Table 1 Revision Historyiv

REVISION HISTORY

Table 1 Revision History

Revision	Date	Remarks
Rev. 0	December 2000	Initial Publication
Rev. A	May 2001	<p>Added specification or clarification for the following items:</p> <ul style="list-style-type: none"> ▪ New mechanism for PDSN/HA pre-shared secret distribution for IKE ▪ Security status is replaced by IKE Pre-shared Secret Request attribute ▪ New counters G15 and G16 for MIP signaling ▪ Clarifications with respect to counters G1 and G2 ▪ A new indicator in RADIUS stop message to indicate session still in progress (to avoid release of the IP address) ▪ Removal of RADIUS accounting fields H1, I2, and I3 ▪ New accounting session to be created when F1, F2 accounting fields vary ▪ Non-zero and zero IP address in IP Configuration option in IPCP is treated as Simple IP by PDSN. MIP is supported with null IP address configuration option (i.e., not included). ▪ The Active Time attribute format changed from standard RADIUS encoding to 3GPP2 specific encoding.
Rev. B	September 2002	<p>This document has been revised to support the following features:</p> <ul style="list-style-type: none"> ▪ Simultaneous multiple service instances concept introduced. ▪ RTP/UDP/IP Header Reduction Schemes ▪ Differentiated Services QoS Policy ▪ Fast handoff for data call (i.e., tunneled PPP between PDSNs) ▪ Dynamic Home Agent allocation with RADIUS ▪ Optional support for DNS server address auto configuration in MS ▪ Always On support ▪ IP Reachability Service with dynamic DNS update ▪ Simple IPv6 ▪ Remote address based accounting
Rev. C	August 2003	<p>New format: the document is split into 6 chapters identified by YYYY.YYY-C, where YYYY is the document number and xxx is the chapter number.</p> <ul style="list-style-type: none"> ▪ Multiple Service Instance support ▪ LLARHC Header Compression and LLA Header Removal ▪ Enhanced CRTP as an additional compression scheme

		<ul style="list-style-type: none"> ▪ Dynamic flow mapping/treatment ▪ PrePaid Packet Data service (phase 1) ▪ PDSN/HA Resource management ▪ Accounting support for 1xEVDV ▪ Packet Data Inactivity Timer ▪ IKE/IPsec clarifications ▪ IP Reachability enhancements ▪ Enhancements to Always On ▪ Enhancements to Simple IPv6
Rev. B Version 2.0	September 2004	This is an addendum to correct errors and omissions in the Revision B Version 1.0 of this document.
Rev. D	February 2006	<ul style="list-style-type: none"> ▪ IPv6 Mobility ▪ Support for end-to-end QoS (MS-PDSN QoS signaling) ▪ Hot-lining ▪ MS-PDSN Version/Capabilities Indication ▪ Short Data Burst Indication Support ▪ RAN-PDSN Flow control Support ▪ DHCPv4 and DHCPv6 ▪ IP Reachability for MIPv6 ▪ Auxiliary Service Connection SO67 support.
Rev. D Version 2.0	October 2008	This is an addendum to correct errors in the Revision D Version 1.0 of this document.
Rev. E Version 1.0	November 2009	<ul style="list-style-type: none"> ▪ Additional PPP Authentications ▪ NCP Inactivity Timer Support ▪ NEMO Support ▪ Network initiated QoS ▪ IP service authorization ▪ EAP support for Access Authentication

FOREWORD

(This foreword is not part of this Standard.)

This document was prepared by 3GPP2 TSG-X.

This document consists of multi-chapter documents that together describes specifications for cdma2000 Wireless IP Network .

This document is subject to change following formal approval. Should this document be modified, it will be re-released with a change of release date and an identifying change in version number as follows:

X.S0011-00n-X-y

where:

- X an uppercase numerical or alphabetic character [A, B, C, ...] that represents the revision level.
- n a numeric string [1, 2, 3, ...] that indicates a chapter.
- y a numeric string [1, 2, 3, ...] that indicates a point release level.

1 Introduction

This document defines requirements for support of wireless packet data networking capability on a third generation wireless system based on cdma2000®¹. This document supports the services and architecture in [1].

This document defines the two methods for accessing public networks (Internet) and private networks (intranets): Simple IP and MIP. It describes the required Quality of Service, Security, Mobility Management, and Accounting capabilities needed to support both methods. IETF protocols are widely employed whenever possible to minimize the number of new protocols required and to maximize the utilization of well accepted standards.

This document is organized into a series of related chapters, some of which address capabilities common to both IP access service types: MIP and Simple IP, and others may describe capabilities applicable to a specific IP access service. The chapters included in this series are:

- Chapter 1** cdma2000 Wireless IP Network Standard: Introduction.
- Chapter 2** cdma2000 Wireless IP Network Standard: Simple IP and MIP Access Services.
- Chapter 3** cdma2000 Wireless IP Network Standard: Packet Data Mobility and Resource Management.
- Chapter 4** cdma2000 Wireless IP Network Standard: Quality of Service and Header Reduction.
- Chapter 5** cdma2000 Wireless IP Network Standard: Accounting Services and 3GPP2 RADIUS VSAs.
- Chapter 6** cdma2000 Wireless IP Network Standard: PrePaid Packet Data Service.

In this set of documents we refer to other documents in the set strictly by their chapter numbers as in [Chapter 1].

- Chapter 1** This chapter presents an overview of the document content, and contains the complete glossary and definitions applicable to all the chapters. It describes the network and protocol reference models for the wireless IP Network entities: PDSN, HA and RADIUS server.
- Chapter 2** This chapter describes the basic IP access services: Simple IPv4/IPv6, MIP6 and MIP4 with Dynamic Home Agent, and Home IP address Assignment. It also addresses the security requirements between the Wireless IP Network nodes: PDSN, HA and RADIUS servers. The chapter includes other capabilities such as Always On, multiple simultaneous MIP4/IPv6 and Simple IPv4/IPv6 packet data session, IP Reachability Service, DHCP support and Hot-Lining.

¹ cdma2000® is the trademark for the technical nomenclature for certain specifications and standards of the Organizational Partners (OPs) of 3GPP2. Geographically (and as of the date of publication), cdma2000® is a registered trademark of the Telecommunications Industry Association (TIA USA) in the United States.

Chapter 3	This chapter describes packet data intra-PDSN, inter-PDSN handoff as well as inter-PDSN fast handoff capabilities and the RAN requirements. The chapter includes mechanisms for PDSN and HA resource management and provisioning of dormancy timers in the RAN. This chapter also includes support for RAN-PDSN Flow Control and Short Data Burst indication.	1 2 3 4 5
Chapter 4	This chapter describes user Differentiated services capability, multiple service connections, flow mapping and treatment, and MS-PDSN QoS signaling. The chapter also includes a detailed description of Link Layer Assisted Robust Header compression and Header Removal treatment to support Voice over IP Service over an auxiliary service connection. In addition, this chapter adds Auxiliary Service Connection SO67 support that allows for the efficient transport of IP packets from the PDSN to the RAN without HDLC-like framing and PPP encapsulation.	6 7 8 9 10 11 12 13 14
Chapter 5	This chapter describes source IP address and remote IP address based accounting and detailed procedures required for this series of standards. It also includes a description of the 3GPP2 RADIUS VSAs required to support this series of standards.	15 16 17 18 19
Chapter 6	This chapter describes the PrePaid Packet Data Service for the Wireless IP Network users and includes the PrePaid service architecture, the detailed procedures and the requirements on the Wireless IP Network elements.	20 21 22 23
	“Shall” and “shall not” identify requirements to be followed strictly to conform to this document and from which no deviation is permitted. “Should” and “should not” indicate that one of several possibilities is recommended as particularly suitable, without mentioning or excluding others, that a certain course of action is preferred but not necessarily required, or that (in the negative form) a certain possibility or course of action is discouraged but not prohibited. “May” and “need not” indicate a course of action permissible within the limits of the document. “Can” and “cannot” are used for statements of possibility and capability, whether material, physical or causal.	24 25 26 27 28 29 30 31 32 33 34 35 36 37 38 39 40 41 42 43 44 45 46 47 48 49 50 51 52 53 54 55 56 57 58 59 60

2 References

2.1 Normative References

The following standards contain provisions which, through reference in this text, constitute provisions of this Specification. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to agreements based on this Standard are encouraged to investigate the possibility of applying the most recent editions of the standards indicated below.

References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.

- For a specific reference, subsequent revisions do not apply.
- For non-specific reference, the latest version applies. In the case of a reference to a 3GPP2 document, a non-specific reference implicitly refers to the latest version of that document in the same Release as the present document.

3 Definitions, Symbols and Abbreviations

This section contains definitions, symbols and abbreviations that are used throughout the document.

3.1 Definitions

A Resource Record

In the DNS, the A resource record type [RFC 1035] is a record specific to the Internet class that stores a single IPv4 address.

AAAA Resource Record

In the DNS, the AAAA resource record type [RFC 1886] is a record specific to the Internet class that stores a single IPv6 address.

A6 Resource Record

In the DNS, the A6 resource record type [RFC 2874] is a record specific to the Internet class that stores IPv6 address.

A10 Connection

A connection between a PCF and a PDSN that uses a GRE tunnel to transport user data for one or more IP flows for an MS. This is the A10 connection specified in [4].

A10 Interface

The interface between the PCF and PDSN that transports user traffic as specified in [4].

A10 Network

An IP network as defined in [4] connecting the PCFs with the PDSNs.

A11 Interface

The interface between the PCF and PDSN that carries signaling information as specified in [4].

Access Provider Network

A cdma2000 network that provides access to cdma2000 users.

Always On

The Always On Service maintains the subscriber's packet data session in the local network (i.e., for Always On service, the PDSN does not initiate release of the subscriber's packet data session, unless the PDSN determines the user is no longer reachable).

Auxiliary Link Flow

1 For HRPD, an auxiliary link flow refers to a link flow that is in addition to the main link flow
2 and is initiated on a per need basis, e.g., when a service such as VoIP is invoked.
3

4 **Auxiliary Service Connection**

6 A logical connection between the MS and the PDSN that is in addition to the main service
7 connection and is established on a per need basis, e.g., when a service such as VoIP is
8 invoked. The data for an auxiliary service connection is usually carried over an auxiliary link
9 flow (HRPD)/auxiliary service instance (cdma2000 1x) and corresponding auxiliary A10
10 connection.
11

12 **Auxiliary Service Instance**

14 A cdma2000 1x term, auxiliary service instance refers to an additional service instance (in
15 addition to the main service instance) that is initiated on a per need basis, e.g., when a service
16 such as VoIP is invoked.
17

18 **Broker RADIUS Server**

20 An intermediate RADIUS server that has security relationships with the Visited RADIUS
21 server and the Home RADIUS server and is used to securely transfer RADIUS messages
22 between the Visited Access Provider Network and the Home IP Network. In some situations,
23 there may be more than one broker RADIUS server in the path between the Visited RADIUS
24 server and the Home RADIUS server.
25

26 **Broker RADIUS Network**

28 A collection of administrative domains that contain Broker RADIUS servers.
29

30 **Default Treatment**

32 The default treatment is the header and payload compressions that are applied to a packet.
33 The particular compression technique for a given packet is chosen from the set of techniques
34 negotiated during IPCP and CCP.
35

36 **Fast Handoff**

38 An inter PDSN based low latency handoff between PCFs. Fast handoff between two PDSNs
39 allows a mobile's PPP session to be maintained via a layer two tunnel passing through a
40 Target PDSN to the Serving PDSN. Note: There is also an intra PDSN fast handoff that is
41 described in [4] that is outside the scope of this document.
42

43 **Handoff**

45 In this document the term "handoff" is defined to mean continuity of IP bindings or PPP link
46 layer state during an interface change from one entity to another. In the absence of any
47 continuity of state whatsoever, this document does not refer to such interface changes as
48 "handoffs".
49

50 **Home RADIUS**

52 The RADIUS server that resides in the Home IP Network.
53
54
55
56
57
58
59
60

HAAA

The AAA server that resides in the Home IP Network.

Home Access Provider Network

A cdma2000 wireless network that is the home for the mobile subscriber.

Home Address

An MS IP address that remains unchanged regardless of the MS's point of attachment to the network.

Home IP Network

The home network that provides IP based data services to the user. This network is where the user's NAI is homed. This network may be a private network, publicly accessible ISP network, or a cdma2000 wireless network.

Hot-Line Application

The Hot-Line Application is the target of redirection of a hot-lined user's packet data service. The Hot-Line Application is responsible for notifying the user of their Hot-Line status, and interacting with the user to resolve the reason for which he/she was put in the Hot-Lined state. The Hot-Line Application interacts with the HAAA instructing it to Hot-Line a user or to turn Hot-Lining off. The specification of the Hot-Line Application is outside the scope of this document.

Hot-Line Device

The Hot-Line Device is the PDSN or the HA that is communicating with the Home RADIUS Server for the purpose of Hot-Lining the user's packet data session.

Hot-Lined User

A Hot-Lined user is a user whose packet data service has been redirected to a Hot-Line Application and/or blocked by the operator.

Intra PDSN Handoff

A handoff that is between PCFs with direct connectivity to the same PDSN.

Inter PDSN Handoff

A handoff that is between PCFs with connectivity to different PDSNs.

IP Flow

A series of packets that share a specific instantiation of IETF protocol layers. For example, an RTP flow may consist of the packets of an RTP/UDP/IP protocol instantiation, all of which share the same source and destination IP addresses and UDP port numbers.

Link Flow

For HRPD, a link flow is an octet or a packet data stream between an MS and the RAN. Associated with each link flow are one or more ReservationLabels. This document defines two categories of link flow, a main link flow and auxiliary link flow. A link flow corresponds to an RLP flow in [15].

Link Local Address

An IPv6 address whose scope is local to a link.

Main A10 Connection

A connection of type SO33 or SO59 between a PCF and a PDSN that uses a GRE tunnel to transport user data and PPP signaling.

Main Link Flow

For HRPD, the link flow that carries ReservationLabel 0xFF. This specification allows exactly one main link flow per MS.

Main Service Connection

Refers to the logical connection established between the MS and the PDSN over which user traffic and PPP signaling is carried. A main service connection is carried over the main link flow (HRPD)/main service instance (cdma2000 1x) and the corresponding main A10 connection. This specification allows exactly one main service connection per MS.

Main Service Instance

For cdma2000 1x, an MS initiated connection between the MS and the RAN of SO 33. This specification allows exactly one main service instance per MS.

MIP

In this document set the when the term MIP appears we are refers to functionality or capabilities that apply to both MIP4 (Mobile IPv4) and MIP6 (Mobile IPv6).

MS-directed Flow ID-to-A10 connection Mapping

A technique where the MS signals the PDSN explicitly the mapping of IP flow(s) to an A10 connection.

Non-specific Traffic Flow Template

A Non-Specific TFT has the NS bit is set to 1. The PDSN gets the mapping of the flows to the A10 connections from the RAN (see RAN-directed FLOW_ID-to-A10 connection mapping) via A11 signaling. For Non-Specific TFT, the PDSN has one TFT for each MS IP address in support of RAN-directed FLOW_ID-to-A10 connection mapping.

Packet Data Service

A general term used for any packet switched data service offered by an access provider network to a user through the user's MS.

Packet Data Service Option

A number specified in [13] that is used to identify a packet switched data service. A packet data service option may be of type 33, 66 [11], 60/61[16], 59 [17], 64 [17,18] or 67[13, 17, 18].

Packet Data Session

Describes continuous use of packet data service by the user. A packet data session begins when the user invokes packet data service. A packet data session ends when the user or the network terminates packet data service. During a particular MIP packet data session, the user may change its point of attachment while maintaining the same home address.

For Simple IP service, changing points of attachments constitutes a change in packet data session because a new IP address is assigned by the new point of attachment. For Simple IP service, a packet data session and a PPP session are concurrent, where as for MIP service, the packet data session can exist through several changes of the PPP session.

Point of Attachment

Point of attachment refers to the node where the MS is connected to access the IP network. In the context of this document, it refers to the PDSN entity.

Pi

Pi is the interface between the PDSN and the public Internet.

P-P Connection

A connection between a Serving and a Target PDSN that uses a GRE tunnel to transport user data for a single service instance during fast handoff.

P-P Interface

The interface between the Target PDSN and the Serving PDSN that is used to support fast handoff.

P-P Session

The set of all P-P connections for a single MS.

PPP Session

A PPP session describes the time during which the Main Service Connection is maintained between the MS and the Serving PDSN. The PPP session is maintained while the MS is dormant. If a user hands off from one RAN to another RAN but is still connected to the same PDSN, the PPP session remains.

PrePaid Packet Data Service

A function that allows a user to pay in advance for the use of packet data service.

PrePaid Server (PPS)

A function that manages prepaid accounts for the users. It maintains the PrePaid accounts on a per user basis or on a per service type basis for a user. It communicates with the PrePaid client for control of the PrePaid packet Data Service.

PrePaid Client (PPC)

A function that resides in the wireless IP network and communicates with the PrePaid Server function (PPS) to control the prepaid user's packet data session. It requests PrePaid account authorization for a user and monitors the user's packet data session to determine when the limits of the authorization are reached.

PrePaid User

A user who paid for the packet data service in advance. The user is charged by either the wireless IP Network Provider or a 3rd Party Packet PrePaid Service Provider.

Private Address

An IP address conforming to [RFC 1918].

Private Network

An IP Network that is isolated from the global Internet. Generally this type of network may reside behind a firewall, proxy-servers or a NAT (-PT) and may use private IPv4 addresses.

QoS BLOB

An object containing a set of QoS Sub BLOBs for one or more Flow IDs. It also specifies the operation to be performed by the RAN upon receipt from the MS of the QoS Sub BLOB for a Flow ID, such as add/update/remove. The QoS BLOB is only used by cdma2000 1x mobiles.

QoS Sub BLOB

An object containing a set of QoS parameter values or QoS Flow Profile IDs for one Flow ID. A QoS Sub BLOB can be Requested (by the mobile) and Granted (by the RAN) and updated (by the PDSN). This object is used in both cdma2000 1x and HRPD systems.

RADIUS

The specific AAA server implementation used in cdma2000 networks for AAA functionality. The RADIUS servers may be located in the Home IP Network, the Broker RADIUS Network, or the Visited Access Provider Network.

Radio Access Network

The RAN is equivalent to the BS and the PCF as defined in the Network Reference Model [14]. In this document, the terms PCF and RAN are used interchangeably when describing handoffs across the A10 interface. The RAN is equivalent to the Radio Access Network (RAN) specified in [4].

RAN-directed FLOW_ID-to-A10 connection Mapping

The mechanism where the PDSN determines the mapping of an IP flow to an A10 connection based on IP flow identifier information received both from the MS via TFT and from the RAN via A11 signaling.

Reservation

Air interface resources set up by the access network to carry one or more IP flows. A reservation is identified by its ReservationLabel. A ReservationLabel is bound to a link flow.

ReservationLabel

A one octet number that, along with the direction of the corresponding IP flow(s), identifies a Reservation. A ReservationLabel is referred to as Flow Id in this document.

Service Connection

A logical connection between an MS and PDSN used to transport user data for the MS. There are two types of service connection: main and auxiliary (see Main service connection and auxiliary service connection.) Each service connection is comprised of two parts: MS to RAN and RAN to PDSN. In cdma2000 1x, the MS to RAN portion is called a service instance (see service instance.) In HRPD, the MS to RAN portion is called a link flow (see link flow.) In both cdma2000 1x and HRPD, the RAN to PDSN portion is called the A10 connection (see A10 connection.) Under some circumstances the IP flow can be carried on a different link flow/service instance from the link flow/service flow normally associated to an A10 connection.

Service Instance

For cdma2000 1x, a connection between an MS and RAN used to transport user data for a packet data service.

Serving PDSN

A PDSN that supports the PPP session to an MS.

Serving A10 Address

The A10 network interface IP address of the Serving PDSN or that of the Target PDSN when fast handoff is used.

Serving P-P Address

The P-P network interface IP address of the Serving PDSN.

Specific Traffic Flow Template

A Specific TFT is used for cdma2000 1x MS only. A specific TFT has the NS bit set to 0. The PDSN determines the mapping of the IP flows to the A10 connections from the TFT itself using the SR_ID. For a Specific TFT, there is one TFT for each MS IP address and A10 connection pair.

SR_ID

Used in cdma2000 1x, a unique number assigned to each service instance.

Target PDSN

A PDSN that co-operates with a Target RAN over the A10 interface, and co-operates with the Serving PDSN over the P-P interface to provide link layer tunneling between the Serving PDSN and the Target RAN in the context of a fast handoff.

Target P-P Address:

The P-P network interface IP address of the Target PDSN.

Traffic Flow Template:

The Traffic Flow Templates (TFT) may include packet filter(s) that identify the IP flow(s) in both the forward and reverse directions as indicated by the MS. The TFTs are used to map forward traffic to the main or the auxiliary A10s and to indicate if a specific flow treatment (e.g. Header Compression technique) should be applied for the forward packet that matches the packet filter. In the reverse direction, the TFT is used for accounting purposes. There are two types of TFTs: specific and non-specific (see Specific Traffic Flow Template and Non-specific Traffic Flow Template).

User Profile:

The User Profile is an abstraction for the collection of all the parameters applied to the user. The User Profile includes the Subscriber QoS profile (which itself includes the Allowed Differentiated Services Marking and Service Option profile).

Visited Access Provider Network:

The visited service provider provides access services through the establishment of a service agreement with a home service provider.

Visited RADIUS:

The RADIUS server that resides in the Visited Access Provider Network.

3.1.1 Symbols and Abbreviations

The following are examples of the appearance of abbreviations:

A10	RAN-PDSN Interface	1
AAA	Authentication, Authorization, and Accounting	2
ACCM	Asynchronous Control Character Map	3
AH	Authentication Header	4
AVP	Attribute Value Pair	5
BA	Binding Acknowledgement	6
BU	Binding Update	7
BCE	Binding Cache Entry	8
BCMCS	Broadcast and Multicast Service	9
BS	Base Station	10
CA	Certificate Authority	11
CCP	Compression Control Protocol	12
CHAP	Challenge Handshake Authentication Protocol	13
CN	Correspondent Node	14
CoA	Care-of Address	15
COA	Change of Authorization	16
CRL	Certificate Revocation List	17
CSRC	Contributing Source	18
CVSE	Critical Vendor/Organization Specific Extension	19
DAD	Duplicate Address Detection	20
D-H	Diffie-Hellman	21
DHCP	Dynamic Host Configuration Protocol	22
DN	Distinguished Name	23
DNS	Domain Name System	24
DSA	Digital Signature Algorithm	25
DSCP	Differentiated Service Code Point	26
DOI	Domain Of Interpretation	27
DQ	Duration Quota	28
DT	Duration Threshold	29
EAP	Extensible Authentication Protocol	30
ESP	Encapsulating Security Payload	31
FQDN	Fully Qualified Domain Name	32
FA	Foreign Agent	33
FAC	Foreign Agent Challenge	34
GRE	Generic Routing Encapsulation	35
HA	Home Agent	36
HAAA	Home AAA	37
HAO	Home Address Option	38
HDLC	High-level Data Link Control	39
HG	Header Generator	40
HL	Home Link	41
HLR	Home Location Register	42
HoA	Home Address	43
HoTi	Home Test Init	44

1	HRPD	High Rate Packet Data
2	HRL	Header Reduction Lower
3	HRU	Header Reduction Upper
4	IANA	Internet Assigned Numbers Authority
5	ID	Identification
6	IETF	Internet Engineering Task Force
7	IID	Interface Identifier
8	IK	Integrity Key
9	IKE	Internet Key Exchange
10	IMSI	International Mobile Subscriber Identity
11	IMT-2000	International Mobile Telecommunications - 2000
12	IP	Internet Protocol
13	IPv4	Internet Protocol version 4
14	IPv6	Internet Protocol version 6
15	IPCP	Internet Protocol Control Protocol
16	ICMP	Internet Control Message Protocol
17	IPv6CP	IPv6 Control Protocol
18	IPsec	IP Security
19	IR	Initialization and Refresh Packet [RFC 3095]
20	IRM	International Roaming MIN
21	IRS	IP Reachability Service
22	ISAKMP	Internet Security Association and Key Management Protocol
23	ISP	Internet Service Provider
24	LAC	Link Access Control
25	LCP	Link Control Protocol
26	LLA	Link-Layer Assisted
27	MAC	Medium Access Control/Message Authentication Code
28	MEID	Mobile Equipment Identifier
29	MH	Mobility Header
30	MIN	Mobile Identification Number
31	MIP	Mobile IP
32	MIP4	Mobile IPv4
33	MIP6	Mobile IPv6
34	MS	Mobile Station
35	MSID	Mobile Station ID
36	NAI	Network Access Identifier
37	NAS	Network Access Server
38	NAT (-PT)	Network Address Translation – Protocol Translation
39	NCP	Network Control Protocol
40	NEMO	Network Mobility
41	NHP	No-Header Packet (as defined in [RFC 3242])
42	NID	Network ID
43	NVSE	Normal Vendor Specific Extension
44	ORO	Option Request Option
45	OUI	Vendor's Organizationally Unique Identifier
46	PAP	Password Authentication Protocol
47	PCF	Packet Control Function
48	PDCH	Packet Data CHannel

PDSN	Packet Data Serving Node	1
PHB	Per Hop Behavior	2
Pi	PDSN – Internet (Interface)	3
PL	Physical Layer	4
P-P	PDSN-PDSN (Interface)	5

4 Protocol Reference Models

This section specifies the protocol architecture between the entities of the Wireless IP Network architecture. Refer to [1] for the description of the Wireless IP Network architecture, its components and message flows. To support fast handoff, an optional interface between PDSN entities is defined in this document. The architecture in [1] for both MIP and Simple IP has been amended to show the new reference point between two adjacent PDSNs.

4.1 Network Reference Models

Figure 1 shows a reference model for Simple IP service with fast handoff.

Figure 2 shows a reference model for MIP service with fast handoff. For Internet access when the MS is in the home network or roaming, the HA resides in a home access provider network. For private network or home ISP access, the HA resides in the respective external network.

The IP Network entity in Figure 1 and represents IP Networks that may reside in the public Internet as well as private IP networks between access provider networks and home IP networks.

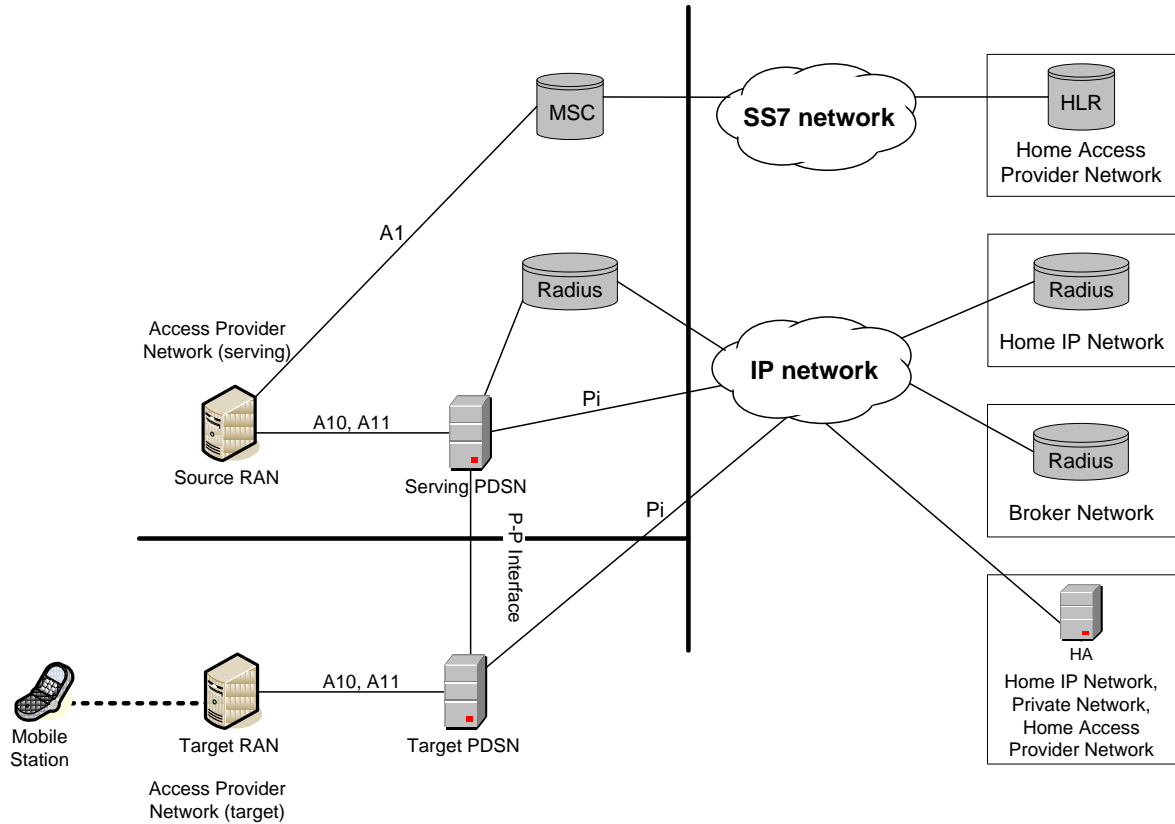

Figure 2 Reference Model for MIP Access with Fast Handoff

The MS is implemented as a single MT0 type device or as a MT2 and a TE2 pair. See [11] for details.

Although MIP and Simple IP services are represented in different protocol reference models, the network provides both Simple IP and MIP service simultaneously to an MS using the same PPP session. The network supports IPv4 and IPv6 MSs simultaneously. The network provides Simple IPv4, Simple IPv6, MIP4, and MIP6 service for the same MS over the same PPP session. Support of IPv6 MSs in the network is independent of the IP version used for transport in the RAN.

4.2 Simple IP

Figure 3 shows the protocol reference model for Simple IPv4 or IPv6 service. Figure 4 shows the protocol reference model for Simple IP access during fast handoff.

Figure 3 Protocol Reference Model for Simple IP Access

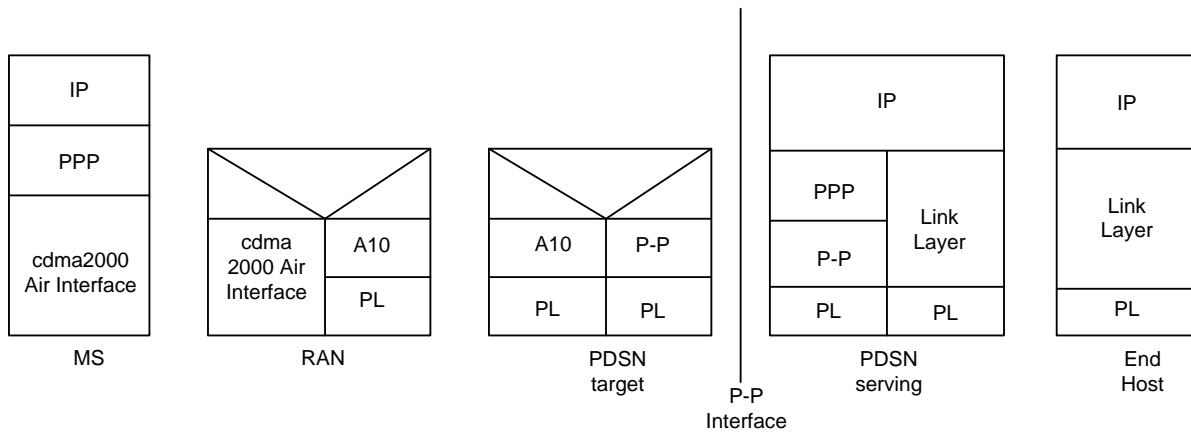

Figure 4 Protocol Reference Model for Simple IP Access During Fast Handoff

4.3 MIP4

Figure 5 and Figure 6 show the protocol reference model for MIP4 control and user data, respectively. IPsec is required in some situations, and not in other situations, as detailed in Chapter 2.

4.5 RADIUS

Figure 17 shows the protocol reference model for the RADIUS entities in the wireless network (as illustrated in Figure 1 and Figure 2) between the PDSN (RADIUS client) and the Home RADIUS server. In this model, the RADIUS servers in the visited network communicate with the RADIUS servers in the home network via zero or more optional proxy (or Broker) RADIUS servers.

A RADIUS server may run IPv4, IPv6, or both. The method of inter-working between IPv4 and IPv6 RADIUS clients and servers is outside the scope of this document.

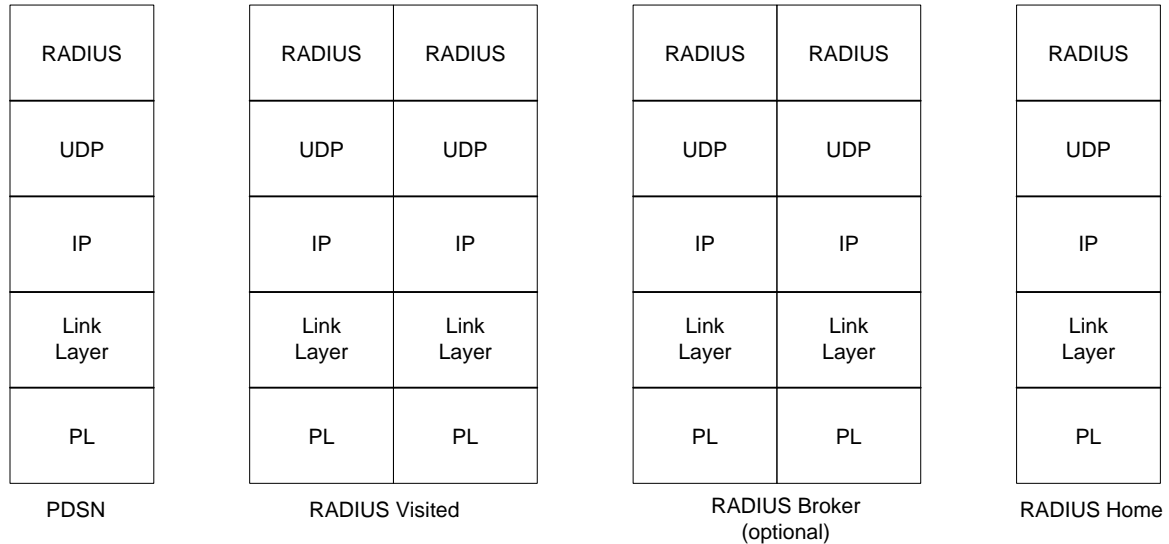

Figure 17 RADIUS Protocol Reference Model
