILOT_REC_TYPE_r is equal to '011', the mobile station shall:
19 – Set the SR3_PRIMARY_PILOT field of PILOT_REC to
20 SR3_PRIMARY_PILOT_r.
21 – Set the SR3_PILOT_POWER1 field of PILOT_REC to
22 SR3_PILOT_POWER1_r.
23 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
24 SR3_PILOT_POWER2_r.
- 25 ◇ If PILOT_REC_TYPE_r is equal to '100', the mobile station shall:
26 – Set the SR3_PRIMARY_PILOT field of PILOT_REC to
27 SR3_PRIMARY_PILOT_r.
28 – Set the SR3_PILOT_POWER1 field of PILOT_REC to
29 SR3_PILOT_POWER1_r.
30 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
31 SR3_PILOT_POWER2_r.
32 – Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
33 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
34 AUX_PILOT_WALSH_r with the Walsh Code length specified by
35 WALSH_LENGTH_r.

- 1 ◇ If PILOT_INCL is equal to '1' and CCSH_INCLUDED is set to '0',
2 then for each Supplemental Channel included in this record, the
3 mobile station shall set
4 CCSH_ENCODER_TYPE_S[FOR_SCH_ID_r][SCCL_INDEX_r][i] to '0'
5 (default Turbo Encoder type).
6 ◇ The mobile station shall delete all pilots that are not included in
7 the list specified by the NUM_PILOTS field from the Active Set of
8 Supplemental Channel for the corresponding SCCL_INDEX_r.
- 9 + If CCSH_INCLUDED is equal to '1', the mobile station shall perform the
10 following:
- 11 o If CCSH_ENCODER_ACTION_TIME_r is received, then the mobile
12 station shall set CCSH_ENCODER_ACTION_TIME_S to
13 CCSH_ENCODER_ACTION_TIME_r, and the mobile station shall apply
14 each CCSH_ENCODER_TYPE_S at the time specified by
15 CCSH_ENCODER_ACTION_TIME_r.
- 16 o If CCSH_ENCODER_ACTION_TIME_r is not received, the mobile
17 station shall apply each CCSH_ENCODER_TYPE_S at the action time
18 of the message.
- 19 + If 3X_FCH_INFO_INCL_r equals '1', for each included member of the
20 Active Set, the mobile station store the following:
- 21 o If 3X_FCH_LOW_INCL_r equals '1', set the QOF_MASK_ID_FCH_LOW
22 field to QOF_MASK_ID_FCH_LOW_r and the CODE_CHAN_FCH_LOW
23 field to CODE_CHAN_FCH_LOW_r. Otherwise, set the
24 QOF_MASK_ID_FCH_LOW field to QOF_MASK_ID_FCH_r and the
25 CODE_CHAN_FCH_LOW to CODE_CHAN_FCH_r.
- 26 o If 3X_FCH_HIGH_INCL_r equals '1', set the QOF_MASK_ID_FCH_HIGH
27 field to QOF_MASK_ID_FCH_HIGH_r and the
28 CODE_CHAN_FCH_HIGH field to CODE_CHAN_FCH_HIGH_r.
29 Otherwise, set the QOF_MASK_ID_FCH_HIGH field to
30 QOF_MASK_ID_FCH_r and the CODE_CHAN_FCH_HIGH to
31 CODE_CHAN_FCH_r.
- 32 + If 3X_DCCH_INFO_INCL_r equals '1', for each included member of the
33 Active Set, the mobile station store the following:
- 34 o If 3X_DCCH_LOW_INCL_r equals '1', set the
35 QOF_MASK_ID_DCCH_LOW field to QOF_MASK_ID_DCCH_LOW_r
36 and the CODE_CHAN_DCCH_LOW field to
37 CODE_CHAN_DCCH_LOW_r. Otherwise, set the
38 QOF_MASK_ID_DCCH_LOW field to QOF_MASK_ID_FCH_r and the
39 CODE_CHAN_DCCH_LOW to CODE_CHAN_FCH_r.

- 1 o If 3X_DCCH_HIGH_INCL_T equals '1', set the
2 QOF_MASK_ID_DCCH_HIGH field to QOF_MASK_ID_DCCH_HIGH_T
3 and the CODE_CHAN_DCCH_HIGH field to
4 CODE_CHAN_DCCH_HIGH_T. Otherwise, set the
5 QOF_MASK_ID_DCCH_HIGH field to QOF_MASK_ID_FCH_T and the
6 CODE_CHAN_DCCH_HIGH to CODE_CHAN_FCH_T.
- 7 + If 3X_FCH_INFO_INCL_T or 3X_DCCH_INFO_INCL_T equals '1', for each
8 included member of the Active Set, the mobile station store the following:
- 9 o If 3X_SCH_INFO_INCL_T equals '1', for each Supplemental Channel
10 included, the mobile station store the following:
- 11 If 3X_SCH_LOW_INCL_T equals '1', set
12 QOF_ID_SCH_LOW[FOR_SCH_ID_T][SCCL_INDEX_T][i] to
13 QOF_MASK_ID_SCH_LOW_T and the
14 FOR_SCH_CC_INDEX_LOW[FOR_SCH_ID_T][SCCL_INDEX_T][i] field
15 to CODE_CHAN_SCH_LOW_T. Otherwise, set
16 QOF_ID_SCH_LOW[FOR_SCH_ID_T][SCCL_INDEX_T][i] to
17 QOF_MASK_ID_SCH_T, and
18 FOR_SCH_CC_INDEX_LOW[FOR_SCH_ID_T][SCCL_INDEX_T][i] to
19 CODE_CHAN_SCH_T.
- 20 If 3X_SCH_HIGH_INCL_T equals '1', set
21 QOF_ID_SCH_HIGH[FOR_SCH_ID_T][SCCL_INDEX_T][i] to
22 QOF_MASK_ID_SCH_HIGH_T and the
23 FOR_SCH_CC_INDEX_HIGH[FOR_SCH_ID_T][SCCL_INDEX_T][i]
24 field to CODE_CHAN_SCH_HIGH_T. Otherwise, set
25 QOF_ID_SCH_HIGH[FOR_SCH_ID_T][SCCL_INDEX_T][i] to
26 QOF_MASK_ID_SCH_T, and
27 FOR_SCH_CC_INDEX_HIGH[FOR_SCH_ID_T][SCCL_INDEX_T][i] to
28 CODE_CHAN_SCH_T.
- 29 + The mobile station shall set FUNDICATED_BCNC_IND_S to
30 FUNDICATED_BCNC_IND_T.
- 31 + If FUNDICATED_BCNC_IND_T equals '1', the mobile station shall store
32 the following:
- 33 o Set REV_FCH_ASSIGNED_S to REV_FCH_ASSIGNED_T.
- 34 + If FUNDICATED_BCNC_IND_T equals '1', the mobile station shall set
35 FCH_BCNC_IND to '1'; otherwise, the mobile station shall set
36 FCH_BCNC_IND to '0'.
- 37 + If FUNDICATED_BCNC_IND_T equals '1' and FOR_CPCCH_INFO_INCL_T is
38 included and is set to '1', for each included member of the Active Set, the
39 mobile station shall store the following:
- 40 o Set FOR_CPCCH_WALSH_S to FOR_CPCCH_WALSH_T.
- 41 o Set FOR_CPCSCH_S to FOR_CPCSCH_T.

- 1 + If FUNDICATED_BCNC_IND_r equals '1' and ADD_PLCM_FOR_FCH_INCL_r
2 is included and is set to '1', the mobile station shall store the following:
- 3 o Set ADD_PLCM_FOR_FCH_TYPE_s to ADD_PLCM_FOR_FCH_TYPE_r.
4 o Set ADD_PLCM_FOR_FCH_39_s to ADD_PLCM_FOR_FCH_39_r if
5 ADD_PLCM_FOR_FCH_TYPE_r is equal to '1'.
- 6 + The mobile station shall delete all pilots that are not listed in the
7 NUM_PILOTS field from the Active Set.
- 8 + The mobile station shall delete all pilots that are not listed in the Active
9 Set from the Active Set of the Supplemental Channel for the Forward
10 Supplemental Channel Assignment (if any). If these deleted pilots
11 include all pilots in the Active Set of the Supplemental Channel, the
12 mobile station shall cancel the Forward Supplemental Channel
13 Assignment.
- 14 - If CH_IND_r is equal to '000', the mobile station shall perform the following:
- 15 + If this message assigns a Forward Packet Data Channel or Reverse
16 Packet Data Channel which was not assigned prior to the action time of
17 this message, Layer 3 shall send SIG-HandoffPDCH.Indication
18 (handoff_type = HANDOFF) to the MAC layer; otherwise, Layer 3 shall
19 send SIG-HandoffPDCH.Indication (handoff_type = ASSIGN) to the MAC
20 layer.
- 21 + If the message includes a Reverse Packet Data Channel assignment, the
22 mobile station shall cancel the Reverse Supplemental Channel
23 assignment, if any, at the action time of the message.
- 24 + The mobile station shall set CH_IND_s to '000'.
- 25 + The mobile station shall set EXT_CH_IND_s to EXT_CH_IND_r.
- 26 + If PDCH_CONTROL_HOLD_r is equal to '0' and
27 PILOT_GATING_USE_RATE is equal to '1', the mobile station shall set
28 PILOT_GATING_USE_RATE to '0' and shall start the continuous reverse
29 pilot at the specified action time of the message and, if a F-PDCH is
30 assigned, the mobile station shall start the continuous R-CQICH as
31 defined in [3].
- 32 + If PDCH_CONTROL_HOLD_r is equal to '1', the mobile station may
33 perform the following:
- 34 o Set PILOT_GATING_USE_RATE equal to '1' and start the reverse pilot
35 gating and Reverse CQI Channel gating at PILOT_GATING_RATE_s at
36 the action time of the message.
- 37 o The mobile station shall cancel the forward and reverse supplemental
38 channel assignment, if any.

- 1 + The mobile station shall set FULL_CI_FEEDBACK_IND_s to
2 FULL_CI_FEEDBACK_IND_r.
- 3 + If EXT_CH_IND_r equals '01000', the mobile station shall set
4 FOR_CPCCH_RATE_s to FOR_CPCCH_RATE_r, and
5 FOR_CPCCH_UPDATE_RATE_s to FOR_CPCCH_UPDATE_RATE_r;
6 otherwise, the mobile station shall set FOR_CPCCH_RATE_s to '00', and
7 FOR_CPCCH_UPDATE_RATE_s to '00'.
- 8 + The mobile station shall set REV_CQICH_FRAME_OFFSET_s to
9 REV_CQICH_FRAME_OFFSET_r.
- 10 + The mobile station shall set REV_CQICH_REPS_s to REV_CQICH_REPS_r.
- 11 + The mobile station shall set REV_ACKCH_REPS_s to REV_ACKCH_REPS_r.
- 12 + If SCH_INCL_r is equal to '1', and EXT_CH_IND_r signals the allocation of a
13 F-FCH or a F-DCCH, and NUM_FOR_SCH is not equal to '00000', for all
14 the NUM_FOR_SCH occurrences, the mobile station shall perform the
15 following:
- 16 o The mobile station shall determine,
17 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], the number of
18 information bits per Forward Supplemental Channel frame identified
19 by FOR_SCH_ID and corresponding to the index SCCL_INDEX
20 according to the following rules:
- 21 If FSCH_VAR_TABLE_ID_s[FOR_SCH_ID_r] is equal to '000', then:
- 22 - If USE_FLEX_NUM_BITS_s is equal to '0' or if
23 USE_FLEX_NUM_BITS_s is equal to '1' and
24 FSCH_NBIT_TABLE_ID_s[FOR_SCH_ID_r] is equal to '0000',
25 then the mobile station shall set the number of information
26 bits per frame,
27 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r] and
28 number of CRC bits per frame,
29 FSCH_CRC_LEN_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r],
30 according to Table 3.7.3.3.2.37-2 using
31 FOR_SCH_NUM_BITS_IDX_r as the index to the table.

- 1 + the mobile station shall set
2 $N_FSCH_BITS_SET_S[FOR_SCH_ID_R][SCCL_INDEX_R]$, the
3 set of number of information bits per frame as follows.
4 The i^{th} member of the set
5 $N_FSCH_BITS_SET_S[FOR_SCH_ID_R][SCCL_INDEX_R]$ is
6 equal to
7 $NUM_BITS_S[FSCH_NBIT_TABLE_ID_S[FOR_SCH_ID_R]]$
8 $[N_FSCH_BITS_IDX_SET_S[FOR_SCH_ID_R][i]]$, where
9 $N_FSCH_BITS_IDX_SET_S[FOR_SCH_ID_R][i]$ denotes the i^{th}
10 member of the set
11 $N_FSCH_BITS_IDX_SET_S[FOR_SCH_ID_R]$ and,
- 12 + the mobile station shall set
13 $FSCH_CRC_LEN_SET_S[FOR_SCH_ID_R][SCCL_INDEX_R]$, the
14 set of number CRC bits per frame as follows.
15 The i^{th} member of the set
16 $FSCH_CRC_LEN_SET_S[FOR_SCH_ID_R][SCCL_INDEX_R]$
17 using Table 3.7.5.20-1 and
18 $CRC_LEN_IDX_S[FSCH_NBIT_TABLE_ID_S[FOR_SCH_ID_R]][N$
19 $_FSCH_BITS_IDX_SET_S[FOR_SCH_ID_R][i]]$ as the index to
20 the table, where
21 $N_FSCH_BITS_IDX_SET_S[FOR_SCH_ID_R][i]$ denotes the i^{th}
22 member of the set
23 $N_FSCH_BITS_IDX_SET_S[FOR_SCH_ID_R]$.
- 24 + If SCH_INCL_R is equal to '1' and NUM_REV_SCH is not equal to '00000',
25 for all the NUM_REV_SCH occurrences, the mobile station shall perform
26 the following:
- 27 o Set $REV_SCH_NUM_BITS_IDX_S[REV_SCH_ID_R]$ to
28 $REV_SCH_NUM_BITS_IDX_R$.
 - 29 o Set $REV_WALSH_ID_S[REV_SCH_ID_R][REV_SCH_NUM_BITS_IDX_S]$ to
30 $REV_WALSH_ID_R$.
- 31 + If $FOR_PDCH_RLGAIN_INCL_R$ is included and equal to '1', the mobile
32 station shall set $RLGAIN_ACKCH_PILOT_S$ to $RLGAIN_ACKCH_PILOT_R$,
33 and $RLGAIN_CQICH_PILOT_S$ to $RLGAIN_CQICH_PILOT_R$.
- 34 + If $FOR_PDCH_PARMS_INCL_R$ is equal to '1', the mobile station shall set
35 $NUM_SOFT_SWITCHING_FRAMES_S$ to
36 $NUM_SOFT_SWITCHING_FRAMES_R + 1$, and
37 $NUM_SOFTER_SWITCHING_FRAMES_S$ to
38 $NUM_SOFTER_SWITCHING_FRAMES_R + 1$.
- 39 + If $CHM_SWITCHING_PARMS_INCL_R$ is included and equal to '1', the
40 mobile station shall set $NUM_SOFT_SWITCHING_FRAMES_CHM_S$ to
41 $NUM_SOFT_SWITCHING_FRAMES_CHM_R + 1$, and
42 $NUM_SOFTER_SWITCHING_FRAMES_CHM_S$ to
43 $NUM_SOFTER_SWITCHING_FRAMES_CHM_R + 1$.

- 1 + If CHM_SWITCHING_PARAMS_INCL_T is included and equal to '0', the
2 mobile station shall set NUM_SOFT_SWITCHING_FRAMES_CHM_S to
3 NUM_SOFT_SWITCHING_FRAMES_T + 1, and
4 NUM_SOFT_SWITCHING_FRAMES_CHM_S to
5 NUM_SOFT_SWITCHING_FRAMES_T + 1.
- 6 + If FOR_PDCH_PARAMS_INCL_T is equal to '1', the mobile station shall
7 set NUM_SOFT_SWITCHING_SLOTS_S according to Table 3.7.2.3.2.21-9
8 based on the value of NUM_SOFT_SWITCHING_SLOTS_T.
- 9 + If FOR_PDCH_PARAMS_INCL_T is equal to '1', the mobile station shall
10 set NUM_SOFT_SWITCHING_SLOTS_S according to Table 3.7.2.3.2.21-
11 9 based on the value of NUM_SOFT_SWITCHING_SLOTS_T.
- 12 + If CHM_SWITCHING_PARAMS_INCL_T is included and equal to '1', the
13 mobile station shall:
- 14 o Set NUM_SOFT_SWITCHING_SLOTS_CHM_S according to Table
15 3.7.2.3.2.21-9 based on the value of
16 NUM_SOFT_SWITCHING_SLOTS_CHM_T.
- 17 o Set NUM_SOFT_SWITCHING_SLOTS_CHM_S according to Table
18 3.7.2.3.2.21-9 based on the value of
19 NUM_SOFT_SWITCHING_SLOTS_CHM_T.
- 20 + If CHM_SWITCHING_PARAMS_INCL_T is included and equal to '0', the
21 mobile station shall:
- 22 o Set NUM_SOFT_SWITCHING_SLOTS_CHM_S according to Table
23 3.7.2.3.2.21-9 based on the value of
24 NUM_SOFT_SWITCHING_SLOTS_T.
- 25 o Set NUM_SOFT_SWITCHING_SLOTS_CHM_S according to Table
26 3.7.2.3.2.21-9 based on the value of
27 NUM_SOFT_SWITCHING_SLOTS_T.
- 28 + If FOR_PDCH_PARAMS_INCL_T is equal to '1', the mobile station shall set
29 PDCH_SOFT_SWITCHING_DELAY_S to PDCH_SOFT_SWITCHING_DELAY_T
30 + 1, and PDCH_SOFT_SWITCHING_DELAY_S to
31 PDCH_SOFT_SWITCHING_DELAY_T + 1.
- 32 + If FOR_PDCH_PARAMS_INCL_T is equal to '1', and
33 FOR_PDCH_COMMON_PARAMS_T is equal to '1', the mobile station shall
34 store the following parameters that are common to all pilots in the Active
35 Set:
- 36 o The mobile station shall set FOR_PDCH_COMMON_PARAMS_S to '1'.
37 o The mobile station shall set WALSH_TABLE_ID_S to
38 WALSH_TABLE_ID_T.
- 39 o The mobile station shall set NUM_PDCCH_S to NUM_PDCCH_T.

- 1 o The mobile station shall set FOR_PDCCH_WALSH_S[i] to the ith
2 occurrence of FOR_PDCCH_WALSH_r.
- 3 o The mobile station shall set TX_DISABLED_TIMER_S to
4 TX_DISABLED_TIMER_r.
- 5 + If FOR_PDCH_PARAMS_INCL_r is equal to '0', and
6 FOR_PDCH_COMMON_PARAMS_S is equal to '0', the mobile station shall
7 send a *Mobile Station Reject Order* with ORDQ equal to '00000011'
8 (message structure not acceptable) and remain in the current state.
- 9 + If EXT_CH_IND_r signals the allocation of a R-PDCH, the mobile station
10 shall:
- 11 o Set FOR_GCH_ASSIGNED_S to FOR_GCH_ASSIGNED_r.
- 12 o Set FOR_RCCH_ASSIGNED_S to FOR_RCCH_ASSIGNED_r.
- 13 o If FOR_RCCH_ASSIGNED_S is equal to '1', the mobile station shall:
- 14 ◇ Set FOR_RCCH_DRC_MODE_S to FOR_RCCH_DRC_MODE_r.
- 15 ◇ Set FOR_RCCH_REPETITION_S to FOR_RCCH_REPETITION_r.
- 16 ◇ Set FOR_RCCH_UPDATE_RATE_S to FOR_RCCH_UPDATE_RATE_r.
- 17 o If FOR_ACKCH_ASSIGNED_r is equal to '1', the mobile station shall
18 set FOR_ACKCH_MODE_S to FOR_ACKCH_MODE_r.
- 19 o If FOR_ACKCH_COMB_SEL_r is included, the mobile station shall set
20 FOR_ACKCH_COMB_SEL_S to FOR_ACKCH_COMB_SEL_r; otherwise,
21 the mobile station shall set FOR_ACKCH_COMB_SEL_S to '0'.
- 22 o If REV_PDCH_RLGAIN_INCL_r is included and equal to '1', the mobile
23 station shall perform the following:
- 24 ◇ The mobile station shall set RLGAIN_SPICH_PILOT_S to
25 RLGAIN_SPICH_PILOT_r.
- 26 ◇ The mobile station shall set RLGAIN_REQCH_PILOT_S to
27 RLGAIN_REQCH_PILOT_r.
- 28 ◇ The mobile station shall set RLGAIN_PDCCH_PILOT_S to
29 RLGAIN_PDCCH_PILOT_r.
- 30 o If REV_PDCH_PARAMS_1_INCL_r is included and equal to '1', the
31 mobile station shall perform the following:
- 32 ◇ The mobile station shall set REV_PDCH_TABLE_SEL_S to
33 REV_PDCH_TABLE_SEL_r.
- 34 ◇ The mobile station shall set REV_PDCH_MAX_AUTO_TPR_S to
35 REV_PDCH_MAX_AUTO_TPR_r.
- 36 + Otherwise, the mobile station shall:
- 37 o Set FOR_GCH_ASSIGNED_S to NULL.

- 1 o Set FOR_RCCH_ASSIGNED_s to NULL.
- 2 + For each member of the Active Set included in the message, the mobile
3 station shall perform the following:
- 4 o Set PILOT_PN to PILOT_PN_r.
- 5 o If SRCH_OFFSET_INCL_r equals '1', set the SRCH_OFFSET field of
6 PILOT_REC to SRCH_OFFSET_r; otherwise, set the SRCH_OFFSET
7 field of PILOT_REC to '000'.
- 8 o Set ADD_PILOT_REC_INCL to ADD_PILOT_REC_INCL_r.
- 9 o If ADD_PILOT_REC_INCL_r equals '1', the mobile station shall also
10 perform the following:
- 11 ◇ Set the PILOT_REC_TYPE field of PILOT_REC to
12 PILOT_REC_TYPE_r.
- 13 ◇ If PILOT_REC_TYPE_r is equal to '000', the mobile station shall set
14 the TD_POWER_LEVEL field of PILOT_REC to
15 TD_POWER_LEVEL_r and set the TD_MODE field of
16 NGHBR_PILOT_REC to TD_MODE_r.
- 17 ◇ If PILOT_REC_TYPE_r is equal to '001', the mobile station shall:
- 18 – Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
- 19 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
20 AUX_PILOT_WALSH_r with the Walsh Code length specified by
21 WALSH_LENGTH_r.
- 22 ◇ If PILOT_REC_TYPE_r is equal to '010', the mobile station shall:
- 23 – Set the AUX_PILOT_TD_QOF field of PILOT_REC to QOF_r.
- 24 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
25 AUX_WALSH_r with the Walsh Code length specified by
26 WALSH_LENGTH_r.
- 27 – Set the AUX_TD_POWER_LEVEL field of PILOT_REC to
28 AUX_TD_POWER_LEVEL_r.
- 29 – Set the TD_MODE field of PILOT_REC to TD_MODE_r.
- 30 o Set FOR_PDCH_INCL_s to FOR_PDCH_INCL_r.
- 31 o If FOR_PDCH_INCL_r is equal to '1', the mobile station shall perform
32 the following:
- 33 ◇ If FOR_PDCH_PARAMS_INCL_r is equal to '1', and
34 FOR_PDCH_COMMON_PARAMS_r is equal to '0', the mobile station
35 shall store the following parameters:
- 36 – The mobile station shall set FOR_PDCH_COMMON_PARAMS_s
37 to '0'.

- 1 – The mobile station shall set WALSH_TABLE_ID_S to
2 WALSH_TABLE_ID_T.
- 3 – The mobile station shall set NUM_PDCCH_S to NUM_PDCCH_T.
- 4 – The mobile station shall set FOR_PDCCH_WALSH_S[i] to the ith
5 occurrence of FOR_PDCCH_WALSH_T.
- 6 ◇ The mobile station shall set MAC_ID_S to MAC_ID_T.
- 7 ◇ The mobile station shall set REV_CQICH_COVER_S to
8 REV_CQICH_COVER_T.
- 9 ◇ If EXT_CH_IND_T signals the allocation of a F-CPCCH, the mobile
10 station shall set FOR_CPCCH_WALSH_S to FOR_CPCCH_WALSH_T,
11 and FOR_CPCSCH_S to FOR_CPCSCH_T.
- 12 ◇ The mobile station shall store FOR_PDCCH_WALSH_S[i] to the ith
13 occurrence of FOR_PDCCH_WALSH_T.
- 14 o The mobile station shall set PWR_COMB_IND_S to PWR_COMB_IND_T.
- 15 o If PDCH_GROUP_IND_INCL_T is equal to '1', the mobile station shall
16 set PDCH_GROUP_IDENTIFIERS as follows:
- 17 ◇ If this is the first pilot in the list that has a F-PDCH assignment,
18 the mobile station shall perform the following:
- 19 – The mobile station shall set PDCH_GROUP_IDENTIFIERS to
20 '000';
- 21 ◇ Otherwise, the mobile station shall perform the following:
- 22 – If PDCH_GROUP_IND_T is set to '1', the mobile station shall set
23 PDCH_GROUP_IDENTIFIERS to the same value as that of the
24 previous pilot in the list that has a F-PDCH assigned;
25 otherwise, the mobile station shall set
26 PDCH_GROUP_IDENTIFIERS to the value one greater than
27 that of the previous pilot in the list that has a F-PDCH
28 assigned.
- 29 o Otherwise, the mobile station shall perform the following:
- 30 ◇ If this is the first pilot in the list that has a F-PDCH assignment,
31 the mobile station shall perform the following:
- 32 – The mobile station shall set PDCH_GROUP_IDENTIFIERS to
33 '000';
- 34 ◇ Otherwise, the mobile station shall perform the following:
- 35 – If F-PDCH is assigned for this pilot, the mobile station shall
36 perform the following:

- 1 + If PWR_COMB_IND_r is set to '1', and there are no pilots
2 between this pilot and the previous pilot in the list that
3 has a F-PDCH assigned, the mobile station shall set
4 PDCH_GROUP_IDENTIFIER_s to the same value as that of
5 the previous pilot in the list that has a F-PDCH assigned.
- 6 + If PWR_COMB_IND_r is set to '1', and all pilots between
7 this pilot and the previous pilot in the list that has a F-
8 PDCH assigned have PWR_COMB_IND set to '1', the
9 mobile station shall set PDCH_GROUP_IDENTIFIER_s to
10 the same value as that of the previous pilot in the list that
11 has a F-PDCH assigned.
- 12 + Otherwise, the mobile station shall set
13 PDCH_GROUP_IDENTIFIER_s to the value one greater than
14 that of the previous pilot in the list.
- 15 - Otherwise, the mobile station shall set
16 PDCH_GROUP_IDENTIFIER_s to NULL.
- 17 o If EXT_CH_IND_r signals the allocation of a F-FCH, the mobile station
18 shall set CODE_CHAN_FCH_s to CODE_CHAN_FCH_r, and
19 QOF_MASK_ID_FCH_s to QOF_MASK_ID_FCH_r.
- 20 o If EXT_CH_IND_r signals the allocation of a F-DCCH, the mobile
21 station shall set CODE_CHAN_DCCH_s to CODE_CHAN_DCCH_r, and
22 QOF_MASK_ID_DCCH_s to QOF_MASK_ID_DCCH_r.
- 23 o If EXT_CH_IND_r signals the allocation of a F-DCCH, the mobile
24 station shall set CODE_CHAN_DCCH_s to CODE_CHAN_DCCH_r, and
25 QOF_MASK_ID_DCCH_s to QOF_MASK_ID_DCCH_r.
- 26 o If FOR_PDCH_INCL_r is equal to '1', EXT_CH_IND_r signals the
27 allocation of a R-PDCH, and if FOR_ACKCH_ASSIGNED_r is equal to
28 '1', the mobile station shall set FOR_ACKCH_WALSH_INDEX_s to
29 FOR_ACKCH_WALSH_INDEX_r, and FOR_ACKSCH_INDEX_s to
30 FOR_ACKSCH_INDEX_r.
- 31 o If FOR_RCCH_INCL_r is included and set to '1', the mobile station
32 shall do the following:
- 33 ◇ set FOR_RCCH_WALSH_INDEX_s to FOR_RCCH_WALSH_INDEX_s.
- 34 ◇ set FOR_RCSCH_INDEX_s to FOR_RCSCH_INDEX_r.
- 35 o If FOR_PDCH_INCL_r is equal to '1', and if FOR_GCH_ASSIGNED_r is
36 included and set to '1', the mobile station shall perform the following;
- 37 ◇ set NUM_FOR_GCH_s to NUM_FOR_GCH_r, and
- 38 ◇ for each of the NUM_FOR_GCH_s occurrences of
39 FOR_GCH_WALSH_INDEX_r, the mobile station shall set
40 FOR_GCH_WALSH_INDEX_s[j] to FOR_GCH_WALSH_INDEX_r[j].

- 1 o Otherwise, the mobile station shall perform the following:
- 2 ◇ set NUM_FOR_GCH_S to 0, and
- 3 ◇ set FOR_GCH_WALSH_INDEX_S to NULL.
- 4 o If SCH_INCL_T is equal to '1' and NUM_SCH is equal to '00000', the
- 5 mobile station shall delete the corresponding pilot from the all entries
- 6 of the corresponding Supplemental Channel.
- 7 o If SCH_INCL_T is equal to '1' and NUM_SCH is not equal to '00000', for
- 8 each Supplemental Channel included in this record, the mobile
- 9 station shall:
- 10 ◇ If PILOT_INCL is equal to '0', then the mobile station shall delete
- 11 the corresponding pilot from the Active Set of Supplemental
- 12 Channel for the corresponding SCCL_INDEX_T.
- 13 ◇ If PILOT_INCL is equal to '1', then for each Supplemental Channel
- 14 included in this record, the mobile station shall set PILOT_PN_S
- 15 [FOR_SCH_ID_T][SCCL_INDEX_T][i] to PILOT_PN_T,
- 16 QOF_ID_S[FOR_SCH_ID_T][SCCL_INDEX_T][i] to
- 17 QOF_MASK_ID_SCH_T, and
- 18 FOR_SCH_CC_INDEX_S[FOR_SCH_ID_T][SCCL_INDEX_T][i] to
- 19 CODE_CHAN_SCH_T.
- 20 ◇ If PILOT_INCL is equal to '1' and CCSH_INCLUDED is set to '1',
- 21 then for each Supplemental Channel included in this record, the
- 22 mobile station shall set
- 23 CCSH_ENCODER_TYPE_S[FOR_SCH_ID_T][SCCL_INDEX_T][i] to
- 24 CCSH_ENCODER_TYPE_T.
- 25 ◇ If PILOT_INCL is equal to '1' and CCSH_INCLUDED is set to '0',
- 26 then for each Supplemental Channel included in this record, the
- 27 mobile station shall set
- 28 CCSH_ENCODER_TYPE_S[FOR_SCH_ID_T][SCCL_INDEX_T][i] to '0'
- 29 (default Turbo Encoder type).
- 30 ◇ The mobile station shall delete all pilots that are not included in
- 31 the list specified by the NUM_PILOTS field from the Active Set of
- 32 Supplemental Channel for the corresponding SCCL_INDEX_T.
- 33 + If CCSH_INCLUDED is equal to '1', the mobile station shall perform the
- 34 following:
- 35 o If CCSH_ENCODER_ACTION_TIME_T is received, then the mobile
- 36 station shall set CCSH_ENCODER_ACTION_TIME_S to
- 37 CCSH_ENCODER_ACTION_TIME_T, and the mobile station shall apply
- 38 each CCSH_ENCODER_TYPE_S at the time specified by
- 39 CCSH_ENCODER_ACTION_TIME_T.

- 1 o If $CCSH_ENCODER_ACTION_TIME_r$ is not received, the mobile
2 station shall apply each $CCSH_ENCODER_TYPE_s$ at the action time
3 of the message.
- 4 + The mobile station shall set $FUNDICATED_BCMC_IND_s$ to
5 $FUNDICATED_BCMC_IND_r$. If $FUNDICATED_BCMC_IND_r$ equals '1' and
6 the $EXT_CH_IND_r$ signals the allocation of a F-FCH, the mobile station
7 shall set FCH_BCMC_IND to '1'; otherwise, the mobile station shall set
8 FCH_BCMC_IND to '0'.
- 9 + If $FUNDICATED_BCMC_IND_r$ equals '1' and $ADD_PLCM_FOR_FCH_INCL_r$
10 is included and is set to '1', the mobile station shall store the following:
- 11 o Set $ADD_PLCM_FOR_FCH_TYPE_s$ to $ADD_PLCM_FOR_FCH_TYPE_r$.
- 12 o Set $ADD_PLCM_FOR_FCH_39_s$ to $ADD_PLCM_FOR_FCH_39_r$ if
13 $ADD_PLCM_FOR_FCH_TYPE_r$ is equal to '1'.
- 14 + The mobile station shall delete all pilots that are not listed in the
15 NUM_PILOTS field from the Active Set.
- 16 + The mobile station shall delete all pilots that are not listed in the Active
17 Set from the Active Set of the Supplemental Channel for the Forward
18 Supplemental Channel Assignment (if any). If these deleted pilots
19 include all pilots in the Active Set of the Supplemental Channel, the
20 mobile station shall cancel the Forward Supplemental Channel
21 Assignment.
- 22 • If the CH_IND_r is set to '111' and $FUNDICATED_BCMC_IND_r$ equals '1', the
23 mobile station shall change the R-FCH assignment as specified in
24 $REV_FCH_ASSIGNED_r$, at the specified action time.
- 25 • If the most significant bit of CH_IND_r is set to '1' and
26 $PILOT_GATING_USE_RATE$ is equal to '1', the mobile station shall set
27 $PILOT_GATING_USE_RATE$ to '0' and shall start the continuous reverse pilot at
28 the specified action time. If the most significant bit of CH_IND_r is set to '0',
29 CH_IND_r is not equal to '000', and $PILOT_GATING_USE_RATE$ is equal to '0', the
30 mobile station shall perform the following:
- 31 – The mobile station shall set $PILOT_GATING_USE_RATE$ to '1' and shall start
32 the reverse pilot gating at the specified action time.
- 33 – If the Fundamental Channel is also being released, the mobile station shall
34 store the configuration used for the Fundamental Channel.
- 35 – The mobile station shall cancel the forward and reverse supplemental
36 channel assignment, if any.
- 37 • The mobile station shall set $IGNORE_ESCAM_s$ and $IGNORE_SCAM_s$ to '0'.
- 38 • Set the pilot detection threshold for the Target Frequency and the Candidate
39 Frequency:
- 40 – Set $TF_T_ADD_s$ to T_ADD_s .

- 1 – If the Target Frequency is the same as the Candidate Frequency
2 (TF_CDMABAND_S is equal to CF_CDMABAND_S and TF_CDMACH_S is equal
3 to CF_CDMACH_S), set CF_T_ADD_S to T_ADD_S.
- 4 • If PERIODIC_SEARCH_S is equal to '0' and a periodic search is in progress, the
5 mobile station shall abort the periodic search (see 2.6.6.2.8.3.4 and
6 2.6.6.2.10.4).
- 7 • The mobile station shall determine its roaming status (see 2.6.5.3). The mobile
8 station should indicate to the user whether the mobile station is roaming.
- 9 • Perform a soft or hard handoff depending on the following conditions:
- 10 – If any of the following conditions is true, the mobile station shall perform a hard
11 handoff:
- 12 + EXTRA_PARMS is set to '1' and either BAND_CLASS_R is not equal to
13 SF_CDMABAND_S, CDMA_FREQ_R is not equal to SF_CDMACH_S, or
14 FRAME_OFFSET_R is not equal to SF_FRAME_OFFSET_S, or
- 15 + The set of pilots specified by the message is disjoint from the Active Set prior
16 to the action time of the message.
- 17 – If the mobile station performs a hard handoff, it shall perform the following:
- 18 + If a Periodic Serving Frequency Pilot Report Procedure is in progress, the
19 mobile station shall abort the procedure (see 2.6.6.2.12).
- 20 + If a Candidate Frequency periodic search is in progress, the mobile station
21 shall abort the periodic search (see 2.6.6.2.8.3.4 and 2.6.6.2.10.4).
- 22 + If a Forward Supplemental Channel assignment or a Reverse Supplemental
23 Channel assignment is in progress, the mobile station shall abort it.
- 24 + The mobile station shall cancel any outstanding Forward Supplemental
25 Channel assignment or Reverse Supplemental Channel assignment that
26 is not specified by this message.
- 27 + The mobile station shall cancel the current Forward Supplemental Channel
28 assignment or the Reverse Supplemental Channel assignment, if it is in
29 progress. If the message does not specify another Forward Supplemental
30 Channel assignment or Reverse Supplemental Channel assignment, the
31 mobile station shall cancel the outstanding Forward Supplemental Channel
32 assignment or Reverse Supplemental Channel assignment, if any.
- 33 + If RETURN_IF_HANDOFF_FAIL_S is equal to '0', the mobile station shall
34 perform actions specified in 2.6.6.2.8.1. If the message specifies more than
35 one pilot, the mobile station shall also perform actions specified in
36 2.6.6.2.7.1 and 2.6.6.2.7.2.
- 37 + If RETURN_IF_HANDOFF_FAIL_S is equal to '1', the mobile station shall
38 perform actions specified in 2.6.6.2.8.2. If the message specifies more than
39 one pilot, the mobile station shall also perform actions specified in
40 2.6.6.2.7.1 and 2.6.6.2.7.2.

- 1 – Otherwise, the mobile station shall perform a soft handoff as specified in
2 2.6.6.2.7.
- 3 12. *Mobile Assisted Burst Operation Parameters Message:* The mobile station shall
4 process this message as follows:
- 5 • The mobile station shall set ORDER_FLAG_s to ORDER_FLAG_r.
 - 6 • If ORDER_FLAG_r is equal to '1', the mobile station shall perform the
7 following:
8 – The mobile station shall set PS_MIN_DELTA_s to PS_MIN_DELTA_r + 1.
9 – The mobile station shall set ORDER_INTERVAL_s to ORDER_INTERVAL_r.
 - 10 • If ORDER_FLAG_r is equal to '0', the mobile station shall perform the
11 following:
12 – The mobile station shall set PS_MIN_DELTA_s to 0.
13 – The mobile station shall set ORDER_INTERVAL_s to 0.
 - 14 • The mobile station shall set PERIODIC_FLAG_s to PERIODIC_FLAG_r.
 - 15 • If PERIODIC_FLAG_r is equal to '1', the mobile station shall perform the
16 following:
17 – The mobile station shall set NUM_PILOTS_s to NUM_PILOTS_r.
18 – The mobile station shall set PERIODIC_INTERVAL_s to
19 PERIODIC_INTERVAL_r.
 - 20 • If PERIODIC_FLAG_r is equal to '0', the mobile station shall perform the
21 following:
22 – The mobile station shall set NUM_PILOTS_s to 0.
23 – The mobile station shall set PERIODIC_INTERVAL_s to 0.
 - 24 • The mobile station shall set THRESHOLD_FLAG_s to THRESHOLD_FLAG_r.
 - 25 • If THRESHOLD_FLAG_r is equal to '1', the mobile station shall perform the
26 following:
27 – The mobile station shall set PS_FLOOR_LOW_s to PS_FLOOR_LOW_r.
28 – The mobile station shall set PS_FLOOR_HIGH_s to PS_FLOOR_HIGH_r.
29 – The mobile station shall set PS_CEILING_LOW_s to PS_CEILING_LOW_r.
30 – The mobile station shall set PS_CEILING_HIGH_s to PS_CEILING_HIGH_r.
 - 31 • If THRESHOLD_FLAG_r is equal to '0', the mobile station shall perform the
32 following:
33 – The mobile station shall set PS_FLOOR_LOW_s to '0'.
34 – The mobile station shall set PS_FLOOR_HIGH_s to '0'.
35 – The mobile station shall set PS_CEILING_LOW_s to '0'.

- The mobile station shall set PS_CEILING_HIGH_s to '0'.

13. *Extended Supplemental Channel Assignment Message*: The mobile station shall process this message as follows:

The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to the specified value if any of the following conditions is true, and shall not perform any other action described in this section for processing the *Extended Supplemental Channel Assignment Message*:

- The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00000110' (capability not supported), if the number of forward or reverse Supplemental Channels specified in the *Extended Supplemental Channel Assignment Message* is greater than the maximum number of Supplemental Channels supported by the mobile station.
- The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00000100' (message field not in valid range), if PILOT_PN specified in the *Extended Supplemental Channel Assignment Message* is not in the Active Set.
- The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00000111' (message can not be handled by the current mobile station configuration), if the message includes a reverse Supplemental Channel assignment, and any of the following conditions is true:
 - any of the mobile station's reverse supplemental channel configuration parameter for the corresponding Supplemental Channel is NULL, or,
 - the Reverse Packet Data Channel is assigned.
- The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00000111' (message can not be handled by the current mobile station configuration), if the message includes a forward Supplemental Channel assignment and any of the mobile station's forward supplemental channel configuration parameter for the corresponding Supplemental Channel is NULL.

If none of the above conditions is true, the mobile station shall perform the following:

- The mobile station shall store REV_SCH_DTX_DURATION_r, Reverse Supplemental Channel Discontinuous Transmission Duration, as REV_SCH_DTX_DURATION_s at the action time of the message.
- The mobile station shall store the unit for START_TIME_UNIT_s = START_TIME_UNIT_r.
- The mobile station shall store USE_T_ADD_ABORT_r, Reverse Supplemental Channel assignment T_ADD abort indicator, as USE_T_ADD_ABORT_s.
- If IGNORE_ESCAM_s is equal to '1' and SCRM_SEQ_NUM_r is not present or is present and is not equal to SCRM_SEQ_NUM_s, then the mobile station shall

- 1 not process the remaining Reverse Supplemental Channel assignment
2 information in this message.
- 3 • If IGNORE_ESCAM_s is equal to '1' and SCRM_SEQ_NUM_r is present and is
4 equal to SCRM_SEQ_NUM_s, then the mobile station shall set
5 IGNORE_ESCAM_s to '0'.
 - 6 • If ADD_INFO_INCL_r is equal to '1', the message includes a Supplemental
7 Channel assignment (that is, NUM_FOR_SCH_r is not equal to '00' and/or
8 NUM_REV_SCH_r is not equal to '00'), and PILOT_GATING_USE_RATE is
9 equal to '1', the mobile station shall process the following information of the
10 *Extended Supplemental Channel Assignment Message* as follows:
 - 11 – The mobile station shall set FPC_PRI_CHAN_s = FPC_PRI_CHAN_r at the
12 action time of the message.
 - 13 • If REV_CFG_INCLUDED is equal to '1', for all the (NUM_REV_CFG_RECS +
14 1) occurrences of the reverse configuration record, the mobile station shall
15 store the REV_WALSH_ID matrix as follows:
 - 16 – REV_WALSH_ID_s[REV_SCH_ID_r][REV_SCH_NUM_BITS_IDX_r] =
17 REV_WALSH_ID_r
 - 18 • If NUM_REV_SCH_r is not equal to '00', then the mobile station shall store
19 the following information for each occurrence of the record and process the
20 Reverse Supplemental Burst as specified in 2.6.6.2.5.1.2:
 - 21 – REV_SCH_START_TIME_INCL_s[REV_SCH_ID_r] =
22 REV_SCH_START_TIME_INCL_r
 - 23 – If REV_SCH_START_TIME_INCL_s[REV_SCH_ID_r] is set to '1', set
24 REV_SCH_START_TIME_s[REV_SCH_ID_r] = REV_SCH_START_TIME_r
 - 25 – REV_SCH_DURATION_s[REV_SCH_ID_r] = REV_SCH_DURATION_r
 - 26 – REV_SCH_NUM_BITS_IDX_s[REV_SCH_ID_r] = REV_SCH_NUM_BITS_IDX_r
 - 27 • If NUM_FOR_SCH_r is not equal to '00', then the mobile station shall store
28 the following information for each occurrence of the record and process the
29 Forward Supplemental Burst as specified in 2.6.6.2.5.1.1:
 - 30 – FOR_SCH_START_TIME_INCL_s[FOR_SCH_ID_r] =
31 FOR_SCH_START_TIME_INCL_r
 - 32 – If FOR_SCH_START_TIME_INCL_s[FOR_SCH_ID_r] is set to '1', set
33 FOR_SCH_START_TIME_s[FOR_SCH_ID_r] = FOR_SCH_START_TIME_r
 - 34 – FOR_SCH_DURATION_s[FOR_SCH_ID_r] = FOR_SCH_DURATION_r
 - 35 – FOR_SCH_FER_REP_s[FOR_SCH_ID_r] = FOR_SCH_FER_REP_r
 - 36 – SCCL_INDEX_s[FOR_SCH_ID_r] = SCCL_INDEX_r
 - 37 – If SCH_BCMC_IND field is included the mobile station shall perform the
38 following:

- 1 + If SCH_BCMC_IND_r equals '1' and USE_ADD_PLCM_FOR_SCH_r
2 equals '1', set corresponding SCH_BCMC_IND[FOR_SCH_ID_r] to '1';
3 otherwise, set SCH_BCMC_IND[FOR_SCH_ID_r] = '0'.
- 4 - If SCH_BCMC_IND_r is included and equals '1' and
5 ADD_PLCM_FOR_SCH_INCL_r is included and is set to '1', the mobile
6 station shall store following fields:
7 + Set ADD_PLCM_FOR_SCH_TYPE_s to ADD_PLCM_FOR_SCH_TYPE_r.
8 + Set ADD_PLCM_FOR_SCH_35_s to ADD_PLCM_FOR_SCH_35_r if
9 ADD_PLCM_FOR_SCH_TYPE_r is equal to '1'.
- 10 - If SCH_BCMC_IND_r is included and equals '1', the mobile station shall
11 store following fields:
12 + USE_ADD_PLCM_FOR_SCH_s[FOR_SCH_ID_r] =
13 USE_ADD_PLCM_FOR_SCH_r
14 + FSCH_OUTERCODE_INCL_s[FOR_SCH_ID_r] =
15 FSCH_OUTERCODE_INCL_r
16 + If FSCH_OUTERCODE_INCL_r equals '1', the mobile station shall store
17 following fields:
18 o FSCH_OUTERCODE_RATE_s[FOR_SCH_ID_r] =
19 FSCH_OUTERCODE_RATE_r
20 o FSCH_OUTERCODE_OFFSET_s[FOR_SCH_ID_r] =
21 FSCH_OUTERCODE_OFFSET_r
- 22 • If FOR_CFG_INCLUDED is equal to '1', the mobile station shall perform the
23 following:
24 - Set FOR_SCH_FER_REP_s to FOR_SCH_FER_REP_r.
25 - If FOR_SCH_FER_REP_r is equal to '0', set SCH_TOT_FRAMES_s and
26 SCH_BAD_FRAMES_s to 0.
27 - Store NUM_FOR_CFG_RECS occurrences of Forward Supplemental
28 Channel Configuration associated with the identification of Forward
29 Supplemental Channel.
- 30 • For each record of the Forward Supplemental Channel Code list the mobile
31 station shall store the Forward Supplemental Channel Code list associated
32 with the FOR_SCH_ID_r as follows:
33 - NUM_SUP_SHO_s[FOR_SCH_ID_r][SCCL_INDEX_r] = NUM_SUP_SHO_r.
34 - The mobile station shall determine,
35 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], the number of
36 information bits per Forward Supplemental Channel frame identified by
37 FOR_SCH_ID and corresponding to the index SCCL_INDEX according to
38 the following rules:
39 + If FSCH_VAR_TABLE_IDS_s[FOR_SCH_ID_r] is equal to '000', then:

- 1 o If USE_FLEX_NUM_BITS_s is equal to '0' or if
2 USE_FLEX_NUM_BITS_s is equal to '1' and
3 FSCH_NBIT_TABLE_IDS[FOR_SCH_ID_r] is equal to '0000', then
4 the mobile station shall set the number of information bits per
5 frame, N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r] and
6 number of CRC bits per frame,
7 FSCH_CRC_LEN_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], according
8 to Table 3.7.3.3.2.37-2 using FOR_SCH_NUM_BITS_IDX_r as the
9 index to the table.
- 10 o If USE_FLEX_NUM_BITS_s is equal to '1' and
11 FSCH_NBIT_TABLE_IDS[FOR_SCH_ID_r] is not equal to '0000',
12 then the mobile station shall set the number of CRC bits per
13 frame, FSCH_CRC_LEN_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r],
14 using Table 3.7.5.20-1 and
15 CRC_LEN_IDX_s[FSCH_NBIT_TABLE_IDS[FOR_SCH_ID_r]][FOR_SC
16 H_NUM_BITS_IDX_r] as the index to the table.
17 The mobile station shall also set the number of information bits
18 per frame corresponding to SCCL_INDEX_r,
19 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], to
20 NUM_BITS_s[FSCH_NBIT_TABLE_IDS[FOR_SCH_ID_r]][FOR_SCH_N
21 UM_BITS_IDX_r].
- 22 + If FSCH_VAR_TABLE_IDS[FOR_SCH_ID_r] is not equal to '000', then:
- 23 o The mobile station shall set
24 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r], the set of indices to the
25 number of information bits per frame as follows:
- 26 ◇ If FOR_SCH_NUM_BITS_IDX_r is equal to '0000', then
27 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r] = {
28 FOR_SCH_NUM_BITS_IDX_r },
- 29 ◇ otherwise the mobile station shall set (initialize)
30 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r] =
31 {FOR_SCH_NUM_BITS_IDX_r} and for i=1, ...,
32 FOR_SCH_NUM_BITS_IDX_r the mobile station shall add
33 FOR_SCH_NUM_BITS_IDX_r -
34 VAR_FSCH_RATE_OFFSET_s[FOR_SCH_ID_r][FOR_SCH_NUM_
35 BITS_IDX_r][i] to the set specified by
36 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r]

- 1 o If USE_FLEX_NUM_BITS_s is equal to '0' or if
2 USE_FLEX_NUM_BITS_s is equal to '1' and
3 FSCH_NBIT_TABLE_IDS_s[FOR_SCH_ID_r] is equal to '0000', then
4 the mobile station shall set
5 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], the set of
6 number of information bits per frame as follows.
7 The *i*th member of the set
8 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r] is obtained
9 using Table 3.7.3.3.2.37-2 and the *i*th member of the set
10 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r] as the index to the table.
- 11 o If USE_FLEX_NUM_BITS_s is equal to '1' and
12 FSCH_NBIT_TABLE_IDS_s[FOR_SCH_ID_r] is not equal to '0000',
13 then
- 14 ◇ the mobile station shall set
15 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], the set of
16 number of information bits per frame as follows.
17 The *i*th member of the set
18 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r] is equal to
19 NUM_BITS_s[FSCH_NBIT_TABLE_IDS_s[FOR_SCH_ID_r]]
20 [N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r][*i*]], where
21 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r][*i*] denotes the *i*th
22 member of the set N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r]
23 and,
- 24 ◇ the mobile station shall set
25 FSCH_CRC_LEN_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], the set
26 of number CRC bits per frame as follows.
27 The *i*th member of the set
28 FSCH_CRC_LEN_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r] using
29 Table 3.7.5.20-1 and
30 CRC_LEN_IDX_s[FSCH_NBIT_TABLE_IDS_s[FOR_SCH_ID_r]][N_FS
31 CH_BITS_IDX_SET_s[FOR_SCH_ID_r][*i*]] as the index to the
32 table, where N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r][*i*]
33 denotes the *i*th member of the set
34 N_FSCH_BITS_IDX_SET_s[FOR_SCH_ID_r].
- 35 – For the *i*th record of the Forward Supplemental Channel Active Set (for all
36 values of *i* between 1 and NUM_SUP_SHO+1) specified in this message,
37 the mobile station shall store the following entries corresponding to the
38 SCCL_INDEX_r as follows:
- 39 + PILOT_PN_s[FOR_SCH_ID_r][SCCL_INDEX_r][*i*] = PILOT_PN_r,
- 40 + Set the ADD_PILOT_REC_INCL field to ADD_PILOT_REC_INCL_r. If
41 ADD_PILOT_REC_INCL_r equals '1', the mobile station shall store the
42 following:

- 1 o Set the PILOT_REC_TYPE field of PILOT_REC to
2 PILOT_REC_TYPE_r.
- 3 o If PILOT_REC_TYPE_r equals '000', the mobile station shall set the
4 TD_POWER_LEVEL field of PILOT_REC to TD_POWER_LEVEL_r
5 and set the TD_MODE field of PILOT_REC to TD_MODE_r.
- 6 o If PILOT_REC_TYPE_r is equal to '001', the mobile station shall.
- 7 – Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
- 8 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
9 AUX_PILOT_WALSH_r with the Walsh Code length specified by
10 WALSH_LENGTH_r.
- 11 o If NGHBR_PILOT_REC_TYPE_r is equal to '010', the mobile station
12 shall:
- 13 – Set the AUX_PILOT_TD_QOF field of PILOT_REC to QOF_r.
- 14 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
15 AUX_WALSH_r with the Walsh Code length specified by
16 WALSH_LENGTH_r.
- 17 – Set the AUX_TD_POWER_LEVEL field of PILOT_REC to
18 AUX_TD_POWER_LEVEL_r.
- 19 – Set the TD_MODE field of NGHBR_PILOT_REC to TD_MODE_r.
- 20 o If PILOT_REC_TYPE_r is equal to '011', the mobile station shall:
- 21 – Set the SR3_PRIMARY_PILOT field of PILOT_REC to
22 SR3_PRIMARY_PILOT_r.
- 23 – Set the SR3_PILOT_POWER1 field of PILOT_REC to
24 SR3_PILOT_POWER1_r.
- 25 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
26 SR3_PILOT_POWER2_r.
- 27 o If PILOT_REC_TYPE_r is equal to '100', the mobile station shall:
- 28 – Set the SR3_PRIMARY_PILOT field of PILOT_REC to
29 SR3_PRIMARY_PILOT_r.
- 30 – Set the SR3_PILOT_POWER1 field of PILOT_REC to
31 SR3_PILOT_POWER1_r.
- 32 – Set the SR3_PILOT_POWER2 field of PILOT_REC to
33 SR3_PILOT_POWER2_r.
- 34 – Set the AUX_PILOT_QOF field of PILOT_REC to QOF_r.
- 35 – Set the AUX_PILOT_WALSH_CODE field of PILOT_REC to
36 AUX_PILOT_WALSH_r with the Walsh Code length specified by
37 WALSH_LENGTH_r.

- 1 – If ADD_INFO_INCL1_r is equal to ‘1’, set the AUX_PILOT_QOF1
2 field of PILOT_REC to QOF1_r and set the
3 AUX_PILOT_WALSH_CODE1 field of PILOT_REC to
4 AUX_PILOT_WALSH1_r with the Walsh Code length specified
5 by WALSH_LENGTH1_r.
- 6 – Otherwise, set the AUX_PILOT_QOF1 field of PILOT_REC to
7 QOF_r and set the AUX_PILOT_WALSH_CODE1 field of
8 PILOT_REC to AUX_PILOT_WALSH_r with the Walsh Code
9 length specified by WALSH_LENGTH_r.
- 10 – If ADD_INFO_INCL2_r is equal to ‘1’, set the AUX_PILOT_QOF2
11 field of PILOT_REC to QOF2_r and set the
12 AUX_PILOT_WALSH_CODE2 field of PILOT_REC to
13 AUX_PILOT_WALSH2_r with the Walsh Code length specified
14 by WALSH_LENGTH2_r.
- 15 – Otherwise, set the AUX_PILOT_QOF2 field of PILOT_REC to
16 QOF_r and set the AUX_PILOT_WALSH_CODE2 field of
17 PILOT_REC to AUX_PILOT_WALSH_r with the Walsh Code
18 length specified by WALSH_LENGTH_r.
- 19 + QOF_MASK_ID_SCH_s[FOR_SCH_ID_r][SCCL_INDEX_r][i] =
20 QOF_MASK_ID_SCH_r,
- 21 + FOR_SCH_CC_INDEX_s[FOR_SCH_ID_r][SCCL_INDEX_r][i]=
22 CODE_CHAN_SCH_r.
- 23 + If the mobile station supports Code Combining Soft Handoff, and
24 CCSH_INCLUDED is set to ‘1’, set
25 CCSH_ENCODER_TYPE_s[FOR_SCH_ID_r][SCCL_INDEX_r][i]=
26 CCSH_ENCODER_TYPE_r.
- 27 + If the mobile station supports Code Combining Soft Handoff, and
28 CCSH_INCLUDED is set to ‘0’, set
29 CCSH_ENCODER_TYPE_s[FOR_SCH_ID_r][SCCL_INDEX_r][i]= 0 (default
30 Turbo Encoder type)
- 31 • The mobile station may soft-combine the Forward Supplemental Channel
32 frames received on the Forward Supplemental Channels in the same
33 Forward Supplemental Channel Active Set.
- 34 • If the mobile station supports any Radio Configuration greater than 2, the
35 mobile station shall perform the following:
- 36 – If FPC_INCL_r is equal to ‘1’, the mobile station shall:
- 37 + Set FPC_MODE_SCH_s to FPC_MODE_SCH_r.
- 38 – If FPC_INCL is equal to ‘1’ and FPC_MODE_SCH is equal to '001', '010',
39 ‘101’, or ‘110’, the mobile station shall:
- 40 + Set FPC_SEC_CHAN_s to FPC_SEC_CHAN_r.

- 1 + Set FPC_BCMC_CHAN_s to FPC_BCMC_CHAN_r.
- 2 – If NUM_SUP_r is included and not equal to ‘00’, for each Supplemental
- 3 Channel included in the message, the mobile station shall:
- 4 + Set SCH_ID_s to SCH_ID_r.
- 5 + Set FPC_SCH_FER_s to FPC_SCH_FER_r.
- 6 + Set FPC_SCH_INIT_SETPT_s as follows:
- 7 o If FPC_SCH_INIT_SETPT_OP_r is set to ‘0’, set
- 8 FPC_SCH_INIT_SETPT_s to FPC_SCH_INIT_SETPT_r.
- 9 o If FPC_SCH_INIT_SETPT_OP_r is set to ‘1’:
- 10 ◊ If FPC_PRI_CHAN_r is equal to ‘0’, set FPC_SCH_INIT_SETPT_s
- 11 to (FPC_FCH_CURR_SETPT_s + FPC_SCH_INIT_SETPT_r).
- 12 ◊ Otherwise, set FPC_SCH_INIT_SETPT_s to
- 13 (FPC_DCCH_CURR_SETPT_s + FPC_SCH_INIT_SETPT_r).
- 14 + Set FPC_SCH_MIN_SETPT_s to FPC_SCH_MIN_SETPT_r.
- 15 + Set FPC_SCH_MAX_SETPT_s to FPC_SCH_MAX_SETPT_r.
- 16 – If FPC_THRESH_SCH_INCL is included and equal to ‘1’, the mobile
- 17 station shall set FPC_SETPT_THRESH_SCH_s to SETPT_THRESH_SCH_r.
- 18 • If RPC_INCL is equal to ‘1’, the mobile station shall set RLGAIN_SCH_PILOT_s
- 19 to RLGAIN_SCH_PILOT_r.
- 20 • If NUM_3X_CFG_r is not equal to ‘00’, the mobile station shall store the
- 21 Forward 3X Supplemental Channel Configuration associated with the
- 22 identification of Forward Supplemental Channel (NUM_3X_CFG_s =
- 23 NUM_3X_CFG_r).
- 24 • For each 3X SCH record included in this message, the mobile station shall
- 25 update the Forward Supplemental Channel Code list associated with the
- 26 FOR_SCH_ID_r as follows:
- 27 – For the *i*th record of the Forward Supplemental Channel Active Set (for all
- 28 values of *i* between 1 and NUM_SUP_SHO+1) specified in this message,
- 29 the mobile station shall store the following three entries corresponding to
- 30 the SCCL_INDEX_r as follows:
- 31 + If 3X_SCH_LOW_INCL_r equals ‘1’, set
- 32 QOF_MASK_ID_SCH_LOW[FOR_SCH_ID_r][SCCL_INDEX_r][*i*] to
- 33 QOF_MASK_ID_SCH_LOW_r and
- 34 FOR_SCH_CC_INDEX_LOW[FOR_SCH_ID_r][SCCL_INDEX_r][*i*] to
- 35 CODE_CHAN_SCH_LOW_r. Otherwise, set
- 36 QOF_MASK_ID_SCH_LOW[FOR_SCH_ID_r][SCCL_INDEX_r][*i*] to
- 37 QOF_MASK_ID_SCH[FOR_SCH_ID_r][SCCL_INDEX_r][*i*] and
- 38 FOR_SCH_CC_INDEX_LOW[FOR_SCH_ID_r][SCCL_INDEX_r][*i*] to
- 39 CODE_CHAN_SCH[FOR_SCH_ID_r][SCCL_INDEX_r][*i*].

- 1 + If $3X_SCH_HIGH_INCL_r$ equals '1', set
2 $QOF_MASK_ID_SCH_HIGH[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ to
3 $QOF_MASK_ID_SCH_HIGH_r$ and
4 $FOR_SCH_CC_INDEX_HIGH[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ to
5 $CODE_CHAN_SCH_HIGH_r$. Otherwise, set
6 $QOF_MASK_ID_SCH_HIGH[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ to
7 $QOF_MASK_ID_SCH[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ and
8 $FOR_SCH_CC_INDEX_HIGH[FOR_SCH_ID_r][SCCL_INDEX_r][i]$ to
9 $CODE_CHAN_SCH[FOR_SCH_ID_r][SCCL_INDEX_r][i]$.
- 10 • If $PILOT_GATING_USE_RATE$ is set to '1' and if $NUM_REV_SCH_r$ or
11 $NUM_FOR_SCH_r$ is not equal to '00', the mobile station shall perform the
12 following:
- 13 – The mobile station shall set $PILOT_GATING_USE_RATE$ to '0' and shall
14 start the continuous reverse pilot at the specified action time and, if a F-
15 PDCH is assigned, the mobile station shall start the continuous R-
16 CQICH as defined in [3].
- 17 – If a F-PDCH is not assigned and the Fundamental Channel was
18 previously established prior to transitioning to the *Control Hold Mode*, the
19 mobile station shall start processing F-FCH and start transmitting on R-
20 FCH at the action time of the message. The mobile station shall establish
21 the Fundamental Channel with the same configuration as previously
22 used.
- 23 • If $FOR_SCH_CC_INCL_r$ equals '1', the mobile station shall store the
24 $NUM_FOR_SCH_r$ occurrences of the Forward Supplemental Channel channel
25 configuration records as follows:
- 26 – The mobile station shall store the Forward Supplemental Channel
27 Identification ($FOR_SCH_ID[FOR_SCH_ID_r]_s = FOR_SCH_ID_r$).
- 28 – The mobile station shall store the Forward Supplemental Channel
29 Multiplex Option ($FOR_SCH_MUX[FOR_SCH_ID_r]_s = FOR_SCH_MUX_r$).
- 30 – The mobile station shall store the Forward Supplemental Channel Radio
31 Configuration ($FOR_SCH_RC[FOR_SCH_ID_r]_s = SCH_RC_r$).
- 32 – The mobile station shall store the Forward Supplemental Channel
33 Coding Type ($FOR_SCH_CODING[FOR_SCH_ID_r]_s = CODING_r$).
- 34 – If $FRAME_40_USED_r$ and $FRAME_80_USED_r$ are both equal to '0', the
35 mobile station shall set $FOR_SCH_FRAME_LENGTH_s[FOR_SCH_ID_r]$ to
36 '00' (i.e., 20 ms frame length).
- 37 – If $FRAME_40_USED_r$ is equal to '1', the mobile station shall set
38 $FOR_SCH_FRAME_LENGTH_s[FOR_SCH_ID_r]$ to '01' (i.e., 40 ms frame
39 length).

- 1 - If FRAME_80_USED_r is equal to '1', the mobile station shall set
- 2 FOR_SCH_FRAME_LENGTH_s[FOR_SCH_ID_r] to '10' (i.e., 80 ms frame
- 3 length).
- 4 - F_MAX_RATE_IDX_s[FOR_SCH_ID_r] = MAX_RATE_r.
- 5 • If REV_SCH_CC_INCL_r equals '1', the mobile station shall store the
- 6 NUM_REV_SCH_r occurrences of the Reverse Supplemental Channel channel
- 7 configuration records as follows:
- 8 - The mobile station shall store the Reverse Supplemental Channel
- 9 Identification (REV_SCH_ID[REV_SCH_ID_r]_s = REV_SCH_ID_r).
- 10 - The mobile station shall store the Reverse Supplemental Channel
- 11 Multiplex Option (REV_SCH_MUX[REV_SCH_ID_r]_s = REV_SCH_MUX_r).
- 12 - The mobile station shall store the Reverse Supplemental Channel Radio
- 13 Configuration (REV_SCH_RC[REV_SCH_ID_r]_s = SCH_RC_r).
- 14 - The mobile station shall store the Reverse Supplemental Channel Coding
- 15 Type (REV_SCH_CODING[REV_SCH_ID_r]_s = CODING_r).
- 16 - If FRAME_40_USED_r and FRAME_80_USED_r are both equal to '0', the
- 17 mobile station shall set REV_SCH_FRAME_LENGTH_s[REV_SCH_ID_r] to
- 18 '00' (i.e., 20 ms frame length).
- 19 - If FRAME_40_USED_r is equal to '1', the mobile station shall set
- 20 REV_SCH_FRAME_LENGTH_s[REV_SCH_ID_r] to '01' (i.e., 40 ms frame
- 21 length).
- 22 - If FRAME_80_USED_r is equal to '1', the mobile station shall set
- 23 REV_SCH_FRAME_LENGTH_s[REV_SCH_ID_r] to '10' (i.e., 80 ms frame
- 24 length).
- 25 - R_MAX_RATE_IDX_s[REV_SCH_ID_r] = MAX_RATE_r.

26 14. *Forward Supplemental Channel Assignment Mini Message:* The mobile station shall
27 process this message as follows:

28 The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
29 set to '00000111' (message can not be handled by the current mobile station
30 configuration), if any of the mobile station's forward supplemental channel
31 configuration parameters for the corresponding Supplemental Channel is NULL.

32 Otherwise, the mobile station shall store the following information and process
33 the Forward Supplemental Burst as specified in 2.6.6.2.5.1.1:

- 34 • Set FOR_SCH_START_TIME_INCL_s[FOR_SCH_ID_r] to '1'
- 35 • FOR_SCH_START_TIME_s[FOR_SCH_ID_r] = FOR_SCH_START_TIME_r
- 36 • FOR_SCH_DURATION_s[FOR_SCH_ID_r] = FOR_SCH_DURATION_r
- 37 • SCCL_INDEX_s[FOR_SCH_ID_r] = SCCL_INDEX_r
- 38 • If PILOT_GATING_USE_RATE is set to '1', the mobile station shall perform
- 39 the following:

- 1 – The mobile station shall set PILOT_GATING_USE_RATE to ‘0’ and shall
2 start the continuous reverse pilot at the specified action time and, if a F-
3 PDCH is assigned, the mobile station shall start the continuous R-
4 CQICH as defined in [3].
- 5 – If a F-PDCH is not assigned and the Fundamental Channel was
6 previously established prior to transitioning to the *Control Hold Mode*, the
7 mobile station shall start processing F-FCH and start transmitting on R-
8 FCH at the action time of the message. The mobile station shall establish
9 the Fundamental Channel with the same configuration as previously
10 used.

11 15. *Reverse Supplemental Channel Assignment Mini Message*: The mobile station shall
12 process this message as follows:

13 The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
14 set to ‘00000111’ (message can not be handled by the current mobile station
15 configuration), if any of the mobile station’s reverse supplemental channel
16 configuration parameters for the corresponding Supplemental Channel is NULL,
17 or if the Reverse Packet Data Channel is assigned.

18 If IGNORE_ESCAM_s is equal to ‘1’, the mobile station shall not process the
19 Reverse Supplemental Channel assignment information in this message.

20 Otherwise, the mobile station shall store the following information and process
21 the Reverse Supplemental Burst as specified in 2.6.6.2.5.1.2:

- 22 • Set REV_SCH_START_TIME_INCL_s[REV_SCH_ID_r] to ‘1’
- 23 • REV_SCH_START_TIME_s[REV_SCH_ID_r] = REV_SCH_START_TIME_r
- 24 • REV_SCH_DURATION_s[REV_SCH_ID_r] = REV_SCH_DURATION_r
- 25 • REV_SCH_NUM_BITS_IDX_s[REV_SCH_ID_r] = REV_SCH_NUM_BITS_IDX_r
- 26 • If PILOT_GATING_USE_RATE is set to ‘1’, the mobile station shall perform
27 the following:

- 28 – The mobile station shall set PILOT_GATING_USE_RATE to ‘0’ and shall
29 start the continuous reverse pilot at the specified action time and, if a F-
30 PDCH is assigned, the mobile station shall start the continuous R-
31 CQICH as defined in [3].
- 32 – If a F-PDCH is not assigned and the Fundamental Channel was
33 previously established prior to transitioning to the *Control Hold Mode*, the
34 mobile station shall start processing F-FCH and start transmitting on R-
35 FCH at the action time of the message. The mobile station shall establish
36 the Fundamental Channel with the same configuration as previously
37 used.

38 2.6.6.2.5.1.1 Processing of the Forward Supplemental Burst Assignment

39 A Forward Supplemental Assignment specifies the explicit start time identified by
40 FOR_SCH_START_TIME or the implicit start time (if FOR_SCH_START_TIME_INCL is set to

1 '0'), FOR_SCH_DURATION, and SCCL_INDEX of a forward burst assignment. The time
 2 interval of duration is specified by FOR_SCH_DURATION (see Table 3.7.3.3.2.37-3) and
 3 starts at the time specified by the explicit start time FOR_SCH_START_TIME or the implicit
 4 start time (if FOR_SCH_START_TIME_INCL is set to '0'). This time interval for a Forward
 5 Supplemental Assignment is called the Forward Supplemental Assignment Interval. A
 6 value of FOR_SCH_DURATION equal to '1111' indicates infinite duration. The variable
 7 SCCL_INDEX_s[FOR_SCH_ID] specifies the rate, QOF index and the Active Set for the
 8 Forward Supplemental Channel identified by FOR_SCH_ID for a given Forward
 9 Supplemental Assignment. A value of FOR_SCH_DURATION equal to '0000' indicates that
 10 the mobile station should stop processing the forward Supplemental Channels at the
 11 explicit start time specified by FOR_SCH_START_TIME or the implicit start time (if
 12 FOR_SCH_START_TIME_INCL is set to '0'). The implicit start time is the time occurring no
 13 later than the first 80 ms boundary (relative to System Time) which occurs at least 80 ms
 14 after the end of the frame containing the last bit of the *Extended Supplemental Channel*
 15 *Assignment Message* or the action time of the *Universal Handoff Direction Message*.

16 If the mobile station receives an *Extended Supplemental Channel Assignment Message* with
 17 FOR_SCH_CC_INCL set to '1', the mobile station shall begin to use the Forward
 18 Supplemental Channel configuration specified by this message at the start time of this
 19 Forward Supplemental Assignment.

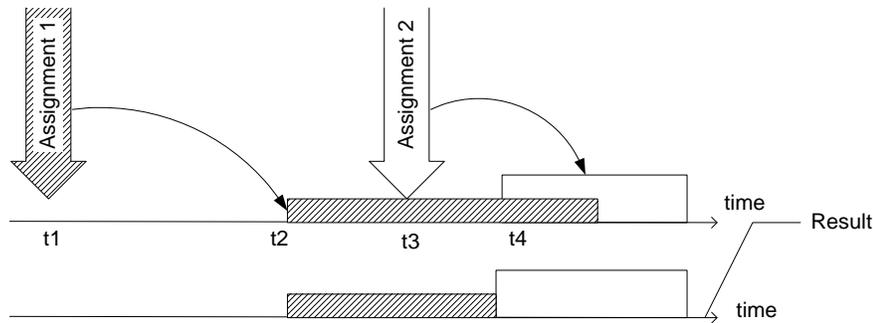

20 For each Forward Supplemental Assignment the mobile station shall determine the start
 21 time for processing forward supplemental channel as the time for which the following
 22 equation holds:

$$23 \quad (\lfloor t / (\text{START_TIME_UNIT}_s + 1) \rfloor - \text{FOR_SCH_START_TIME}_r) \bmod 32 = 0,$$

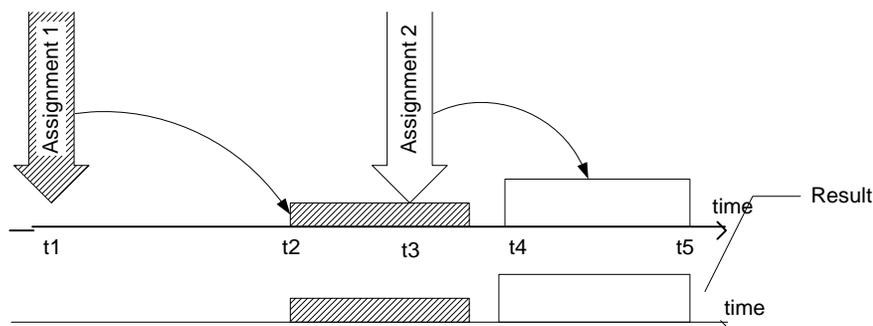

24 where t is the System Time in units of 20 ms.

25 Figure 2.6.6.2.5.1.1-1 illustrates the scenario in which a second Forward Supplemental
 26 Assignment is received while the mobile station is processing the forward supplemental
 27 channel according to a previously received assignment. Two cases are displayed in Figure
 28 2.6.6.2.5.1.1-1: Case a) where the first assignment extends beyond the start time of the
 29 second assignment and Case b) where the first assignment ends before the second one
 30 starts.

31

a) "Assignment 1" extends beyond the start time for "Assignment 2"

b) "Assignment 1" ends prior to the start time of "Assignment 2"

Figure 2.6.6.2.5.1.1-1. New Supplemental Channel Assignment Received while a Previous Supplemental Channel Assignment is in Progress

Figure 2.6.6.2.5.1.1-2 shows an example scenario in which the mobile station receives a second Forward Supplemental Assignment before it starts processing the supplemental channel according to the first assignment. In this case, the second assignment simply replaces the first assignment.

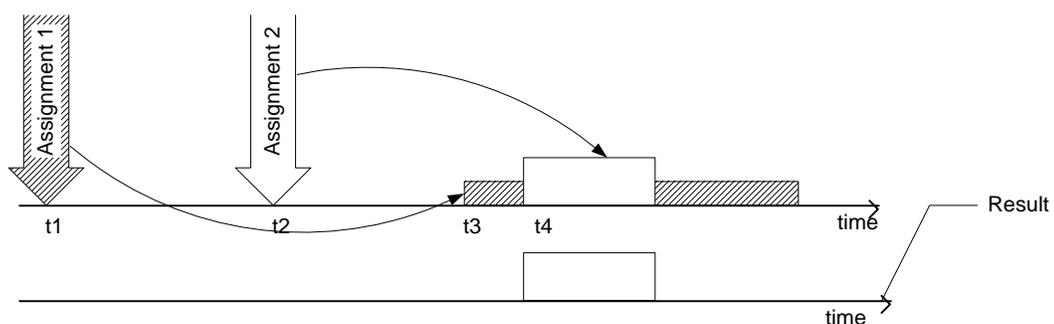

Figure 2.6.6.2.5.1.1-2. New Supplemental Channel Assignment Received before a Previous Supplemental Channel Assignment starts

The mobile station shall set FPC_MODE_S to $FPC_MODE_SCH_S$ at the $FOR_SCH_START_TIME_S$ of the forward Supplemental Channel assignment. The mobile station shall set FPC_MODE_S to $FPC_MODE_NO_SCH_S$ at the end of the forward Supplemental Channel assignment.

1 For each Forward Supplemental Channel assignment corresponding to each Forward
 2 Supplemental Channel (identified by FOR_SCH_ID), the mobile station should perform the
 3 following:

- 4 • If FOR_SCH_DURATION_s[FOR_SCH_ID] is not equal to '0000', then
 - 5 - If the mobile station is currently processing the Forward Supplemental Channel
 6 identified by FOR_SCH_ID, then the mobile station should continue processing
 7 the Forward Supplemental Channel identified by FOR_SCH_ID according to the
 8 Forward Supplemental Assignment previously received for the Forward
 9 Supplemental Channel identified by FOR_SCH_ID up to the time specified by
 10 the FOR_SCH_START_TIME_s[FOR_SCH_ID] (i.e., the mobile station should stop
 11 processing the forward supplemental channel identified by FOR_SCH_ID at
 12 either the time specified by the start time of the new assignment, or at the time
 13 the previously received assignment ends, whichever time is earlier).

14 At the time specified by FOR_SCH_START_TIME_s[FOR_SCH_ID], the mobile
 15 station should start processing the Forward Supplemental Channel identified by
 16 FOR_SCH_ID for a duration of time specified by
 17 FOR_SCH_DURATION[FOR_SCH_ID]_s with FOR_SCH_MUX_s[FOR_SCH_ID_r],
 18 FOR_SCH_RC_s[FOR_SCH_ID_r], FOR_SCH_CODING_s[FOR_SCH_ID_r],
 19 FOR_SCH_FRAME_LENGTH_s[FOR_SCH_ID_r], the QOF index, the Supplemental
 20 Channel Active Set indexed by SCCL_INDEX_s[FOR_SCH_ID], and number of
 21 information bits per frame (or set of number of bits per frame if
 22 FSCH_VAR_TABLE_IDS_s[FOR_SCH_ID_r] is not equal to '000') specified by
 23 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r].

24 If the set of number of bits per frame,
 25 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r], has more than one member
 26 and F_INC_RATE_ALLOWED_s is equal to '0', then the following rule applies for
 27 the duration of this assignment:

- 28 + Once the mobile station determines the forward Supplemental Channel
 29 number of bits per frame, the number of bits per frame in the subsequent
 30 Forward Supplemental Channel frames may be any member of the set
 31 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r] which is smaller or equal
 32 to the number of bits in the current frame.
- 33 - Otherwise, if the mobile station is not currently processing the Forward
 34 Supplemental Channel identified by FOR_SCH_ID, then at the time specified by
 35 FOR_SCH_START_TIME_s[FOR_SCH_ID], the mobile station should start
 36 processing the Forward Supplemental Channel identified by FOR_SCH_ID for a
 37 duration of time specified by FOR_SCH_DURATION_s[FOR_SCH_ID] with the
 38 QOF index, the Supplemental Channel Active Set indexed by
 39 SCCL_INDEX_s[FOR_SCH_ID], and number of bits per frame (or set of number of
 40 information bits per frame if FSCH_VAR_TABLE_IDS_s[FOR_SCH_ID_r] is not equal
 41 to '000') specified by N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r].

42 If the set of number of bits per frame,
 43 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r] and

1 F_INC_RATE_ALLOWED_s is equal to '0', has more than one member, then the
2 following rule applies for the duration of this assignment:

3 + Once the mobile station determines the forward Supplemental Channel
4 number of bits per frame, the number of bits per frame in the subsequent
5 Forward Supplemental Channel frames may be any member of the set
6 N_FSCH_BITS_SET_s[FOR_SCH_ID_r][SCCL_INDEX_r] which is smaller or equal
7 to the number of bits in the current frame.

8 • If FOR_SCH_DURATION_s[FOR_SCH_ID] is equal to '0000', the mobile station should
9 perform the following:

10 - If the mobile station is currently processing the Forward Supplemental Channel
11 identified by FOR_SCH_ID, then the mobile station should continue processing
12 the Forward Supplemental Channel identified by FOR_SCH_ID according to the
13 Forward Supplemental Assignment previously received for the Forward
14 Supplemental Channel identified by FOR_SCH_ID up to the time specified by
15 the implicit start time (FOR_SCH_START_TIME_INCL_s is set to '0') or the explicit
16 start time (FOR_SCH_START_TIME_INCL_s is set to '1') (i.e., the mobile station
17 should stop processing the forward supplemental channel identified by
18 FOR_SCH_ID at the time specified by the implicit start time or the explicit start
19 time, or at the time the previously received assignment ends, whichever time is
20 earlier). The mobile station should cancel the pending Forward Supplemental
21 Channel assignment if any.

22 + If FOR_SCH_START_TIME_INCL_s is equal to '1', the mobile station should
23 stop processing the Forward Supplemental Channel identified by
24 FOR_SCH_ID at the time specified by
25 FOR_SCH_START_TIME_s[FOR_SCH_ID].

26 + If FOR_SCH_START_TIME_INCL_s is equal to '0', the mobile station should
27 stop processing the Forward Supplemental Channel identified by
28 FOR_SCH_ID no later than the first 80 ms boundary (relative to System
29 Time) occurring at least 80 ms after the end of the frame containing the last
30 bit of the *Extended Supplemental Channel Assignment Message* or the action
31 time of the *Universal Handoff Direction Message*.

32 - Otherwise, if the mobile station is not currently processing the Forward
33 Supplemental Channel identified by FOR_SCH_ID, the mobile station should
34 cancel the pending Forward Supplemental Channel assignment if any.

35 2.6.6.2.5.1.2 Processing of the Reverse Supplemental Burst Assignment

36 A Reverse Supplemental Assignment specifies the explicit start time identified by
37 REV_SCH_START_TIME or the implicit start time (if REV_SCH_START_TIME_INCL is set to
38 '0'), REV_SCH_DURATION, and REV_SCH_NUM_BITS_IDX of a reverse burst assignment.
39 The time interval of duration is specified by REV_SCH_DURATION (see Table 3.7.3.3.2.37-
40 3) and starts at the time specified by the explicit start time REV_SCH_START_TIME or the
41 implicit start time (if REV_SCH_START_TIME_INCL is set to '0'). This time interval for a
42 Reverse Supplemental Assignment is called the reverse supplemental assignment interval.

1 A value of REV_SCH_DURATION equal to '1111' indicates infinite duration. A value of
 2 REV_SCH_DURATION equal to '0000' indicates that the mobile station should stop
 3 transmitting the reverse Supplemental Channels at the explicit start time specified by
 4 REV_SCH_START_TIME or the implicit start time (if REV_SCH_START_TIME_INCL is set to
 5 '0'). The implicit start time is the time occurring no later than the first 80 ms boundary
 6 (relative to System Time) which occurs at least 80 ms after the end of the frame containing
 7 the last bit of the *Extended Supplemental Channel Assignment Message* or the action time of
 8 the *Universal Handoff Direction Message*.

9 If the mobile station receives an *Extended Supplemental Channel Assignment Message* with
 10 REV_SCH_CC_INCL set to '1', the mobile station shall begin to use the Reverse
 11 Supplemental Channel configuration specified by this message at the start time of this
 12 Reverse Supplemental Assignment.

13 For each Reverse Supplemental Assignment the mobile station shall determine the start
 14 time for processing reverse supplemental channel as the time for which the following
 15 equation holds:

$$\lfloor t / (\text{START_TIME_UNIT}_s + 1) \rfloor - \text{REV_SCH_START_TIME}_r \bmod 32 = 0,$$

17 where t is the System Time in units of 20 ms.

18 Figure 2.6.6.2.5.1.1-1 illustrates the scenario in which a second Reverse Supplemental
 19 Assignment is received while the mobile station is transmitting on the reverse
 20 supplemental channel according to a previously received assignment. Two cases are
 21 displayed in Figure 2.6.6.2.5.1.1-1: Case a) where the first assignment extends beyond the
 22 start time of the second assignment and Case b) where the first assignment ends before the
 23 second one starts.

24 Figure 2.6.6.2.5.1.1-2 shows an example scenario in which the mobile station receives a
 25 second Reverse Supplemental Assignment before it starts transmitting on the supplemental
 26 channel according to the first assignment. In this case, the second assignment simply
 27 replaces the first assignment.

28 For each Reverse Supplemental Channel assignment corresponding to each Reverse
 29 Supplemental Channel (identified by REV_SCH_ID), the mobile station shall perform the
 30 following:

- 31 • The mobile station shall determine, $N_{\text{RSCH_BITS}_s}[\text{REV_SCH_ID}_r]$, the number of
 32 information bits per Reverse Supplemental Channel frame identified by
 33 REV_SCH_ID according to the following rules:
 - 34 - If $\text{RSCH_VAR_TABLE_ID}_s[\text{REV_SCH_ID}_r]$ is equal to '000', then:
 - 35 + If $\text{USE_FLEX_NUM_BITS}_s$ is equal to '0' or if $\text{USE_FLEX_NUM_BITS}_s$ is equal
 36 to '1' and $\text{RSCH_NBIT_TABLE_ID}_s[\text{REV_SCH_ID}_r]$ is equal to '0000', then the
 37 mobile station shall set the number of information bits per frame,
 38 $N_{\text{RSCH_BITS_SET}_s}[\text{REV_SCH_ID}_r]$ and number of CRC bits per frame,
 39 $\text{RSCH_CRC_LEN_SET}_s[\text{REV_SCH_ID}_r]$, according to Table 3.7.3.3.2.37-2
 40 using $\text{REV_SCH_NUM_BITS_IDX}_r$ as the index to the table.

- 1 + If USE_FLEX_NUM_BITS_s is equal to '1' and
2 RSCH_NBIT_TABLE_IDS[REV_SCH_ID_r] is not equal to '0000', then the
3 mobile station shall set the number of CRC bits per frame,
4 RSCH_CRC_LEN_SET_s[REV_SCH_ID_r], according to Table 3.7.5.20-1 using
5 CRC_LEN_IDX_s[RSCH_NBIT_TABLE_IDS[REV_SCH_ID_r]][REV_SCH_NUM_BI
6 TS_IDX_r] as the index to the table. The mobile station shall also set the
7 number of information bits per frame, N_SCH_BITS_SET_s[REV_SCH_ID_r], to
8 NUM_BITS_s[RSCH_NBIT_TABLE_IDS[REV_SCH_ID_r]]
9 [REV_SCH_NUM_BITS_IDX_r].
- 10 - If RSCH_VAR_TABLE_IDS[REV_SCH_ID_r] is not equal to '000', then:
- 11 + The mobile station shall set N_RSCH_BITS_IDX_SET_s[REV_SCH_ID_r], the set
12 of indices to the number of information bits per frame as follows:
- 13 ○ If REV_SCH_NUM_BITS_IDX_r is equal to '0000', then
14 N_RSCH_BITS_IDX_SET_s[REV_SCH_ID_r] = {REV_SCH_NUM_BITS_IDX_r},
- 15 ○ otherwise, the mobile station shall set (initialize)
16 N_RSCH_BITS_IDX_SET_s[REV_SCH_ID_r] = { REV_SCH_NUM_BITS_IDX_r
17 }, and for i=1, ..., REV_SCH_NUM_BITS_IDX_r the mobile station shall
18 add REV_SCH_NUM_BITS_IDX_r -
19 VAR_RSCH_RATE_OFFSET_s[REV_SCH_ID_r][REV_SCH_NUM_BITS_IDX_r][i
20] to the set specified by N_RSCH_BITS_IDX_SET_s[FOR_SCH_ID_r]
- 21 + If USE_FLEX_NUM_BITS_s is equal to '0' or if USE_FLEX_NUM_BITS_s is equal
22 to '1' and RSCH_NBIT_TABLE_IDS[REV_SCH_ID_r] is equal to '0000', then the
23 mobile station shall determine N_RSCH_BITS_SET_s[REV_SCH_ID_r], the set
24 of number of information bits per frame as follows. The *i*th member of the set
25 N_RSCH_BITS_SET_s[REV_SCH_ID_r] is obtained using Table 3.7.3.3.2.37-1
26 and the *i*th member of the set N_RSCH_BITS_IDX_SET_s[REV_SCH_ID_r] as the
27 index to the table.
- 28 + If USE_FLEX_NUM_BITS_s is equal to '1' and
29 RSCH_NBIT_TABLE_IDS[FOR_SCH_ID_r] is not equal to '0000', then
- 30 ○ the mobile station shall set N_RSCH_BITS_SET_s[REV_SCH_ID_r], the set
31 of number of information bits per frame as follows.
32 The *i*th member of the set N_RSCH_BITS_SET_s[REV_SCH_ID_r] is equal to
33 NUM_BITS_s[SCH_NBIT_TABLE_IDS[REV_SCH_ID_r]]
34 [N_RSCH_BITS_IDX_SET_s[REV_SCH_ID_r][i]], where
35 N_RSCH_BITS_IDX_SET_s[REV_SCH_ID_r][i] denotes the *i*th member of the
36 set N_RSCH_BITS_IDX_SET_s[REV_SCH_ID_r].

- 1 ○ the mobile station shall set $RSCH_CRC_LEN_SET_s[REV_SCH_ID_r]$, the
2 set of number of information bits per frame as follows.
3 The i^{th} member of the set $RSCH_CRC_LEN_IDX_SET_s[REV_SCH_ID_r]$ is
4 equal to
5 $CRC_LEN_IDX_s[RSCH_NBIT_TABLE_ID_s[REV_SCH_ID_r]][N_RSCH_BITS_I$
6 $DX_SET_s[REV_SCH_ID_r][i]]$, where
7 $N_RSCH_BITS_IDX_SET_s[REV_SCH_ID_r][i]$ denotes the i^{th} member of the
8 set $N_RSCH_BITS_IDX_SET_s[REV_SCH_ID_r]$.
- 9 • If $REV_SCH_DURATION_s[REV_SCH_ID]$ is not equal to '0000', then
- 10 - If the mobile station is currently transmitting on the Reverse Supplemental
11 Channel identified by REV_SCH_ID , then the mobile station may continue
12 transmitting on the Reverse Supplemental Channel identified by REV_SCH_ID
13 with the Walsh cover specified by
14 $REV_WALSH_ID_s[REV_SCH_ID][REV_SCH_NUM_BITS_IDX[REV_SCH_ID_r]]$
15 according to the current Reverse Supplemental Assignment for the Reverse
16 Supplemental Channel identified by REV_SCH_ID up to the time specified by
17 the $REV_SCH_START_TIME_s[REV_SCH_ID_r]$ (i.e., the mobile station shall stop
18 transmitting on the reverse supplemental channel identified by REV_SCH_ID at
19 either the time specified by the start time of the new assignment, or at the time
20 the previously received assignment ends, whichever time is earlier).
- 21 At the time specified by $REV_SCH_START_TIME_s[REV_SCH_ID_r]$, the mobile
22 station may start transmitting on the Reverse Supplemental Channel identified
23 by REV_SCH_ID with $REV_SCH_MUX_s[REV_SCH_ID_r]$,
24 $REV_SCH_RC_s[REV_SCH_ID_r]$, $REV_SCH_CODING_s[REV_SCH_ID_r]$,
25 $REV_SCH_FRAME_LENGTH_s[REV_SCH_ID_r]$, the Walsh cover specified by
26 $REV_WALSH_ID_s[REV_SCH_ID][REV_SCH_NUM_BITS_IDX_s[REV_SCH_ID_r]]$ and
27 number of bits per frame (or set of number of information bits per frame if
28 $RSCH_VAR_TABLE_ID_s[REV_SCH_ID_r]$ is not equal to '000') specified by
29 $N_RSCH_BITS_SET_s[REV_SCH_ID_r]$.
- 30 If the set of number of bits per frame, $N_RSCH_BITS_SET_s[REV_SCH_ID_r]$, has
31 more than one member and $R_INC_RATE_ALLOWED_s$ is equal to '0', then the
32 following rule applies for the duration of this assignment:
- 33 + Once the mobile station transmits n number of bits per Reverse
34 Supplemental Channel specified by REV_SCH_ID , where n is a member of
35 the set $N_RSCH_BITS_SET_s[REV_SCH_ID_r]$, the mobile station shall not
36 transmit at a rate higher than the one specifies by n information bits per
37 frame for the duration of the assignment.
- 38 - If the mobile station is not currently transmitting on the Reverse Supplemental
39 Channel identified by $REV_SCH_ID_r$, then at the time specified by
40 $REV_SCH_START_TIME_s[REV_SCH_ID_r]$, the mobile station may start
41 transmitting on the Reverse Supplemental Channel identified by REV_SCH_ID
42 with the Walsh cover specified by
43 $REV_WALSH_ID_s[REV_SCH_ID][REV_SCH_NUM_BITS_IDX_s[REV_SCH_ID_r]]$ and

1 number of bits per frame (or set of number of information bits per frame if
 2 RSCH_VAR_TABLE_IDS_s[REV_SCH_ID_r] is not equal to '000') specified by
 3 N_RSCH_BITS_SET_s[REV_SCH_ID_r]. If the set of number of bits per frame,
 4 N_RSCH_BITS_SET_s[REV_SCH_ID_r], has more than one member and
 5 R_INC_RATE_ALLOWED_s is equal to '0', then the following rule applies for the
 6 duration of this assignment:

- 7 + Once the mobile station transmits n number of bits per Reverse
 8 Supplemental Channel specifies by REV_SCH_ID, where n is a member of
 9 the set N_RSCH_BITS_SET_s[REV_SCH_ID_r], the mobile station shall not
 10 transmit at a rate higher than the one specifies by n information bits per
 11 frame for the duration of the assignment.
- 12 • If REV_SCH_DURATION_s[REV_SCH_ID_r] is equal to '0000', the mobile station shall
 13 perform the followings:
 - 14 - If the mobile station is currently transmitting on the Reverse Supplemental
 15 Channel identified by REV_SCH_ID, then the mobile station may continue
 16 transmitting on the Reverse Supplemental Channel identified by REV_SCH_ID
 17 with the Walsh cover specified by
 18 REV_WALSH_IDS[REV_SCH_ID][REV_SCH_NUM_BITS_IDX[REV_SCH_ID_r]]
 19 according to the current Reverse Supplemental Assignment for the Reverse
 20 Supplemental Channel identified by REV_SCH_ID up to the time specified by
 21 the implicit start time (if REV_SCH_START_TIME_INCL_s is equal to '1') or the
 22 explicit start time (if REV_SCH_START_TIME_INCL_s is equal to '1') (i.e., the
 23 mobile station shall stop transmitting on the reverse supplemental channel
 24 identified by REV_SCH_ID at the implicit start time or the explicit start time, or
 25 at the time the previously received assignment ends, whichever time is earlier).
 26 The mobile station shall cancel the pending Reverse Supplemental Channel
 27 assignment if any.
 - 28 + If REV_SCH_START_TIME_INCL_s is equal to '1', the mobile station shall stop
 29 transmitting on the Reverse Supplemental Channel identified by
 30 REV_SCH_ID_r at the time specified by
 31 REV_SCH_START_TIME_s[REV_SCH_ID_r].
 - 32 + If REV_SCH_START_TIME_INCL_s is equal to '0', the mobile station shall stop
 33 transmitting on the Reverse Supplemental Channel identified by
 34 REV_SCH_ID_r no later than the first 80 ms boundary (relative to System
 35 Time) occurring at least 80 ms after the end of the frame containing the last
 36 bit of the *Extended Supplemental Channel Assignment Message* or the action
 37 time of the *Universal Handoff Direction Message*.
 - 38 - Otherwise, if the mobile is not currently transmitting on the Reverse
 39 Supplemental Channel identified by REV_SCH_ID, the mobile station shall
 40 cancel the pending Forward Supplemental Channel assignment if any.
- 41 • If REV_SCH_DTX_DURATION_s is not equal to '1111', the mobile station shall
 42 perform the following:

- 1 - The mobile station shall maintain a
2 REV_SCH_DTX_TRANSMISSION_COUNTER[REV_SCH_ID_r] counter counting
3 discontinuous transmission time in units of 20 ms as follows:
- 4 + The mobile station shall reset the
5 REV_SCH_DTX_TRANSMISSION_COUNTER[REV_SCH_ID_r] counter to 0:
- 6 ○ For each Reverse Supplemental Channel assignment corresponding to
7 REV_SCH_ID_r, at action time specified by the REV_SCH_START_TIME_r
8 field for that assignment, if included; otherwise at the action time of the
9 message.
- 10 ○ Each time the mobile station resumes transmission on Reverse
11 Supplemental Channelc after discontinued operation on the Reverse
12 Supplemental Channel.
- 13 + The mobile station shall increment the
14 REV_SCH_DTX_TRANSMISSION_COUNTER[REV_SCH_ID_r] counter by one
15 at each 20ms interval for which the mobile station is not transmitting on the
16 Reverse Supplemental Channel during the Reverse Supplemental Channel
17 duration.
- 18 - If the REV_SCH_DTX_TRANSMISSION_COUNTER[REV_SCH_ID_r] counter value
19 exceeds REV_SCH_DTX_DURATION_s (i.e., the mobile station discontinues
20 transmission on the Reverse Supplemental Channel for more than the duration
21 specified by REV_SCH_DTX_DURATION_s), the mobile station shall perform the
22 following:
- 23 + The mobile station shall not resume transmission on the Reverse
24 Supplemental Channel corresponding to REV_SCH_ID_r.
- 25 + The mobile station shall send an indication to each affected service instance
26 indicating that the mobile station has terminated transmission on the
27 supplemental channel corresponding to REV_SCH_ID_r due to expiration of
28 the discontinued transmission period.

29 2.6.6.2.5.2 Processing of Reverse Traffic Channel Handoff Messages

30 The mobile station sends the following messages on the Reverse Traffic Channel in support
31 of handoff when its transmitter is enabled, following the receipt of a *forward dedicated*
32 *channel acquired* indication from Layer 2 (see [4]):

33 1. *Pilot Strength Measurement Message* or *Extended Pilot Strength Measurement*

34 *Message*: The mobile station shall send an autonomous *Pilot Strength Measurement*
35 *Message* if P_REV_IN_USE_s is less than seven or *Extended Pilot Strength*
36 *Measurement Message* if P_REV_IN_USE_s is equal to or greater than seven in
37 assured mode. The mobile station shall send either *Pilot Strength Measurement*
38 *Message* or *Extended Pilot Strength Measurement Message* containing measurements
39 consistent with the event whenever any of the following events occur:

- 40 • P_REV_IN_USE_s is less than or equal to three or SOFT_SLOPE_s is equal to
41 ‘000000’ and the strength of a Neighbor Set or Remaining Set pilot is found to
42 be above T_ADD_s.

- P_REV_IN_USE_s is greater than three, SOFT_SLOPE_s is not equal to '000000', and the strength PS, as specified in 2.6.6.2.2, of any Candidate Set pilot is found to satisfy the following inequality:

$$10 \times \log_{10} PS > \frac{\text{SOFT_SLOPE}_s}{8} \times 10 \times \log_{10} \sum_{i \in A} PS_i + \frac{\text{ADD_INTERCEPT}_s}{2}$$

where the summation is performed over all pilots currently in the Active Set and a *Pilot Strength Measurement Message* or an *Extended Pilot Strength Measurement Message* carrying this information has not been sent since the last *Extended Handoff Direction Message*, *General Handoff Direction Message* or *Universal Handoff Direction Message* was received.

- P_REV_IN_USE_s is greater than three, SOFT_SLOPE_s is not equal to '000000', and the strength PS, as specified in 2.6.6.2.2, of any Neighbor Set or Remaining Set pilot is found to satisfy the following inequality:

$$10 \times \log_{10} PS > \max\left(\frac{\text{SOFT_SLOPE}_s}{8} \times 10 \times \log_{10} \sum_{i \in A} PS_i + \frac{\text{ADD_INTERCEPT}_s}{2}, -\frac{T_ADD_s}{2}\right)$$

where the summation is performed over all pilots currently in the Active Set.

- P_REV_IN_USE_s is less than or equal to three or SOFT_SLOPE_s is equal to '000000', the strength of a Candidate Set pilot exceeds the strength of an Active Set pilot by T_COMP_s × 0.5 dB, and a *Pilot Strength Measurement Message* carrying this information has not been sent since the last *Extended Handoff Direction Message*, *General Handoff Direction Message* or *Universal Handoff Direction Message* was received.
- P_REV_IN_USE_s is greater than three, SOFT_SLOPE_s is not equal to '000000', and the strength of a Candidate Set pilot exceeds the strength of an Active Set pilot by T_COMP_s × 0.5 dB and satisfies the following inequality:

$$10 \times \log_{10} PS > \frac{\text{SOFT_SLOPE}_s}{8} \times 10 \times \log_{10} \sum_{i \in A} PS_i + \frac{\text{ADD_INTERCEPT}_s}{2}$$

where the summation is performed over all pilots currently in the Active Set and a *Pilot Strength Measurement Message* or an *Extended Pilot Strength Measurement Message* carrying this information has not been sent since the last *Extended Handoff Direction Message*, *General Handoff Direction Message* or *Universal Handoff Direction Message* was received.

- The handoff drop timer of an Active Set pilot has expired and a *Pilot Strength Measurement Message* or an *Extended Pilot Strength Measurement Message* carrying this information has not been sent since the last *Extended Handoff Direction Message*, *General Handoff Direction Message*, or *Universal handoff Direction Message* was received.
- A Candidate Set pilot has been autonomously promoted to the Active Set (see 2.6.6.2.6.1), and an *Extended Pilot Strength Measurement Message* carrying this information has not been sent since the last *Extended Handoff Direction*

1 *Message, General Handoff Direction Message, or Universal Handoff Direction*
2 *Message* was received.

3 2. *Handoff Completion Message or Extended Handoff Completion Message*: The mobile
4 station shall send a *Handoff Completion Message* if $P_REV_IN_USE_s$ is less than
5 seven or an *Extended Handoff Completion Message* if $P_REV_IN_USE_s$ is equal to or
6 greater than seven in assured mode as follows:

7 • If the handoff message (*Extended Handoff Direction Message, General Handoff*
8 *Direction Message or Universal Handoff Direction Message*) specifies a soft
9 handoff, the mobile station shall send the *Handoff Completion Message* if
10 $P_REV_IN_USE_s$ is less than seven or an *Extended Handoff Completion Message*
11 if $P_REV_IN_USE_s$ is equal to or greater than seven within T_{56m} seconds after
12 the action time of the received handoff message.

13 • If the handoff message (*Extended Handoff Direction Message, General Handoff*
14 *Direction Message or Universal Handoff Direction Message*) specifies a hard
15 handoff without return on failure (see 2.6.6.2.8.1), the mobile station shall send
16 the *Handoff Completion Message* if $P_REV_IN_USE_s$ is less than seven or an
17 *Extended Handoff Completion Message* if $P_REV_IN_USE_s$ is equal to or greater
18 than seven within T_{73m} seconds after the action time of the received handoff
19 message.

20 • If the handoff message (*General Handoff Direction Message or Universal Handoff*
21 *Direction Message*) specifies a hard handoff with return on failure (see
22 2.6.6.2.8.2), the mobile station shall send the *Handoff Completion Message* if
23 $P_REV_IN_USE_s$ is less than seven or an *Extended Handoff Completion Message*
24 if $P_REV_IN_USE_s$ is equal to or greater than seven within T_{56m} seconds after
25 mobile station declares the handoff to be successful (see 2.6.6.2.8.2).

26 3. *Candidate Frequency Search Report Message*: The mobile station shall send a
27 *Candidate Frequency Search Report Message* in assured mode, whenever any of the
28 following events occur:

29 • $RETURN_IF_HANDOFF_FAIL_s$ is equal to '1', and a handoff attempt is
30 unsuccessful (see 2.6.6.2.8.2). In this case, the mobile station shall send a
31 *Candidate Frequency Search Report Message* within T_{56m} seconds after
32 completing a search of all pilots in the Candidate Frequency Search Set and
33 resuming the use of the Serving Frequency Active Set (see 2.6.6.2.8.2.1).

34 • $RETURN_IF_HANDOFF_FAIL_s$ is equal to '1', an inter-frequency handoff attempt
35 is unsuccessful (see 2.6.6.2.8.2), and $PERIODIC_SEARCH_s$ is equal to '1'. In
36 this case, the mobile station shall send a *Candidate Frequency Search Report*
37 *Message* in a search period if the conditions specified in 2.6.6.2.8.3.2 are met.

38 • The mobile station receives a *Candidate Frequency Search Request Message* or a
39 *Candidate Frequency Search Control Message* with $SEARCH_TYPE$ set to '01'. If
40 none of the conditions requiring the mobile station to send a *Mobile Station*
41 *Reject Order* is true (see 2.6.6.2.5.1), the mobile station shall send a *Candidate*
42 *Frequency Search Report Message*, as described in 2.6.6.2.8.3.1 and
43 2.6.6.2.10.1.

- 1 • The mobile station receives a *Candidate Frequency Search Request Message* or
2 *Candidate Frequency Search Control Message* with SEARCH_TYPE set to '11',
3 SEARCH_MODE_s is equal to '0000' and the Candidate Frequency Search Set is
4 not empty. If none of the conditions requiring the mobile station to send a
5 *Mobile Station Reject Order* is true (see 2.6.6.2.5.1), the mobile station shall send
6 a *Candidate Frequency Search Report Message* in a search period if the
7 conditions specified in 2.6.6.2.8.3.2 are met.
- 8 4. *Periodic Pilot Strength Measurement Message*: The mobile station shall send a
9 *Periodic Pilot Strength Measurement Message* in unassured mode, as specified in
10 2.6.6.2.5.1 and 2.6.6.2.12.
- 11 5. *Pilot Strength Measurement Mini Message*: If the mobile station supports the Mobile
12 Assisted Burst operation capability, the mobile station shall send this message
13 while processing any Supplemental Channel, according to the following:
- 14 • The mobile station shall transmit a *Pilot Strength Measurement Mini Message* for
15 a pilot *p* in the Active Set on the r-dsch logical channel whenever all of the
16 following conditions are true:
- 17 – ORDER_FLAG_s is equal to '1'.
- 18 – The pilot *p* in the Active Set has a received signal strength that is greater
19 than the signal strength of another pilot in the Active Set by
20 PS_MIN_DELTA_s, in units of 0.5 dB, at the current time and has been for
21 ORDER_INTERVAL_s most recent successive 20 ms frame intervals since this
22 pilot was last reported in a rank order based *Pilot Strength Measurement Mini*
23 *Message*.
- 24 – The rank order of pilot *p* has changed.
- 25 • If PERIODIC_FLAG_s is equal to '1', the mobile station shall transmit a *Pilot*
26 *Strength Measurement Mini Message* within PERIODIC_INTERVAL_s 20 ms frame
27 intervals on the r-dsch for each of the *n* pilots in the Active Set with the largest
28 signal strengths, where *n* = (min (NUM_PILOTS, the number of pilots in the
29 Active Set)), whenever the following condition is true:
- 30 – The mobile station has not transmitted another *Pilot Strength*
31 *Measurement Mini Message* for the corresponding pilot during the last
32 PERIODIC_INTERVAL_s 20 ms frame intervals.
- 33 • If THRESHOLD_FLAG_s is equal to '1', the mobile station shall transmit a *Pilot*
34 *Strength Measurement Mini Message* for pilot *p* on the r-dsch logical channel
35 whenever all of the following conditions are true:
- 36 – The mobile station has not transmitted a previous *Pilot Strength*
37 *Measurement Mini Message* for pilot *p* within the most recent
38 THRESHOLD_INTERVAL_s 20 ms frames intervals.
- 39 – Pilot *p* is in the Active Set.

- 1 – The signal strength of pilot p is greater than $PS_CEILING_HIGH_s$ and the
2 signal strength of pilot p was less than or equal to $PS_CEILING_LOW_s$ at any
3 time since the mobile station last sent a *Pilot Strength Measurement Mini*
4 *Message* for pilot p ; or the signal strength of pilot p is less than
5 $PS_FLOOR_LOW_s$ and the signal strength for pilot p was greater than or
6 equal to $PS_FLOOR_HIGH_s$ at any time since the last time that the mobile
7 station sent a *Pilot Strength Measurement Mini Message* for pilot p .

8 2.6.6.2.6 Set Maintenance

9 2.6.6.2.6.1 Maintenance of the Active Set

10 The mobile station shall support a maximum Active Set size of N_{6m} pilots. The mobile
11 station shall track the pilot strengths of all pilots in the Active Set.

12 When the mobile station is first assigned Forward Traffic Channels, the mobile station shall
13 initialize the Active Set to contain the pilots associated with the assigned Forward Traffic
14 Channels. When the mobile station processes an *Extended Handoff Direction Message*, a
15 *General Handoff Direction Message* or *Universal Handoff Direction Message*, then at the
16 action time of the message the mobile station shall replace the pilots in the Active Set with
17 the pilots listed in the message.

18 If the call rescue allowed timer is enabled, then the mobile station shall autonomously add
19 one or more Candidate Set pilots whose strength exceeds T_ADD_s to the Active Set,
20 beginning with the strongest, provided that:

- 21 • the $NGHBR_RESQ_CONFIGURED$ field of the $NGHBR_REC$ for the corresponding
22 pilot is equal to '1', and
- 23 • the resulting Active Set size does not exceed N_{6m} pilots.

24 When autonomously adding Rescue Channel pilots to the Active Set, the mobile station
25 may autonomously drop one or more of the existing pilots in the Active Set, beginning with
26 the weakest, to allow for adding pilots when the Active Set is full.

27 2.6.6.2.6.2 Maintenance of the Candidate Set

28 The mobile station shall support a maximum Candidate Set size of N_{7m} pilots.

29 When the mobile station is first assigned a Forward Traffic Channel, the mobile station
30 shall initialize the Candidate Set to contain no pilots. The mobile station shall adjust the
31 Candidate Set whenever any of the following events occur:

- 32 • If the mobile station detects that the strength of a Neighbor Set pilot or a Remaining
33 Set pilot exceeds T_ADD_s , the mobile station shall add the pilot to the Candidate
34 Set.
- 35 • If the mobile station processes an *Extended Handoff Direction Message*, a *General*
36 *Handoff Direction Message* or a *Universal Handoff Direction Message* which does not
37 list a pilot in the current Active Set, and the handoff drop timer corresponding to
38 that pilot has not expired at the action time of the message, the mobile station shall
39 add the pilot to the Candidate Set at the action time of the message.

- 1 • If the mobile station autonomously drops an existing pilot in the Active Set (see
2 2.6.6.2.6.1), and the handoff drop timer corresponding to that pilot has not expired,
3 the mobile station shall add the pilot to the Candidate Set.
- 4 • If $P_REV_IN_USE_s$ is greater than three, and $SOFT_SLOPE_s$ is not equal to '000000',
5 the mobile station shall perform the following:
 - 6 - If the mobile station processes a *General Handoff Direction Message* or a
7 *Universal Handoff Direction Message* which does not list a pilot in the current
8 Active Set, the handoff drop timer corresponding to that pilot has expired at the
9 action time of the message, and that pilot is found to be above T_DROP_s , the
10 mobile station shall add the pilot to the Candidate Set at the action time of the
11 message.
 - 12 - If the mobile station autonomously drops an existing pilot in the Active Set (see
13 2.6.6.2.6.1), the handoff drop timer corresponding to that pilot has expired, and
14 that pilot is found to be above T_DROP_s , the mobile station shall add the pilot to
15 the Candidate Set.
- 16 • If the mobile station processes an *Extended Handoff Direction Message*, a *General*
17 *Handoff Direction Message* or *Universal Handoff Direction Message*, which lists a
18 pilot in the current Candidate Set, the mobile station shall delete the pilot from the
19 Candidate Set at the action time of the message.
- 20 • If the handoff drop timer corresponding to a Candidate Set pilot expires, the mobile
21 station shall delete the pilot from the Candidate Set.
- 22 • If the mobile station autonomously adds a Candidate Set pilot to the Active Set (see
23 2.6.6.2.6.1), the mobile station shall delete the pilot from the Candidate Set.
- 24 • If the mobile station adds a pilot to the Candidate Set, and the resulting Candidate
25 Set size exceeds N_{7m} , the mobile station shall delete from the Candidate Set the
26 pilot whose handoff drop timer is closest to expiration. If more than one such pilot
27 exists, the mobile station shall delete one such pilot that has the lowest strength. If
28 no pilot in the Candidate Set has an enabled handoff drop timer, the mobile station
29 shall delete from the Candidate Set the pilot that has the lowest strength.

30 2.6.6.2.6.3 Maintenance of the Neighbor Set

31 The mobile station shall support a Neighbor Set size of at least N_{8m} pilots.

32 When the mobile station is first assigned a Forward Traffic Channel, the mobile station
33 shall initialize the Neighbor Set to contain all the pilots specified in the most recently
34 received *Neighbor List Message*, *Extended Neighbor List Message* or *General Neighbor List*
35 *Message*.

36 The mobile station shall maintain a counter, AGE_s , for each pilot in the Neighbor Set. The
37 mobile station shall initialize this counter to zero when it moves the pilot from the Active
38 Set or the Candidate Set to the Neighbor Set. The mobile station shall initialize this
39 counter to $NGHBR_MAX_AGE_s$ when it moves the pilot from the Remaining Set to the
40 Neighbor Set. The mobile station shall increment AGE_s for each pilot in the Neighbor Set
41 upon receipt of a *Neighbor List Update Message* or an *Extended Neighbor List Update*

1 *Message*. When the mobile station is first assigned to a Forward Traffic Channel, the
2 mobile station shall set AGE_S for each pilot in the Neighbor Set to $NGHBR_MAX_AGE_S$.

3 The mobile station shall adjust the Neighbor Set whenever any of the following events
4 occur:

- 5 • If the mobile station receives a *Neighbor List Update Message* or an *Extended*
6 *Neighbor List Update Message*, it shall perform the following:
 - 7 - Increment AGE_S for each pilot in the Neighbor Set.
 - 8 - Delete from the Neighbor Set all pilots whose AGE_S exceeds $NGHBR_MAX_AGE_S$.
 - 9 - Add to the Neighbor Set each pilot named in the message, if it is not already a
10 pilot of the Active Set, Candidate Set, or Neighbor Set. If the mobile station can
11 store in the Neighbor Set only k additional pilots, and more than k new pilots
12 were sent in the *Neighbor List Update Message* or the *Extended Neighbor List*
13 *Update Message*, the mobile station shall store the first k new pilots listed in the
14 message.
- 15 • If the handoff drop timer of a pilot in the Candidate Set expires, the mobile station
16 shall add the pilot to the Neighbor Set.
- 17 • If $P_REV_IN_USE_S$ is less than or equal to three or $SOFT_SLOPE_S$ is equal to
18 '000000', the mobile station shall perform the following:
 - 19 - If the mobile station processes an *Extended Handoff Direction Message*, a
20 *General Handoff Direction Message*, or a *Universal Handoff Direction Message* in
21 which a pilot in the Active Set is not listed, and the handoff drop timer
22 corresponding to the pilot has expired, the mobile station shall add the pilot to
23 the Neighbor Set.
 - 24 - If the mobile station autonomously drops an existing pilot in the Active Set (see
25 2.6.6.2.6.1) and the handoff drop timer corresponding to the pilot has expired,
26 the mobile station shall add the pilot to the Neighbor Set.
- 27 • If $P_REV_IN_USE_S$ is greater than three, and $SOFT_SLOPE_S$ is not equal to '000000',
28 the mobile station shall perform the following:
 - 29 - If the mobile station processes an *Extended Handoff Direction Message*, a
30 *General Handoff Direction Message*, or a *Universal Handoff Direction Message*
31 which does not list a pilot in the current Active Set, the handoff drop timer
32 corresponding to that pilot has expired, and that pilot is found to be below
33 T_DROP_S , the mobile station shall add the pilot to the Neighbor Set.
 - 34 - If the mobile station autonomously drops an existing pilot in the Active Set (see
35 2.6.6.2.6.1), the handoff drop timer corresponding to that pilot has expired, and
36 that pilot is found to be below T_DROP_S , the mobile station shall add the pilot to
37 the Neighbor Set.
- 38 • If the mobile station adds a pilot to the Candidate Set, and the resulting Candidate
39 Set size exceeds the size supported by the mobile station, the mobile station shall
40 add the deleted Candidate Set pilot to the Neighbor Set (see 2.6.6.2.6.2).

- 1 • If the mobile station detects that the strength of a Neighbor Set pilot exceeds
2 T_ADD_S , the mobile station shall delete the pilot from the Neighbor Set.
- 3 • If the mobile station processes an *Extended Handoff Direction Message*, a *General*
4 *Handoff Direction Message* or a *Universal Handoff Direction Message* which lists a
5 pilot in the current Neighbor Set, the mobile station shall delete the pilot from the
6 Neighbor Set.
- 7 • If the mobile station adds a pilot to the Neighbor Set, and the resulting Neighbor Set
8 size exceeds the size supported by the mobile station, the mobile station shall delete
9 from the Neighbor Set the pilot whose AGE_S is the largest. If more than one such
10 pilot exists, the mobile station shall delete one such pilot that has the lowest
11 strength.

12 2.6.6.2.7 Soft Handoff

13 2.6.6.2.7.1 Forward Traffic Channel Processing

14 All Forward Traffic Channels associated with pilots in the Active Set of the mobile station
15 carry identical modulation symbols with the exception of the power control subchannel (see
16 [2]).

17 When the Active Set contains more than one pilot, the mobile station should provide
18 diversity combining of the associated Forward Traffic Channels. The mobile station shall
19 provide for differential propagation delays from zero to at least 150 μ s.

20 2.6.6.2.7.2 Reverse Traffic Channel Power Control During Soft Handoff

21 The *Extended Handoff Direction Message*, a *General Handoff Direction Message* or a
22 *Universal Handoff Direction Message* identifies sets of Forward Fundamental Channels or
23 Forward Dedicated Control Channels that carry identical closed loop power control
24 subchannels. A set consists of one or more Forward Fundamental Channels or Forward
25 Dedicated Control Channels with identical power control information.

26 The *Universal Handoff Direction Message* identifies sets of Forward Common Power Control
27 Channels that carry identical closed loop power control subchannels. A set consists of one
28 or more Forward Common Power Control Channels with identical power control
29 information.

30 Each Rescue Channel that has been autonomously promoted to the Active Set as part of
31 Call Rescue Soft Handoff (see 2.6.6.2.13) shall form its own set. The mobile station shall
32 not diversity combine the closed loop power control subchannel of any Rescue Channel
33 with any other Forward Fundamental Channel until directed otherwise by an *Extended*
34 *Handoff Direction Message*, *General Handoff Direction Message*, or *Universal Handoff*
35 *Direction Message*.

36 In each power control group containing valid power control bits (see [2]), the mobile station
37 should provide diversity combining of the identical closed loop power control subchannels
38 and shall obtain at most one power control bit from each set of identical closed loop power
39 control subchannels. The mobile station should only combine reliable power control bits
40 (see [11]) as follows:

- 1 • If the reliable power control bits obtained from all sets are equal to '0', the mobile
2 station shall increase its power as specified in [2].
- 3 • If the reliable power control bit obtained from any set is equal to '1', the mobile
4 station shall decrease its power as specified in [2].

5 2.6.6.2.7.3 Starting Periodic Search following Soft Handoff

6 If the PERIODIC SEARCH_s is equal to '1', a periodic search is not already in progress, and
7 the Frequency Assignment after handoff is different from the Candidate Frequency
8 (CDMABAND_s is not equal to CF_CDMABAND_s or CDMACH_s is not equal to
9 CF_CDMACH_s), the mobile station shall perform the following:

- 10 • The mobile station shall set ALIGN_TIMING_USED_s to '0' and SEARCH_OFFSET_s to
11 '000000'.
- 12 • The mobile station shall start a periodic search as described in 2.6.6.2.8.3.2.

13 2.6.6.2.8 CDMA-to-CDMA Hard Handoff

14 The base station directs the mobile station to perform a CDMA-to-CDMA hard handoff by
15 sending an *Extended Handoff Direction Message*, a *General Handoff Direction Message* or a
16 *Universal Handoff Direction Message* in which the mobile station is transitioned between
17 disjoint sets of base stations, different Frequency Assignments, or different frame offsets.
18 When the base station uses a *Extended Handoff Direction Message*, a *General Handoff*
19 *Direction Message*, *MEID Universal Handoff Direction Message* or a *Universal Handoff*
20 *Direction Message* to direct the mobile to a channel with flexible channel spacing between
21 the forward and reverse channels, the base station extends these message using the
22 *General Extension Message* and include channel records that specify the forward and
23 reverse frequencies to be used by the mobile station for handoff. The mobile station shall
24 process this message as specified in section 2.6.18. If RETURN_IF_HANDOFF_FAIL_s is
25 equal to '0', the mobile station performs the actions described in 2.6.6.2.8.1. If
26 RETURN_IF_HANDOFF_FAIL_s is equal to '1', the mobile station performs the actions
27 described in 2.6.6.2.8.2.

28 2.6.6.2.8.1 Hard Handoff without Return on Failure

29 At the action time specified in the *Extended Handoff Direction Message*, the *General*
30 *Handoff Direction Message* or *Universal Handoff Direction Message* the mobile station shall
31 disable its transmitter, reset the fade timer specified in 2.6.4.1.8, suspend incrementing
32 TOT_FRAMES_s, BAD_FRAMES_s, DCCH_TOT_FRAMES_s, and DCCH_BAD_FRAMES_s if
33 applicable as specified in 2.6.4.1.1, and tune to the assigned Forward Traffic Channel. The
34 mobile station shall perform acquisition of the pilots in the new Active Set.

35 If a periodic Serving Frequency pilot report procedure is in progress, the mobile station
36 shall abort it (see 2.6.6.2.12).

37 The mobile station shall begin monitoring the assigned Forward Traffic Channel within the
38 time specified below:

- 1 • If the *Extended Handoff Direction Message*, *General Handoff Direction Message* or
2 *Universal Handoff Direction Message* specifies a CDMA Frequency Assignment
3 different from the Serving Frequency and an Active Set containing pilots with pilot
4 PN sequence offsets identical to those of the pilots in the Serving Frequency Active
5 Set, the mobile station shall begin monitoring the assigned Forward Traffic Channel
6 within T_{60m} seconds after the action time.
- 7 • If the *Extended Handoff Direction Message*, *General Handoff Direction Message* or
8 *Universal Handoff Direction Message* specifies a CDMA Frequency Assignment
9 different from the Serving Frequency and an Active Set containing a pilot with pilot
10 PN sequence offset not equal to that of any pilot in the Serving Frequency Active
11 Set, the mobile station shall begin monitoring the assigned Forward Traffic Channel
12 within T_{61m} seconds after the action time.
- 13 • If the *Extended Handoff Direction Message*, *General Handoff Direction Message* or
14 *Universal Handoff Direction Message* specifies a CDMA-to-CDMA hard handoff
15 without changing the CDMA Frequency Assignment, the mobile station shall begin
16 monitoring the assigned Forward Traffic Channel within T_{62m} seconds after the
17 action time.

18 If the Target Frequency is the same as the Candidate Frequency ($TF_CDMABAND_S$ is equal
19 to $CF_CDMABAND_S$, and TF_CDMACH_S is equal to CF_CDMACH_S) and is different from the
20 Serving Frequency ($TF_CDMABAND_S$ is not equal to $SF_CDMABAND_S$, or TF_CDMACH_S is
21 not equal to SF_CDMACH_S), the mobile station shall perform the following:

- 22 • If applicable, the mobile station shall replace its Neighbor Set with its Candidate
23 Frequency Neighbor Set, excluding the pilots in its Active Set. When the mobile
24 station adds a pilot from its Candidate Frequency Neighbor Set to its Active Set, it
25 shall maintain $SEARCH_PRIORITY_S$, $SRCH_WIN_NGHBR_S$, and
26 $SRCH_OFFSET_NGHBR_S$ associated with the pilot.
- 27 • The mobile station shall set $PILOT_INC_S$ to $CF_PILOT_INC_S$, $SRCH_WIN_N_S$ to
28 $CF_SRCH_WIN_N_S$, and $SRCH_WIN_R_S$ to $CF_SRCH_WIN_R_S$.
- 29 • The mobile station shall set $SEARCH_PRIORITY_INCL_S$ to
30 $CF_SEARCH_PRIORITY_INCL_S$, $SRCH_OFFSET_INCL_S$ to $CF_SRCH_OFFSET_INCL_S$,
31 and $SRCH_WIN_NGHBR_INCL_S$ to $CF_SRCH_WIN_NGHBR_INCL_S$.

32 If a F-CPCCH is not assigned, the mobile station shall perform the following:

- 33 • After the action time, upon receiving a period of $(N_{11m} \times 20)$ ms with sufficient
34 signal quality on the physical channel corresponding to $FPC_PRI_CHAN_S$ on the
35 assigned Forward Traffic Channel, the mobile station shall re-enable its transmitter.
36 The mobile station shall transmit the Traffic Channel Preamble, as described in [2],
37 followed by a Handoff Completion Message or Extended Handoff Completion
38 Message.
- 39 • After the action time, upon receiving a period of $(N_{3m} \times 20)$ ms with sufficient signal
40 quality on the physical channel corresponding to $FPC_PRI_CHAN_S$, the mobile
41 station shall resume incrementing TOT_FRAMES_S , BAD_FRAMES_S ,

1 DCCH_TOT_FRAMES_s, and DCCH_BAD_FRAMES_s if applicable as specified in
2 2.6.4.1.1.

3 If a F-CPCCH is assigned, the mobile station shall perform the following:

- 4 • After the action time, upon receiving a period of $(N_{19m} \times 1.25)$ ms with sufficient
5 signal quality on the Forward Common Power Control Subchannels assigned to this
6 mobile station, the mobile station shall re-enable its transmitter. The mobile station
7 shall transmit the Traffic Channel Preamble, as described in [2], followed by an
8 *Extended Handoff Completion Message*. The mobile station shall also transmit the
9 Reverse Channel Quality Indicator Channel as described in [2] and [3].

10 If the PERIODIC_SEARCH_s is equal to '1', a periodic search is not already in progress, and
11 the Frequency Assignment after handoff is different from the Candidate Frequency
12 (CDMABAND_s is not equal to CF_CDMABAND_s or CDMACH_s is not equal to
13 CF_CDMACH_s), the mobile station shall perform the following:

- 14 • The mobile station shall set ALIGN_TIMING_USED_s to '0' and SEARCH_OFFSET_s to
15 '000000'.
- 16 • The mobile station shall start a periodic search as described in 2.6.6.2.8.3.2.

17 2.6.6.2.8.2 Hard Handoff with Return on Failure

18 At the action time specified in the *General Handoff Direction Message* or *Universal Handoff*
19 *Direction Message*, the mobile station shall perform the following:

- 20 • The mobile station shall stop processing the Forward Fundamental Channel, the
21 Forward Dedicated Control Channel, the Forward Supplemental Code Channels (if
22 any), and the Forward Supplemental Channels (if any).
- 23 • The mobile station shall stop transmitting on the Reverse Fundamental Channel, on
24 the Reverse Dedicated Control Channel, and on the Reverse Supplemental Code
25 Channels (if any), and on the Reverse Supplemental Channels (if any).
- 26 • The mobile station shall disable the fade timer (see 2.6.4.1.8) and the handoff drop
27 timers corresponding to the Serving Frequency Active Set and Candidate Set (see
28 2.6.6.2.3), and shall suspend incrementing TOT_FRAMES_s, BAD_FRAMES_s,
29 DCCH_TOT_FRAMES_s, and DCCH_BAD_FRAMES_s if applicable (see 2.6.4.1.1).
- 30 • The mobile station shall lock the accumulation of valid level changes in the closed
31 loop mean output power and shall ignore received power control bits related to the
32 period that the transmitter is disabled (see [2]).
- 33 • If the Serving Frequency is different from the Target Frequency (SF_CDMACH_s is
34 not equal to TF_CDMACH_s or SF_CDMABAND_s is not equal to TF_CDMABAND_s),
35 the mobile station shall set CDMACH_s to TF_CDMACH_s and CDMABAND_s to
36 TF_CDMABAND_s, and shall tune to the Target Frequency.

37 The mobile station shall not change its time reference (see [2]) until the handoff is
38 successfully completed (as described later in this section) or the mobile station resumes
39 using the Serving Frequency Active Set (as described in 2.6.6.2.8.2.1).

1 The mobile station shall maintain a *handoff* timer. The mobile station shall set the
 2 expiration time for the handoff timer to $(0.08 \times TF_WAIT_TIME_S)$ seconds and enable the
 3 timer at the action time of the *General Handoff Direction Message* or *Universal Handoff*
 4 *Direction Message*.

5 The mobile station shall perform the following actions:

- 6 • If the Target Frequency is different from the Serving Frequency ($TF_CDMABAND_S$ is
 7 not equal to $SF_CDMABAND_S$, or TF_CDMACH_S is not equal to SF_CDMACH_S), the
 8 mobile station shall measure the mean input power on the Target Frequency
 9 ($target_freq_pwr$, in dBm/1.23 MHz) and may use $target_freq_pwr$ along with the
 10 measurement of the average input power on the Serving Frequency
 11 ($avg_serving_freq_pwr$, in dBm/1.23 MHz) in the handoff procedure. The mobile
 12 station may declare the handoff attempt to be unsuccessful if all of the following
 13 conditions are true:
 - 14 – $DIFF_RX_PWR_THRESH_S$ is not equal to '00000',
 - 15 – the mobile station has been measuring the received power on the Serving
 16 Frequency for at least the last N_{12m} frames, and
 - 17 – $(target_freq_pwr - avg_serving_freq_pwr)$ is less than $(-30 + 2 \times$
 18 $DIFF_RX_PWR_THRESH_S)$ dB.

19 If the mobile station declares the handoff attempt to be unsuccessful, it shall
 20 restore the configuration to what it was before the handoff attempt (see 2.6.6.2.5.1)
 21 and send a *Candidate Frequency Search Report Message* as described in
 22 2.6.6.2.8.2.1.

- 23 • The mobile station shall measure E_C/I_0 for each pilot in the Active Set using the
 24 procedures specified in 2.6.6.2.2, if any of the following conditions is true:
 - 25 – the Target Frequency is the same as the Serving Frequency ($TF_CDMABAND_S$ is
 26 equal to $SF_CDMABAND_S$, and TF_CDMACH_S is equal to SF_CDMACH_S),
 - 27 – the mobile station does not use the power measurements in the handoff
 28 procedure,
 - 29 – $DIFF_RX_PWR_THRESH_S$ is equal to '00000',
 - 30 – the mobile station has not been measuring the received power on the Serving
 31 Frequency for at least the last N_{12m} frames, or
 - 32 – $(target_freq_pwr - avg_serving_freq_pwr)$ is not less than $(-30 + 2 \times$
 33 $DIFF_RX_PWR_THRESH_S)$ dB.

34 If the mobile station measures E_C/I_0 for pilots in the Active Set, it shall compare the
 35 sum of the measured E_C/I_0 for all pilots with the minimum total pilot E_C/I_0
 36 threshold ($MIN_TOTAL_PILOT_EC_IO_S$).

- 37 – If $MIN_TOTAL_PILOT_EC_IO_S$ is not equal to '00000', and $(-20 \times \log_{10}$
 38 $(E_C/I_0)_{total})$ is greater than $MIN_TOTAL_PILOT_EC_IO_S$, where $(E_C/I_0)_{total}$ is the
 39 sum of the measured E_C/I_0 for the pilots in the Active Set, the mobile station

1 shall declare the handoff attempt to be unsuccessful, and shall perform the
2 following:

3 + If COMPLETE_SEARCH_s is equal to '1', and the Target Frequency is the
4 same as the Candidate Frequency (TF_CDMABAND_s is equal to
5 CF_CDMABAND_s, and TF_CDMACH_s is equal to CF_CDMACH_s) and is
6 different from the Serving Frequency (TF_CDMABAND_s is not equal to
7 SF_CDMABAND_s, or TF_CDMACH_s is not equal to SF_CDMACH_s), the
8 mobile station shall measure the strength of each pilot in its Candidate
9 Frequency Search Set using the procedures specified in 2.6.6.2.2; otherwise,
10 the mobile station shall end the search.

11 + The mobile station shall then restore its configuration to what it was before
12 the handoff attempt (see 2.6.6.2.5.1) and send a *Candidate Frequency Search*
13 *Report Message* as described in 2.6.6.2.8.2.1.

14 - If MIN_TOTAL_PILOT_EC_IO_s is equal to '00000', or $(-20 \times \log_{10} (E_c/I_o)_{total})$ is
15 not less than MIN_TOTAL_PILOT_EC_IO_s, where $(E_c/I_o)_{total}$ is the sum of the
16 measured E_c/I_o for the pilots in the Active Set, the mobile station shall attempt
17 to demodulate the Forward Traffic Channel(s). If the Active Set contains more
18 than one pilot, the mobile station shall perform the actions specified in
19 2.6.6.2.7. If the Target Frequency is the same as the Candidate Frequency
20 (TF_CDMABAND_s is equal to CF_CDMABAND_s, and TF_CDMACH_s is equal to
21 CF_CDMACH_s), and is different from the Serving Frequency (TF_CDMABAND_s is
22 not equal to SF_CDMABAND_s, or TF_CDMACH_s is not equal to SF_CDMACH_s),
23 the mobile station shall measure the strength of each pilot in its Candidate
24 Frequency Search Set using the procedures specified in 2.6.6.2.2, and the
25 mobile station shall wait for the first of the following events to occur:

26 + If the handoff timer expires, the mobile station shall declare the handoff
27 attempt to be unsuccessful, and perform the following:

28 o If COMPLETE_SEARCH_s is equal to '1', and if the Target Frequency is the
29 same as the Candidate Frequency (TF_CDMABAND_s is equal to
30 CF_CDMABAND_s, and TF_CDMACH_s is equal to CF_CDMACH_s) and is
31 different from the Serving Frequency (TF_CDMABAND_s is not equal to
32 SF_CDMABAND_s, or TF_CDMACH_s is not equal to SF_CDMACH_s), and
33 the mobile station has not completed the search of all pilots in its
34 Candidate Frequency Search Set, then it shall complete the search, i.e.,
35 it shall obtain at least one measurement of the strength of each pilot in
36 its Candidate Frequency Search Set, using the search procedures
37 specified in 2.6.6.2.8.3.

38 o Otherwise, the mobile station shall end the search.

39 The mobile station shall then restore its configuration to what it was before
40 the handoff attempt (see 2.6.6.2.5.1) and send a *Candidate Frequency Search*
41 *Report Message* as described in 2.6.6.2.8.2.1.

- 1 + If a F-CPCCH is not assigned, and the mobile station receives a period of
2 ($N_{11m} \times 20$) ms with sufficient signal quality on the physical channel
3 corresponding to FPC_PRI_CHAN_s, or if a F-CPCCH is assigned, and the
4 mobile station receives a period of ($N_{19m} \times 1.25$) ms with sufficient signal
5 quality on the Forward Common Power Control Subchannels assigned to
6 this mobile station, then, the mobile station shall declare the handoff
7 attempt to be successful, and perform the following:
- 8 o The mobile station shall disable the handoff timer.
 - 9 o If TF_RESET_L2_s is equal to '1', Layer 3 shall send a L2-
10 Supervision.Request primitive to Layer 2 to reset the acknowledgment
11 procedures as specified in [4].
 - 12 o If TF_RESET_FPC_s is equal to '1', the mobile station shall initialize the
13 Forward Traffic Channel power control counters as specified in
14 2.6.4.1.1.1.
 - 15 o If the Target Frequency is the same as the Candidate Frequency
16 (TF_CDMABAND_s is equal to CF_CDMABAND_s, and TF_CDMACH_s is
17 equal to CF_CDMACH_s) and is different from the Serving Frequency
18 (TF_CDMABAND_s is not equal to SF_CDMABAND_s, or TF_CDMACH_s is
19 not equal to SF_CDMACH_s), the mobile station shall perform the
20 following:
 - 21 ◇ If applicable, the mobile station shall replace its Neighbor Set with its
22 Candidate Frequency Neighbor Set, excluding the pilots in its Active
23 Set. When the mobile station adds a pilot from its Candidate
24 Frequency Neighbor Set to its Active Set, it shall maintain
25 SEARCH_PRIORITY_s, SRCH_WIN_NGHBR_s, and
26 SRCH_OFFSET_NGHBR_s associated with the pilot.
 - 27 ◇ The mobile station shall set PILOT_INC_s to CF_PILOT_INC_s,
28 SRCH_WIN_N_s to CF_SRCH_WIN_N_s, and SRCH_WIN_R_s to
29 CF_SRCH_WIN_R_s.
 - 30 ◇ The mobile station shall set SEARCH_PRIORITY_INCL_s to
31 CF_SEARCH_PRIORITY_INCL_s, SRCH_OFFSET_INCL_s to
32 CF_SRCH_OFFSET_INCL_s, and SRCH_WIN_NGHBR_INCL_s to
33 CF_SRCH_WIN_NGHBR_INCL_s.
 - 34 o The mobile station shall re-enable its transmitter and shall re-enable the
35 fade timer (see 2.6.4.1.8) and reset it for T_{5m} seconds. Then, the mobile
36 station shall transmit the Traffic Channel Preamble, as described in [2],
37 followed by a *Handoff Completion Message* if P_REV_IN_USE_s is less than
38 seven or an *Extended Handoff Completion Message* if P_REV_IN_USE_s is
39 equal to or greater than seven.

- 1 o If a F-CPCCH is not assigned, after starting the handoff timer, upon
2 receiving the first period of $(N_{3m} \times 20)$ ms with sufficient signal quality
3 on the physical channel corresponding to $FPC_PRI_CHAN_s$, the mobile
4 station shall resume incrementing TOT_FRAMES_s , BAD_FRAMES_s ,
5 $DCCH_TOT_FRAMES_s$, and $DCCH_BAD_FRAMES_s$ if applicable as
6 specified in 2.6.4.1.1.
- 7 o If the Target Frequency is same as the Candidate Frequency
8 ($TF_CDMABAND_s$ is equal to $CF_CDMABAND_s$ and TF_CDMACH_s is
9 equal to CF_CDMACH_s), then the mobile station shall set
10 $PERIODIC_SEARCH_s$ to '0'.
- 11 o If $PERIODIC_SEARCH_s$ is equal to '1', the mobile station shall perform
12 the following:
- 13 ◇ The mobile station shall set $ALIGN_TIMING_USED_s$ to '0' and
14 $SEARCH_OFFSET_s$ to '000000'.
- 15 ◇ The mobile station shall start a periodic search as described in
16 2.6.6.2.8.3.2.
- 17 o The mobile station shall maintain its pilot sets using the procedures
18 described in 2.6.6.2.6.

19 2.6.6.2.8.2.1 Restoring the Configuration

20 If the mobile station declares a handoff attempt to be unsuccessful (see 2.6.6.2.8.2), it shall
21 perform the following actions:

- 22 • If the handoff timer is enabled, the mobile station shall disable it.
- 23 • The mobile station shall restore the following parameters:
- 24 – Message encryption mode: If $SF_ENCRYPT_MODE_s$ is equal to '0', the mobile
25 station shall turn off message encryption; otherwise, it shall turn on message
26 encryption.
- 27 – Service configuration: The mobile station shall use the service configuration
28 stored in $SF_SERVICE_CONFIG_s$ to process Forward and Reverse Traffic
29 Channel frames.
- 30 – The mobile station shall restore the list of calls stored in SF_CALLS_s .
- 31 – Protocol revision level ($P_REV_s = SF_P_REV_s$)
- 32 – Protocol revision level in use on the serving frequency ($P_REV_IN_USE_s =$
33 $SF_P_REV_IN_USE_s$)
- 34 – Service negotiation type ($SERV_NEG_s = SF_SERV_NEG_s$)
- 35 – Private long code mask: If $SF_PRIVATE_LCM_s$ is set to '1' then the mobile
36 station shall set $PVTLCM_42$ to $SF_PVTLCM_42_s$.
- 37 – Long code mask: If $SF_PRIVATE_LCM_s$ is equal to '1', the mobile station shall
38 use the private long code mask; otherwise, it shall use the public long code
39 mask derived from $SF_PLCM_TYPE_s$ and $SF_PLCM_39_s$ (if any).

- 1 – Search window size for the Active Set and Candidate Set
- 2 (SRCH_WIN_A_s = SF_SRCH_WIN_A_s)
- 3 – Search window size for the Neighbor Set
- 4 (SRCH_WIN_N_s = SF_SRCH_WIN_N_s)
- 5 – Search window size for the Remaining Set
- 6 (SRCH_WIN_R_s = SF_SRCH_WIN_R_s)
- 7 – Pilot detection threshold (T_ADD_s = SF_T_ADD_s)
- 8 – Pilot drop threshold (T_DROP_s = SF_T_DROP_s)
- 9 – Soft slope for the dynamic add and drop threshold (SOFT_SLOPE_s =
- 10 SF_SOFT_SLOPE_s)
- 11 – Intercept for the dynamic add threshold (ADD_INTERCEPT_s =
- 12 SF_ADD_INTERCEPT_s)
- 13 – Intercept for the dynamic drop threshold (DROP_INTERCEPT_s =
- 14 SF_DROP_INTERCEPT_s)
- 15 – Active Set versus Candidate Set comparison threshold (T_COMP_s =
- 16 SF_T_COMP_s)
- 17 – Drop timer value (T_TDROPS_s = SF_T_TDROPS_s)
- 18 – Drop timer range value (T_TDROPS_RANGE_s = SF_T_TDROPS_RANGE_s)
- 19 – Frame offset (FRAME_OFFSET_s = SF_FRAME_OFFSET_s)
- 20 – Nominal power setting (NOM_PWR_s = SF_NOM_PWR_s)
- 21 – Extended nominal power setting (NOM_PWR_EXT_s = SF_NOM_PWR_EXT_s)
- 22 – Power control step (PWR_CNTL_STEP_s = SF_PWR_CNTL_STEP_s)
- 23 – CDMA band class (CDMABAND_s = SF_CDMABAND_s)
- 24 – Frequency assignment (CDMACH_s = SF_CDMACH_s)
- 25 – Active Set (For each pilot in the Serving Frequency Active Set: (PILOT_REC,
- 26 PWR_COMB_IND))
- 27 – Code channel list (CODE_CHAN_LIST_s = SF_CODE_CHAN_LIST_s)
- 28 • The mobile station shall tune to the Serving Frequency and resume using the
- 29 Serving Frequency Active Set as follows:
- 30 – If the mobile station was processing the Forward Fundamental Channel prior to
- 31 tuning to the Candidate Frequency, the mobile station shall resume processing
- 32 the Forward Fundamental Channel. If the mobile station was transmitting on
- 33 the Reverse Fundamental Channel prior to tuning to the Candidate Frequency,
- 34 the mobile station shall resume transmitting on the Reverse Fundamental
- 35 Channel.

- 1 – If the mobile station was processing the Forward Dedicated Control Channel
2 prior to tuning to the Candidate Frequency, the mobile station shall resume
3 processing the Forward Dedicated Control Channel. If the mobile station was
4 transmitting on the Reverse Dedicated Control Channel prior to tuning to the
5 Candidate Frequency, the mobile station shall resume transmitting on the
6 Reverse Dedicated Control Channel.
- 7 – The mobile station shall not resume transmitting on the Reverse Supplemental
8 Code Channels and Reverse Supplemental Channels (if any). The mobile station
9 shall not process on the Forward Supplemental Code Channels and Forward
10 Supplemental Channels (if any).
- 11 – When the mobile station resumes transmission on the Reverse Traffic Channel,
12 it shall use the following rules to re-enable its transmitter:
- 13 + If the interval between the time that the mobile station disables its
14 transmitter and the time that it resumes using the Serving Frequency Active
15 Set is equal to or greater than $(N_{2m} \times 20)$ ms, then:
- 16 o If a F-CPCCH is not assigned, the mobile station shall wait to receive a
17 period of $(N_{3m} \times 20)$ ms with sufficient signal quality on the physical
18 channel corresponding to $FPC_PRI_CHAN_S$ before it re-enables its
19 transmitter.
- 20 o If a F-CPCCH is assigned, the mobile station shall wait to receive a
21 period of $(N_{17m} \times 1.25)$ ms with sufficient signal quality on the Forward
22 Common Power Control Subchannels assigned to this mobile station
23 before it re-enables its transmitter.
- 24 + Otherwise, after the mobile station tunes to the Serving Frequency, the
25 mobile station shall re-enable its transmitter no later than $N_{3m} \times 20$ ms if a
26 F-CPCCH is not assigned, and no later than $(N_{17m} \times 1.25)$ ms if a F-CPCCH
27 is assigned. The mobile station should re-enable its transmitter earlier.
28 After the mobile station re-enables its transmitter, the mean output power
29 shall be as specified in [2] for a step change in input power. If the mobile
30 station re-enables its transmitter earlier than $(N_{3m} \times 20)$ ms if a F-CPCCH is
31 not assigned, or earlier than $(N_{17m} \times 1.25)$ ms if a F-CPCCH is assigned,
32 after it tunes to the Serving Frequency, the initial mean output power shall
33 be as specified in [2], where the initial mean input power estimate is either:
- 34 o within 6 dB of the actual mean input power, or
- 35 o equal to the mean input power before the mobile station tuned to the
36 Target Frequency.
- 37 • The mobile station shall enable the fade timer and the handoff drop timers
38 corresponding to the pilots in its Active Set and Candidate Set. The mobile station
39 shall resume incrementing TOT_FRAMES_S , BAD_FRAMES_S , $DCCH_TOT_FRAMES_S$,
40 and $DCCH_BAD_FRAMES_S$ if applicable as specified in 2.6.4.1.1.
- 41 • The mobile station shall send a *Candidate Frequency Search Report Message* within
42 T_{56m} seconds of declaring the handoff attempt to be unsuccessful. The mobile

1 station shall report the contents of the *Candidate Frequency Search Report Message*
2 as follows:

- 3 – The mobile station shall report the two components of the Target Frequency
4 in the CDMA_FREQ and BAND_CLASS fields.
- 5 – The mobile station shall report the received power on the Target Frequency and
6 on the Serving Frequency in the CF_TOTAL_RX_PWR and SF_TOTAL_RX_PWR
7 fields, respectively.
- 8 – For each pilot in the Target Frequency Active Set that measures above
9 TF_T_ADD_s, the mobile station shall report its phase and strength in the fields
10 PILOT_PN_PHASE and PILOT_STRENGTH, respectively.
- 11 – If the Target Frequency is the same as the Candidate Frequency
12 (TF_CDMABAND_s is equal to CF_CDMABAND_s, and TF_CDMACH_s is equal to
13 CF_CDMACH_s), and is different from the Serving Frequency (TF_CDMABAND_s is
14 not equal to SF_CDMABAND_s or TF_CDMACH_s is not equal to SF_CDMACH_s),
15 the mobile station shall also report the strength of each pilot in the Candidate
16 Frequency Search Set that measures above CF_T_ADD_s.
- 17 • If the Serving Frequency is the same as the Candidate Frequency (SF_CDMABAND_s
18 is equal to CF_CDMABAND_s and SF_CDMACH_s is equal to CF_CDMACH_s), then the
19 mobile station shall set PERIODIC_SEARCH_s to '0'.
- 20 • If PERIODIC_SEARCH_s is equal to '1' and the Candidate Frequency Search Set is
21 not empty, the mobile station shall perform the following:
 - 22 – The mobile station shall set ALIGN_TIMING_USED_s to '0' and
23 SEARCH_OFFSET_s to '000000'.
 - 24 – The mobile station shall carry out the periodic search procedures described in
25 2.6.6.2.8.3.2.

26 2.6.6.2.8.3 Search of Pilots on the CDMA Candidate Frequency
27 If SEARCH_MODE_s is equal to '0000', the mobile station shall perform the following: If
28 PERIODIC_SEARCH_s is equal to '0', the mobile station shall search the Candidate
29 Frequency Search Set once, as described in 2.6.6.2.8.3.1; otherwise, the mobile station
30 shall search the Candidate Frequency Search Set periodically, as described in
31 2.6.6.2.8.3.2.

32 2.6.6.2.8.3.1 CDMA Candidate Frequency Single Search

33 The mobile station does a single search of the Candidate Frequency Search Set by
34 performing the following actions at the action time of the *Candidate Frequency Search*
35 *Control Message* or the *Candidate Frequency Search Request Message* that started the
36 search:

- 37 • If ALIGN_TIMING_USED_s is set to '0', the mobile station shall measure the strength
38 of all pilots in the Candidate Frequency Search Set in one or more visits to the
39 Candidate Frequency, as described in 2.6.6.2.8.3.3.

- 1 • If $ALIGN_TIMING_USED_s$ is set to '1', the mobile station shall measure the strength
2 of all pilots in the Candidate Frequency Search Set in one or more scheduled visits
3 (see below) to the Candidate Frequency, as described in 2.6.6.2.8.3.3.

4 The mobile station shall schedule visits to the Candidate Frequency only at $((0.00125 \times$
5 $SEARCH_OFFSET_s) + k \times (SEARCH_TIME_RESOLUTION_s \times inter_visit_time))$ seconds after
6 the action time of the *Candidate Frequency Search Request Message* or the *Candidate*
7 *Frequency Search Control Message* that started the search, where

8 $k =$ an integer between 0 and max_num_visits , inclusive, where
9 max_num_visits is the value of MAX_NUM_VISITS field of the
10 last *Candidate Frequency Search Response Message* sent by the
11 mobile station,

12 and

13 $inter_visit_time =$ the value of the $INTER_VISIT_TIME$ field of the last *Candidate*
14 *Frequency Search Response Message* sent by the mobile station.

- 15 • The mobile station shall complete the measurements and send a *Candidate*
16 *Frequency Search Report Message* within $((0.00125 \times SEARCH_OFFSET_s) +$
17 $freshness_interval)$ seconds after the action time of the *Candidate Frequency Search*
18 *Control Message*, or the *Candidate Frequency Search Request Message*, where
19 $freshness_interval$ is determined as follows:

- 20 – If the value of the $TOTAL_OFF_TIME_FWD$ field or of the $TOTAL_OFF_TIME_REV$
21 field of the last *Candidate Frequency Search Response Message* sent by the
22 mobile station to the base station is greater than or equal to $\lceil (T_{70m} - T_{71m}) /$
23 $SEARCH_TIME_RESOLUTION_s \rceil$, then

24 $freshness_interval = (\max(fwd_time, rev_time) + T_{71m})$ seconds,

25 where

26 $fwd_time = SEARCH_TIME_RESOLUTION_s \times$ (value of the
27 $TOTAL_OFF_TIME_FWD$ field of the last *Candidate Frequency*
28 *Search Response Message* sent by the mobile station),

29 and

30 $rev_time = SEARCH_TIME_RESOLUTION_s \times$ (value of the
31 $TOTAL_OFF_TIME_REV$ field of the last *Candidate Frequency*
32 *Search Response Message* sent by the mobile station).

- 33 – Otherwise,

34 $freshness_interval = T_{70m}$ seconds.

35 The mobile station shall set the fields of the *Candidate Frequency Search Report Message* as
36 follows:

- 37 – The mobile station shall report the two components of the Candidate Frequency
38 in the $CDMA_FREQ$ and $BAND_CLASS$ fields.

- 1 – The mobile station shall report the received power on the Candidate Frequency
2 and on the Serving Frequency in the CF_TOTAL_RX_PWR and
3 SF_TOTAL_RX_PWR fields, respectively.
- 4 – For each pilot in the Candidate Frequency Search Set that measures above
5 CF_T_ADD_s, the mobile station shall report its phase and strength in the fields
6 PILOT_PN_PHASE and PILOT_STRENGTH, respectively.

7 2.6.6.2.8.3.2 Candidate Frequency Periodic Search

8 When the mobile station performs a periodic search, it periodically searches the Candidate
9 Frequency Search Set and reports the results to the base station in the *Candidate*
10 *Frequency Search Report Message*, as described in this section. The mobile station may
11 measure all pilots in the Candidate Frequency Search Set in one visit to the Candidate
12 Frequency, or it may visit the Candidate Frequency several times in a search period, each
13 time measuring all or some of the pilots in the Candidate Frequency Search Set, as
14 described in 2.6.6.2.8.3.3.

15 If SF_TOTAL_EC_THRESH_s is not equal to '11111', while tuned to the Serving Frequency
16 (specified by CDMACH_s and CDMABAND_s), the mobile station shall measure the total
17 received power spectral density, in mW/1.23 MHz, on the Serving Frequency at least once
18 every 20 ms frame. The mobile station shall maintain the average of the spectral density
19 (*spec_density*) over the last N_{12m} frames.

20 (In the following, (E_c/I_o)_{total} is the total E_c/I_o of the pilots in the Active Set, measured as
21 specified in 2.6.6.2.2, and *total_ec* is defined as (10 × log₁₀ ((E_c/I_o)_{total} × *spec_density*)).

22 The mobile station shall maintain a periodic search timer as follows:

- 23 • When the mobile station starts a periodic search, it shall set the periodic search
24 timer to the value in Table 2.6.6.2.8.3.2-1 corresponding to SEARCH_PERIOD_s and
25 shall enable the timer.
 - 26 – If the periodic search is started by a *Candidate Frequency Search Request*
27 *Message* or a *Candidate Frequency Search Control Message*, then the mobile
28 station shall start the periodic search (0.00125 × SEARCH_OFFSET_s) seconds
29 after the action time of the *Candidate Frequency Search Request Message* or the
30 *Candidate Frequency Search Control Message* that started the search.
 - 31 – If the periodic search is started following successful or unsuccessful handoff
32 attempt, the mobile station shall start the periodic search:
 - 33 + Upon sending the *Handoff Completion Message* or *Extended Handoff*
34 *Completion Message*, in the case that the handoff was successful.
 - 35 + Upon sending the *Candidate Frequency Search Report Message*, in the case
36 that the handoff was unsuccessful.
- 37 • When the periodic search timer expires, the mobile station shall reset the periodic
38 search timer to the value in Table 2.6.6.2.8.3.2-1 corresponding to
39 SEARCH_PERIOD_s and shall re-enable the timer.

- 1 • If ALIGN_TIMING_USED_s is set to '0', SF_TOTAL_EC_THRESH_s is not equal to
2 '11111' and SF_TOTAL_EC_IO_THRESH_s is equal to '11111', the mobile station
3 shall perform the following actions once per frame:
- 4 – Disable the periodic search timer if *total_ec* is not less than
5 (-120 + 2 × SF_TOTAL_EC_THRESH_s).
- 6 – Reset the expiration time of the periodic search timer to the value in
7 Table 2.6.6.2.8.3.2-1 corresponding to SEARCH_PERIOD_s, and re-enable the
8 timer if the following conditions are true:
9 + the periodic search timer is disabled, and
10 + *total_ec* is less than (-120 + 2 × SF_TOTAL_EC_THRESH_s).
- 11 • If ALIGN_TIMING_USED_s is set to '0', SF_TOTAL_EC_THRESH_s is equal to '11111'
12 and SF_TOTAL_EC_IO_THRESH_s is not equal to '11111', the mobile station shall
13 perform the following actions once per frame:
- 14 – Disable the periodic search timer if $(-20 \times \log_{10} (E_c/I_o)_{total})$ is not greater than
15 SF_TOTAL_EC_IO_THRESH_s.
- 16 – Reset the expiration time of the periodic search timer to the value in
17 Table 2.6.6.2.8.3.2-1 corresponding to SEARCH_PERIOD_s, and re-enable the
18 timer if the following conditions are true:
19 + the periodic search timer is disabled, and
20 + $(-20 \times \log_{10} (E_c/I_o)_{total})$ is greater than SF_TOTAL_EC_IO_THRESH_s.
- 21 • If ALIGN_TIMING_USED_s is set to '0', SF_TOTAL_EC_THRESH_s is not equal to
22 '11111' and SF_TOTAL_EC_IO_THRESH_s is not equal to '11111', the mobile station
23 shall perform the following actions once per frame:
- 24 – Disable the periodic search timer if the following conditions are true:
25 + *total_ec* is not less than (-120 + 2 × SF_TOTAL_EC_THRESH_s), and
26 + $(-20 \times \log_{10} (E_c/I_o)_{total})$ is not greater than SF_TOTAL_EC_IO_THRESH_s.
- 27 – Reset the expiration time of the periodic search timer to the value in
28 Table 2.6.6.2.8.3.2-1 corresponding to SEARCH_PERIOD_s, and re-enable the
29 timer if the following conditions are true:
30 + the periodic search timer is disabled, and
31 + *total_ec* is less than (-120 + 2 × SF_TOTAL_EC_THRESH_s), or $(-20 \times \log_{10}$
32 $(E_c/I_o)_{total})$ is greater than SF_TOTAL_EC_IO_THRESH_s.
- 33 • The mobile station shall maintain the periodic search timer independent of the total
34 E_c and the total E_c/I_o of the pilots in the Serving Frequency Active Set, if any of the
35 following conditions is true:
- 36 – ALIGN_TIMING_USED_s is set to '1', or

- 1 – SF_TOTAL_EC_THRESH_s is equal to ‘11111’ and SF_TOTAL_EC_IO_THRESH_s is
2 equal to ‘11111’.
3

4 **Table 2.6.6.2.8.3.2-1. Search Period Values**

SEARCH_PERIOD _s	Search Period (seconds)	SEARCH_PERIOD _s	Search Period (seconds)
0	0.48	8	30
1	0.96	9	40
2	2	10	50
3	2.96	11	60
4	4	12	80
5	4.96	13	100
6	10	14	150
7	20	15	200

5
6 If the periodic search timer is enabled, the mobile station shall perform the following
7 actions before the timer expires:

- 8 • If ALIGN_TIMING_USED_s is set to ‘0’, the mobile station shall measure the strength
9 of all pilots in the Candidate Frequency Search Set at least once in one or more
10 visits to the Candidate Frequency, as described in 2.6.6.2.8.3.3.
11 • If ALIGN_TIMING_USED_s is set to ‘1’, the mobile station shall measure the strength
12 of all pilots in the Candidate Frequency Search Set in one or more scheduled visits
13 (see below) to the Candidate Frequency, as described in 2.6.6.2.8.3.3.

14 The mobile station shall schedule visits to the Candidate Frequency only at $((0.00125 \times$
15 $SEARCH_OFFSET_s) + k \times (SEARCH_TIME_RESOLUTION_s \times inter_visit_time))$ seconds after
16 the action time of the *Candidate Frequency Search Request Message* or the *Candidate*
17 *Frequency Search Control Message* that started the search, where

18 $k =$ an integer between 0 and max_num_visits , inclusive, where
19 max_num_visits is the value of MAX_NUM_VISITS field of the
20 last *Candidate Frequency Search Response Message* sent by the
21 mobile station,

22 and

23 $inter_visit_time =$ the value of the INTER_VISIT_TIME field of the last *Candidate*
24 *Frequency Search Response Message* sent by the mobile station.

- 25 – The mobile station shall abort a scheduled visit to the Candidate Frequency
26 if at the scheduled time, one or both of the following conditions hold:

- 1 + SF_TOTAL_EC_THRESH_s is not equal to '11111' and *total_ec* is not less than
2 (-120 + 2 × SF_TOTAL_EC_THRESH_s), or
- 3 + SF_TOTAL_EC_IO_THRESH_s is not equal to '11111' and (-20 × log₁₀
4 (E_c/I_o)_{total}) is not greater than SF_TOTAL_EC_IO_THRESH_s.
- 5 – If the mobile station aborts a scheduled visit during a search period, it may
6 abort all remaining scheduled visits in that search period.
- 7 • The mobile station shall send a *Candidate Frequency Search Report Message* if
8 MIN_TOTAL_PILOT_EC_IO_s is equal to '00000' or if (- 20 × log₁₀ (E_c/I_o)_{total}) is less
9 than or equal to MIN_TOTAL_PILOT_EC_IO_s, where (E_c/I_o)_{total} is the sum of E_c/I_o
10 for all those pilots that measure above CF_T_ADD_s in the current search period.

11 The mobile station shall report the contents of the *Candidate Frequency Search*
12 *Report Message* as follows:

- 13 – The mobile station shall report the two components of the Candidate Frequency
14 in the CDMA_FREQ and BAND_CLASS fields.
- 15 – The mobile station shall report the received power on the Candidate Frequency
16 and on the Serving Frequency in the CF_TOTAL_RX_PWR and
17 SF_TOTAL_RX_PWR fields, respectively.
- 18 – For each pilot in the Candidate Frequency Search Set that measures above
19 CF_T_ADD_s, the mobile station shall report its phase and strength in the fields
20 PILOT_PN_PHASE and PILOT_STRENGTH, respectively.
- 21 • The mobile station shall ensure that the strength measurement for all pilots in the
22 Candidate Frequency Search Set were obtained within *freshness_interval* before the
23 *Candidate Frequency Search Report Message* is sent, where *freshness_interval* is
24 determined as follows:

- 25 – If the value of the TOTAL_OFF_TIME_FWD field or of the TOTAL_OFF_TIME_REV
26 field of the last *Candidate Frequency Search Response Message* sent by the
27 mobile station to the base station is greater than or equal to
28 $\lceil (T_{70m} - T_{71m}) / \text{SEARCH_TIME_RESOLUTION}_s \rceil$, then

29
$$\text{freshness_interval} = (\max(\text{fwd_time}, \text{rev_time}) + T_{71m}) \text{ seconds,}$$

30 where

31
$$\text{fwd_time} = \text{SEARCH_TIME_RESOLUTION}_s \times (\text{value of the}$$

32 TOTAL_OFF_TIME_FWD field of the last *Candidate Frequency*
33 *Search Response Message* sent by the mobile station),

34 and

35
$$\text{rev_time} = \text{SEARCH_TIME_RESOLUTION}_s \times (\text{value of the}$$

36 TOTAL_OFF_TIME_REV field of the last *Candidate Frequency*
37 *Search Response Message* sent by the mobile station).

- 38 – Otherwise,

39
$$\text{freshness_interval} = T_{70m} \text{ seconds.}$$

2.6.6.2.8.3.3 Candidate Frequency Pilot Measurements

The mobile station measures the strength of all pilots in the Candidate Frequency Search Set in one or more visits to the Candidate Frequency. The mobile station shall perform the following actions each time it visits the Candidate Frequency to measure pilot strengths:

- If the mobile station is processing the Forward Fundamental Channel, the mobile station shall stop processing the Forward Fundamental Channel. If the mobile station is transmitting on the Reverse Fundamental Channel, the mobile station shall stop transmitting on the Reverse Fundamental Channel.
- If the mobile station is processing the Forward Dedicated Control Channel, the mobile station shall stop processing the Forward Dedicated Control Channel. If the mobile station is transmitting on the Reverse Dedicated Control Channel, the mobile station shall stop transmitting on the Reverse Dedicated Control Channel.
- The mobile station shall stop processing the Forward Supplemental Code Channels and Forward Supplemental Channels (if any). The mobile station shall stop transmitting on the Reverse Supplemental Code Channels and Reverse Supplemental Channels (if any).
- The mobile station shall disable the fade timer (see 2.6.4.1.8) and the handoff drop timers corresponding to its current Active Set and Candidate Set (see 2.6.6.2.3), and shall suspend incrementing TOT_FRAMES_S , BAD_FRAMES_S , $DCCH_TOT_FRAMES_S$, $DCCH_BAD_FRAMES_S$, $SCH_TOT_FRAMES_S$, and $SCH_BAD_FRAMES_S$ if applicable (see 2.6.4.1.1).
- The mobile station shall lock the accumulation of valid level changes in the closed loop mean output power and shall ignore received power control bits related to the period that the transmitter is disabled (see [2]).
- The mobile station shall store the following parameters from its current configuration:
 - CDMA band class ($SF_CDMABAND_S = CDMABAND_S$)
 - Frequency Assignment ($SF_CDMACH_S = CDMACH_S$)
 - Pilot detection threshold ($SF_T_ADD_S = T_ADD_S$)
- The mobile station shall set the following parameters:
 - $CDMABAND_S = CF_CDMABAND_S$
 - $CDMACH_S = CF_CDMACH_S$
 - $T_ADD_S = CF_T_ADD_S$

The mobile station shall tune to the Candidate Frequency.

- The mobile station shall not change its time reference (see [2]) until it resumes using the Serving Frequency Active Set, as described below.
- The mobile station shall measure the mean input power on the Candidate Frequency ($cand_freq_pwr$, in dBm / 1.23 MHz), and may use $cand_freq_pwr$ along

- 1 with the measurement of the mean input power on the Serving Frequency
 2 (*avg_serving_freq_pwr*, in dBm / 1.23 MHz) in the search procedure as follows:
- 3 – If $\text{DIFF_RX_PWR_THRESH}_s$ is not equal to '00000', and (*cand_freq_pwr* -
 4 *avg_serving_freq_pwr*) is less than $(-30 + 2 \times \text{DIFF_RX_PWR_THRESH}_s)$ dB, the
 5 mobile station may terminate the search for pilots in the current visit to the
 6 Candidate Frequency.
 - 7 – If $\text{DIFF_RX_PWR_THRESH}_s$ is equal to '00000', the mobile station does not use
 8 the power measurements in the search procedure, or (*cand_freq_pwr* -
 9 *avg_serving_freq_pwr*) is not less than $(-30 + 2 \times \text{DIFF_RX_PWR_THRESH}_s)$ dB,
 10 the mobile station shall measure E_c/I_o for all or some of the pilots in its
 11 Candidate Frequency Search Set, using the search procedures specified in
 12 2.6.6.2.2.
- 13 • The mobile station shall restore the following parameters:
 - 14 – Pilot detection threshold ($T_ADD_s = SF_T_ADD_s$)
 - 15 – CDMA band class ($CDMABAND_s = SF_CDMABAND_s$)
 - 16 – Frequency assignment ($CDMACH_s = SF_CDMACH_s$)
 - 17 • The mobile station shall tune to the Serving Frequency and shall resume using the
 18 Serving Frequency Active Set as follows:
 - 19 – If the mobile station was processing the Forward Fundamental Channel prior to
 20 tuning to the Candidate Frequency, the mobile station shall resume processing
 21 the Forward Fundamental Channel. If the mobile station was transmitting on
 22 the Reverse Fundamental Channel prior to tuning to the Candidate Frequency,
 23 the mobile station shall resume transmitting on the Reverse Fundamental
 24 Channel.
 - 25 – If the mobile station was processing the Forward Dedicated Control Channel
 26 prior to tuning to the Candidate Frequency, the mobile station shall resume
 27 processing the Forward Dedicated Control Channel. If the mobile station was
 28 transmitting on the Reverse Dedicated Control Channel prior to tuning to the
 29 Candidate Frequency, the mobile station shall resume transmitting on the
 30 Reverse Dedicated Control Channel.
 - 31 – If the Forward Supplemental Code Channels and Forward Supplemental
 32 Channels assignment has not expired, the mobile station shall resume
 33 processing the Forward Supplemental Code Channels and Forward
 34 Supplemental Channels (if any). If the Reverse Supplemental Code Channel and
 35 Reverse Supplemental Channels assignment has not expired, the mobile station
 36 may resume transmitting on the Reverse Supplemental Code Channels and
 37 Reverse Supplemental Channels (if any).
 - 38 – When the mobile station resumes transmission on the Reverse Traffic Channel,
 39 it shall use the following rules to re-enable its transmitter:

- 1 + If the interval between the time that the mobile station disables its
2 transmitter and the time that it resumes using the Serving Frequency Active
3 Set is equal to or greater than $(N_{2m} \times 20)$ ms, then the mobile station shall
4 wait to receive a period of $(N_{3m} \times 20)$ ms with sufficient signal quality on the
5 physical channel corresponding to $FPC_PRI_CHAN_S$ before it re-enables its
6 transmitter.
- 7 + Otherwise, the mobile station shall re-enable its transmitter no later than
8 $N_{3m} \times 20$ ms after the mobile station tunes to the Serving Frequency. The
9 mobile station should re-enable its transmitter earlier. After the mobile
10 station re-enables its transmitter, the mean output power shall be as
11 specified in 2.1.2.4.1 for a step change in input power. If the mobile station
12 re-enables its transmitter earlier than $N_{3m} \times 20$ ms after it tunes to the
13 Serving Frequency, the initial mean output power shall be as specified in [2],
14 where the initial mean input power estimate is either:
- 15 o within 6 dB of the actual mean input power, or
 - 16 o equal to the mean input power before the mobile station tuned to the
17 Target Frequency.
- 18 • The mobile station shall enable the fade timer and the handoff drop timers
19 corresponding to the pilots in its Active Set and Candidate Set. The mobile station
20 shall resume incrementing TOT_FRAMES_S , BAD_FRAMES_S , $DCCH_TOT_FRAMES_S$,
21 $DCCH_BAD_FRAMES_S$, $SCH_TOT_FRAMES_S$, and $SCH_BAD_FRAMES_S$ if applicable
22 as specified in 2.6.4.1.8.

23 2.6.6.2.8.3.4 Aborting CDMA Candidate Frequency Periodic Search

24 When the mobile station aborts a periodic search, it shall perform the following:

- 25 • The mobile station shall cancel any remaining visits to the Candidate Frequency in
26 the current search period, and shall not send a *Candidate Frequency Search Report*
27 *Message* for the current search period.
- 28 • The mobile station shall disable the periodic search timer.

29 2.6.6.2.9 Reserved

30 2.6.6.2.10 Reserved

31 2.6.6.2.11 Processing of Reverse Supplemental Code Channels and Reverse Supplemental 32 Channels

33 Reverse Supplemental Code Channels are not supported for $P_REV_IN_USE_S$ greater than
34 or equal to nine.

35 If $USE_T_ADD_ABORT_S$ is set to '1', and the strength of a Neighbor Set or Remaining Set
36 pilot is found to be above T_ADD_S , then the mobile station shall terminate any active
37 transmission on Reverse Supplemental Code Channels or Reverse Supplemental Channels
38 at the end of the current 20 ms frame. The mobile station shall perform the following:

- 39 • Any previously active Reverse Supplemental Code Channel or Reverse Supplemental
40 Channel assignment shall be considered implicitly terminated.

- 1 • If active transmission on Reverse Supplemental Code Channels is terminated, the
2 mobile station shall set NUM_REV_CODES_s to '000' and shall set IGNORE_SCAM_s
3 to '1'.
- 4 • If active transmission on Reverse Supplemental Channels is terminated, the mobile
5 station shall set IGNORE_ESCAM_s to '1'.
- 6 • The mobile station shall set SCRM_SEQ_NUM_s to (SCRM_SEQ_NUM_s + 1) mod 16.
- 7 • The mobile station shall transmit a *Supplemental Channel Request Message* with
8 USE_SCRM_SEQ_NUM set to '1', SCRM_SEQ_NUM set to SCRM_SEQ_NUM_s, and
9 SIZE_OF_REQ_BLOB set to '0000'.

10 2.6.6.2.12 Periodic Serving Frequency Pilot Report Procedure

11 While the mobile station is tuned to the Serving Frequency (specified by CDMACH_s and
12 CDMABAND_s), the mobile station shall measure the total received power spectral density,
13 in mW/1.23 MHz, on the Serving Frequency at least once every 20 ms frame. The mobile
14 station shall maintain the average value of the total received power spectral density,
15 *spec_density*, over the last N_{12m} frames. The mobile station shall maintain the PPSMM
16 timer as follows:

- 17 • When the mobile station starts a Periodic Serving Frequency Pilot Report Procedure,
18 it shall set the PPSMM timer to PPSMM_PERIOD_s × 0.08 seconds and shall enable
19 the timer.
- 20 • When the PPSMM timer expires, the mobile station shall send a *Periodic Pilot*
21 *Strength Measurement Message* (2.6.6.2.5.2) to the base station, reset the PPSMM
22 timer to PPSMM_PERIOD_s × 0.08 seconds and shall re-enable the timer.
- 23 • When the mobile station receives an *Extended Handoff Direction Message*, a *General*
24 *Handoff Direction Message* or a *Universal Handoff Direction Message* directing the
25 mobile station to perform a hard handoff (see 2.6.6.2.5.1), it shall abort the Periodic
26 Serving Frequency Pilot Report Procedure and disable the PPSMM timer if it is
27 enabled.
- 28 • If MIN_PILOT_PWR_THRESH_s is not equal to '11111' and
29 MIN_PILOT_EC_IO_THRESH_s is equal to '11111', the mobile station shall perform
30 the following actions once per frame:
 - 31 – Disable the PPSMM timer if the received total energy per PN chip, E_C, of the
32 pilots in the Active Set is not less than (-120 + 2 × MIN_PILOT_PWR_THRESH_s),
33 where the value of E_C is computed as 10 × log₁₀ (PS × *spec_density*) and PS is
34 the total E_C/I₀ of the pilots in the Active Set measured as specified in 2.6.6.2.2.
 - 35 – Reset the expiration time of the PPSMM timer to PPSMM_PERIOD_s × 0.08
36 seconds and re-enable the timer if the following conditions are true:
 - 37 o the PPSMM timer is disabled, and
 - 38 o the received total energy per PN chip, E_C, of the pilots in the Active Set is
39 less than (-120 + 2 × MIN_PILOT_PWR_THRESH_s).

- 1 • If $\text{MIN_PILOT_PWR_THRESH}_s$ is equal to '11111' and $\text{MIN_PILOT_EC_IO_THRESH}_s$
 2 is not equal to '11111', the mobile station shall perform the following actions once
 3 per frame:
- 4 – Disable the PPSMM timer if the total pilot strength of the pilots in the Active Set,
 5 PS, satisfies the condition that $(-20 \times \log_{10}(\text{PS}))$ is not greater than
 6 $\text{MIN_PILOT_EC_IO_THRESH}_s$.
- 7 – Reset the expiration time of the PPSMM timer to $\text{PPSMM_PERIOD}_s \times 0.08$
 8 seconds and re-enable the timer if the following conditions are true:
- 9 o the PPSMM timer is disabled, and
- 10 o the total pilot strength of the pilots in the Active Set, PS, satisfies the
 11 condition that $(-20 \times \log_{10}(\text{PS}))$ is greater than $\text{MIN_PILOT_EC_IO_THRESH}_s$.
- 12 • If $\text{MIN_PILOT_PWR_THRESH}_s$ is not equal to '11111' and
 13 $\text{MIN_PILOT_EC_IO_THRESH}_s$ is not equal to '11111', the mobile station shall
 14 perform the following actions once per frame:
- 15 – Disable the PPSMM timer if the following conditions are true:
- 16 o the received total energy per PN chip, E_C , of the pilots in the Active Set is not
 17 less than $(-120 + 2 \times \text{MIN_PILOT_PWR_THRESH}_s)$, and
- 18 o the total pilot strength of the pilots in the Active Set, PS, satisfies the
 19 condition that $(-20 \times \log_{10}(\text{PS}))$ is not greater than
 20 $\text{MIN_PILOT_EC_IO_THRESH}_s$.
- 21 – Reset the expiration time of the PPSMM timer to $\text{PPSMM_PERIOD}_s \times 0.08$
 22 seconds and re-enable the timer if the following conditions are true:
- 23 o the PPSMM timer is disabled, and
- 24 o the received total energy per PN chip, E_C , of the pilots in the Active Set is
 25 less than $(-120 + 2 \times \text{MIN_PILOT_PWR_THRESH}_s)$, or the total pilot strength
 26 of the pilots in the Active Set, PS, satisfies the condition that $(-20 \times$
 27 $\log_{10}(\text{PS}))$ is greater than $\text{MIN_PILOT_EC_IO_THRESH}_s$.
- 28 • If $\text{MIN_PILOT_PWR_THRESH}_s$ is equal to '11111' and $\text{MIN_PILOT_EC_IO_THRESH}_s$
 29 is equal to '11111', the mobile station shall maintain the PPSMM timer independent
 30 of the received power and the total E_C/I_0 of the pilots.

31 2.6.6.2.13 Call Rescue Soft Handoff

32 This section presents an overview and mobile station requirements for the support of call
 33 rescue soft handoff while the mobile station is in the *Mobile Station Control on the Traffic*
 34 *Channel State*.

35 2.6.6.2.13.1 Overview

36 Support for the call rescue feature is mandatory for the mobile station. The mobile station
 37 initiates call rescue soft handoff after disabling its transmitter due to:

- 38 • insufficient signal quality on the Forward Traffic Channel (see 2.6.4.1.8)

- 1 • an acknowledgment failure.

2 In order for a pilot to be autonomously added to the Active Set, it must be a valid soft
3 handoff candidate on the mobile station's neighbor list, and must also support a Rescue
4 Channel. A Rescue Channel is a Fundamental Channel that is used for call rescue soft
5 handoff, and has a pre-allocated Walsh Code that is provided to the mobile station as part
6 of the *General Neighbor List Message*, *Universal Neighbor List Message*, and *Extended*
7 *Neighbor List Update Message*.

8 If the mobile station is eligible to attempt call rescue soft handoff, then it re-enables its
9 transmitter and monitors the Rescue Channel (as well as the other Traffic Channels in the
10 Active Set) for good frames. Once good frames are received, then the call continues
11 normally.

12 Three timers are used as part of call rescue soft handoff: the rescue delay timer, the rescue
13 allowed timer, and the rescue attempt timer.

14 2.6.6.2.13.2 Requirements

15 If the rescue delay timer expires and the interval specified by $RESQ_MIN_PERIOD_S$ has
16 elapsed since the last successful call rescue, then the mobile station shall enable the
17 rescue allowed timer with an initial value of $(RESQ_ALLOWED_TIME_S \times 80)$ ms.

18 While the rescue allowed timer is enabled, if the mobile station is able to promote any new
19 pilots to the Active Set (see 2.6.6.2.6.1), then the mobile station shall perform the following:

- 20 • disable the rescue allowed timer,
21 • update the service configuration as specified in 2.6.6.2.13.3.
22 • cancel any current and pending Forward or Reverse Supplemental Channel
23 assignments.
24 • re-enable its transmitter at the last closed-loop power level plus
25 $RESQ_POWER_DELTA_S$,
26 • enable the rescue attempt timer with an initial value of $(RESQ_ATTEMPT_TIME_S \times$
27 40) ms.
28 • transmit the Traffic Channel preamble followed by a *Extended Pilot Strength*
29 *Measurement Message*, where the length of the Traffic Channel preamble is
30 determined as follows:
- 31 – If operating in Radio Configuration 1 or 2, the length of the Traffic Channel
32 preamble is given by $RESQ_NUM_PREAMBLE_RC1_RC2_S \times 20$ ms.
33 – If operating in Radio Configuration greater than 2, the length of the Traffic
34 Channel preamble is given by the duration corresponding to
35 $RESQ_NUM_PREAMBLE_S$ as specified by the Table 3.7.3.3.2.17-1.

36 If the rescue allowed timer expires, then the mobile station shall not autonomously
37 promote any new pilots to the Active Set.

1 While the rescue attempt timer is enabled, the mobile station shall not perform the
 2 Forward or Reverse Traffic Channel power control procedures specified in 2.6.4.1.1 and
 3 2.6.6.2.7.2, respectively.

4 If the rescue attempt timer expires, then the mobile station shall disable its transmitter.

5 2.6.6.2.13.3 Service Configuration Update Due to Call Rescue

6 The mobile station shall set CH_IND_s to '01'.

7 The mobile station shall replace the current Logical-to-Physical Mapping with the default
 8 Logical-to-Physical Mapping as specified in Table 2.6.4.2-1, where:

- 9 • requirement 1 is as follows: The SR_ID field shall be set to the SR_ID corresponding
 10 to the services mapped to the Fundamental Channel, and
- 11 • requirements 2 and 3 are as follows: the PHYSICAL_RESOURCE field shall be set
 12 to '0000'.

13 The mobile station shall replace the current Service Configuration information record with
 14 a new Service Configuration information record created as follows:

- 15 • The mobile station shall delete all Service Option Connection Records corresponding
 16 to an SR_ID that is not listed in the Call Rescue Logical-to-Physical Mapping
 17 created above and the Layer 3 shall terminate the corresponding call control
 18 instance (currently existing or pending instantiation).
- 19 • The mobile station shall identify the Call Control instance corresponding to the first
 20 service option connection listed in this newly created Service Configuration
 21 information record by the NULL identifier.

22 The mobile station shall set SYNC_ID_s to NULL.

23 2.6.6.3 Typical Message Exchanges During Handoffs

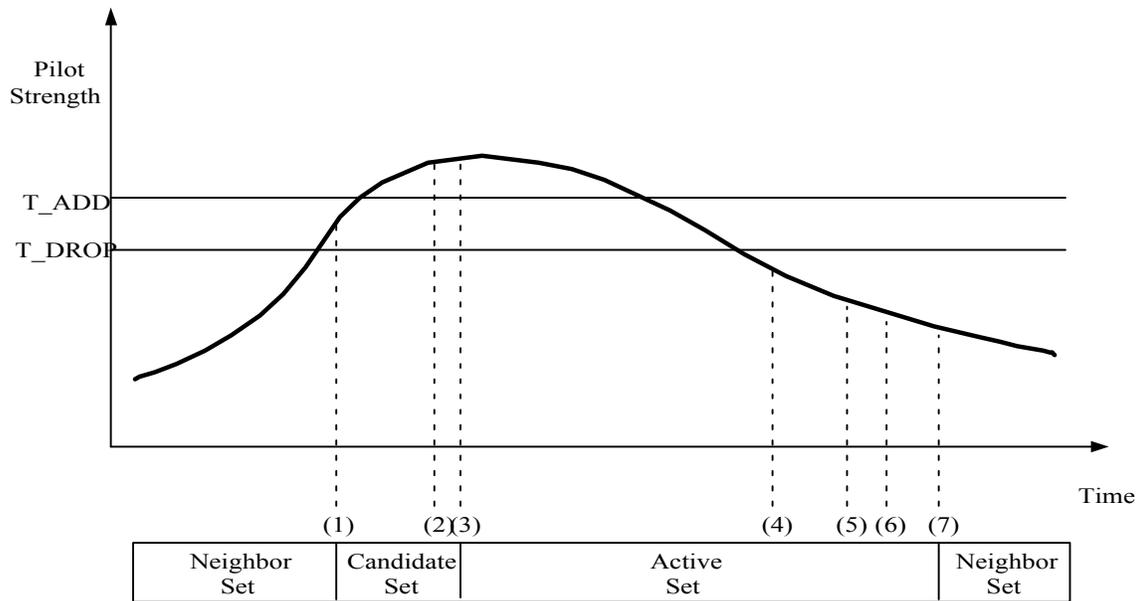

24 The following examples illustrate typical message exchanges between the mobile station
 25 and the base station during handoff. Refer to Annex B for examples of call processing
 26 during handoff.

27 Figure 2.6.6.3-1 shows an example of the messages exchanged between the mobile station
 28 and the base station during a typical handoff process if P_REV_IN_USE_s is less than or
 29 equal to three or SOFT_SLOPE_s is equal to '000000'.

30 Figure 2.6.6.3-2 shows an example of the messages exchanged between the mobile station
 31 and the base station during a typical handoff process if P_REV_IN_USE_s is greater than
 32 three and SOFT_SLOPE_s is not equal to '000000'.

33 Figure 2.6.6.3-3 illustrates the messaging triggered by a pilot of the Candidate Set as its
 34 strength gradually rises above the strength of each pilot of the Active Set if P_REV_IN_USE_s
 35 is less than or equal to three, or SOFT_SLOPE_s is equal to '000000'. Note that the mobile
 36 station reports that a Candidate Set pilot is stronger than an Active Set pilot only if the
 37 difference between their respective strengths is at least $T_COMP \times 0.5$ dB.

1 Figure 2.6.6.3-4 illustrates the messaging triggered by a pilot of the Candidate Set as its
2 strength gradually rises above the strength of each pilot of the Active Set if $P_REV_IN_USE_s$
3 is greater than three and $SOFT_SLOPE_s$ is not equal to '000000'. Note that the mobile
4 station reports that a Candidate Set pilot is stronger than an Active Set pilot only if the
5 difference between their respective strengths is at least $T_COMP \times 0.5$ dB and Pilot P_0
6 strength exceeds $[(SOFT_SLOPE/8) \times 10 \times \log_{10}(PS_1 + PS_2) + ADD_INTERCEPT/2]$.
7

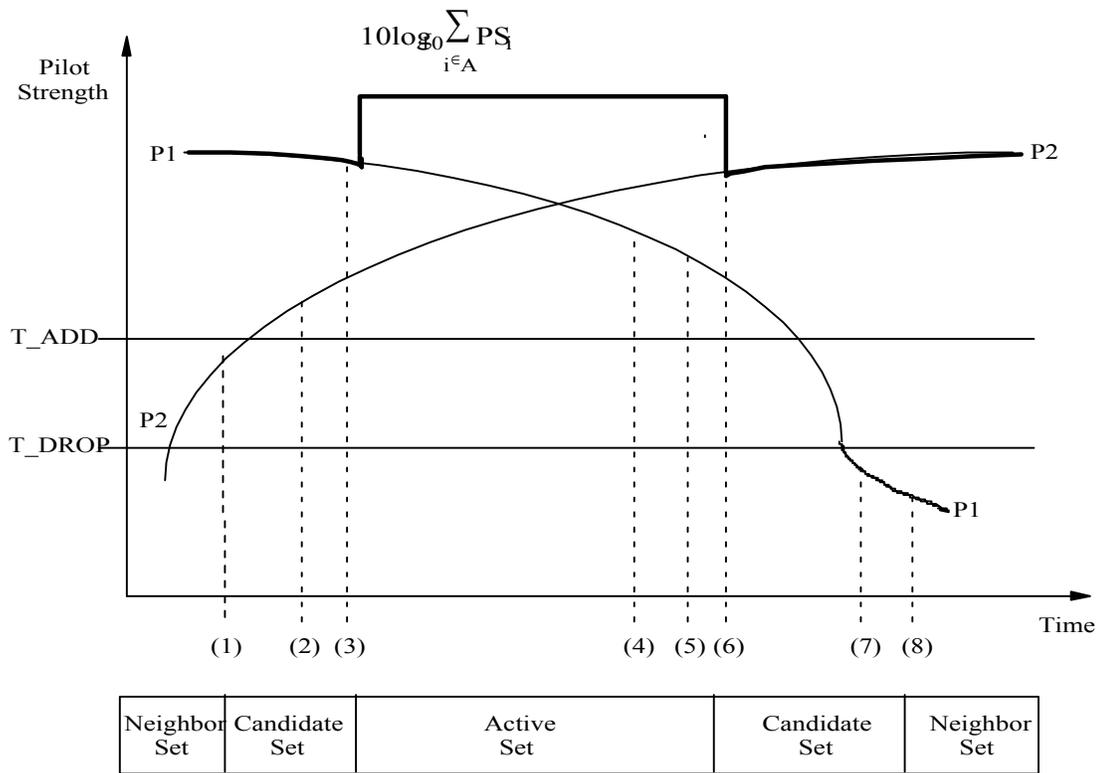

1
2

- 3 (1) Pilot strength exceeds T_ADD . Mobile station sends a *Pilot Strength Measurement*
4 *Message* and transfers pilot to the Candidate Set.
- 5 (2) Base station sends an *Extended Handoff Direction Message*, a *General Handoff*
6 *Direction Message* or a *Universal Handoff Direction Message*.
- 7 (3) Mobile station transfers pilot to the Active Set and sends a *Handoff Completion*
8 *Message*.
- 9 (4) Pilot strength drops below T_DROP . Mobile station starts the handoff drop timer.
- 10 (5) Handoff drop timer expires. Mobile station sends a *Pilot Strength Measurement*
11 *Message*.
- 12 (6) Base station sends an *Extended Handoff Direction Message*, a *General Handoff*
13 *Direction Message* or a *Universal Handoff Direction Message*.
- 14 (7) Mobile station moves pilot from the Active Set to the Neighbor Set and sends a
15 *Handoff Completion Message*.

16 **Figure 2.6.6.3-1. Handoff Threshold Example if $P_REV_IN_USE_s$ is Less Than or Equal**
17 **to Three, or $SOFT_SLOPE_s$ is Equal to '000000'**

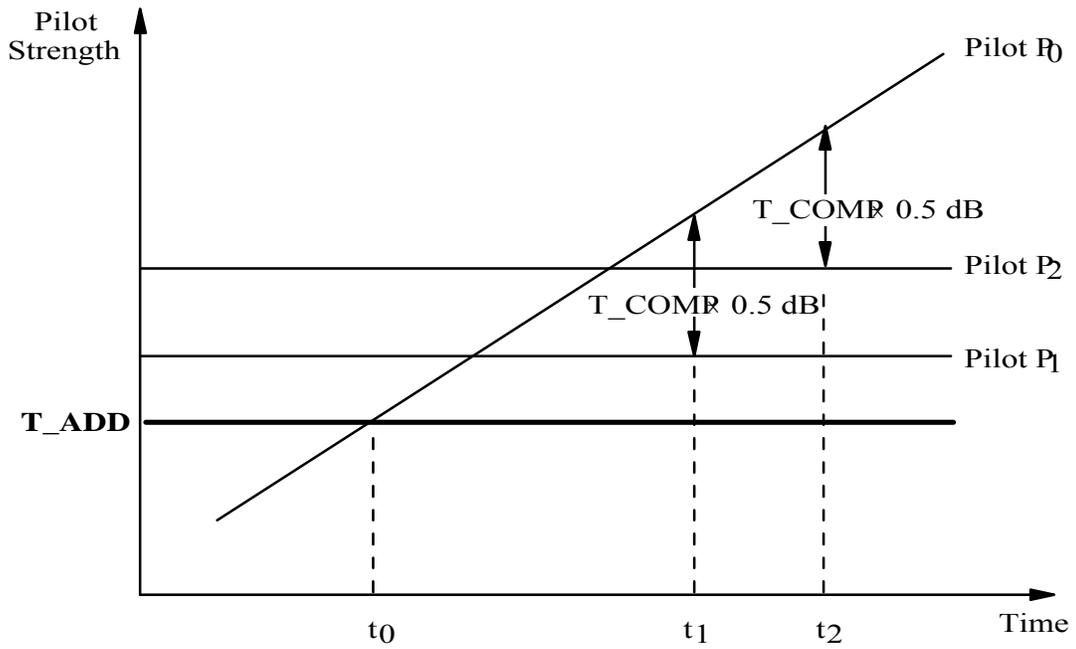

18

1

- 2 (1) Pilot P₂ strength exceeds T_ADD. Mobile station transfers the pilot to the Candidate Set.
- 3 (2) Pilot P₂ strength exceeds $[(SOFT_SLOPE/8) \times 10 \times \log_{10}(PS_1) + ADD_INTERCEPT/2]$.
- 4 Mobile station sends a *Pilot Strength Measurement Message*.
- 5 (3) Mobile station receives an *Extended Handoff Direction Message*, a *General Handoff*
- 6 *Direction Message* or a *Universal Handoff Direction Message*, transfers the pilot P₂ to the
- 7 Active Set, and sends a *Handoff Completion Message*.
- 8 (4) Pilot P₁ strength drops below $[(SOFT_SLOPE/8) \times 10 \times \log_{10}(PS_2) +$
- 9 $DROP_INTERCEPT/2]$. Mobile station starts the handoff drop timer.
- 10 (5) Handoff drop timer expires. Mobile station sends a *Pilot Strength Measurement*
- 11 *Message*.
- 12 (6) Mobile station receives an *Extended Handoff Direction Message*, a *General Handoff*
- 13 *Direction Message* or a *Universal Handoff Direction Message*, transfers the pilot P₁ to the
- 14 Candidate Set and sends a *Handoff Completion Message*.
- 15 (7) Pilot P₁ strength drops below T_DROP. Mobile station starts the handoff drop timer.
- 16 (8) Handoff drop timer expires. Mobile station moves the pilot P₁ from the Candidate Set
- 17 to the Neighbor Set.

1 **Figure 2.6.6.3-2. Handoff Threshold Example if P_REV_IN_USE_s is Greater Than**

15

16

1 2.6.7 Hash Functions and Randomization

2 2.6.7.1 Hash Function

3 Certain procedures require a uniform distribution of mobile stations among N resources.
 4 The following function returns an integer, using as arguments the mobile station's IMSI,
 5 the number of resources N, and a modifier DECORR. The modifier serves to decorrelate
 6 the values obtained for the various applications from the same mobile station.

7 HASH_KEY shall be equal to the 32 least significant bits of $(\text{IMSI_O_S1} + 2^{24} \times \text{IMSI_O_S2})$.

8 Define:

- 9 • Word L to be bits 0-15 of HASH_KEY
- 10 • Word H to be bits 16-31 of HASH_KEY

11 where bit 0 is the least significant bit of HASH_KEY.

12 For determining CDMA Band, CDMA Channel Number, Paging Channel Number, Forward
 13 Common Control Channel Number, Quick Paging Channel Number, and Paging Slot
 14 Number, the hash value is computed as follows:⁷⁰

$$15 \quad R = \lfloor N \times ((40503 \times (L \oplus H \oplus \text{DECORR})) \bmod 2^{16}) / 2^{16} \rfloor$$

16 For determining a mobile station's assigned paging indicator bit positions, the hash value
 17 is computed as follows:

$$18 \quad R_1 = \lfloor N \times ((40503 \times (L \oplus H \oplus \text{DECORR}_1)) \bmod 2^{16}) / 2^{16} \rfloor$$

19 and

$$20 \quad R_2 = \lfloor (1 - \lfloor (2 \times R_1) / (N+4) \rfloor) \times (N+4) / 2 + \lfloor (2 \times R_1) / (N+4) \rfloor \times ((N+4) / 2 - 4) \times ((40503 \times (L \\ 21 \quad \oplus H \oplus \text{DECORR}_2)) \bmod 2^{16}) / 2^{16} \rfloor + N + 4 + \lfloor (2 \times R_1) / (N+4) \rfloor \times ((N+4) / 2) \text{ for Quick} \\ 22 \quad \text{Paging Channel indicator rate of 4800 bps, or}$$

$$23 \quad R_2 = \lfloor (1 - \lfloor (2 \times R_1) / (N+8) \rfloor) \times (N+8) / 2 + \lfloor (2 \times R_1) / (N+8) \rfloor \times ((N+8) / 2 - 8) \times ((40503 \\ 24 \quad \times (L \oplus H \oplus \text{DECORR}_2)) \bmod 2^{16}) / 2^{16} \rfloor + N + 8 + \lfloor (2 \times R_1) / (N+8) \rfloor \times ((N+8) / 2) \text{ for} \\ 25 \quad \text{Quick Paging Channel indicator rate of 9600 bps.}$$

26 The mobile station shall choose the range N and the modifiers DECORR, DECORR₁, and
 27 DECORR₂ according to the application as shown in Table 2.6.7.1-1. In the table,
 28 HASH_KEY [0...11] denotes the 12 least significant bits of HASH_KEY.

⁷⁰ This formula is adapted from Knuth, Donald N., *The Art of Computer Programming*, 2 volumes, (Reading, MA, Addison-Wesley, 1998).

1

Table 2.6.7.1-1. Hash Function Modifier

Application	N	DECORR	Return Value
CDMA Band Number	Number of band entries	$2 \times \text{HASH_KEY} [0\dots11]$	R + 1
CDMA Channel Number	Number of channel entries	0	R + 1
Paging Channel Number	PAGE_CHAN _s from <i>System Parameters Message</i> (up to 7)	$2 \times \text{HASH_KEY} [0\dots11]$	R + 1
Quick Paging Channel Number	NUM_QPCH _s from <i>Extended System Parameters Message</i> or <i>MC-RR Parameters Message</i> (up to 3)	$2 \times \text{HASH_KEY} [0\dots11]$	R + 1
Paging Slot Number	2048	$6 \times \text{HASH_KEY}[0\dots11]$	R
Paging Indicator Positions	376 (for 9600 bps), 188 (for 4800 bps)	$\text{DECORR}_1 = \lfloor t / 64 \rfloor \bmod 2^{16},$ $\text{DECORR}_2 = \lfloor t / 64 + 1 \rfloor \bmod 2^{16},$ where t is the System Time in 20ms frames, relative to the beginning of the assigned Quick Paging Channel slot.	R ₁ and R ₂
Forward Common Control Channel Number	NUM_FCCCH _s from <i>MC-RR Parameters Message</i> (up to 7)	$2 \times \text{HASH_KEY} [0\dots11]$	R + 1

2

3 2.6.7.2 Pseudorandom Number Generator

4 Where pseudorandom numbers are needed, a linear congruential generator shall be used.
 5 The mobile station shall implement the linear congruential generator defined by:

$$6 \quad z_n = a \times z_{n-1} \bmod m$$

7 where $a = 7^5 = 16807$ and $m = 2^{31} - 1 = 2147483647$. z_n is the output of the generator.⁷¹

⁷¹ This generator has full period, ranging over all integers from 1 to m-1; the values 0 and m are never produced. Several suitable implementations can be found in Park, Stephen K. and Miller, Keith W., "Random Number Generators: Good Ones are Hard to Find," *Communications of the ACM*, vol. 31, no. 10, October 1988, pp. 1192-1201.

1 During the *Mobile Station Initialization State*, the mobile station shall seed its generator with

$$2 \quad z_0 = (\text{ESN} \oplus \text{RANDOM_TIME}) \bmod m$$

3 where RANDOM_TIME shall be the least-significant 32-bits of SYS_TIME_s stored from the
4 *Sync Channel Message*. If the initial value so produced is found to be zero, it shall be
5 replaced with one. The mobile station shall compute a new z_n for each subsequent use.

6 The mobile station shall use the value $u_n = z_n / m$ for those applications that require a
7 binary fraction u_n , $0 < u_n < 1$.

8 The mobile station shall use the value $k_n = \lfloor N \times z_n / m \rfloor$ for those applications that require
9 a small integer k_n , $0 \leq k_n \leq N - 1$.

10 2.6.8 CODE_CHAN_LIST_s Maintenance

11 The CODE_CHAN_LIST_s is a descriptive structure used to manage the Forward
12 Fundamental Channel and Forward Supplemental Code Channels, if any, associated with
13 the mobile station's Active Set. Associated with each member of the mobile station's Active
14 Set, there is an ordered array of code channels. The first entry of the ordered array
15 specifies the Forward Fundamental Channel associated with the pilot and the subsequent
16 entries, if any, specify the Forward Supplemental Code Channels associated with the pilot.
17 The CODE_CHAN_LIST_s is the collection of ordered arrays of code channels for each
18 member of the mobile station's Active Set. The i^{th} entry in every array (of code channels
19 associated with a member of the Active Set) corresponds to the i^{th} code channel.

20 The mobile station shall maintain the CODE_CHAN_LIST_s as follows:

- 21 • When the mobile station is first assigned a Forward Fundamental Channel, it shall
22 initialize the CODE_CHAN_LIST_s to contain the Forward Fundamental Channel for
23 each member of the Active Set.
- 24 • When the mobile station processes the *Extended Handoff Direction Message*, the
25 mobile station shall update the CODE_CHAN_LIST_s as follows:
 - 26 – For each pilot listed in the *Extended Handoff Direction Message* which does not
27 have a corresponding code channel in the CODE_CHAN_LIST_s, the mobile
28 station shall add the code channel, CODE_CHAN, of that pilot to the
29 CODE_CHAN_LIST_s, as the Forward Fundamental Channel for the pilot.
 - 30 – The mobile station shall delete all information in the CODE_CHAN_LIST_s
31 associated with a pilot that is not included in the *Extended Handoff Direction*
32 *Message*.
- 33 • When the mobile station processes the *General Handoff Direction Message*, the
34 mobile station shall update the CODE_CHAN_LIST_s to contain the Forward
35 Fundamental Channel associated with each pilot included in the *General Handoff*
36 *Direction Message*. The first code channel occurrence associated with each pilot
37 included in the *General Handoff Direction Message* corresponds to the Forward
38 Fundamental Channel. The mobile station shall perform the following:
 - 39 – If FOR_SUP_CONFIG_r is included and FOR_SUP_CONFIG_r is equal to '10' or
40 '11', the mobile station shall perform the following actions:

- 1 + For each pilot listed in the *General Handoff Direction Message*, the mobile
2 station shall set the Forward Supplemental Code Channels (associated with
3 the pilot) in the CODE_CHAN_LIST_s to the Forward Supplemental Code
4 Channels specified in the *General Handoff Direction Message*.
- 5 + The mobile station shall delete all information in the CODE_CHAN_LIST_s
6 associated with a pilot that is not included in the *General Handoff Direction*
7 *Message*.
- 8 – If FOR_SUP_CONFIG_r is equal to ‘00’ or ‘01’ or if FOR_SUP_CONFIG_r is not
9 included in the *General Handoff Direction Message*, the mobile station shall not
10 update Supplemental Code Channels associated with the pilots included in the
11 *General Handoff Direction Message*. The mobile station shall perform the
12 following actions:
- 13 + For each pilot listed in the *General Handoff Direction Message* which does
14 not have a corresponding code channel in the CODE_CHAN_LIST_s, the
15 mobile station shall add the code channel, CODE_CHAN, of that pilot to the
16 CODE_CHAN_LIST_s, as the Forward Fundamental Channel for the pilot.
- 17 + The mobile station shall delete all information in the CODE_CHAN_LIST_s
18 associated with a pilot that is not included in the *General Handoff Direction*
19 *Message*.
- 20 • When the mobile station processes the *Supplemental Channel Assignment Message*
21 it shall follow the following rules:
- 22 – If FOR_SUP_CONFIG_r is equal to ‘10’ or ‘11’, the mobile station shall update the
23 Forward Supplemental Code Channels for each pilot in the Active Set.
- 24 – If the pilot is not listed in the *Supplemental Channel Assignment Message*, the
25 mobile station shall delete all occurrences of Forward Supplemental Code
26 Channels associated with the pilot from the Code Channel List.
- 27 – If a pilot is listed in the *Supplemental Channel Assignment Message*, then the
28 mobile station shall set the Forward Supplemental Code Channels (associated
29 with the pilot) in the CODE_CHAN_LIST_s to the Forward Supplemental Code
30 Channels specified in the *Supplemental Channel Assignment Message*.
- 31 – If FOR_SUP_CONFIG_r is equal to ‘00’ or ‘01’, the mobile station shall not update
32 Supplemental Code Channels associated with the pilots included in the
33 *Supplemental Channel Assignment Message*.

34 2.6.9 CDMA Tiered Services

35 This section presents an overview and mobile station requirements for the support of
36 CDMA Tiered services while the mobile station is in the *Mobile Station Idle State* and in the
37 *Mobile Station Control on the Traffic Channel State*.

1 2.6.9.1 Overview

2 2.6.9.1.1 Definition

3 The mobile station may support Tiered Services based upon User Zones. Tiered Services
4 provide the user custom services and special features based upon the mobile station
5 location. Tiered Services also provides private network support. Important to the
6 operation of CDMA Tiered Services is the concept of User Zones. It is via User Zones by
7 which the base station offers custom services based upon the mobile station location.

8 User Zones are associated with a set of features and services, plus a geographic area in
9 which the User Zone features/services are made available to the customers that have
10 subscribed to that User Zone. The boundary of the User Zone Geographic area may be
11 established based on the coverage area of a public or private base station or it may be
12 established independent of RF topology.

13 User Zones may be supported by the public system on the same frequency as the serving
14 base station, or they may be supported on a private system operating on a different
15 frequency.

16 2.6.9.1.2 Types of User Zones

17 User Zones may be of two basic types:

- 18 • *Broadcast User Zones*: Broadcast User Zones are identified to the mobile station
19 using the Paging Channel or the Primary Broadcast Control Channel. In this case,
20 the base station broadcasts on the Paging Channel or the Primary Broadcast Control
21 Channel messages identifying the User Zones that fall within the coverage area of the
22 particular cell/sector. Mobile stations, as part of their monitoring of the Paging
23 Channel or the Primary Broadcast Control Channel, will identify the presence of a
24 particular User Zone.
- 25 • *Mobile Specific User Zones*: Mobile Specific User Zones are not broadcast by the base
26 station. The mobile station may use other overhead message parameters and
27 compare them with internally stored User Zone parameters to identify the presence
28 of a particular User Zone. These parameters may include: SID, NID, BASE_ID,
29 BASE_LAT, and BASE_LONG.

30 *Broadcast User Zones* allow for permanent as well as temporary subscription. Temporary
31 subscription provides User Zone features and capabilities to users who are not subscribed
32 to the User Zone. In this case, a mobile station, upon entering a new coverage area, may
33 detect the presence of a User Zone that it presently does not subscribe to, but one that
34 supports temporary subscription. The mobile station then queries the network to obtain
35 the User Zone parameters. Once these parameters are received, the mobile station offers to
36 the user via the mobile station user interface, the option of subscribing to the particular
37 User Zone.

38 Some User Zones may require active registration (Active User Zones) upon the mobile
39 station's entry to immediately trigger a change in a feature(s). For others, the implicit
40 registration at call setup is sufficient (Passive User Zones). Active User Zones are used
41 where inbound features change as a result of being in the User Zone. During the *Mobile*

1 *Station Idle State*, a mobile stations needs to register to update the User Zone ID whenever
2 the User Zone that the mobile station is entering and/or leaving is of the Active type.

3 A mobile station that supports User Zone services may store a list of User Zones, where
4 each User Zone is identified by a User Zone ID (UZID). Associated with each stored User
5 Zone, the mobile station may also store a number of determinant parameters used for
6 identifying User Zones.

7 2.6.9.2 Requirements

8 If the mobile station supports User Zone services, it shall maintain and update UZID_s
9 according the following rule:

10 If the mobile station selects a User Zone supported by the base station, the mobile station
11 shall set UZID_s to the User Zone Identifier associated with the User Zone; otherwise, the
12 mobile station shall set UZID_s to '0000000000000000'. The precise process for
13 determining how to select a User Zone that is supported by the base station is left to the
14 mobile station manufacturer.

15 If the mobile station does not support User Zone services, the mobile station shall set
16 UZID_s to '0000000000000000'.

17 The mobile station may search pilots of private neighbor base stations on other frequencies
18 and band classes as identified in the *Private Neighbor List Message*. Search performance
19 criteria are defined [11].

20 2.6.9.2.1 User Zone Operation in the Mobile Station Idle State:

21 When a mobile station performs an idle handoff, it selects User Zones based on internally
22 stored parameters and information broadcast on the Paging Channel or on the Primary
23 Broadcast Control Channel as described in 2.6.9.1.

24 After the mobile station performs idle handoff, if the mobile station determines that a
25 change from one Broadcast User Zone to another Broadcast User Zone is required, the
26 mobile station shall not update UZID_s, UZ_EXIT_IN_USE_s and shall not perform User Zone
27 registration until the pilot strength of the currently serving base station exceeds that of the
28 base station corresponding to the old User Zone by the value of UZ_EXIT_IN_USE_s.

29 If the mobile station determines that it needs to change User Zone, and if the difference
30 between the pilot strengths exceeds UZ_EXIT_IN_USE_s, then the mobile station shall
31 perform the following:

- 32 • Perform User Zone registration.
- 33 • Update UZID_s.
- 34 • Set UZ_EXIT_IN_USE_s to UZ_EXIT_RCVD_s.

35 The mobile station may also implement other means to avoid the premature exiting of a
36 User Zone due to rapid changes in signal strength. The exact implementation of such
37 techniques is left to mobile station implementation.

38 If the mobile station is in the *Mobile Station Idle State* and it receives a *User Zone Reject*
39 *Message* the mobile station shall perform the following:

- 1 • Set REJECT_ACTION_INDI_S to REJECT_ACTION_INDI_R.
- 2 • If UZID_ASSIGN_INCL_R = '0', the mobile station shall set UZID_S to
- 3 '0000000000000000', otherwise; the mobile station shall set UZID_S to
- 4 ASSIGN_UZID_R.

5 If the mobile station is in the *Mobile Station Idle State* and it selects an active User Zone,

6 then the mobile station shall perform User Zone registration (see 2.6.5.1.10) by entering

7 the *System Access State* with a registration indication.

8 The mobile station should provide the user with a User Zone indication corresponding to

9 the User Zone in service each time UZID_S is updated.

10 2.6.9.2.2 User Zone Operation in the Mobile Station Control on the Traffic Channel State

11 If the mobile station is in the *Traffic Channel Substate* of the *Mobile Station Control on the*

12 *Traffic Channel State* and if it determines that the User Zone has changed, it shall update

13 UZID_S and send a *User Zone Update Request Message* to the base station.

14 If the mobile station is in the *Traffic Channel Substate or Release Substate* of the *Mobile*

15 *Station Control on the Traffic Channel State* and it receives a *User Zone Update Message*,

16 then the mobile station shall update UZID_S and set it equal to UZID_R.

17 If the mobile station is in the *Traffic Channel Substate or Release Substate* of the *Mobile*

18 *Station Control on the Traffic Channel State* and it receives a *User Zone Reject Message*, then

19 the mobile station shall perform the following:

- 20 • Set REJECT_ACTION_INDI_S to REJECT_ACTION_INDI_R.
- 21 • If UZID_ASSIGN_INCL_R = 0, the mobile station shall set UZID_S to '0', otherwise; the
- 22 mobile station shall set UZID_S to ASSIGN_UZID_R.

23 The mobile station should provide the user with a User Zone indication corresponding to

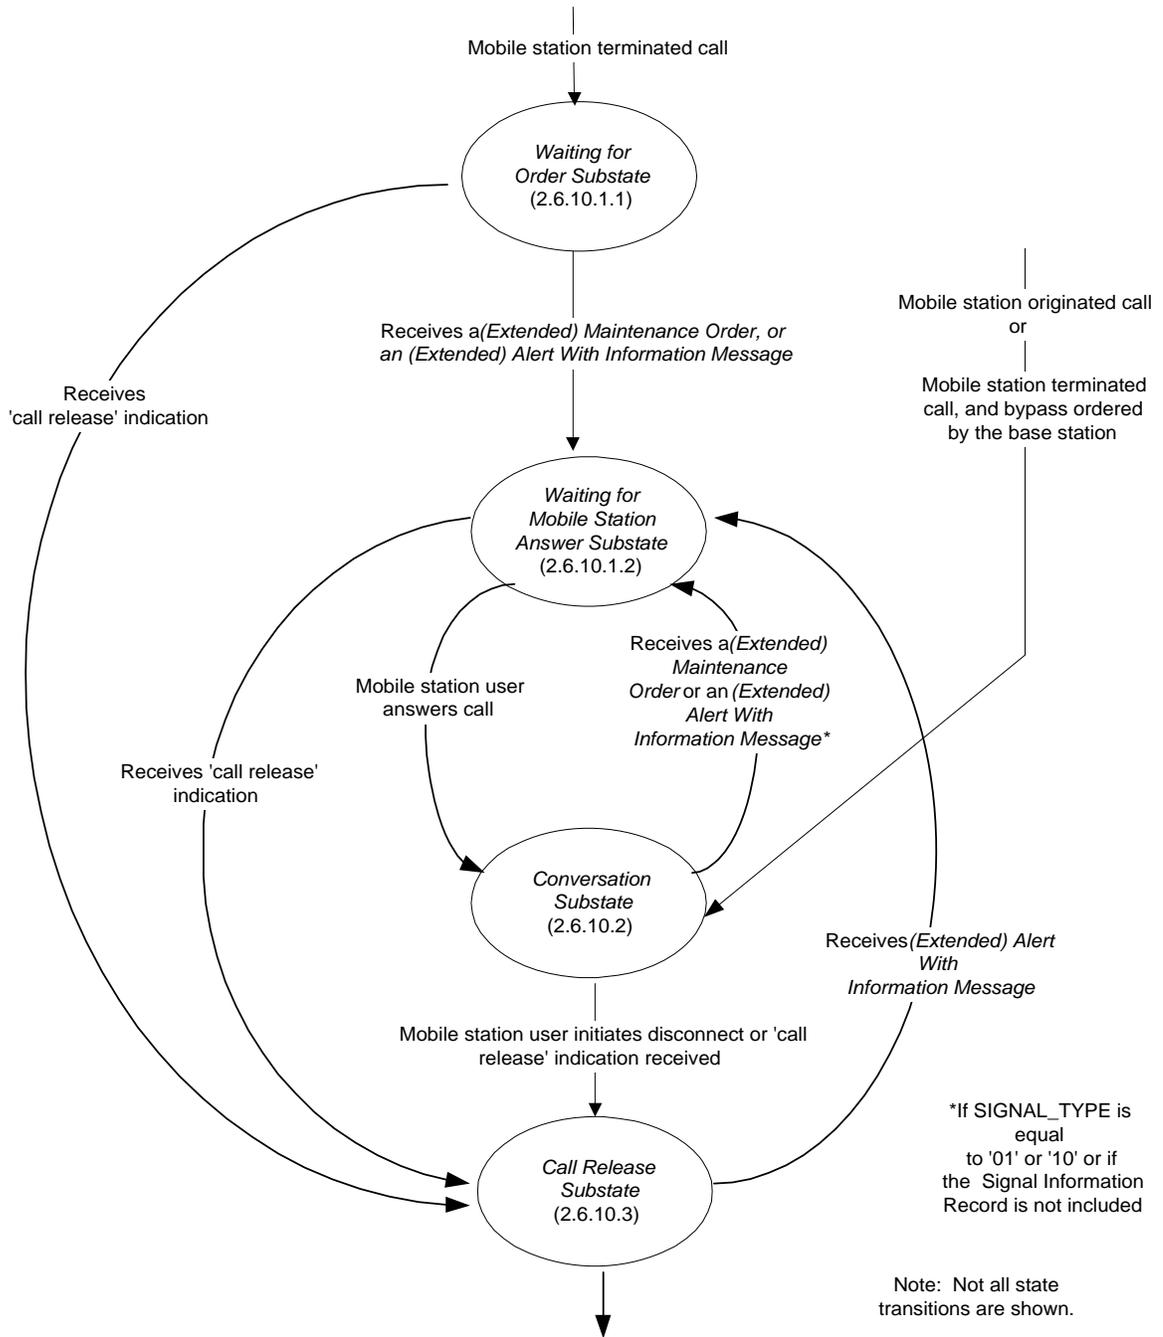

24 the User Zone in service each time UZID_S is updated.

25 2.6.10 Call Control Processing

26 As illustrated in Figure 2.6.10-1, the Call Control consists of the following states:

- 27 • *Waiting for Order Substate* - In this substate, the Call Control instance waits for an
- 28 *Alert With Information Message* or an *Extended Alert With Information Message*.
- 29 • *Waiting for Mobile Station Answer Substate* - In this substate, the Call Control
- 30 instance waits for the user to answer the call.
- 31 • *Conversation Substate* - In this substate, the parties involved in this call
- 32 communicate.
- 33 • *Call Release Substate* - In this substate, the Call Control instance waits for the call
- 34 to be disconnected.

35

1
2
3
4

Figure 2.6.10-1. Call Control

1 The following messages are processed by the Call Control:

- 2 • *Alert With Information Message*
- 3 • *Extended Alert with Information Message:*
- 4 • *Flash With Information Message*
- 5 • *Extended Flash With Information Message*
- 6 • *Send Burst DTMF Message*
- 7 • *Origination Continuation Message*

8 The following orders are processed by the Call Control:

- 9 • *Continuous DTMF Tone Order*
- 10 • *Maintenance Order*
- 11 • *Connect Order*

12 Upon instantiation, the Call Control instance shall perform the following:

- 13 • If this Call Control instance is instantiated with a 'restore indication', the Call
14 Control instance shall enter the *Conversation Substate*.
- 15 • If the call is mobile station terminated, and BYPASS_ALERT_ANSWER_s is '1', the
16 Call Control instance shall perform the following:
 - 17 - The Call Control instance shall enter the *Conversation Substate*.
 - 18 - The mobile station shall not connect the audio input, e.g., the microphone of the
19 mobile station, to the reverse link without the knowledge of the user.
- 20 • If the call is mobile station terminated and BYPASS_ALERT_ANSWER_s is '0', the
21 Call Control instance shall enter the *Waiting for Order Substate*.
- 22 • If the call is mobile station originated, the Call Control instance shall enter the
23 *Conversation Substate*.

24 2.6.10.1 Alerting

25 2.6.10.1.1 Waiting for Order Substate

26 In this substate, the Call Control instance waits for an *Alert With Information Message* or an
27 *Extended Alert With Information Message*.

28 Upon entering the *Waiting for Order Substate*, the Call Control instance shall set the
29 substate timer for T_{52m} seconds.

30 While in the *Waiting for Order Substate*, the Call Control instance shall perform the
31 following:

- 1 • If the substate timer expires, the Call Control instance shall send a “substate timer
2 expired indication” to the Layer 3 and shall enter the *Call Release Substate*.
- 3 • If the Call Control instance receives a “reset waiting for order substate timer
4 indication” from the Layer 3, the Call Control instance shall reset the substate timer
5 for T_{52m} seconds.
- 6 • If the Call Control instance receives a “release indication” from the Layer 3, the Call
7 Control instance shall enter the *Call Release Substate*.
- 8 • If the Call Control instance receives an indication that the user has originated an
9 emergency call (see 2.6.4.3), the mobile station shall send a *Flash With Information*
10 *Message* or an *Extended Flash With Information Message* in assured mode with a
11 Global Emergency Call Information Record (see 2.7.4.31), as follows:
- 12 - If this Call Control instance is identified by NULL, the mobile station shall send
13 either a *Flash With Information Message* or an *Extended Flash With Information*
14 *Message* (with either the CON_REF_INCL field of the message set to ‘0’ or the
15 CON_REF_INCL field set to ‘1’ and the CON_REF field set to the connection
16 reference of the service option connection corresponding to this call); otherwise,
17 the mobile station shall send an *Extended Flash With Information Message*, with
18 the CON_REF_INCL field of the message set to ‘1’ and the CON_REF field of the
19 message set to the connection reference of the service option connection
20 corresponding to this call.
- 21 • If the Call Control instance receives a message from the Layer 3 which is included
22 in the following list and every message field value is within its permissible range,
23 the Call Control instance shall process the message as described below and in
24 accordance with the message’s action time (see 2.6.4.1.5).
- 25 1. *Alert With Information Message*: If the message contains a Signal information
26 record, the mobile station should alert the user in accordance with the Signal
27 information record; otherwise, the mobile station should use standard alert as
28 defined in 3.7.5.5. The Call Control instance shall enter the *Waiting for Mobile*
29 *Station Answer Substate* (see 2.6.10.1.2).
- 30 2. *Extended Alert with Information Message*: If the message contains a Signal
31 information record, the mobile station should alert the user in accordance with
32 the Signal information record; otherwise, the mobile station should use
33 standard alert as defined in 3.7.5.5. The Call Control instance shall enter the
34 *Waiting for Mobile Station Answer Substate* (see 2.6.10.1.2).
- 35 3. *Maintenance Order*: The Call Control instance shall enter the *Waiting for Mobile*
36 *Station Answer Substate*.
- 37 • If the Call Control instance receives a message that is not included in the above list,
38 cannot be processed, or requires a capability which is not supported, the Call
39 Control instance shall discard the message and send a ‘message rejected indication’

1 to the Layer 3, with the reject reason indicated except when the following condition
2 applies.

- 3 - If the Call Control instance fails to meet the criteria solely due to receipt of the
4 Extended Record Type – International information record, the information record
5 shall be discarded and the message shall be processed in accordance with the
6 above procedures specified for the applicable message.

7 2.6.10.1.2 Waiting for Mobile Station Answer Substate

8 In this substate, the Call Control instance waits for the user to answer the mobile station
9 terminated call or to invoke special treatment.

10 Upon entering the *Waiting for Mobile Station Answer Substate*, the Call Control instance
11 shall set the substate timer for T_{53m} seconds.

12 While in the *Waiting for Mobile Station Answer Substate*, the Call Control instance shall
13 perform the following:

- 14 • If the substate timer expires, the Call Control instance shall send a “substate timer
15 expired indication” to the Layer 3 and shall enter the *Call Release Substate*.
- 16 • If the Call Control instance receives a “release indication” from the Layer 3, the Call
17 Control instance shall enter the *Call Release Substate*.
- 18 • If the Call Control instance is directed by the user to answer the call, the mobile
19 station shall send a *Connect Order* in assured mode:
 - 20 - If P_REV_IN_USE_s is equal to or greater than seven, the mobile station shall
21 perform the following: If this Call Control instance is identified by NULL, the
22 mobile station shall either set the CON_REF_INCL field of the message to ‘0’ or
23 set the CON_REF_INCL field to ‘1’ and set the CON_REF field to the connection
24 reference of the service option connection corresponding to this call; otherwise,
25 the mobile station shall set the CON_REF_INCL field of the message to ‘1’ and
26 the CON_REF field of the message to the connection reference of the service
27 option connection corresponding to this call.

28 The Call Control instance shall enter the *Conversation Substate*.

- 29 • If the Call Control instance is directed by the user to forward the incoming call, the
30 mobile station shall send a *Flash With Information Message* or an *Extended Flash
31 With Information Message* in assured mode with a *Keypad Facility* information record
32 (see 2.7.4.2) or the *Extended Keypad Facility* information record (see 2.7.4.35) with
33 the CHARi field set to a pre-programmed feature code which indicates User
34 Selective Call Forwarding with a pre-registered number, as follows:
 - 35 - If P_REV_IN_USE_s is less than seven, the mobile station shall send a *Flash With
36 Information Message*.

1 - If P_REV_IN_USE_s is equal to or greater than seven, the mobile station shall
2 perform the following: if this Call Control instance is identified by NULL, the
3 mobile station shall send either a *Flash With Information Message* or an
4 *Extended Flash With Information Message* (with either the CON_REF_INCL field
5 of the message set to '0' or the CON_REF_INCL field set to '1' and the CON_REF
6 field set to the connection reference of the service option connection
7 corresponding to this call); otherwise, the mobile station shall send an *Extended*
8 *Flash With Information Message*, with the CON_REF_INCL field of the message
9 set to '1' and the CON_REF field of the message set to the connection reference
10 of the service option connection corresponding to this call.

11 • If the Call Control instance is directed by user to forward the incoming call to a
12 number stored in the mobile station, the mobile station shall send a *Flash With*
13 *Information Message* or an *Extended Flash With Information Message* in assured
14 mode with a *Keypad Facility* information record (see 2.7.4.2) or the *Extended*
15 *Keypad Facility* information record (see 2.7.4.35) with the CHARi field set to the
16 following:

- 17 - a pre-programmed feature code which indicates User Selective Call Forwarding
18 to a number stored in the mobile station as the first digits in the field and
- 19 - the forwarding to number immediately following the pre-programmed feature
20 code.

21 The mobile station shall send the message as follows:

22 - If P_REV_IN_USE_s is less than seven, the mobile station shall send a *Flash With*
23 *Information Message*.

24 - If P_REV_IN_USE_s is equal to or greater than seven, the mobile station shall
25 perform the following: if this Call Control instance is identified by NULL, the
26 mobile station shall send either a *Flash With Information Message* or an
27 *Extended Flash With Information Message* (with either the CON_REF_INCL field
28 of the message set to '0' or the CON_REF_INCL field set to '1' and the CON_REF
29 field set to the connection reference of the service option connection
30 corresponding to this call); otherwise, the mobile station shall send an *Extended*
31 *Flash With Information Message*, with the CON_REF_INCL field of the message
32 set to '1' and the CON_REF field of the message set to the connection reference
33 of the service option connection corresponding to this call.

34 • If the Call Control instance is directed by the user to forward the incoming call to
35 network-based voice mail, the mobile station shall send a *Flash With Information*
36 *Message* or an *Extended Flash With Information Message* in assured mode with a
37 *Keypad Facility* information record (see 2.7.4.2) or the *Extended Keypad Facility*
38 information record (see 2.7.4.35) with the CHARi field set to a pre-programmed
39 feature code which indicates User Selective Call Forwarding to voice mail, as
40 follows:

- 1 - If P_REV_IN_USE_S is less than seven, the mobile station shall send a *Flash With*
2 *Information Message*.
- 3 - If P_REV_IN_USE_S is equal to or greater than seven, the mobile station shall
4 perform the following: if this Call Control instance is identified by NULL, the
5 mobile station shall send either a *Flash With Information Message* or an
6 *Extended Flash With Information Message* (with either the CON_REF_INCL field
7 of the message set to '0' or the CON_REF_INCL field set to '1' and the CON_REF
8 field set to the connection reference of the service option connection
9 corresponding to this call); otherwise, the mobile station shall send an *Extended*
10 *Flash With Information Message*, with the CON_REF_INCL field of the message
11 set to '1' and the CON_REF field of the message set to the connection reference
12 of the service option connection corresponding to this call.
- 13 • If the Call Control instance is directed by the user to activate answer holding, the
14 mobile station shall send a *Flash With Information Message* or an *Extended Flash*
15 *With Information Message* in assured mode requiring confirmation of delivery with a
16 *Keypad Facility* information record (see 2.7.4.2) or the *Extended Keypad Facility*
17 information record (see 2.7.4.35) with the CHARi field set to a pre-programmed
18 feature code which indicates Answer Holding:
- 19 - If P_REV_IN_USE_S is less than seven, the mobile station shall send a *Flash With*
20 *Information Message*.
- 21 - If P_REV_IN_USE_S is equal to or greater than seven, the mobile station shall
22 perform the following: if this Call Control instance is identified by NULL, the
23 mobile station shall send either a *Flash With Information Message* or an
24 *Extended Flash With Information Message* (with either the CON_REF_INCL field
25 of the message set to '0' or the CON_REF_INCL field set to '1' and the CON_REF
26 field set to the connection reference of the service option connection
27 corresponding to this call); otherwise, the mobile station shall send an *Extended*
28 *Flash With Information Message*, with the CON_REF_INCL field of the message
29 set to '1' and the CON_REF field of the message set to the connection reference
30 of the service option connection corresponding to this call.

31 After receiving confirmation of delivery of the *Flash With Information Message* or the
32 *Extended Flash With Information Message*, the mobile station shall send a *Connect*
33 *Order* in assured mode:

- 34 - If P_REV_IN_USE_S is equal to or greater than seven, the mobile station shall
35 perform the following: If this Call Control instance is identified by NULL, the
36 mobile station shall either set the CON_REF_INCL field of the message to '0' or
37 set the CON_REF_INCL field to '1' and set the CON_REF field to the connection
38 reference of the service option connection corresponding to this call; otherwise,
39 the mobile station shall set the CON_REF_INCL field of the message to '1' and
40 the CON_REF field of the message to the connection reference of the service
41 option connection corresponding to this call.

1 The Call Control instance shall enter the *Conversation Substate*.

- 2 • If the Call Control instance receives an indication that the user has originated an
3 emergency call (see 2.6.4.3), the mobile station shall send a *Flash With Information*
4 *Message* or an *Extended Flash With Information Message* in assured mode with a
5 Global Emergency Call Information Record (see 2.7.4.31), as follows:
 - 6 - If this Call Control instance is identified by NULL, the mobile station shall send
7 either a *Flash With Information Message* or an *Extended Flash With Information*
8 *Message* (with either the CON_REF_INCL field of the message set to '0' or the
9 CON_REF_INCL field set to '1' and the CON_REF field set to the connection
10 reference of the service option connection corresponding to this call); otherwise,
11 the mobile station shall send an *Extended Flash With Information Message*, with
12 the CON_REF_INCL field of the message set to '1' and the CON_REF field of the
13 message set to the connection reference of the service option connection
14 corresponding to this call.
- 15 • If the Call Control instance receives a message from Layer 3 which is included in
16 the following list and every message field value is within its permissible range, the
17 Call Control instance shall process the message as described below and in
18 accordance with the message's action time (see 2.6.4.1.5).
 - 19 1. *Alert With Information Message*: The Call Control instance shall reset the
20 substate timer for T_{53m} seconds. If this message does not contain a Signal
21 information record, the mobile station should use standard alert as defined in
22 3.7.5.5.
 - 23 2. *Extended Alert With Information Message*: The Call Control instance shall reset
24 the substate timer for T_{53m} seconds. If this message does not contain a Signal
25 information record, the mobile station should use standard alert as defined in
26 3.7.5.5.
 - 27 3. *Maintenance Order*: The mobile station shall reset the substate timer for T_{53m}
28 seconds.
- 29 • If the Call Control instance receives a message that is not included in the above list,
30 cannot be processed, or requires a capability which is not supported, the Call
31 Control instance shall discard the message and send a 'message rejected indication'
32 to the Layer 3, with the reject reason indicated except when the following condition
33 applies.
 - 34 - If the Call Control instance fails to meet the criteria solely due to receipt of
35 the Extended Record Type – International information record, the information
36 record shall be discarded and the message shall be processed in accordance
37 with the above procedures specified for the applicable message.

38 2.6.10.2 Conversation Substate

39 While in the *Conversation Substate*, the Call Control instance shall perform the following:

- 1 • If the Call Control instance receives a “release indication” from the Layer 3, the Call
2 Control instance shall enter the *Call Release Substate*.
- 3 • The mobile station shall send an *Origination Continuation Message* in assured mode,
4 within T_{54m} seconds after the Call Control instance entering the *Conversation*
5 *Substate* if any of the following conditions occur:
- 6 - The mobile station originated the call, and did not send all the dialed digits in
7 the *Origination Message*.
- 8 - There is more than one calling party number associated with the mobile station.
- 9 - A calling party subaddress is used in the call.
- 10 - A called party subaddress is used in the call.

11 If more than one calling party number is associated with the mobile station, the mobile
12 station shall include the calling party number being used in the calling party number
13 information record in the *Origination Continuation Message*. If only one calling party
14 number is associated with the mobile station, the mobile station shall not include the
15 calling party number information record in the *Origination Continuation Message*. If a
16 calling party subaddress is used, the mobile station shall include the calling party
17 subaddress information record in the *Origination Continuation Message*; otherwise, the
18 mobile station shall omit the calling party subaddress information record. If a called party
19 subaddress is used, the mobile station shall include the called party subaddress
20 information record in the *Origination Continuation Message*; otherwise, the mobile station
21 shall omit the called party subaddress information record.

- 22 • If the Call Control instance is directed by the user to issue a flash, the mobile
23 station shall build a *Flash With Information Message* or an *Extended Flash With*
24 *Information Message* with the collected digits or characters contained in a *Keypad*
25 *Facility* information record, if needed, and shall send the message in assured mode,
26 as follows:
- 27 - If $P_REV_IN_USE_s$ is less than seven, the mobile station shall send a *Flash With*
28 *Information Message*.
- 29 - If $P_REV_IN_USE_s$ is equal to or greater than seven, the mobile station shall
30 perform the following: if this Call Control instance is identified by NULL, the
31 mobile station shall send either a *Flash With Information Message* or an
32 *Extended Flash With Information Message* (with either the CON_REF_INCL field
33 of the message set to ‘0’ or the CON_REF_INCL field set to ‘1’ and the CON_REF
34 field set to the connection reference of the service option connection
35 corresponding to this call); otherwise, the mobile station shall send an *Extended*
36 *Flash With Information Message*, with the CON_REF_INCL field of the message
37 set to ‘1’ and the CON_REF field of the message set to the connection reference
38 of the service option connection corresponding to this call.
- 39 • If the Call Control instance is directed by the user to forward the incoming call, the
40 mobile station shall send a *Flash With Information Message* or an *Extended Flash*
41 *With Information Message* in assured mode with a *Keypad Facility* information record

1 (see 2.7.4.2) or the *Extended Keypad Facility* information record (see 2.7.4.35) with
 2 the CHARi field set to a pre-programmed feature code which indicates User
 3 Selective Call Forwarding with a pre-registered number, as follows:

- 4 - If P_REV_IN_USE_s is less than seven, the mobile station shall send a *Flash With*
 5 *Information Message*.
- 6 - If P_REV_IN_USE_s is equal to or greater than seven, the mobile station shall
 7 perform the following: if this Call Control instance is identified by NULL, the
 8 mobile station shall send either a *Flash With Information Message* or an
 9 *Extended Flash With Information Message* (with either the CON_REF_INCL field
 10 of the message set to '0' or the CON_REF_INCL field set to '1' and the CON_REF
 11 field set to the connection reference of the service option connection
 12 corresponding to this call); otherwise, the mobile station shall send an *Extended*
 13 *Flash With Information Message*, with the CON_REF_INCL field of the message
 14 set to '1' and the CON_REF field of the message set to the connection reference
 15 of the service option connection corresponding to this call.
- 16 • If the Call Control instance is directed by the user to forward the incoming call to a
 17 number stored in the mobile station, the mobile station shall send a *Flash With*
 18 *Information Message* or an *Extended Flash With Information Message* in assured
 19 mode with a *Keypad Facility* information record (see 2.7.4.2) or the *Extended*
 20 *Keypad Facility* information record (see 2.7.4.35) with the CHARi field set to the
 21 following:
 - 22 - a pre-programmed feature code which indicates User Selective Call Forwarding
 23 to a number stored in the mobile station as the first digits in the field and
 - 24 - the forwarding to number immediately following the pre-programmed feature
 25 code.

26 The mobile station shall send the message as follows:

- 27 - If P_REV_IN_USE_s is less than seven, the mobile station shall send a *Flash With*
 28 *Information Message*.
- 29 - If P_REV_IN_USE_s is equal to or greater than seven and if this Call Control
 30 instance is identified by NULL, the mobile station shall send either a *Flash With*
 31 *Information Message* or an *Extended Flash With Information Message* (with either
 32 the CON_REF_INCL field of the message set to '0' or the CON_REF_INCL field set
 33 to '1' and the CON_REF field set to the connection reference of the service option
 34 connection corresponding to this call). Otherwise, the mobile station shall send
 35 an *Extended Flash With Information Message*, with the CON_REF_INCL field of
 36 the message set to '1' and the CON_REF field of the message set to the
 37 connection reference of the service option connection corresponding to this call.
- 38 • If the Call Control instance is directed by the user to forward the incoming call to
 39 network-based voice mail, the mobile station shall send a *Flash With Information*
 40 *Message* or an *Extended Flash With Information Message* in assured mode with a

1 *Keypad Facility* information record (see 2.7.4.2) or the *Extended Keypad Facility*
2 information record (see 2.7.4.35) with the CHARi field set to a pre-programmed
3 feature code which indicates User Selective Call Forwarding to voice mail, as
4 follows:

- 5 - If P_REV_IN_USE_S is less than seven, the mobile station shall send a *Flash With*
6 *Information Message*.
- 7 - If P_REV_IN_USE_S is equal to or greater than seven and if this Call Control
8 instance is identified by NULL, the mobile station shall send either a *Flash With*
9 *Information Message* or an *Extended Flash With Information Message* (with either
10 the CON_REF_INCL field of the message set to '0' or the CON_REF_INCL field set
11 to '1' and the CON_REF field set to the connection reference of the service option
12 connection corresponding to this call). Otherwise, the mobile station shall send
13 an *Extended Flash With Information Message*, with the CON_REF_INCL field of
14 the message set to '1' and the CON_REF field of the message set to the
15 connection reference of the service option connection corresponding to this call.
- 16 • If the Call Control instance is directed by the user to activate answer holding, the
17 mobile station shall send a *Flash With Information Message* or an *Extended Flash*
18 *With Information Message* in assured mode requiring confirmation of delivery with a
19 *Keypad Facility* information record (see 2.7.4.2) or the *Extended Keypad Facility*
20 information record (see 2.7.4.35) with the CHARi field set to a pre-programmed
21 feature code which indicates Answer Holding, as follows:
 - 22 - If P_REV_IN_USE_S is less than seven, the mobile station shall send a *Flash With*
23 *Information Message*.
 - 24 - If P_REV_IN_USE_S is equal to or greater than seven, the mobile station shall
25 perform the following: if this Call Control instance is identified by NULL, the
26 mobile station shall send either a *Flash With Information Message* or an
27 *Extended Flash With Information Message* (with either the CON_REF_INCL field
28 of the message set to '0' or the CON_REF_INCL field set to '1' and the CON_REF
29 field set to the connection reference of the service option connection
30 corresponding to this call); otherwise, the mobile station shall send an *Extended*
31 *Flash With Information Message*, with the CON_REF_INCL field of the message
32 set to '1' and the CON_REF field of the message set to the connection reference
33 of the service option connection corresponding to this call.

- 1 • If answer holding is activated and the Call Control instance is directed by the user
2 to deactivate answer holding, the mobile station shall send a *Flash With Information*
3 *Message* or an *Extended Flash With Information Message* in assured mode with a
4 *Keypad Facility* information record (see 2.7.4.2) or the *Extended Keypad Facility*
5 information record (see 2.7.4.35) with the CHARi field set to a pre-programmed
6 feature code which indicates Answer Holding, as follows:
- 7 - If P_REV_IN_USE_S is less than seven, the mobile station shall send a *Flash With*
8 *Information Message*.
- 9 - If P_REV_IN_USE_S is equal to or greater than seven, the mobile station shall
10 perform the following: if this Call Control instance is identified by NULL, the
11 mobile station shall send either a *Flash With Information Message* or an
12 *Extended Flash With Information Message* (with either the CON_REF_INCL field
13 of the message set to '0' or the CON_REF_INCL field set to '1' and the CON_REF
14 field set to the connection reference of the service option connection
15 corresponding to this call); otherwise, the mobile station shall send an *Extended*
16 *Flash With Information Message*, with the CON_REF_INCL field of the message
17 set to '1' and the CON_REF field of the message set to the connection reference
18 of the service option connection corresponding to this call.
- 19 • If the Call Control instance is directed by the user to send burst DTMF digits, the
20 mobile station shall build the *Send Burst DTMF Message* with the dialed digits and
21 shall send the message in assured mode requiring confirmation of delivery.
- 22 - If P_REV_IN_USE_S is equal to or greater than seven, the mobile station shall
23 perform the following: If this Call Control instance is identified by NULL, the
24 mobile station shall set the CON_REF_INCL field of the message to '0';
25 otherwise, the mobile station shall set the CON_REF_INCL field of the message
26 to '1' and the CON_REF field of the message to the connection reference of the
27 service option connection corresponding to this call.

28 The mobile station sending multiple *Send Burst DTMF Messages* shall preserve relative
29 ordering of these messages (see [4]). The mobile station should attempt to preserve the
30 user timing as much as possible, using recommended values of DTMF_ON_LENGTH (see
31 Table 2.7.2.3.2.7-1) and DTMF_OFF_LENGTH (see Table 2.7.2.3.2.7-2).

- 32 • If the Call Control instance is directed by the user to send a continuous DTMF digit,
33 the mobile station shall build the *Continuous DTMF Tone Order* with the dialed digit
34 and shall send the order in assured mode requiring confirmation of delivery, as
35 follows:

- 1 - If P_REV_IN_USE_s is equal to or greater than seven, the mobile station shall
2 perform the following: If this Call Control instance is identified by NULL, the
3 mobile station shall either set the CON_REF_INCL field of the message to '0' or
4 set the CON_REF_INCL field to '1' and set the CON_REF field to the connection
5 reference of the service option connection corresponding to this call; otherwise,
6 the mobile station shall set the CON_REF_INCL field of the message to '1' and
7 the CON_REF field of the message to the connection reference of the service
8 option connection corresponding to this call.

9 When the Call Control instance is directed by the user to cease sending the
10 continuous DTMF digit, the mobile station shall send the *Continuous DTMF Tone*
11 *Order* (ORDQ = '11111111') in assured mode requiring confirmation of delivery, as
12 follows:

- 13 - If P_REV_IN_USE_s is equal to or greater than seven, the mobile station shall
14 perform the following: If this Call Control instance is identified by NULL, the
15 mobile station shall either set the CON_REF_INCL field of the message to '0' or
16 set the CON_REF_INCL field to '1' and set the CON_REF field to the connection
17 reference of the service option connection corresponding to this call; otherwise,
18 the mobile station shall set the CON_REF_INCL field of the message to '1' and
19 the CON_REF field of the message to the connection reference of the service
20 option connection corresponding to this call.

21 The mobile station sending multiple *Continuous DTMF Tone Orders* shall preserve relative
22 ordering of these messages (see [2]). The mobile station shall send the *Continuous DTMF*
23 *Tone Order* with the ORDQ set to '11111111' indicating the completion of the current
24 continuous DTMF digit before sending the *Continuous DTMF Tone Order* for another digit or
25 the *Send Burst DTMF Message*.

- 26 • If the Call Control instance is directed by the user to disconnect the call, the Call
27 Control instance shall send a 'call release request' to the Layer 3 and shall enter the
28 *Call Release Substate*.
- 29 • If the Call Control instance receives an indication that this packet data service
30 instance has been inactivated, the Call Control instance shall send a "call inactive
31 indication" to the Layer 3 and shall enter the *Call Release Substate*.
- 32 • If the Call Control instance receives an indication that the user has originated an
33 emergency call (see 2.6.4.3), the mobile station shall send a *Flash With Information*
34 *Message* or an *Extended Flash With Information Message* in assured mode with a
35 Global Emergency Call Information Record (see 2.7.4.31), as follows:
- 36 – If this Call Control instance is identified by NULL, the mobile station shall
37 send either a *Flash With Information Message* or an *Extended Flash With*
38 *Information Message* (with either the CON_REF_INCL field of the message set to
39 '0' or the CON_REF_INCL field set to '1' and the CON_REF field set to the
40 connection reference of the service option connection corresponding to this call);
41 otherwise, the mobile station shall send an *Extended Flash With Information*
42 *Message*, with the CON_REF_INCL field of the message set to '1' and the

1 CON_REF field of the message set to the connection reference of the service
2 option connection corresponding to this call.

- 3 • If the Call Control instance receives a message from the Layer 3 which is included
4 in the following list and every message field value is within its permissible range,
5 the Call Control instance shall process the message as described below and in
6 accordance with the message's action time (see 2.6.4.1.5).
 - 7 1. *Alert With Information Message*: If the message contains a Signal information
8 record with the SIGNAL_TYPE field set to '01' or '10', or if the message does not
9 contain a Signal information record, the Call Control instance shall enter the
10 *Waiting For Mobile Station Answer Substate*. The mobile station should alert the
11 user in accordance with the Signal information record. If this message does not
12 contain a Signal information record, the mobile station should use standard
13 alert as defined in 3.7.5.5.
 - 14 2. *Continuous DTMF Tone Order*
 - 15 3. *Extended Alert With Information Message*: If the message contains a Signal
16 information record with the SIGNAL_TYPE field set to '01' or '10', or if the
17 message does not contain a Signal information record, the Call Control instance
18 shall enter the *Waiting For Mobile Station Answer Substate*. The mobile station
19 should alert the user in accordance with the Signal information record. If this
20 message does not contain a Signal information record, the mobile station should
21 use standard alert as defined in 3.7.5.5.
 - 22 4. *Flash With Information Message*
 - 23 5. *Extended Flash With Information Message*
 - 24 6. *Maintenance Order*: The Call Control instance shall enter the *Waiting for Mobile*
25 *Station Answer Substate*.
 - 26 7. *Send Burst DTMF Message*:
 - 27 • If the Call Control instance receives a message that is not included in the above list,
28 cannot be processed, or requires a capability which is not supported, the Call
29 Control instance shall discard the message and send a 'message rejected indication'
30 to the Layer 3, with the reject reason indicated except when the following condition
31 applies.
 - 32 - If the Call Control instance fails to meet the criteria solely due to receipt of
33 the Extended Record Type – International information record, the information
34 record shall be discarded and the message shall be processed in accordance
35 with the above procedures specified for the applicable message.

36 2.6.10.3 Call Release Substate

37 In this substate, the Call Control instance waits for the call to be released.

1 While in the *Call Release Substate*, the Call Control instance shall perform the following:

- 2 • If the Call Control instance receives a message from the Layer 3 which is included
3 in the following list and every message field value is within its permissible range,
4 the Call Control instance shall process the message as described below and in
5 accordance with the message's action time (see 2.6.4.1.5).
 - 6 1. *Alert With Information Message*: The Call Control instance shall send an "enter
7 traffic channel substate indication" to the Layer 3 and shall enter the *Waiting for*
8 *Mobile Station Answer Substate*. If this message does not contain a Signal
9 information record, the mobile station should use standard alert as defined in
10 3.7.5.5.
 - 11 2. *Extended Alert With Information Message*: The Call Control instance shall send a
12 "enter traffic channel substate indication" to Layer 3 and shall enter the *Waiting*
13 *for Mobile Station Answer Substate*. If this message does not contain a Signal
14 information record, the mobile station should use standard alert as defined in
15 3.7.5.5.
- 16 • If the Call Control instance receives a message that is not included in the above list,
17 cannot be processed, or requires a capability which is not supported, the Call
18 Control instance shall discard the message and send a 'message rejected indication'
19 to the Layer 3, with the reject reason indicated except when the following condition
20 applies.
 - 21 - If the Call Control instance fails to meet the criteria solely due to receipt of the
22 Extended Record Type – International information record, the information record
23 shall be discarded and the message shall be processed in accordance with the
24 above procedures specified for the applicable message.

25 2.6.11 Common Procedures for Extended Encryption and Message Integrity

26 This section describes the common procedures for the messages used for extended
27 encryption and message integrity.

28 2.6.11.1 Registration Accepted Order

29 The mobile station shall perform the following procedures in the order listed below.

- 30 • If $ORDQ_R$ is equal to '00000101', the mobile station shall set $ROAM_INDI_S$ to
31 $ROAM_INDI_R$ and should display the roaming condition.
- 32 • If $ORDQ_R$ is equal to '00000111', the mobile station shall perform the following:
 - 33 - Set $ROAM_INDI_S$ to $ROAM_INDI_R$ and the mobile station should display the
34 roaming condition.
 - 35 - Set $C_SIG_ENCRYPT_MODE_S$ to $C_SIG_ENCRYPT_MODE_R$.
 - 36 - If $ENC_KEY_SIZE_R$ is included, the mobile station shall set $ENC_KEY_SIZE_S$ to
37 $ENC_KEY_SIZE_R$.

- 1 - If MSG_INTEGRITY_SUP_s is equal to '0' and C_SIG_ENCRYPT_MODE_r is not
2 equal to '000', the mobile station shall perform the following:
- 3 + Set TX_EXT_SSEQ[0][KEY_ID], TX_EXT_SSEQ[1][KEY_ID],
4 RX_EXT_SSEQ[0][KEY_ID], and RX_EXT_SSEQ[1][KEY_ID] to $1 + 256 \times$
5 NEW_SSEQ_H included in the *Registration Message*.
- 6 + Form a 128-bit pattern by concatenating the CMEAKEY with a copy of itself
7 (the most recently generated CMEAKEY is associated with the AUTHR of the
8 *Registration Message*).
- 9 + Set ENC_KEY[KEY_ID] to the 128-bit pattern.
- 10 + Set INT_KEY[KEY_ID] to the 128-bit pattern.
- 11 - If MSG_INTEGRITY_SUP_s is equal to '1', the mobile station shall perform the
12 following:
- 13 + If CHANGE_KEYS_r is equal to '0', the mobile station shall set RESTORE_KEY
14 to '0'.
- 15 + If CHANGE_KEYS_r is equal to '1', the mobile station shall perform the
16 following:
- 17 o Set KEY_ID to SDU_KEY_ID provided by the LAC Layer (see [4]).
- 18 o Set TX_EXT_SSEQ[0][KEY_ID], TX_EXT_SSEQ[1][KEY_ID],
19 RX_EXT_SSEQ[0][KEY_ID], and RX_EXT_SSEQ[1][KEY_ID] to $1 + 256 \times$
20 NEW_SSEQ_H included in the *Registration Message*.
- 21 o If KEY_ID is equal to '00' or '01', the mobile station shall perform the
22 following:
- 23 Form a 128-bit pattern by concatenating the CMEAKEY with a copy of
24 itself (the most recently generated CMEAKEY associated with the
25 AUTHR of the *Registration Message*).
- 26 Set ENC_KEY[KEY_ID] to the 128-bit pattern.
- 27 Set INT_KEY[KEY_ID] to the 128-bit pattern.
- 28 Set LAST_2G_KEY_ID_s to KEY_ID.
- 29 o If KEY_ID is equal to '10' or '11', the mobile station shall perform the
30 following:
- 31 Set ENC_KEY[KEY_ID] to the CK generated by AKA.
- 32 Set INT_KEY[KEY_ID] to the IK generated by AKA.
- 33 Set LAST_3G_KEY_ID_s to KEY_ID.
- 34 If the mobile station supports R-UIM, then the mobile shall set
35 USE_UAK_s to USE_UAK_r; otherwise, the mobile station shall perform
36 the following:
- 37 - Set USE_UAK_s to '0'.

- 1 o Set ENC_KEY[KEY_ID] to the 128-bit pattern.
- 2 o Set INT_KEY[KEY_ID] to the 128-bit pattern.
- 3 – If C_SIG_ENCRYPT_MODE_r is included, the mobile station shall set
- 4 C_SIG_ENCRYPT_MODE_s to C_SIG_ENCRYPT_MODE_r.
- 5 • If P_REV_IN_USE_s is equal to or greater than 10 and MSG_INTEGRITY_SUP_s is
- 6 equal to ‘1’, the mobile station shall perform the following:
- 7 – If the LAC Layer indicates that the message does not contain a valid MACI, the
- 8 mobile station shall set D_SIG_ENCRYPT_MODE_s to C_SIG_ENCRYPT_MODE_s;
- 9 otherwise, the mobile station shall perform the following:
- 10 + Set D_SIG_ENCRYPT_MODE_s to D_SIG_ENCRYPT_MODE_r.
- 11 + If C_SIG_ENCRYPT_MODE is included, the mobile station shall set
- 12 C_SIG_ENCRYPT_MODE_s to C_SIG_ENCRYPT_MODE_r.
- 13 + If ENC_KEY_SIZE_r is included, the mobile station shall set
- 14 ENC_KEY_SIZE_s to ENC_KEY_SIZE_r.
- 15 + If MSG_INTEGRITY_INFO_r is set to ‘1’, the mobile station shall perform
- 16 the following:
- 17 o If CHANGE_KEYS_r is equal to ‘0’, the mobile station shall set
- 18 RESTORE_KEY to ‘0’.
- 19 o If CHANGE_KEYS_r is equal to ‘1’, the mobile station shall perform the
- 20 following:
- 21 Set KEY_ID to SDU_KEY_ID provided by the LAC Layer (see [4]).
- 22 Set TX_EXT_SSEQ[0][KEY_ID], TX_EXT_SSEQ[1][KEY_ID],
- 23 RX_EXT_SSEQ[0][KEY_ID], and RX_EXT_SSEQ[1][KEY_ID] to 1 + 256
- 24 × NEW_SSEQ_H included in the *Origination Message* or *Page*
- 25 *Response Message*.
- 26 If KEY_ID is equal to ‘00’ or ‘01’, the mobile station shall perform the
- 27 following:
- 28 – Form a 128-bit pattern by concatenating the CMEAKEY with
- 29 a copy of itself (the most recently generated CMEAKEY associated
- 30 with the AUTHR of the *Origination Message* or *Page Response*
- 31 *Message*).
- 32 – Set ENC_KEY[KEY_ID] to the 128-bit pattern.
- 33 – Set INT_KEY[KEY_ID] to the 128-bit pattern.
- 34 – Set LAST_2G_KEY_ID_s to KEY_ID.
- 35 If KEY_ID is equal to ‘10’ or ‘11’, the mobile station shall perform the
- 36 following:
- 37 – Set ENC_KEY[KEY_ID] to the CK generated by AKA.

- 1 – Set INT_KEY[KEY_ID] to the IK generated by AKA.
- 2 – Set LAST_3G_KEY_ID_s to KEY_ID
- 3 – If the mobile station supports R-UIM, then the mobile shall
- 4 set USE_UAK_s to USE_UAK_r; otherwise, the mobile station shall
- 5 perform the following:
- 6 + Set USE_UAK_s to '0'.
- 7 + If USE_UAK_r is equal to '1', then the mobile station shall
- 8 send a *Mobile Station Reject Order* with ORDQ equal to
- 9 '00010100' (UAK not supported).

10 Set RESTORE_KEY to '0'.

11 Send a *Security Mode Completion Order*.

12 Disable the key setup timer if it is running.

- 13 o Set INTEGRITY_MODE_s to the SDU_INTEGRITY_ALGO delivered by the
- 14 LAC Layer.

- 15 • If ENC_KEY_SIZE_r is included and not set to reserved value and if current key
- 16 strength is greater than the desired key strength specified by ENC_KEY_SIZE_r
- 17 according to table 3.7.4.5-2, mobile station shall perform the key strength reduction
- 18 algorithm procedures to reduce the key strength of ENC_KEY[KEY_ID] according to
- 19 ENC_KEY_SIZE_r as described in 2.3.12.5.4. The current key strength is 64 bit if
- 20 KEY_ID is equal to '00' or '01' and is 128 bit if KEY_ID is equal to '10' or '11'.

21 2.6.11.3 General Handoff Direction Message and Universal Handoff Direction Message

22 The mobile station shall perform the following procedures in the order listed below at the
23 action time of the message.

- 24 • If D_SIG_ENCRYPT_MODE_r is included, the mobile station shall set
- 25 D_SIG_ENCRYPT_MODE_s to D_SIG_ENCRYPT_MODE_r.
- 26 • If ENC_KEY_SIZE_r is included, the mobile station shall set ENC_KEY_SIZE_s to
- 27 ENC_KEY_SIZE_r.
- 28 • If REGISTER_IN_IDLE_r is included, the mobile station shall set
- 29 REGISTER_IN_IDLE_s to REGISTER_IN_IDLE_r.
- 30 • If MSG_INTEGRITY_SUP_r is included, the mobile station shall set
- 31 MSG_INTEGRITY_SUP_s to MSG_INTEGRITY_SUP_r.
- 32 • If GEN_2G_KEY_r is included and is set to '1', the mobile station shall perform the
- 33 following in the order listed below:
- 34 – Perform the CDMA_3G_2G_Conversion procedure as defined in [44] for 3G to 2G
- 35 one-way roaming to generate a new CMEAKEY from CK.

- 1 – Set TX_EXT_SSEQ[0][‘00’] to TX_EXT_SSEQ[0][KEY_ID], TX_EXT_SSEQ[1][‘00’]
2 to TX_EXT_SSEQ[1][KEY_ID], RX_EXT_SSEQ[0][‘00’] to
3 RX_EXT_SSEQ[0][KEY_ID], and RX_EXT_SSEQ[1][‘00’] to
4 RX_EXT_SSEQ[1][KEY_ID].
- 5 – Form a 128-bit pattern by concatenating the resultant CMEAKEY with a copy of
6 itself.
- 7 – Store the 128-bit pattern in ENC_KEY[‘00’] and INT_KEY[‘00’].
- 8 – Set KEY_ID and LAST_2G_KEY_IDS to ‘00’.
- 9 • If ENC_KEY_SIZE_r is included and not set to reserved value and if current key
10 strength is greater than the desired key strength specified by ENC_KEY_SIZE_r
11 according to table 3.7.4.5-2, mobile station shall perform the key strength reduction
12 algorithm procedures to reduce the key strength of ENC_KEY[KEY_ID] according to
13 ENC_KEY_SIZE_r as described in 2.3.12.5.4. The current key strength is 64 bit if
14 KEY_ID is equal to ‘00’ or ‘01’ and is 128 bit if KEY_ID is equal to ‘10’ or ‘11’.

15 2.6.11.4 Security Mode Command Message on f-csch

16 The mobile station shall perform the following procedures in the order listed below.

- 17 • Set C_SIG_ENCRYPT_MODE_s to C_SIG_ENCRYPT_MODE_r.
- 18 • If ENC_KEY_SIZE_r is included, the mobile station shall set ENC_KEY_SIZE_s to
19 ENC_KEY_SIZE_r.
- 20 • If MSG_INTEGRITY_SUP_s is equal to ‘0’, C_SIG_ENCRYPT_MODE_r is not equal to
21 ‘000’ and the mobile sent a *Security Mode Request Message* with the
22 NEW_SSEQ_H_INCL field equal to ‘1’ prior to receiving this message when
23 C_SIG_ENCRYPT_MODE_s was not equal to ‘000’, the mobile station shall perform
24 the following:
- 25 – Set TX_EXT_SSEQ[0][KEY_ID], TX_EXT_SSEQ[1][KEY_ID],
26 RX_EXT_SSEQ[0][KEY_ID], and RX_EXT_SSEQ[1][KEY_ID] to $1 + 256 \times$
27 NEW_SSEQ_H included in the *Security Mode Request Message*.
- 28 • If MSG_INTEGRITY_SUP_s is equal to ‘1’ and MSG_INTEGRITY_INFO_r is equal to ‘1’,
29 the mobile station shall perform the following:
- 30 – If CHANGE_KEYS_r is equal to ‘0’, the mobile station shall set RESTORE_KEY to
31 ‘0’.
- 32 – If CHANGE_KEYS_r is equal to ‘1’, the mobile station shall perform the following:
- 33 + Set KEY_ID to SDU_KEY_ID provided by the LAC Layer (see [4]).
- 34 + If KEY_ID is equal to ‘00’ or ‘01’, the mobile station shall perform the
35 following:
- 36 o Set TX_EXT_SSEQ[0][KEY_ID], TX_EXT_SSEQ[1][KEY_ID],
37 RX_EXT_SSEQ[0][KEY_ID], and RX_EXT_SSEQ[1][KEY_ID] to $1 + 256 \times$
38 NEW_SSEQ_H included in the *Security Mode Request Message*.

- 1 o Form a 128-bit pattern by concatenating the CMEAKEY with a copy of
2 itself (the most recently generated CMEAKEY associated with the AUTHR
3 of the *Registration Message*, *Origination Message*, *Page Response Message*
4 or the CMEAKEY associated with the AUTHU generated during Unique
5 Challenge-Response procedure as described in 2.3.12.1.4).
- 6 o Set ENC_KEY[KEY_ID] to the 128-bit pattern.
- 7 o Set INT_KEY[KEY_ID] to the 128-bit pattern.
- 8 o Set LAST_2G_KEY_ID_s to KEY_ID.
- 9 + If KEY_ID is equal to '10' or '11', the mobile station shall perform the
10 following:
- 11 o Set TX_EXT_SSEQ[0][KEY_ID], TX_EXT_SSEQ[1][KEY_ID],
12 RX_EXT_SSEQ[0][KEY_ID], and RX_EXT_SSEQ[1][KEY_ID] to $1 + 256 \times$
13 NEW_SSEQ_H included in the *Authentication Response Message*, or
14 *Security Mode Request Message*.
- 15 o Set ENC_KEY[KEY_ID] to the CK generated by AKA.
- 16 o Set INT_KEY[KEY_ID] to the IK generated by AKA.
- 17 o Set LAST_3G_KEY_ID_s to KEY_ID.
- 18 o If the mobile station supports R-UIM, then the mobile station shall set
19 USE_UAK_s to USE_UAK_r; otherwise, the mobile station shall perform the
20 following:
- 21 ◇ Set USE_UAK_s to '0'.
- 22 ◇ If USE_UAK_r is equal to '1', then the mobile station shall send a
23 *Mobile Station Reject Order* with ORDQ equal to '00010100' (UAK not
24 supported).
- 25 + Set RESTORE_KEY to '0'.
- 26 + Perform the key strength reduction algorithm procedures to reduce the
27 key strength of ENC_KEY[KEY_ID] according to ENC_KEY_SIZE_r as
28 described in 2.3.12.5.3.
- 29 + Send a *Security Mode Completion Order*.
- 30 + Disable the key setup timer if it is running.
- 31 – Set INTEGRITY_MODE_s to the SDU_INTEGRITY_ALGO delivered by the LAC
32 Layer.
- 33 • If ENC_KEY_SIZE_r is included and not set to reserved value and if current key
34 strength is greater than the desired key strength specified by ENC_KEY_SIZE_r
35 according to table 3.7.4.5-2, mobile station shall perform the key strength reduction
36 algorithm procedures to reduce the key strength of ENC_KEY[KEY_ID] according to
37 ENC_KEY_SIZE_r as described in 2.3.12.5.4. The current key strength is 64 bit if
38 KEY_ID is equal to '00' or '01' and is 128 bit if KEY_ID is equal to '10' or '11'.

2.6.11.5 Base Station Reject Order on f-csch and f-dsch.

The mobile station shall perform the following procedures in the order listed below.

- If $ORDQ_R$ is equal to '00000000' or if $ORDQ_R$ is equal to '00000010', $REJECT_REASON_R = '0011'$, and $REJECTED_L3_MSG_TYPE_R$ indicates the rejected message is an *Origination Message*, the mobile station shall set $ENC_KEY[i]$ and $INT_KEY[i]$ to NULL, where i ranges from '00' to '11'. The mobile station shall set $C_SIG_ENCRYPT_MODE_S$ to '000'. The mobile station shall re-originate by sending a new *Origination Message*.
- If $ORDQ_R$ is equal to '00000001' or if $ORDQ_R$ is equal to '00000010' and $REJECTED_L3_MSG_TYPE_R$ indicates the rejected message is not an *Origination Message*, the mobile station shall send a *Security Mode Request Message*. If $MSG_INTEGRITY_SUP_S$ is equal to '0', the mobile station shall select a 24-bit number and include this number in the NEW_SSEQ_H field in the *Security Mode Request Message*; otherwise, the mobile station shall select a 24-bit number and deliver this number to the LAC Layer along with the *Security Mode Request Message*. If the mobile receives two *Base Station Reject Orders* without successfully decrypting any encrypted message or without successfully validating the MACI of any message between the two orders, the mobile station shall set $REG_SECURITY_RESYNC$ to YES and enter the *System Determination Substate* with an encryption/message integrity failure indication.

2.6.11.6 Mobile Station processing when decryption or MACI check failed

Whenever the mobile station cannot decrypt an encrypted message or validate the MACI of a message that requires MACI validation, the mobile station may send an un-encrypted *Mobile Station Reject Order* indicating the failure condition to the base station.

If the failure to decrypt or to validate MACI persists, the mobile station may attempt to resynchronize the crypto-sync with the base station by sending a *Security Mode Request Message* to the base station as follows:

- If $MSG_INTEGRITY_SUP_S$ is equal to '0', the mobile station shall select a 24-bit number and include this number in the NEW_SSEQ_H ⁷³ field in the *Security Mode Request Message*; otherwise, the mobile station shall select a 24-bit number and deliver this number to the LAC Layer along with the *Security Mode Request Message*.

The mobile station shall set $REG_SECURITY_RESYNC$ to YES and enter the *System Determination Substate* with an encryption/message integrity failure indication if either of the following conditions are true:

- The mobile station chooses not to perform resynchronization procedure as described above.

⁷³ The mobile station should select a different value of NEW_SSEQ_H every time NEW_SSEQ_H is included in a message. This is to prevent the re-use of the same 24 most significant bits of the 32-bit crypto-sync.

- 1 • The mobile station still cannot decrypt message or validate the MACI of message
 2 from the base station after successfully receiving and processing *Security Mode*
 3 *Command Message* in response to *Security Mode Request Message* sent by mobile
 4 station in resynchronization procedure as specified in 2.6.11.4 or 2.6.4.1.14.

5 2.6.12 Common Procedures for Processing f-csch Messages

6 This section describes the common procedures for processing messages received on the f-
 7 csch.

8 2.6.12.1 Fast Call Setup Order

9 The mobile station shall perform the following procedures in the order listed below:

- 10 • If $RER_MODE_ENABLED_r$ is included and equal to '1', and the mobile station
 11 supports operation in the radio environment reporting mode, the mobile station
 12 shall set $RER_MODE_ENABLED$ to YES, RER_COUNT to 0, and shall perform the
 13 following:
- 14 – The mobile station shall disable the radio environment report timer, if enabled.
 - 15 – The mobile station shall store the following:
 - 16 + Maximum number of *Radio Environment Messages* that the mobile station is
 17 permitted to transmit while in radio environment reporting mode
 18 ($RER_MAX_NUM_MSG_s = infinity$, if $RER_MAX_NUM_MSG_IDX_r$ is equal to
 19 '111'; otherwise, $RER_MAX_NUM_MSG_s = 2^{RER_MAX_NUM_MSG_IDX_r}$).
 - 20 + Maximum number of pilots to maintain in RER_PILOT_LIST
 21 ($MAX_RER_PILOT_LIST_SIZE_s = MAX_RER_PILOT_LIST_SIZE_r$).
 - 22 + System identification for radio environment reporting mode ($RER_SID_s =$
 23 SID_s).
 - 24 + Network identification for radio environment reporting mode ($RER_NID_s =$
 25 NID_s).
 - 26 – The initial radio environment report pilot list (RER_PILOT_LIST) is generated as
 27 follows:
 - 28 + If $ORDQ_r$ is equal to '00000001' and the size of the current RER_PILOT_LIST
 29 is greater than $MAX_RER_PILOT_LIST_SIZE_s$, the mobile station shall
 30 remove all but the first $MAX_RER_PILOT_LIST_SIZE_s$ pilots from
 31 RER_PILOT_LIST .
 - 32 + Otherwise, the initial RER_PILOT_LIST is generated according to the
 33 procedures specified in [4].
 - 34 – The mobile station shall enable the radio environment report timer with an
 35 initial value of *infinity* if RER_TIME_r is equal to '111'; otherwise, the mobile
 36 station shall enable the radio environment report timer with an initial value of
 37 $2^{RER_TIME_r}$ seconds if $RER_TIME_UNIT_r$ is equal to '00', or $2^{RER_TIME_r}$ minutes if
 38 $RER_TIME_UNIT_r$ is equal to '01', or $2^{RER_TIME_r}$ hours if $RER_TIME_UNIT_r$ is
 39 equal to '10'.

- 1 • If RER_MODE_ENABLED_r is included and equal to '0', and RER_MODE_ENABLED
2 is equal to YES, the mobile station shall perform the following:
- 3 – The mobile station shall disable the radio environment report timer and set
4 RER_MODE_ENABLED to NO.
- 5 – If TKZ_MODE_PENDING is equal to YES, then the mobile station shall set
6 TKZ_MODE_PENDING to NO.
- 7 • If TKZ_MODE_ENABLED_r is included and equal to '1', and the mobile station
8 supports tracking zone reporting, the mobile station shall set TKZ_COUNT to 0 and
9 perform the following:
- 10 – The mobile station shall disable the tracking zone update timer, if enabled.
- 11 – The mobile station shall store the following:
- 12 + Tracking zone list length (TKZ_LIST_LEN_s = TKZ_LIST_LEN_r).
- 13 + Tracking zone timer (TKZ_TIMER_s = TKZ_TIMER_r).
- 14 + Maximum number of *Radio Environment Messages* that the mobile station is
15 permitted to transmit while in tracking zone mode (TKZ_MAX_NUM_MSG_s =
16 *infinity*, if TKZ_MAX_NUM_MSG_IDX_r is equal to '111'; otherwise,
17 TKZ_MAX_NUM_MSG_s = 2^{TKZ_MAX_NUM_MSG_IDX_r}).
- 18 + System identification for tracking zone mode (TKZ_SID_s = SID_s).
- 19 + Network identification for tracking zone mode (TKZ_NID_s = NID_s).
- 20 + Tracking zone update period (TKZ_UPDATE_PRD_s = TKZ_UPDATE_PRD_r).
- 21 – If RER_MODE_ENABLED is equal to NO, the mobile station shall set
22 TKZ_MODE_ENABLED to YES; otherwise, the mobile station shall set
23 TKZ_MODE_PENDING to YES.
- 24 – If TKZ_MODE_ENABLED is equal to YES, the mobile station shall perform the
25 following:
- 26 + Initialize the tracking zone list (TKZ_LIST) to contain TKZ_ID_s.
- 27 + Enable the tracking zone update timer with an initial value of infinity if
28 TKZ_UPDATE_PRD_s is equal to '1111'; otherwise, the mobile station shall
29 enable the tracking zone update timer with an initial value of
30 2^{TKZ_UPDATE_PRD_s} + 6 seconds.
- 31 • If TKZ_MODE_ENABLED_r is included and equal to '0', and TKZ_MODE_ENABLED is
32 equal to YES, the mobile station shall perform the following:
- 33 – The mobile station shall disable the tracking zone update timer and set
34 TKZ_MODE_ENABLED to NO.

35 If ORDQ_r is equal to '00000000' (base station request for mobile station to operate in a fast
36 call setup mode), the mobile station shall respond with a *Fast Call Setup Order* (ORDQ =
37 '00000001') as follows:

- 1 • If RSC_MODE_SUPPORTED_r is equal to '1' and the mobile station accepts operation
2 in the reduced slot cycle mode, the mobile station shall set the RSC_MODE_IND
3 field to '1' and perform the following:
- 4 – Set RSC_MODE_ENABLED to YES.
- 5 – Set the RSC_END_TIME_UNIT and RSC_END_TIME_VALUE fields as specified in
6 2.7.3.6, and store the system time specified by these fields as RSC_END_TIME.
7 The value of RSC_END_TIME shall be no later than the system time specified by
8 MAX_RSC_END_TIME_UNIT_r and MAX_RSC_END_TIME_VALUE_r.
- 9 – Set the RSCI field as specified in 2.7.3.6 and store it as RSCI_s; if RSCI_s is equal
10 to '0111', set SLOTTED_s to NO.
- 11 – Set IGNORE_QPCH_s to IGNORE_QPCH_r.
- 12 • Otherwise, the mobile station shall set the RSC_MODE_IND field to '0'.

13 If ORDQ_r is equal to '0000001' (base station response to mobile station's request to
14 operate in a fast call setup mode), the mobile station shall perform the following:

- 15 • If RSC_MODE_SUPPORTED_r is equal to '1', the mobile station shall perform the
16 following:– Set RSC_END_TIME to the earlier of the current value of
17 RSC_END_TIME, and the system time specified by MAX_RSC_END_TIME_UNIT_r and
18 MAX_RSC_END_TIME_VALUE_r.
- 19 – Set IGNORE_QPCH_s to IGNORE_QPCH_r.
- 20 • If RSC_MODE_SUPPORTED_r is equal to '0', the mobile station shall set
21 RSC_MODE_ENABLED to NO and set SLOTTED_s to YES.

22

23 2.6.13 Mobile Station BCMC Operation

24 This section specifies the mobile station requirements for monitoring BCMC flows. If the
25 mobile station supports BCMC, the requirements in this section apply in addition to all
26 other requirements in the Mobile Station Idle State, System Access State, and Mobile
27 Station Control on the Traffic Channel State.

28 The operations performed by a mobile station that supports BCMC are as follows:

- 29 • Procedures for commencing reception of a BCMC flow while in Mobile Station Idle
30 State or System Access State (see 2.6.13.1)
- 31 • Procedures while monitoring a Forward Supplemental Channel in *Mobile Station Idle*
32 *State* or *System Access State* (see 2.6.13.2)
- 33 • Procedures for BCMC registration while in Mobile Station Idle State or System
34 Access State (see 2.6.13.3)
- 35 • Procedures for Idle Handoff while Monitoring Forward Supplemental Channel while
36 in Mobile Station Idle State or System Access State (see 2.6.13.4)
- 37 • Procedures for stopping reception of a BCMC flow while in Mobile Station Idle State
38 or System Access State (see 2.6.13.5)

- 1 • Procedures for processing *BCMC Service Parameters Message* Updates while in
2 Mobile Station Idle State or System Access State (see 2.6.13.6)
- 3 • Procedures for Browsing BCMC flows while in Mobile Station Idle State or System
4 Access State (see 2.6.13.7)
- 5 • Procedures for BCMC Operation while in Mobile Station Control on the Traffic
6 Channel State (see 2.6.13.8)
- 7 • Procedures for computation of Authorization Signature (see 2.6.13.9)
- 8 • Procedures for generating public long code mask for F-SCH *Mobile Station Idle State*
9 or *System Access State* (see 2.6.13.10)

10 The following primitives can be received by Layer 3 from the BCMC Service Layer:

- 11 • *BCMC-Monitor.Request(BCMC_FLOW_ID⁷⁴, priority)* - to request Layer 3 to commence
12 monitoring the specified BCMC flow, where
 - 13 – *BCMC_FLOW_ID* identifies the BCMC flow to monitor.
 - 14 – *priority* is to be used when current BCMC flow(s) and the new BCMC flow cannot
15 both be accommodated.
- 16 • *BCMC-Browse.Request* - to request Layer 3 to report all BCMC flows currently
17 available.
- 18 • *BCMC-Stop-Monitor.Request(BCMC_FLOW_ID)* - to request Layer 3 to stop monitoring
19 the specified BCMC flow, where
 - 20 – *BCMC_FLOW_ID* identifies the BCMC flow to stop monitoring.

21 The following primitives can be sent by Layer 3 to the BCMC Service Layer:

- 22 • *BCMC-Monitor.Response(BCMC_FLOW_ID, result, cause, reason_ind)* – response to
23 the BCMC Service Layer for a request to monitor a BCMC flow or due to mobility,
24 where
 - 25 – *BCMC_FLOW_ID* identifies the requested BCMC flow.
 - 26 – *result* indicates the result of the request and can be one of following:
 - 27 + SUCCESS indicates the request was successful
 - 28 + FAILURE indicates the request was unsuccessful
 - 29 – *cause* indicates the reason for failure when the request was unsuccessful and
30 can be one of the following
 - 31 + FLOW_NOT_AVAILABLE which indicates the requested BCMC flow is not
32 available in this base station

⁷⁴ Although the primitive is modeled to allow the Upper Layer to request for a single BCMC_FLOW_ID at a time, this procedure can be implemented such that multiple BCMC_FLOW_IDs can be requested simultaneously.

- 1 + CANNOT_ACCOMMODATE which indicates the requested BCMC flow cannot
- 2 be monitored due to monitoring other higher priority BCMC flow(s)
- 3 + UNSUPPORTED_BEARER_CONFIG which indicates that the requested
- 4 BCMC flow cannot be monitored due to a physical channel capability
- 5 mismatch
- 6 + FLOW_NOT_TRANSMITTED which indicates that the requested BCMC flow
- 7 is not being transmitted by this base station although it is configured for
- 8 transmission.
- 9 + FLOW_TRANSMITTED_IN_IDLE which indicates that the requested BCMC
- 10 flow is being transmitted by this base station in idle state.
- 11 + CALL_RELEASED which indicates that the call was released.
- 12 – *reason_ind* is included when the request is unsuccessful and can be one of the
- 13 following
- 14 + CURRENT_SYS to indicate it occurred in current system
- 15 + MOBILITY to indicate it occurred due to idle handoff
- 16 • *BCMC-Browse.Response(result, {BCMC_FLOW_IDS})* - response to the BCMC Service
- 17 Layer for a request to browse for BCMC flows, where
- 18 – *result* indicates the result of the request and can be one of following:
- 19 + SUCCESS indicates current sector is configured to transmit one or more
- 20 BCMC flows and this list of BCMC flows is passed as {BCMC_FLOW_IDS}
- 21 + FAILURE indicates current sector is not configured to transmit any BCMC
- 22 flows.

23 The following primitives are sent by Layer 3 to Multiplex sublayer:

- 24 • *BMAC-Start-Deliver.Request(FSCH_ID, BSR_ID)* - to request the Multiplex sublayer to
- 25 start delivering the data blocks corresponding to the specified BCMC flow, where
- 26 – *FSCH_ID* identifies the physical channel on which this BCMC flow is being
- 27 carried
- 28 – *BSR_ID* identifies the BCMC Service Reference Identifier being used by this
- 29 BCMC flow on this physical channel
- 30 • *BMAC-Stop-Deliver.Request(FSCH_ID, BSR_ID)* - to request the Multiplex sublayer to
- 31 stop delivering the data blocks corresponding to the specified BCMC flow, where
- 32 – *FSCH_ID* identifies the physical channel on which this BCMC flow is being
- 33 carried
- 34 – *BSR_ID* identifies the BCMC Service Reference Identifier being used by this
- 35 BCMC flow on this physical channel

36 If the mobile station is currently not monitoring a BCMC flow, the mobile station shall

37 perform the following:

- 1 • If Layer 3 receives a *BCMC-Monitor.Request(BCMC_FLOW_ID, priority)* from the
2 BCMC Service Layer, Layer 3 shall perform the procedures specified in 2.6.13.1 to
3 commence reception of the BCMC flow.
- 4 • If Layer 3 receives a *BCMC-Browse.Request* from the BCMC Service Layer, Layer 3
5 shall perform the procedures specified in 2.6.13.7 to determine which BCMC flows
6 are currently available.

7 2.6.13.1 Procedures for commencing reception of a BCMC Flow

8 If Layer 3 is requested by the BCMC Service Layer to commence reception of a BCMC flow
9 (see 2.6.13), the mobile station shall perform the following procedures in the order
10 specified:

- 11 • If *SENDING_BSPM_s* equals '0', Layer 3 shall send a *BCMC-*
12 *Monitor.Response(BCMC_FLOW_ID, result = FAILURE, cause =*
13 *FLOW_NOT_AVAILABLE, reason_ind = CURRENT_SYS)* to the BCMC Service Layer
14 and shall not perform the remaining procedures in this section.
- 15 • If the stored *BCMC Service Parameters Message* parameters do not include this
16 *BCMC_FLOW_ID* (See section 2.6.13.11) and *FULL_BSPM_IND = '0'*, the mobile
17 station shall monitor the overhead channel to receive the *BCMC Service Parameters*
18 *Message* as specified in 2.6.2.2.18 until its stored *BCMC Service Parameters*
19 *Message* parameters include this *BCMC_FLOW_ID*, or until *FULL_BSPM_IND = '1'*
- 20 • The mobile station shall perform the following:
 - 21 – If *FLOW_INFO_ON_OTHER_FREQ* equals '1', the mobile station shall perform
22 the following:
 - 23 + If *FREQ_CHG_REG_REQUIRED_s* equals '1', the mobile station shall perform
24 BCMC registration procedures as specified in 2.6.13.3 to indicate change in
25 the frequency where the mobile station will reside to receive the *BCMC*
26 *Service Parameters Message*.
 - 27 + The mobile station shall tune to the frequency specified by
28 *BSPM_CDMA_FREQ* and *BSPM_BAND_CLASS*; the mobile station should
29 tune to the new frequency only after performing BCMC registration specified
30 above (if any). If *FREQ_CHG_REG_TIMER_s* is not equal to *NULL* and the
31 BCMC frequency registration timer for the previous frequency is not enabled
32 or has expired, the mobile station shall start the BCMC frequency
33 registration timer for the previous frequency with a value of
34 *FREQ_CHG_REG_TIMER_s*.
 - 35 + The mobile station shall monitor the overhead channel to receive the *BCMC*
36 *Service Parameters Message* as specified in 2.6.2.2.18, and shall perform the
37 following:

- 1 o If $SENDING_BSPM_s$ equals '0', Layer 3 shall send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result = FAILURE, cause =*
2 *FLOW_NOT_AVAILABLE, reason_ind = CURRENT_SYS)* to the BCMC
3 Service Layer and shall not perform the remaining procedures in this
4 section.
5
- 6 o Otherwise, the mobile station shall perform the remaining procedures in
7 this section.
- 8 – If the stored *BCMC Service Parameters Message* parameters do not include this
9 BCMC_FLOW_ID (See section 2.6.13.11) and $AUTO_REQ_ALLOWED_IND_s$
10 equals '0', Layer 3 shall send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result*
11 *= FAILURE, cause = FLOW_NOT_AVAILABLE, reason_ind = CURRENT_SYS)* to the
12 BCMC Service Layer and shall not perform the remaining procedures in this
13 section.
- 14 – If the *BCMC Service Parameters Message* includes the BCMC flow indicated by
15 BCMC_FLOW_ID, BCMC_FLOW_ON_IND corresponding to this BCMC flow
16 equals '1', and BCMC_FLOW_ON_TRAFFIC_IND corresponding to this BCMC
17 flow equals '1', the mobile station shall either perform Mobile Station Origination
18 Operation as specified in 2.6.2.5 to request this flow in the *Mobile Station Control*
19 *on the Traffic Channel State* or monitor the flow in the *Mobile Station Idle State* as
20 specified in 2.6.13.2.
- 21 – If the stored *BCMC Service Parameters Message* does not include this
22 BCMC_FLOW_ID (See section 2.6.13.11), $AUTO_REQ_ALLOWED_IND_s$ equals '1'
23 and $BCMC_ON_TRAFFIC_SUP_s$ equals '1'; or the *BCMC Service Parameters*
24 *Message* includes the BCMC flow indicated by BCMC_FLOW_ID,
25 BCMC_FLOW_ON_IND corresponding to this BCMC flow equals '0', and
26 BCMC_FLOW_ON_TRAFFIC_IND corresponding to this BCMC flow equals '1',
27 the mobile station shall perform the following:
- 28 + The mobile station shall perform Mobile Station Origination Operation as
29 specified in 2.6.2.5 to request transmission of this BCMC flow. The mobile
30 station shall include the BCMC_FLOW_ID (See section 2.6.13.11) in the
31 *Origination Message*.
- 32 – If the stored *BCMC Service Parameters Message* parameters do not include this
33 BCMC_FLOW_ID (See section 2.6.13.11), $AUTO_REQ_ALLOWED_IND_s$ equals
34 '1', and $BCMC_ON_TRAFFIC_SUP_s$ equals '0'; or the stored *BCMC Service*
35 *Parameters Message* parameters include the BCMC flow indicated by
36 BCMC_FLOW_ID, BCMC_FLOW_ON_IND corresponding to this BCMC flow
37 equals '0', and BCMC_FLOW_ON_TRAFFIC_IND corresponding to this BCMC
38 flow equals '0', the mobile station shall perform the following:
- 39 + The mobile station shall send a *Registration Message* to request transmission
40 of this BCMC flow. Upon receiving conformation of delivery of the
41 *Registration Message*, the mobile station shall enable the BCMC wait timer
42 with a value of $BSPM_WAIT_TIME$ seconds and shall wait for an updated
43 *BCMC Service Parameters Message*.

- 1 + If the BCMC wait timer expires, Layer 3 shall send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result = FAILURE, cause =*
2 *FLOW_NOT_TRANSMITTED, reason_ind = CURRENT_SYS)* to the BCMC
3 Service Layer, and shall not perform the remaining procedures in this
4 section.
5
- 6 + If the mobile station receives a *BCMC Order* from the base station prior to
7 the expiration of the BCMC wait timer, the mobile station shall perform the
8 following:
- 9 o If *CLEAR_ALL_RETRY_DELAY_r* equals '1', the mobile station shall delete
10 the currently stored BCMC Retry Delay List.
- 11 o If *CLEAR_RETRY_DELAY_r* equals '1', the mobile station shall delete the
12 entry in the *BCMC_RETRY_DELAY_LIST_s[i]* corresponding to
13 *BCMC_FLOW_ID* (See section 2.6.13.11) in this message.
- 14 o If *ALL_BCMC_REASON_r* or *BCMC_REASON_r* equals '0000', Layer 3 shall
15 send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result = FAILURE, cause*
16 *= FLOW_NOT_AVAILABLE, reason_ind = CURRENT_SYS)* for each of the
17 corresponding *BCMC_FLOW_ID* to the BCMC Service Layer, and shall
18 not perform the remaining procedures in this section for the
19 corresponding *BCMC_FLOW_ID*.
- 20 o If *ALL_BCMC_REASON_r* or *BCMC_REASON_r* equals '0001', Layer 3 shall
21 send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result = FAILURE, cause*
22 *= FLOW_NOT_TRANSMITTED, reason_ind = CURRENT_SYS)* for each of
23 the corresponding *BCMC_FLOW_ID* to the BCMC Service Layer, and
24 shall not perform the remaining procedures in this section for the
25 corresponding *BCMC_FLOW_ID*.
- 26 o If *ALL_BCMC_REASON_r* or *BCMC_REASON_r* equals '0011', Layer 3 shall
27 send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result = SUCCESS,*
28 *reason_ind = REGISTRATION_ACCEPTED)* for each of the corresponding
29 *BCMC_FLOW_ID* to the BCMC Service Layer and shall not perform the
30 remaining procedures in this section for the corresponding
31 *BCMC_FLOW_ID*.
- 32 o If *ALL_BCMC_REASON_r* or *BCMC_REASON* equals '0100', Layer 3 shall
33 send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result = FAILURE, cause*
34 *= AUTHORIZATION_FAILURE, reason_ind = CURRENT_SYS)* for each of the
35 corresponding *BCMC_FLOW_ID* to the BCMC Service Layer, and shall
36 not perform the remaining procedures in this section for the
37 corresponding *BCMC_FLOW_ID*.
- 38 o If *ALL_BCMC_REASON_r* or *BCMC_REASON* equals '0101', the mobile
39 station shall perform the following:
- 40 ◇ Layer 3 shall send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result*
41 *= FAILURE, cause = RETRY_LATER, reason_ind = CURRENT_SYS)* for

- 1 each of the corresponding BCMC_FLOW_ID to the BCMC Service
2 Layer.
- 3 ◇ For each of the corresponding BCMC_FLOW_ID, if there is a
4 BCMC_RETRY_DELAY_LIST_s[i].BCMC_FLOW_ID which is same as
5 BCMC_FLOW_ID (See section 2.6.13.11), the mobile station shall set
6 BCMC_RETRY_DELAY_LIST_s[i].RETRY_DELAY to current system
7 time plus ALL_BCMC_RETRY_DELAY_r/BCMC_RETRY_DELAY_r;
8 otherwise, Layer 3 shall add new BCMC_RETRY_DELAY_LIST_s[i] to
9 the BCMC Retry Delay List and shall set
10 BCMC_RETRY_DELAY_LIST_s[i].BCMC_FLOW_ID to BCMC_FLOW_ID,
11 BCMC_RETRY_DELAY_LIST_s[i].RETRY_DELAY to current system
12 time plus ALL_BCMC_RETRY_DELAY_r/BCMC_RETRY_DELAY_r.
- 13 ◇ The mobile station shall not perform the remaining procedures in
14 this section for the corresponding BCMC_FLOW_ID.
- 15 o If the BCMC flow corresponding to this BCMC_FLOW_ID (See section
16 2.6.13.11) is included in the stored *BCMC Service Parameters Message*
17 parameters and BCMC_FLOW_ON_IND corresponding to this BCMC flow
18 changes to '1' prior to the expiration of the BCMC wait timer, the mobile
19 station shall disable the BCMC wait timer and perform the remaining
20 procedures in this section.
- 21 • The mobile station shall determine the Forward Supplemental Channel
22 corresponding to this BCMC_FLOW_ID from BCMC_FLOW_LIST_s. If the BCMC flow
23 corresponding to this BCMC_FLOW_ID is configured for transmission in the mobile
24 station's hash-to-frequency, the mobile station shall choose the mobile station's
25 hash-to-frequency; otherwise, the mobile station shall use the hash algorithm
26 specified in 2.6.7.1 and the number of CDMA channels on which this
27 BCMC_FLOW_ID is configured for transmission to choose the frequency to monitor.
28 The mobile station shall perform the following:
- 29 – The mobile station shall determine the Band Class (FSCH_BAND_CLASS) and
30 the CDMA channel (FSCH_FREQ) corresponding to the selected Forward
31 Supplemental Channel from FBSCH_LIST_s. If FSCH_BAND_CLASS is not equal
32 to CDMA_BAND_s or FSCH_FREQ is not equal to CDMACH_s and the mobile
33 station is currently monitoring one or more BCMC flows in the current
34 frequency that have a higher priority than the requested BCMC flow, Layer 3
35 shall send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result = FAILURE, cause=*
36 *CANNOT_ACCOMMODATE, reason_ind = CURRENT_SYS)* to the BCMC Service
37 Layer, and shall not perform the remaining procedures in this section.
- 38 – If the mobile station will not be able to monitor the Forward Supplemental
39 Channel on which the BCMC flow is being transmitted due to a capability
40 mismatch, Layer 3 shall send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result*
41 *= FAILURE, cause = UNSUPPORTED_BEARER_CONFIG, reason_ind =*
42 *CURRENT_SYS)* to the BCMC Service Layer, and shall not perform the
43 remaining procedures in this section.

- 1 • If FSCH_BAND_CLASS is not equal to CDMA_BAND_s or FSCH_FREQ is not equal to
2 CDMA_BAND_s, the mobile station shall perform the following:
- 3 – If FREQ_CHG_REG_REQUIRED_s equals '1', the mobile station shall perform
4 BCMC registration procedures as specified in 2.6.13.3 to indicate change in the
5 frequency where the mobile station will reside while monitoring this BCMC flow.
- 6 – The mobile station shall tune to FSCH_FREQ in FSCH_BAND_CLASS; the
7 mobile station should tune to the new frequency only after performing BCMC
8 registration specified above (if any). If FREQ_CHG_REG_TIMER_s is not equal to
9 NULL and the BCMC frequency registration timer for the previous frequency is
10 not enabled or has expired, the mobile station shall start the BCMC frequency
11 registration timer for the previous frequency with a value of
12 FREQ_CHG_REG_TIMER_s.
- 13 – For each BCMC flow in current frequency that can no longer be monitored in
14 new frequency, the mobile station shall perform the following:
- 15 + Layer 3 shall send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result =*
16 *FAILURE, cause = CANNOT_ACCOMMODATE, reason_ind = CURRENT_SYS)* to
17 the BCMC Service Layer.
- 18 + Layer 3 shall send a *BMAC-Stop-Deliver.Request(FSCH_ID, BSR_ID)* to the
19 multiplex sublayer where *FSCH_ID* and *BSR_ID* are the values in
20 *BCMC_FLOW_LIST_s* corresponding to this *BCMC_FLOW_ID*.
- 21 • The mobile station shall set the Forward Supplemental Channel parameters as
22 given in *FBSCH_LIST_s* and shall start to monitor the Forward Supplemental
23 Channel.
- 24 • The mobile station shall send a *BMAC-Start-Deliver.Request(FSCH_ID, BSR_ID)* to the
25 multiplex sublayer where *FSCH_ID* and *BSR_ID* are the values in
26 *BCMC_FLOW_LIST_s* corresponding to the logical-to-physical mapping selected for
27 this *BCMC_FLOW_ID*.
- 28 • The mobile station shall send a *BCMC-Monitor.Response(BCMC_FLOW_ID,*
29 *result=SUCCESS)* to the BCMC Service Layer.
- 30 • The mobile station shall perform the procedures as specified in 2.6.13.2 while
31 monitoring the Forward Supplemental Channel

32 2.6.13.2 Procedures while monitoring an Forward Supplemental Channel

33 While monitoring a Forward Supplemental Channel, the mobile station shall perform the
34 following:

- 35 • The mobile station shall determine the hash-to frequency based on received CDMA
36 Channel List Message or the Extended CDMA Channel List Message but shall not
37 tune to the hash-to frequency. If FREQ_CHG_REG_REQUIRED_s equals '1' and the
38 mobile station determines that the hash-to frequency has changed and the mobile
39 station currently resides in the previous hash-to frequency, the mobile station shall
40 perform BCMC registration procedures as specified in 2.6.13.3 to indicate current
41 frequency.

- 1 • If the mobile station performs an idle handoff (see 2.6.2.1.4), the mobile station
2 shall perform the procedures as specified in 2.6.13.4. If the idle handoff results in
3 the mobile station residing in a frequency other than the frequency prior to the idle
4 handoff, the mobile station shall perform the following:
- 5 – If `FREQ_CHG_REG_REQUIREDs` equals '1', the mobile station shall perform
6 BCMC registration procedures as specified in 2.6.13.3 to indicate change in the
7 frequency where the mobile station will reside while monitoring this BCMC flow.
8 If `FREQ_CHG_REG_TIMERs` is not equal to NULL and the BCMC frequency
9 registration timer for the previous frequency is not enabled or is enabled and
10 has not expired, the mobile station shall start the BCMC frequency registration
11 timer for the previous frequency with a value of `FREQ_CHG_REG_TIMERs`.
- 12 • If the `BCMC_FLOW_LISTs[i].REGISTRATION_REQ_FLAG` is equal to '1' for any
13 BCMC flow being monitored by the mobile station, then the mobile station shall
14 perform BCMC registration procedures as specified in 2.6.13.3 if any of the
15 following conditions are true:
- 16 – The mobile station determines that
17 `BCMC_FLOW_LISTs[i].REGISTRATION_REQ_FLAG` was set to '0' since the last
18 time the mobile station initiated registration procedures due to
19 `BCMC_FLOW_LISTs[i].REGISTRATION_REQ_FLAG`.
- 20 – The mobile station cannot determine that
21 `BCMC_FLOW_LISTs[i].REGISTRATION_REQ_FLAG` was not set to '0' since the
22 last time the mobile station initiated registration procedures due to
23 `BCMC_FLOW_LISTs[i].REGISTRATION_REQ_FLAG`.
- 24 • If Layer 3 receives a *BCMC-Stop-Monitor.Request(BCMC_FLOW_ID)* from the BCMC
25 Service Layer, Layer 3 shall stop monitoring this BCMC flow as specified in
26 2.6.13.5.
- 27 • If Layer 3 receives a *BCMC-Monitor.Request(BCMC_FLOW_ID, priority)* from the
28 BCMC Service Layer, Layer 3 shall perform the procedures specified in 2.6.13.1 to
29 commence reception of the BCMC flow.
- 30 • If the mobile station determines that the content of the *BCMC Service Parameters*
31 *Message* has changed, Layer 3 shall perform the procedures as specified in
32 2.6.13.6.
- 33 • If the BCMC frequency registration timer for the frequency where the mobile station
34 is currently residing expires, the mobile station shall perform BCMC registration
35 procedures as specified in 2.6.13.3 to indicate current frequency.

36 2.6.13.3 Procedures for BCMC Registration

37 If the mobile station is to perform BCMC registration due to the
38 `REGISTRATION_REQ_FLAG` indicator being set, the mobile station shall perform the
39 following:

- 1 • If this is the first time $\text{BCMC_FLOW_LIST}_s[i].\text{REGISTRATION_REQ_FLAG}$ is set to '1'
- 2 for this BCMC flow received after an idle handoff, the mobile station shall perform a
- 3 BCMC registration immediately.
- 4 • Otherwise, if the BCMC registration required timer is not enabled, the mobile
- 5 station shall perform the following:
 - 6 – Enable the BCMC registration required timer with the initial value set to a
 - 7 pseudorandom value between 0 and $\text{REGISTRATION_REQ_TIMER_MAX}$.
 - 8 – Subsequently, if the $\text{BCMC_FLOW_LIST}_s[i].\text{REGISTRATION_REQ_FLAG}$ for all
 - 9 BCMC flows being monitored by the mobile station are equal to '0', the mobile
 - 10 station shall disable the BCMC registration required timer.
 - 11 – Otherwise, when the BCMC registration required timer expires, the mobile
 - 12 station shall perform a BCMC registration.

13 If the mobile station is to perform BCMC registration due to a frequency change, layer 3
14 shall perform the following:

- 15 • If the BCMC frequency registration timer for target frequency is enabled and has not
- 16 expired, the mobile station shall not perform the remaining procedures in this
- 17 section.
- 18 • Otherwise, the mobile station shall enter the System Access State with a
- 19 registration indication.

20 2.6.13.4 Procedures for Idle Handoff while Monitoring Forward Supplemental Channel

21 While monitoring a Forward Supplemental Channel, if the conditions for performing an idle
22 handoff are detected (see 2.6.2.1.4), the mobile station shall perform an idle handoff as
23 specified in this section.

24 When the mobile station performs an idle handoff the BCMC registration required timer
25 shall be disabled.

26 While performing an idle handoff, the mobile station should not begin operating in non-
27 slotted mode after the idle handoff if all of the following conditions hold:

- 28 • The mobile station supports the Quick Paging Channel;
- 29 • The mobile station has knowledge that the new base station supports configuration
- 30 change indicators;
- 31 • The mobile station determines that the Quick Paging Channel configuration change
- 32 indicator for the new Quick Paging Channel is set to "OFF" (see 2.6.2.1.2.1); and
- 33 • No more than T_{31m} seconds have elapsed since the mobile station last received a
- 34 valid message on the new Paging Channel or Forward Common Control
- 35 Channel/Primary Broadcast Control Channel.

36 Otherwise, the mobile station shall operate in non-slotted mode until the mobile station
37 has received at least one valid configuration message or mobile station-addressed page on
38 the new Paging Channel or Forward Common Control Channel/Primary Broadcast Control
39 Channel. Following the reception of this message the mobile station may resume slotted

1 mode operation in accordance with 2.6.2.1.1.3. After performing an idle handoff, the
 2 mobile station shall discard all unprocessed messages received on the old Paging Channel
 3 or Forward Common Control Channel/Primary Broadcast Control Channel.

4 If the new base station is listed in NGHBR_REC_LIST for the old base station (see 2.6.2.2.3,
 5 2.6.2.2.7, and 2.6.2.1.4.1), the mobile station shall use the corresponding 3-bit
 6 NGHBR_CONFIG field to determine the actions required to transition to the new base
 7 station. If the new base station is not listed in NGHBR_REC_LIST for the old base station,
 8 the mobile station shall perform the handoff operation using the same procedure as for a
 9 pilot in NGHBR_REC_LIST with the NGHBR_CONFIG field set to '011'.

10 If the new base station is listed in BCMC_FLOW_LIST_s[i].LPM_INFO[j].NGHBR_INFO[k]
 11 record of the current base station, the mobile station shall use the corresponding 3-bit
 12 NGHBR_BCMC_CONFIG field to determine the actions required to monitor the Forward
 13 Supplemental Channel of the new base station. If the new base station is not listed in
 14 BCMC_FLOW_LIST_s[i].LPM_INFO[j].NGHBR_INFO[k] record for the current base station, the
 15 mobile station shall determine the actions required to monitor the Forward Supplemental
 16 Channel of the new base station using the same procedure as for a pilot in
 17 BCMC_FLOW_LIST_s[i].LPM_INFO[j].NGHBR_INFO[k] record with the
 18 NGHBR_BCMC_CONFIG field set to '000'.

19 If the mobile station is currently monitoring the Paging Channel and selected a neighbor
 20 base station for idle handoff which supports Primary Broadcast Control Channel, the
 21 mobile station shall perform the following:

- 22 • If the mobile station has not received parameters for the Primary Broadcast Control
 23 Channel of the neighbor base station from the *BCMC System Parameters Message*,
 24 the mobile station shall enter the System Determination Substate of the Mobile
 25 Station Initialization State with a new system indication, upon performing idle
 26 handoff to this neighbor base station.
- 27 – Upon entering the Mobile Station Idle State of the new system, the mobile
 28 station shall resume monitoring the BCMC flow(s) as specified in 2.6.13.6.
- 29 – The mobile station shall not perform any of the remaining procedures in this
 30 section.

31 If the NGHBR_CONFIG field is '011', the mobile station shall perform the following:

- 32 • Enter the System Determination Substate of the Mobile Station Initialization State
 33 with a new system indication (see 2.6.1.1)
- 34 • Upon entering the Mobile Station Idle State of the new system, the mobile station
 35 shall resume monitoring the BCMC flow(s) as specified in 2.6.13.6.
- 36 • The mobile station shall not perform any of the remaining procedures in this
 37 section.

38 If the NGHBR_BCMC_CONFIG field is '000' or '011', the mobile station shall perform the
 39 following:

- 1 • The mobile station shall perform idle handoff according to the procedures in
2 2.6.2.1.4.1 just as if the mobile station is currently not monitoring a Forward
3 Supplemental Channel.
- 4 • Upon completing the idle handoff, the mobile station shall resume monitoring the
5 BCMC flow as specified in 2.6.13.6.

6 If the NGHBR_BCMC_CONFIG field is '001' or '010', the mobile station shall perform the
7 following:

- 8 • If the mobile station has monitored the Paging Channel before the idle handoff, or
9 the mobile station has monitored the Forward Common Control Channel/Primary
10 Broadcast Control Channel before the idle handoff and NGHBR_CONFIG field is set
11 to '001', the mobile station shall perform the following:
 - 12 – The mobile station shall set ACC_MSG_SEQ_s and CURR_ACC_MSG_SEQ to
13 NULL and shall set PILOT_PN_s to the pilot offset index of the base station
14 transmitting the new Paging Channel.
 - 15 – If the stored information for any of the Paging Channels on the associated
16 NGHBR_FSCH_FREQ of the new base station is current, the mobile station shall
17 perform the following:
 - 18 + The mobile station shall use the hash algorithm specified in 2.6.7.1 to select
19 a new Paging Channel number in the range 1 to PAGE_CHAN_s, where
20 PAGE_CHAN_s is the value stored for the Paging Channel whose stored
21 information is current. The mobile station shall store the new Paging
22 Channel number as PAGECH_s. The mobile station shall perform the
23 following:
 - 24 o If the mobile station has not stored configuration parameters for the new
25 Paging Channel, or if the stored parameters are not current (see 2.6.2.2),
26 the mobile station shall set CONFIG_MSG_SEQ_s, SYS_PAR_MSG_SEQ_s,
27 NGHBR_LST_MSG_SEQ_s, EXT_NGHBR_LST_MSG_SEQ_s,
28 GEN_NGHBR_LST_MSG_SEQ_s, CHAN_LST_MSG_SEQ_s,
29 EXT_SYS_PAR_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s,
30 PRI_NGHBR_LST_MSG_SEQ_s, and
31 EXT_GLOB_SERV_REDIR_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
32 FD_CHAN_LST_MSG_SEQ_s, AP_PILOT_INFO_MSG_SEQ_s,
33 AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s,
34 FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s and
35 GLOB_SERV_REDIR_MSG_SEQ_s to NULL.
 - 36 o If the stored information for the new Paging Channel is current, the
37 mobile station shall set CONFIG_MSG_SEQ_s to the stored information
38 for the new Paging Channel and set NGHBR_REC_LIST, FBSCH_LIST_s,
39 and BCMC_FLOW_LIST_s to the stored information for the new Paging
40 Channel.

- 1 + If the mobile station has monitored the Forward Common Control
2 Channel/Primary Broadcast Control Channel before the idle handoff, the
3 mobile station shall set $PRAT_S = '00'$.
- 4 + If $CDMACH_S$ is not equal to $NGHBR_FSCH_FREQ$, the mobile station shall
5 set $CDMACH_S$ to $NGHBR_FSCH_FREQ$ and tune to the new CDMA Channel.
6 The mobile station shall begin monitoring the new Paging Channel and the
7 Forward Supplemental Channel of the new base station.
- 8 – If none of the Paging Channel stored information on the associated
9 $NGHBR_FSCH_FREQ$ of the new base station are current, the mobile station
10 shall perform the following:
- 11 + The mobile station shall set $CONFIG_MSG_SEQ_S$, $SYS_PAR_MSG_SEQ_S$,
12 $NGHBR_LST_MSG_SEQ_S$, $EXT_NGHBR_LST_MSG_SEQ_S$,
13 $GEN_NGHBR_LST_MSG_SEQ_S$, $CHAN_LST_MSG_SEQ_S$,
14 $EXT_SYS_PAR_MSG_SEQ_S$, $GLOB_SERV_REDIR_MSG_SEQ_S$,
15 $EXT_GLOB_SERV_REDIR_MSG_SEQ_S$, $EXT_CHAN_LST_MSG_SEQ_S$,
16 $FD_CHAN_LST_MSG_SEQ_S$, $USER_ZONE_ID_MSG_SEQ_S$,
17 $AP_PILOT_INFO_MSG_SEQ_S$, $AP_IDT_MSG_SEQ_S$, $AP_ID_TEXT_MSG_SEQ_S$,
18 $GOI_MSG_SEQ_S$, $FREQ_GOI_MSG_SEQ_S$, $ATIM_MSG_SEQ_S$ and
19 $PRI_NGHBR_LST_MSG_SEQ_S$ to NULL.
- 20 + If the mobile station has monitored the Forward Common Control
21 Channel/Primary Broadcast Control Channel before the idle handoff, the
22 mobile station shall set $PRAT_S = '00'$.
- 23 + The mobile station shall set $PAGE_CHAN_S$ to '1' and $PAGECH_S$ to the
24 Primary Paging Channel. If $CDMACH_S$ is not equal to $NGHBR_FSCH_FREQ$,
25 the mobile station shall set $CDMACH_S$ to $NGHBR_FSCH_FREQ$ and tune to
26 the new CDMA Channel. The mobile station shall begin monitoring the
27 Primary Paging Channel and Forward Supplemental Channel of the new
28 base station.
- 29 If $PACA_S$ is equal to enabled, the mobile station shall enter the *Update Overhead*
30 *Information Substate* of the *System Access State* (see 2.6.3) with an origination
31 indication within T_{33m} seconds to re-originate the PACA call using the new base
32 station.
- 33 • If the mobile station has monitored the Forward Common Control Channel/Primary
34 Broadcast Control Channel before the idle handoff or if the mobile station has
35 monitored the Paging Channel before the idle handoff, and selected a neighbor base
36 station for idle handoff which supports Primary Broadcast Control Channel and the
37 mobile station has received parameters for the Primary Broadcast Control Channel
38 of the neighbor base station from the *BCMC System Parameters Message*, the mobile
39 station shall perform the following:
- 40 – The mobile station shall set $ACC_MSG_SEQ_S$ and $CURR_ACC_MSG_SEQ$ to
41 NULL and shall set $PILOT_PN_S$ to the pilot offset index of the base station
42 transmitting the new Forward Common Control Channel/Primary Broadcast
43 Control Channel.

- 1 – If the stored information for any of the Forward Common Control Channels and
2 Primary Broadcast Control Channel on the associated NGHBR_FSCH_FREQ of
3 the new base station is current, the mobile station shall perform the following:
- 4 + The mobile station shall use the hash algorithm specified in 2.6.7.1 to select
5 a new Forward Common Control Channel number in the range 1 to
6 NUM_FCCCH_s, where NUM_FCCCH_s is the stored value. The mobile station
7 shall store the new Forward Common Control Channel number as
8 FCCCH_ID_s. The mobile station shall perform the following:
- 9 o If the mobile station has not stored configuration parameters for the new
10 Forward Common Control Channel and Primary Broadcast Control
11 Channel, or if the stored parameters are not current (see 2.6.2.2), the
12 mobile station shall set CONFIG_MSG_SEQ_s, A41_SYS_PAR_MSG_SEQ_s,
13 UNI_NGHBR_LST_MSG_SEQ_s, MC_RR_PAR_MSG_SEQ_s,
14 EXT_GLOB_SERV_REDIR_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
15 FD_CHAN_LST_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s,
16 AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s,
17 AP_ID_TEXT_MSG_SEQ_s, GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s,
18 ATIM_MSG_SEQ_s and PRI_NGHBR_LST_MSG_SEQ_s to NULL.
- 19 o If the stored information for the new Forward Common Control Channel
20 and Primary Broadcast Control Channel is current, the mobile station
21 shall set CONFIG_MSG_SEQ_s to the stored information for the new
22 Forward Common Control Channel and Primary Broadcast Control
23 Channel and set NGHBR_REC_LIST to the stored information for the new
24 Forward Common Control Channel and Primary Broadcast Control
25 Channel.
- 26 + If CDMACH_s is not equal to NGHBR_FSCH_FREQ, the mobile station shall
27 set CDMACH_s to NGHBR_FSCH_FREQ and tune to the new CDMA Channel.
28 The mobile station shall begin monitoring the new Forward Common Control
29 Channel/Primary Broadcast Control Channel and the Forward
30 Supplemental Channel of the new base station.
- 31 – If none of the Forward Common Control Channel and Primary Broadcast
32 Control Channel stored information on the associated NGHBR_FSCH_FREQ of
33 the new base station are current, the mobile station shall perform the following:
- 34 + The mobile station shall set the mobile station shall set
35 CONFIG_MSG_SEQ_s, A41_SYS_PAR_MSG_SEQ_s,
36 UNI_NGHBR_LST_MSG_SEQ_s, MC_RR_PAR_MSG_SEQ_s,
37 EXT_GLOB_SERV_REDIR_MSG_SEQ_s, EXT_CHAN_LST_MSG_SEQ_s,
38 FD_CHAN_LST_MSG_SEQ_s, USER_ZONE_ID_MSG_SEQ_s,
39 AP_PILOT_INFO_MSG_SEQ_s, AP_IDT_MSG_SEQ_s, AP_ID_TEXT_MSG_SEQ_s,
40 GOI_MSG_SEQ_s, FREQ_GOI_MSG_SEQ_s, ATIM_MSG_SEQ_s and
41 PRI_NGHBR_LST_MSG_SEQ_s to NULL.

- 1 + If $CDMACH_s$ is not equal to $NGHBR_FSCH_FREQ$, the mobile station shall
 2 set $CDMACH_s$ to $NGHBR_FSCH_FREQ$ and tune to the new CDMA Channel.
 3 The mobile station shall begin monitoring the Primary Broadcast Control
 4 Channel of the new base station, using the same rate, code rate, and code
 5 channel. The mobile station shall begin monitoring the Forward
 6 Supplemental Channel of the new base station.
- 7 – If $PACA_s$ is equal to enabled, the mobile station shall enter the *Update Overhead*
 8 *Information Substate* of the *System Access State* (see 2.6.3) with an origination
 9 indication within T_{33m} seconds to re-originate the PACA call using the new base
 10 station.

11 2.6.13.5 Procedures for stopping reception of a BCMC Flow

12 If Layer 3 is requested by the BCMC Service Layer to stop monitoring a BCMC flow given by
 13 $BCMC_FLOW_ID$, the mobile station perform the following:

- 14 • Layer 3 shall send a *BMAC-Stop-Deliver.Request(FSCH_ID, BSR_ID)* to the multiplex
 15 sublayer where $FSCH_ID$ and BSR_ID are the values in $BCMC_FLOW_LIST_s$
 16 corresponding to this $BCMC_FLOW_ID$.
- 17 • If this is the only BCMC flow being monitored on this Forward Supplemental
 18 Channel, the mobile station shall stop monitoring this Forward Supplemental
 19 Channel.
- 20 • If this is the only BCMC flow being monitored on this frequency, the mobile station
 21 shall return to the hash-to frequency as follows:
- 22 – If the mobile station is currently monitoring the Paging Channel, the mobile
 23 station shall monitor the CDMA Channel List Message or Extended CDMA
 24 Channel List Message to determine the hash-to frequency as specified in
 25 2.6.2.2.4 and 2.6.2.2.12.1 respectively.
- 26 – If the mobile station is currently monitoring the Primary Broadcast Control
 27 Channel/Forward Common Control Channel, the mobile station shall monitor
 28 the *Extended CDMA Channel List Message* to determine the hash-to frequency as
 29 specified in 2.6.2.2.12.2.
- 30 – If this results in the mobile station residing in a frequency other than the
 31 frequency prior to stopping BCMC flow reception, the mobile station shall
 32 perform BCMC registration procedures as specified in 2.6.13.3 to indicate
 33 change in the frequency.

34 2.6.13.6 Procedures for Handling *BCMC Service Parameters Message* Updates

35 If the mobile station determines that the contents of the *BCMC Service Parameters Message*
 36 has changed or that the *BCMC Service Parameters Message* is not being transmitted
 37 anymore, the mobile station shall perform the following:

- 38 • If $SENDING_BSPM_s$ equals '0', the mobile station shall perform the following:
- 39 – For each BCMC flow currently being monitored, Layer 3 shall send a *BCMC-*
 40 *Monitor.Response(BCMC_FLOW_ID, result = FAILURE, cause =*

- 1 *FLOW_NOT_AVAILABLE, reason_ind*) to the BCMC Service Layer, where
 2 *reason_ind* is set to MOBILITY if this is due to idle handoff or to CURRENT_SYS
 3 otherwise.
- 4 – For each BCMC flow currently being monitored, Layer 3 shall send a *BMAC-*
 5 *Stop-Deliver.Request(FSCH_ID, BSR_ID)* to the multiplex sublayer where *FSCH_ID*
 6 and *BSR_ID* are the values in the previous BCMC_FLOW_LIST corresponding to
 7 this BCMC_FLOW_ID.
 - 8 – The mobile station shall not perform the remaining procedures in this section.
 - 9 • For each BCMC flow that the mobile station is currently monitoring, if the mobile
 10 station determines that the base station is not transmitting this BCMC flow
 11 anymore, the mobile station shall perform the following:
 - 12 – Layer 3 shall send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result=FAILURE,*
 13 *cause= FLOW_NOT_AVAILABLE, reason_ind)* to the BCMC Service Layer, where
 14 *reason_ind* is set to MOBILITY if this is due to idle handoff or to CURRENT_SYS
 15 otherwise, and shall stop monitoring this BCMC flow as specified in 2.6.13.5.
 - 16 • For each BCMC flow that the mobile station is currently monitoring, if the mobile
 17 station determines that this BCMC flow is being transmitted on a different Forward
 18 Supplemental Channel than currently transmitted, the mobile station shall perform
 19 the following:
 - 20 – If more than one BCMC flows that the mobile station is currently monitoring are
 21 still available, then the mobile station shall choose the frequency based on the
 22 BCMC flow with the highest priority; if the BCMC flow is configured for
 23 transmission in the mobile station's hash-to-frequency, the mobile station shall
 24 choose the mobile station's hash-to-frequency; otherwise, the mobile station
 25 shall use the hash algorithm specified in 2.6.7.1 and the number of CDMA
 26 channels on which this BCMC_FLOW_ID is configured for transmission to
 27 choose the frequency to monitor.
 - 28 – Layer 3 shall send a *BMAC-Stop-Deliver.Request(FSCH_ID, BSR_ID)* to the
 29 multiplex sublayer where *FSCH_ID* and *BSR_ID* are the values in the previous
 30 BCMC_FLOW_LIST corresponding to this BCMC_FLOW_ID.
 - 31 – The mobile station shall determine the band class (*FSCH_BAND_CLASS*) and
 32 CDMA channel (*FSCH_FREQ*) corresponding to the selected Forward
 33 Supplemental Channel from *FBSCH_LIST_s*. If *FSCH_BAND_CLASS* is not equal
 34 to *CDMA_BAND_s* or *FSCH_FREQ* is not equal to *CDMACH_s* and the mobile
 35 station is currently monitoring one or more BCMC flows in the current
 36 frequency that have a higher priority than this BCMC flow, Layer 3 shall send a
 37 *BCMC-Monitor.Response(BCMC_FLOW_ID, result = FAILURE, cause =*
 38 *CANNOT_ACCOMMODATE, reason_ind)* to the BCMC Service Layer, where
 39 *reason_ind* is set to MOBILITY if this is due to idle handoff or to CURRENT_SYS
 40 otherwise, and shall not perform the remaining procedures in this section.
 - 41 – If the mobile station will not be able to monitor the Forward Supplemental
 42 Channel on which the BCMC flow is being transmitted due to a capability

- 1 mismatch, Layer 3 shall send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result*
 2 *= FAILURE, cause = UNSUPPORTED_BEARER_CONFIG, reason_ind)* to the BCMC
 3 Service Layer, where *reason_ind* is set to MOBILITY if this is due to idle handoff
 4 or to CURRENT_SYS otherwise, and shall not perform the remaining procedures
 5 in this section for this BCMC flow.
- 6 – If FSCH_BAND_CLASS is not equal to CDMA_BAND_S or FSCH_FREQ is not
 7 equal to CDMACH_S, the mobile station shall perform the following:
 - 8 + If FREQ_CHG_REG_REQUIRED_S equals '1', the mobile station shall perform
 9 BCMC registration procedures as specified in 2.6.13.3 to indicate change in
 10 the frequency where the mobile station will reside while monitoring this
 11 BCMC flow.
 - 12 + The mobile station shall tune to FSCH_FREQ in FSCH_BAND_CLASS; the
 13 mobile station should tune to the new frequency only after performing
 14 BCMC registration (if any) specified above. If FREQ_CHG_REG_TIMER_S is
 15 not equal to NULL and the BCMC frequency registration timer for the
 16 previous frequency is not enabled or is enabled and has not expired, the
 17 mobile station shall start the BCMC frequency registration timer for the
 18 previous frequency with a value of FREQ_CHG_REG_TIMER_S.
 - 19 + For each BCMC flow in current frequency that can no longer be monitored in
 20 new frequency, the mobile station shall perform the following:
 - 21 o Layer 3 shall send a *BCMC-Monitor.Response(BCMC_FLOW_ID,*
 22 *result=FAILURE, cause= CANNOT_ACCOMMODATE, reason_ind)* to the
 23 BCMC Service Layer, where *reason_ind* is set to MOBILITY if this is due
 24 to idle handoff or to CURRENT_SYS otherwise.
 - 25 o Layer 3 shall send a *BMAC-Stop-Deliver.Request(FSCH_ID, BSR_ID)* to the
 26 multiplex sublayer where *FSCH_ID* and *BSR_ID* are the values in
 27 BCMC_FLOW_LIST_S corresponding to this BCMC_FLOW_ID.
 - 28 – The mobile station shall set the Forward Supplemental Channel parameters as
 29 given in FBSCH_LIST_S and shall start to monitor the Forward Supplemental
 30 Channel.
 - 31 – The mobile station shall send a *BMAC-Start-Deliver.Request(FSCH_ID, BSR_ID)* to
 32 the multiplex sublayer where *FSCH_ID* and *BSR_ID* are the values in
 33 BCMC_FLOW_LIST_S corresponding to the logical-to-physical mapping selected
 34 for this BCMC_FLOW_ID.
 - 35 • For any BCMC flow that the mobile station is currently monitoring, if the mobile
 36 station determines to monitor this BCMC flow on a traffic channel (e.g.,
 37 BCMC_FLOW_ON_IND corresponding to this BCMC flow equals '0', and
 38 BCMC_FLOW_ON_TRAFFIC_IND corresponding to this BCMC flow equals '1'), the
 39 mobile station shall perform the following:
 - 40 – For each BCMC flow currently being monitored in the *Mobile Station Idle State*,
 41 Layer 3 shall send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result=FAILURE,*

1 *cause= CANNOT_ACCOMMODATE, reason_ind*) to the BCMC Service Layer,
 2 where *reason_ind* is set to MOBILITY if this is due to idle handoff or to
 3 CURRENT_SYS otherwise, and shall stop monitoring this BCMC flow as
 4 specified in 2.6.13.5.

- 5 – The mobile station shall perform Mobile Station Origination Operation as
 6 specified in 2.6.2.5 to request monitoring of this BCMC flow on the *Traffic*
 7 *Channel Substate*. The mobile station shall include the BCMC_FLOW_ID (See
 8 section 2.6.13.11) in the *Origination Message*.
 9 2.6.13.7 Procedures for Browsing BCMC Flows

10 If Layer 3 is requested by the BCMC Service Layer to report list of all available BCMC flows
 11 (see 2.6.13), the mobile station shall perform the following procedures in the order
 12 specified:

- 13 • If SENDING_BSPM_s equals '0', Layer 3 shall send a *BCMC-*
 14 *Browse.Response(result=FAILURE)* to the BCMC Service Layer.
- 15 • Otherwise, if FULL_BSPM_IND = '0', the mobile station shall monitor the overhead
 16 channel to receive the *BCMC Service Parameters Message* as specified in 2.6.2.2.18
 17 or until FULL_BSPM_IND = '1', and shall perform the following:
 - 18 – Layer 3 shall send a *BCMC-Browse.Response(result = SUCCESS,*
 19 *{BCMC_FLOW_IDS}*) to the BCMC Service Layer where *{BCMC_FLOW_IDS}* is a
 20 list of all unique BCMC flows configured for transmission in this sector as
 21 determined from the stored *BCMC Service Parameters Message* parameters.

22 2.6.13.8 Procedures for BCMC Operation while on Traffic Channel

23 This section specifies the mobile station requirements for BCMC feature while in the Mobile
 24 Station Control on the Traffic Channel State.

25 If Layer 3 is requested by the BCMC Service Layer to commence reception of a BCMC flow
 26 (see 2.6.13), the mobile station shall send *Enhanced Origination Message* as specified in
 27 2.6.4.3.

28 If Layer 3 is requested by the BCMC Service Layer to stop monitoring a BCMC flow (see
 29 2.6.13), the mobile station shall release a BCMC call as specified in 2.6.4.3.

30 If the mobile station is monitoring BCMC flow on traffic channel, when traffic channel is
 31 released and the BCMC Service Layer has not requested to stop monitoring the BCMC flow,
 32 the mobile station shall either continue monitoring the BCMC flow in idle state (see 2.6.13)
 33 or the Layer 3 shall send a *BCMC-Monitor.Response(BCMC_FLOW_ID, result = FAILURE,*
 34 *cause = CALL_RELEASED)* to the BCMC Service Layer.

35 2.6.13.9 Procedures for Computation of Authorization Signature

36 For each BCMC flow included in the *Registration Message, Origination Message, Page*
 37 *Response Message* and *Enhanced Origination Message*, if
 38 BCMC_FLOW_LIST_s[i].AUTH_SIGNATURE_REQ_IND equals '1', then the mobile station
 39 shall compute the Authorization Signature value for the BCMC flow as follows:

- The mobile station shall create an input working buffer to EHMACSHA as shown in Table 2.6.13.9 1.

Table 2.6.13.9-1. Subfields of the input working buffer

Subfield	Length (bits)
TIME_STAMP_LONG	TIME_STAMP_LONG_LENGTHs

4

5 TIME_STAMP_LONG The mobile station shall set this field to the LSBs of the CDMA
 6 System Time, in units of $2^{\text{TIME_STAMP_UNIT}_s}$ slots, corresponding to a
 7 time that is not later than when the Physical Layer will begin
 8 transmission of the *Registration Message*, *Origination Message*,
 9 *Page Response Message*, or *Enhanced Origination Message* that
 10 will carry this Authorization Signature. The mobile station shall
 11 use the same TIME_STAMP_LONG field for computing all
 12 Authorization Signature parameters included in a *Registration*
 13 *Message*, *Origination Message*, *Page Response Message* or a
 14 *Enhanced Origination Message*.

- The mobile terminal shall compute the Authorization Signature value as follows using the EHMACSHA procedure as specified in [43], section 3.3.
 - The KEY parameter of EHMACSHA shall be set to BAK.
 - The L_KEY parameter of EHMACSHA shall be set to 16, identifying the length of BAK in octets.
 - The MESSAGE parameter of EHMACSHA shall be set to the pointer to the most significant bit of the input working buffer.
 - The MESSAGE_OFFSET parameter of EHMACSHA shall be set to 0.
 - The MESSAGE_LENGTH parameter of EHMACSHA shall be set to the number of bits of data in the input working buffer
 - The HMAC parameter of EHMACSHA shall be set to the pointer to the most significant bit of the output buffer that will contain the computed MAC value.
 - The L_HMAC parameter of EHMACSHA shall be set to 4, identifying the length of the output in octets.

29 The mobile station shall set the AUTH_SIGNATURE field to the 32 least significant bits
 30 of the Message Digest computed MAC value obtained in the previous step.

31 2.6.13.10 Procedures for Public Long Code Mask schemes

32 2.6.13.10.1 Procedures for BCMC Flow ID based autonomous PLCM generation

33 The Public Long Code Mask of the Forward Supplemental Channel to be received in idle
 34 state is determined as follows:

- If the first occurrence of the BCMC_FLOW_ID (see section 2.6.13.11) in the *BCMC Service Parameters Message* multiplexed on this Forward Supplemental Channel is 16bits, FIRST_FLOW_ID shall be set as follows.

37

- 1 - The 16 MSBs shall be set to sixteen '0's.
- 2 - The 16 LSBs shall be set to the BCMC_FLOW_ID.
- 3 • If the first occurrence of the BCMC_FLOW_ID (see section 2.6.13.11) in the *BCMC*
4 *Service Parameters Message* multiplexed on this Forward Supplemental Channel is
5 24bits, FIRST_FLOW_ID shall be set as follows.
- 6 - The 8 MSBs shall be set to eight '0's.
- 7 - The 24 LSBs shall be set to the BCMC_FLOW_ID.
- 8 • If the first occurrence of the BCMC_FLOW_ID (see section 2.6.13.11) in the *BCMC*
9 *Service Parameters Message* multiplexed on this Forward Supplemental Channel is
10 32bits, FIRST_FLOW_ID shall be set to the BCMC_FLOW_ID.
- 11 • Set the FIRST_BSR_ID to the BSR_ID corresponding to the FIRST_FLOW_ID in the
12 *BCMC Service Parameters Message* multiplexed on this Forward Supplemental
13 Channel.
- 14 • PLCM_42 is set as follows.
- 15 - Bits P41 through P35 shall be set to '1100111'.
- 16 - Bits P34 through P3 shall be set to FIRST_FLOW_ID.
- 17 - Bits P2 through P0 shall be set to FIRST_BSR_ID.

18 2.6.13.10.2 Procedures for index based PLCM generation

19 The Public Long Code Mask of the Forward Supplemental Channel to be received in idle
20 state is determined as follows:

- 21 • PLCM_42 is set as follows.
- 22 - Bits P41 through P24 shall be set to '110011100110111000'.
- 23 - Bits P23 through P16 shall be set to FSCH_PLCM_INDEX_s.
- 24 - Bits P15 through P0 shall be set to '0000000000000000'.

25 2.6.13.11 BCMC_FLOW_ID generation

26 The BCMC_FLOW_ID structure is shown in Figure 2.6.13.11-1.

27

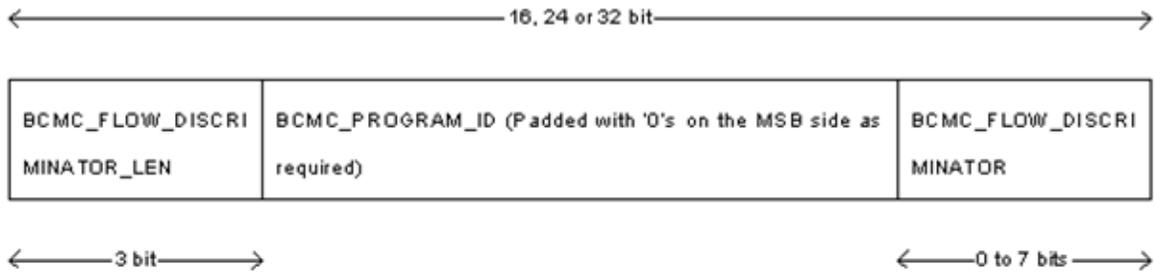

Figure 2.6.13.11-1. Structure of BCMC_FLOW_ID

BCMC_FLOW_ID is obtained by concatenating the BCMC_FLOW_DISCRIMINATOR_LEN field, the BCMC_PROGRAM_ID field, and BCMC_FLOW_DISCRIMINATOR fields as follows:

- The exact contents of the 3 bit BCMC_FLOW_DISCRIMINATOR_LEN field,
- The unsigned binary value of the BCMC_PROGRAM_ID field padded with '0's on the most significant bits as necessary to satisfy the following:
 - If the sum of the lengths of the BCMC_FLOW_DISCRIMINATOR_LEN, BCMC_PROGRAM_ID, and BCMC_FLOW_DISCRIMINATOR fields is less than or equal to 16 bits, then the BCMC_FLOW_ID shall be of 16 bits length.
 - If the sum of the lengths of the BCMC_FLOW_DISCRIMINATOR_LEN, BCMC_PROGRAM_ID, and BCMC_FLOW_DISCRIMINATOR fields is less than or equal to 24 bits but greater than 16 bits, then the BCMC_FLOW_ID shall be of 24 bits length.
 - If the sum of the lengths of the BCMC_FLOW_DISCRIMINATOR_LEN, BCMC_PROGRAM_ID, and BCMC_FLOW_DISCRIMINATOR fields is less than or equal to 32 bits but greater than 24 bits, then the BCMC_FLOW_ID shall be of 32 bits length.
- and the exact content of the BCMC_FLOW_DISCRIMINATOR field, where the length of this field is specified by the value of BCMC_FLOW_DISCRIMINATOR_LEN.

The length of a BCMC_FLOW_ID shall be 16, 24, or 32 bits.

2.6.13.12 BCMC TDM

Base station may multiplex multiple BCMC flows on a single F-SCH. Time Division Multiplexing (TDM) is an optional feature that supports BCMC. When multiple flows are multiplexed on a single F-SCH, the base station may include TDM related parameters. Mobile station can use TDM related parameters to save battery, by waking up only when BCMC_FLOW that MS is interested in is transmitted.

TDM related parameters are included in *BCMC Service Parameters Message*. TDM related parameters are TDM_STRUCTURE_IND, TDM_SLOT_LENGTH, TDM_SUPER_PERIOD_MASK_LEN, TDM_MEGA_PERIOD_MASK_LEN, TDM_USED_IND,

1 TDM_MASK, TDM_SUPER_PERIOD_MASK_INCL, TDM_SUPER_PERIOD_MASK,
2 TDM_MEGA_PERIOD_MASK_INCL, TDM_MEGA_PERIOD_MASK.

3 TDM parameters include 3 levels TDM masks TDM_MASK, TDM_SUPER_PERIOD_MASK
4 and TDM_MEGA_PERIOD_MASK. These masks indicate BCMC flow to F-SCH time slot
5 mapping.

6 Each bit of TDM_MASK indicates presence of a flow on a slot. Length of a slot is defined by
7 TDM_SLOT_LENGTH. Each bit of TDM_SUPER_PERIOD_MASK indicates presence of a flow
8 on a super slot. Super slot length is equal to slot length multiplied by number of bits in
9 TDM_MASK. Each bit of TDM_MEGA_PERIOD_MASK indicates presence of a flow on a
10 mega slot. Super slot length is equal to super slot length multiplied by number of bits in
11 TDM_SUPER_PERIOD_MASK.

12 When outer coding is used TDM_SUPER_PERIOD_MASK length is always 16 bits, but only
13 partial mask (first part) is included in the *BCMC Service Parameters Message*. Remaining
14 bits in the mask that are not included in the *BCMC Service Parameters Message* are “don’t
15 care” bits, and the mobile station can decide if remaining slots need to be received based on
16 outer coding algorithm.

17 Subsection 2.6.13.12.1 defines how TDM period is aligned with system time.

18 2.6.13.12.1 BCMC TDM period alignment requirement

19 Each TDM period for a BCMC flow on a particular Forward Supplemental Channel starts
20 when the system time (t) in 20 ms units satisfies the following equation:

- 21 • If outer coding is used for the FSCH where this BCMC flow is transmitted (i.e.
22 FSCH_OUTER_CODE_INCL for the FSCH is equal to ‘1’)

$$23 \quad t \bmod (\text{TDM period}) = \text{FSCH_OUTERCODE_OFFSET}$$

24 where FSCH_OUTERCODE_OFFSET is the outer coding buffer offset for the
25 FSCH where this BCMC flow is transmitted

- 26 • Otherwise

$$27 \quad t \bmod (\text{TDM period}) = 0$$

28 Here, TDM period is calculated as following:

- 29 • If TDM_MEGA_PERIOD_MASK_INCL for the BCMC flow on this particular Forward
30 Supplemental Channel is equal to ‘1’

31 TDM period = (duration of mega slot in 20 ms units) × (length of
32 TDM_MEGA_PERIOD_MASK in bits)

- 33 • Otherwise

$$34 \quad \text{TDM period} = \text{duration of mega slot in 20 ms units}$$

35 2.6.14 Common Procedures for Processing r-csch Messages

36 This section describes the common procedures for processing messages sent on the r-csch.

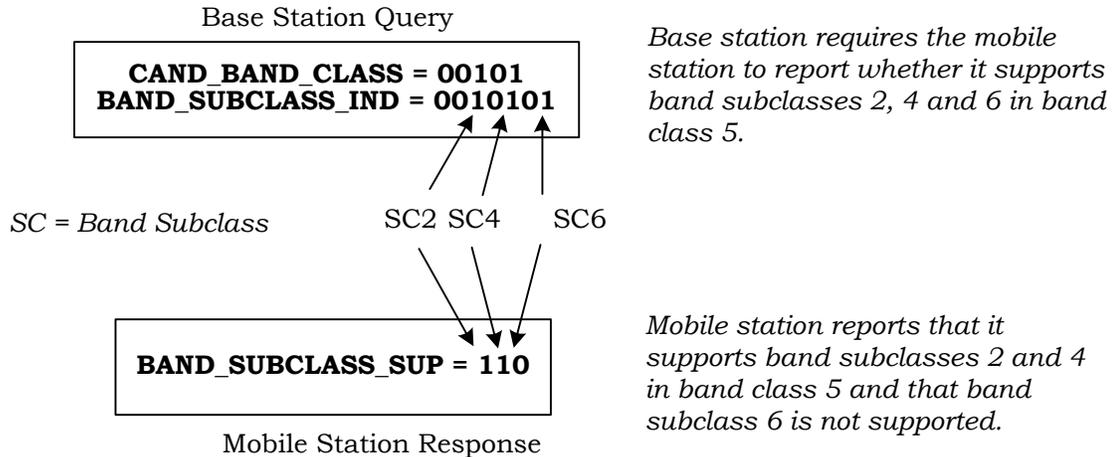

2.6.14.1 Reporting Band Class – Band Subclass Capabilities

If the `FD_CHAN_LST_INDs` is set to '0' and `CAND_BAND_INFO_REQr` is set to '1' in the *Extended System Parameters Message* or in the *MC-RR Parameters Message*, the mobile station shall report band subclass capabilities via the *Registration Message*, *Origination Message* or *Page Response Message*. If the `FD_CHAN_LST_INDs` is set to '1' and `CAND_BAND_INFO_REQr` is set to '1' the mobile station shall use *General Extension Message* to carry the *Registration Message*, *Origination Message* or *Page Response Message* and include the Supported Band Class - Subclass Record. The mobile station shall perform the following procedures when reporting band class:

- In the procedures below, the following assumptions apply:
 - For band classes defined with multiple band subclasses, the mobile station shall indicate support of this band class if at least one band subclass is supported.
 - If the mobile station supports a candidate band class but it is not aware of any band subclass definition for that band class, the mobile station shall report its capabilities as if it supports band subclass 0 of that band class.
- If the mobile station supports at least one band class and band subclass (if applicable) combination queried by the base station, the mobile station shall set `BAND_SUB_REP_INCL` to '1'; otherwise, the mobile station shall set this field to '0' and shall not perform the remaining procedures.
- If the mobile station is sending this information in a Bandclass - Subclass Information Record included in General Extension Message then the mobile station shall initialize `NUM_BAND_SUBCLASS` to '00000'.
- Otherwise, the mobile station shall initialize `NUM_BAND_SUBCLASS` to '0000'.
- If the mobile station supports all candidate band class and band subclass (if applicable) combinations queried by the base station, the mobile station shall not perform the remaining procedures; otherwise, for $i = 1$ to `NUM_CAND_BAND_CLASSs`, the mobile station shall perform the following:
 - If `CAND_BAND_CLASS_REC[i].SUBCLASS_INFO_INCL` is equal to '0', the mobile station shall perform the following:
 - + The mobile station shall include one instance of the `BAND_SUBCLASS_SUP` field and set it as follows. If the mobile station supports the candidate band class `CAND_BAND_CLASS_REC[i].CAND_BAND_CLASS`, the mobile station shall set this field to '1'; otherwise, it shall set it to '0'.
 - + The mobile station shall increment `NUM_BAND_SUBCLASS` by 1.
 - Otherwise, for $j = 0$ to `CAND_BAND_CLASS_REC[i].SUBCLASS_REC_LEN`, if `CAND_BAND_CLASS_REC[i].BAND_SUBCLASS_IND_REC[j]` is equal to '1', the mobile station shall perform the following:

- 1 + The mobile station shall include one instance of the BAND_SUBCLASS_SUP
- 2 field and set it as follows. If the mobile station supports the band subclass
- 3 CAND_BAND_CLASS_REC[i].BAND_SUBCLASS_IND_REC[j], the mobile
- 4 station shall set this field to '1'; otherwise, it shall set it to '0'.
- 5 + The mobile station shall increment NUM_BAND_SUBCLASS by 1.

6 Figure 2.6.14.1-1 illustrates the relationship between the base station
 7 CAND_BAND_CLASS, BAND_SUBCLASS_IND fields and the mobile station
 8 BAND_SUBCLASS_SUP fields for one possible scenario.

9
 10

11 **Figure 2.6.14.1-1. Illustration of Band Class - Band Subclass Reporting**

12 2.6.14.2 Reporting Additional Geo Location Type Capabilities

13 If the ADD_LOC_GEM_ALLOWED_s is set to '1' the mobile station may use⁷⁵ a *General*
 14 *Extension Message* to include a Additional Geo Location Type Record with Origination and
 15 Registration Messages⁷⁶.

16 2.6.15 MEID procedures when communicating with P_REV 6, 7, 8, 10 Base Stations

17 The mobile station shall conform to the requirements in [47] when communicating with a
 18 P_REV 6, 7, 8, or 10 base station.

19 2.6.16 Initialization of RC parameters

20 The mobile station shall initialize the RC parameters as follows:

⁷⁵ The mobile station may include this record for an emergency call.

⁷⁶ The mobile station will not use GEM to include a Additional Geo Location Type Record if the base station allows access entry handoff and the neighboring base station to which the mobile station could perform an access handoff and this neighboring base station does not support the use of GEM.

- 1 • The mobile station shall set FOR_FCH_ACK_MASK_RL_BLANKING_S to '0001 1001
- 2 1001 1000' and set FOR_FCH_ACK_MASK_NO_RL_BLANKING_S to '0000 1010 1010
- 3 1010'.
- 4 • The mobile station shall set REV_FCH_ACK_MASK_S to '0000 1010 1010 1010'.
- 5 • The mobile station shall set FOR_SCH_ACK_MASK_RL_BLANKING_S to '0000 0000
- 6 0001 1000' and set FOR_SCH_ACK_MASK_NO_RL_BLANKING_S to '0000 0000 0010
- 7 1000'.
- 8 • The mobile station shall set REV_SCH_ACK_MASK_S to '0000 0000 0010 1010'.
- 9 • The mobile station shall set FOR_SCH_DELAYED_ACK_MASK_S to '000'
- 10 • The mobile station shall set REV_SCH_DELAYED_ACK_MASK_S to '000'
- 11 • The mobile station shall set FOR_N2M_IND_S to '001' (4 bad frames).
- 12 • The mobile station shall set RPC_MODE_S to '00' (200 to 400 bps).
- 13 • The mobile station shall set PWR_CNTL_STEP_S to '000' (1 dB).
- 14 • The mobile station shall set FOR_FCH_BLANKING_DUTYCYCLE_S to '001' (N=4).
- 15 • The mobile station shall set REV_FCH_BLANKING_DUTYCYCLE_S to '000~~1~~' (N=4~~1~~).
- 16 • The mobile station shall set REV_FCH_BLANKING_DUTYCYCLE_IN_USE to '000~~1~~'
- 17 (N=4~~1~~).
- 18 • The mobile station shall set REV_ACKCH_GAIN_ADJ_ACS1_S to '0000 000'.
- 19 • The mobile station shall set REV_ACKCH_GAIN_ADJ_ACS2PLUS_S to '0000 000'.
- 20 • The mobile station shall initialize RC_PARAMS_RECORD_S to have entry
- 21 RC_PARAMS_RECORD_S[i] for each of the PILOT_PNs assigned to mobile and
- 22 initialize corresponding fields of each of the RC_PARAMS_RECORD_S[i] record as
- 23 follows:
- 24 – Set RC_PARAMS_RECORD_S[i].QOF_SET_IN_USE set to '000'.
- 25 – Set RC_PARAMS_RECORD_S[i].REV_SCH_ACK_CH_WALSH[00] to NULL.
- 26 – Set RC_PARAMS_RECORD_S[i].REV_SCH_ACK_BIT[00] to NULL.
- 27 – Set RC_PARAMS_RECORD_S[i].REV_SCH_ACK_CH_WALSH[01] to NULL.
- 28 – Set RC_PARAMS_RECORD_S[i].REV_SCH_ACK_BIT[01] to NULL.
- 29 – Set RC_PARAMS_RECORD_S[i].FOR_FCH_CCSH_INTERLEAVER_TYPE to '0'.

30 2.6.17 RC_PARAMS_RECORD update procedures

31 The mobile station shall update RC_PARAMS_RECORD in Traffic Channel Substate as
32 follows:

- 33 • When a pilot is added to the active set for which there is no entry present in
- 34 RC_PARAMS_RECORD_S, the mobile station shall update RC_PARAMS_RECORD_S to
- 35 add an entry RC_PARAMS_RECORD_S[i] and perform the following:

- 1 – Set RC_PARAMS_RECORD_s[i].PILOT_PN to the PILOT_PN of the added pilot.
- 2 – Set RC_PARAMS_RECORD_s[i].QOF_SET_IN_USE to '000'.
- 3 – Set RC_PARAMS_RECORD_s[i].REV_SCH_ACK_CH_WALSH[00] to NULL.
- 4 – Set RC_PARAMS_RECORD_s[i]. REV_SCH_ACK_BIT[00] to NULL.
- 5 – Set RC_PARAMS_RECORD_s[i]. REV_SCH_ACK_CH_WALSH[01] to NULL.
- 6 – Set RC_PARAMS_RECORD_s[i]. REV_SCH_ACK_BIT[01] to NULL.
- 7 – Set RC_PARAMS_RECORD_s[i]. FOR_FCH_CCSH_INTERLEAVER_TYPE to '0'.
- 8 • When a pilot is removed from the active set for which there was an entry present in
- 9 RC_PARAMS_RECORD_s, the mobile station shall update RC_PARAMS_RECORD_s to
- 10 remove the entry.
- 11 • When a ~~an~~ *Radio Configuration Parameters Message* or *General Extension Message*
- 12 *carrying the Radio Configuration Parameters record* is received, the mobile station
- 13 shall update RC_PARAMS_RECORD_s as described in section 2.6.4.3.

14 2.6.18 Processing of General Extension Message

15 The base station may extend layer 3 messages with additional fields using the *General*
16 *Extension Message*. The mobile station shall process this message at the action time:

- 17 • ~~E~~xplicitly specified in the message carried in the MESSAGE_REC field, or
- 18 • implicitly specified by the message carried in the MESSAGE_REC field when action
- 19 time is not carried explicitly in the message carried in the MESSAGE_REC field.

20 The mobile station shall process this message as follows:

- 21 • The mobile station shall store the ith occurrence of the GE_REC_TYPE_r in
- 22 GE_REC_TYPE_s[i].
- 23 • The mobile station shall store the ith occurrence of the GE_REC_LEN_r in
- 24 GE_REC_LEN_s[i].
- 25 • If any General Extension Record type is not supported, the mobile station shall
- 26 send a *Mobile Station Reject Order* with ORDQ equal to 00011101.
- 27 • If any field value in any of the General Extension Records is outside its permissible
- 28 range, the mobile station shall send a *Mobile Station Reject Order* with ORDQ equal
- 29 to 00011110.
- 30 • If any field value in any of the General Extension Records is not supported, the
- 31 mobile station shall send a *Mobile Station Reject Order* with ORDQ equal to
- 32 00011111.
- 33 • The mobile station shall store the ith occurrence of the GE_REC_r as follows.
- 34 • If GE_REC_TYPE_s[i] is equal to '00000000' the mobile station shall store the
- 35 BAND_CLASS_r field in the GE_REC_r as BAND_CLASS_s and REV_CHAN_r field in the
- 36 GE_REC_r as REV_CHAN_s. The mobile station shall use the REV_CHAN_s channel

- 1 number of BAND_CLASS_s as the associated reverse link for the channel carried in
2 the message carried by the MESSAGE_REC field.
- 3 • If GE_REC_TYPE_s[i] is equal to '00000001' the mobile station shall store and use
4 the fields included in the Radio Configuration Parameters Record at the action time.
5 If the USE_TIME field in the Radio Configuration Parameters Record is set to '0'⁷⁷,
6 the mobile station shall process the message contained in the MESSAGE_REC and
7 then update the stored parameters by the values of the fields included in the Radio
8 Configuration Parameters Record as follows:
- 9 - If Radio Configuration Parameters Record is received with an *Extended Channel*
10 *Assignment Message* or a *MEID Extended Channel Assignment Message*, the
11 mobile station should initialize the radio configuration parameters and
12 RC PARAMS RECORD according to section 2.6.16 and then update the
13 parameters and RC PARAMS RECORD using the values included in the Radio
14 Configuration Parameters Record as described in 2.6.4.3.
- 15 - If Radio Configuration Parameters Record is received with *Universal Handoff*
16 *Direction Message* or an *Extended Handoff Direction Message* or a *General*
17 *Handoff Direction Message* or a *MEID Universal Handoff Direction Message* that
18 requires a hard handoff, the mobile station should initialize the Radio
19 Configuration Parameters and RC PARAMS RECORD according to section
20 2.6.16 and then update the parameters and RC PARAMS RECORD using the
21 values included in the Radio Configuration Parameters Record as described in
22 2.6.4.3.
- 23 • The mobile station shall use the MESSAGE_TYPE field as specified in [4] and
24 process the reception of layer 3 message carried in the MESSAGE_REC field.

25 2.6.19 Delayed ACK Record update procedures

26 The mobile station shall update Delayed ACK Record as follows:

- 27 • If the mobile station receives a Delayed ACK record in a General Extension Message
28 that contains FOR_SCH_DELAYED_ACK_MASK or
29 REV_SCH_DELAYED_ACK_MASK values that the mobile station does not support,
30 the mobile station shall send a Mobile Station Reject Order with ORDQ equal to
31 00011111.
- 32 • If the mobile station receives a Delayed ACK record in a General Extension Message
33 that contains FOR_SCH_DELAYED_ACK_MASK or
34 REV_SCH_DELAYED_ACK_MASK values that the mobile station can support, the
35 mobile station shall:

⁷⁷ The base station will set the USE_TIME field for Radio Configuration Parameters Record to '0' when this record is sent in a General Extension Message.

- 1 • If the FOR_SCH_DELAYED_ACK_MASK_INCL_r is set to '1', the mobile station shall
2 set FOR_SCH_DELAYED_ACK_MASKs to FOR_SCH_DELAYED_ACK_MASK value
3 received in the Delayed ACK record.
- 4 • If the REV_SCH_DELAYED_ACK_MASK_INCL_r is set to '1', the mobile station shall
5 set REV_SCH_DELAYED_ACK_MASKs to REV_SCH_DELAYED_ACK_MASK value
6 received in the Delayed ACK record.

7 The base station and mobile station may use the FOR_SCH_DELAYED_ACK_MASK or
8 REV_SCH_DELAYED_ACK_MASK to transmit an ACK or NAK for frame n during the
9 reception of frame n+1.⁷⁸⁷⁹

10 The mobile station should use the FOR_SCH_DELAYED_ACK_MASK to transmit an
11 acknowledgement only when the F-SCH is assigned to the mobile station.

12 2.6.20 SO 73 support for RL RC 8, FL RC 11 and 12 Operation

13 If the mobile station supports RL RC 8 or FL RC 11 or FL RC 12 then the mobile station
14 shall support Service Option 73 NB Mode (i.e. Operating Point 1 through 7 of Service
15 Option 73) and shall indicate support for SO 73 to the base station.

16 **2.7 PDU Formats for Mobile Stations**

17 This section describes the formats of the PDUs corresponding to the messages sent by the
18 mobile station.

19 In any multi-bit field in the following messages, the most significant bit (MSB) shall be
20 transmitted first.

21 Some bits in the PDUs are marked as RESERVED. These bits allow extension of the PDUs
22 for future features and capabilities. The mobile station sets all reserved bits to '0'. Some
23 fields include values marked as reserved. The mobile station shall not set a field to a value
24 that is marked as reserved.

25

⁷⁸ The physical layer characteristics of acknowledgement transmission using FOR_SCH_DELAYED_ACK_MASK and REV_SCH_DELAYED_ACK_MASK are similar to transmission using REV_SCH_ACK_MASK and FOR_SCH_ACK_MASK_RL_BLANKING and FOR_SCH_ACK_MASK_NO_RL_BLANKING.

⁷⁹ The base station will set one of the bit of the FOR_SCH_DELAYED_ACK_MASK_INCL and REV_SCH_DELAYED_ACK_MASK_INCL to '1' and other to '0' to prevent unnecessary ACK channel transmissions.

1 2.7.1 r-csch

2 This section describes the messages and their PDU formats sent by the mobile station on
3 the r-csch.

NUM_FLOW_DISCRIMINATOR+1 or 1 occurrences of the following variable length record:

{ (NUM_FLOW_DISCRIMINATOR+1) or 1

BCMC_FLOW_DISCRIMINATOR	BCMC_FLOW_DISCRIMINATOR_LEN
AUTH_SIGNATURE_IND	0 or 1
AUTH_SIGNATURE_SAME_IND	0 or 1

BAK_ID	0 or 4
AUTH_SIGNATURE	0 or 32

} (NUM_FLOW_DISCRIMINATOR+1) or 1

} (NUM_BCNC_PROGRAMS)

BAND_SUB_REP_INCL	0 or 1
NUM_BAND_SUBCLASS	0 or 4

NUM_BAND_SUBCLASS occurrences of the following field:

{ (NUM_BAND_SUBCLASS)

BAND_SUBCLASS_SUP	1
-------------------	---

} (NUM_BAND_SUBCLASS)

ADD_GEO_LOC_INCL	0 or 1
ADD_GEO_LOC_TYPE_LEN_IND	0 or 1
ADD_GEO_LOC_TYPE	0 or 16 or 24

REG_TYPE – Registration type.

This field indicates which type of event generated the registration attempt.

The mobile station shall set this field to the REG_TYPE value shown in Table 2.7.1.3.2.1-1 corresponding to the event that caused this registration to occur (see 2.6.5.1).

Table 2.7.1.3.2.1-1. Registration Type (REG_TYPE) Codes

REG_TYPE (binary)	Type of Registration
0000	Timer-based (see 2.6.5.1.3)
0001	Power-up (see 2.6.5.1.1)
0010	Zone-based (see 2.6.5.1.5)
0011	Power-down (see 2.6.5.1.2)
0100	Parameter-change (see 2.6.5.1.6)
0101	Ordered (see 2.6.5.1.7)
0110	Distance-based (see 2.6.5.1.4)
0111	User Zone-based (see 2.6.5.1.10)
1000	Encryption Re-sync required (see 2.6.5.1.11)
1001	BCMC Registration (see 2.6.13.3)
All other REG_TYPE values are reserved.	

- 2
- 3 SLOT_CYCLE_INDEX – Slot cycle index.
- 4 If P_REV_IN_USE_s is less than 11, or if
- 5 MIN_SLOT_CYCLE_INDEX is equal to '0', the mobile station
- 6 shall perform the following:
- 7
- 8 • If the mobile station is configured for slotted mode
 - 9 operation, the mobile station shall set this field to max (0,
 - 10 SLOT_CYCLE_INDEX_p) (see 2.6.2.1.1). Otherwise, the
 - 11 mobile station shall set this field to '000'.
- Otherwise, the mobile station shall perform the following:
- 12 • If the mobile station is configured for slotted mode
 - 13 operation, the mobile station shall set this field to the
 - 14 absolute value of the preferred slot cycle index,
 - 15 SLOT_CYCLE_INDEX_p (see 2.6.2.1.1); otherwise, the
 - 16 mobile station shall set this field to '000'. The sign of the
 - 17 preferred slot cycle index, SLOT_CYCLE_INDEX_p, is
 - 18 specified in the SIGN_SLOT_CYCLE_INDEX field of this
 - 19 message (see Table 2.7.1.3.2.1-8).
- 20 MOB_P_REV – Protocol revision of the mobile station.
- 21 The mobile station shall set this field to '00001100'.
- 22 SCM – Station class mark.
- 23 The mobile station shall set this field to its station class mark.
- 24 See 2.3.3.
- 25 MOB_TERM – Mobile terminated calls accepted indicator.

1 If the mobile station is configured to accept mobile terminated
 2 calls while operating with the current roaming status (see
 3 2.6.5.3), the mobile station shall set this bit to '1'. Otherwise,
 4 the mobile station shall set this bit to '0'.

5 RETURN_CAUSE – Reason of the mobile station registration or access.
 6 The mobile station shall set this field to the RETURN_CAUSE
 7 value shown in Table 2.7.1.3.2.1-2 corresponding to the
 8 service redirection failure condition (see 2.6.1.1).

9

10 **Table 2.7.1.3.2.1-2. RETURN_CAUSE Codes**

RETURN_CAUSE (binary)	Redirect Failure Condition
0000	Normal access.
0001	Service redirection failed as a result of system not found.
0010	Service redirection failed as a result of protocol mismatch.
0011	Service redirection failed as a result of registration rejection.
0100	Service redirection failed as a result of wrong SID.
0101	Service redirection failed as a result of wrong NID.
All other RETURN_CAUSE values are reserved.	

11

12 QPCH_SUPPORTED – Quick Paging Channel supported indicator.
 13 If P_REV_IN_USE_s is less than six, the mobile station shall
 14 omit this field; otherwise, the mobile station shall include this
 15 field and set it as follows.

16 If the mobile station supports the Quick Paging Channel, the
 17 mobile station shall set this field to '1'; otherwise, the mobile
 18 station shall set this field to '0'.

19 ENHANCED_RC – Enhanced radio configuration supported indicator.
 20 If P_REV_IN_USE_s is less than six, the mobile station shall
 21 omit this field; otherwise, the mobile station shall include this
 22 field and set it as follows.

23 If the mobile station supports any radio configuration in the
 24 Radio Configuration Class 2 (see 1.1.1), the mobile station
 25 shall set this field to '1'; otherwise, the mobile station shall set
 26 this field to '0'.

27 UZID_INCL – User Zone Identifier included indicator.

- 1 If P_REV_IN_USE_S is less than six, the mobile station shall
 2 omit this field; otherwise, the mobile station shall include this
 3 field and set it as follows.
- 4 If the message is to contain the User Zone Identifier, the
 5 mobile station shall set this field to '1'; otherwise, the mobile
 6 station shall set this field to '0'.
- 7 UZID – User Zone Identifier.
- 8 If the UZID_INCL is included in the message and is set to '1',
 9 the mobile station shall include this field and set it to UZID_S;
 10 otherwise, the mobile station shall omit this field.
- 11 GEO_LOC_INCL – Geo-location included indicator.
- 12 If P_REV_IN_USE_S is less than seven, the mobile station shall
 13 omit this field; otherwise, the mobile station shall include this
 14 field and set it as follows.
- 15 If the message is to contain the GEO_LOC_TYPE field, the
 16 mobile station shall set this field to '1'; otherwise, the mobile
 17 station shall set this field to '0'.
- 18 GEO_LOC_TYPE – Geo-Location Type.
- 19 If GEO_LOC_INCL is included in the message and is set to '1',
 20 the mobile station shall include this field and shall set it to
 21 the value shown in Table 2.7.1.3.2.4-7; otherwise, the mobile
 22 station shall omit this field.
- 23 OTD_SUPPORTED – Orthogonal Transmit Diversity supported.
- 24 If P_REV_IN_USE_S is less than seven, the mobile station shall
 25 omit this field; otherwise, the mobile station shall include this
 26 field and set it as follows.
- 27 The mobile station shall set this field to '1' if Orthogonal
 28 Transmit Diversity is supported; otherwise, the mobile station
 29 shall set this field to '0'.
- 30 STS_SUPPORTED – Space Time Spreading Transmit Diversity supported.
- 31 If P_REV_IN_USE_S is less than seven, the mobile station shall
 32 omit this field; otherwise, the mobile station shall include this
 33 field and set it as follows.
- 34 The mobile station shall set this field to '1', if Space Time
 35 Spreading Transmit Diversity is supported; otherwise, the
 36 mobile station shall set this field to '0'.
- 37 3X_CCH_SUPPORTED – 3X Common Channels supported.
- 38 If P_REV_IN_USE_S is less than seven, the mobile station shall
 39 omit this field; otherwise, the mobile station shall include this
 40 field and set it as follows.
- 41 The mobile station shall set this field to '1' if the mobile
 42 station supports the Spreading Rate 3 common channels (3X
 43 BCCH, 3X F-CCCH, and 3X R-EACH); otherwise, the mobile
 44 station shall set this field to '0'.

- 1 WLL_INCL – WLL information included indicator.
 2 If P_REV_IN_USE_s is less than seven, the mobile station shall
 3 omit this field; otherwise, the mobile station shall include this
 4 field and set it as follows.
 5 If the mobile station is a Wireless Local Loop device, the
 6 mobile station shall set this field to ‘1’; otherwise, the mobile
 7 station shall set this field to ‘0’.
- 8 WLL_DEVICE_TYPE – WLL device type indicator.
 9 If WLL_INCL is not included, or if WLL_INCL is included and
 10 is set to ‘0’, the mobile station shall omit this field; otherwise,
 11 the mobile station shall set this field as follows.
 12 The mobile station shall set this field to the
 13 WLL_DEVICE_TYPE value shown in Table 2.7.1.3.2.1-3
 14 corresponding to the mobile station device type.

15 **Table 2.7.1.3.2.1-3. WLL Device Types**

WLL_DEVICE_TYPE (binary)	Description
000	Wireless Local Loop terminal with no mobility
001	Wireless Local Loop terminal with limited mobility
010	Wireless Local Loop terminal with full mobility
011 - 111	Reserved

- 16
- 17 HOOK_STATUS – WLL terminal hook status.
 18 If WLL_INCL is not included, or if WLL_INCL is included and
 19 is set to ‘0’, the mobile station shall omit this field; otherwise,
 20 the mobile station shall set this field to the value shown in
 21 Table 2.7.1.3.2.1-4 corresponding to the hook state.

1

Table 2.7.1.3.2.1-4. Hook Status Values

HOOK_STATUS (binary)	Description
0000	Subscriber terminal is on-hook
0001	Subscriber terminal is off-hook
0010	Subscriber terminal is stuck off-hook
0011 – 1111	Reserved

2

3

ENC_INFO_INCL – Encryption fields included.

4

If P_REV_IN_USE_S is less than seven, the mobile station shall omit this field; otherwise, the mobile station shall include this field and set it as follows.

5

6

7

The mobile station shall set this field to '1' if the encryption related fields are included; otherwise the mobile station shall set this field to '0'. The mobile station shall set this field to '0' if the base station does not support encryption or the mobile station does not support any of the encryption modes supported by the base station.

8

9

10

11

12

13

SIG_ENCRYPT_SUP – Signaling encryption supported indicator.

14

If ENC_INFO_INCL is included and is set to '1', the mobile station shall include this field; otherwise, the mobile station shall omit this field. If this field is included, the mobile station shall set this field to indicate which signaling encryption algorithms are supported by the mobile station.

15

16

17

18

1 This field consists of the subfields shown in Table 2.7.1.3.2.1-
 2 5.

3 **Table 2.7.1.3.2.1-5. Encoding of the SIG_ENCRYPT_SUP Field**

Subfield	Length (bits)	Subfield Description
CMEA	1	Support of Cellular Message Encryption Algorithm
ECMEA	1	Support of Enhanced Cellular Message Encryption Algorithm
REA	1	Support of the Rijndael Encryption Algorithm
RESERVED	5	Reserved bits

4 If this field is included, the mobile station shall set the
 5 subfields as follows:

6 The mobile station shall set the CMEA subfield to '1'.

7 The mobile station shall set each other subfield to '1' if the
 8 corresponding signaling encryption algorithm is supported by
 9 the mobile station; otherwise, the mobile station shall set the
 10 subfield to '0'.

11 The mobile station shall set the RESERVED subfield to
 12 '00000'.

13 C_SIG_ENCRYPT_REQ – Common Channel signaling message encryption request
 14 indicator.

15 If ENC_INFO_INCL is included and is set to '1', the mobile
 16 station shall include this field; otherwise, the mobile station
 17 shall omit this field. If this field is included, the mobile
 18 station shall set this field to '1' to request signaling encryption
 19 to be turned on for signaling messages sent on f-csch and r-
 20 csch, and to '0' to request signaling encryption to be turned
 21 off for signaling messages sent on f-csch and r-csch.

22 NEW_SSEQ_H – The 24-bit value used to initialize the 24 MSB of the crypto-
 23 sync.

24 If SIG_ENCRYPT_SUP is included and the ECMEA or REA
 25 subfield in SIG_ENCRYPT_SUP is set to '1', the mobile station
 26 shall include this field; otherwise, the mobile station shall
 27 omit this field. If this field is included, the mobile station
 28 shall set this field to a 24-bit value that will be used as the
 29 initial value of the 24 MSB of the crypto-sync for both forward
 30 and reverse link message encryption and integrity (if message
 31 integrity is performed).

32 NEW_SSEQ_H_SIG – The signature of NEW_SSEQ_H

- 1 If NEW_SSEQ_H is included, the mobile station shall include
 2 this field; otherwise, the mobile station shall omit this field. If
 3 this field is included, the mobile station shall set this field to
 4 the digital signature of the NEW_SSEQ_H computed as
 5 described in 2.3.12.4.5.
- 6 UI_ENCRYPT_SUP - User information encryption supported indicator.
- 7 If ENC_INFO_INCL is included and is set to '1', the mobile
 8 station shall include this field; otherwise, the mobile station
 9 shall omit this field. If this field is included, the mobile
 10 station shall set this field to indicate the supported user
 11 information encryption algorithms.
- 12 This field consists of the subfields shown in Table 2.7.1.3.2.4-
 13 9.
- 14 The mobile station shall set each subfield to '1' if the
 15 corresponding user information encryption algorithm is
 16 supported by the mobile station; otherwise, the mobile station
 17 shall set the subfield to '0'.
- 18 The mobile station shall set the RESERVED subfield to
 19 '000000'.
- 20 MSG_INT_INFO_INCL - Signaling message integrity information included indicator.
- 21 If P_REV_IN_USE_s is less than nine, the mobile station shall
 22 omit this field; otherwise, the mobile station shall include this
 23 field and set it as follows.
- 24 If MSG_INTEGRITY_SUP_s is equal to '0', the mobile station
 25 shall set this field to '0'; otherwise, the mobile station shall set
 26 this field to '1'.
- 27 SIG_INTEGRITY_SUP_INCL - Signaling message integrity information included
 28 indicator.
- 29 If MSG_INT_INFO_INCL is included and is set to '1', the
 30 mobile station shall include this field and set it as follows;
 31 otherwise, the mobile station shall omit this field.
- 32 If the mobile station supports other integrity algorithm(s) in
 33 addition to the default integrity algorithm, the mobile station
 34 shall set this field to '1'; otherwise, the mobile station shall set
 35 this field to '0'.
- 36 SIG_INTEGRITY_SUP - Signaling integrity algorithm supported by the mobile station.
- 37 If SIG_INTEGRITY_SUP_INCL is included and is set to '1', the
 38 mobile station shall set this field as follows; otherwise, the
 39 mobile station shall omit this field.
- 40 The mobile station shall set this field to indicate the
 41 supported message integrity algorithms in addition to the
 42 default integrity algorithm.

This field consists of the subfields shown in Table 2.7.1.3.2.1-6.

The mobile station shall set each subfield to ‘1’ if the corresponding message integrity algorithm is supported by the mobile station; otherwise, the mobile station shall set the subfield to ‘0’.

Table 2.7.1.3.2.1-6. Encoding of the SIG_INTEGRITY_SUP Field

Subfield	Length (bits)	Subfield Description
RESERVED	8	Reserved bits

The mobile station shall set the RESERVED subfield to ‘00000000’.

SIG_INTEGRITY_REQ - Signaling message integrity algorithm requested by the mobile station.

If SIG_INTEGRITY_SUP_INCL is included and is set to ‘1’, the mobile station shall set this field as follows; otherwise, the mobile station shall omit this field.

The mobile station shall include this field and set it to the value corresponding to the message integrity algorithm requested as shown in Table 2.7.1.3.2.1-7.

Table 2.7.1.3.2.1-7. Encoding of the SIG_INTEGRITY_REQ Field

SIG_INTEGRITY_REQ	Value	Description
DEFAULT_UIA	‘000’	Default message integrity algorithm
RESERVED	‘001’ – ‘111’	Reserved

NEW_KEY_ID - New key identifier.

If MSG_INT_INFO_INCL is included and is set to ‘1’, the mobile station shall include this field and set it as follows; otherwise, the mobile station shall omit this field.

The mobile station shall set this field as follows:

- If LAST_2G_KEY_ID equals ‘00’, the mobile station shall set this field to ‘01’.
- If LAST_2G_KEY_ID equals ‘01’, the mobile station shall set this field to ‘00’.

NEW_SSEQ_H_INCL - The 24-bit value used to initialize the 24 MSB of crypto-sync.

If MSG_INT_INFO_INCL is included and is set to ‘1’, the mobile station shall include this field and set it as follows; otherwise, the mobile station shall omit this field.

The mobile station shall set this field to ‘0’ if any of the following is true:

1

Table 2.7.1.3.2.1-8. Slot Cycle Index Values

Slot Cycle Index Value	SIGN_SLOT_CYCLE_INDEX	SLOT_CYCLE_INDEX	RSCI, REQ_RSCI	Slot Cycle Length
-7	N/A	N/A	0111	Non-slotted
-4	0	100	0100	0.08s (1 slot)
-3	0	011	0011	0.16s (2 slots)
-2	0	010	0010	0.32s (4 slots)
-1	0	001	0001	0.64s (8 slots)
0	omitted	000	0000	1.28s (16 slots)
1	1	001	1001	2.56s (32 slots)
2	1	010	1010	5.12s (64 slots)
3	1	011	1011	10.24s (128 slots)
4	1	100	1100	20.48s (256 slots)
5	1	101	1101	40.96s (512 slots)
6	1	110	1110	81.92s (1024 slots)
7	1	111	N/A	163.84s (2048 slots)
All other values reserved.				

2

3

1	BCMC_FREQ_INFO_INCL-	BCMC frequency information included indicator.
2		If the REG_TYPE field is not set to '1001', the mobile station
3		shall omit this field; otherwise, the mobile station shall
4		include this field and set it as follows:
5		If the BCMC band class and frequency fields are included in
6		this message, the mobile station shall set this field to '1';
7		otherwise, the mobile station shall set this field to '0'.
8		If this Registration Message is being sent only to request
9		transmission of BCMC flows, the mobile station shall set this
10		field to '0'.
11	BCMC_BAND_CLASS -	BCMC Band Class.
12		If the BCMC_FREQ_INFO_INCL field is not included or is
13		included and is set to '0', the mobile station shall omit this
14		field; otherwise, the mobile station shall include this field and
15		set it as follows:
16		The mobile station shall set this field to the CDMA band class,
17		as specified in [30], corresponding to the CDMA frequency
18		assignment for the CDMA Channel containing the Forward
19		Broadcast Supplemental Channel that the mobile station will
20		tune to upon receiving confirmation of delivery of this
21		message.
22	BCMC_CDMA_FREQ -	BCMC Frequency.
23		If the BCMC_FREQ_INFO_INCL field is not included or is
24		included and is set to '0', the mobile station shall omit this
25		field; otherwise, the mobile station shall include this field and
26		set it as follows:
27		The mobile station shall set this field to the CDMA Channel
28		number corresponding to the CDMA frequency assignment for
29		the CDMA Channel containing the Forward Broadcast
30		Supplemental Channel that the mobile station will tune to
31		upon receiving confirmation of delivery of this message.
32	NUM_BCMC_PROGRAMS-	Number of BCMC programs being registered.
33		If the REG_TYPE field is not set to '1001', the mobile station
34		shall omit this field; otherwise, the mobile station shall
35		include this field and set it as follows:
36		The mobile station shall set this field to the number of BCMC
37		programs included in this message.
38	AUTH_SIGNATURE_INCL -	Authorization signature included indication.
39		If the REG_TYPE field is not set to '1001', the mobile station
40		shall omit this field; otherwise, the mobile station shall
41		include this field and set it as follows:
42		The mobile station shall set this field to '1' to indicate that the
43		authorization signature is included in this message for some
44		of the BCMC flows included in this message; otherwise, the
45		mobile station shall set this field to '0'.

1 TIME_STAMP_SHORT_LENGTH - Length of time stamp included in this message.

2 If the AUTH_SIGNATURE_INCL field is not included or is
3 included and is set to '0', the mobile station shall omit this
4 field; otherwise, the mobile station shall include this field and
5 set it as follows:

6 The mobile station shall set this field to the length of the time
7 stamp, in units of bits, included in this message.

8 TIME_STAMP_SHORT - Time stamp short.

9 If the AUTH_SIGNATURE_INCL field is not included or is
10 included and is set to '0', the mobile station shall omit this
11 field; otherwise, the mobile station shall include this field and
12 set it as follows:

13 The mobile station shall set this field to the
14 TIME_STAMP_SHORT_LENGTH least significant bits of the
15 time stamp parameter used to generate the Authorization
16 signature included in this message.

17 The mobile station shall include NUM_BCMC_PROGRAMS occurrences of the following
18 fields:

19 BCMC_PROGRAM_ID_LEN - Length of BCMC_PROGRAM_ID field

20 The mobile station shall set this field to one less than the
21 length, in bits, of the BCMC_PROGRAM_ID of this program.

22 BCMC_PROGRAM_ID - BCMC program Identifier

23 The length of this field shall be one more than the value of
24 BCMC_PROGRAM_ID_LEN bits.

25 The mobile station shall set this field to the identifier of the
26 BCMC program corresponding to one or more flows that the
27 mobile station will continue to monitor or start to monitor
28 upon receiving confirmation of delivery of this message or is
29 requesting transmission.

30 BCMC_FLOW_DISCRIMINATOR_LEN - Length of BCMC_FLOW_DISCRIMINATOR field

31 The mobile station shall set this field to the length, in bits, of
32 the BCMC_FLOW_DISCRIMINATOR of this program. To
33 request all flows associated with this BCMC_PROGRAM_ID,
34 the mobile station may set this field to '000'.

35 NUM_FLOW_DISCRIMINATOR - Number of BCMC flow discriminators.

36 The length of this field shall be determined by the value of the
37 BCMC_FLOW_DISCRIMINATOR_LEN as follows: if
38 BCMC_FLOW_DISCRIMINATOR_LEN is set to '000', this field
39 is omitted; otherwise, the length of this field shall be
40 BCMC_FLOW_DISCRIMINATOR_LEN bits.

41 The mobile station shall set this field to the number of flow
42 discriminators included for this program minus one.

1 If NUM_FLOW_DISCRIMINATOR field is included, the mobile station shall include
 2 NUM_FLOW_DISCRIMINATOR+1 occurrences of the following variable length record;
 3 otherwise, the mobile station shall include 1 occurrence of the following variable length
 4 record:

5 BCMC_FLOW_DISCRIMINATOR – BCMC Flow discriminator.

6 The length of this field shall be determined by the value of the
 7 BCMC_FLOW_DISCRIMINATOR_LEN as follows: if
 8 BCMC_FLOW_DISCRIMINATOR_LEN is set to '000', this field
 9 is omitted; otherwise, the length of this field shall be
 10 BCMC_FLOW_DISCRIMINATOR_LEN bits.

11 The mobile station shall set this field to the discriminator of
 12 the BCMC flow that the mobile station will continue to
 13 monitor or start to monitor upon receiving confirmation of
 14 delivery of this message or is requesting transmission.

15 AUTH_SIGNATURE_IND - Authorization signature indicator.

16 If the AUTH_SIGNATURE_INCL field is not included or is
 17 included and is set to '0', the mobile station shall omit this
 18 field; otherwise, the mobile station shall include this field and
 19 set it as follows:

20 The mobile station shall set this field to '1' to indicate that the
 21 authorization signature is included in this message for this
 22 BCMC flow; otherwise, the mobile station shall set this field to
 23 '0'.

24 AUTH_SIGNATURE_SAME_IND - Authorization signature same as previous BCMC
 25 flow indicator.

26 If the AUTH_SIGNATURE_IND field is not included or is
 27 included and is set to '0', the mobile station shall omit this
 28 field; otherwise, the mobile station shall include this field and
 29 set it as follows:

30 The mobile station shall set this field to '1' to indicate that the
 31 authorization signature generated for this BCMC flow is the
 32 same as the one generated for the BCMC flow listed prior to
 33 this BCMC flow in this message; otherwise, the mobile station
 34 shall set this field to '0'.

35 For the first BCMC flow listed in this message, the mobile
 36 station shall set this field to '0'.

37 BAK_ID - BAK identifier.

38 If the AUTH_SIGNATURE_SAME_IND field is not included or
 39 is included and is set to '1', the mobile station shall omit this
 40 field; otherwise, the mobile station shall include this field and
 41 set it as follows:

- 1 The mobile station shall set this field to BAK identifier used to
 2 generate the Authorization signature included in this
 3 message.
- 4 AUTH_SIGNATURE - Authorization signature.
- 5 If the AUTH_SIGNATURE_SAME_IND field is not included or
 6 is included and is set to '1', the mobile station shall omit this
 7 field; otherwise, the mobile station shall include this field and
 8 set it as follows:
- 9 The mobile station shall set this field to the Authorization
 10 signature computed for this BCMC flow as specified in
 11 2.6.13.9.
- 12 BAND_SUB_REP_INCL - Band class - band subclass report included
- 13 If P_REV_IN_USE_S is less than eleven, the mobile station shall
 14 omit this field; otherwise, the mobile station shall include this
 15 field and set it as follows:
- 16 If CAND_BAND_INFO_REQ_S is equal to '1' and the mobile
 17 station supports at least 1 band class and band subclass (if
 18 applicable) combination queried by the base station, the
 19 mobile station shall set this field to '1'; otherwise, the mobile
 20 station shall set this field to '0'.
- 21
- 22 NUM_BAND_SUBCLASS - Number of band class - band subclass capabilities reported
- 23 If BAND_SUB_REP_INCL is set to '0' or is not included, this
 24 field shall be omitted; otherwise, the mobile station shall
 25 include this field and set it as follows:
- 26 If the mobile station supports all candidate band class and
 27 band subclass (if applicable) combinations queried by the
 28 base station, the mobile station shall set this field to '0000';
 29 otherwise, the mobile station shall set this field to the number
 30 of band class-band subclass capabilities reported.
- 31 If the NUM_BAND_SUBCLASS field is included in this message, the mobile station shall
 32 include NUM_BAND_SUBCLASS occurrences of the BAND_SUBCLASS_SUP field:
- 33 BAND_SUBCLASS_SUP - Band class - Band subclass supported indicator
- 34 The mobile station shall set this field as specified in section
 35 2.6.14.1.
- 36 ADD_GEO_LOC_INCL - Additional Geo-location included indicator.
- 37 If P_REV_IN_USE_S is less than twelve, the mobile station shall
 38 omit this field; otherwise, the mobile station shall include this
 39 field and set it as follows.

1 If the message is to contain the ADD_GEO_LOC_TYPE field,
2 the mobile station shall set this field to '1'; otherwise, the
3 mobile station shall set this field to '0'.

4 ADD_GEO_LOC_TYPE_LEN_IND – Additional Geo-Location Type Length Indicator.

5 If ADD_GEO_LOC_INCL is included in the message and is set
6 to '1', the mobile station shall include this field and shall set it
7 as described below; otherwise, the mobile station shall omit
8 this field.

9 The mobile station shall set this field to '0' to indicate length
10 of the ADD_GEO_LOC_TYPE field is 16 bits. The mobile
11 station shall set this field to '1' to indicate length of the
12 ADD_GEO_LOC_TYPE field is 24 bits.

13 ADD_GEO_LOC_TYPE – Additional Geo-Location Type.

14 If ADD_GEO_LOC_INCL is included in the message and is set
15 to '1', the mobile station shall include this field and shall set it
16 as described below; otherwise, the mobile station shall omit
17 this field.

18 This field consists of the subfields shown in 2.7.4.46-1.

19 The mobile station shall set each subfield to '1' if the
20 corresponding capability is supported by the mobile station;
21 otherwise, the mobile station shall set the subfield to '0'.

22

1 2.7.1.3.2.2 Order Message
 2 MSG_TAG: ORDM

3

Field	Length (bits)
ORDER	6
ADD_RECORD_LEN	3
Order-specific fields (if used)	8 × ADD_RECORD_LEN

4

- 5 ORDER – Order code.
 6 The mobile station shall set this field to the ORDER code
 7 (see 2.7.3) for this type of *Order Message*.
 8 ADD_RECORD_LEN – Additional record length.
 9 The mobile station shall set this field to the number of octets
 10 in the order-specific fields included in this message.
 11 order-specific fields – Order-specific fields.
 12 The mobile station shall include order-specific fields as
 13 specified in 2.7.3.

14

2.7.1.3.2.3 Data Burst Message

MSG_TAG: DBM

Field	Length (bits)
MSG_NUMBER	8
BURST_TYPE	6
NUM_MSGS	8
NUM_FIELDS	8

NUM_FIELDS occurrences of the following field:

{ (NUM_FIELDS)

CHAR _i	8
-------------------	---

} (NUM_FIELDS)

- MSG_NUMBER – Message number within the data burst stream.
The mobile station shall set this field to the number of this message within the data burst stream.
- BURST_TYPE – Data burst type.
The mobile station shall set the value of this field for the type of this data burst as defined in [30]. If the mobile station sets this field equal to ‘111110’, it shall set the first two CHAR_i fields of this message equal to EXTENDED_BURST_TYPE_INTERNATIONAL as described in the definition of CHAR_i below. If the mobile station sets this field equal to ‘111111’, it shall set the first two CHAR_i fields of this message equal to the EXTENDED_BURST_TYPE as described in the definition of CHAR_i below.
- NUM_MSGS – Number of messages in the data burst stream.
The mobile station shall set this field to the number of messages within this data burst stream.
- NUM_FIELDS – Number of characters in this message.
The mobile station shall set this field to the number of CHAR_i fields included in this message.
- CHAR_i – Character.
The mobile station shall include NUM_FIELDS occurrences of this field. The mobile station shall set these fields to the corresponding octet of the data burst stream.

7
8
9
10
11
12
13

If the BURST_TYPE field of this message is equal to '111110', the first two CHAR_i octets shall represent a 16 bit EXTENDED_BURST_TYPE_INTERNATIONAL field, which is encoded as shown below. The first ten bits of this field contain a binary mapping of the Mobile Country Code (MCC). Encoding of the MCC shall be as specified in 2.3.1.3. The remaining six bits of the EXTENDED_BURST_TYPE_INTERNATIONAL field shall specify the COUNTRY_BURST_TYPE. The mobile station shall set the value of the COUNTRY_BURST_TYPE according to the type of this data burst as defined in standards governed by the country where this data burst type is to be used.

Field	Length (bits)
Mobile Country Code	10
COUNTRY_BURST_TYPE	6
Remaining CHAR _i fields	8 × (NUM_FIELDS - 2)

14
15
16
17
18
19
20

If the BURST_TYPE field of this message is equal to '111111', the first two CHAR_i octets shall represent a single, 16 bit, EXTENDED_BURST_TYPE field, as shown below. The mobile station shall set the value of the EXTENDED_BURST_TYPE according to the type of this data burst as defined in [30].

Field	Length (bits)
EXTENDED_BURST_TYPE (first two CHAR _i fields)	16
Remaining CHAR _i fields	8 × (NUM_FIELDS - 2)

- MOB_TERM – Mobile terminated calls accepted indicator.
- If the mobile station is configured to accept mobile terminated calls while operating with the current roaming status (see 2.6.5.3), the mobile station shall set this bit to ‘1’; otherwise, the mobile station shall set this bit to ‘0’.
- SLOT_CYCLE_INDEX – Slot cycle index.
- If P_REV_IN_USE_s is less than 11, or if MIN_SLOT_CYCLE_INDEX is equal to ‘0’, the mobile station shall perform the following:
- If the mobile station is configured for slotted mode operation, the mobile station shall set this field to max (0, SLOT_CYCLE_INDEX_p) (see 2.6.2.1.1). Otherwise, the mobile station shall set this field to ‘000’.
- Otherwise, the mobile station shall perform the following:
- If the mobile station is configured for slotted mode operation, the mobile station shall set this field to the absolute value of the preferred slot cycle index, SLOT_CYCLE_INDEX_p (see 2.6.2.1.1); otherwise, the mobile station shall set this field to ‘000’. The sign of the preferred slot cycle index, SLOT_CYCLE_INDEX_p, is specified in the SIGN_SLOT_CYCLE_INDEX field of this message (see Table 2.7.1.3.2.1-8).
- MOB_P_REV – Protocol revision of the mobile station.
- The mobile station shall set this field to ‘00001100’.
- SCM – Station class mark.
- The mobile station shall set this field to the station class mark of the mobile station. See 2.3.3.
- REQUEST_MODE – Requested mode code.
- The mobile station shall set this field to the value shown in Table 2.7.1.3.2.4-1 corresponding to its current configuration.

1

Table 2.7.1.3.2.4-1. REQUEST_MODE Codes

Value (binary)	Requested Mode
000	Reserved
001	CDMA only
010	Reserved (Previously: Wide analog only)
011	Reserved (Previously: Either wide analog or CDMA only)
100	Reserved (Previously: Narrow analog only)
101	Reserved (Previously: Either narrow analog or CDMA only)
110	Reserved (Previously: Either narrow analog or wide analog only)
111	Reserved (Previously: Narrow analog or wide analog or CDMA)

2

3

SPECIAL_SERVICE – Special service option indicator.

4

5

6

To request a special service option, the mobile station shall set this field to '1'. To request the default service option (Service Option 1), the mobile station shall set this field to '0'.

7

SERVICE_OPTION – Requested service option for this origination.

8

9

10

11

If the SPECIAL_SERVICE field is set to '1', the mobile station shall set this field to the value specified in [30], corresponding to the requested service option. If the SPECIAL_SERVICE field is set to '0', the mobile station shall omit this field.

12

PM – Privacy mode indicator.

13

14

To request voice privacy, the mobile station shall set this field to '1'; otherwise, the mobile station shall set this field to '0'.

15

DIGIT_MODE – Digit mode indicator.

16

17

This field indicates whether the dialed digits are 4-bit DTMF codes or 8-bit ASCII codes using a specified numbering plan.

18

19

20

21

22

To originate the call using the binary representation of DTMF digits (i.e., CHARi fields are represented in Table 2.7.1.3.2.4-4), the mobile station shall set this field to '0'. To originate the call using ASCII characters, the mobile station shall set this field to '1'.

23

NUMBER_TYPE – Type of number.

24

25

26

27

28

The mobile station shall set this field to the NUMBER_TYPE value shown in Table 2.7.1.3.2.4-2 corresponding to the type of the number as defined in [7], Section 4.5.9. If the DIGIT_MODE field is set to '0' and P_REV_IN_USE_s is less than 9, the mobile station shall omit this field.

1
2
3
4
5
6

If this field is included and the mobile station determines that the user has entered an international number (for example, with a leading “+” as specified in [39] for Plus Code Dialing or an international access code), the mobile station should set this field to ‘001’.

Table 2.7.1.3.2.4-2. Number Types

Description	NUMBER_TYPE (binary)
Unknown	000
International number	001
National number	010
Network-specific number	011
Subscriber number	100
Reserved	101
Abbreviated number	110
Reserved for extension	111

15

NUMBER_PLAN – Numbering plan.

If the DIGIT_MODE field is set to ‘1’, the mobile station shall set this field to the NUMBER_PLAN value shown in Table 2.7.1.3.2.4-3 corresponding to the requested numbering plan as defined in [7], Section 4.5.9. If the DIGIT_MODE field is set to ‘0’, the mobile station shall omit this field.

Table 2.7.1.3.2.4-3. Numbering Plan Identification

Description	NUMBER_PLAN (binary)
Unknown	0000
ISDN/Telephony numbering plan ([17] and [16])	0001
Data numbering plan ([20])	0011
Telex numbering plan ([19])	0100
Private numbering plan	1001
Reserved for extension	1111
All other NUMBER_PLAN codes are reserved.	

16
17

MORE_FIELDS – More dialed digits indicator.

- 1 This field indicates whether additional dialed digits will be
 2 sent in a later *Origination Continuation Message*.
- 3 If all dialed digits will fit into this message, the mobile station
 4 shall set this field to '0'. If not, the mobile station shall set
 5 this field to '1'.
- 6 NUM_FIELDS – Number of dialed digits in this message.
 7 The mobile station shall set this field to the number of dialed
 8 digits included in this message.
- 9 CHARi – A dialed digit or character.
 10 The mobile station shall include NUM_FIELDS occurrences of
 11 this field. If the DIGIT_MODE field is set to '0', the mobile
 12 station shall set each occurrence of this field to the code value
 13 shown in Table 2.7.1.3.2.4-4 corresponding to the dialed
 14 digit. If the DIGIT_MODE field is set to '1', the mobile station
 15 shall set each occurrence of this field to the ASCII
 16 representation corresponding to the dialed digit, as specified
 17 in [9], with the most significant bit set to '0'.

18

19

Table 2.7.1.3.2.4-4. Representation of DTMF Digits

Digit	Code (binary)	Digit	Code (binary)
1	0001	7	0111
2	0010	8	1000
3	0011	9	1001
4	0100	0	1010
5	0101	*	1011
6	0110	#	1100
All other codes are reserved.			

20

- 21 NAR_AN_CAP – Narrow analog capability.
 22 If the mobile station is capable of narrow analog operation,
 23 the mobile station shall set this bit to '1'; otherwise, the
 24 mobile station shall set this bit to '0'. The mobile station shall
 25 set this bit to '0'.
- 26 PACA_REORIG – PACA re-origination.
 27 If this is a user directed origination, the mobile station shall
 28 set this field to '0'. If this is a PACA re-origination, the mobile
 29 station shall set this field to '1'.
- 30 RETURN_CAUSE – Reason for the mobile station registration or access.
 31 The mobile station shall set this field to the RETURN_CAUSE
 32 value shown in Table 2.7.1.3.2.1-2 corresponding to the
 33 service redirection failure condition (see 2.6.1.1).

- 1 **MORE_RECORDS** – More records indicator.
- 2 This field indicates whether information records will be sent
- 3 in a later *Origination Continuation Message*. If information
- 4 records will be sent, the mobile station shall set this field to
- 5 ‘1’; otherwise, the mobile station shall set this field to ‘0’.
- 6 **ENCRYPTION_SUPPORTED** – Encryption algorithms supported by the mobile station.
- 7 If P_REV_IN_USE_s is greater than or equal to seven or
- 8 AUTH_MODE is equal to ‘00’, the mobile station shall omit the
- 9 ENCRYPTION_SUPPORTED field. If P_REV_IN_USE_s is less
- 10 than seven and AUTH_MODE is not equal to ‘00’, the mobile
- 11 station shall set this field as specified in Table 2.7.1.3.2.4-5.

12
13 **Table 2.7.1.3.2.4-5. Encryption Algorithms Supported**

Description	ENCRYPTION_SUPPORTED (binary)
Basic encryption supported	0000
Basic and Enhanced encryption supported	0001
Reserved	0010 - 1111

- 14
- 15 **PACA_SUPPORTED** – CDMA PACA support indication.
- 16 This field identifies the mobile station’s support for PACA in
- 17 CDMA mode. The mobile station shall set this field to ‘1’.
- 18 **NUM_ALT_SO** – Number of alternative service options.
- 19 If P_REV_IN_USE_s is less than seven, the mobile station shall
- 20 set this field to the number of alternative service options it
- 21 supports other than the one specified in the
- 22 SERVICE_OPTION field. The mobile station shall set this field
- 23 to a value less than or equal to MAX_NUM_ALT_SO_s.
- 24 If P_REV_IN_USE_s is equal to or greater than seven, the
- 25 mobile station shall set this field to the number of alternate
- 26 service options, which either have no service option group
- 27 number assigned or do not belong to the same service option
- 28 group whose bitmap is being included. The alternate service
- 29 option numbers are other than the one specified in the
- 30 SERVICE_OPTION field. The mobile station shall set this field
- 31 to a value less than or equal to MAX_NUM_ALT_SO_s.
- 32 **ALT_SO** – Alternative service option.
- 33 If P_REV_IN_USE_s is less than 7, the mobile station shall
- 34 include NUM_ALT_SO occurrences of this field. The mobile
- 35 station shall set this field to the value specified in [30],
- 36 corresponding to the alternative service option supported by
- 37 the mobile station.

- 1 If P_REV_IN_USE_S is equal to or greater than seven, the
 2 mobile station shall include NUM_ALT_SO occurrences of this
 3 field. The mobile station shall set this field to the service
 4 option number defined in [30] corresponding to the alternate
 5 service options which either have no service option group
 6 number assigned or do not belong to the same service option
 7 group whose bitmap is included in this message.
- 8 DRS – Data Ready to Send.
- 9 If P_REV_IN_USE_S is less than six, the mobile station shall
 10 omit this field; otherwise, the mobile station shall include this
 11 field and set it as follows.
- 12 If the service instance corresponding to SR_ID has data to
 13 send, the mobile station shall set this field to ‘1’; otherwise,
 14 the mobile station shall set this field to ‘0’.
- 15 UZID_INCL – User Zone Identifier included indicator.
- 16 If P_REV_IN_USE_S is less than six, the mobile station shall
 17 omit this field; otherwise, the mobile station shall include this
 18 field and set it as follows.
- 19 If the message is to contain the User Zone Identifier, the
 20 mobile station shall set this field to ‘1’; otherwise, the mobile
 21 station shall set this field to ‘0’.
- 22 UZID – User Zone Identifier.
- 23 If the UZID_INCL field is included in the message and is set to
 24 ‘1’, the mobile station shall include this field and set it to
 25 UZID_S; otherwise, the mobile station shall omit this field.
- 26 CH_IND – Channel indicator.
- 27 If P_REV_IN_USE_S is less than six, the mobile station shall
 28 omit this field; otherwise, the mobile station shall include this
 29 field and set it, as shown in Table 2.7.1.3.2.4-6, to request
 30 physical resources.

Table 2.7.1.3.2.4-6. Channel Indicator

CH_IND (binary)	Channel(s) Requested
00	Refer to EXT_CH_IND
01	Fundamental Channel
10	Dedicated Control Channel
11	Fundamental Channel and Dedicated Control Channel

- 1 SR_ID – Service reference identifier.
- 2 If P_REV_IN_USE_s is less than six, the mobile station shall
- 3 omit this field; otherwise, the mobile station shall include this
- 4 field and set it as follows:
- 5 If the SYNC_ID_INCL field is not included or is included and
- 6 is set to '0', the mobile station shall set this field as follows:
- 7 o If the service instance provides a service reference
- 8 identifier, the mobile station shall set this field to the
- 9 service reference identifier specified by the service
- 10 instance. If the service instance does not provide a service
- 11 reference identifier, the mobile station shall set this field
- 12 to the smallest unused service reference identifier value
- 13 between 1 and 6 (inclusive).
- 14 Otherwise, the mobile station shall set this field as follows:
- 15 o If the mobile station requests the restoration of a single
- 16 service option connection from the stored service
- 17 configuration, the mobile station shall set this field to the
- 18 corresponding service reference identifier.
- 19 o If the mobile station requests the restoration of more than
- 20 one but not all service option connections from the stored
- 21 service configuration, the mobile station shall set this field
- 22 to the service reference identifier corresponding to one of
- 23 the service option connections to be restored.
- 24 o Otherwise (that is, the mobile station requests the
- 25 restoration of all the service option connections from the
- 26 stored service configuration), the mobile station shall set
- 27 this field to '111'.
- 28 OTD_SUPPORTED – Orthogonal Transmit Diversity supported indicator.
- 29 If P_REV_IN_USE_s is less than six, the mobile station shall
- 30 omit this field; otherwise, the mobile station shall include this
- 31 field and set it as follows.
- 32 If the mobile station supports orthogonal transmit diversity, it
- 33 shall set this field to '1'; otherwise, the mobile station shall set
- 34 this field to '0'.
- 35 QPCH_SUPPORTED – Quick Paging Channel supported indicator.
- 36 If P_REV_IN_USE_s is less than six, the mobile station shall
- 37 omit this field; otherwise, the mobile station shall include this
- 38 field and set it as follows.
- 39 If the mobile station supports the Quick Paging Channel, the
- 40 mobile station shall set this field to '1'; otherwise, the mobile
- 41 station shall set this field to '0'.
- 42 ENHANCED_RC – Enhanced radio configuration supported indicator.

- 1 If P_REV_IN_USE_s is less than six, the mobile station shall
 2 omit this field; otherwise, the mobile station shall include this
 3 field and set it as follows.
- 4 If the mobile station supports any radio configuration in the
 5 Radio Configuration Class 2 (see 1.1.1), the mobile station
 6 shall set this field to '1'; otherwise, the mobile station shall set
 7 this field to '0'.
- 8 FOR_RC_PREF – Forward Radio Configuration preference.
- 9 If P_REV_IN_USE_s is less than six, the mobile station shall
 10 omit this field; otherwise, the mobile station shall include this
 11 field and set this field as follows.
- 12 The mobile station shall set this field to its preferred Radio
 13 Configuration for the Forward Fundamental Channel and/or
 14 Forward Dedicated Control Channel.
- 15 REV_RC_PREF – Reverse Radio Configuration Preference.
- 16 If P_REV_IN_USE_s is less than six, the mobile station shall
 17 omit this field; otherwise, the mobile station shall include this
 18 field and set it as follows.
- 19 The mobile station shall set this field to its preferred Radio
 20 Configuration for the Reverse Fundamental Channel and/or
 21 Reverse Dedicated Control Channel.
- 22 FCH_SUPPORTED – Fundamental Channel supported indicator.
- 23 If P_REV_IN_USE_s is less than six, the mobile station shall
 24 omit this field; otherwise, the mobile station shall include this
 25 field and set it as follows.
- 26 The mobile station shall set this field to '1' if the mobile
 27 station supports Fundamental Channel; otherwise, the mobile
 28 station shall set this field to '0'.
- 29 FCH Capability
- 30 Type-specific fields – Fundamental Channel capability information.
- 31 If the FCH_SUPPORTED field is included and is set to '1', the
 32 mobile station shall include this field and set it as defined in
 33 2.7.4.27.1; otherwise, the mobile station shall omit this field.
- 34 DCCH_SUPPORTED – Dedicated Control Channel supported indicator.
- 35 If P_REV_IN_USE_s is less than six, the mobile station shall
 36 omit this field; otherwise the mobile station shall include this
 37 field and set it as follows.
- 38 The mobile station shall set this field to '1' if the mobile
 39 station supports Dedicated Control Channel; otherwise, the
 40 mobile station shall set this field to '0'.
- 41 DCCH Capability
- 42 Type specific fields – Dedicated Control Channel capability information.

1 If the DCCH_SUPPORTED field is included and is set to '1',
 2 the mobile station shall include this field and set it as defined
 3 in 2.7.4.27.2; otherwise, the mobile station shall omit this
 4 field.

5 GEO_LOC_INCL – Geo-location included indicator.
 6 If P_REV_IN_USE_s is less than six, the mobile station shall
 7 omit this field. If P_REV_IN_USE_s is equal to six, the mobile
 8 station shall set this field to '0'. Otherwise, the mobile station
 9 shall include this field and set it as follows.

10 If the message is to contain the GEO_LOC_TYPE field, the
 11 mobile station shall set this field to '1'; otherwise, the mobile
 12 station shall set this field to '0'.

13 GEO_LOC_TYPE – Geo-Location Type.
 14 If GEO_LOC_INCL is included in the message and is set to '1',
 15 the mobile station shall include this field and shall set it to
 16 the value shown in Table 2.7.1.3.2.4-7; otherwise, the mobile
 17 station shall omit this field.

18 **Table 2.7.1.3.2.4-7. Geo-location Types**

GEO_LOC_ TYPE (binary)	Type of Geo-location
000	No mobile station assisted geo-location capabilities
001	IS-801 capable (Advanced Forward Link Triangulation only (AFLT))
010	IS-801 capable (Advanced Forward Link Triangulation and Global Positioning Systems)
011	Global Positioning Systems only
All other GEO_LOC_TYPE values are reserved.	

19 REV_FCH_GATING_REQ – Reverse Fundamental Channel eighth gating mode request
 20 indicator.
 21 If P_REV_IN_USE_s is less than six, the mobile station shall
 22 omit this field; otherwise, the mobile station shall include this
 23 field and set it as follows:

24 If the mobile station requests to turn on the reverse
 25 Fundamental Traffic Channel gating mode in Radio
 26 Configurations 3, 4, 5, and 6, the mobile station shall set this
 27 field to '1'; otherwise, the mobile station shall set this field to
 28 '0'.

29 ORIG_REASON – Re-Origination reason indicator.
 30 If P_REV_IN_USE_s is less than or equal to six, the mobile
 31 station shall omit this field; otherwise, the mobile station
 32 shall include this field and set it as follows.

1 The mobile station shall set this field to '1' if the mobile
 2 station initiates a silent-retry, i.e. an autonomous access re-
 3 attempt to re-originate this call without user interaction, after
 4 the mobile station received an access attempt failure from the
 5 ARQ Sublayer for a user initiated origination; otherwise, the
 6 mobile station shall set this field to '0'.

7 ORIG_COUNT - Re-Origination count.

8 If P_REV_IN_USE_S is less than or equal to six, the mobile
 9 station shall omit this field; otherwise, the mobile station
 10 shall include this field and set it as follows.

11 If the ORIG_REASON is set to '1', the mobile station shall set
 12 this field to the number of consecutive silent-retry, i.e. an
 13 autonomous access re-attempt that were made to re-originate
 14 the call, without user interaction, that were due to the mobile
 15 receiving an access attempt failure from the ARQ Sublayer. If
 16 the number of consecutive silent-retry is greater than three,
 17 the mobile station shall set this field to '11'.

18 If the ORIG_REASON is set to '0', the mobile station shall set
 19 this field according to Table 2.7.1.3.2.4-8 depending on the
 20 number of autonomous re-connection attempts for the
 21 desired service (specified by SERVICE_OPTION) that have
 22 failed since the last successful connection of that desired
 23 service⁸¹. The count shall only include attempts since the last
 24 power-up.

25 **Table 2.7.1.3.2.4-8. ORIG_COUNT field for ORIG_REASON = '0'**

Number of autonomous re-origination attempts for the desired service that have failed since the last successful connection	ORIG_COUNT (binary)
0	'00'
1, 2, 3 or 4	'01'
5, 6, 7 or 8	'10'
9 or more	'11'

26
 27 STS_SUPPORTED - STS supported indicator.

⁸¹ For example, if the mobile station requests SO_x in the *Origination Message* and SO_y is granted by the base station, the counter associated with SO_x is reset.

1 If P_REV_IN_USE_S is less than seven, the mobile station shall
2 omit this field; otherwise, the mobile station shall include this
3 field and set it as follows.

4 The mobile station shall set this field to '1' if the mobile
5 station supports Space Time Spreading Transmit Diversity;
6 otherwise, the mobile station shall set this field to '0'.

7 3X_CCH_SUPPORTED – 3X Common Channels supported.

8 If P_REV_IN_USE_S is less than seven, the mobile station shall
9 omit this field; otherwise, the mobile station shall include this
10 field and set it as follows.

11 The mobile station shall set this field to '1' if the mobile
12 station supports the Spreading Rate 3 common channels (3X
13 BCCH, 3X F-CCCH, and 3X R-EACH); otherwise, the mobile
14 station shall set this field to '0'.

15 WLL_INCL – WLL information included indicator.

16 If P_REV_IN_USE_S is less than seven, the mobile station shall
17 omit this field; otherwise, the mobile station shall include this
18 field and set it as follows.

19 If the mobile station is a Wireless Local Loop device, the
20 mobile station shall set this field to '1'; otherwise, the mobile
21 station shall set this field to '0'.

22 WLL_DEVICE_TYPE – WLL device type indicator.

23 If WLL_INCL is not included, or if WLL_INCL is included and
24 is set to '0', the mobile station shall omit this field; otherwise,
25 the mobile station shall set this field as follows.

26 The mobile station shall set this field to the
27 WLL_DEVICE_TYPE value shown in Table 2.7.1.3.2.1-3
28 corresponding to the mobile station device type.

29 GLOBAL_EMERGENCY_CALL – Global Emergency Call indicator.

30 If P_REV_IN_USE_S is less than seven, the mobile station shall
31 omit this field; otherwise, the mobile station shall include this
32 field and shall set it as follows:

33 The mobile station shall set this field to '1' if the mobile
34 station recognizes that this is an emergency call; otherwise,
35 the mobile station shall set this field to '0'.

36 MS_INIT_POS_LOC_IND – Mobile Initiated Position Location Session indicator.

37 If the GLOBAL_EMERGENCY_CALL field is not included in
38 this message or is included but is set to '0', the mobile station
39 shall omit this field; otherwise, the mobile station shall
40 include this field and shall set it as follows:

41 The mobile station shall set this field to '1' if
42 MS_INIT_POS_LOC_SUP_IND_S is equal to '1' and if the mobile
43 station is to initiate a position location session associated
44 with this emergency call; otherwise, the mobile station shall
45 set this field to '0'.

- 1 QOS_PARMS_INCL - Presence indicator for the QoS parameters.
2 If P_REV_IN_USE_s is less than seven, the mobile station shall
3 omit this field; otherwise the mobile station shall include this
4 field and set it as follows.
5 The mobile station shall set this field to '1', if QoS parameters
6 are included in the message for the service instance
7 corresponding to SR_ID; otherwise the mobile station shall set
8 this field to '0'. The mobile station shall not set this field to
9 '1', if MOB_QOS_s is set to '0' or if the inclusion of the QoS
10 parameters would prevent the inclusion of all the dialed digits
11 in the message.
- 12 QOS_PARMS_LEN - Length of the block of QoS parameters.
13 If QOS_PARMS_INCL is included and is set to '1', the mobile
14 station shall include this field; otherwise, the mobile station
15 shall omit this field. If this field is included, the mobile station
16 shall set this field to the combined length in octets, of the
17 QOS_PARMS field and the immediately following
18 QOS_RESERVED field.
- 19 QOS_PARMS - QoS parameters block.
20 If QOS_PARMS_INCL is included and is set to '1', the mobile
21 station shall include this field; otherwise, the mobile station
22 shall omit this field. If this field is included, the mobile station
23 shall set it to the set of QoS parameter values as defined in
24 accordance with the requirements for the requested service
25 option and/or for the user, per subscription.
- 26 QOS_RESERVED - QoS reserved bits.
27 If QOS_PARMS_INCL is included and is set to '1', the mobile
28 station shall include the minimum number of bits of '0', such
29 that the combined length of the QOS_PARMS field and of this
30 field is an integer number of octets; otherwise, the mobile
31 station shall omit this field.
- 32 ENC_INFO_INCL - Encryption fields included.
33 If P_REV_IN_USE_s is less than seven, the mobile station shall
34 omit this field; otherwise, the mobile station shall include this
35 field and set it as follows.
36 The mobile station shall set this field to '1' if the encryption
37 related fields are included; otherwise the mobile station shall
38 set this field to '0'. The mobile station shall set this field to '0'
39 if the base station does not support encryption or the mobile
40 station does not support any of the encryption modes
41 supported by the base station.
- 42 SIG_ENCRYPT_SUP - Signaling encryption supported indicator.
43 If ENC_INFO_INCL is included and is set to '1', the mobile
44 station shall include this field; otherwise, the mobile station
45 shall omit this field. If this field is included, this field
46 indicates which signaling encryption algorithms are
47 supported by the mobile station.

- 1 This field consists of the subfields shown in Table 2.7.1.3.2.1-
2 5.
- 3 If this field is included, the mobile station shall set the
4 subfields as follows:
- 5 The mobile station shall set the CMEA subfield to '1'.
- 6 The mobile station shall set each other subfield to '1' if the
7 corresponding signaling encryption algorithm is supported by
8 the mobile station; otherwise, the mobile station shall set the
9 subfield to '0'.
- 10 The mobile station shall set the RESERVED subfield to
11 '00000'.
- 12 **D_SIG_ENCRYPT_REQ** – Dedicated channel signaling encryption request indicator.
13 If ENC_INFO_INCL is included and is set to '1', the mobile
14 station shall include this field; otherwise, the mobile station
15 shall omit this field. If this field is included, the mobile
16 station shall set this field to '1' to request signaling encryption
17 to be turned on for signaling messages sent on f-dsch and r-
18 dsch, and to '0' to request signaling encryption to be turned
19 off for signaling messages sent on f-dsch and r-dsch.
- 20 **C_SIG_ENCRYPT_REQ** – Common channel signaling encryption request indicator.
21 If ENC_INFO_INCL is included and is set to '1', the mobile
22 station shall include this field; otherwise, the mobile station
23 shall omit this field. If this field is included, the mobile
24 station shall set this field to '1' to request signaling encryption
25 to be turned on for signaling messages sent on f-csch and r-
26 csch, and to '0' to request signaling encryption to be turned
27 off for signaling messages sent on f-csch and r-csch.
- 28 **NEW_SSEQ_H** – The 24-bit value used to initialize the 24 MSB of the crypto-
29 sync.
30 If SIG_ENCRYPT_SUP is included and the ECMEA or REA
31 subfield in SIG_ENCRYPT_SUP is set to '1', the mobile station
32 shall include this field; otherwise, the mobile station shall
33 omit this field. If this field is included, the mobile station
34 shall set this field to a 24-bit value that will be used as the
35 initial value of the 24 MSB of the crypto-sync for both forward
36 and reverse link message encryption and integrity (if message
37 integrity is performed).
- 38 **NEW_SSEQ_H_SIG** – The signature of NEW_SSEQ_H
39 If NEW_SSEQ_H is included, the mobile station shall include
40 this field; otherwise, the mobile station shall omit this field. If
41 this field is included, the mobile station shall set this field to
42 the digital signature of the NEW_SSEQ_H as described in
43 2.3.12.4.5.
- 44 **UI_ENCRYPT_REQ** – Request for user information encryption on the traffic channel
45 indicator.

1 If ENC_INFO_INCL is included and is set to '1', the mobile
2 station shall include this field; otherwise, the mobile station
3 shall omit this field. If this field is included, the mobile
4 station shall set this field to '1' to request user information
5 encryption, and to '0' to request no user information
6 encryption.

7 UI_ENCRYPT_SUP – User information encryption supported indicator.

8 If ENC_INFO_INCL is included and is set to '1', the mobile
9 station shall include this field; otherwise, the mobile station
10 shall omit this field. If this field is included, the mobile
11 station shall set this field to indicate the supported user
12 information encryption algorithms.

1 This field consists of the subfields shown in Table 2.7.1.3.2.4-
 2 9.

3 **Table 2.7.1.3.2.4-9. Encoding of the UI_ENCRYPT_SUP Field**

Subfield	Length (bits)	Subfield Description
ORYX	1	Support for ORYX encryption algorithm
REA	1	Support for the Rijndael encryption algorithm used in extended encryption
RESERVED	6	Reserved bits

4 The mobile station shall set each subfield to '1' if the
 5 corresponding user information encryption algorithm is
 6 supported by the mobile station; otherwise, the mobile station
 7 shall set the subfield to '0'.

8 The mobile station shall set the RESERVED subfield to
 9 '000000'.

10 SYNC_ID_INCL - Service Configuration synchronization identifier included
 11 indicator.

12 If P_REV_IN_USE_s is less than seven, the mobile station shall
 13 omit this field; otherwise, the mobile station shall include this
 14 field and shall set it as follows:

15 The mobile station shall set this field to '1' if the SYNC_ID
 16 field is included in this message; otherwise, the mobile station
 17 shall set this field to '0'.

18 If SYNC_ID_SUPPORTED_s is equal to '0', the mobile station
 19 shall set this field to '0'.

20 SYNC_ID_LEN - Service Configuration synchronization identifier length
 21 indicator.

22 If the SYNC_ID_INCL field is not included or is included and
 23 is set to '0', the mobile station shall omit this field; otherwise
 24 the mobile station shall include this field and set it as follows:

25 The mobile station shall set this field to the length of the
 26 SYNC_ID field included in this message.

27 SYNC_ID - Service Configuration synchronization identifier.

28 If the SYNC_ID_INCL field is not included, or is included but
 29 is set to '0', the mobile station shall omit this field; otherwise,
 30 the mobile station shall include this field and set it as follows:

31 The mobile station shall set this field to the Service
 32 Configuration synchronization identifier corresponding to a
 33 stored service configuration.

- 1 PREV_SID_INCL - Previous System Identification (SID) included indicator.
2 If P_REV_IN_USE_s is less than seven, the mobile station shall
3 omit this field; otherwise, the mobile station shall include this
4 field and set it as follows:
5 The mobile station shall set this field to '1' if:
- 6 - The mobile station determines that the SID has been
 - 7 changed after a packet data dormant handoff, and
 - 8 - This message includes the main service instance (see
 - 9 [42]).
- 10 Otherwise, the mobile station shall set this field to '0'.
- 11 PREV_SID - Previous System Identification.
12 If PREV_SID_INCL is not included, or is included but is set to
13 '0', the mobile station shall omit this field; otherwise, the
14 mobile station shall include this field and set it as follows:
15 The mobile station shall set this field to the previous SID.
- 16 PREV_NID_INCL - Previous Network Identification (NID) included indicator.
17 If P_REV_IN_USE_s is less than seven, the mobile station shall
18 omit this field; otherwise, the mobile station shall include this
19 field and set it as follows:
20 The mobile station shall set this field to '1' if:
- 21 • The mobile station determines that NID has been changed
 - 22 after a packet data dormant handoff, and
 - 23 • This message includes the main service instance (see
 - 24 [42]).
- 25 Otherwise, the mobile station shall set this field to '0'.
- 26 PREV_NID - Previous Network Identification.
27 If PREV_NID_INCL is not included, or is included but is set to
28 '0', the mobile station shall omit this field; otherwise, the
29 mobile station shall include this field and set it as follows:
30 The mobile station shall set this field to the previous NID.
- 31 PREV_PZID_INCL - Previous Packet Zone ID (PZID) included indicator.
32 If P_REV_IN_USE_s is less than seven, the mobile station shall
33 omit this field; otherwise, the mobile station shall include this
34 field and set it as follows:

1 The mobile station shall set this field to '1' if:

- 2 • The mobile station determines that the Packet Zone ID
- 3 has been changed after a packet data dormant handoff,
- 4 and
- 5 • This message includes the main service instance (see
- 6 [42]).

7 Otherwise, the mobile station shall set this field to '0'.

8 PREV_PZID - Previous Packet Zone ID.

9 If PREV_PZID_INCL is not included, or is included but is set

10 to '0', the mobile station shall omit this field; otherwise, the

11 mobile station shall include this field and set it as follows:

12 The mobile station shall set this field to the previous PZID.

13 SO_BITMAP_IND - Service option bitmap indicator.

14 If P_REV_IN_USE_s is less than 7, the mobile station shall omit

15 this field; otherwise, [if the P_REV_IN_USE_s is less than 11,](#)

16 [the mobile station shall set this field as defined for the values](#)

17 ['00', '01', and '10' in Table 2.7.1.3.2.4-10, otherwise,](#) the

18 mobile station shall set this field as defined in Table

19 2.7.1.3.2.4-10.

20 **Table 2.7.1.3.2.4-10. Encoding of the SO_BITMAP_IND Field**

SO_BITMAP_IND	Size of bitmap (in bits) included
00	0 bit (i.e., No bitmap included)
01	4 bits
10	8 bits
11	16 bits

21

22 SO_GROUP_NUM - Service option group number.

23 If SO_BITMAP_IND is included and not set to '00', the mobile

24 station shall include this field and set this field to service

25 option group number defined in [30], of the bitmap to be

26 included in this message; otherwise, the mobile station shall

27 omit this field.

28 SO_BITMAP - Service option bitmap.

29 If the field SO_BITMAP_IND is included and is not set to '00',

30 the mobile station shall include the bitmap of the service

31 option group (SO_GROUP_NUM); otherwise, the mobile

32 station shall omit this field.

1 When the service option bitmap is included, if there are more
 2 than $(2^{(1+SO_BITMAP_IND)})$ service options defined in [30]
 3 for the service option group [SO_GROUP_NUM], the mobile
 4 station shall include the bitmap containing the least
 5 significant bits $(2^{(1+SO_BITMAP_IND)})$ for the service option
 6 group.

7 The mobile station shall set a bit in this bitmap to '1', if the
 8 mobile station is capable of supporting the service option for
 9 which the bit represents; otherwise, the mobile station shall
 10 set a bit in this bitmap to '0'.

11 SDB_DESIRED_ONLY – Short Data Burst Desired Only.

12 If P_REV_IN_USE_s is less than eight, the mobile station shall
 13 omit this field; otherwise, the mobile station shall include this
 14 field and set it as follows:

15 If the mobile station desires to exchange user data using only
 16 Short Data Bursts on common channels, it shall set this field
 17 to '1'; otherwise, it shall set this field to '0'.

18 ALT_BAND_CLASS_SUP – Alternate band class support indicator.

19 If P_REV_IN_USE_s is less than eight, then the mobile station
 20 shall omit this field; otherwise, the mobile station shall
 21 include this field and set it as follows:

22 If BAND_CLASS_INFO_REQ_s is equal to '1' and the mobile
 23 station supports the CDMA band class specified by
 24 ALT_BAND_CLASS_s, then the mobile station shall set this
