## CONTENTS

1	FOREWORD AND SCOPE .....	xlvi
2	NOTES .....	xlvi
3	REFERENCES .....	li
4	1. GENERAL.....	1-1
5	1.1 Terms and Numeric Information.....	1-1
6	1.1.1 Terms .....	1-1
7	1.1.2 Numeric Information.....	1-28
8	1.1.2.1 Reserved .....	1-29
9	1.1.2.2 CDMA Numeric Information .....	1-29
10	1.2 Signaling Architecture .....	1-61
11	1.3 Signaling and Functionality .....	1-61
12	1.3.1 General Architecture .....	1-61
13	1.3.2 Interface to Layer 2 .....	1-61
14	1.3.2.1 Message Control and Status Block (MCSB) .....	1-61
15	1.3.2.2 Interface Primitives .....	1-62
16	1.3.3 Reserved .....	1-63
17	1.3.4 Functional Description .....	1-63
18	1.3.5 PDU Transmission and Reception .....	1-63
19	2. REQUIREMENTS FOR MOBILE STATION CDMA OPERATION .....	2-1
20	2.1 Reserved .....	2-1
21	2.2 Reserved .....	2-1
22	2.3 Security and Identification .....	2-1
23	2.3.1 Mobile Station Identification Number.....	2-1
24	2.3.1.1 Encoding of IMSI_M_S and IMSI_T_S .....	2-3
25	2.3.1.2 Encoding of IMSI_M_11_12 and IMSI_T_11_12.....	2-6
26	2.3.1.3 Encoding of the MCC_M and MCC_T .....	2-6
27	2.3.1.4 Mobile Directory Number.....	2-6
28	2.3.2 Electronic Serial Number (ESN), R-UIM Identifier (UIM_ID), and Mobile	
29	Equipment Identifier (MEID) .....	2-6
30	2.3.2.1 Electronic Serial Number (ESN) .....	2-6
31	2.3.2.2 Mobile Equipment Identifier (MEID) .....	2-6
32	2.3.2.2.1 Pseudo-ESN .....	2-7

**CONTENTS**

1	2.3.2.3 R-UIM Identifier (UIM_ID, EXT_UIM_ID).....	2-7
2	2.3.3 Station Class Mark .....	2-7
3	2.3.4 Registration Memory.....	2-8
4	2.3.5 Access Overload Class .....	2-9
5	2.3.6 Public Long Code Mask and Private Long Code Mask .....	2-10
6	2.3.6.1 Public Long Code Mask Formats .....	2-10
7	2.3.6.1.1 Public Long Code Mask PLCM_42, ADD_PLCM_FOR_FCH_42 and	
8	ADD_PLCM_FOR_SCH_42 .....	2-12
9	2.3.6.2 Private Long Code Mask PVTLCM_42 .....	2-13
10	2.3.7 Reserved .....	2-14
11	2.3.8 Home System and Network Identification .....	2-14
12	2.3.9 Local Control Option.....	2-14
13	2.3.10 Preferred Operation Selection.....	2-14
14	2.3.10.1 Preferred System .....	2-14
15	2.3.10.2 Reserved .....	2-14
16	2.3.11 Discontinuous Reception .....	2-14
17	2.3.12 Authentication, Encryption of Signaling Information/User Data and Voice	
18	Privacy.....	2-14
19	2.3.12.1 Authentication.....	2-14
20	2.3.12.1.1 Shared Secret Data (SSD).....	2-15
21	2.3.12.1.2 Random Challenge Memory (RAND) .....	2-15
22	2.3.12.1.3 Call History Parameter (COUNT <sub>S-p</sub> ).....	2-15
23	2.3.12.1.4 Unique Challenge-Response Procedure.....	2-16
24	2.3.12.1.5 Updating the Shared Secret Data (SSD) .....	2-17
25	2.3.12.2 Signaling Message Encryption.....	2-21
26	2.3.12.2.1 Encrypted Messages on the f-dsch .....	2-22
27	2.3.12.2.2 Encrypted Messages on the r-dsch.....	2-24
28	2.3.12.3 Voice Privacy.....	2-27
29	2.3.12.4 Extended Encryption for Signaling Message and User Information .....	2-28
30	2.3.12.4.1 Extended Encryption for Signaling Messages .....	2-28
31	2.3.12.4.1.1 Extended Encryption for Signaling on f/r-csch .....	2-28
32	2.3.12.4.1.2 Extended Encryption for Signaling on f/r-dsch .....	2-29

**CONTENTS**

1	2.3.12.4.1.3 Signaling Encryption/Decryption Procedures.....	2-29
2	2.3.12.4.1.4 Computation of the 8-bit Layer 3 PDU CRC Field.....	2-31
3	2.3.12.4.1.5 Duplicate Detection of Security Sequence Number .....	2-32
4	2.3.12.4.2 Extended Encryption for User Information .....	2-33
5	2.3.12.4.2.1 User Information Encryption/Decryption Procedures .....	2-34
6	2.3.12.4.3 Interface to the Encryption Algorithms .....	2-34
7	2.3.12.4.4 Encryption Negotiation .....	2-37
8	2.3.12.4.5 Computation of NEW_SSEQ_H_SIG .....	2-38
9	2.3.12.5 Authentication and Key Set-up Procedures when P_REV_IN_USE <sub>S</sub> >=	
10	10 .....	2-38
11	2.3.12.5.1 2G Authentication when P_REV_IN_USE <sub>S</sub> >= 10 .....	2-40
12	2.3.12.5.2 3G Authentication (AKA) when P_REV_IN_USE <sub>S</sub> >= 10.....	2-41
13	2.3.12.5.3 Restoring (IK, CK) upon power on.....	2-46
14	2.3.12.5.4 Key Strength Reduction Algorithm .....	2-46
15	2.3.12.5.5 Message Integrity Check Negotiation and Other Requirements.....	2-47
16	2.3.13 Lock and Maintenance Required Orders.....	2-48
17	2.3.14 Mobile Station Revision Identification .....	2-48
18	2.3.15 Temporary Mobile Subscriber Identity.....	2-48
19	2.3.15.1 Overview .....	2-48
20	2.3.15.2 TMSI Assignment Memory .....	2-50
21	2.4 Accumulated Statistics.....	2-50
22	2.4.1 Monitored Quantities and Statistics .....	2-50
23	2.4.2 Accumulated Paging, Broadcast, and Forward Common Control Channel	
24	Statistics .....	2-50
25	2.5 Reserved .....	2-52
26	SECTION (Continued) .....	2-53
27	2.6 Layer 3 Processing.....	2-53
28	2.6.1 Mobile Station Initialization State.....	2-55
29	2.6.1.1 System Determination Substate .....	2-57
30	2.6.1.1.1 Custom System Selection Process.....	2-63
31	2.6.1.1.2 System Selection Using Current Redirection Criteria .....	2-63
32	2.6.1.1.2.1 System Selection Using Current Redirection Record .....	2-64

**CONTENTS**

1	2.6.1.1.3 System Selection Using System Reselection Criteria .....	2-65
2	2.6.1.1.4 Acquiring the Selected System.....	2-65
3	2.6.1.2 Pilot Channel Acquisition Substate .....	2-66
4	2.6.1.3 Sync Channel Acquisition Substate .....	2-66
5	2.6.1.4 Timing Change Substate.....	2-69
6	2.6.2 Mobile Station Idle State.....	2-72
7	2.6.2.1 Idle Procedures .....	2-75
8	2.6.2.1.1 Forward Channel Monitoring Procedures .....	2-75
9	2.6.2.1.1.1 General Overview .....	2-75
10	2.6.2.1.1.1.1 General Overview for Individually Addressed Messages .....	2-76
11	2.6.2.1.1.1.1.1 Overview of Stopping Monitoring via the General Page	
12	Message.....	2-78
13	2.6.2.1.1.1.1.2 Overview of Stopping Monitoring via the Universal Page	
14	Message.....	2-80
15	2.6.2.1.1.1.2 Overview of Broadcast Messages on Paging Channel.....	2-80
16	2.6.2.1.1.1.2.1 Method 1: Multi-Slot Broadcast Message Transmission.....	2-80
17	2.6.2.1.1.1.2.2 Method 2: Periodic Broadcast Paging .....	2-81
18	2.6.2.1.1.1.3 Overview of Broadcast Messages on Broadcast Control	
19	Channel.....	2-82
20	2.6.2.1.1.1.3.1 Method 1: Multi-Slot Enhanced Broadcast Paging.....	2-82
21	2.6.2.1.1.1.3.2 Method 2: Periodic Enhanced Broadcast Paging .....	2-83
22	2.6.2.1.1.1.4 Overview of Broadcast Messages on Forward Common	
23	Control Channel.....	2-83
24	2.6.2.1.1.1.4.1 Method 1: Multi-Slot Broadcast Message Transmission.....	2-83
25	2.6.2.1.1.1.4.2 Method 2: Periodic Enhanced Broadcast Paging .....	2-84
26	2.6.2.1.1.2 Non-Slotted Mode Requirements .....	2-84
27	2.6.2.1.1.3 Slotted Mode Requirements .....	2-85
28	2.6.2.1.1.3.1 Monitoring Assigned Slots .....	2-85
29	2.6.2.1.1.3.2 Determination of the Slot Cycle Index.....	2-88
30	2.6.2.1.1.3.3 Slot Cycles for Broadcast Message Transmission.....	2-88
31	2.6.2.1.1.3.3.1 Slot Cycles for Broadcast Message Transmission on the	
32	Paging Channel .....	2-88
33	2.6.2.1.1.3.3.2 Slot Cycles for Broadcast Message Transmission on the	
34	Forward Common Control Channel.....	2-89

## CONTENTS

1	2.6.2.1.1.3.4 Monitoring Paging Channel Broadcasts .....	2-89
2	2.6.2.1.1.3.5 Support of Broadcast Delivery Options on the Paging	
3	Channel.....	2-91
4	2.6.2.1.1.3.6 Monitoring the Forward Common Control Channel for the	
5	Enhanced Broadcast Page.....	2-91
6	2.6.2.1.1.3.7 Support of Broadcast Delivery Options on the Forward	
7	Common Control Channel/Broadcast Control Channel	
8	when NUM_BCCH_BCAST <sub>S</sub> does not equal '000' .....	2-93
9	2.6.2.1.1.3.7.1 Support of Broadcast Delivery Options on the Forward	
10	Common Control Channel when NUM_BCCH_BCAST <sub>S</sub>	
11	equals '000' .....	2-93
12	2.6.2.1.1.3.8 Slot Cycles for BSPM Transmission.....	2-94
13	2.6.2.1.1.3.8.1 BSPM Slot Cycle on the Paging Channel .....	2-94
14	2.6.2.1.1.3.8.2 BSPM Slot Cycle on the Primary Broadcast Control	
15	Channel .....	2-94
16	2.6.2.1.1.4 Common Channel Supervision.....	2-94
17	2.6.2.1.2 Quick Paging Channel Monitoring Procedures.....	2-95
18	2.6.2.1.2.1 Overview.....	2-95
19	2.6.2.1.2.2 Requirements .....	2-98
20	2.6.2.1.3 Registration.....	2-100
21	2.6.2.1.4 Idle Handoff.....	2-100
22	2.6.2.1.4.1 Pilot Search .....	2-100
23	2.6.2.1.4.2 Idle Handoff Procedures .....	2-103
24	2.6.2.1.5 Primary Broadcast Control Channel Monitoring.....	2-113
25	2.6.2.1.5.1 General Overview .....	2-113
26	2.6.2.1.5.2 Requirements .....	2-113
27	2.6.2.1.6 System Reselection Procedures.....	2-113
28	2.6.2.1.7 Slotted Timer Expiration .....	2-114
29	2.6.2.1.8 Exiting the Reduced Slot Cycle Mode.....	2-114
30	2.6.2.1.9 Radio Environment Report Timer Expiration .....	2-114
31	2.6.2.2 Response to Overhead Information Operation .....	2-114
32	2.6.2.2.1 System Parameters Message .....	2-120
33	2.6.2.2.1.1 Stored Parameters .....	2-121
34	2.6.2.2.1.2 Paging Channel Assignment Change .....	2-125

**CONTENTS**

1	2.6.2.2.1.3 RESCAN Parameter .....	2-125
2	2.6.2.2.1.4 Roaming Status .....	2-125
3	2.6.2.2.1.5 Registration.....	2-126
4	2.6.2.2.1.6 Slot Cycle Index .....	2-126
5	2.6.2.2.1.7 PACA Disable for SID Change .....	2-126
6	2.6.2.2.1.8 Retry Delay Disable for Packet Zone ID or SID/NID Change .....	2-126
7	2.6.2.2.1.9 Encryption key reset for SID/NID Change .....	2-126
8	2.6.2.2.2 Access Parameters Message .....	2-127
9	2.6.2.2.3 Neighbor List Message .....	2-129
10	2.6.2.2.4 CDMA Channel List Message .....	2-130
11	2.6.2.2.5 Extended System Parameters Message .....	2-131
12	2.6.2.2.6 Global Service Redirection Message .....	2-140
13	2.6.2.2.7 Extended Neighbor List Message .....	2-141
14	2.6.2.2.8 General Neighbor List Message .....	2-143
15	2.6.2.2.9 User Zone Identification Message .....	2-148
16	2.6.2.2.10 Private Neighbor List Message .....	2-149
17	2.6.2.2.11 Extended Global Service Redirection Message .....	2-150
18	2.6.2.2.12 Extended CDMA Channel List Message Overview .....	2-151
19	2.6.2.2.12.1 Extended CDMA Channel List Message on Paging Channel .....	2-152
20	2.6.2.2.12.2 Extended CDMA Channel List Message on Primary Broadcast	
21	Control Channel .....	2-156
22	2.6.2.2.13 ANSI-41 System Parameters Message .....	2-161
23	2.6.2.2.13.1 Stored Parameters.....	2-161
24	2.6.2.2.13.2 Roaming Status .....	2-165
25	2.6.2.2.13.3 Registration.....	2-165
26	2.6.2.2.13.4 PACA Disable for SID Change .....	2-165
27	2.6.2.2.14 MC-RR Parameters Message .....	2-165
28	2.6.2.2.14.1 Stored Parameters.....	2-166
29	2.6.2.2.14.2 Slot Cycle Index .....	2-174
30	2.6.2.2.14.3 Forward Common Control Channel Assignment Change.....	2-175
31	2.6.2.2.14.4 RESCAN Parameter .....	2-175
32	2.6.2.2.15 Enhanced Access Parameters Message .....	2-175

## CONTENTS

1	2.6.2.2.16 ANSI-41 RAND Message .....	2-180
2	2.6.2.2.17 Universal Neighbor List Message.....	2-181
3	2.6.2.2.18 <i>BCMC Service Parameters Message</i> .....	2-186
4	2.6.2.2.19 Access Point Pilot Information Message .....	2-197
5	2.6.2.2.20 Access Point Identification Message.....	2-198
6	2.6.2.2.21 Access Point Identification Text Message .....	2-200
7	2.6.2.2.22 <i>General Overhead Information Message</i> .....	2-200
8	2.6.2.2.23 Flex Duplex CDMA Channel List Message Overview .....	2-201
9	2.6.2.2.23.1 Flex Duplex CDMA Channel List Message on Paging Channel ..	2-204
10	2.6.2.2.23.2 Flex Duplex CDMA Channel List Message on Primary	
11	Broadcast Control Channel.....	2-207
12	2.6.2.2.24 Alternative Technologies Information Message .....	2-211
13	2.6.2.3 Mobile Station Page Match Operation.....	2-212
14	2.6.2.4 Mobile Station Order and Message Processing Operation.....	2-213
15	2.6.2.5 Mobile Station Origination Operation .....	2-223
16	2.6.2.6 Mobile Station Message Transmission Operation .....	2-224
17	2.6.2.7 Mobile Station Power-Down Operation .....	2-225
18	2.6.2.8 Mobile Station PACA Cancel Operation .....	2-225
19	2.6.3 System Access State .....	2-225
20	2.6.3.1 Access Procedures .....	2-226
21	2.6.3.1.1 Access Attempts .....	2-226
22	2.6.3.1.2 Reserved.....	2-227
23	2.6.3.1.3 Handoffs.....	2-227
24	2.6.3.1.3.1 Pilot Search .....	2-228
25	2.6.3.1.3.2 Access Handoff.....	2-229
26	2.6.3.1.3.3 Access Probe Handoff.....	2-230
27	2.6.3.1.4 System Access State Exit Procedures.....	2-232
28	2.6.3.1.5 Reserved.....	2-232
29	2.6.3.1.6 Full-TMSI Timer .....	2-232
30	2.6.3.1.7 Monitoring Pilots.....	2-232
31	2.6.3.1.7.1 Generation of the Initial Access Handoff List .....	2-232
32	2.6.3.1.7.2 Update of the Access Handoff List.....	2-233

**CONTENTS**

1	2.6.3.1.7.3 Generation of the Other Reported List .....	2-233
2	2.6.3.1.7.4 Update of OTHER_REPORTED_LIST .....	2-234
3	2.6.3.1.8 Paging Channel and Forward Common Control Channel/ Primary	
4	Broadcast Control Channel Monitoring .....	2-234
5	2.6.3.2 Update Overhead Information Substate.....	2-235
6	2.6.3.3 Page Response Substate .....	2-240
7	2.6.3.4 Mobile Station Order/Message Response Substate .....	2-280
8	2.6.3.5 Mobile Station Origination Attempt Substate.....	2-284
9	2.6.3.6 Registration Access Substate.....	2-328
10	2.6.3.7 Mobile Station Message Transmission Substate.....	2-334
11	2.6.3.8 PACA Cancel Substate.....	2-341
12	2.6.4 Mobile Station Control on the Traffic Channel State .....	2-345
13	2.6.4.1 Special Functions and Actions .....	2-347
14	2.6.4.1.1 Forward Traffic Channel Power Control .....	2-347
15	2.6.4.1.1.1 Forward Traffic Channel Power Control Initialization .....	2-350
16	2.6.4.1.1.2 Processing the Power Control Parameters Message .....	2-350
17	2.6.4.1.1.3 Processing the Power Control Message .....	2-351
18	2.6.4.1.1.4 Processing the Rate Change Message .....	2-353
19	2.6.4.1.2 Service Configuration and Negotiation.....	2-355
20	2.6.4.1.2.1 Use of Variables .....	2-360
21	2.6.4.1.2.1.1 Maintaining the Service Request Sequence Number .....	2-360
22	2.6.4.1.2.1.2 Maintaining the Service Negotiation Indicator Variable .....	2-360
23	2.6.4.1.2.1.3 Maintaining the Service Option Request Number .....	2-360
24	2.6.4.1.2.1.4 Stored Service Configuration and Reconnection .....	2-360
25	2.6.4.1.2.2 Service Subfunctions .....	2-361
26	2.6.4.1.2.2.1 Normal Service Subfunction.....	2-364
27	2.6.4.1.2.2.2 Waiting for Service Request Message Subfunction.....	2-366
28	2.6.4.1.2.2.3 Waiting for Service Response Message Subfunction .....	2-369
29	2.6.4.1.2.2.4 Waiting for Service Connect Message Subfunction .....	2-372
30	2.6.4.1.2.2.5 Waiting for Service Action Time Subfunction.....	2-375
31	2.6.4.1.2.2.5.1 Storing a Service Configuration with SYNC_ID .....	2-382

## CONTENTS

1	2.6.4.1.2.2.5.2 Restoring a stored Service Configuration based on	
2	SYNC_ID .....	2-383
3	2.6.4.1.2.2.6 SO Negotiation Subfunction.....	2-383
4	2.6.4.1.3 Ordering of Messages .....	2-385
5	2.6.4.1.4 Processing the In-Traffic System Parameters Message.....	2-385
6	2.6.4.1.5 Message Action Times .....	2-388
7	2.6.4.1.6 Long Code Transition Request Processing .....	2-388
8	2.6.4.1.7 Power Up Function (PUF) .....	2-389
9	2.6.4.1.7.1 Processing the Power Up Function Message .....	2-390
10	2.6.4.1.7.2 Power Up Function Procedures .....	2-391
11	2.6.4.1.7.2.1 PUF Probe On Serving Frequency.....	2-391
12	2.6.4.1.7.2.2 PUF Probe On PUF Target Frequency.....	2-392
13	2.6.4.1.7.3 Processing the Power Up Function Completion Message .....	2-393
14	2.6.4.1.8 Forward Traffic Channel Supervision.....	2-393
15	2.6.4.1.8.1 Forward Traffic Channel Supervision when a Forward Common	
16	Power Control Channel is not assigned .....	2-394
17	2.6.4.1.8.1.1 Triggers.....	2-395
18	2.6.4.1.8.2 Forward Traffic Channel Supervision when a Forward Common	
19	Power Control Channel is assigned .....	2-395
20	2.6.4.1.9 Processing the Extended Release Message and the Extended Release	
21	Mini Message .....	2-396
22	2.6.4.1.10 Processing the Resource Allocation Message and Resource	
23	Allocation Mini Message .....	2-400
24	2.6.4.1.11 Reserved.....	2-400
25	2.6.4.1.12 Processing the Service Configuration Record.....	2-400
26	2.6.4.1.13 Processing the Non-Negotiable Service Configuration Record.....	2-404
27	2.6.4.1.14 Processing the Security Mode Command Message.....	2-419
28	2.6.4.1.15 Processing the Handoff Supplementary Information Solicit Message	
29	.....	2-421
30	2.6.4.2 Traffic Channel Initialization Substate .....	2-421
31	2.6.4.2.1 Return to Traffic Channel Initialization Substate with Initialization	
32	Failure Indication .....	2-445
33	2.6.4.2.2 Exiting the Traffic Channel Initialization Substate .....	2-447
34	2.6.4.3 Traffic Channel Substate .....	2-450

**CONTENTS**

1	2.6.4.4 Release Substate.....	2-477
2	2.6.4.4.1 Procedures for Exiting the Release Substate.....	2-486
3	2.6.5 Registration .....	2-490
4	2.6.5.1 Forms of Registration.....	2-490
5	2.6.5.1.1 Power-Up Registration .....	2-492
6	2.6.5.1.2 Power-Down Registration.....	2-492
7	2.6.5.1.3 Timer-Based Registration.....	2-492
8	2.6.5.1.3.1 Timer-Based Registration based on Frequency of Implicit	
9	Registrations.....	2-493
10	2.6.5.1.4 Distance-Based Registration.....	2-494
11	2.6.5.1.5 Zone-Based Registration.....	2-495
12	2.6.5.1.6 Parameter-Change Registration .....	2-497
13	2.6.5.1.7 Ordered Registration.....	2-498
14	2.6.5.1.8 Implicit Registration.....	2-498
15	2.6.5.1.9 Traffic Channel Registration .....	2-498
16	2.6.5.1.10 User Zone Registration.....	2-498
17	2.6.5.1.11 Encryption/Message Integrity Re-sync Required Registration.....	2-498
18	2.6.5.1.12 BCMC Registration .....	2-498

## FOREWORD AND SCOPE

**(This foreword and scope are not part of this specification)**

This Specification was prepared by Technical Specification Group C of the Third Generation Partnership Project 2 (3GPP2). This Specification contains the Layer 3 layer of the IMT-2000 CDMA Multi-Carrier Mode, IMT-2000 CDMA MC, also known as cdma2000<sup>®1</sup>. It provides a specification for land mobile wireless systems based upon cellular principles. This Specification includes the capabilities of Telecommunications Industry Association Standard TIA/EIA-95-B.

This Specification provides the Layer 3 Upper Layer signaling protocol architecture and functionality. Other specifications are required to complete the air interface and the rest of the system. Some of these specifications are listed in the References section.

**1. General.** This section defines the terms and numeric indications used in this document. This section also describes the general signaling architecture.

**2. Requirements for Mobile Station CDMA Operation.** This section describes the requirements for mobile stations operating in the CDMA mode. A mobile station complying with these requirements will be able to operate with CDMA base stations complying with this document.

**3. Requirements for Base Station CDMA Operation.** This section describes the requirements for CDMA base stations. A base station complying with these requirements will be able to operate in the CDMA mode with mobile stations complying with this document.

**Annex A. Reserved.**

**Annex B. CDMA Call Flow Examples.** This informative annex provides examples of simple call flows in the CDMA system.

**Annex C. Additional CDMA Call Flows.** This informative annex provides examples of additional simple call flows in the CDMA system.

**Annex D. CDMA Constants.** This normative annex contains tables that give specific values for the constant identifiers found in Section 2 and Section 3.

**Annex E. CDMA Retrievable and Settable Parameters.** This normative annex describes the mobile station parameters that the base station can set and retrieve.

<sup>1</sup>cdma2000<sup>®</sup> is the trademark for the technical nomenclature for certain specifications and standards of the Organizational Partners (OPs) of 3GPP2. Geographically (and as of the date of publication), cdma2000<sup>®</sup> is a registered trademark of the Telecommunications Industry Association (TIA-USA) in the United States.

- 1 **Annex F. Mobile Station Database.** This informative annex describes a database model
- 2 that can be used for mobile stations complying with this document.
- 3 **Annex G. Encryption Call Flows.** This informative annex provides examples of extended
- 4 encryption call flows in the CDMA system.

1

**NOTES**

- 2 1. Compatibility, as used in connection with cdma2000<sup>®2</sup>, is understood to mean:  
 3 any cdma2000 mobile station is able to place and receive calls in cdma2000 and  
 4 IS-95 systems. Conversely, any cdma2000 system is able to place and receive calls  
 5 for cdma2000 and IS-95 mobile stations.
- 6 2. Reserved.
- 7 3. This compatibility specification is based upon spectrum allocations that have been  
 8 defined by various governmental administrations.
- 9 4. Each mobile station is assigned either a single unique 32-bit binary serial number  
 10 (ESN) or a single unique 56-bit binary serial number (MEID) that cannot be  
 11 changed by the subscriber without rendering the mobile station inoperative (see  
 12 2.3.2).
- 13 5. “Base station” refers to the functions performed in the fixed network. These  
 14 functions typically distributed among cells, sectors, and mobile switching centers.
- 15 6. This standard uses the following verbal forms: “Shall” and “shall not” identify  
 16 requirements strictly to be followed in order to conform with the standard and from  
 17 which no deviation is permitted. “Should” and “should not” indicate that one of  
 18 several possibilities is recommended as particularly suitable, without mentioning  
 19 or excluding others; that a certain course of action is preferred but not necessarily  
 20 required; or that (in the negative form) a certain possibility or course of action is  
 21 discouraged but not prohibited. “May” and “need not” indicate a course of action  
 22 permissible within the limits of the standard. “Can” and “cannot” are used for  
 23 statements of possibility and capability, whether material, physical, or causal.
- 24 7. Footnotes appear at various points in this specification to elaborate and further  
 25 clarify items discussed in the body of the specification.
- 26 8. Unless indicated otherwise, this document presents numbers in decimal form.  
 27 Binary numbers are distinguished in the text by the use of single quotation marks.
- 28 9. The following operators define mathematical operations:
- 29  $\times$  indicates multiplication.
- 30  $\lfloor x \rfloor$  indicates the largest integer less than or equal to  $x$ :  $\lfloor 1.1 \rfloor = 1$ ,  $\lfloor 1.0 \rfloor = 1$ .
- 31  $\lceil x \rceil$  indicates the smallest integer greater or equal to  $x$ :  $\lceil 1.1 \rceil = 2$ ,  $\lceil 2.0 \rceil = 2$ .
- 32  $|x|$  indicates the absolute value of  $x$ :  $|-17| = 17$ ,  $|17| = 17$ .

---

<sup>2</sup> “cdma2000<sup>®</sup> is the trademark for the technical nomenclature for certain specifications and standards of the Organizational Partners (OPs) of 3GPP2. Geographically (and as of the date of publication), cdma2000<sup>®</sup> is a registered trademark of the Telecommunications Industry Association (TIA-USA) in the United States.”

- 1            $\oplus$  indicates exclusive OR (modulo-2 addition).
- 2            $\min(x, y)$  indicates the minimum of  $x$  and  $y$ .
- 3            $\max(x, y)$  indicates the maximum of  $x$  and  $y$ .
- 4            $x \bmod y$  indicates the remainder after dividing  $x$  by  $y$ :  $x \bmod y = x - (y \times \lfloor x/y \rfloor)$ .
- 5            $\text{weight}(x)$  indicates the number of '1's in the binary representation of  $x$ .
- 6            $\gg$  indicates binary right shift operation.
- 7            $\ll$  indicates binary left shift operation.

8       10. While communication between Layer 3 and Layer 2 is specified, there is no  
9       requirement to implement layering.

10      11. The following indentation is advised :

11      “No indentation

- 12          •   bullet 1
- 13              –   bullet 2
- 14                  +   bullet 3.
- 15                      □   bullet 4.
- 16                          ◇   bullet 5.
- 17                              –   bullet 6.
- 18                                  +   bullet 7.

## 1 1. GENERAL

2 This section defines the terms and numeric indications used in this document. This  
3 section also describes the general signaling architecture.

### 4 1.1 Terms and Numeric Information

#### 5 1.1.1 Terms

6 **Abbreviated Alert.** An abbreviated alert is used to remind the mobile station user that  
7 previously selected alternative routing features are still active.

8 **AC.** See Authentication Center.

9 **Access Attempt.** The entire process of sending one message and receiving (or failing to  
10 receive) an acknowledgment for that message, consisting of one or more access sub-  
11 attempts. See also Access Probe, Access Probe Sequence, and Access Sub-attempt.

12 **Access Channel.** A Reverse CDMA Channel used by mobile stations for communicating  
13 to the base station. The Access Channel is used for short signaling message exchanges  
14 such as call originations, responses to pages, and registrations. The Access Channel is a  
15 slotted random access channel.

16 **Access Channel Message.** The information part of an access probe consisting of the  
17 message body, length field, and CRC.

18 **Access Channel Message Capsule.** An Access Channel message plus the padding.

19 **Access Channel Preamble.** The preamble of an access probe consisting of a sequence of  
20 all-zero frames that are sent at the 4800 bps rate.

21 **Access Channel Request Message.** An Access Channel message that is autonomously  
22 generated by the mobile station. See also Access Channel Response Message.

23 **Access Channel Response Message.** A message on the Access Channel generated to  
24 reply to a message received from the base station.

25 **Access Channel Slot.** The assigned time interval for an access probe. An Access Channel  
26 slot consists of an integer number of frames. The transmission of an access probe is  
27 performed within the boundaries of an Access Channel slot.

28 **Access Entry Handoff.** The act of transferring reception of the Paging Channel from one  
29 base station to another, when the mobile station is transitioning from the *Mobile Station*  
30 *Idle State* to the *System Access State*.

31 **Access Handoff.** The act of transferring reception of the Paging Channel from one base  
32 station to another, when the mobile station is in the *System Access State* after an Access  
33 Attempt.

34 **Access Overload Class.** See Overload Class.

35 **Access Probe.** One Access Channel transmission consisting of a preamble and a  
36 message. The transmission is an integer number of frames in length and transmits one

1 Access Channel message. See also Access Probe Sequence, Access Sub-attempt, and  
2 Access Attempt.

3 **Access Probe Handoff.** A handoff that occurs while the mobile station is performing an  
4 Access Attempt in the *System Access State*.

5 **Access Probe Sequence.** A sequence of one or more access probes on the Access  
6 Channel. Other than the reported pilot information, the same Access Channel message  
7 content is transmitted in every access probe of an access sub-attempt. See also Access  
8 Probe, Access Sub-attempt, and Access Attempt.

9 **Access Sub-attempt.** A sequence of one or more access probe sequences on the Access  
10 Channel transmitted to one pilot, containing the same message content other than the  
11 reported pilot information. See also Access Probe, Access Probe Sequence, and Access  
12 Attempt.

13 **Acknowledgment.** A Layer 2 response by the mobile station or the base station  
14 confirming that a signaling message was received correctly.

15 **Action Time.** The time at which the action implied by a message should take effect.

16 **Active Set.** The set of pilots associated with the CDMA Channels containing Forward  
17 Traffic Channels assigned to a particular mobile station.

18 **Active User Zone.** A user zone in which the mobile station makes its presence known via  
19 an explicit registration in order to activate tiered service features. See also CDMA Tiered  
20 Services, User Zone, and Passive User Zone.

21 **Aging.** A mechanism through which the mobile station maintains in its Neighbor Set the  
22 pilots that have been recently sent to it from the base station and the pilots whose handoff  
23 drop timers have recently expired.

24 **AKA.** Authentication and Key Agreement. An authentication procedure that allows  
25 mutual authentication of the mobile station and base station.

26 **A-key.** A secret, 64-bit pattern stored in the mobile station and HLR/AC. It is used to  
27 generate/update the mobile station's Shared Secret Data.

28 **Alternate Interleaver Pattern.** An interleaver pattern used for convolutional coded frames  
29 for code combining soft handoff for Radio Configuration 12. The alternate interleaver  
30 pattern is used by some base stations in the mobile station active set to increase the  
31 probability of frame early termination.

32 **ARQ.** Automatic Repeat Request. The ARQ is an automatic retransmission protocol that  
33 ensures the delivery of encoder packets from the sender to the receiver by retransmission  
34 of portions of a turbo encoded packet based on the feedback from the receiver that  
35 indicates if the encoder packets have been received and decoded successfully (ACK) or not  
36 (NAK).

37 **Assured Mode.** Mode of delivery that guarantees that a PDU will be delivered to the peer.  
38 A PDU sent in assured mode is retransmitted by the LAC sublayer, up to a maximum  
39 number of retransmissions, until the LAC entity at the sender receives an  
40 acknowledgment for the PDU. See also Confirmation of Delivery.

- 1 **Authentication.** A procedure used by a base station to validate a mobile station's  
2 identity.
- 3 **Authentication Center (AC).** An entity that manages the authentication information  
4 related to the mobile station.
- 5 **Authentication Response (AUTHR).** An 18-bit output of the authentication algorithm. It  
6 is used, for example, to validate mobile station registrations, originations and  
7 terminations.
- 8 **Autonomous Registration.** A method of registration in which the mobile station registers  
9 without an explicit command from the base station.
- 10 **Auxiliary Pilot Channel.** A non-data-bearing, direct-sequence spread spectrum signal  
11 optionally transmitted by a CDMA base station.
- 12 **Auxiliary Transmit Diversity Pilot Channel.** A pilot channel, counterpart to an Auxiliary  
13 Pilot Channel, that is transmitted by a CDMA base station from the non-primary antenna  
14 when orthogonal transmit diversity is employed.
- 15 **AV.** Authentication Vector used by AKA.
- 16 **Bad Frames.** Frames classified as insufficient frame quality or as 9600 bps primary traffic  
17 only, with bit errors. See also Good Frames.
- 18 **Band Class.** A set of CDMA frequency assignments and a numbering scheme for these  
19 channels. See also CDMA Frequency Assignment.
- 20 **Base Station.** A fixed station used for communicating with mobile stations. Depending  
21 upon the context, the term base station may refer to a cell, a sector within a cell, an MSC,  
22 or other part of the wireless system. See also MSC.
- 23 **Base Station Authentication Response (AUTHBS).** An 18-bit pattern generated by the  
24 authentication algorithm. AUTHBS is used to confirm the validity of base station orders to  
25 update the Shared Secret Data.
- 26 **Base Station Random Variable (RANDBS).** A 32-bit random number generated by the  
27 mobile station for authenticating base station orders to update the Shared Secret Data.
- 28 **BCMC Service Layer.** The functional components residing above the signaling layer  
29 (Layer 3) that provide BCMC services.
- 30 **BCMC TDM Mode.** A mode of operation where a time-division multiplexing (TDM)  
31 structure is used on a Forward Supplemental Channel (F-SCH) for BCMC content  
32 transmission to mobile stations in *Mobile Station Idle State*.
- 33 **Blank-and-Burst.** The preemption of an entire Traffic Channel frame's primary traffic by  
34 signaling traffic or secondary traffic. Blank-and-burst is performed on a frame-by-frame  
35 basis.
- 36 **BLOB.** Block of Bits.
- 37 **bps.** Bits per second.

1 **Boosted Mode.** Mode of operation of Reverse Packet Data Channel where selected data  
2 packets are transmitted by the mobile station at a higher power to increase the probability  
3 of being received by the base station.

4 **Broadcast Control Channel.** A code channel in a Forward CDMA Channel used for  
5 transmission of control information or broadcast messages from a base station to a mobile  
6 station.

7 **Broadcast Control Channel Number (BCN).** A number that identifies the Broadcast  
8 Control Channel. BCN number 1 corresponds to the Primary Broadcast Control Channel.  
9 BCN numbers 2 through 7 correspond to other Broadcast Control Channels (if any).

10 **Broadcast User Zone.** A user zone that is identified to the mobile station by means of  
11 broadcast messages. It corresponds to the RF coverage area of a particular set of cells and  
12 sectors. See also CDMA Tiered Services and Mobile-Specific User Zone.

13 **Call Disconnect.** The process that releases the resources handling a particular call. The  
14 disconnect process begins either when the mobile station user indicates the end of the  
15 call by generating an on-hook condition or other call-release mechanism, or when the  
16 base station initiates a release.

17 **Call History Parameter (COUNT).** A modulo-64 event counter maintained by the mobile  
18 station and Authentication Center that is used for clone detection.

19 **Call Rescue Soft Handoff.** The ability for a mobile station to autonomously add one or  
20 more strong pilots to its Active Set in order to minimize the probability of dropped calls.

21 **Candidate Frequency.** The frequency, for which the base station specifies a search set,  
22 using a *Candidate Frequency Search Request Message*.

23 **Candidate Set.** The set of pilots that have been received with sufficient strength by the  
24 mobile station to be successfully demodulated, but have not been placed in the Active Set  
25 by the base station. See also Active Set, Neighbor Set, and Remaining Set.

26 **CCK.** An encryption key derived from the CMEA key. A 128-bit pattern that is the 64-bit  
27 CMEA key concatenated with a copy of itself.

28 **CCSH.** See Code Combining Soft Handoff.

29 **CDMA.** See Code Division Multiple Access.

30 **CDMA Candidate Frequency.** The Candidate Frequency specified for a search of CDMA  
31 pilots.

32 **CDMA Channel.** The set of channels transmitted between the base station and the  
33 mobile stations within a given CDMA Frequency Assignment. See also Forward CDMA  
34 Channel and Reverse CDMA Channel.

35 **CDMA Channel Number.** An 11-bit number that identifies a CDMA Frequency  
36 Assignment.

37 **CDMA Frequency Assignment.** A 1.23 or 3.69 MHz segment of spectrum. The center of a  
38 CDMA frequency assignment is given by a CDMA Channel Number.

**CDMA Preferred Set.** The set of CDMA channel numbers in a CDMA system corresponding to Frequency Assignments that a mobile station will normally search to acquire a CDMA Pilot Channel. For CDMA cellular systems, the primary and secondary channels comprise the CDMA Preferred Set.

**CDMA Tiered Services.** System features and services that are based on location, potentially including private networks. User zones establish the availability of services. See also User Zone, Broadcast User Zone, Mobile-Specific User Zone, Active User Zone, and Passive User Zone.

**Center SR3 Frequency.** The Spreading Rate 3 frequency that has the center frequency assignment.

**Chip.** See PN Chip.

**CIK.** An integrity key derived from the CMEA key. A 128-bit pattern that is the 64-bit CMEA key concatenated with a copy of itself.

**CK.** Cipher Key. A 128-bit pattern produced by AKA that is used for encryption.

**CMEA.** Cellular Message Encryption Algorithm.

**Code Channel.** A subchannel of a Forward CDMA Channel or Reverse CDMA Channel. Each subchannel uses an orthogonal Walsh function or quasi-orthogonal function.

**Code Combining Soft Handoff (CCSH).** A Soft Handoff method for Fundamental Channels on the forward link in Radio Configuration 12 and Supplemental Channels on the forward link in Radio Configurations 4, 5, and 12. For Supplemental Channels using Turbo codes in this mode, certain base stations encode and transmit the data with the default Turbo Encoder, whereas others use the complementary Turbo Encoder. Mobile stations in soft handoff can then combine both codes to achieve lower code rate. For Fundamental Channels and Supplemental Channels using Convolutional codes in this mode certain base stations transmit using the default interleaver pattern, whereas others use an alternate interleaver pattern. Mobile stations in handoff combine transmissions from both base stations to decode the frames earlier.

**Code Division Multiple Access (CDMA).** A technique for spread-spectrum multiple-access digital communications that creates channels through the use of unique code sequences.

**Code Symbol.** The output of an error-correcting encoder. Information bits are input to the encoder and code symbols are output from the encoder. See Convolutional Code.

**Configuration Change Indicator.** A one-bit datum, sent on the Quick Paging Channel. Appearance of the Configuration Change Indicator in the Quick Paging Channel serves to alert a slotted mode mobile station, operating in the idle state, that, after performing an idle handoff, it should monitor the Paging Channel, the Forward Common Control Channel, or the Primary Broadcast Control Channel in order to determine if it should update its stored parameters.

**Confirmation of Delivery.** A notification sent by the LAC sublayer to Layer 3 at the sender, when the LAC entity at the sender receives the acknowledgment for a specific PDU sent in assured mode.

- 1 **Convolutional Code.** A type of error-correcting code. A code symbol can be considered  
2 as modulo 2 the convolution of the input data sequence with the impulse response of a  
3 generator function.
- 4 **CRC.** See Cyclic Redundancy Code.
- 5 **Cyclic Redundancy Code (CRC).** A class of linear error detecting codes that generate  
6 parity check bits by finding the remainder of a polynomial division. See also Frame  
7 Quality Indicator.
- 8 **dBm.** A measure of power expressed in terms of its ratio (in dB) to one milliwatt.
- 9 **dBm/Hz.** A measure of power spectral density. The ratio, dBm/Hz, is the power in one  
10 Hertz of bandwidth, where power is expressed in units of dBm.
- 11 **dBW.** A measure of power expressed in terms of its ratio (in dB) to one Watt.
- 12 **Dedicated Control Channel.** A portion of a Traffic Channel (Forward or Reverse) that  
13 carries a combination of user data, signaling, and power control information.
- 14 **Deinterleaving.** The process of unpermuting the symbols that were permuted by the  
15 interleaver. Deinterleaving is performed on received symbols prior to decoding.
- 16 **Direct Channel Assignment.** A MS-terminated call set-up procedure where the channel  
17 assignment can be sent directly to a mobile station without receiving a page response  
18 message from the mobile station.
- 19 **Discontinuous Transmission (DTX).** A mode of operation in which a base station or a  
20 mobile station switches its transmitter on and off on a particular code channel  
21 autonomously. For the case of DTX operation on the Forward Dedicated Control Channel,  
22 the Forward Power Control Subchannel is still transmitted.
- 23 **Distance-Based Registration.** An autonomous registration method in which the mobile  
24 station registers whenever it enters a cell whose distance from the cell in which the mobile  
25 station last registered exceeds a given threshold.
- 26 **DTMF.** See Dual-Tone Multifrequency.
- 27 **Dual-Tone Multifrequency (DTMF).** Signaling by the simultaneous transmission of two  
28 tones, one from a group of low frequencies and another from a group of high frequencies.  
29 Each group of frequencies consists of four frequencies.
- 30  **$E_b$ .** A measure of the energy in a signal, at some point in a communication system, per  
31 information bit conveyed by that signal, or an average value of such energies. Its  
32 relevance to system performance is most often expressed by its ratio to additive noise and  
33 interference, such as in  $E_b/N_0$  or  $E_b/I_0$ . Such ratios are dimensionless, and are usually  
34 expressed in dB units.
- 35  **$E_c/I_0$ .** A notation used to represent a dimensionless ratio of the average power of some  
36 code-distinguished CDMA signal channel, typically a pilot, to the total power comprised of  
37 signal plus interference, within the signal bandwidth. It is usually expressed in dB units.
- 38 **Effective Radiated Power (ERP).** The product of the power supplied to the antenna and  
39 its gain relative to a half-wave dipole in a given direction.

- 1 **EIRP.** See Equivalent Isotropic Radiated Power.
- 2 **Electronic Serial Number (ESN).** A 32-bit number assigned by the mobile station  
3 manufacturer, uniquely identifying the mobile station equipment.
- 4 **Encoder Tail Bits.** A fixed sequence of bits added to the end of a block of data to reset  
5 the convolutional encoder to a known state.
- 6 **Enhanced Access Channel.** A reverse channel used by mobile station for communicating  
7 to the base station. The Enhanced Access Channel operates in the Basic Access Mode,  
8 and Reservation Access Mode. It is used for transmission of short messages, such as  
9 signaling, MAC messages, response to pages, and call originations. It can also be used to  
10 transmit moderate-sized data packets.
- 11 **Enhanced Access Channel Preamble.** A non-data bearing portion of the Enhanced  
12 Access probe sent by the mobile station to assist the base station in initial acquisition and  
13 channel estimation.
- 14 **Enhanced Access Channel Slot.** The assigned time interval for an enhanced access  
15 probe. The transmission of an enhanced access probe is performed within the boundaries  
16 of an Enhanced Access Channel slot.
- 17 **Enhanced Access Data.** The data transmitted while in the Basic Access Mode on the  
18 Enhanced Access Channel or while in the Reservation Access Mode on a Reverse Common  
19 Control Channel.
- 20 **Enhanced Access Header.** A frame containing access origination information transmitted  
21 immediately after the Enhanced Access Channel Preamble while in the Reservation Access  
22 Mode.
- 23 **Enhanced Access Probe.** One Enhanced Access Channel transmission consisting of an  
24 Enhanced Access Channel preamble, optionally an Enhanced Access header, and  
25 optionally Enhanced Access data. See also Enhanced Access Probe Sequence.
- 26 **Enhanced Access Probe Sequence.** A sequence of one or more Enhanced Access probes  
27 on the Enhanced Access Channel. See also Enhanced Access Probe.
- 28 **Enhanced Rate Adaptation Mode (ERAM).** A flexible and variable data rate mode for the  
29 Supplemental Channel operation with turbo codes. ERAM is defined on forward link for  
30 Radio Configurations 4 and 5, and on the reverse link for Radio Configuration 4. In this  
31 mode, lower rate turbo codes are used to match the desired channel interleaver block size  
32 instead of pure code symbol repetitions.
- 33 **Equivalent Isotropically Radiated Power (EIRP).** The product of the power supplied to  
34 the antenna and the antenna gain in a direction relative to an isotropic antenna.
- 35 **ERAM.** See Enhanced Rate Adaptation Mode.
- 36 **Erase Indicator Bit.** See [2].
- 37 **ERP.** See Effective Radiated Power.
- 38 **ESN.** See Electronic Serial Number.
- 39 **ESN\_ME.** ESN associated with the mobile equipment. See Electronic Serial Number (ESN)

and ME.

**EXT\_SSEQ.** Security sequence number. A 32-bit crypto-sync that is used for encryption, message integrity, or both.

**EXT\_UIM\_ID.** An extended (length more than 32-bits) electronic identification (ID) number that is unique to the R-UIM. See [40]. EXT\_UIM\_ID can be either SF\_EUIMID or LF\_EUIMID. The mobile station uses SF\_EUIMID in place of MEID, with the exception of the MEID\_ME information record, when configured with a R-UIM which indicates that SF\_EUIMID is to be used in place of MEID (see [40]).

**F-ACKCH.** Forward Acknowledgment Channel. A channel used by the base station to acknowledge the successful receipt and decoding of the encoder packets (ACK) sent by the mobile station on Reverse Packet Data Channel or the failure to do so (NAK).

**f-csch.** Forward common signaling logical channel.

**f-dsch.** Forward dedicated signaling logical channel.

**F-GCH.** Forward Grant Channel. A channel used by the base station to assign or “grant” the mobile station a certain data rate on the Reverse Packet Data Channel.

**F-RCCH.** Forward Rate Control Channel. A channel used by the base station to modify the transmission data rate used on the Reverse Packet Data Channel by the mobile station. The data rates possible are allocated in advance.

**Fade Timer.** A timer kept by the mobile station as a measure of Forward Traffic Channel continuity. If the fade timer expires, the mobile station drops the call.

**Fast Call Setup Mode.** Any operational mode of a mobile station in the *Mobile Station Idle State* that can improve setup time for call originations or terminations. See Radio Environment Reporting Mode, Reduced Slot Cycle Mode, and Tracking Zone Mode.

**Flash.** An indication sent on the Reverse CDMA Channel indicating that the user directed the mobile station to invoke special processing.

**Foreign NID Roamer.** A mobile station operating in the same system (SID) but in a different network (NID) from the one in which service was subscribed. See also Foreign SID Roamer and Roamer.

**Foreign SID Roamer.** A mobile station operating in a system (SID) other than the one from which service was subscribed. See also Foreign NID Roamer and Roamer.

**Forward CDMA Channel.** A CDMA Channel from a base station to mobile stations. The Forward CDMA Channel contains one or more code channels that are transmitted on a CDMA Frequency Assignment using a particular pilot PN offset. The code channels are associated with the Pilot Channel, Sync Channel, Paging Channels, Broadcast Control Channel, Forward Common Control Channels, and Traffic Channels. The Forward CDMA Channel always carries a Pilot Channel and may also carry up to one Sync Channel, up to seven Paging Channels, up to seven Broadcast Control Channels, up to seven Forward Common Control Channels and up to the maximum number of channels allowed for the assigned Radio Configuration minus one Traffic Channels, as long as the total number of channels, including the Pilot Channel, is no greater than the maximum number of channels allowed for the assigned Radio Configuration (see [2] section 3.1.3.1.13).

**Forward Acknowledgment Channel.** A portion of a Forward CDMA Channel used for the transmission of acknowledgments from a base station to multiple mobile stations in response to the data received on the Reverse Packet Data Channel or the Reverse Fundamental Channel.

**Forward Common Acknowledgment Channel.** A portion of the Forward CDMA Channel used for the transmission of Acknowledgments from a base station to multiple mobile stations in response to the Reverse Supplemental Channel from mobile stations operating with reverse link Radio Configuration 8. The Forward Common Acknowledgment Channel is used by the base station to early terminate Reverse Supplemental Channel frames.

**Forward Common Acknowledgment Subchannel.** A subchannel on the Forward Common Acknowledgment Channel used by the base station to early terminate the Reverse Supplemental Channel from a mobile station operating with Radio Configuration 8.

**Forward Common Control Channel.** A control channel used for the transmission of digital control information from a base station to one or more mobile stations.

**Forward Dedicated Control Channel.** A Dedicated Control Channel that is transmitted on the Forward CDMA Channel.

**Forward Fundamental Channel.** A Fundamental Channel that is transmitted on the Forward CDMA Channel.

**Forward Packet Data Channel.** A portion of a Forward Link channel with Spreading Rate 1 used for the transmission of higher-level data from a base station to a mobile station.

**Forward Packet Data Control Channel.** A portion of a Forward Link channel with Spreading Rate 1 used for the transmission of the control information for the subpacket being transmitted on the Forward Packet Data Channel.

**Forward Pilot Channel.** A non-data-bearing direct-sequence spread spectrum signal transmitted continuously by each CDMA base station. The Forward Pilot Channel allows a mobile station to acquire the timing of the Forward CDMA Channel, provides a phase reference for coherent demodulation, and provides a means for signal strength comparisons between base stations for determining when to handoff. Different base stations are identified by different pilot PN sequence time phases. See also Pilot PN Sequence, Pilot PN Sequence Offset.

**Forward Supplemental Channel.** A Supplemental Channel that is transmitted on the Forward CDMA Channel.

**Forward Supplemental Code Channel.** A Supplemental Code Channel that is transmitted on the Forward CDMA Channel.

**Forward Traffic Channel.** One or more code channels used to transport user and signaling traffic from the base station to the mobile station. See Forward Fundamental

Channel, Forward Dedicated Control Channel, Forward Packet Data Channel, Forward Supplemental Channel, and Forward Supplemental Code Channel.<sup>3</sup>

**Forward Transmit Diversity Pilot Channel.** A pilot channel transmitted by a CDMA base station from the non-primary antenna when orthogonal transmit diversity is employed.

**Frame.** A basic timing interval in the system. For the Sync Channel, a frame is 26.666... ms long. For the Access Channel, the Paging Channel, the Forward Supplemental Code Channel, and the Reverse Supplemental Code Channel, a frame is 20 ms long. For the Forward Supplemental Channel and the Reverse Supplemental Channel, a frame is 20, 40, or 80 ms long. For the Enhanced Access Channel, the Forward Common Control Channel, and the Reverse Common Control Channel, a frame is 5, 10, or 20 ms long. For the Forward Fundamental Channel, Forward Dedicated Control Channel, Reverse Fundamental Channel, and Reverse Dedicated Control Channel, a frame is 5 or 20 ms long. For the Common Assignment Channel, a frame is 5 ms long. For the Broadcast Control Channel, a frame is 40 ms long; the frame may be transmitted once, twice, or four times. For the Forward Packet Data Control Channel and the Forward Packet Data Channel, a frame could be 1.25, 2.5, or 5 ms long. For the Reverse Acknowledgment Channel and the Reverse Channel Quality Indicator Channel, a frame is 1.25 ms long. For the Reverse Packet Data Channel, the Reverse Packet Data Control Channel, the Reverse Request Channel, the Forward Indicator Control Channel, the Forward Grant Channel, and the Forward Acknowledgment Channel, a frame is 10 ms long.

**Frame Category.** A classification of a received Traffic Channel frame based upon transmission data rate, the frame contents (primary traffic, secondary traffic, or signaling traffic), and whether there are detected errors in the frame.

**Frame Early Termination.** A method used to terminate transmission of a frame earlier than the nominal length of the frame (20 ms) if the receiver has successfully received the frame. The receiver transmits an acknowledgment to the transmitter following successful reception of the frame.

**Frame Number.** CDMA System Time, in integer multiples of 20 ms.

**Frame Offset.** A time skewing of Traffic Channel frames from System Time in integer multiples of 1.25 ms. The maximum frame offset is 18.75 ms.

**Frame Quality Indicator.** See [2].

**Full TMSI.** The combination of TMSI\_ZONE and TMSI\_CODE. The full TMSI is a globally unique address for the mobile station.

**Fundamental Channel.** A portion of a Traffic Channel that can carry a combination of primary data, secondary data, signaling, and power control information.

**Fundicated Channel.** Fundamental Channel, Dedicated Control Channel, or both.

---

<sup>3</sup> The Forward Traffic Channel does not include F-PDCCH, F-CPCCH.

- 1 **Gating Rate Set.** This specifies the set of supported reverse pilot gating rates. The base  
2 station and the mobile station may support one or more gating rates.
- 3 **GHz.** Gigahertz ( $10^9$  Hertz).
- 4 **Global Positioning System (GPS).** A US government satellite system that provides  
5 location and time information to users. See Navstar GPS Space Segment / Navigation  
6 User Interfaces ICD-GPS-200 for specifications.
- 7 **Good Frames.** Frames not classified as bad frames. See also Bad Frames.
- 8 **GPS.** See Global Positioning System.
- 9 **Handoff.** The act of transferring communication with a mobile station from one base  
10 station to another.
- 11 **Hard Handoff.** A handoff characterized by a temporary disconnection of the Traffic  
12 Channel. Hard handoffs occur when the mobile station is transferred between disjoint  
13 Active Sets, when the CDMA Frequency Assignment changes, or when the frame offset  
14 changes. See also Soft Handoff.
- 15 **Hash Function.** A function used by the mobile station to select one out of N available  
16 resources. The hash function distributes the available resources uniformly among a  
17 random sample of mobile stations.
- 18 **HARQ.** Hybrid ARQ (Automatic Repeat Request). A “hybrid ARQ” is a combination of an  
19 ARQ with an error correction mechanism to repair some errors in the encoder packet.
- 20 **Highest SR3 Frequency.** The SR3 frequency that has the highest frequency assignment.
- 21 **HLR.** See Home Location Register.
- 22 **Home Location Register (HLR).** The location register to which a MIN/IMSI is assigned  
23 for record purposes such as subscriber information.
- 24 **Home System.** The wireless system in which the mobile station subscribes for service.
- 25 **Hopping Pilot Beacon.** A pilot beacon that changes CDMA Frequency periodically to  
26 simulate multiple base stations operating on different frequencies. The transmission of  
27 the hopping pilot beacon is discontinuous on any CDMA Channel.
- 28 **Idle Handoff.** The act of transferring reception of the Paging Channel, Broadcast Control  
29 Channel or the Forward Common Control Channel from one base station to another, when  
30 the mobile station is in the *Mobile Station Idle State*.
- 31 **IK.** Integrity Key. A 128-bit pattern produced by AKA that is used for integrity protection.
- 32 **Implicit Registration.** A registration achieved by a successful transmission of an  
33 origination or page response on the r-csch.
- 34 **IMSI.** See International Mobile Subscriber Identity.
- 35 **IMSI\_M.** MIN-based IMSI using the lower 10 digits to store the MIN.
- 36 **IMSI\_O.** Operational value of IMSI used by the mobile station for operation with the base  
37 station.

- 1 **IMSI\_T.** True IMSI not associated with MIN. This could be 15 digits or fewer.
- 2 **Interleaving.** The process of permuting a sequence of symbols.
- 3 **International Mobile Subscriber Identity (IMSI).** A method of identifying stations in the  
4 land mobile service as specified in [18].
- 5 **kHz.** Kilohertz ( $10^3$  Hertz).
- 6 **ksps.** Kilo-symbols per second ( $10^3$  symbols per second).
- 7 **LAC.** See Link Access Control.
- 8 **Layering.** A method of organization for communication protocols in which the transmitted  
9 or received information is transferred in pipeline fashion, within each station, in well-  
10 defined encapsulated data units between otherwise decoupled processing entities  
11 ("layers"). A layer is defined in terms of its communication protocol to a peer layer in  
12 another entity and the services it offers to the next higher layer in its own entity.
- 13 **Layer 1.** Layer 1 provides for the transmission and reception of radio signals between the  
14 base station and the mobile station. Also see Physical Layer.
- 15 **Layer 2.** Layer 2 provides for the correct transmission and reception of signaling  
16 messages, including partial duplicate detection. Layer 2 makes use of the services  
17 provided by Layer 1. See also Layering and Layer 3.
- 18 **Layer 3.** Layer 3 provides the control messaging for the wireless telephone system. Layer  
19 3 originates and terminates signaling messages according to the semantics and timing of  
20 the communication protocol between the base station and the mobile station. Layer 3  
21 makes use of the services provided by Layer 2. See also Layering and Layer 2.
- 22 **Link Access Control.** See LAC. The LAC Sublayer is the upper sublayer of Layer 2. It  
23 implements a data link protocol that provides for the correct transport and delivery of  
24 signaling messages generated by Layer 3. The LAC Sublayer makes use of the services  
25 provided by the Lower Layers (Layer 1 and the MAC Sublayer).
- 26 **Local Control.** An optional mobile station feature used to perform manufacturer-specific  
27 functions.
- 28 **Logical Channel.** A communication path between the mobile station and the base  
29 station, described in terms of the intended use of, and access to, the transferred data, and  
30 direction of transfer. A logical channel can be "mapped" to and from one or more physical  
31 channels.
- 32 **Logical-to-physical Mapping.** The technique for forming associations between logical and  
33 physical channels.
- 34 **Long Code.** A PN sequence with period  $2^{42} - 1$  that is used for scrambling on the Forward  
35 CDMA Channel and spreading on the Reverse CDMA Channel. The long code uniquely  
36 identifies a mobile station on both the Reverse Traffic Channel and the Forward Traffic  
37 Channel. The long code provides limited privacy. The long code also separates multiple  
38 Access Channels and Enhanced Access Channels on the same CDMA Channel. See also  
39 Public Long Code and Private Long Code.

- 1 **Long Code Mask.** A 42-bit binary number that creates the unique identity of the long  
2 code. See also Public Long Code, Private Long Code, Public Long Code Mask, and Private  
3 Long Code Mask.
- 4 **Lowest SR3 Frequency.** The SR3 frequency that has the lowest frequency assignment.
- 5 **LSB.** Least significant bit.
- 6 **LTU.** Logical Transmission Unit. One of more Type 3 MuxPDUs with a 16-bit CRC.
- 7 **MAC.** See Medium Access Control.
- 8 **MAC-I.** Message Authentication Code for message integrity. The 32-bit output of the  
9 message integrity algorithm that allows the receiver to authenticate the message.
- 10 **MACI.** A 32-bit LAC Layer field that carries either the MAC-I or the UMAC of a signaling  
11 message.
- 12 **Maximal Length Sequence (m-Sequence).** A binary sequence of period  $2^n - 1$ ,  $n$  being a  
13 positive integer, with no internal periodicities. A maximal length sequence can be  
14 generated by a tapped  $n$ -bit shift register with linear feedback.
- 15 **MC System.** Multi Carrier CDMA System (1x and 3x).
- 16 **MCC.** See Mobile Country Code.
- 17 **Mcps.** Megachips per second ( $10^6$  chips per second).
- 18 **MCSB.** See Message Control and Status Block.
- 19 **ME.** Mobile Equipment. The part of a mobile station that does not include the UIM.
- 20 **Mean Input Power.** The total received calorimetric power measured in a specified  
21 bandwidth at the antenna connector, including all internal and external signal and noise  
22 sources.
- 23 **Mean Output Power.** The total transmitted calorimetric power measured in a specified  
24 bandwidth at the antenna connector when the transmitter is active.
- 25 **Medium Access Control.** See MAC. The MAC Sublayer is the lower sublayer of Layer 2.  
26 It implements the medium access protocol and is responsible for transport of LAC protocol  
27 data units using the services provided by Layer 1.
- 28 **MEID.** See Mobile Equipment Identifier.
- 29 **MEID\_ME.** MEID associated with the mobile equipment. See Mobile Equipment Identifier  
30 (MEID) and ME.
- 31 **Message.** A data structure that conveys control information or application information. A  
32 message consists of a length field (MSG\_LENGTH), a message body (the part conveying the  
33 information), and a CRC.
- 34 **Message Body.** The part of the message contained between the length field  
35 (MSG\_LENGTH) and the CRC field.
- 36 **Message Capsule.** A sequence of bits comprising a single message and padding. The  
37 padding always follows the message and may be of zero length.

- 1 **Message Control and Status Block.** In this document, a parameter block representing  
2 the PCI being transferred between Layer 3 and Layer 2.
- 3 **Message CRC.** The CRC check associated with a message. See also Cyclic Redundancy  
4 Code.
- 5 **Message Field.** A basic named element in a message. A message field may consist of zero  
6 or more bits.
- 7 **Message Record.** An entry in a message consisting of one or more fields that repeats in  
8 the message.
- 9 **MHz.** Megahertz ( $10^6$  Hertz).
- 10 **MIN.** See Mobile Identification Number.
- 11 **MNC.** See Mobile Network Code.
- 12 **Mobile Country Code (MCC).** A part of the E.212 IMSI identifying the home country. See  
13 [18].
- 14 **Mobile Directory Number.** A dialable directory number that is not necessarily the same  
15 as the mobile station's air interface identification, i.e., MIN, IMSI\_M or IMSI\_T.
- 16 **Mobile Equipment Identifier (MEID).** A 56-bit number assigned by the mobile station  
17 manufacturer, uniquely identifying the mobile station equipment.
- 18 **Mobile Identification Number (MIN).** The 34-bit number that is a digital representation  
19 of the 10-digit number assigned to a mobile station.
- 20 **Mobile Network Code (MNC).** A part of the E.212 IMSI identifying the home network  
21 within the home country. See [18].
- 22 **Mobile Protocol Capability Indicator (MPCI).** A 2-bit field used to indicate the mobile  
23 station's capabilities.
- 24 **Mobile-Specific User Zone.** A user zone that is identified by the mobile station. The  
25 mobile station may consider parameters such as the identity of the serving system, cell,  
26 and sector, and the geographic location of that station in making the determination. See  
27 also CDMA Tiered Services, User Zone, Broadcast User Zone, Active User Zone, and  
28 Passive User Zone.
- 29 **Mobile Station.** A station in the Public Wireless Radio Telecommunications Service  
30 intended to be used while in motion or during halts at unspecified points. Mobile stations  
31 include portable units (e.g., hand-held personal units) and units installed in vehicles. A  
32 mobile station consists of two parts – ME and UIM.
- 33 **Mobile Station Class.** A classification of mobile stations based on characteristics such as  
34 slotted operation and transmission power. See [12] and Table 2.3.3-1 of this document.
- 35 **Mobile Station Identification Number (MSIN).** A part of the E.212 IMSI identifying the  
36 mobile station within its home network. See [18].
- 37 **Mobile Station Originated Call.** A call originating from a mobile station.

- 1 **Mobile Station Terminated Call.** A call received by a mobile station (not to be confused  
2 with a disconnect or call release).
- 3 **ms.** Millisecond ( $10^{-3}$  second).
- 4 **MSB.** Most significant bit.
- 5 **MSC.** See Mobile Switching Center.
- 6 **MSIN.** See Mobile Subscriber Identification Number.
- 7 **Multiplex Option.** The ability of the multiplex sublayer and lower layers to be tailored to  
8 provide special capabilities. A multiplex option defines such characteristics as the frame  
9 format, the maximum number of Supplemental Code Channels supported, and the rate  
10 decision rules. See also Multiplex Sublayer.
- 11 **Multiplex Sublayer.** One of the conceptual layers of the system that multiplexes and  
12 demultiplexes primary traffic, secondary traffic, and signaling traffic.
- 13 **NAM.** See Number Assignment Module.
- 14 **National Mobile Subscriber Identity (NMSI).** A part of the E.212 IMSI identifying the  
15 mobile station within its home country. The NMSI consists of the MNC and the MSIN.  
16 See [18].
- 17 **NDSS.** See Network Directed System Selection.
- 18 **Neighbor Set.** The set of pilots associated with the CDMA Channels that are probable  
19 candidates for handoff. Normally, the Neighbor Set consists of the pilots associated with  
20 CDMA Channels that cover geographical areas near the mobile station. See also Active  
21 Set, Candidate Set, Remaining Set, and Private Neighbor Set.
- 22 **Network.** A network is a subset of a wireless system, such as an area-wide cellular  
23 network, a private group of base stations, or a group of base stations set up to handle a  
24 special requirement. A network can be as small or as large as needed, as long as it is fully  
25 contained within a system. See also System.
- 26 **Network Directed System Selection (NDSS).** A feature that allows the mobile station to  
27 automatically register with a preferred system while roaming, or to be automatically  
28 directed by a service provider, typically the home service provider, to a suggested system,  
29 regardless of the frequency band class, cellular band, or PCS frequency block.
- 30 **Network Identification (NID).** A number that uniquely identifies a network within a  
31 wireless system. See also System Identification.
- 32 **NEW\_KEY\_ID.** In *ROP*, this is the index of the pending (CIK, CCK) and NEW\_SSEQ\_H  
33 associated with AUTHR. In *Authentication Response Message*, this is the index of the  
34 pending (IK, CK) and NEW\_SSEQ\_H associated with the (RANDA, AUTHN).
- 35 **NEW\_SSEQ\_H.** The pending 24-bit security sequence number used for encryption and/or  
36 integrity protection.
- 37 **NEW\_SSEQ\_H\_SIG.** An 8-bit digital signature of NEW\_SSEQ\_H computed by  $RAND_S$ ,  
38  $SSD_A$ , and NEW\_SSEQ\_H.
- 39 **NID.** See Network Identification.

- 1   **NMSI.** See National Mobile Subscriber Identity.
- 2   **Non-Autonomous Registration.** A registration method in which the base station initiates  
3 registration. See also Autonomous Registration.
- 4   **Non-Slotted Mode.** An operation mode of the mobile station in which the mobile station  
5 continuously monitors the Paging Channel, or the Forward Common Control Channel/  
6 Broadcast Control Channel.
- 7   **ns.** Nanosecond ( $10^{-9}$  second).
- 8   **NULL.** Any value that is not in the specified range of a field.
- 9   **Null Traffic Channel Data.** One or more frames of a specified data sequence sent at the  
10 lowest agreed-upon rate of the negotiated radio configuration. Null Traffic Channel data  
11 may be sent when there is no primary, secondary, or signaling traffic available. Null  
12 Traffic Channel data serves to maintain the connectivity between the mobile station and  
13 the base station.
- 14   **Number Assignment Module (NAM).** A set of MIN/IMSI-related parameters stored in the  
15 mobile station.
- 16   **Numeric Information.** Numeric information consists of parameters that appear as  
17 numeric fields in messages exchanged by the base station and the mobile station and  
18 information used to describe the operation of the mobile station.
- 19   **Optional Field.** A field defined within a message structure that is optionally transmitted  
20 to the message recipient.
- 21   **Order.** A type of message that contains control codes for either the mobile station or the  
22 base station.
- 23   **Ordered Registration.** A registration method in which the base station orders the mobile  
24 station to send registration related parameters.
- 25   **Orthogonal Transmit Diversity (OTD).** An optional method of transmission of the  
26 Forward CDMA Channel that uses two antennas, each transmitting a fraction of the code  
27 symbols. It can be used to enhance performance in the presence of multipath fading radio  
28 propagation.
- 29   **OTD.** See Orthogonal Transmit Diversity
- 30   **Overhead Message.** A message sent by the base station on the Paging Channel or the  
31 Primary Broadcast Control Channel to communicate base-station-specific and system-  
32 wide information to mobile stations.
- 33   **Overload Class (OLC).** The means used to control system access by mobile stations,  
34 typically in emergency or other overloaded conditions. Mobile stations are assigned one  
35 (or more) of sixteen overload classes. Access to the CDMA system can then be controlled  
36 on a per class basis by persistence values transmitted by the base station.
- 37   **PACA.** Priority Access and Channel Assignment. See PACA Call.

- 1 **PACA Call.** A priority mobile station originated call for which no traffic channel or voice  
2 channel was immediately available, and which has been queued for a priority access  
3 channel assignment.
- 4 **Packet.** The unit of information exchanged between the service option applications of the  
5 base station and the mobile station.
- 6 **Padding.** A sequence of bits used to fill from the end of a message to the end of a message  
7 capsule, typically to the end of the frame or half frame. All bits in the padding are '0'.
- 8 **Paging.** The act of seeking a mobile station when a call has been placed to that mobile  
9 station.
- 10 **Paging Channel.** A code channel in a Forward CDMA Channel used for transmission of  
11 control information and pages from a base station to a mobile station.
- 12 **Paging Channel Slot.** An 80 ms interval on the Paging Channel. Mobile stations  
13 operating in the slotted mode are assigned specific slots in which they monitor messages  
14 from the base station.
- 15 **Paging Indicator.** A one-bit datum, sent on the Quick Paging Channel. Quick paging  
16 indicators are associated with mobile stations, in pairs, via a hashing algorithm.  
17 Appearance of both of its indicators in its assigned Quick Paging Channel slot serves to  
18 alert a slotted mode mobile station, operating in the idle state, that it should monitor the  
19 Paging Channel or the Forward Common Control Channel starting in the next slot. See  
20 also Quick Paging Channel.
- 21 **Parameter-Change Registration.** A registration method in which the mobile station  
22 registers when certain of its stored parameters change.
- 23 **Parity Check Bits.** Bits added to a sequence of information bits to provide error  
24 detection, correction, or both.
- 25 **Passive User Zone.** A user zone in which the implicit registration that takes place at call  
26 set-up is sufficient to trigger a change in tiered service features. See also CDMA Tiered  
27 Services, User Zone, and Active User Zone.
- 28 **PCI.** See Protocol Control Information.
- 29 **PCS.** See Personal Communications Services.
- 30 **PCSC.** See Personal Communications Switching Center.
- 31 **PCS System.** See Personal Communications Services System.
- 32 **PDU.** See Protocol Data Unit.
- 33 **Personal Communications Services System.** A configuration of equipment that provides  
34 PCS radiotelephone services.
- 35 **Personal Communications Services (PCS).** A family of mobile and portable radio  
36 communications services for individuals and businesses that may be integrated with a  
37 variety of competing networks. Broadcasting is prohibited and fixed operations are to be  
38 ancillary to mobile operations.

- 1 **Personal Communications Switching Center (PCSC).** See Mobile Switching Center
- 2 (MSC).
- 3 **Physical Channel.** A communication path between stations, described in terms of the RF
- 4 characteristics such as coding, power control policies, etc.
- 5 **Physical Layer.** The part of the communication protocol between the mobile station and
- 6 the base station that is responsible for the transmission and reception of data. The
- 7 physical layer in the transmitting station is presented a frame by the multiplex sublayer
- 8 and transforms it into an over-the-air waveform. The physical layer in the receiving
- 9 station transforms the waveform back into a frame and presents it to the multiplex
- 10 sublayer above it.
- 11 **Pilot Beacon.** A transmit-only base station that broadcasts a Pilot Channel, a Sync
- 12 Channel, optionally a Paging Channel or a Primary Broadcast Control Channel, but no
- 13 Forward Common Control Channels and Forward Traffic Channels. The mobile station
- 14 measures the pilot beacon to assist in CDMA hard handoffs and inter-frequency idle-mode
- 15 handoffs.
- 16 **Pilot Channel.** A non-data-bearing signal transmitted by a CDMA station. See Forward
- 17 Pilot Channel, Transmit Diversity Pilot Channel, Auxiliary Pilot Channel, Auxiliary
- 18 Transmit Diversity Pilot Channel, and Reverse Pilot Channel.
- 19 **Pilot PN Chip.** One bit, or bit pair, of a pilot PN sequence, or the time interval
- 20 corresponding thereto.
- 21 **Pilot PN Sequence.** A pair of modified maximal length PN sequences used to spread the
- 22 quadrature components of a CDMA Channel.
- 23 **Pilot PN Sequence Offset.** The time offset of a Forward Pilot Channel from CDMA System
- 24 time, as transmitted by the base station, expressed modulo the pilot period.
- 25 **Pilot PN Sequence Offset Index.** The pilot PN sequence offset in units of 64 PN chips of a
- 26 Forward Pilot Channel, relative to the zero offset pilot PN sequence.
- 27 **Pilot Strength.** The ratio of pilot power to total power in the signal bandwidth of a CDMA
- 28 Forward or Reverse Channel. See also  $E_c/I_o$ .
- 29 **Plus Code Dialing.** Plus code dialing relieves the user of the need to dial an international
- 30 access prefix, which may vary between countries and carriers. This capability allows
- 31 telephony addresses to be entered, received, displayed, stored and transmitted in an
- 32 international format (full ITU-T E.164 number, including country code). When addresses
- 33 are entered by a user, the MS user interface can provide an input aid, such as a key
- 34 marked with a “+” sign, to indicate that the address is international. When displayed by
- 35 the MS, they can be identified by a visual device, such as a “+” prefix. When received,
- 36 transmitted, or stored, an international indicator can be included with the address digits.
- 37 It will be the responsibility of the network to ignore the international indicator when
- 38 attached to a national number. This allows users to store and dial all phone numbers in a
- 39 consistent format, which is particularly useful for international travelers. See [39].
- 40 **PN.** Pseudonoise.

- 1 **PN Chip.** One bit in a PN sequence, or the time duration of such a bit. It corresponds to  
2 the smallest modulation interval in a CDMA system.
- 3 **PN Sequence.** Pseudonoise sequence. A deterministic, periodic binary sequence having  
4 limited statistical similarity to a Bernoulli (coin-tossing).
- 5 **Power Control Bit.** A bit sent on the Forward Power Control Subchannel or Reverse  
6 Power Control Subchannel to signal the mobile station or base station to increase or  
7 decrease its transmit power.
- 8 **Power Control Group.** A 1.25 ms interval on the Forward Traffic Channel and the  
9 Reverse Traffic Channel. See also Power Control Bit.
- 10 **Power-Down Registration.** An autonomous registration method in which the mobile  
11 station registers on power-down.
- 12 **Power Up Function.** A method by which the mobile station increases its output power to  
13 support location services.
- 14 **Power-Up Registration.** An autonomous registration method in which the mobile station  
15 registers on power-up.
- 16 **PPM.** Parts per million.
- 17 **Preamble.** See Access Channel Preamble and Traffic Channel Preamble.
- 18 **Primary CDMA Channel.** A pre-assigned channel in a CDMA Cellular System used by  
19 the mobile station for initial acquisition. See also Secondary CDMA Channel.
- 20 **Primary Paging Channel (CDMA).** The default code channel (code channel 1) assigned for  
21 paging on a CDMA Channel.
- 22 **Primary Pilot.** One of the three pilots on the Spreading Rate 3 Forward Channels. The  
23 primary pilot may be on any one of the SR3 frequencies and may have a higher  
24 transmission power comparing to the pilots on the other two SR3 frequencies.
- 25 **Primary Traffic.** The main traffic stream carried between the mobile station and the base  
26 station on the Traffic Channel. See also Secondary Traffic and Signaling Traffic.
- 27 **Primitive.** An atomic, well-defined method of transferring data and control information  
28 between two adjacent layers and sublayers. Conventionally represented as a function  
29 invocation with the data and/or control information as parameters.
- 30 **Private Long Code.** The long code characterized by the private long code mask. See also  
31 Long Code.
- 32 **Private Long Code Mask.** The long code mask used to form the private long code. See  
33 also Public Long Code Mask and Long Code.
- 34 **Private Neighbor Set.** The set of pilots associated with the private system base stations  
35 that are probable candidates for idle handoff. See also Active Set, Neighbor Set,  
36 Remaining Set, and CDMA Tiered Services.
- 37 **Protocol Control Information (PCI).** Data passed between adjacent layers in the protocol  
38 stack, together with the SDU, to assist a layer to properly encapsulate/decapsulate the  
39 SDU. Examples of PCI in this document are the MCSB and the PCSB.

**Protocol Data Unit.** Encapsulated data communicated between peer layers on the mobile station and base station. Unless specified otherwise, in this document PDU refers to the Layer 3 protocol data unit transferred at the interface between Layer 3 and Layer 2.

**Protocol Stack.** Conceptual model of the layered architecture for communication protocols (see Layering) in which layers within a station are represented in the order of their numeric designation and requiring that transferred data be processed sequentially by each layer, in the order of their representation. Graphically, the “stack” is drawn vertically, with the layer having the lowest numeric designation at the base.

**Pseudo-ESN.** A 32 bit number derived from MEID and used in place of ESN.

**Public Long Code.** The long code characterized by the public long code mask.

**Public Long Code Mask.** The long code mask used to form the public long code. The mask can contain a permutation of the mobile station’s ESN, or the particular mask specified by the base station. The mask also includes the channel number when used for a Supplemental Code Channel. See also Private Long Code Mask and Long Code.

**PUF.** See Power Up Function.

**PUF Attempt.** A sequence of PUF probes sent by the mobile station in response to a *Power Up Function Message*.

**PUF Probe.** One or more consecutive frames on the Reverse Traffic Channel within which the mobile station transmits the PUF pulse.

**PUF Pulse.** Portion of PUF probe that may be transmitted at elevated output power.

**PUF Target Frequency.** The CDMA frequency assignment to which the base station directs a mobile station for transmitting the PUF probe.

**Punctured Code.** An error-correcting code generated from another error-correcting code by deleting (i.e., puncturing) code symbols from the coder output.

**QoS.** See Quality of Service.

**Quality of Service.** Set of parameters and procedures associated with a service and/or user, indicating some of the capabilities and constraints related to the delivery of the service to the user.

**Quick Paging.** A feature that permits mobile stations to further conserve battery power beyond the savings achieved by slotted mode operation. See also Paging Indicator and Configuration Change Indicator.

**Quick Paging Channel.** An uncoded, on-off-keyed (OOK) spread spectrum signal sent by base stations to inform slotted mode mobile stations, operating in the idle state, whether to monitor the Paging Channel or the Forward Common Control Channel. See also Quick Paging, Paging Indicator, and Configuration Change Indicator.

**Quick Paging Channel Slot.** An 80 ms interval on the Quick Paging Channel. See also Paging Indicator and Configuration Change Indicator.

**Quick Repeats.** Additional transmissions of identical copies of a message within a short interval to increase the probability that the message is received correctly.

- 1   **r-csch.** Reverse common signaling logical channel.
- 2   **r-dsch.** Reverse dedicated signaling logical channel.
- 3   **R-PDCCH.** Reverse Packet Data Control Channel. A control channel used for the  
4   transmission of control information for the subpacket being transmitted on the Reverse  
5   Packet Data Channel and the Mobile Status Indicator Bit.
- 6   **R-PDCH.** Reverse Packet Data Channel. A portion of a Radio Configuration 7 Reverse  
7   Traffic Channel which carries higher-level data and control information from a mobile  
8   station to a base station.
- 9   **R-REQCH.** Reverse Request Channel. A control channel used by the mobile station to  
10   report available power headroom and buffer status.
- 11   **R-SPICH.** Reverse Secondary Pilot Channel. An unmodulated, direct-sequence spread  
12   spectrum signal transmitted by a CDMA mobile station in conjunction with certain  
13   transmissions on the Reverse Packet Data Channel. The secondary pilot channel provides  
14   additional phase reference for the Reverse Packet Data Channel for coherent  
15   demodulation and may provide a means for signal strength measurement.
- 16   **Radio Configuration.** A set of Forward Traffic Channel and Reverse Traffic Channel  
17   transmission formats that are characterized by physical layer parameters such as  
18   transmission rates, modulation characteristics and spreading rate. See [2].
- 19   **Radio Configuration Class.** A group of Radio Configurations. All Radio Configurations,  
20   for the Forward Traffic Channel and the Reverse Traffic Channel, are divided into three  
21   classes by the types of pre-spreading symbols (BPSK and QPSK) and spreading rates. RC  
22   Class 1 consists of RC 1 and RC 2 for the Forward Traffic Channel and the Reverse Traffic  
23   Channel. RC Class 2 consists of RC 3, RC 4, and RC 8 of the Reverse Traffic Channel, and  
24   RC 3, RC 4, RC 5, RC 11, and RC12 of the Forward Traffic Channel. RC Class 3 consists of  
25   RC 5 and RC 6 of the Reverse Traffic Channel, and RC 6, RC 7, RC 8, and RC 9 of the  
26   Forward Traffic Channel.
- 27   **Radio Environment Reporting Mode.** A fast call setup mode of the mobile station in the  
28   *Mobile Station Idle State*, in which *Radio Environment Messages* are triggered based on a  
29   radio environment report pilot list (RER\_PILOT\_LIST). This mode may be used to assist  
30   the base station with direct channel assignment. See also Direct Channel Assignment.
- 31   **RANDA.** The random challenge number contained in an AV.
- 32   **RC.** See Radio Configuration.
- 33   **Reduced Slot Cycle Mode.** A fast call setup mode of the mobile station in which the  
34   mobile station operates in the slotted mode with a shorter slot cycle than the registered  
35   slot cycle or in the non-slotted mode for the negotiated duration of time. See also Slotted  
36   Mode and Non-Slotted Mode.
- 37   **RES.** A *Registration Accepted Order*, *Extended Channel Assignment Message*, or *Security*

1 *Mode Command Message.*

2 **Registration.** The process by which a mobile station identifies its location and  
3 parameters to a base station.

4 **Registration Zone.** A collection of one or more base stations treated as a unit when  
5 determining whether a mobile station should perform zone-based registration. See also  
6 User Zone, with which it should not be confused.

7 **Release.** A process that the mobile station and base station use to inform each other of  
8 call disconnect.

9 **Remaining Set.** The set of all allowable pilot offsets as determined by PILOT\_INC,  
10 excluding the pilot offsets of the pilots in the Active Set, Candidate Set, and Neighbor Set.  
11 See also Active Set, Candidate Set, and Neighbor Set.

12 **Replay Attack.** An attempt by a third party to record an over-the-air message and send it  
13 later in time so as to mislead the receiver.

14 **Request.** A Layer 3 message generated by either the mobile station or the base station to  
15 retrieve information, ask for service, or command an action.

16 **Rescue Channel.** A Fundamental Channel used for call rescue soft handoff. The Walsh  
17 Code is pre-allocated and advertised to the mobile station. In the event that the mobile  
18 station loses the Forward Traffic Channel or declares an acknowledgment failure,  
19 communication with a new base station can be established on the Rescue Channel.

20 **Response.** A Layer 3 message generated as a result of another message, typically a  
21 request.

22 **Reverse Acknowledgment Channel.** A portion of Reverse CDMA Channel used for the  
23 transmission of acknowledgments from the mobile station to the base station in response  
24 to the data transmitted on the Forward Packet Data Channel, the Forward Packet Data  
25 Control Channel, the Forward Fundamental Channel and the Forward Supplemental  
26 Channel.

27 **Reverse Channel Quality Indicator Channel.** A portion of Reverse CDMA Channel used  
28 by the mobile station to indicate to the base station the quality of the Forward Link Pilot  
29 Channel received at the mobile station.

30 **Reverse CDMA Channel.** The CDMA Channel from the mobile station to the base station.  
31 From the base station's perspective, the Reverse CDMA Channel is the sum of all mobile  
32 station transmissions on a CDMA Frequency Assignment.

33 **Reverse Dedicated Control Channel.** A Dedicated Control Channel that is transmitted  
34 on the Reverse CDMA Channel.

35 **Reverse Fundamental Channel.** A Fundamental Channel that is transmitted on the  
36 Reverse CDMA Channel.

37 **Reverse Pilot Channel.** A non-data-bearing direct-sequence spread spectrum signal  
38 transmitted by each CDMA mobile station whenever the Enhanced Access Channel,  
39 Reverse Common Control Channel, or Reverse Traffic Channel is enabled. The Reverse  
40 Pilot Channel allows a base station to acquire the timing of the Reverse CDMA Channel

1 and provides a phase reference for coherent demodulation. The Reverse Pilot Channel  
2 may be transmitted either continuously or in gated mode.

3 **Reverse Supplemental Channel.** A Supplemental Channel that is transmitted on the  
4 Reverse CDMA Channel.

5 **Reverse Supplemental Code Channel.** A Supplemental Code Channel that is  
6 transmitted on the Reverse CDMA Channel.

7 **Reverse Traffic Channel.** A Traffic Channel on which data and signaling are transmitted  
8 from a mobile station to a base station. The Reverse Traffic Channel is composed of zero  
9 or one Reverse Fundamental Channel, zero to seven Reverse Supplemental Code  
10 Channels, zero to two Reverse Supplemental Channels, and zero or one Reverse Dedicated  
11 Control Channel.<sup>4</sup>

12 **ROP.** A *Registration Message*, *Origination Message*, or *Page Response Message*.

13 **Roamer.** A mobile station operating in a wireless system (or network) other than the one  
14 from which service was subscribed. See also Foreign NID Roamer and Foreign SID  
15 Roamer.

16 **R-UIM.** Removable UIM.

17 **SAP.** See Service Access Point.

18 **SCI.** See Synchronized Capsule Indicator Bit.

19 **SDU.** See Service Data Unit.

20 **Search Window.** The range of PN sequence offsets that a mobile station searches for a  
21 pilot.

22 **Search Window Offset.** PN sequence offset used by the mobile station to position the  
23 search window when searching for a pilot.

24 **Secondary CDMA Channel.** A pre-assigned channel in a CDMA Cellular System used by  
25 the mobile station for initial acquisition. See also Primary CDMA Channel.

26 **Secondary Traffic.** An additional traffic stream that can be carried between the mobile  
27 station and the base station on the Traffic Channel. See also Primary Traffic and Signaling  
28 Traffic.

29 **Service Access Point.** Conceptual point at the interface between two adjacent layers  
30 where services are provided to the upper layer and data and protocol information is  
31 exchanged between layers.

32 **Service Configuration.** The common attributes used by the mobile station and the base  
33 station to build and interpret Traffic Channel frames. Service configuration corresponds  
34 to the parameters contained in the Service Configuration information record and the Non-  
35 negotiable Service Configuration information record. Examples of such parameters

---

<sup>4</sup> The Reverse Traffic Channel does not include R-CQICH, R-ACKCH.

1 include Forward and Reverse Traffic Channel multiplex options, Forward and Reverse  
2 Traffic Channel transmission rates, service option connections, and reverse pilot gating  
3 rate.

4 **Service Configuration Synchronization Identifier (SYNC\_ID).** An identifier assigned by  
5 the base station that identifies a specific Service Configuration information record and  
6 Non-negotiable Service Configuration information record.

7 **Service Data Unit.** Data transferred between adjacent layers in the protocol stack.  
8 Unless specified otherwise in this document SDU refers to the Layer 3 service data unit  
9 being transferred to/from Layer 2.

10 **Service Negotiation.** The procedures used by the mobile station and base station to  
11 establish a service configuration. See also Service Option Negotiation.

12 **Service Option.** A service capability of the system. Service options may be applications  
13 such as voice, data, or facsimile. See [30].

14 **Service Option Connection.** A particular instance or session in which the service  
15 defined by a service option is used. Associated with a service option connection are a  
16 reference, which is used for uniquely identifying the service option connection, a service  
17 option, which specifies the particular type of service in use, a Forward Traffic Channel  
18 traffic type, which specifies what type of Forward Traffic Channel traffic is used to support  
19 the service option connection, and a Reverse Traffic Channel traffic type, which specifies  
20 what type of Reverse Traffic Channel traffic is used by the service option connection.

21 **Service Option Connection Reference.** A designator used by the base station and  
22 mobile station to uniquely identify a particular service option connection.

23 **Service Option Negotiation.** The procedures used by the mobile station and base station  
24 to establish a service configuration. Service option negotiation is similar to service  
25 negotiation, but allows less flexibility for specifying the attributes of the service  
26 configuration. See also Service Negotiation.

27 **Service Redirection.** The process by which the base station alters the system selection  
28 made by a mobile station. It can be used temporarily during maintenance and testing to  
29 divert subscribers to an alternate system.

30 **Serving Frequency.** The CDMA frequency on which a mobile station is currently  
31 communicating with one or more base stations.

32 **Shared Secret Data (SSD).** A 128-bit pattern stored in the mobile station (in semi-  
33 permanent memory) and known by the base station. SSD is a concatenation of two 64-bit  
34 subsets: SSD\_A, which is used to support the authentication procedures, and SSD\_B,  
35 which serves as one of the inputs to the process generating the encryption mask and  
36 private long code.

37 **Short Message Services (SMS).** A suite of services such as SMS Text Delivery, Digital  
38 Paging (i.e., Call Back Number - CBN), and Voice Mail Notification (VMN).

39 **SID.** See System Identification.

**1 Signaling Traffic.** Control messages that are carried between the mobile station and the  
**2** base station on the Traffic Channel. See also Primary Traffic and Secondary Traffic.

**3 Silent Re-origination.** An autonomous attempt to re-originate a call after the mobile  
**4** station Layer 3 receives an access attempt failure indication from Layer 2 following a user-  
**5** initiated origination or a re-origination. Silent re-origination does not apply to any user-  
**6** programmable capabilities or services, e.g. user-programmable automatic redial.

**7 Slotted Mode.** An operation mode of the mobile station in which the mobile station  
**8** monitors only selected slots on the Paging Channel or the Forward Common Control  
**9** Channel when in the *Mobile Station Idle State*.

**10 Soft Handoff.** A handoff occurring while the mobile station is in the *Mobile Station Control*  
**11** *on the Traffic Channel State*. This handoff is characterized by commencing  
**12** communications with a new base station on the same CDMA Frequency Assignment  
**13** before terminating communications with an old base station. See also Hard Handoff.

**14 SOM.** Start-of-Message bit.

**15 Space Time Spreading (STS).** A forward link transmission method which transmits all  
**16** forward link channel symbols on multiple antennas and spreads the symbols with  
**17** complementary Walsh or quasi-orthogonal functions.

**18 Spreading Rate.** The PN chip rate of the system, defined as a multiple of 1.2288 Mcps.

**19 Spreading Rate 1.** A 1.2288 Mcps chip rate-based system using a direct-spread single  
**20** carrier.

**21 Spreading Rate 3.** A 3.6864 Mcps chip rate-based system using three 1.2288 Mcps  
**22** carriers on the Forward CDMA Channel. The Reverse CDMA Channel uses a 3.6864 Mcps  
**23** direct-spread carrier.

**24 sps.** Symbols per second.

**25 SR.** See Spreading Rate.

**26 SR1.** See Spreading Rate 1.

**27 SR3.** See Spreading Rate 3.

**28 SR3 Frequencies.** CDMA frequencies for the three 1.2288 Mcps carriers on the Forward  
**29** CDMA Channel. SR3 frequencies include the lowest SR3 frequency, the center SR3  
**30** frequency, and the highest SR3 frequency.

**31 SR3 Primary Pilot.** See Primary Pilot.

**32 SSD.** See Shared Secret Data.

**33 SSEQ.** Security sequence number. The 8 LSB of the EXT\_SSEQ used for an input to  
**34** encryption functions and as an input to MACI calculations.

**35 Station Class Mark (SCM).** An identification of certain characteristics of a mobile station.  
**36** Classes are defined in [12] and Table 6.3.3-1 of this document.

**Subscriber Authentication Key.** A secret, 128-bit pattern stored in the mobile station and AC. It is used to generate/update the mobile station's IK, CK and UAK during AKA procedure.

**Supplemental Channel.** An optional portion of a Traffic Channel (Forward or Reverse Radio Configurations 3 and above) that operates in conjunction with a Fundamental Channel in that Traffic Channel, and (optionally) with other Supplemental Channels to provide higher data rate services.

**Supplemental Code Channel.** An optional portion of a Traffic Channel (Forward or Reverse Radio Configurations 1 and 2) that operates in conjunction with a Fundamental Channel in that Traffic Channel, and (optionally) with other Supplemental Code Channels to provide higher data rate services. On this channel a combination of primary data, secondary data, or both (but never signaling information) are transmitted.

**Symbol.** See Code Symbol and Modulation Symbol.

**Sync Channel.** Code channel 32 in the Forward CDMA Channel which transports the synchronization message to the mobile station.

**Sync Channel Superframe.** An 80 ms interval consisting of three Sync Channel frames (each 26.666... ms in length).

**System.** A system is a wireless communications service that covers a geographic area such as a city, metropolitan region, county, or group of counties. See also Network.

**System Identification (SID).** A number uniquely identifying a wireless system.

**System Time.** The time reference used by the system. System Time is synchronous to UTC time (except for leap seconds) and uses the same time origin as GPS time. All base stations use the same System Time (within a small error). Mobile stations use the same System Time, offset by the propagation delay from the base station to the mobile station. See also Universal Coordinated Time.

**Target Frequency.** The CDMA frequency assignment to which the base station directs a mobile station in a handoff using an *Extended Handoff Direction Message*, a *General Handoff Direction Message*, or a *Universal Handoff Direction Message*.

**TD.** See Transmit Diversity.

**Temporary Mobile Subscriber Identity (TMSI).** A temporary mobile station identification assigned by the base station.

**Tracking Zone Mode.** A fast call setup mode of the mobile station in the *Mobile Station Idle State*, in which *Radio Environment Messages* are triggered based on the tracking zone identifier (TKZ\_ID) broadcast by the base station and hysteresis criteria. This mode may be used to assist the base station with direct channel assignment. See also Direct Channel Assignment.

**Timer-Based Registration.** A registration method in which the mobile station registers whenever a counter reaches a predetermined value. The counter is incremented an average of once per 80 ms period.

**Time Reference.** A reference established by the mobile station that is synchronous with the earliest arriving multipath component used for demodulation.

**TMSI.** See Temporary Mobile Subscriber Identity.

**TMSI Zone.** The administrative zone that allows the TMSI to be reused. The TMSI\_CODE has to be unique within a TMSI zone but may be reused in a different TMSI zone. The TMSI zone is identified by the field TMSI\_ZONE.

**Traffic Channel.** A communication path between a mobile station and a base station used for user and signaling traffic. The term Traffic Channel implies a Forward Traffic Channel and Reverse Traffic Channel pair. See also Forward Traffic Channel and Reverse Traffic Channel.

**Traffic Channel Preamble.** For RC1 and RC2, a sequence of all-zero frames that is sent by the mobile station on the Reverse Traffic Channel as an aid to Traffic Channel acquisition. For RC3 to RC6 inclusive, the traffic preamble is the ungated transmission of the Reverse Pilot.

**Transmit Diversity.** See Orthogonal Transmit Diversity and Space Time Spreading.

**UAK.** UIM Authentication Key. A 128-bit pattern produced by AKA that is used for authentication of the R-UIM.

**UIM.** User Identity Module.

**UIM\_ID.** A 32-bit electronic identification (ID) number that is unique to the R-UIM. The mobile station uses UIM\_ID in place of ESN, with the exception of the ESN\_ME information record, when configured with a R-UIM which indicates that UIM ID is to be used (see [40]).

**UMAC.** A 32-bit output of the UMAC algorithm computed by UIM based on MAC-I.

**Unassured Mode.** Mode of delivery that does not guarantee that a PDU will be delivered to the peer. The LAC entity at the receiver does not acknowledge a PDU sent in unassured mode.

**Unique Challenge-Response Procedure.** An exchange of information between a mobile station and a base station for the purpose of confirming the mobile station's identity. The procedure is initiated by the base station and is characterized by the use of a challenge-specific random number (i.e., RANDU) instead of the random variable broadcast globally (RAND).

**Unique Random Variable (RANDU).** A 24-bit random number generated by the base station in support of the Unique Challenge-Response procedure.

**Universal Coordinated Time (UTC).** An internationally agreed-upon time scale maintained by the Bureau International de l'Heure (BIH) used as the time reference by nearly all commonly available time and frequency distribution systems i.e., WWV, WWVH, LORAN-C, Transit, Omega, and GPS.

**User Zone.** An area within which CDMA Tiered Services may be provided. It may correspond to an RF coverage area, or it may be established independent of RF topology. User Zones are classified as broadcast versus mobile-specific, and as active versus

passive. See Broadcast User Zone, Mobile-Specific User Zone, Active User Zone, and Passive User Zone. See also Registration Zone, with which it should not be confused.

**User Zone Registration.** An autonomous registration method in which the mobile station registers when it selects an active user zone while in the Idle State. See also Zone-Based Registration, with which it should not be confused.

**Upper Layers.** General reference to Layer 3 and the layers above it.

**User Zone Exit parameter.** A parameter used by the mobile station to determine if it should exit a User Zone.

**UTC.** Universal Temps Coordoné. See Universal Coordinated Time.

**Voice Privacy.** The process by which user voice transmitted over a CDMA Traffic Channel is afforded a modest degree of protection against eavesdropping over the air.

**Walsh Chip.** See [2].

**Walsh Function.** One of  $2^N$  time orthogonal binary functions (note that the functions are orthogonal after mapping '0' to 1 and '1' to -1).

**Wireless Local Loop.** Wireless alternative access mechanism to provide standard telecommunication services using standard wireline terminal via a radio link between the network and customer premises equipment.

**WLL.** See Wireless Local Loop.

**Zone-Based Registration.** An autonomous registration method in which the mobile station registers whenever it enters a zone that is not in the mobile station's zone list. See also User Zone Registration, with which it should not be confused.

**Zone Timer.** A timer used by the mobile station to remove outdated entries from its list of zones in which it has previously registered.

**μs.** Microsecond ( $10^{-6}$  second).

#### 1.1.2 Numeric Information

Numeric information is used to describe the operation of the mobile station. The following subscripts are used to clarify the use of the numeric information:

- "s" indicates a value stored in a mobile station's temporary memory.
- "sv" indicates a stored value that varies as a mobile station processes various tasks.
- "sl" indicates the stored limits on values that vary.
- "r" indicates a value received by a mobile station over a CDMA Forward Channel.
- "p" indicates a value set in a mobile station's permanent security and identification memory.
- "s-p" indicates a value stored in a mobile station's semi-permanent security and identification memory.

1 1.1.2.1 Reserved

2 1.1.2.2 CDMA Numeric Information

3 The following are internal values that are stored by the mobile station in temporary  
4 memory that are not sent over the air. See Annex F for values stored by the mobile station  
5 in permanent and semi-permanent memory.

6 **1XRL\_FREQ\_OFFSET<sub>s</sub>** – Frequency offset of the 1X reverse link.

7 **A41\_SYS\_PAR\_MSG\_SEQ<sub>s</sub>** – *ANSI-41 System Parameters Message* sequence number.

8 **ACC\_CHAN<sub>s</sub>** – Number of Access Channels supported by the current Paging Channel.

9 **ACC\_ENT\_HO\_ORDER<sub>s</sub>** – Access entry handoff permitted from the *Mobile Station Order*  
10 *and Message Processing Operation* of the *Mobile Station Idle State*.

11 **ACCESS\_ENTRY\_HO<sub>s</sub>** – Idle handoff permitted when entering the *System Access State*.

12 **ACCESS\_HO<sub>s</sub>** – Handoff permitted after performing an access attempt while the mobile  
13 station is in the *System Access State*.

14 **ACCESS\_HO\_ALLOWED<sub>s</sub>** – Handoff permitted to the corresponding neighbor base station  
15 while in the *System Access State*.

16 **ACCESS\_HO\_LIST** – List of pilots to which access handoff or access probe handoff is  
17 permitted.

18 **ACC\_HO\_LIST\_UPD<sub>s</sub>** – Access handoff list update permitted indicator.

19 **ACCESS\_HO\_MSG\_RSP<sub>s</sub>** – Access handoff permitted in the *System Access State* between  
20 the time that the mobile station receives a message and responds to that message.

21 **ACCESS\_PROBE\_HO<sub>s</sub>** – Access probe handoff permitted during an access attempt in the  
22 *Mobile Station Origination Attempt Substate* or the *Page Response Substate*.

23 **ACC\_MSG\_SEQ<sub>s</sub>** – Last received *Access Parameters Message* or *Enhanced Access*  
24 *Parameters Message* sequence number.

25 **ACC\_PROBE\_HO\_OTHER\_MSG<sub>s</sub>** – Access probe handoff permitted for Access Channel  
26 messages other than the *Origination Message*, *Reconnect Message*, and the *Page Response*  
27 *Message*.

28 **ACCT\_INCL\_EMG<sub>s</sub>** – Access Control based on Call Type (ACCT) applies to emergency calls  
29 indicator.

30 **ACCT\_SO\_GRP\_LIST** – List of service option groups that have Access Control based on  
31 Call Type (ACCT) enabled.

32 **ACCT\_SO\_LIST** – List of individual service options that have Access Control based on Call  
33 Type (ACCT) enabled.

34 **ACH\_ACC\_TMO<sub>s</sub>** – Access Channel acknowledgment timeout, in units of 80 ms.

35 **ACK\_WAITING<sub>s[i]</sub>** – Acknowledgment status indicator for message sequence number i.  
36 Set to YES if an acknowledgment is pending for the message; otherwise, set to NO.

- 1    **ADD\_INTERCEPT<sub>s</sub>** – The intercept in the inequality criterion for adding a pilot to the
- 2    Active Set.
- 3    **ADD\_PLCM\_FOR\_FCH\_39<sub>s</sub>** –    The 39 least significant bits of the additional Public Long
- 4    Code Mask for the forward Fundamental Channel.
- 5    **ADD\_PLCM\_FOR\_FCH\_TYPE<sub>s</sub>** – Additional Public Long Code Mask for forward
- 6    Fundamental Channel type indicator.
- 7    **AGE<sub>s</sub>** – Neighbor list age. For each pilot in the Neighbor Set, the mobile station
- 8    increments this counter each time a *Neighbor List Update Message* or an *Extended*
- 9    *Neighbor List Update Message* is received. When AGE<sub>s</sub> exceeds NGBHR\_MAX\_AGE, the
- 10   pilot is deleted from the Neighbor Set.
- 11   **ALIGN\_TIMING\_USED<sub>s</sub>** – Indicates whether the mobile station aligns the times of visits
- 12   away from the Serving Frequency, as requested by the base station, in the periodic search
- 13   procedures.
- 14   **ASSIGNED\_QPAGECH<sub>s</sub>** – Assigned Quick Paging Channel number.
- 15   **AUTH<sub>s</sub>** – Current authentication mode.
- 16   **AUTO\_FCSO\_ALLOWED<sub>s</sub>** – Base station support of autonomous *Fast Call Setup Order*
- 17   indicator.
- 18   **AUTO\_MSG\_INTERVAL** – Autonomous message interval.
- 19   **AUTO\_MSG\_SUPPORTED** – Autonomous message supported indicator.
- 20   **BAD\_FRAMES<sub>s</sub>** – Forward Fundamental Channel bad frames count. The number of
- 21   received bad Forward Fundamental Channel frames.
- 22   **BAND\_SUBCLASS\_IND\_REC** – Band subclass indicator record. This record specifies the
- 23   band subclasses that the base station requires the mobile station to report whether it
- 24   supports.
- 25   **BASE\_CLASS<sub>s</sub>** – Base station class of the current base station.
- 26   **BASE\_ID<sub>s</sub>** – Base station identification of the current base station.
- 27   **BASE\_LAT<sub>s</sub>** – Latitude of the current base station, in units of 0.25 seconds.
- 28   **BASE\_LONG<sub>s</sub>** – Longitude of the current base station, in units of 0.25 seconds.
- 29   **BCMC\_FLOW\_LIST<sub>s</sub>[i]** – BCMC Flow Information. This is an array that contains
- 30   information corresponding to each BCMC flow being transmitted by the base station in
- 31   this sector:
- 32      •   BCMC\_FLOW\_ID - BCMC flow identifier.
- 33      •   REGISTRATION\_REQ\_FLAG – Registration required flag.
- 34      •   AUTH\_SIGNATURE\_REQ\_IND – Authorization signature required indication.
- 35      •   BCMC\_FLOW\_ON\_TRAFFIC\_IND – BCMC flow on traffic channel supported
- 36      indicator.

- 1       • BCMC\_FLOW\_ON\_IND – BCMC flow On indicator.
- 2       • LPM\_INFO[j] - For each BCMC\_FLOW\_ID, one or more Logical-to-Physical Mapping
- 3       entries:
- 4           ○ FSCH\_ID - Forward Broadcast Supplemental Channel identifier.
- 5           ○ TDM\_USED\_IND - TDM used indicator.
- 6           ○ TDM\_MASK - TDM mask.
- 7           ○ TDM\_SUPER\_PERIOD\_MASK - TDM super period mask.
- 8           ○ TDM\_MEGA\_PERIOD\_MASK - TDM mega period mask.
- 9           ○ BSR\_ID - BCMC Service Reference identifier.
- 10          ○ NGHBR\_INFO[k] - For each Logical-to-Physical Mapping entries, information on
- 11          one or more neighbor base stations:
- 12              ▪ NGHBR\_PN - Neighbor pilot PN sequence offset index.
- 13              ▪ NGHBR\_BCMC\_CONFIG - Neighbor BCMC Configuration.
- 14              ▪ NGHBR\_FSCH\_BAND\_CLASS - Neighbor band class of the Forward
- 15              Broadcast Supplemental Channel.
- 16              ▪ NGHBR\_FSCH\_CDMA\_FREQ - Neighbor Frequency assignment of the
- 17              Forward Broadcast Supplemental Channel.
- 18              ▪ NGHBR\_FSCH\_CODE\_CHAN - Neighbor Forward Broadcast
- 19              Supplemental Channel Code Channel Index.
- 20              ▪ NGHBR\_FSCH\_PLCM - Neighbor Public Long Code Mask of the Forward
- 21              Broadcast Supplemental Channel.
- 22              ▪ NGHBR\_FSCH\_MUX\_OPTION - Neighbor Multiplex Option of the
- 23              Forward Broadcast Supplemental Channel.
- 24              ▪ NGHBR\_FSCH\_RC - Neighbor Radio configuration of the Forward
- 25              Broadcast Supplemental Channel.
- 26              ▪ NGHBR\_FSCH\_CODING - Neighbor Coding Type of the Forward
- 27              Broadcast Supplemental Channel.
- 28              ▪ NGHBR\_FSCH\_OUTERCODE\_RATE - Neighbor outer code rate of the
- 29              Forward Broadcast Supplemental Channel.

- 1                   ▪ NGHBR\_FSCH\_OUTERCODE\_OFFSET - Neighbor outer coding buffer
- 2                   offset of the Forward Broadcast Supplemental Channel.
- 3                   ▪ NGHBR\_FSCH\_NUM\_BITS\_IDX - Neighbor number of information bits
- 4                   index of the Forward Broadcast Supplemental Channel.
- 5                   ▪ NGHBR\_FSCH\_FRAME\_40\_USED - Neighbor Forward Broadcast
- 6                   Supplemental Channel 40ms frame used indicator.
- 7                   ▪ NGHBR\_FSCH\_FRAME\_80\_USED - Neighbor Forward Broadcast
- 8                   Supplemental Channel 80ms frame used indicator.
- 9   **BCMC\_RETRY\_DELAY\_LISTs[i]** - BCMC Retry Delay List. This is an array that contains
- 10 retry time corresponding to each BCMC flow rejected with BCMC Reason indicating
- 11 RETRY\_LATER:
- 12   • BCMC\_FLOW\_ID - BCMC flow identifier.
- 13   • RETRY\_DELAY - Retry time for this BCMC flow.
- 14 **BEGIN\_PREAMBLE<sub>s</sub>** - A stored variable in the mobile station that contains the size of the
- 15 preamble that shall be transmitted on a Reverse Supplemental Code Channel at the
- 16 beginning of a Reverse Supplemental Code Channel transmission.
- 17 **BKOFF<sub>s</sub>** - Access Channel probe sequence backoff range.
- 18 **BRAT<sub>s</sub>** - Data rate of the Primary Broadcast Control Channel.
- 19 **BSPM\_MSG\_SEQ<sub>s</sub>** - *BCMC Service Parameters Message* sequence number.
- 20 **BSPM\_WAIT\_TIME** - The maximum duration the mobile station waits to receive a BCMC
- 21 Service Parameters Message after sending a Registration Message requesting a BCMC
- 22 flow.
- 23 **BYPASS\_ALERT\_ANSWER<sub>s</sub>** - Mobile station termination bypass indicator. This is set to
- 24 '1' if the mobile station is to bypass the *Waiting for Order Substate* and the *Waiting for*
- 25 *Mobile Station Answer Substate*, and proceed directly to the *Conversation Substate* when
- 26 Layer 3 receives a *forward dedicated channel-acquired* indication from Layer 2.
- 27 **CAND\_BAND\_CLASS\_REC** - Candidate band class record. This record specifies the band
- 28 classes that the base station requires the mobile station to report whether it supports.
- 29 **CCSH\_ENCODER\_ACTION\_TIME<sub>s</sub>** - Specifies the time at which Code Combining Soft
- 30 Handoff Turbo Encoder swapping takes effect.
- 31 **CDMABAND<sub>s</sub>**. CDMA band class. The CDMA band class currently used by the mobile
- 32 station.
- 33 **CDMACH<sub>s</sub>** - CDMA Channel number. The CDMA Channel number currently used by the
- 34 mobile station.
- 35 **CDMA\_OFF\_TIME\_REP\_SUP\_IND<sub>s</sub>** - CDMA off time report supported indicator.
- 36 **CDMA\_OFF\_TIME\_REP\_THRESHOLD<sub>s</sub>** - CDMA off time report threshold.

- 1 **CF\_CDMABAND<sub>s</sub>** – Candidate Frequency CDMA band class. The CDMA band class  
2 specified in the *Candidate Frequency Search Request Message*.
- 3 **CF\_CDMACH<sub>s</sub>** – Candidate Frequency CDMA Channel number. The CDMA Channel  
4 number specified in the *Candidate Frequency Search Request Message*.
- 5 **CF\_PILOT\_INC<sub>s</sub>** – PILOT\_INC to be used by the mobile station after an inter-frequency  
6 hard handoff to the CDMA Candidate Frequency is successfully completed.
- 7 **CF\_SEARCH\_PRIORITY\_INCL<sub>s</sub>** – Candidate Frequency neighbor pilots' search priority  
8 included indicator.
- 9 **CF\_SRCH\_OFFSET\_INCL<sub>s</sub>** – Candidate Frequency neighbor pilot search window offset  
10 included indicator.
- 11 **CF\_SRCH\_WIN\_NGHR\_INCL<sub>s</sub>** – Candidate Frequency neighbor pilots' search window  
12 included indicator.
- 13 **CF\_SRCH\_WIN\_N<sub>s</sub>** – Search window size for the Candidate Frequency Search Set.
- 14 **CF\_SRCH\_WIN\_R<sub>s</sub>** – Search window size to be used for the Remaining Set after an inter-  
15 frequency hard handoff to the CDMA Candidate Frequency is successfully completed.
- 16 **CF\_T\_ADD<sub>s</sub>** – Pilot detection threshold to be used on the CDMA Candidate Frequency.  
17 The stored value is a positive value in units of 0.5 dB.
- 18 **CH\_IND<sub>s</sub>** – A two-bit physical channel indicator, based on the currently established  
19 physical channels. The least significant bit denotes the Fundamental Channel, and the  
20 most significant bit denotes the Dedicated Control Channel.
- 21 **CHAN\_LST\_MSG\_SEQ<sub>s</sub>** – *CDMA Channel List Message* sequence number.
- 22 **CHM\_SUPPORTED<sub>s</sub>** – Indicates whether the base station supports Control Hold Mode  
23 operation.
- 24 **CODE\_CHAN\_LIST** – Code Channel List. A descriptive structure used to manage the  
25 Forward Fundamental Channel, and Forward Supplemental Code Channels, if any,  
26 associated with the mobile station's Active Set.
- 27 **COMPLETE\_PUF\_FRAME<sub>s</sub>** – Number of power control groups required to make the PUF  
28 probe an integer number of frames.
- 29 **COMPLETE\_SEARCH<sub>s</sub>** – Flag to indicate if the mobile station is to complete the search of  
30 the Candidate Frequency Search Set after it has determined that the inter-frequency  
31 handoff attempt to the CDMA Candidate Frequency is unsuccessful.
- 32 **CONFIG\_MSG\_SEQ<sub>s</sub>** – Current message sequence number for the *System Parameters*  
33 *Message*, *Neighbor List Message*, *Extended Neighbor List Message*, *General Neighbor List*  
34 *Message*, *CDMA Channel List Message*, *Extended System Parameters Message*, *Global*  
35 *Service Redirection Message*, *Private Neighbor List Message*, *User Zone Identification*  
36 *Message*, *Extended CDMA Channel List Message*, *Extended Global Service Redirection*  
37 *Message*, *MC-RR Parameters Message*, *ANSI-41 System Parameters Message*.
- 38 **COUNTER\_ENABLED<sub>s</sub>** – Timer-based registration indicator. Set to YES if timer-based  
39 registration is enabled; otherwise, set to NO.

- 1 **C\_SIG\_ENCRYPT\_MODE<sub>s</sub>** – Common Channel signaling message encryption mode.
- 2 **CS\_SUPPORTED<sub>s</sub>** – Base station Concurrent Services supported indicator. This 1-bit field
- 3 is set to '1' if the base station supports concurrent connection of at least two services that
- 4 use either Primary or Secondary traffic type.
- 5 **CURR\_ACC\_MSG\_SEQ** – Current *Access Parameters Message* or *Enhanced Access*
- 6 *Parameters Message* sequence number.
- 7 **CURRENT\_ACTIVE\_PILOT<sub>s</sub>** – Identifies the current pilot in the Active Set during an
- 8 access attempt.
- 9 **CURRENT\_PUF\_PROBE<sub>s</sub>** – Number of the next PUF probe to be transmitted within the
- 10 PUF attempt.
- 11 **DAYLT<sub>s</sub>** – Daylight Savings Time indicator.
- 12 **DCCH\_BAD\_FRAMES<sub>s</sub>** – Forward Dedicated Control Channel bad frames count. The
- 13 number of received bad Forward Dedicated Control Channel frames.
- 14 **DCCH\_TOT\_FRAMES<sub>s</sub>** – Total Forward Dedicated Control Channel frames received. The
- 15 total number of received Forward Dedicated Control Channel frames, counted for Forward
- 16 Traffic Channel power control.
- 17 **DECORR** – Hashing function input used to decorrelate hashing function applications for
- 18 the same mobile station.
- 19 **DEFAULT\_CONFIG<sub>s</sub>** – Mobile station current default configuration.
- 20 **DELETE\_FOR\_TMSI<sub>s</sub>** – A storage variable in the mobile station that indicates whether the
- 21 mobile station should delete its current TMSI if the TMSI was assigned in a different TMSI
- 22 zone.
- 23 **DIFF\_RX\_PWR\_THRESH<sub>s</sub>** – Threshold for the difference between the received power on
- 24 the Serving Frequency and the received power on the CDMA Candidate Frequency for the
- 25 mobile station to search for pilots on the CDMA Candidate Frequency.
- 26 **DIRECT\_CH\_ASSIGN\_RECOVER\_IND<sub>s</sub>** – Direct Channel Assignment Recover Indicator.
- 27 **DISTANCE** – Distance from registered base station to current base station, used for
- 28 distance-based registration.
- 29 **DROP\_INTERCEPT<sub>s</sub>** – The intercept in the inequality criterion for dropping a pilot from
- 30 the Active Set.
- 31 **D\_SIG\_ENCRYPT\_MODE<sub>s</sub>** – Dedicated Channel signaling message encryption mode.
- 32 **EACH\_ACC\_TMO<sub>s</sub>** – Enhanced Access Channel acknowledgment timeout, in units of 20
- 33 ms.
- 34 **EACH\_SLOT<sub>s</sub>** – See [2].
- 35 **EACH\_SLOT\_OFFSET1<sub>s</sub>** – See [2].
- 36 **EACH\_SLOT\_OFFSET2<sub>s</sub>** – See [2].
- 37 **EARLY\_RL\_TRANSMIT\_IND<sub>s</sub>** – The early reverse link transmission flag indicates whether,

- 1 upon channel assignment, the mobile station is allowed to enable its transmitter and  
 2 transmit the preamble prior to receiving sufficient energy on the forward link.
- 3 **EC\_I0\_THRESH<sub>s</sub>** – Pilot  $E_c/I_0$  threshold used for system reselection.
- 4 **EC\_THRESH<sub>s</sub>** – Pilot power threshold used for system reselection.
- 5 **ENC\_KEY\_SIZE<sub>s</sub>** – The key size used for signaling and user information encryption on  
 6 common channel and dedicated channel.
- 7 **ENC\_KEY[*j*]** – An array of encryption keys for signaling and user information encryption  
 8 on common channel and dedicated channel, where *j* is the key identifier that ranges from  
 9 ‘00’ to ‘11’.
- 10 **SSEQ<sup>5</sup>** – An 8-bit temporary variable for encryption/decryption and message integrity.
- 11 **ENCRYPT\_MODE<sub>s</sub>** – Current message encryption mode.
- 12 **EXCL\_P\_REV\_MS** – Exclude from redirection by MOB\_P\_REV indicator.
- 13 **EXT\_CHAN\_LST<sub>s</sub>** – *Extended CDMA Channel List Message* sent indicator.
- 14 **EXT\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>** – *Extended CDMA Channel List Message* sequence number.
- 15 **EXT\_NGHR\_LST\_MSG\_SEQ<sub>s</sub>** – *Extended Neighbor List Message* sequence number.
- 16 **EXT\_PREF\_MSID\_TYPE<sub>s</sub>** – Extended preferred mobile station identifier field type.
- 17 **RX\_EXT\_SSEQ[*i*][*j*]<sup>6</sup>** – An array of 32-bit crypto-sync counters used for encryption and  
 18 message integrity, where *i* = 0 is for unassured messages and *i* = 1 is for assured  
 19 messages, where *j* is the key identifier that ranges from ‘00’ to ‘11’.
- 20 **TX\_EXT\_SSEQ[*i*][*j*]<sup>7</sup>** – An array of 32-bit crypto-sync counters used for encryption and  
 21 message integrity, where *i* = 0 is for unassured messages and *i* = 1 is for assured  
 22 messages, where *j* is the key identifier that ranges from ‘00’ to ‘11’.
- 23 **EXT\_SSEQ<sup>8</sup>** – A 32-bit temporary variable for encryption and message integrity.
- 24 **INT\_KEY[*j*]** – An array of 128-bit integrity keys for message integrity, where *j* is the key  
 25 identifier that ranges from ‘00’ to ‘11’.
- 26 **KEY\_ID** – A 2-bit index of INT\_KEY[.], ENC\_KEY[.], TX\_EXT\_SSEQ[.][.], and  
 27 RX\_EXT\_SSEQ[.][.] that are “in use”. The values ‘00’ to ‘01’ are used to index 2G keys and  
 28 security sequence numbers. The values ‘10’ to ‘11’ are used to index 3G keys and security  
 29 sequence numbers.
- 30 **EXT\_GLOBAL\_REDIRECT<sub>s</sub>** – *Extended Global Service Redirection Message* sent indicator.

---

<sup>5</sup> Formerly called ENC\_SEQ.

<sup>6</sup> Formerly called EXT\_DECRYPT\_SEQ[*i*].

<sup>7</sup> Formerly called EXT\_ENCRYPT\_SEQ[*i*].

<sup>8</sup> Formerly called EXT\_ENC\_SEQ[*i*].

- 1    **EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub>** - *Extended Global Service Redirection Message*  
2    sequence number.
- 3    **EXT\_SYS\_PARAMETER<sub>s</sub>** - *Extended System Parameters Message* sent indicator.
- 4    **EXT\_SYS\_PAR\_MSG\_SEQ<sub>s</sub>** - *Extended System Parameters Message* sequence number.
- 5    **FBSCH\_LIST<sub>s[i]</sub>** - Forward Broadcast Supplemental Channel information. This is an array  
6    that contains information corresponding to each Forward Supplemental Channel  
7    transmitted by the base station:
- 8        • FSCH\_ID - Forward Broadcast Supplemental Channel identifier.
- 9        • FSCH\_BAND\_CLASS - Band class of the Forward Broadcast Supplemental  
10       Channel.
- 11       • FSCH\_FREQ - Frequency assignment of the Forward Broadcast Supplemental  
12       Channel.
- 13       • FSCH\_CODE\_CHAN - Code Channel index of the Forward Broadcast Supplemental  
14       Channel.
- 15       • FSCH\_PLCM - Public Long Code Mask of the Forward Broadcast Supplemental  
16       Channel
- 17       • FSCH\_MUX\_OPTION - Multiplex Option of the Forward Broadcast Supplemental  
18       Channel
- 19       • FSCH\_RC - Radio configuration of the Forward Broadcast Supplemental Channel.
- 20       • FSCH\_CODING - Coding Type of the Forward Broadcast Supplemental Channel.
- 21       • FSCH\_OUTERCODE\_RATE - Outer code rate of the Forward Broadcast  
22       Supplemental Channel.
- 23       • FSCH\_OUTERCODE\_OFFSET - Outer coding buffer offset of the Forward Broadcast  
24       Supplemental Channel.
- 25       • FSCH\_NUM\_BITS\_IDX - Number of information bits index of the Forward  
26       Broadcast Supplemental Channel.
- 27       • FSCH\_FRAME\_40\_USED - Forward Broadcast Supplemental Channel 40ms frame  
28       used indicator.
- 29       • FSCH\_FRAME\_80\_USED - Forward Broadcast Supplemental Channel 80ms frame  
30       used indicator.
- 31       • TDM\_STRUCTURE\_IND - Forward Broadcast Supplemental Channel TDM structure  
32       used indicator.

- 1       • TDM\_SLOT\_LENGTH - Forward Broadcast Supplemental Channel TDM slot length
- 2       • TDM\_SUPER\_PERIOD\_MASK\_LEN - TDM super period mask length indicator.
- 3       • TDM\_MEGA\_PERIOD\_MASK\_LEN - TDM mega period mask length indicator.
- 4       **FCCCH<sub>s</sub>** - Current Forward Common Control Channel number.
- 5       **FIRST\_ACTIVE\_PILOT<sub>s</sub>** - While the mobile station is in the *System Access State*, identifies
- 6       the pilot to which the first access probe was transmitted, upon entering the *System Access*
- 7       *State*.
- 8       **FIXED\_NUM\_PREAMBLE<sub>s</sub>** - Traffic Channel preamble length for fixed preamble
- 9       transmission.
- 10      **FIXED\_PREAMBLE\_TRANSMIT\_IND<sub>s</sub>** - The fixed preamble transmission flag indicates
- 11      whether the mobile station is allowed to enter the *Traffic Channel Substate* of the *Mobile*
- 12      *Station Control on the Traffic Channel State*, after sending the number of preambles
- 13      specified in *Extended Channel Assignment Message*.
- 14      **FOR\_ACKCH\_ASSIGNED<sub>s</sub>** - Forward Acknowledgment Channel assignment
- 15      indicator.
- 16      **FOR\_ACKCH\_COMB\_SEL<sub>s</sub>** - Forward Acknowledgment Channel combining method
- 17      selector.
- 18      **FOR\_ACKCH\_MODE<sub>s</sub>** - Forward Acknowledgment Channel Mode.
- 19      **FOR\_ACKCH\_WALSH\_INDEX<sub>s</sub>** - Forward Acknowledgment Channel Walsh Code index.
- 20      **FOR\_ACKSCH\_INDEX<sub>s</sub>** - Forward Acknowledgment Channel subchannel index.
- 21      **FOR\_CPCCH\_RATE<sub>s</sub>** - Forward Common Power Control Channel Rate.
- 22      **FOR\_DCCH\_MUX\_OPTION<sub>s</sub>** - Forward Dedicated Control Channel Multiplex Option.
- 23      **FOR\_DURATION<sub>s</sub>** - A stored variable in the mobile station that contains the duration (in
- 24      units of 80 ms) of a forward Supplemental Code Channel transmission that begins at time
- 25      FOR\_START\_TIME<sub>s</sub>.
- 26      **FOR\_FCH\_MUX\_OPTION<sub>s</sub>** - Forward Fundamental Channel Multiplex Option.
- 27      **FOR\_FCH\_RC<sub>s</sub>** - Forward Fundamental Channel Radio Configuration.
- 28      **FOR\_FRAME\_40\_MAX\_RATE<sub>s</sub>** - The maximum data rate for the mobile station's
- 29      transmission at 40 ms frame length on the Forward Supplemental Channel.
- 30      **FOR\_FRAME\_80\_MAX\_RATE<sub>s</sub>** - The maximum data rate for the mobile station's
- 31      transmission at 80 ms frame length on the Forward Supplemental Channel.
- 32      **FOR\_GCH\_ASSIGNED<sub>s</sub>** - Forward Grant Channel assigned indicator.
- 33      **FOR\_GCH\_WALSH\_INDEX<sub>s</sub>** - Forward Grant Channel Walsh Index. The Walsh index of
- 34      the Forward Grant Channel assigned to a mobile station.
- 35      **FOR\_LINKED\_HDM\_SEQ<sub>s</sub>** - Storage variable containing the most recent forward sequence
- 36      number of the *General Handoff Direction Message* to which a *Supplemental Channel*

- 1 *Assignment Message* forward assignment was linked.
- 2 **FOR\_NID\_REG<sub>s</sub>** – Foreign NID roamer autonomous registration enable.
- 3 **FOR\_RCCH\_ASSIGNED<sub>s</sub>** – Assigned Forward Rate Control Channel. An on or off indicator
- 4 used to determine if Forward Rate Control Channel is assigned or not.
- 5 **FOR\_RCCH\_MODE<sub>s</sub>** – Forward Rate Control Channel mode.
- 6 **FOR\_RCCH\_REPETITION<sub>s</sub>** – Forward Rate Control Channel Subchannel repetition factor.
- 7 **FOR\_RCCH\_WALSH\_INDEX<sub>s</sub>** – Forward Rate Control Channel Walsh code.
- 8 **FOR\_RCSCH\_INDEX<sub>s</sub>** – Forward Rate Control Channel subchannel index.
- 9 **FOR\_PDCH\_SUPPORTED<sub>s</sub>** – Forward Packet Data Channel supported indicator.
- 10 **FOR\_PDCH\_INCL<sub>s</sub>** – Forward Packet Data Channel assigned indicator for each pilot in the
- 11 active set.
- 12 **FOR\_RC<sub>s</sub>** – Forward Channel Radio Configuration.
- 13 **FOR\_SCH\_CC\_INDEX<sub>s</sub>** – Supplemental code channel index used on the Supplemental
- 14 Channel.
- 15 **FOR\_SCH\_DURATION<sub>s</sub>** – A stored variable in the mobile station, which contains the
- 16 duration of a forward Supplemental Channel transmission, which begins at time
- 17 FOR\_SCH\_START\_TIME<sub>s</sub>.
- 18 **FOR\_SCH\_FRAME\_LENGTH<sub>s</sub>** – The Forward Supplemental Channel frame length.
- 19 **FOR\_SCH\_RATE<sub>s</sub>** – The rate of the Forward Supplemental Channel.
- 20 **FOR\_SCH\_START\_TIME<sub>s</sub>** – A stored variable in the mobile station which contains the
- 21 System Time, in units of time specified by START\_TIME\_UNIT<sub>s</sub>, (modulo 32) at which the
- 22 mobile station shall start (or resume) processing Forward Supplemental Channels.
- 23 **FOR\_SID\_REG<sub>s</sub>** – Foreign SID roamer autonomous registration enable.
- 24 **FOR\_START\_TIME<sub>s</sub>** – A stored variable in the mobile station that contains the System
- 25 Time, in units of 80 ms, (modulo 64) at which the mobile station shall start (or resume)
- 26 processing Forward Supplemental Code Channels.
- 27 **FPC\_DCCH\_CURR\_SETPT<sub>s</sub>** – Current power control subchannel outer loop setpoint for
- 28 the Forward Dedicated Control Channel.
- 29 **FPC\_DCCH\_FER<sub>s</sub>** – Target frame error rate for the Forward Dedicated Control Channel.
- 30 **FPC\_DCCH\_MAX\_SETPT<sub>s</sub>** – Maximum value of the power control subchannel outer loop
- 31 setpoint for the Forward Dedicated Control Channel.
- 32 **FPC\_DCCH\_MIN\_SETPT<sub>s</sub>** – Minimum value of the power control subchannel outer loop
- 33 setpoint for the Forward Dedicated Control Channel.
- 34 **FPC\_DELTA\_SCH\_SETPT<sub>s</sub>** – The difference between the Fundamental Channel current
- 35 power control subchannel outer loop setpoint and the Supplemental Channel current
- 36 power control subchannel outer loop setpoint.

- 1 **FPC\_DELTA\_SETPT<sub>s</sub>** – The difference between the Fundamental Channel current power  
2 control subchannel outer loop setpoint and the Dedicated Control Channel current power  
3 control subchannel outer loop setpoint.
- 4 **FPC\_FCH\_CURR\_SETPT<sub>s</sub>** – Current power control subchannel outer loop setpoint for the  
5 Forward Fundamental Channel.
- 6 **FPC\_FCH\_FER<sub>s</sub>** – Target frame error rate for the Forward Fundamental Channel.
- 7 **FPC\_FCH\_MAX\_SETPT<sub>s</sub>** – Maximum value of the power control subchannel outer loop  
8 setpoint for the Forward Fundamental Channel.
- 9 **FPC\_FCH\_MIN\_SETPT<sub>s</sub>** – Minimum value of the power control subchannel outer loop  
10 setpoint for the Forward Fundamental Channel.
- 11 **FPC\_MODE<sub>s</sub>** – Forward power control operating mode.
- 12 **FPC\_MODE\_NO\_SCH<sub>s</sub>** – Forward power control operating mode except during the forward  
13 Supplemental Channel assignment interval.
- 14 **FPC\_MODE\_SCH<sub>s</sub>** – Forward power control operating mode during the forward  
15 Supplemental Channel assignment interval.
- 16 **FPC\_PRI\_CHAN<sub>s</sub>** – Primary power control subchannel measured channel.
- 17 **FPC\_SEC\_CHAN<sub>s</sub>** – Index of Forward Supplemental Channel to be measured by the  
18 secondary power control subchannel.
- 19 **FPC\_SCH\_CURR\_SETPT<sub>s</sub>[i]** – Current power control subchannel outer loop setpoint for  
20 Forward Supplemental Channel i.
- 21 **FPC\_SCH\_FER<sub>s</sub>[i]** – Target frame error rate for Forward Supplemental Channel i.
- 22 **FPC\_SCH\_MAX\_SETPT<sub>s</sub>[i]** – Maximum value of the power control subchannel outer loop  
23 setpoint for Forward Supplemental Channel i.
- 24 **FPC\_SCH\_MIN\_SETPT<sub>s</sub>[i]** – Minimum value of the power control subchannel outer loop  
25 setpoint for Forward Supplemental Channel i.
- 26 **FPC\_SETPT\_THRESH<sub>s</sub>** – Power control subchannel outer loop setpoint report threshold  
27 for the Dedicated Control Channel.
- 28 **FPC\_SETPT\_THRESH\_SCH<sub>s</sub>** – Power control subchannel outer loop setpoint report  
29 threshold for the Supplemental Channel.
- 30 **FRAME\_OFFSET<sub>s</sub>** – Current Traffic Channel frame offset, in units of 1.25 ms.
- 31 **FULL\_BSPM\_IND** – Indicates whether mobile station had the complete BSPM information  
32 at the time it received the last Full or Differential *BCMC Service Parameters Message*.
- 33 **FUNDICATED\_BCMC\_IND<sub>s</sub>** – Broadcast-Multicast services on Fundicated Channel  
34 Indicator.
- 35 **GEN\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>** – General Neighbor List Message sequence number.
- 36 **GLOBAL\_REDIRECT<sub>s</sub>** – *Global Service Redirection Message* sent indicator.
- 37 **GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub>** – Global Service Redirection Message sequence number.

- 1    **GRANTED\_MODE<sub>s</sub>** – Mobile station current granted mode.
- 2    **HASH\_KEY** – Hashing function input that determines the return value. Derived from
- 3    IMSI\_O.
- 4    **HDM\_SEQ<sub>s</sub>** – Last received *Extended Handoff Direction Message, General Handoff Direction*
- 5    *Message, or Universal Handoff Direction Message* sequence number.
- 6    **HOME\_REG<sub>s</sub>** – Home (non-roaming) autonomous registration enable.
- 7    **IGNORE\_ESCAM<sub>s</sub>** – Identifies whether a mobile station will process the reverse
- 8    supplemental channel assignment portion of the subsequent *Supplemental Channel*
- 9    *Assignment Message* or *Reverse Supplemental Channel Assignment Mini Message*.
- 10   **IGNORE\_QPCH<sub>s</sub>** – Ignore QPCH indicators flag. Indicates whether the mobile station is to
- 11   ignore its assigned paging indicators on the QPCH while operating in the reduced slot
- 12   cycle mode if the reduced slot cycle index is -3 or -4.
- 13   **IGNORE\_SCAM<sub>s</sub>** – Identifies whether a mobile station will process the reverse
- 14   supplemental code channel assignment portion of the subsequent *Supplemental Channel*
- 15   *Assignment Message*.
- 16   **IMSI\_10<sub>s</sub>** – The least significant digit of MNC when the MNC is 3-digit.
- 17   **IMSI\_11\_12<sub>s</sub>** – The 11th and 12th digits of the IMSI used for address matching.
- 18   **IMSI\_O\_ADDR\_NUM<sub>s</sub>**– The number of digits in the NMSI of the Operational IMSI (IMSI\_O)
- 19   minus four.
- 20   **IMSI\_O\_S<sub>s</sub>** – The last 10-digits of Operational IMSI (IMSI\_O).
- 21   **IMSI\_O\_11\_12<sub>s</sub>** – The 11th and 12th digits of the Operational IMSI (IMSI\_O).
- 22   **INIT\_PWR<sub>s</sub>** – Initial power offset for Access Channel probes.
- 23   **LC\_STATE<sub>s</sub>** – Long code state obtained from the *Sync Channel Message*.
- 24   **LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE** – This table contains the logical to physical
- 25   mapping for signaling and user traffic.
- 26   **LP\_SEC<sub>s</sub>** – Leap seconds count (offset of CDMA system time from UTC).
- 27   **LTM\_OFF<sub>s</sub>** – Local time offset from UTC, in units of 30 minutes.
- 28   **MAX\_ADD\_SERV\_INSTANCE<sub>s</sub>** – Maximum number of additional service reference
- 29   identifiers allowed in origination.
- 30   **MAX\_CAP\_SZ<sub>s</sub>** – Maximum number of Access Channel frames in an Access Channel
- 31   message capsule, less 3.
- 32   **MAX\_NUM\_ALT\_SO<sub>s</sub>** – The maximum number of alternative service option numbers that
- 33   the mobile station is allowed to include in the *Origination Message* or in the *Page Response*
- 34   *Message*.
- 35   **MAX\_NUM\_PROBE\_HO<sub>s</sub>** – The maximum number of times that a mobile station is
- 36   permitted to perform an access probe handoff.

- 1    **MAX\_PWR\_PUF<sub>s</sub>** – Maximum number of PUF probes to be transmitted at maximum  
2    mobile station output power during a PUF attempt.
- 3    **MAX\_REQ\_SEQ<sub>s</sub>** – Maximum number of access probe sequences for an Access Channel or  
4    Enhanced Access Channel request.
- 5    **MAX\_RER\_PILOT\_LIST\_SIZE<sub>s</sub>** – Maximum number of pilots to be maintained in the radio  
6    environment report pilot list while in the radio environment reporting mode.
- 7    **MAX\_RSP\_SEQ<sub>s</sub>** – Maximum number of access probe sequences for an Access Channel or  
8    Enhanced Access Channel response.
- 9    **MAX\_SLOT\_CYCLE\_INDEX<sub>s</sub>** – Maximum value of the slot cycle index allowed by the  
10    current base station. This parameter can take values between 0 and 7, inclusive.
- 11    **MCC<sub>s</sub>** – The Mobile Country Code used for address matching.
- 12    **MCC\_O<sub>s</sub>** – The Mobile Country Code of IMSI\_O.
- 13    **MC\_RR\_PAR\_MSG\_SEQ<sub>s</sub>** – *MC-RR Parameters Message* sequence number.
- 14    **MIN\_PILOT\_EC\_I0\_THRESH<sub>s</sub>** – Threshold for total  $E_c/I_0$  of pilots in the Serving  
15    Frequency Active Set used in the Periodic Serving Frequency Pilot Report Procedure.
- 16    **MIN\_PILOT\_PWR\_THRESH<sub>s</sub>** – Threshold for total  $E_c$  of pilots in the Serving Frequency  
17    Active Set used in the Periodic Serving Frequency Pilot Report Procedure.
- 18    **MIN\_P\_REV<sub>s</sub>** – Minimum mobile station protocol revision level required for access to the  
19    CDMA system.
- 20    **MIN\_SLOT\_CYCLE\_INDEX** – Minimum value of the slot cycle index allowed by the current  
21    base station. This parameter can take the values -4 or 0.
- 22    **MIN\_TOTAL\_PILOT\_EC\_I0<sub>s</sub>** – Total pilot strength threshold for the mobile station to  
23    attempt to demodulate the Forward Traffic Channel on the CDMA Candidate Frequency.
- 24    **MOB\_QOS<sub>s</sub>** – Indicator of whether the mobile station is allowed to request QoS settings in  
25    the *Origination Message*, *Origination Continuation Message*, or *Enhanced Origination*  
26    *Message*.
- 27    **MOB\_TERM<sub>s</sub>** – Mobile station termination indicator. Set to '1' if the mobile station will  
28    accept mobile station terminated calls in its current roaming status.
- 29    **MSG\_PERSIST<sub>s</sub>** – Persistence modifier for Access Channel message and Enhanced Access  
30    data transmissions.
- 31    **MS\_LAT<sub>s</sub>** – The latitude of the mobile station as estimated by the base station.
- 32    **MS\_LOC\_TSTAMP<sub>s</sub>** – The time corresponding to the estimate of mobile station's latitude  
33    and longitude.
- 34    **MS\_LONG<sub>s</sub>** – The longitude of the mobile station as estimated by the base station.
- 35    **MS\_INIT\_POS\_LOC\_SUP\_IND<sub>s</sub>** – Mobile station initiated position location determination  
36    supported indicator.

- 1    **MULT\_NIDS<sub>s</sub>** – Multiple NID storage indicator. Set to ‘1’ if the mobile station may store
- 2    more than one entry in SID\_NID\_LIST<sub>s</sub> for each SID.
- 3    **MULT\_SIDS<sub>s</sub>** – Multiple SID storage indicator. Set to ‘1’ if the mobile station may store
- 4    entries in SID\_NID\_LIST<sub>s</sub> having different SIDs.
- 5    **NDSS\_ORIG<sub>s</sub>** – NDSS Origination Indicator. Indicator used when the mobile station is
- 6    NDSS-redirected while originating a call.
- 7    **NEW\_BAND\_RECORD** – Record carrying information pertaining to a channel on a new
- 8    band to which the mobile station has hashed. The record includes the following fields:
- 9        • NEW\_BAND\_CLASS – The new band class.
- 10       • NEW\_FREQ – The new frequency in the new band class.
- 11   **NGHBR\_BAND<sub>s</sub>** – Neighbor band class.
- 12   **NGHBR\_CONFIG<sub>s</sub>** – Neighbor base station channel allocation configuration.
- 13   **NGHBR\_FREQ<sub>s</sub>** – Neighbor CDMA channel number.
- 14   **NGHBR\_LST\_MSG\_SEQ<sub>s</sub>** – *Neighbor List Message* sequence number.
- 15   **NGHBR\_MAX\_AGE<sub>s</sub>** – Neighbor set maximum age for retention in the set.
- 16   **NGHBR\_PN<sub>s</sub>** – Neighbor base station Pilot Channel PN sequence offset in units of 64 PN
- 17   chips.
- 18   **NGHBR\_REC** – Record containing information about a neighbor base station (see also
- 19   NGHBR\_REC\_LIST).
- 20   **NGHBR\_REC\_LIST** – Neighbor base station record list. A descriptive structure used to
- 21   manage the base station’s information records about neighbor base stations (see also
- 22   NGHBR\_REC).
- 23   **NGHBR\_SET\_ACCESS\_INFO<sub>s</sub>** – Neighbor Set access handoff or access probe handoff
- 24   information included indicator.
- 25   **NGHBR\_SET\_ENTRY\_INFO<sub>s</sub>** – Neighbor Set access entry handoff information included
- 26   indicator.
- 27   **NGHBR\_SET\_SIZE<sub>s</sub>** – Size of the Neighbor Set.
- 28   **NGHBR\_TIMING\_INCL<sub>s</sub>** – Indicates that hopping pilot beacon timing information is
- 29   included.
- 30   **NGHBR\_TX\_DURATION<sub>s</sub>** – Hopping pilot beacon transmit time duration.
- 31   **NGHBR\_TX\_OFFSET<sub>s</sub>** – Hopping pilot beacon transmit time offset.
- 32   **NGHBR\_TX\_PERIOD<sub>s</sub>** – Hopping pilot beacon transmit time period.
- 33   **NID<sub>s</sub>** – Network identification. A network is a subset of the base stations within a wireless
- 34   system.
- 35   **NOM\_PWR<sub>s</sub>** – Nominal transmit power offset. A correction factor to be used by mobile
- 36   stations in the open loop power estimate.

- 1 **NUM\_FCCCH<sub>s</sub>** – Number of Forward Common Control Channels supported on the current  
2 CDMA channel.
- 3 **NUM\_PREAMBLE<sub>s</sub>** –Traffic Channel preamble length for hard handoff.
- 4 **NUM\_QPCH<sub>s</sub>** – Number of Quick Paging Channels supported on the current CDMA  
5 channel.
- 6 **NUM\_REV\_CODES<sub>s</sub>** – A storage variable in the mobile station that contains the number of  
7 Reverse Supplemental Code Channels that will be utilized in the next Reverse  
8 Supplemental Code Channel transmission beginning at time REV\_START\_TIME<sub>s</sub>. A value  
9 of 0 indicates no Reverse Supplemental Code Channel transmission will be permitted (i.e.,  
10 there is no pending Reverse Supplemental Code Channel transmission).
- 11 **NUM\_SOFT\_SWITCHING\_FRAMES<sub>s</sub>** – Number of frames for R-CQICH soft switching. The  
12 duration of the cell switching period, during which the mobile station is to transmit the  
13 cell switch sequence on the R-CQICH channel when it switches between two pilots which  
14 are in different groups.
- 15 **NUM\_SOFT\_SWITCHING\_FRAMES\_CHM<sub>s</sub>** – Number of frames for R-CQICH soft switching  
16 while in Control Hold. The duration of the cell switching period, during which the mobile  
17 station, while in Control Hold, is to transmit the cell switch sequence on the R-CQICH  
18 channel when it switches between two pilots which are in different groups.
- 19 **NUM\_SOFT\_SWITCHING\_SLOTS<sub>s</sub>** – Number of slots per frame for R-CQICH soft  
20 switching. The duration of the cell switching slots within a switching frame, during which  
21 the mobile station is to transmit the cell switch indication by using Walsh cover of target  
22 on the R-CQICH channel when it switches between two pilots which are in different  
23 groups.
- 24 **NUM\_SOFT\_SWITCHING\_SLOTS\_CHM<sub>s</sub>** – Number of slots per frame for R-CQICH soft  
25 switching while in Control Hold. The duration of the cell switching slots within a switching  
26 frame, during which the mobile station, while in Control Hold, is to transmit the cell  
27 switch indication by using Walsh cover of target on the R-CQICH channel when it  
28 switches between two pilots which are in different groups.
- 29 **NUM\_SOFTER\_SWITCHING\_FRAMES<sub>s</sub>** – Number of frames for R-CQICH softer switching.  
30 The duration of the cell switching period, during which the mobile station is to transmit  
31 the cell switch sequence on the R-CQICH channel when it switches between two pilots  
32 which are in the same group.
- 33 **NUM\_SOFTER\_SWITCHING\_FRAMES\_CHM<sub>s</sub>** – Number of frames for R-CQICH softer  
34 switching while in Control Hold. The duration of the cell switching period, during which  
35 the mobile station, while in Control Hold, is to transmit the cell switch sequence on the R-  
36 CQICH channel when it switches between two pilots which are in the same group.
- 37 **NUM\_SOFTER\_SWITCHING\_SLOTS<sub>s</sub>** – Number of slots per frame for R-CQICH softer  
38 switching. The duration of the cell switching slots within a switching frame. During this  
39 time the mobile station is to transmit the cell switch indication by using the Walsh cover  
40 of the target sector in the cell switch sequence on the R-CQICH channel when it switches  
41 between two pilots which are in the same group.

- 1 **NUM\_SOFTEN\_SWITCHING\_SLOTS\_CHM<sub>s</sub>** - Number of slots per frame for R-CQICH  
2 softer switching while in Control Hold. The duration of the cell switching slots within a  
3 switching frame. During this time the mobile station, while in Control Hold, is to transmit  
4 the cell switch indication by using the Walsh cover of the target sector in the cell switch  
5 sequence on the R-CQICH channel when it switches between two pilots which are in the  
6 same group.
- 7 **NUM\_STEP<sub>s</sub>** - Number of access probes or enhanced access probes in a single access  
8 probe sequence or enhanced access probe sequence.
- 9 **NUM\_SYNC\_ID\_SUPPORTED** - Number of SYNC\_IDs supported by the mobile station.
- 10 **OTHER\_REPORTED\_LIST** - List of other pilots that have pilot strengths exceeding T\_ADD  
11 and that are not included in ACCESS\_HO\_LIST.
- 12 **PACA<sub>s</sub>** - PACA call indicator. Set to enabled to indicate that the mobile station is waiting  
13 for a priority access channel assignment; otherwise, set to disabled. In Sections 2 and 3,  
14 PACA<sub>s</sub> = 0 is equivalent to setting PACA<sub>s</sub> to disabled and PACA<sub>s</sub> = 1 is equivalent to  
15 setting PACA<sub>s</sub> to enabled.
- 16 **PACA\_CANCEL** - PACA call cancel indicator. Set to '1' when the mobile station is directed  
17 by the user to cancel the PACA call; otherwise, set to '0'.
- 18 **PACA\_SID<sub>s</sub>** - PACA system identifier. Equal to the SID of the system on which the mobile  
19 station originated a PACA call.
- 20 **PACA\_TIMEOUT<sub>s</sub>** - PACA state timer duration. Specifies how long the mobile station  
21 should wait for a *PACA Message* from the base station.
- 22 **PACKET\_ZONE\_ID<sub>s</sub>** - Packet data services zone identifier of the base station.
- 23 **PAGECH<sub>s</sub>** - Current CDMA Paging Channel number.
- 24 **PAGED** - Indicator for a page match detected while the mobile station is in the *System*  
25 *Access State*.
- 26 **PAGE\_CHAN<sub>s</sub>** - Number of Paging Channels supported on the current CDMA channel.
- 27 **PAM\_SZ<sub>s</sub>** - Number of frames in the Access Channel or Enhanced Access Channel  
28 preamble, less 1.
- 29 **PARAMETER\_REG<sub>s</sub>** - Parameter-change registration enable.
- 30 **PDCH\_CHM\_SUPPORTED<sub>s</sub>** - Indicates whether the base station supports PDCH Control  
31 Hold Mode operation. **PDCH\_GROUP\_IDENTIFIER<sub>s</sub>** - A three-bit Packet Data Channel  
32 group identifier. It is used to determine whether the mobile station should use the softer  
33 or soft reselection parameters when repointing between pilots in its Active Set (See [3]).
- 34 **PDCH\_SOFT\_SWITCHING\_DELAY<sub>s</sub>** - PDCH soft switching delay. The minimum  
35 interruption seen by the mobile station when the mobile station is to transmit the cell  
36 switch sequence on the R-CQICH channel when it switches between two pilots which are  
37 in different groups.
- 38 **PDCH\_SOFTEN\_SWITCHING\_DELAY<sub>s</sub>** - PDCH softer switching delay. The minimum  
39 interruption seen by the mobile station when the mobile station is to transmit the cell

- 1 switch sequence on the R-CQICH channel when it switches between two pilots which are  
2 in the same group.
- 3 **PERIODIC\_SEARCH<sub>s</sub>** – Flag to indicate if the mobile station is to perform a periodic  
4 search on the Candidate Frequency.
- 5 **PGSLOT** – Value obtained from the hashing function, used to determine the mobile  
6 station's assigned Paging Channel slots.
- 7 **PILOT\_ARRIVAL** – Time of occurrence, as measured at the mobile station antenna  
8 connector, of the earliest arriving usable multipath component of the pilot. The arrival  
9 time is measured relative to the mobile station's time reference.
- 10 **PILOT\_INFO\_REQ\_SUPPORTED<sub>s</sub>** – Pilot information request supported indicator.
- 11 **PILOT\_GATING\_RATE<sub>s</sub>** – Reverse pilot gating rate on the Reverse Pilot Channel.
- 12 **PILOT\_GATING\_USE\_RATE** – Reverse pilot gating rate enable indicator. It indicates  
13 whether or not the Reverse Pilot Channel is gated.
- 14 **PILOT\_INC<sub>s</sub>** – Pilot PN sequence offset index increment. The interval between pilots, in  
15 units of 64 PN chips, for base stations in a system.
- 16 **PILOT\_PN<sub>s</sub>** – Pilot Channel PN sequence offset, in units of 64 PN chips, for a base station.
- 17 **PILOT\_PN\_PHASE** – Calculated Pilot Channel PN phase, in chips, including the PN  
18 sequence offset and the arrival time relative to the mobile station's time reference.
- 19 **PILOT\_REPORT<sub>s</sub>** – Pilot reporting indicator.
- 20 **PLCM\_TYPE<sub>s</sub>** – Public long code mask type. Indicates the long code mask generation  
21 algorithm when Public Long Code Mask is in use. See 2.3.6.
- 22 **POTENTIAL\_CDMACH<sub>s</sub>** – The CDMA Channel number that could potentially be used by  
23 the mobile station.
- 24 **POWER\_DOWN\_REG<sub>s</sub>** – Power down registration enable indicator.
- 25 **POWER\_UP\_REG<sub>s</sub>** – Power up registration enable indicator.
- 26 **PPSMM\_PERIOD<sub>s</sub>** – The period used in the Periodic Serving Frequency Pilot Report  
27 Procedure.
- 28 **PRAT<sub>s</sub>** – Data rate of the Paging Channels.
- 29 **P\_REV<sub>s</sub>** – Protocol revision level supported by a base station.
- 30 **P\_REV\_IN\_USE<sub>s</sub>** – Protocol revision level currently in use by a mobile station.
- 31 **PREF\_MSID\_TYPE<sub>s</sub>** – Preferred mobile station identifier field type.
- 32 **PREVIOUS\_ACTIVE\_PILOT<sub>s</sub>** – Identifies the pilot, if any, which was in the Active Set  
33 immediately prior to the current pilot in the Active Set, during the current access attempt.
- 34 **PRI\_NGHBR\_LST<sub>s</sub>** – *Private Neighbor List Message* sent indicator.
- 35 **PRI\_NGHBR\_PN** – Private Neighbor base station Pilot Channel PN sequence offset in units  
36 of 64 PN chips.

- 1 **PRI\_NGHBR\_REC** – Record containing information about a private neighbor base station
- 2 (see also PRI\_NGHBR\_REC\_LIST).
- 3 **PRI\_NGHBR\_REC\_LIST** – Private neighbor base station record list. A descriptive
- 4 structure used to manage the base station's information records about private neighbor
- 5 base stations (see also PRI\_NGHBR\_REC).
- 6 **PRI\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>** – Private Neighbor List Message sequence number.
- 7 **PROBE\_BKOFF<sub>s</sub>** – Access Channel probe backoff range, in slots.
- 8 **PROBE\_PN\_RAN<sub>s</sub>** – Range for hashing function selection of the delay prior to transmission
- 9 of Access Channel probes. Value is  $\log_2(\text{range} + 1)$ .
- 10 **PSIST<sub>s</sub>** – Persistence value for the mobile station's overload class.
- 11 **PUF\_FREQ\_INCL<sub>s</sub>** – Flag to indicate whether the mobile station is to transmit a PUF probe
- 12 on the serving frequency or on a target frequency.
- 13 **PUF\_INIT\_PWR<sub>s</sub>** – Power increase (in dB) of the first PUF pulse in a PUF attempt.
- 14 **PUF\_INTERVAL<sub>s</sub>** – Number of frames between the start of each PUF probe.
- 15 **PUF\_PULSE\_SIZE<sub>s</sub>** – Duration of a PUF pulse in power control groups.
- 16 **PUF\_PWR\_STEP<sub>s</sub>** – Amount (in dB) by which the mobile station is to increment the power
- 17 of a PUF pulse above nominal power from one PUF pulse to the next.
- 18 **PUF\_SETUP\_SIZE<sub>s</sub>** – Number of power control groups within a PUF probe before the
- 19 transmission of the PUF pulse.
- 20 **PUF\_SF\_CDMABAND<sub>s</sub>** – Serving Frequency CDMA band class.
- 21 **PUF\_SF\_CDMACH<sub>s</sub>** – Serving Frequency CDMA Channel number.
- 22 **PUF\_TF\_CDMABAND<sub>s</sub>** – Target Frequency CDMA band class.
- 23 **PUF\_TF\_CDMACH<sub>s</sub>** – Target Frequency CDMA Channel number.
- 24 **PUF\_TX\_PWR<sub>s</sub>** – Mobile station's output power for the PUF pulse.
- 25 **PWR\_CNTL\_STEP<sub>s</sub>** – Power control step size assigned by the base station that the mobile
- 26 station is to use for closed loop power control.
- 27 **PWR\_PERIOD\_ENABLE<sub>s</sub>** – Forward power control periodic reporting enabled indicator.
- 28 **PWR\_REP\_DELAY<sub>s</sub>** – Power report delay. The period that the mobile station waits
- 29 following an autonomous *Power Measurement Report* before restarting frame counting for
- 30 power control purposes.
- 31 **PWR\_REP\_FRAMES<sub>s</sub>** – Power control reporting frame count. The number of frames over
- 32 which the mobile station is to count frame errors. Value is  $2 \times \log_2(\text{frames} / 5)$ .
- 33 **PWR\_REP\_THRESH<sub>s</sub>** – Power control reporting threshold. The number of bad frames to
- 34 be received in a measurement period before the mobile station is to generate a *Power*
- 35 *Measurement Report Message*.
- 36 **PWR\_STEP<sub>s</sub>** – Power increment for successive access probes, in units of 1.0 dB.

- 1 **PWR\_THRESH\_ENABLE<sub>s</sub>** – Forward power control threshold reporting enabled indicator.
- 2 **QOF\_ID<sub>s</sub>** – Quasi-orthogonal function index on the Supplemental Channel.
- 3 **QPAGECH<sub>s</sub>** – Current Quick Paging Channel number.
- 4 **QPCH\_CCI\_SUPPORTED<sub>s</sub>** – Flag to indicate if configuration change indicators are  
5 supported on the Quick Paging Channel.
- 6 **QPCH\_POWER\_LEVEL\_PAGE<sub>s</sub>** – Relative power level of the transmitted Quick Paging  
7 Channel Paging Indicator modulation symbols, relative to the Forward Pilot Channel.
- 8 **QPCH\_POWER\_LEVEL\_CONFIG<sub>s</sub>** – Relative power level of the transmitted Quick Paging  
9 Channel Configuration Change Indicator modulation symbols, relative to the Forward Pilot  
10 Channel.
- 11 **QPCH\_RATE<sub>s</sub>** – Indicator rate of the current Quick Paging Channel(s).
- 12 **QPCH\_SUPPORTED<sub>s</sub>** – Flag to indicate if the Quick Paging Channel is supported by the  
13 base station.
- 14 **RA** – Random access channel number. The Access Channel number generated (pseudo-  
15 randomly) by the mobile station.
- 16 **RAND<sub>s</sub>** – Authentication random challenge value.
- 17 **RANDC** – The eight most-significant bits of the random challenge value used by the  
18 mobile station.
- 19 **RANDOM\_TIME** – Random time. A portion of SYS\_TIME used to seed the random number  
20 generator.
- 21 **RC\_CAP\_REQUESTED<sub>s</sub>** – Radio Configuration Capability indicator. When set to “1” the  
22 mobile station shall include the Radio Configuration capabilities that it supports in the  
23 *Origination Message and Page Response Message*.
- 24 **RCCCH\_SLOT<sub>s</sub>** – See [2].
- 25 **RCCCH\_SLOT\_OFFSET1<sub>s</sub>** – See [2].
- 26 **RCCCH\_SLOT\_OFFSET2<sub>s</sub>** – See [2].
- 27 **REDIRECTION<sub>s</sub>** – Service redirection indicator. Set to enabled to indicate that service  
28 redirection is currently in effect; otherwise, set to disabled.
- 29 **REDIRECT\_REC<sub>s</sub>** – Holds the service redirection criteria specified in the redirection  
30 record of the most recently received *Extended Global Service Redirection Message, Global*  
31 *Service Redirection Message* or *Service Redirection Message*.
- 32 **REDIRECT\_REC\_LIST** – An array of redirection records selected from the most recently  
33 received *Extended Global Service Redirection Message*. Each redirection record in this  
34 array specifies a redirection criteria. See REDIRECT\_REC<sub>s</sub>.
- 35 **REG\_COUNT<sub>s</sub>** – The timer-based registration counter.
- 36 **REG\_COUNT\_MAX<sub>s</sub>** – Timer-based registration count limit. The timer-based registration  
37 counter expiration value computed from REG\_PRD<sub>r</sub>.

- 1    **REG\_DIST<sub>s</sub>** – Registration distance. Distance from last registration that causes a  
2    distance-based registration to occur.
- 3    **REG\_ENABLED<sub>s</sub>** – Autonomous registrations enabled indicator.
- 4    **REG\_NID<sub>s</sub>** – Network identification corresponding to the base station where the mobile  
5    station is considered registered upon receiving confirmation of delivery of *Registration*  
6    *Message*, *Origination Message*, *Page Response Message*, or *Reconnect Message*.
- 7    **REG\_REG\_ZONE<sub>s</sub>** – Registration zone number corresponding to the base station where  
8    the mobile station is considered registered upon receiving confirmation of delivery of  
9    *Registration Message*, *Origination Message*, *Page Response Message*, or *Reconnect Message*.
- 10   **REG\_SECURITY\_RESYNC** – Security re-sync required registration indicator.
- 11   **REG\_SID<sub>s</sub>** – System identification corresponding to the base station where the mobile  
12   station is considered registered upon receiving confirmation of delivery of *Registration*  
13   *Message*, *Origination Message*, *Page Response Message*, or *Reconnect Message*.
- 14   **REGISTERED<sub>s</sub>** – Mobile station registered indicator.
- 15   **REG\_PRD<sub>s</sub>** – Registration period. The time interval between timer-based registrations.  
16   Value is  $4 \times \log_2(\text{time} / 0.08 \text{ s})$ .
- 17   **REG\_PERSIST<sub>s</sub>** – Persistence modifier for registration accesses (except ordered registrations).
- 18   **REG\_ZONE<sub>s</sub>** – Registration zone number of the base station.
- 19   **REG\_ZONE\_TIMER<sub>s</sub>** – Zone timer length corresponding to the base station where the  
20   mobile station is considered registered upon receiving confirmation of delivery of  
21   *Registration Message*, *Origination Message*, *Page Response Message*, or *Reconnect Message*.
- 22   **REJECT\_UZID<sub>s</sub>** – User Zone identifier of the User Zone rejected by the base station.
- 23   **RELEASE\_TO\_IDLE\_IND<sub>s</sub>** – Indicator of whether the mobile station is allowed to  
24   transition directly to the *Mobile Station Idle State* upon releasing all the dedicated  
25   channels.
- 26   **RER\_MAX\_NUM\_MSG<sub>s</sub>** – The maximum number of Radio Environment Messages that the  
27   mobile station is permitted to transmit while in the radio environment reporting mode.
- 28   **RER\_MODE\_ENABLED** – Flag that indicates whether the radio environment reporting  
29   mode is currently enabled at the mobile station.
- 30   **RER\_PILOT\_LIST** – Radio environment report pilot list used while in the radio  
31   environment reporting mode.
- 32   **RER\_MODE\_SUPPORTED<sub>s</sub>** – Base station support of radio environment reporting mode  
33   indicator.
- 34   **RESELECT\_INCLUDED<sub>s</sub>** – System reselection information included indicator. When this  
35   is set to '1', the system reselection procedure is enabled.
- 36   **RESPOND\_IND<sub>s</sub>** – Respond Requested Indicator. Indicates if the mobile station is to  
37   acknowledge direct channel assignment by sending a page response message or a  
38   reconnect message in unassured mode.

- 1 **RESQ\_ENABLED<sub>s</sub>** – Call rescue feature enabled indicator. Flag to indicate if the call  
2 rescue feature is enabled in the network.
- 3 **RESQ\_ALLOWED\_TIME<sub>s</sub>** – Call rescue allowed timer. Specifies the maximum interval  
4 that the mobile station has to begin a call rescue soft handoff attempt, after the call rescue  
5 delay timer expires.
- 6 **RESQ\_ATTEMPT\_TIME<sub>s</sub>** – Call rescue attempt timer. Specifies the maximum time a  
7 mobile station is allowed to keep its transmitter re-enabled while waiting to receive N<sub>3m</sub>  
8 consecutive good frames during a call rescue soft handoff attempt.
- 9 **RESQ\_CODE\_CHAN<sub>s</sub>** – The code channel index of the Rescue Channel for neighbor base  
10 stations that are configured with a Rescue Channel.
- 11 **RESQ\_DELAY\_TIME<sub>s</sub>** – Call rescue delay timer. Specifies the minimum delay before the  
12 mobile station can attempt call rescue soft handoff, after the mobile station disables its  
13 transmitter due to receiving N<sub>2m</sub> consecutive bad frames or declaring an acknowledgment  
14 failure.
- 15 **RESQ\_MIN\_PERIOD<sub>s</sub>** – Minimum time between consecutive call rescues. Specifies the  
16 minimum time after a successful call rescue (i.e. receipt of N<sub>3m</sub> consecutive good frames  
17 by the mobile station after the rescue attempt timer is enabled) before any subsequent call  
18 rescue attempts can be initiated.
- 19 **RESQ\_NUM\_PREAMBLE\_RC1\_RC2<sub>s</sub>** – The Traffic Channel preamble length for Call  
20 Rescue Soft Handoff when operating in Radio Configuration 1 or 2.
- 21 **RESQ\_NUM\_PREAMBLE<sub>s</sub>** – The Traffic Channel preamble length for Call Rescue Soft  
22 Handoff when operating in Radio Configuration greater than 2.
- 23 **RESQ\_NUM\_TOT\_TRANS\_20MS<sub>s</sub>** – The required number of transmissions of a regular  
24 PDU before declaring a L2 Acknowledgment Failure when Call Rescue is enabled.
- 25 **RESQ\_NUM\_TOT\_TRANS\_5MS<sub>s</sub>** – The required number of transmissions of a mini PDU  
26 before declaring a L2 Acknowledgment Failure when Call Rescue is enabled.
- 27 **RESQ\_POWER\_DELTA<sub>s</sub>** – The power level adjustment to be applied to the last closed-loop  
28 power level when re-enabling the transmitter for call rescue soft handoff.
- 29 **RESQ\_QOF<sub>s</sub>** – The Quasi-Orthogonal Function mask identifier of the Rescue Channel for  
30 neighbor base stations that are configured with a Rescue Channel.
- 31 **RESUME\_PREAMBLE<sub>s</sub>** – A storage variable in the mobile station that contains the size of  
32 the preamble that shall be transmitted on a Reverse Supplemental Code Channel at the  
33 beginning of transmission on a Reverse Supplemental Code Channel when resuming  
34 transmission following an interruption when discontinuous transmission is occurring.
- 35 **RETRY\_DELAY<sub>s</sub>[i]** – A storage variable in the mobile station that contains the system time  
36 before which the mobile station may not transmit a specific message. The type of message  
37 that cannot be transmitted is specified by RETRY\_TYPE, represented here by i. A  
38 RETRY\_DELAY<sub>s</sub>[i] value of 0 indicates no retry delay is in effect, and a value of '1111111'  
39 indicates an infinite retry delay.
- 40 **RETRY\_DELAY\_UNIT<sub>s</sub>** – The units for the value of RETRY\_DELAY<sub>s</sub>. Possible values are

- 1 1000ms and 60000ms.
- 2 **RETRY\_DELAY\_VALUE<sub>s</sub>** – The unitless value of the retry delay.
- 3 **RETRY\_TYPE<sub>s</sub>** – The retry delay type. It specifies the type of message to which the retry
- 4 delay value applies. If set to a value of 0, it indicates that all retry delay values should be
- 5 cleared.
- 6 **RETURN\_CAUSE<sub>s</sub>** – Reason for the mobile station registering or accessing the system.
- 7 **RETURN\_IF\_FAIL<sub>s</sub>** – Return if fail indicator. Set to '1' to indicate that mobile station is to
- 8 return to the system from which it was redirected if it fails to acquire service on a system
- 9 using specified redirection criteria. Otherwise, set to '0'.
- 10 **RETURN\_IF\_HANDOFF\_FAIL<sub>s</sub>** – Return if handoff fail indicator. Indicates if the mobile
- 11 station is to resume using the Active Set on the Serving Frequency following an
- 12 unsuccessful hard handoff attempt.
- 13 **REV\_DCCH\_MUX\_OPTION<sub>s</sub>** – Reverse Dedicated Control Channel Multiplex Option.
- 14 **REV\_DTX\_DURATION<sub>s</sub>** – Maximum duration of time in units of 20 ms that the mobile
- 15 station is allowed to stop transmitting on a Reverse Supplemental Code Channel within
- 16 the reverse assignment duration.
- 17 **REV\_DURATION<sub>s</sub>** – A stored variable in the mobile station that contains the duration (in
- 18 units of 80 ms) of the Reverse Supplemental Code Channel transmission that will begin at
- 19 time REV\_START\_TIME<sub>s</sub>.
- 20 **REV\_FCH\_GATING\_MODE<sub>s</sub>** – The reverse Fundamental Traffic Channel gating mode in
- 21 Radio Configurations 3, 4, 5, and 6 where 50% of the PCGs in the 1500 bps and 1800 bps
- 22 frames are gated off (see [2]). Set to '1' if the mobile station is operating in the reverse
- 23 fundamental channel gating mode.
- 24 **REV\_FCH\_MUX\_OPTION<sub>s</sub>** – Reverse Fundamental Channel Multiplex Option.
- 25 **REV\_FCH\_RC<sub>s</sub>** – Reverse Fundamental Channel Radio Configuration.
- 26 **REV\_FRAME\_40\_MAX\_RATE<sub>s</sub>** – The maximum data rate for the mobile station's
- 27 transmission at 40 ms frame length on the Reverse Supplemental Channel.
- 28 **REV\_FRAME\_80\_MAX\_RATE<sub>s</sub>** – The maximum data rate for the mobile station's
- 29 transmission at 80 ms frame length on the Reverse Supplemental Channel.
- 30 **REV\_LINKED\_HDM\_SEQ<sub>s</sub>** – Storage variable containing the most recent reverse sequence
- 31 number of the *General Handoff Direction Message* to which a *Supplemental Channel*
- 32 *Assignment Message* reverse assignment was linked.
- 33 **REV\_PDCH\_AUTO\_ALLOWED<sub>s</sub>[i]** – Reverse Packet Data Channel Autonomous
- 34 Transmission allowed indicator. An on or off indicator used to identify whether
- 35 autonomous transmission is allowed or not allowed for each SR\_ID.
- 36 **REV\_PDCH\_BOOST\_ALLOWED<sub>s</sub>[i]** – Reverse Packet Data Channel boost allowed
- 37 indicator. An on or off indicator that identifies whether traffic to pilot ratio boosting is
- 38 allowed or not allowed for each SR\_ID.
- 39 **REV\_PDCH\_BOOST\_OVERSHOOT<sub>s</sub>** – Reverse Packet Data Channel Boost Overshoot.

1 **REV\_PDCH\_BUFFER\_SIZE<sub>s</sub>[i]** – Reverse Packet Data Buffer size. An array of buffer sizes  
2 that correspond to the buffer status.

3 **REV\_PDCH\_DEFAULT\_PERSISTENCE<sub>s</sub>** – Reverse Packet Data Default Persistence. The  
4 initial default persistence value.

5 **REV\_PDCH\_GRANT\_PRECEDENCE<sub>s</sub>** – Reverse Packet Data Channel Grant  
6 Precedence Indicator.

7 **REV\_PDCH\_INIT\_TARGET\_TPR<sub>s</sub>** – Reverse Packet Data Channel Initial Target for Traffic  
8 to pilot ratio. The initial target traffic to pilot ratio.

9 **REV\_PDCH\_MAX\_AUTO\_TPR<sub>s</sub>** – The maximum traffic to pilot ratio for autonomous  
10 transmission.

11 **REV\_PDCH\_MAX\_SIZE\_ALLOWED\_ENCODER\_PACKET<sub>s</sub>**– Maximum Allowed Reverse  
12 Packet Data Channel encoder packet size.

13 **REV\_PDCH\_MAX\_SIZE\_SUPPORTED\_ENCODER\_PACKET** – Maximum supported  
14 Reverse Packet Data Channel encoder packet size by the mobile station.

15 **REV\_PDCH\_MAX\_TARGET\_TPR<sub>s</sub>** – Reverse Packet Data Maximum Target Traffic to Pilot  
16 Ratio. The maximum target traffic to pilot ratio that is allowed.

17 **REV\_PDCH\_MSIB\_SUPPORTED<sub>s</sub>** – Reverse Packet Data Channel Mobile Station Indicator  
18 Supported Bit.

19 **REV\_PDCH\_MUX\_OPTION\_HIGH\_RATE<sub>s</sub>** – Reverse Packet Data Channel Multiplex  
20 Option for higher data rates indicator.

21 **REV\_PDCH\_MUX\_OPTION\_LOW\_RATE<sub>s</sub>** – Reverse Packet Data Channel Multiplex  
22 Option for lower data rates indicator.

23 **REV\_PDCH\_NUM\_ARQ\_ROUNDS\_BOOST<sub>s</sub>** – The maximum number of ARQ rounds for  
24 boosted transmission that can be performed on the Reverse Packet Data Channel.

25 **REV\_PDCH\_NUM\_ARQ\_ROUNDS\_NORMAL<sub>s</sub>** – The maximum number of ARQ rounds for  
26 non-boosted transmission that can be performed on the Reverse Packet Data Channel.

27 **REV\_PDCH\_QUICK\_START\_THRESH<sub>s</sub>** – Reverse Packet Data Quick Start Threshold. The  
28 Quick start threshold for the Reverse Packet Data Control Channel.

29 **REV\_PDCH\_RC** – Reverse Packet Data Channel radio configuration.

30 **REV\_PDCH\_RESET\_PERSISTENCE<sub>s</sub>** – Reverse Packet Data Channel Reset Persistence.  
31 Determines the value of current persistence [3] at the end of a non-persistent grant for the  
32 Reverse Packet Data Channel.

33 **REV\_PDCH\_REQCH\_TRIGGER<sub>s</sub>[i]** – Reverse Packet Data Request Channel Trigger. The  
34 following parameters are contained in this array and will be triggered for the REQCH.

- 35 • **REV\_REQCH\_MIN\_DURATION** – Minimum duration between REQCH messages for  
36 this SR\_ID.
- 37 • **REV\_REQCH\_USE\_BUFFER\_REPORTS** – An on or off indicator used to allow buffer  
38 reports.

- 1       • REV\_REQCH\_USE\_POWER\_REPORTS – An on or off indicator used to allow power  
2       status reports.
- 3       • REV\_REQCH\_USE\_WATERMARKS – An on or off indicator used to allow watermark  
4       reports.
- 5       • REV\_REQCH\_HIGH\_WATERMARK – The high watermark level, in octets.
- 6       • REV\_REQCH\_LOW\_WATERMARK – The low watermark level, in octets.
- 7       • REV\_REQCH\_CEILING – The high ceiling level, in octets, used for high priority  
8       reporting.
- 9       • REV\_REQCH\_FLOOR – The low floor level, in octets, used for high priority  
10      reporting.
- 11      **REV\_PDCH\_SOFT\_HANDOFF\_RESET\_IND<sub>s</sub>** – Reverse Packet Data Channel Soft Handoff  
12      Reset Indicator. An indicator used to determine whether the Reverse Packet Data  
13      Channel control function must be initialized when soft selection is to occur or not.
- 14      **REV\_PDCH\_STEP\_DOWN<sub>s</sub>[i]** – Reverse Packet Data Channel Step “down” for rate  
15      control.
- 16      **REV\_PDCH\_STEP\_UP<sub>s</sub>[i]** – Reverse Packet Data Channel Step “up” for rate  
17      control.
- 18      **REV\_PDCH\_TABLE\_SEL<sub>s</sub>** – Reverse Packet Data Channel Table selector.
- 19      **REV\_PDCH\_TPR\_BOOSTED<sub>s</sub>[i]** – Reverse Packet Data Traffic to Pilot Ratio Boosted. An  
20      array indicating the traffic to pilot ratio for boosted traffic.
- 21      **REV\_PDCH\_TPR\_NORMAL<sub>s</sub>[i]** – Reverse Packet Data Channel Traffic to Pilot Normal. An  
22      array indicating the traffic to pilot ratio for non-boosted traffic.
- 23      **REV\_PWR\_CNTL\_DELAY<sub>s</sub>** – The reverse link power control delay for the reverse  
24      fundamental channel gating mode in Radio Configurations 3, 4, 5, and 6 and the gated  
25      preamble transmission on the Enhanced Access Channel or the Reverse Common Control  
26      Channel. The delay is the time between the end of the reverse link PCG and the  
27      beginning of the forward link PCG minus one, when the round trip delay is zero.
- 28      **REV\_RC<sub>s</sub>** – Reverse Channel Radio Configuration.
- 29      **REV\_REQCH\_ADJ\_GAIN<sub>s</sub>** – Reverse Request Channel Adjustment Gain.
- 30      **REV\_REQCH\_HEADROOM\_DURATION<sub>s</sub>** – Reverse Request Channel minimum power  
31      headroom update trigger interval.
- 32      **REV\_REQCH\_MAX\_POWER\_UPDATE\_DURATION<sub>s</sub>** – Reverse Request Channel  
33      maximum power headroom update trigger interval.
- 34      **REV\_REQCH\_POWER\_HEADROOM\_DECREASE<sub>s</sub>** – Reverse Request Channel Power  
35      headroom decrease delta to trigger power report.

- 1 **REV\_REQCH\_POWER\_HEADROOM\_INCREASE<sub>s</sub>** – Reverse Request Channel Power  
2 headroom increase delta to trigger power report.
- 3 **REV\_REQCH\_QUICK\_REPEAT\_ALLOWED<sub>s</sub>** – Reverse Request Channel Quick Repeat  
4 Allowed indicator.
- 5 **REV\_SCH\_DTX\_DURATION<sub>s</sub>** – Maximum duration of time in units of 20 ms that the  
6 mobile station is allowed to stop transmitting on a Reverse Supplemental Channel within  
7 the reverse assignment duration.
- 8 **REV\_SCH\_DURATION<sub>s</sub>** – A stored variable in the mobile station which contains the  
9 duration of the Reverse Supplemental Channel transmission which will begin at time  
10 REV\_SCH\_START\_TIME<sub>s</sub>.
- 11 **REV\_SCH\_FRAME\_LENGTH<sub>s</sub>** – The Reverse Supplemental Channel frame length.
- 12 **REV\_SCH\_RATE<sub>s</sub>** – The rate of the Reverse Supplemental Channel.
- 13 **REV\_SCH\_START\_TIME<sub>s</sub>** – A stored variable in the mobile station which contains the  
14 System Time, in units of time specified by START\_TIME\_UNIT<sub>s</sub>, (modulo 32) at which the  
15 mobile station shall start (or resume) processing Reverse Supplemental Channels.
- 16 **REV\_SPICH\_ADJ\_GAIN<sub>s</sub>** – Reverse Secondary Pilot Channel Adjustment Gain.
- 17 **REV\_SPICH\_EP\_SIZE<sub>s</sub>** – Minimum Encoder Packet Size for which the Reverse  
18 Secondary Pilot Channel is used.
- 19 **REV\_START\_TIME<sub>s</sub>** – A stored variable in the mobile station that contains the next 80 ms  
20 frame boundary (modulo 64) on which the mobile station is assigned to start Reverse  
21 Supplemental Code Channel transmission.
- 22 **REV\_WALSH\_ID<sub>s</sub>** – Reverse Supplemental Channel Walsh cover Identifier.
- 23 **RLGAIN\_ACKCH\_PILOT<sub>s</sub>** – Reverse Acknowledgment Channel to pilot adjustment  
24 gain.
- 25 **RLGAIN\_CQICH\_PILOT<sub>s</sub>** – Reverse Channel Quality Indicator Channel to pilot  
26 adjustment gain.
- 27 **RLGAIN\_PDCCH\_PILOT<sub>s</sub>** – Reverse Packet Data Channel to pilot adjustment gain.
- 28 **RLGAIN\_REQCH\_PILOT<sub>s</sub>** – Reverse Request Channel to pilot adjustment gain.
- 29 **RLGAIN\_SPICH\_PILOT<sub>s</sub>** – Reverse Secondary Pilot Channel to pilot adjustment  
30 gain.
- 31 **RN\_HASH\_KEY<sub>s</sub>** – Name of an internal variable having the same value as the mobile  
32 station's ESN. This variable is used by procedures defined in [3].
- 33 **ROAM\_INDI<sub>s</sub>** – Enhanced roaming indicator used for mobile station roaming condition  
34 display.
- 35 **RS** – Inter-probe sequence backoff. The delay in slots generated (pseudorandomly) by the  
36 mobile station following an unsuccessful access probe sequence or prior to the first access  
37 probe in a response attempt.

- 1    **RSC\_END\_TIME** – Reduced slot cycle mode end time. The system time at which a mobile
- 2    station operating in the reduced slot cycle mode will exit the mode.
- 3    **RSC\_MODE\_ENABLED** – Mobile Station flag that indicates whether reduced slot cycle
- 4    mode is enabled.
- 5    **RSCI<sub>s</sub>** – Reduced slot cycle index.
- 6    **RT** – Inter-probe backoff. The delay in slots generated (pseudorandomly) by the mobile
- 7    station following an unacknowledged access probe.
- 8    **RTC\_NOM\_PWR<sub>s</sub>** – Reverse Traffic Channel Nominal Power. The nominal power to be
- 9    used by the mobile station for its initial transmission on the Reverse Traffic Channel when
- 10   Direct Channel Assignment is used.
- 11   **RTC\_NOM\_PWR\_USE\_IND** – Reverse Traffic Channel Nominal Power Used Indicator.
- 12   Indicates if the mobile station uses RTC\_NOM\_PWR<sub>s</sub>. See RTC\_NOM\_PWR<sub>s</sub>.
- 13   **SCAM\_FOR\_DURATION\_MODE<sub>s</sub>** – Indicator for a specific or an indefinite Forward
- 14   Supplemental Code Channel assignment duration.
- 15   **SCAM\_FOR\_ORDER<sub>s</sub>** – The stop or start command set by a *Supplemental Channel*
- 16   *Assignment Message* that is linked to a *General Handoff Direction Message*.
- 17   **SCAM\_REV\_DURATION\_MODE<sub>s</sub>** – Indicator for a specific or an indefinite Reverse
- 18   Supplemental Code Channel assignment duration.
- 19   **SCH\_BAD\_FRAMES<sub>s</sub>** – Forward Supplemental Channel bad frames count. The number of
- 20   received bad Forward Supplemental Channel frames.
- 21   **SCH\_TOT\_FRAMES<sub>s</sub>** – Total Forward Supplemental Channel frames received. The total
- 22   number of received Forward Supplemental Channel frames, counted for Forward Traffic
- 23   Channel power control.
- 24   **SCRM\_SEQ\_NUM<sub>s</sub>** – Storage variable containing the most recently transmitted
- 25   *Supplemental Channel Request Message* sequence number.
- 26   **SEARCH\_MODE<sub>s</sub>** – Search mode to be used in a search on the Candidate Frequency.
- 27   **SEARCH\_OFFSET<sub>s</sub>** – Time offset of the start of the first search from the action time of the
- 28   *Candidate Frequency Search Request Message* or the *Candidate Frequency Search Control*
- 29   *Message* that starts a search.
- 30   **SEARCH\_PERIOD<sub>s</sub>** – Period for search on the Candidate Frequency.
- 31   **SEARCH\_PRIORITY<sub>s</sub>** – Neighbor Pilot Channel search priority.
- 32   **SEARCH\_PRIORITY\_INCL<sub>s</sub>** – Search priorities included indicator.
- 33   **SEARCH\_TIME\_RESOLUTION<sub>s</sub>** – Unit of delay used in the *Candidate Frequency Search*
- 34   *Report Message* to report the total and maximum times away from the Serving Frequency.
- 35   **SENDING\_BSPM<sub>s</sub>** – *BCMC Service Parameters Message* is being transmitted indicator.
- 36   **SENDING\_RAND<sub>s</sub>** – *ANSI-41 RAND Message* sent indicator.

- 1 **SERV\_NEG<sub>s</sub>** – Service negotiation indicator. Indicates whether the mobile station is to  
2 use service negotiation or service option negotiation.
- 3 **SERV\_REQ\_NUM<sub>s</sub>** – Service request sequence number. Sequence number to use when  
4 requesting a new service configuration.
- 5 **SERVSYS<sub>s</sub>** – Selected serving system indicator for Band Class 0. Set to SYS\_A if the  
6 mobile station operates in system A; otherwise, set to SYS\_B.
- 7 **SETTING\_SEARCH\_WIN** – SRCH\_WIN\_NGHBR Setting flag. Set to '1' if the mobile station  
8 shall set the SRCH\_WIN\_NGHBR field of each NGHBR\_REC to SEARCH\_WIN\_N<sub>s</sub> for all  
9 NGHBR\_SET\_SIZE<sub>s</sub> entries upon receiving the *System Parameters Message*.
- 10 **SF\_ADD\_INTERCEPT<sub>s</sub>** – Intercept of the handoff add criterion for the Serving Frequency,  
11 stored during hard handoff.
- 12 **SF\_CDMABAND<sub>s</sub>** – Serving Frequency CDMA band class, stored during hard handoff.
- 13 **SF\_CDMACH<sub>s</sub>** – Serving Frequency CDMA Channel number, stored during hard handoff.
- 14 **SF\_CODE\_CHAN\_LIST<sub>s</sub>** – Serving Frequency Code Channel List, stored during hard  
15 handoff.
- 16 **SF\_DROP\_INTERCEPT<sub>s</sub>** – Intercept of the handoff drop criterion for the Serving  
17 Frequency, stored during hard handoff.
- 18 **SF\_ENCRYPT\_MODE<sub>s</sub>** – Message encryption indicator for the Serving Frequency, stored  
19 during hard handoff.
- 20 **SF\_FRAME\_OFFSET<sub>s</sub>** – Traffic Channel frame offset used on the Serving Frequency,  
21 stored during hard handoff.
- 22 **SF\_NOM\_PWR<sub>s</sub>** – Nominal transmit power offset used on the Serving Frequency, stored  
23 during hard handoff.
- 24 **SF\_NOM\_PWR\_EXT<sub>s</sub>** – Extended nominal transmit power offset indicator for the Serving  
25 Frequency, stored during hard handoff.
- 26 **SF\_P\_REV<sub>s</sub>** – Protocol revision level supported by the base station on the Serving  
27 Frequency.
- 28 **SF\_P\_REV\_IN\_USE<sub>s</sub>** – Protocol revision level currently used by the mobile station on the  
29 Serving Frequency.
- 30 **SF\_PLCM\_TYPE<sub>s</sub>** – Public long code mask type for the Serving Frequency, stored during  
31 hard handoff.
- 32 **SF\_PLCM\_39<sub>s</sub>** – 39-bit public long code mask specified by the base station for the Serving  
33 Frequency, stored during hard handoff.
- 34 **SF\_PRIVATE\_LCM<sub>s</sub>** – Private long code mask indicator for the Serving Frequency, stored  
35 during hard handoff.
- 36 **SF\_PVTLCM\_42<sub>s</sub>** – Private long code mask for the Serving Frequency, stored during hard  
37 handoff.

- 1 **SF\_SERV\_NEG<sub>s</sub>** – Service negotiation indicator for the Serving Frequency, stored during
- 2 hard handoff.
- 3 **SF\_SERVICE\_CONFIG<sub>s</sub>** – Service configuration (service configuration record and non-
- 4 negotiable service configuration record) for the Serving Frequency.
- 5 **SF\_SOFT\_SLOPE<sub>s</sub>** – Slope of the handoff add/drop criterion for the Serving Frequency,
- 6 stored during hard handoff.
- 7 **SF\_SRCH\_WIN\_A<sub>s</sub>** – Search window size for the Active Set and Candidate Set used on the
- 8 Serving Frequency, stored during hard handoff.
- 9 **SF\_SRCH\_WIN\_N<sub>s</sub>** – Search window size for the Neighbor Set used on the Serving
- 10 Frequency, stored during hard handoff.
- 11 **SF\_SRCH\_WIN\_R<sub>s</sub>** – Search window size for the Remaining Set used on the Serving
- 12 Frequency, stored during hard handoff.
- 13 **SF\_T\_ADD<sub>s</sub>** – Pilot detection threshold used on the Serving Frequency, stored during hard
- 14 handoff.
- 15 **SF\_T\_COMP<sub>s</sub>** – Active Set versus Candidate Set comparison threshold used on the
- 16 Serving Frequency, stored during hard handoff.
- 17 **SF\_T\_DROP<sub>s</sub>** – Pilot drop threshold used on the Serving Frequency, stored during hard
- 18 handoff.
- 19 **SF\_T\_TDROP<sub>s</sub>** – Pilot drop timer value used on the Serving Frequency, stored during hard
- 20 handoff.
- 21 **SF\_T\_TDROP\_RANGE<sub>s</sub>** – Pilot drop timer range value used on the Serving Frequency,
- 22 stored during hard handoff.
- 23 **SF\_TOTAL\_EC\_THRESH<sub>s</sub>** – Threshold for total  $E_c$  of pilots in the Serving Frequency
- 24 Active Set used in the Candidate Frequency periodic search procedures.
- 25 **SF\_TOTAL\_EC\_IO\_THRESH<sub>s</sub>** – Threshold for total  $E_c/I_o$  of pilots in the Serving Frequency
- 26 Active Set used in the Candidate Frequency periodic search procedures.
- 27 **SID<sub>s</sub>** – System identifier.
- 28 **SID\_NID\_LIST<sub>s</sub>** – Registration SID, NID list. The SID, NID pairs in which the mobile
- 29 station has registered.
- 30 **SLOT\_CYCLE\_INDEX<sub>s</sub>** – Slot cycle index. This is a signed parameter that can take values
- 31 between -4 and +7, inclusive. It is computed from the SLOT\_CYCLE\_INDEX\_REG, and
- 32 bounded by the minimum and maximum slot cycle indices allowed by the current base
- 33 station.
- 34 **SLOT\_CYCLE\_INDEX\_REG** – Slot cycle index registered. This is a signed parameter that
- 35 can take values between -4 and +7, inclusive. It is computed based on the slot cycle index
- 36 value included in the last registration attempt.
- 37 **SLOT\_NUM** – Paging Channel or Forward Common Control Channel slot number.

- 1    **SOFT\_SLOPE<sub>s</sub>** – The slope in the inequality criterion for adding a pilot to the Active Set, or
- 2    dropping a pilot from the Active Set.
- 3    **SO\_REQ<sub>s</sub>** – Service option request number. The number of the service option requested
- 4    by the mobile station during service option negotiation.
- 5    **SR1\_BRAT\_NON\_TD<sub>s</sub>** – Spreading Rate 1 Primary Broadcast Control Channel data rate
- 6    with no transmit diversity.
- 7    **SR1\_BRAT\_TD<sub>s</sub>** – Spreading Rate 1 Primary Broadcast Control Channel data rate with
- 8    transmit diversity.
- 9    **SR1\_CRAT\_NON\_TD<sub>s</sub>** – Spreading Rate 1 coding rate with no transmit diversity.
- 10   **SR1\_CRAT\_TD<sub>s</sub>** – Spreading Rate 1 coding rate with transmit diversity.
- 11   **SR1\_TD\_MODE<sub>s</sub>** – Spreading Rate 1 transmit diversity mode in support of OTD or STS.
- 12   **SR1\_TD\_LEVEL<sub>s</sub>** – Spreading Rate 1 transmit diversity power level.
- 13   **SR3\_BRAT<sub>s</sub>** – Data rate of the Broadcast Control Channel on SR3 frequencies.
- 14   **SR3\_PRIMARY\_PILOT<sub>s</sub>** – Frequency offset of the primary SR3 pilot.
- 15   **SR3\_PILOT\_POWER1<sub>s</sub>** – The power level of the primary pilot with respect to the pilot on
- 16   the lower frequency of the two remaining SR3 frequencies.
- 17   **SR3\_PILOT\_POWER2<sub>s</sub>** – The power level of the primary pilot with respect to the pilot on
- 18   the higher frequency of the two remaining SR3 frequencies.
- 19   **SRCH\_OFFSET\_INCL<sub>s</sub>** – Neighbor pilot search window offset included indicator.
- 20   **SRCH\_OFFSET\_NGHBR<sub>s</sub>** – Neighbor pilot search window offset.
- 21   **SRCH\_WIN\_A<sub>s</sub>** – Search window size for the Active Set and Candidate Set.
- 22   **SRCH\_WIN\_NGHBR<sub>s</sub>** – Neighbor Pilot Channel search window size.
- 23   **SRCH\_WIN\_NGHBR\_INCL<sub>s</sub>** – Neighbor Pilot Channel search window size included
- 24   indicator.
- 25   **SRCH\_WIN\_N<sub>s</sub>** – Search window size for the Neighbor Set.
- 26   **SRCH\_WIN\_R<sub>s</sub>** – Search window size for the Remaining Set.
- 27   **START\_TIME\_UNIT<sub>s</sub>** – A stored variable in the mobile station which contains the time
- 28   unit used for determining FOR\_SCH\_START\_TIME and REV\_SCH\_START\_TIME on
- 29   Supplemental Channels.
- 30   **SYNC\_ID<sub>s</sub>** – Service Configuration Synchronization Identifier identifying the service
- 31   configuration currently in use (i.e. Service Configuration information record and Non-
- 32   negotiable Service Configuration information record).
- 33   **SYS\_PAR\_MSG\_SEQ<sub>s</sub>** – *System Parameters Message* sequence number.
- 34   **SYS\_TIME<sub>s</sub>** – Current value of CDMA system time as received in the *Sync Channel*
- 35   *Message*.
- 36   **TA** – Acknowledgment response timeout.

- 1    **T\_ADD<sub>s</sub>** – Pilot detection threshold. The stored value is a positive value in units of 0.5 dB.
- 2    **T\_COMP<sub>s</sub>** – Active Set versus Candidate Set comparison threshold. The stored value is a
- 3    positive value in units of 0.5 dB.
- 4    **T\_DROP<sub>s</sub>** – Pilot drop threshold. The stored value is a positive value in units of 0.5 dB.
- 5    **T\_TDROPRANGE<sub>s</sub>** – Pilot drop timer range value.
- 6    **T\_SLOTTED<sub>s</sub>** – Slotted timer, used for the slotted timer feature.
- 7    **TAG<sub>s</sub>** – Transaction identifier. This is a 4-bit parameter maintained by the mobile station
- 8    which is used to uniquely identify a new call origination (via an *Enhanced Origination*
- 9    *Message*) by the mobile station. When the mobile station is to send an *Enhanced*
- 10    *Origination Message*, the mobile station increments the stored value of TAG and includes it
- 11    in the message.
- 12    **TAG\_OUTSTANDING\_LIST** – List of outstanding TAG values. This corresponds to those
- 13    values of TAG sent in the *Enhanced Origination Message* which have neither been accepted
- 14    by the base station (by assigning the requested call) nor rejected by the base station.
- 15    **TBR\_RAND\_SUPPR\_ENABLE<sub>s</sub>** – Flag to indicate if suppression of timer-based registration
- 16    randomization based upon frequent implicit registrations is enabled.
- 17    **TBR\_RAND\_WINDOW<sub>s</sub>** – Indicates the window over which the next timer-based
- 18    registration following call release is randomized.
- 19    **TEMP\_SUB<sub>s</sub>** – User Zone temporary subscription flag.
- 20    **TF\_CDMABAND<sub>s</sub>** – Target Frequency CDMA band class. The CDMA band class specified
- 21    in the *Extended Handoff Direction Message* or the *General Handoff Direction Message*.
- 22    **TF\_CDMACH<sub>s</sub>** – Target Frequency CDMA Channel number. The CDMA Channel number
- 23    specified in the *Extended Handoff Direction Message* or the *General Handoff Direction*
- 24    *Message*.
- 25    **TF\_RESET\_FPC<sub>s</sub>** – Flag to initialize the Forward Traffic Channel power control counters
- 26    on the Target Frequency.
- 27    **TF\_RESET\_L2<sub>s</sub>** – Flag to reset acknowledgment procedures on the Target Frequency.
- 28    **TF\_T\_ADD<sub>s</sub>** – Pilot detection threshold to be used on the Target Frequency. The stored
- 29    value is a positive value in units of 0.5 dB.
- 30    **TF\_WAIT\_TIME<sub>s</sub>** – Maximum time that the mobile station may wait to receive a period of
- 31    ( $N_{11m} \times 20$ ) ms with sufficient signal quality on the CDMA Target Frequency.
- 32    **TKZ\_ID<sub>s</sub>** – Tracking zone identifier used while in tracking zone mode.
- 33    **TKZ\_LIST\_LEN<sub>s</sub>** – Number of tracking zone identifiers to be maintained in the tracking
- 34    zone list while in tracking zone mode.
- 35    **TKZ\_MAX\_NUM\_MSG<sub>s</sub>** – The maximum number of *Radio Environment Messages* that the
- 36    mobile station is permitted to transmit while in the tracking zone mode.
- 37    **TKZ\_MODE\_ENABLED** – Flag that indicates whether the tracking zone mode is currently
- 38    enabled at the mobile station.

- 1 **TKZ\_MODE\_PENDING** – Flag that indicates whether the tracking zone mode is currently  
2 pending at the mobile station. If the tracking zone mode is pending, then it becomes  
3 enabled when the radio environment reporting mode is disabled.
- 4 **TKZ\_MODE\_SUPPORTED<sub>s</sub>** – Base station support of tracking zone mode indicator.
- 5 **TKZ\_LIST** – Tracking zone list. A list of most recent TKZ\_IDs that the mobile station has  
6 received while in the tracking zone mode.
- 7 **TMSI\_ZONE<sub>s</sub>** – TMSI zone number of the base station.
- 8 **TMSI\_ZONE\_LEN<sub>s</sub>** – The number of octets in TMSI zone.
- 9 **T\_MULCHAN<sub>s</sub>** – The threshold offset that the mobile station is to use when reporting  
10 neighbor pilot strength measurements in a *Supplemental Channel Request Message*. The  
11 stored value is a positive value in units of 0.5 dB.
- 12 **TOTAL\_PUF\_PROBES<sub>s</sub>** – Maximum number of PUF probes transmitted in a PUF attempt.
- 13 **TOTAL\_ZONES<sub>s</sub>** – Number of registration zones to be retained in ZONE\_LIST<sub>s</sub>.
- 14 **TOT\_FRAMES<sub>s</sub>** – Total Forward Fundamental Channel frames received. The total number  
15 of received Forward Fundamental Channel frames, counted for Forward Traffic Channel  
16 power control.
- 17 **TX\_PWR\_LIMIT<sub>s</sub>** – Transmit Power Limit. If the mobile station is operating in the  
18 1915MHz – 1920MHz block of the PCS band, the mobile station is to limit its transmission  
19 power to no more than the value indicated by this field.
- 20 **T\_TDROPS** – Pilot drop timer value.
- 21 **USE\_ERAM<sub>s</sub>** – Use ERAM indicator. Indicates whether ERAM is to be used on the flexible  
22 and variable data rate Supplemental Channel with turbo codes in RC4 and RC5 Forward  
23 Link and RC4 Reverse Link.
- 24 **USE\_FOR\_HDM\_SEQ<sub>s</sub>** – Storage variable containing a flag indicating a pending  
25 *Supplemental Channel Assignment Message* forward assignment that is linked to a *General*  
26 *Handoff Direction Message*.
- 27 **USE\_REV\_HDM\_SEQ<sub>s</sub>** – Storage variable containing a flag indicating a pending  
28 *Supplemental Channel Assignment Message* reverse assignment that is linked to a *General*  
29 *Handoff Direction Message*.
- 30 **USE\_T\_ADD\_ABORT<sub>s</sub>** – A storage variable in the mobile station that contains the Reverse  
31 Supplement Code Channel assignment T\_ADD abort indicator.
- 32 **USE\_TMSI<sub>s</sub>** – Base station's preference of the use of TMSI.
- 33 **USER\_ZONE\_ID<sub>s</sub>** – *User Zone Identification Message* sent indicator.
- 34 **USER\_ZONE\_ID\_MSG\_SEQ<sub>s</sub>** – *User Zone Identification Message* sequence number.
- 35 **UZ\_EXIT\_IN\_USE<sub>s</sub>** – The User Zone Exit parameter that the mobile station received from  
36 the *User Zone Identification Message* broadcast by the last base station of the old user  
37 zone.

- 1    **UZ\_EXIT\_RCVD<sub>s</sub>** – The User Zone Exit parameter that the mobile station just received
- 2    from the *User Zone Identification Message* broadcast by the currently serving base station.
- 3    **UZID<sub>s</sub>** – User Zone identifier.
- 4    **UZ\_REC** – Record containing information about a User Zone broadcast by the base station
- 5    (see also UZ\_REC\_LIST).
- 6    **UZ\_REC\_LIST** – Broadcast User Zone record list. A descriptive structure used to manage
- 7    the base station's information records about broadcast User Zones (see also UZ\_REC).
- 8    **UZ\_REV<sub>s</sub>** – User Zone update revision number.
- 9    **ZONE\_LIST<sub>s</sub>** – Registration zone list. List of zones in which the mobile station has
- 10   registered.
- 11   **ZONE\_TIMER<sub>s</sub>** – Zone timer length.
- 12

## 1.2 Signaling Architecture

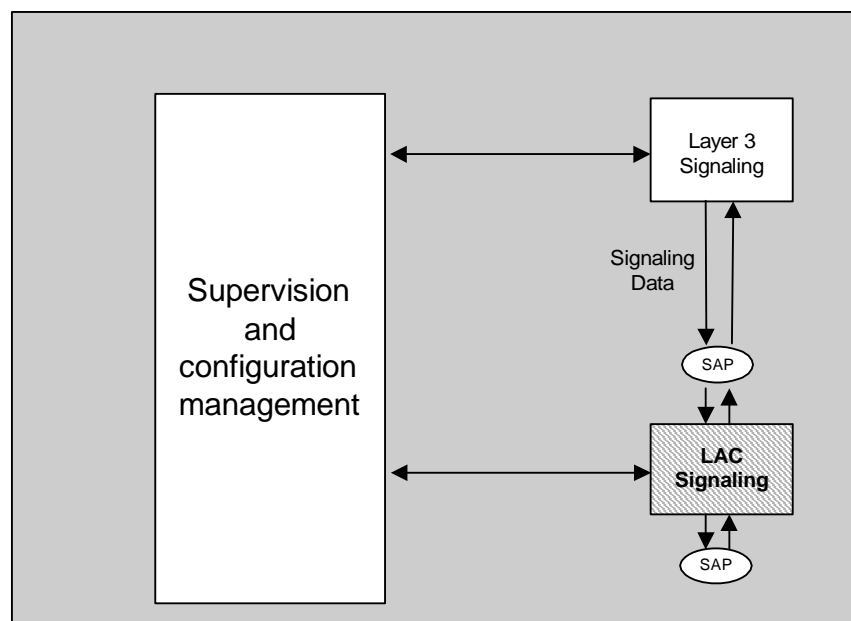

Layer 3 signaling for cdma2000 is modeled as follows:

- **Protocol Layer.** Layer 3 generates Layer 3 PDUs and passes these PDUs to Lower Layers, where proper encapsulation into Lower Layer PDUs is performed. On the receiving end, Lower Layer PDUs are decapsulated and the resulting SDUs are sent from Lower Layers to Layer 3 for processing.
- **Service Access Points.** SAPs and corresponding communication primitives are defined between the Layer 3 and Lower Layers over the data plane. No SAPs are defined for communications through the control plane.

## 1.3 Signaling and Functionality

### 1.3.1 General Architecture

The general architecture is presented in Figure 1.3.1-1.

**Figure 1.3.1-1. cdma2000 Signaling - General Architecture**

### 1.3.2 Interface to Layer 2

The interface between Layer 3 and Layer 2 is a Service Access Point (SAP). At the SAP, Layer 3 and Layer 2 exchange Service Data Units (SDU) and interface control information in the form of Message Control and Status Blocks (MCSB) using a set of primitives.

#### 1.3.2.1 Message Control and Status Block (MCSB)

The MCSB is a parameter block for the defined primitives, containing relevant information about an individual Layer 3 message (PDU), as well as instructions on how the message may be handled or how it is to be (for transmission), or was (for reception), processed by

Layer 2. The MCSB is a conceptual construct and is not subject to detailed specification in this document; see [4] for more information on the content of the MCSB.

### 1.3.2.2 Interface Primitives

The following primitives are defined for communication between the Layer 3 and Layer 2:

**Name: L2-Data.Request**

**Type: Request**

**Direction: Layer 3 to Layer 2**

**Parameters: PDU, MCSB**

**Action: The PDU is handed to Layer 2 for delivery across the radio interface.**

**Name: L2-Data.Confirm**

**Type: Confirm**

**Direction: Layer 2 to Layer 3**

**Parameters: MCSB**

**Action: Reception of the specified (in the MCSB) transmitted PDU was acknowledged at Layer 2 by the addressee.**

**Name: L2-Data.Indication**

**Type: Indication**

**Direction: Layer 2 to Layer 3**

**Parameters: PDU, MCSB**

**Action: The received PDU is handed to Layer 3.**

**Name: L2-Condition.Notification**

**Type: Indication**

**Direction: Layer 2 to Layer 3**

**Parameters: MCSB**

**Action: Layer 3 is notified of a relevant event (e.g. abnormal condition) detected at Layer 2. Details are indicated via the MCSB.**

**Name: L2-Supervision.Request**

**Type: Request**

1 Direction: Layer 3 to Layer 2

2 Parameters: MCSB

3 Action: Layer 2 executes a control command as directed by Layer 3. This could be,  
4 for example, an order to abandon retransmission of a message or an order  
5 for local reset for the message sequence number, acknowledgment  
6 sequence number and duplicate detection.

7 1.3.3 Reserved

8

9 1.3.4 Functional Description

10 In the Data Plane, Layer 3 originates and terminates signaling data units according to the  
11 semantic and timing of the communication protocol between the base station and the  
12 mobile station. From a semantic point of view the signaling data units are referred to as  
13 “messages” (or “orders”). From a protocol point of view, the signaling data units are PDUs.  
14 In general, the language of this specification does not explicitly distinguish between the  
15 terms “PDU” and “Message”. It is considered that the context provides enough  
16 information to allow the reader to make the appropriate distinctions.

17 1.3.5 PDU Transmission and Reception

18 Layer 3 employs the services offered at the interface with Layer 2 to transfer PDUs to and  
19 from the Layer 3 entity.

20 When requesting the transmission of a PDU, Layer 3 will typically specify whether the  
21 transfer will be performed in *assured mode* or in *unassured mode* (for example, by setting  
22 the proper parameters in the MCSB argument of the L2-Data.Request primitive). For  
23 transmission in assured mode, Layer 3 may specify if *confirmation of delivery* of the PDU is  
24 required.

25 Layer 2 guarantees that an assured mode PDU received from the transmitting Layer 3  
26 entity is delivered to the receiving Layer 3 entity. Each assured mode PDU is delivered to  
27 the receiving Layer 3 entity only once and without errors. Additionally, if the transmitting  
28 Layer 3 entity requests confirmation of delivery of an assured mode PDU, Layer 2 will send  
29 an indication to the transmitting Layer 3 entity (for example by using the L2-Data.Confirm  
30 primitive) when Layer 2 receives an acknowledgment for that PDU. If Layer 2 is not able to  
31 deliver an assured mode PDU, it sends an indication of the failure to Layer 3 which can  
32 then take corrective action.

33 Layer 2 does not guarantee that an unassured mode PDU received from the transmitting  
34 Layer 3 entity is delivered to the receiving Layer 3 entity. Thus, Layer 2 acknowledgments  
35 may not be required for unassured mode PDUs. To increase the probability of delivery of  
36 unassured mode PDUs, Layer 3 may request Layer 2 to send those PDUs multiple times in  
37 quick repeat sequence and rely on the duplicate detection capabilities of the receiver to  
38 achieve uniqueness of delivery.

39 Layer 3 can also request Layer 2 to perform a reset of the Layer 2 ARQ procedures (for  
40 example, by using the L2-Supervision.Request primitive).

41

1    **2. REQUIREMENTS FOR MOBILE STATION CDMA OPERATION**

2    This section defines requirements that are specific to CDMA mobile station equipment and  
3    operation. A CDMA mobile station may support operation in one or more band classes.

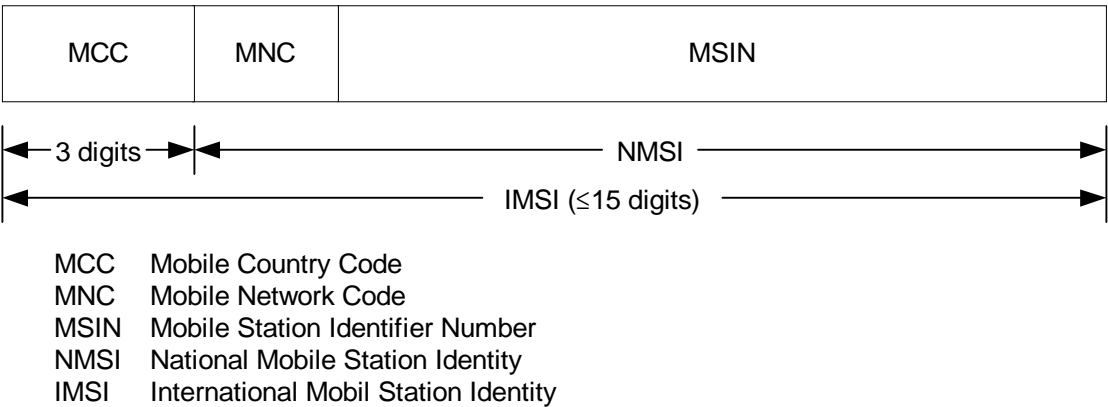

4    **2.1 Reserved**

5    **2.2 Reserved**

6    **2.3 Security and Identification**

7    2.3.1 Mobile Station Identification Number

8    Mobile stations operating in the CDMA mode are identified by the International Mobile  
9    Subscriber Identity (IMSI).<sup>9</sup> Mobile Stations shall have two different identifiers, IMSI\_T  
10   and IMSI\_M. The IMSI consists of up to 15 numerical characters (0-9). The first three  
11   digits of the IMSI are the Mobile Country Code (MCC), and the remaining digits are the  
12   National Mobile Subscriber Identity (NMSI). The NMSI consists of the Mobile Network  
13   Code (MNC) and the Mobile Station Identification Number (MSIN). The IMSI structure is  
14   shown in Figure 2.3.1-1.

16  
17  
18                    **Figure 2.3.1-1. IMSI Structure**

19  
20    An IMSI that is 15 digits in length is called a class 0 IMSI (the NMSI is 12 digits in length);  
21    an IMSI that is less than 15 digits in length is called a class 1 IMSI (the NMSI is less than  
22    12 digits in length).

---

<sup>9</sup> See [18].

IMSI\_M is an IMSI that contains a MIN in the lower ten digits of the NMSI. An IMSI\_M is always a class 0 IMSI. If the IMSI\_M is not programmed, the mobile station shall set the four least-significant digits of the IMSI\_M to the value of the ESN<sub>p</sub>, converted directly from binary to decimal, modulo 10000, and the mobile station shall set the other digits to 0.

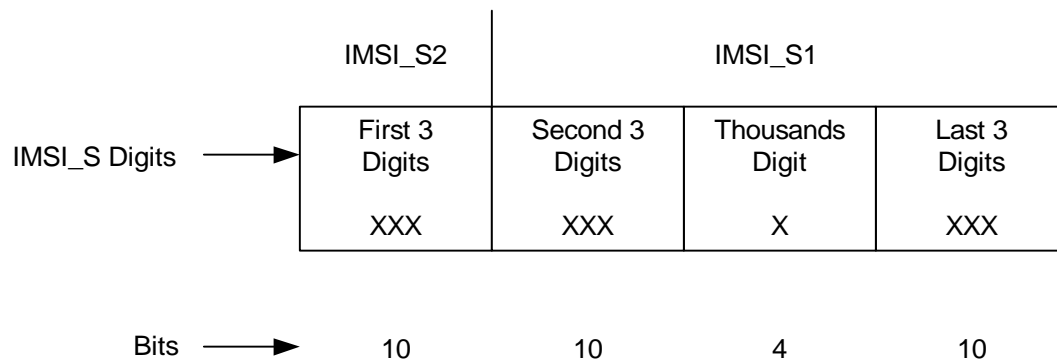

IMSI\_T is an IMSI that is not associated with the MIN assigned to the mobile station. An IMSI\_T can be a class 0 or class 1 IMSI. If the IMSI\_T is not programmed, the mobile station shall set the four least-significant digits of the IMSI\_T to the value of the ESN<sub>p</sub>, converted directly from binary to decimal, modulo 10000, and the mobile station shall set the other digits to 0.

When operating in the CDMA mode the mobile station shall set its operational IMSI value, IMSI\_O, to either the IMSI\_M or the IMSI\_T depending on the capabilities of the base station (See 2.6.2.2.5).

An IMSI\_S is a 10-digit (34-bit) number derived from the IMSI. When an IMSI has 15 digits, IMSI\_S is equal to the least significant ten digits of the IMSI. When an IMSI has fewer than fifteen digits, zeros are added to the most significant side of MSIN to obtain a 15-digit padded IMSI; IMSI\_S is equal to the last 10-digit of the padded IMSI.

A 10-digit IMSI\_S consists of 3- and 7-digit parts, called IMSI\_S2 and IMSI\_S1, respectively, as illustrated in Figure 2.3.1-2. IMSI\_S is mapped into a 34-bit number (see 2.3.1.1). The IMSI\_S derived from IMSI\_M is designated IMSI\_M\_S. The IMSI\_S derived from IMSI\_T is designated IMSI\_T\_S. The IMSI\_S derived from IMSI\_O is designated IMSI\_O\_S.

The mobile station shall have memory to store the 34-bit IMSI\_M\_S<sub>p</sub> and the 34-bit IMSI\_T\_S<sub>p</sub>. IMSI\_M\_S<sub>p</sub> is represented by the 10-bit IMSI\_M\_S2<sub>p</sub> and the 24 bit IMSI\_M\_S1<sub>p</sub>. IMSI\_T\_S<sub>p</sub> is represented by the 10-bit IMSI\_T\_S2<sub>p</sub> and the 24 bit IMSI\_T\_S1<sub>p</sub>.

**Figure 2.3.1-2. IMSI\_S Binary Mapping**

When an IMSI has 15 digits, IMSI\_11\_12 is equal to the 11th and 12th digits of the IMSI.

When an IMSI has fewer than 15 digits, zeros are added to the most significant side of

1 MSIN to obtain a 15-digit padded IMSI; the IMSI<sub>11\_12</sub> is equal to the 11th and 12th  
 2 digits of the resulting number.

3 IMSI<sub>11\_12</sub> is encoded as described in 2.3.1.2. The mobile station shall have memory to  
 4 store the 7-bit IMSI<sub>M\_11\_12p</sub> and the 7-bit IMSI<sub>T\_11\_12p</sub>.

5 The 3-digit MCC is encoded as described in 2.3.1.3. The mobile station shall have memory  
 6 to store the 10-bit MCC<sub>Mp</sub> and the 10-bit MCC<sub>Tp</sub>.

7 If the mobile station has a class 1 IMSI<sub>T</sub>, it shall have memory to store  
 8 IMSI<sub>T\_ADDR\_NUMp</sub>. IMSI<sub>T\_ADDR\_NUMp</sub> is equal to the number of digits in the  
 9 NMSI<sup>10</sup> minus four.

#### 10 2.3.1.1 Encoding of IMSI<sub>M\_S</sub> and IMSI<sub>T\_S</sub>

11 The IMSI<sub>M\_S</sub> and IMSI<sub>T\_S</sub> binary mapping is defined as follows:

- 12 1. The first three digits of the IMSI<sub>M\_S</sub> and the first three digits of the IMSI<sub>T\_S</sub> are  
 13 mapped into ten bits (corresponding to IMSI<sub>M\_S2p</sub> and IMSI<sub>T\_S2p</sub>, respectively)  
 14 by the following coding algorithm:
  - 15 a. Represent these three digits as D<sub>1</sub> D<sub>2</sub> D<sub>3</sub> with the digit equal to zero being  
 16 given the value of ten.
  - 17 b. Compute  $100 \times D_1 + 10 \times D_2 + D_3 - 111$ .
  - 18 c. Convert the result in step b to binary by the standard decimal-to-binary  
 19 conversion as shown in Table 2.3.1.1-1.

20

---

<sup>10</sup> It is assumed that the number of digits in NMSI is greater than three.

2. The second three digits of IMSI\_M\_S and the second three digits of IMSI\_T\_S are mapped into the ten most significant bits of IMSI\_M\_S1<sub>p</sub> and IMSI\_T\_S1<sub>p</sub>, respectively, by the coding algorithm indicated in 1.

3. The last four digits of IMSI\_M\_S and the last four digits of IMSI\_T\_S are mapped into the 14 least significant bits of IMSI\_M\_S1<sub>p</sub> and IMSI\_T\_S1<sub>p</sub>, respectively, as follows:

a. The thousands digit is mapped into four bits by a Binary-Coded-Decimal (BCD) conversion, as shown in Table 2.3.1.1-2.

b. The last three digits are mapped into ten bits by the coding algorithm indicated in 1.

2

3 The following example illustrates the IMSI\_T\_S2<sub>p</sub> and IMSI\_T\_S1<sub>p</sub> calculation procedure.  
 4 Let the IMSI\_T be the 9-digit number 123456789. Since the IMSI\_T has fewer than ten  
 5 digits, the nine least significant digits of the IMSI\_T\_S are equal to the IMSI\_T digits and  
 6 the most significant IMSI\_T\_S digit is set to zero. So the 10-digit IMSI\_T\_S is 012 345 6  
 7 789. IMSI\_T\_S2<sub>p</sub> and IMSI\_T\_S1<sub>p</sub> are calculated as follows:

8 • IMSI\_T\_S2<sub>p</sub>. The ten-bit IMSI\_T\_S2<sub>p</sub> is derived from the first three digits of the  
 9 IMSI\_T\_S (i.e., 012):

10 a.  $D_1 = 10$ ;  $D_2 = 1$ ;  $D_3 = 2$ .

11 b.  $100 \times D_1 + 10 \times D_2 + D_3 - 111 = 100 \times 10 + 10 \times 1 + 2 - 111 = 901$ .

12 c. 901 in binary is '11 1000 0101'.

13 Therefore, IMSI\_T\_S2<sub>p</sub> is '11 1000 0101'.

14 • IMSI\_T\_S1<sub>p</sub>. The ten most significant bits of IMSI\_T\_S1<sub>p</sub> are derived from the  
 15 second three digits of the IMSI\_T\_S (i.e., 345):

16 a.  $D_1 = 3$ ;  $D_2 = 4$ ;  $D_3 = 5$ .

17 b.  $100 \times D_1 + 10 \times D_2 + D_3 - 111 = 100 \times 3 + 10 \times 4 + 5 - 111 = 234$ .

18 c. 234 in binary is '0011 1010 10'.

19 The next four most significant bits of IMSI\_T\_S1<sub>p</sub> are derived from the thousands digit of  
 20 the IMSI\_T\_S (i.e., 6) by BCD conversion: 6 in BCD is '0110'.

21 The ten least significant bits of IMSI\_T\_S1<sub>p</sub> are derived from the last three digits of the  
 22 IMSI\_T\_S (i.e., 789):

23 a.  $D_1 = 7$ ;  $D_2 = 8$ ;  $D_3 = 9$ .

24 b.  $100 \times D_1 + 10 \times D_2 + D_3 - 111 = 100 \times 7 + 10 \times 8 + 9 - 111 = 678$ .

c. 678 in binary is '10 1010 0110'.

Therefore, IMSI\_T\_S1<sub>p</sub> is '0011 1010 1001 1010 1010 0110'.

### 2.3.1.2 Encoding of IMSI\_M\_11\_12 and IMSI\_T\_11\_12

The IMSI\_M\_11\_12 and IMSI\_T\_11\_12 binary mapping is defined as follows:

1. Represent the 11th digit as D<sub>11</sub> and the 12th digit as D<sub>12</sub> with the digit equal to zero being given the value of ten.
2. Compute  $10 \times D_{12} + D_{11} - 11$ .
3. Convert the result in step 2 to binary by a standard decimal-to-binary conversion as described in Table 2.3.1.1-1 and limit the resulting number to the 7 least significant bits.

### 2.3.1.3 Encoding of the MCC\_M and MCC\_T

The MCC\_M and MCC\_T binary mapping is defined as follows:

1. Represent the 3-digit Mobile Country Code as D<sub>1</sub> D<sub>2</sub> D<sub>3</sub> with the digit equal to zero being given the value of ten.
2. Compute  $100 \times D_1 + 10 \times D_2 + D_3 - 111$ .
3. Convert the result in step (2) to binary by a standard decimal-to-binary conversion as described in Table 2.3.1.1-1.

### 2.3.1.4 Mobile Directory Number

A Mobile Directory Number (MDN) is a dialable number associated with the mobile station through a service subscription. A Mobile Directory Number is not necessarily the same as the mobile station identification on the air interface, i.e., MIN, IMSI\_M or IMSI\_T. An MDN consists of up to 15 digits. The mobile station should have memory to store at least one Mobile Directory Number (see Table F.3-1).

## 2.3.2 Electronic Serial Number (ESN), R-UIM Identifier (UIM\_ID), and Mobile Equipment Identifier (MEID)

The mobile station shall be configured with 32-bit ESN or 56-bit MEID, but not both. All mobile stations with MOB\_P\_REV<sub>p</sub> less than 11 shall be configured with ESN. All mobile stations with MOB\_P\_REV<sub>p</sub> greater than or equal to 11 shall be configured with MEID. The ESN or MEID is used to uniquely identify a mobile station in a wireless system.

### 2.3.2.1 Electronic Serial Number (ESN)

The ESN value is available to procedures in the mobile station as the value of the variable ESN<sub>p</sub>. The value of the variable RN\_HASH\_KEY<sub>s</sub> is the same as the value of the variable ESN<sub>p</sub>, and need not be stored separately.

### 2.3.2.2 Mobile Equipment Identifier (MEID)

The MEID value is available to procedures in the mobile station as the value of the

1 variable MEID<sub>p</sub>. If the mobile station is configured with MEID, ESN<sub>p</sub> stores 32-bit pseudo-  
 2 ESN value derived from MEID as defined in 2.3.2.2.1.

### 3 2.3.2.2.1 Pseudo-ESN

4 Pseudo-ESN is a 32-bit identifier derived from MEID.

5 Mobile station shall use the following procedure to derive pseudo-ESN from MEID<sup>11</sup>:

- 6 1. The upper 8 bits of pseudo-ESN shall be set to 0x80.
- 7 2. The lower 24 bits of pseudo-ESN shall be the 24 least significant bits of the SHA-  
 8 1 digest of the MEID. See [41] for the specification of the SHA-1 algorithm.

### 9 2.3.2.3 R-UIM Identifier (UIM\_ID, EXT\_UIM\_ID)

10 If the mobile station has a R-UIM which indicates that UIM ID is to be used, then the mobile  
 11 station shall use UIM\_ID instead of ESN in every place where ESN is used in this  
 12 document with the exception of the ESN\_ME information record (see [40]).

13 If the mobile station has a R-UIM which indicates that SF\_EUIMID is to be used in place of  
 14 MEID, then the mobile station shall use SF\_EUIMID instead of MEID in every place where  
 15 MEID is used in this document with the exception of the MEID\_ME information record  
 16 (see [40]).

### 17 2.3.3 Station Class Mark

18 Class-of-station information referred to as the station class mark (SCM<sub>p</sub>) must be stored  
 19 in a mobile station. The digital representation of this class mark is specified in Table  
 20 2.3.3-1.

21

---

<sup>11</sup> Example: if the 56-bit MEID is (hexadecimal) FF 00 00 01 12 34 56, the pseudo-ESN is (hexadecimal) 80 07 37 E1.

1

**Table 2.3.3-1. Station Class Mark**

Function	Bit(s)	Setting
Extended SCM Indicator	7	Band Classes 1,4,14 1XXXXXXX Other bands 0XXXXXXX
Dual Mode	6	Always 0 <sup>12</sup> (CDMA Only) X0XXXXXX
Slotted Class	5	Non-Slotted XX0XXXXX Slotted XX1XXXXX
MEID support indicator <sup>13</sup>	4	MEID not configured XXX0XXXX MEID configured XXX1XXXX
25 MHz Bandwidth	3	Always 1 XXXX1XXX
Transmission	2	Continuous XXXXX0XX Discontinuous XXXXX1XX
Power Class for Band Class 0 Analog Operation	1 - 0	Always 00 <sup>14</sup> XXXXXX00

2

3 The mobile station shall set the Power Class function bits to '00'.

4 The mobile station shall set bit 4 (MEID support indicator) of the Station Class Mark field  
5 to '1' in the *Registration Message*, *Origination Message*, *Page Response Message*, *Terminal*  
6 *Information* and *Extended Terminal Information* information record.

#### 7 2.3.4 Registration Memory

8 The mobile station shall have memory to store one element in the zone-based registration  
9 list ZONE\_LIST<sub>S-P</sub> (see 2.6.5.1.5 and 2.6.5.5). This stored element shall include both  
10 REG\_ZONE and the corresponding (SID, NID) pair. The data retention time under power-  
11 off conditions shall be at least 48 hours. If, after 48 hours, the data integrity cannot be  
12 guaranteed, then the entry in ZONE\_LIST<sub>S-P</sub> shall be deleted upon power-on.

---

<sup>12</sup> 'Dual Mode' bit is always set to '0' to indicate 'CDMA only' mode.

<sup>13</sup> The corresponding bit '4' was previously defined as the IS-54 Power Class which was always set to '0'. The base station uses this field to identify mobile stations that comply with [47].

<sup>14</sup> 'Power Class for Band Class 0 Analog Operation' bits are always set to '00' to indicate mobile station does not support analog mode operation.

1 The mobile station shall have memory to store one element in the system/network  
 2 registration list  $SID\_NID\_LIST_{s-p}$  (see 2.6.5.1.5 and 2.6.5.5). The data retention time  
 3 under power-off conditions shall be at least 48 hours. If, after 48 hours, the data integrity  
 4 cannot be guaranteed, then the entry in  $SID\_NID\_LIST_{s-p}$  shall be deleted upon power-on.

5 The mobile station shall have memory to store the distance-based registration variables  
 6  $BASE\_LAT\_REG_{s-p}$ ,  $BASE\_LONG\_REG_{s-p}$ , and  $REG\_DIST\_REG_{s-p}$  (see 2.6.5.1.4 and  
 7 2.6.5.5). The data retention time under power-off conditions shall be at least 48 hours. If,  
 8 after 48 hours, the data integrity cannot be guaranteed, then  $REG\_DIST\_REG_{s-p}$  shall be  
 9 set to zero upon power-on.

### 10 2.3.5 Access Overload Class

11 The 4-bit access overload class indicator ( $ACCOLC_p$ ) is used to identify which overload  
 12 class controls access attempts by the mobile station and is used to identify redirected  
 13 overload classes in global service redirection.

14 The mobile station shall store 4-bit access overload class ( $ACCOLC_p$ ). Mobile stations that  
 15 are not for test or emergency use should be assigned to overload classes  $ACCOLC$  0  
 16 through  $ACCOLC$  9. For mobile stations that are classified as overload classes  $ACCOLC$  0  
 17 through  $ACCOLC$  9, the mobile station's 4-bit access overload class indicator ( $ACCOLC_p$ )  
 18 shall be automatically derived from the last digit of the associated decimal representation  
 19 of the  $IMSI\_M$  by a decimal to binary conversion as specified in Table 2.3.5-1. When a  
 20 mobile station's  $IMSI\_M$  is updated, the mobile station shall re-calculate the  $ACCOLC_p$  as  
 21 indicated above. Mobile stations designated for test use should be assigned to  $ACCOLC$   
 22 10; mobile stations designated for emergency use should be assigned to  $ACCOLC$  11.  
 23  $ACCOLC$  12 through  $ACCOLC$  15 are reserved.<sup>15</sup> Programming the 4-bit  $ACCOLC_p$  for  
 24 overload classes  $ACCOLC$  10 through  $ACCOLC$  15 as specified in Table 2.3.5-2 shall  
 25 require a special facility only available to equipment manufacturers and system operators.

26 The content of  $ACCOLC_p$  shall not be visible through the mobile station's display.

27

---

### 2.3.6 Public Long Code Mask and Private Long Code Mask

The Public Long Code Mask and the Private Long Code Mask consist of 42 bits (see [2]).

When using a Public Long Code Mask, the long code mask is generated based on the value of `PLCM_TYPES`. When using the Private Long Code Mask, the value of `PLCM_TYPES` is maintained unless updated by the base station.

#### 2.3.6.1 Public Long Code Mask Formats

The 42 bit Public Long Code Mask `PLCM_42` is generated using `PLCM_37` or `PLCM_40` as defined in section 2.3.6.1.1, where the least significant bits `PLCM_37` or `PLCM_40` are set

1 as defined in this section below.

2 The 42 bit Public Long Code Mask ADD\_PLCM\_FOR\_FCH\_42 is generated using  
3 ADD\_PLCM\_FOR\_FCH\_40 as defined in section 2.3.6.1.1, where the least significant bits  
4 ADD\_PLCM\_FOR\_FCH\_40 are set as defined in this section below.

5 The 42 bit Public Long Code Mask ADD\_PLCM\_FOR\_SCH\_42 is generated using  
6 ADD\_PLCM\_FOR\_SCH\_35 as defined in section 2.3.6.1.1, where the least significant bits  
7 ADD\_PLCM\_FOR\_SCH\_35 are set as defined in this section below.

8 If  $PLCM\_TYPE_S$  is equal to '0000', the 37 least significant bits (PLCM\_37) are set as follows:

- 9 • Bits  $M_{36}$  through  $M_{32}$  shall be set to '11000';
- 10 • Bits  $M_{31}$  through  $M_0$  shall be set to a permutation of the mobile station's ESN as  
11 follows:

12  $ESN = (E_{31}, E_{30}, E_{29}, E_{28}, E_{27}, E_{26}, E_{25}, \dots E_2, E_1, E_0)$

13 Permuted ESN =  $(E_0, E_{31}, E_{22}, E_{13}, E_4, E_{26}, E_{17}, E_8, E_{30}, E_{21}, E_{12}, E_3, E_{25}, E_{16},$   
14  $E_7, E_{29}, E_{20}, E_{11}, E_2, E_{24}, E_{15}, E_6, E_{28}, E_{19}, E_{10}, E_1, E_{23}, E_{14},$   
15  $E_5, E_{27}, E_{18}, E_9).$

16 If  $PLCM\_TYPE_S$  is equal to '0001', the 40 least significant bits (PLCM\_40) are set as follows:

- 17 • Bit  $M_{39}$  shall be set to '1';
- 18 • Bits  $M_{38}$  through  $M_0$  of the public long code mask shall be specified by  $PLCM_{39_S}$   
19 and shall be set as follows:

20  $PLCM_{39_S} = (P_{38}, P_{37}, P_{36}, P_{35}, P_{34}, P_{33}, P_{32}, \dots P_2, P_1, P_0)$

21 If  $ADD\_PLCM\_FOR\_FCH\_TYPE_S$  is equal to '1', the 40 least significant bits  
22 ( $ADD\_PLCM\_FOR\_FCH_{40}$ ) are set as follows:

- 23 • Bit  $M_{39}$  shall be set to '1';
- 24 • Bits  $M_{38}$  through  $M_0$  of the public long code mask shall be specified by  
25  $ADD\_PLCM\_FOR\_FCH_{39_S}$  and shall be set as follows:

26  $ADD\_PLCM\_FOR\_FCH_{39_S} = (P_{38}, P_{37}, P_{36}, P_{35}, P_{34}, P_{33}, P_{32}, \dots P_2, P_1, P_0)$

27 If  $ADD\_PLCM\_FOR\_SCH\_TYPE_S$  is equal to '1', the 35 least significant bits  
28 ( $ADD\_PLCM\_FOR\_SCH_{35}$ ) are set as follows:

- 29 • Bits  $M_{34}$  through  $M_0$  of the public long code mask shall be specified by  
30  $ADD\_PLCM\_FOR\_SCH_{35_S}$  and shall be set as follows:

31  $ADD\_PLCM\_FOR\_SCH_{35_S} = (P_{34}, P_{33}, P_{32}, P_{31}, P_{30}, P_{29}, P_{28}, \dots P_2, P_1, P_0)$

32 If  $PLCM\_TYPE_S$  is equal to '0010', the 37 least significant bits (PLCM\_37) are set as follows:

- 33 • Bits  $M_{36}$  through  $M_{34}$  shall be set to '001';
- 34 • Bits  $M_{33}$  through  $M_0$  shall be set to  $IMSI\_O\_S$ .

If `PLCM_TYPEs` is equal to '0011', the 37 least significant bits (`PLCM_37`) are set as follows:

- Bits `M36` through `M34` shall be set to '000';
- Bits `M33` through `M0` shall be set to `IMSI_O_S`.

If `PLCM_TYPEs` is equal to '0100', the 40 least significant bits (`PLCM_40`) are set as follows:

- Bit `M39` shall be set to '0';
- Bits `M38` through `M0` shall be set as follows:
- The 39 least significant bits of the SHA-1 digest of the MEID<sup>16</sup>. See [41] for the specification of the SHA-1 algorithm.

#### 2.3.6.1.1 Public Long Code Mask `PLCM_42`, `ADD_PLCM_FOR_FCH_42` and `ADD_PLCM_FOR_SCH_42`

If `PLCM_37` is defined, the public long code mask `PLCM_42` shall be as follows: bits `M36` through `M0` of the public long code mask shall be specified by `PLCM_37` (see 2.3.6). Bits `M41` through `M37` shall be set to '11000'. The resulting public long code mask `PLCM_42` is shown in Figure 2.3.6.1-1 (a).

If `PLCM_40` is defined, the public long code mask `PLCM_42` shall be as follows: bits `M39` through `M0` of the public long code mask shall be specified by `PLCM_40` (see 2.3.6.1). Bits `M41` through `M40` shall be set to '10'. The resulting public long code mask `PLCM_42` is shown in Figure 2.3.6.1-1 (b).

If `ADD_PLCM_FOR_FCH_40` is defined, the public long code mask `ADD_PLCM_FOR_FCH_42` shall be as follows: bits `M39` through `M0` of the public long code mask shall be specified by `ADD_PLCM_FOR_FCH_40` (see 2.3.6.1). Bits `M41` through `M40` shall be set to '10'. The resulting public long code mask `ADD_PLCM_FOR_FCH_42` is shown in Figure 2.3.6.1-1 (c).

If `ADD_PLCM_FOR_SCH_35` is defined, the public long code mask `ADD_PLCM_FOR_SCH_42` shall be as follows: bits `M34` through `M0` of the public long code mask shall be specified by `ADD_PLCM_FOR_SCH_35` (see 2.3.6.1). Bits `M41` through `M35` shall be set to '1100111'. The resulting public long code mask `ADD_PLCM_FOR_SCH_42` is shown in Figure 2.3.6.1-1 (d).

---

<sup>16</sup> Example: if the 56-bit MEID is (hexadecimal) FF 00 00 01 12 34 56, the bits `M38` through `M0` of `PLCM` are (hexadecimal) 1A 0E 07 37 E1, and (binary) '001 1010 0000 1110 0000 0111 0011 0111 1110 0001'.

6 2.3.6.2 Private Long Code Mask PVTLCM\_42

7 The 42 bit private long code mask PVTLCM\_42 shall be as follows: Bits M<sub>41</sub> through M<sub>40</sub>  
8 shall be set to '01'. Bits M<sub>39</sub> through M<sub>0</sub> shall be the 40 least significant bits of the Voice  
9 Privacy Mask (VPM) generated by the Key\_VPM\_Generation procedure or  
10 CDMA\_3G\_2G\_Conversion procedure. M<sub>0</sub> of the private long code mask shall be the least  
11 significant bit of the VPM. See [15] for details of the Key\_VPM\_Generation procedure and  
12 see [44] for details of the CDMA\_3G\_2G\_Conversion procedure. The resulting private long  
13 code mask PVTLCM\_42 is shown in Figure 2.3.6.2-1.

**Figure 2.3.6.2-1 Private Long Code Mask PVTLCM\_42 Format**

### 2.3.7 Reserved

### 2.3.8 Home System and Network Identification

The mobile station shall provide memory to store at least one home (SID<sub>p</sub>, NID<sub>p</sub>) pair. The mobile station shall also provide memory to store the 1-bit parameters MOB\_TERM\_HOME<sub>p</sub>, MOB\_TERM\_FOR\_SID<sub>p</sub>, and MOB\_TERM\_FOR\_NID<sub>p</sub> (see 2.6.5.3).

### 2.3.9 Local Control Option

If the mobile station supports the local control option, a means shall be provided within the mobile station to enable or disable the local control option.

### 2.3.10 Preferred Operation Selection

#### 2.3.10.1 Preferred System

If the mobile station supports operation in Band Class 0 or Band Class 3 (see [2]), a means shall be provided within the mobile station to identify the preferred system. In addition, the mobile station may provide a means for allowing operation only with System A or only with System B.

#### 2.3.10.2 Reserved

### 2.3.11 Discontinuous Reception

The mobile station shall provide memory to store the preferred slot cycle index, SLOT\_CYCLE\_INDEX<sub>p</sub> (see 2.6.2.1.1.3.2).

### 2.3.12 Authentication, Encryption of Signaling Information/User Data and Voice Privacy

#### 2.3.12.1 Authentication

Authentication is the process by which information is exchanged between a mobile station and base station for the purpose of confirming the identity of the mobile station. A successful outcome of the authentication process occurs only when it can be demonstrated that the mobile station and base station possess identical sets of shared secret data.

The authentication algorithms are described in [15]. The interface (input and output parameters) for the algorithms is described in [23], Table 2.3.12.1-1 summarizes the setting of the input parameters of the Auth\_Signature procedure for each of its uses in this standard.

For authentication purposes, the mobile station shall use IMSI\_M if it is programmed; otherwise, the mobile station shall use IMSI\_T. The base station uses the IMSI selected according to the same criteria.

**Table 2.3.12.1-1. Auth\_Signature Input Parameters**

Procedure	RAND_CHALLENGE	ESN	AUTH_DATA	SSD_AUTH	SAVE_REGISTERS
Unique Challenge (2.3.12.1.4)	RANDU and 8 LSBs of IMSI_S2	ESN <sub>p</sub>	IMSI_S1	SSD_A	TRUE if GEN_CMEAKEY is set to 1 in the AUCM; otherwise FALSE

#### 2.3.12.1.1 Shared Secret Data (SSD)

SSD is a 128-bit quantity that is stored in semi-permanent memory in the mobile station and is readily available to the base station. As depicted in Figure 2.3.12.1.1-1, SSD is partitioned into two distinct subsets. Each subset is used to support a different process.

Contents	SSD_A	SSD_B
Length (bits)	64	64

**Figure 2.3.12.1.1-1. Partitioning of SSD**

SSD\_A is used to support the authentication procedures and SSD\_B is used to support voice privacy (see 2.3.12.3) and message encryption (see 2.3.12.2). SSD is generated according to the procedure specified in 2.3.12.1.5. The SSD shall not be accessible to the user.

#### 2.3.12.1.2 Random Challenge Memory (RAND)

RAND is a 32-bit value held in the mobile station. When operating in CDMA mode, it is equal to the RAND value received in the last *Access Parameters Message* (see 3.7.2.3.2.2) or the *ANSI-41 RAND Message* (see 3.7.2.3.2.31) of the CDMA f-csch.

RAND<sub>s</sub> is used in conjunction with SSD\_A and other parameters, as appropriate, to authenticate mobile station originations, terminations and registrations.

#### 2.3.12.1.3 Call History Parameter (COUNT<sub>s-p</sub>)

COUNT<sub>s-p</sub> is a modulo-64 count held in the mobile station. COUNT<sub>s-p</sub> is updated by the mobile station when a *Parameter Update Order* is received on the f-dsch (see 3.7.4).

#### 2.3.12.1.4 Unique Challenge-Response Procedure

The Unique Challenge-Response Procedure is initiated by the base station and can be carried out either on the f-csch and r-csch, or on the f-dsch and r-dsch. The procedure is as follows:

The base station generates the 24-bit quantity RANDU and sends it to the mobile station in the *Authentication Challenge Message* on either the f-csch or f-dsch. Upon receipt of the *Authentication Challenge Message*, the mobile station shall set the input parameters of the Auth\_Signature procedure (see [23] section 2.3) as illustrated in Figure 2.3.12.1.5-3. The 24 most significant bits of the RAND\_CHALLENGE input parameter shall be filled with RANDU, and the 8 least significant bits of RAND\_CHALLENGE shall be filled with the 8 least significant bits of IMSI\_S2.

The mobile station shall set the SAVE\_REGISTERS input parameter to TRUE if the GEN\_CMEAKEY field is set to '1' and FALSE if the GEN\_CMEAKEY is set to '0'.

The mobile station shall then execute the Auth\_Signature procedure. The 18-bit output AUTH\_SIGNATURE shall be used to fill the AUTHU field of the *Authentication Challenge Response Message*, which shall be sent to the base station.

The base station computes the value of AUTHU in the same manner as the mobile station, but using its internally stored value of SSD\_A. The base station compares its computed value of AUTHU to the value received from the mobile station. If the comparison fails, the base station may deny further access attempts by the mobile station, drop the call in progress, or initiate the process of updating SSD (see 2.3.12.1.5).

Upon receiving delivery confirmation for the *Authentication Challenge Response Message* from the LAC layer indicating a successful Unique Challenge, MS may perform the following procedure: If GEN\_CMEAKEY was set to '1' in the *Authentication Challenge Message* and either of the following conditions is met:

- If neither encryption nor integrity protection is turned on and mobile station wants to turn on encryption or integrity protection or both.
- If the encryption or integrity protection is turned on and mobile station wants to switch to new keys based on new SSD.

the mobile station shall perform the following procedures:

- If MSG\_INTEGRITY\_SUPs is equal to '1', the mobile station then associates a pending key id NEW\_KEY\_ID with the pending CMEAKEY.
- The mobile station shall send a *Security Mode Request Message*. If MSG\_INTEGRITY\_SUPs is equal to '0', the mobile station shall select a 24-bit number and include this number in the NEW\_SSEQ\_H field in the *Security Mode Request Message*; otherwise, the mobile station shall select a 24-bit number and deliver this number to the LAC Layer along with the *Security Mode Request Message*.

- Upon reception of the *Security Mode Request Message*, the base station validates the NEW\_SSEQ\_H\_SIG field in the message. If validation returns success, then the CMEAKEY associated with the AUTHU generated during Unique Challenge-Response procedure and the pending NEW\_SSEQ\_H can become “in use” in the base station. If Voice Privacy was enabled during this procedure, the base station shall indicate to the mobile station to disable Voice Privacy. The base station then confirms the key set-up by sending the *Security Mode Command Message* to the mobile station. Upon reception of *Security Mode Command Message*, the CMEAKEY associated with the AUTHU generated during Unique Challenge-Response procedure, the pending NEW\_SSEQ\_H and key id become “in use” for the mobile station.

#### 2.3.12.1.5 Updating the Shared Secret Data (SSD)

SSD is updated using the SSD\_Generation procedure (see [23], section 2.2.1), initialized with mobile station specific information, random data, and the mobile station's A-key. The A-key is 64 bits long. It is assigned to the mobile station and is stored in the mobile station's permanent security and identification memory. The A-key is known only to the mobile station and to its associated Home Location Register/Authentication Center (HLR/AC) (see [13]). Non-manual methods, such as described in [26], are preferred for entry of the A-key into the mobile station. A manual method of entry that may be used when automated methods are not available is described in [29].

The SSD update procedure is performed as follows (see Figure 2.3.12.1.5-1):

The base station sends an *SSD Update Message* on either the f-csch or the f-dsch. The RANDSSD field of the *SSD Update Message* contains the same value used for the HLR/AC computation of SSD.

Upon receipt of the *SSD Update Message* the mobile station shall set the input parameters of the SSD\_Generation procedure (see [23], section 2.2.1) as illustrated in Figure 2.3.12.1.5-2. The mobile station shall then execute the SSD\_Generation procedure. The mobile station shall set SSD\_A\_NEW and SSD\_B\_NEW to the outputs of the SSD\_Generation procedure.

The mobile station shall then select a 32-bit random number, RANDBS, and shall send it to the base station in a *Base Station Challenge Order* on the r-csch or r-dsch.

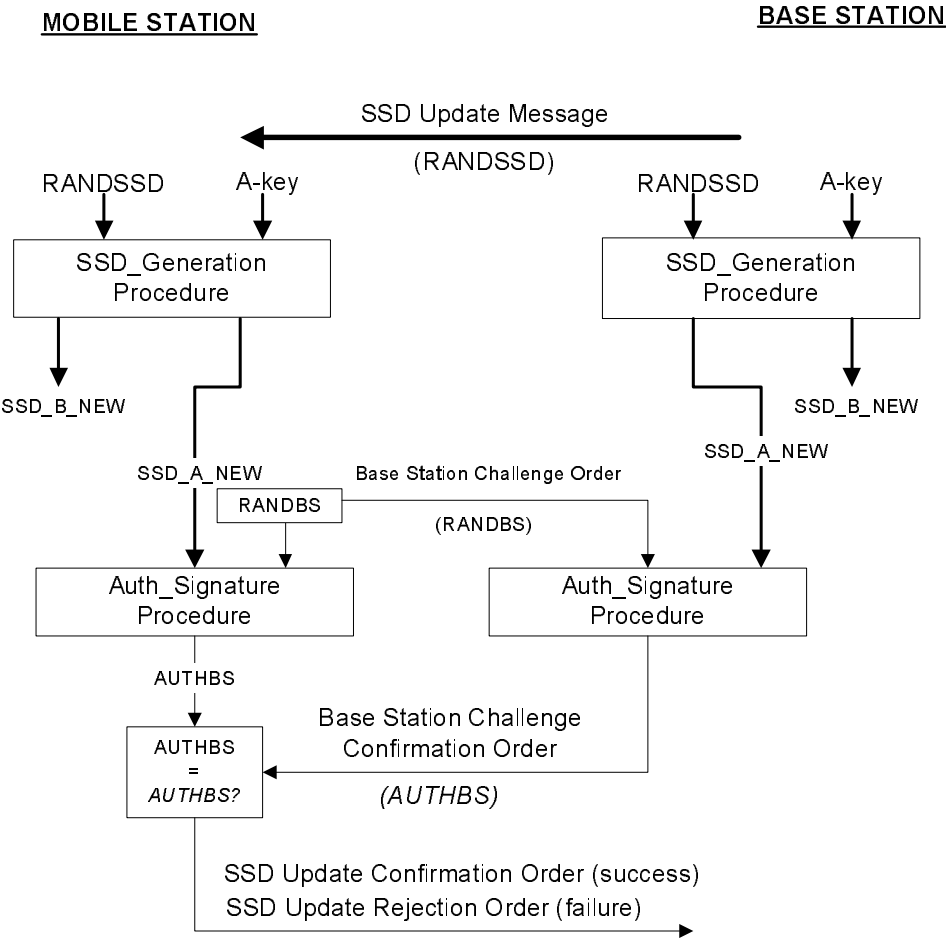

Both the mobile station and the base station shall then set the input parameters of the Auth\_Signature procedure (see [23], section 2.3) as illustrated in Figure 2.3.12.1.5-3 and shall execute the Auth\_Signature procedure.

The mobile station and base station shall set the SAVE\_REGISTERS input parameter to FALSE.

The mobile station and base station shall execute the Auth\_Signature procedure. AUTHBS is set to the 18-bit result AUTH\_SIGNATURE. The base station sends its computed value of AUTHBS to the mobile station in a *Base Station Challenge Confirmation Order* on the f-csch or the f-dsch.

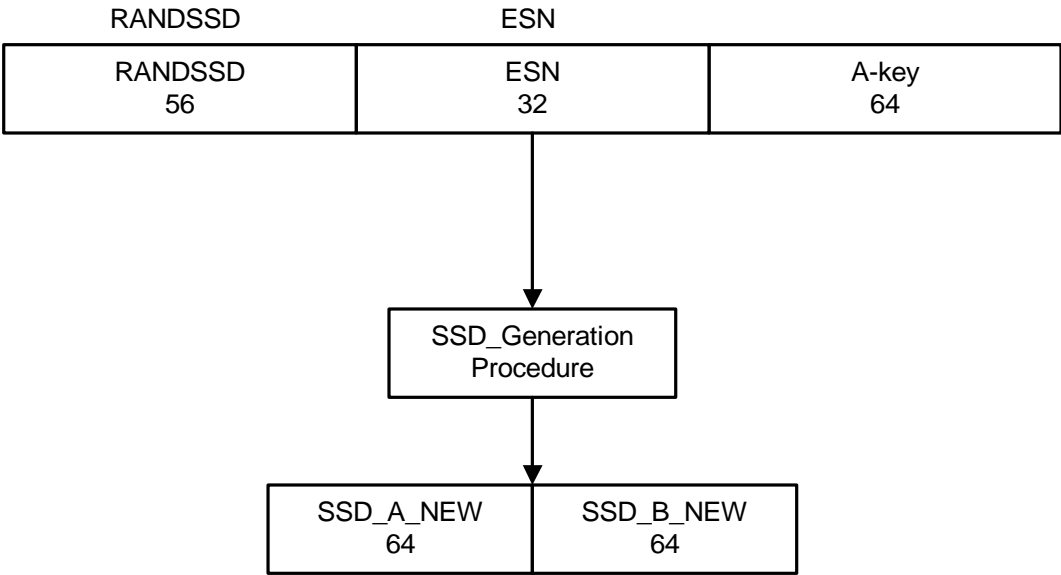

- 1 Upon receipt of the *Base Station Challenge Confirmation Order* the mobile station shall  
2 compare the received value of AUTHBS to its internally computed value. (If the mobile  
3 station receives a *Base Station Challenge Confirmation Order* when an SSD update is not in  
4 progress, the mobile station shall respond with an *SSD Update Rejection Order*.)
- 5 If the comparison is successful, the mobile station shall execute the SSD\_Update  
6 procedure (see [23], section 2.2.2) to set SSD\_A and SSD\_B to SSD\_A\_NEW and  
7 SSD\_B\_NEW, respectively. The mobile station shall then send an *SSD Update*  
8 *Confirmation Order* to the base station, indicating successful completion of the SSD  
9 update.
- 10 If the comparison is not successful, the mobile station shall discard SSD\_A\_NEW and  
11 SSD\_B\_NEW. The mobile station shall then send an *SSD Update Rejection Order* to the  
12 base station, indicating unsuccessful completion of the SSD update.
- 13 Upon receipt of the *SSD Update Confirmation Order*, the base station sets SSD\_A and  
14 SSD\_B to the values received from the HLR/AC (see [13]).
- 15 If the mobile station fails to receive the *Base Station Challenge Confirmation Order* within  
16 T<sub>64m</sub> seconds of when the acknowledgment to the *Base Station Challenge Order* was  
17 received, the mobile station shall discard SSD\_A\_NEW and SSD\_B\_NEW. The mobile  
18 station shall then terminate the SSD update process.
- 19

### 2.3.12.2 Signaling Message Encryption

In an effort to enhance the authentication process and to protect sensitive subscriber information (such as PINs), a method is provided to encrypt certain fields of selected f-dsch or r-dsch signaling messages.

The following is a description of the messages on f-dsch (see 2.3.12.2.1) and r-dsch (see 2.3.12.2.2) that are enciphered using the Cellular Message Encryption Algorithm (see section 2.5.1, [15]) or the Enhanced Cellular Message Encryption Algorithm (see section 2.5.2, [15]), and when ENCRYPT\_MODE<sub>S</sub> is set to '01' or '10'. The availability of encryption algorithm information is under government control.

For each message, the enciphered fields are identified. The messages are grouped by channel designation.

Messages shall not be encrypted if authentication is not performed (AUTH<sub>S</sub> is set to '00'). See [23] for details of the initialization and use of the encryption procedure.

Signaling message encryption is controlled for each call individually. If P\_REV\_IN\_USE<sub>S</sub> is less than or equal to six, the mobile station identifies its encryption capability in the ENCRYPTION\_SUPPORTED field in the *Origination Message* and the *Page Response Message* as shown in Table 2.7.1.3.2.4-5. If P\_REV\_IN\_USE<sub>S</sub> is greater than or equal to seven, the mobile station identifies its encryption capability in the SIG\_ENCRYPT\_SUP field in *Registration Message*, *Origination Message*, *Page Response Message*, *Security Mode Request Message*, and the encryption capability information record in *Status Response Message* and *Extended Status Response Message*, as shown in Table 2.7.1.3.2.1-5. The initial encryption mode for the call is established by setting the ENCRYPT\_MODE field to '00', '01', or '10' in the *Channel Assignment Message* or in the *Extended Channel Assignment Message*. If ENCRYPT\_MODE is set to '00', message encryption is off. To turn encryption on after channel assignment, the base station sends one of the following f-dsch messages to the mobile station:

- *Extended Handoff Direction Message* with the ENCRYPT\_MODE field set to '01' or '10'
- *General Handoff Direction Message* with the ENCRYPT\_MODE field set to '01' or '10'
- *Universal Handoff Direction Message* with the ENCRYPT\_MODE field set to '01' or '10'
- *Message Encryption Mode Order* with the ENCRYPT\_MODE field set to '01' or '10'

To turn signaling message encryption off, the base station sends one of the following f-dsch messages to the mobile station:

- *Extended Handoff Direction Message* with the ENCRYPT\_MODE field set to '00'
- *General Handoff Direction Message* with the ENCRYPT\_MODE field set to '00'
- *Universal Handoff Direction Message* with the ENCRYPT\_MODE field set to '00'
- *Message Encryption Mode Order* with the ENCRYPT\_MODE field set to '00'

Encryption shall apply only to the part of the Layer 3 message specified below.

When encryption is off, all fields of all Layer 3 messages sent by the mobile station and base station are unencrypted.

When additional octets are inserted, the overall Lower Layers message length is updated to reflect the addition. Specific Layer 3 record length fields (e.g., RECORD\_LEN, NUM\_FIELDS, or NUM\_DIGITS) shall not be affected by the insertion of additional bits.

If the Enhanced Cellular Message Encryption Algorithm is used, the following requirements apply:

- The mobile station and base station shall each maintain an 8-bit encryption sequence counter. The encryption sequence counter shall be incremented modulo 256 for each new encryption. The counter value, hereafter called ES\_COUNT, shall be used to form the SYNC parameter of the Enhanced Cellular Message Encryption Algorithm as described below.
- As part of each encryption, an additional octet of value ES\_COUNT shall be inserted immediately following the encrypted part of the message. This additional octet shall not be encrypted. The additional octet shall be removed from the message after decryption.

#### 2.3.12.2.1 Encrypted Messages on the f-dsch

When encryption is on (ENCRYPT\_MODE<sub>s</sub> equal to binary '01' or '10'), the encryptable fields of the following messages sent on f-dsch, as listed below, shall be encrypted. All other messages sent on f-dsch shall be unencrypted.

1. Alert With Information Message (see 3.7.3.3.2.3) and Extended Alert With Information Message (see 3.7.3.3.2.42) are encrypted.

The type-specific fields of all information records (see 3.7.5) shall be encrypted. For each information record, the type-specific fields shall be treated by the encryption procedure as a new single message. If the type-specific fields of an information record consist of a single octet (RECORD\_LEN field equal to 1), an additional octet of value '00000000' shall be inserted following the information record and shall be encrypted as if part of the record. (If the RECORD\_LEN field is 0, the information record contains no type-specific fields, and the record contains no encrypted data.)

No other fields in the *Alert With Information Message* and *Extended Alert With Information Message* are encrypted.

If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT\_MODE<sub>s</sub> equal to binary '10'), the following requirements apply for each information record:

- The DATA\_TYPE parameter shall be set to '0'.
- The SYNC parameter shall be set as follows:
  - SYNC[0] = ES\_COUNT
  - SYNC[1] = RECORD\_TYPE

2. Flash With Information Message (see 3.7.3.3.2.14) and Extended Flash With Information Message (see 3.7.3.3.2.43) are encrypted.

The type-specific fields of all information records (see 3.7.5) shall be encrypted. For each information record, the type-specific fields shall be treated by the encryption procedure as a new single message. If the type-specific fields of an information record consist of a single octet (RECORD\_LEN field equal to 1), an additional octet of value '00000000' shall be inserted following the information record and shall be encrypted as if part of the record. (If the RECORD\_LEN field is 0, the information record contains no type-specific fields, and the record contains no encrypted data.)

No other fields in the *Flash With Information Message* and *Extended Flash With Information Message* are encrypted.

If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT\_MODE<sub>s</sub> equal to binary '10'), the following requirements apply for each information record:

- The DATA\_TYPE parameter shall be set to '0'.
- The SYNC parameter shall be set as follows:
  - SYNC[0] = ES\_COUNT
  - SYNC[1] = RECORD\_TYPE

3. *Send Burst DTMF Message* (see 3.7.3.3.2.9) is encrypted.

The DIGIT<sub>i</sub> fields of the *Send Burst DTMF Message* shall be encrypted. These fields are treated by the encryption procedure as a new single message, with the 4-bit digit codes packed into consecutive octets. If the NUM\_DIGITS field contains an odd number, four bits of value '0000' shall follow the last digit and shall be included in the encrypted message. If NUM\_DIGITS is less than 3, an additional eight bits of value '00000000' shall follow the DIGIT<sub>i</sub> fields and shall be included in the encrypted part of the message.

If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT\_MODE<sub>s</sub> equal to binary '10'), the following requirements apply:

- The DATA\_TYPE parameter shall be set to '0'.
- The SYNC parameter shall be set as follows:
  - SYNC[0] = ES\_COUNT
  - SYNC[1] = MSG\_TYPE = '00001001'

4. *Continuous DTMF Tone Order* (see 3.7.3.3.2.1) is encrypted.

The 16 bits comprised of ADD\_RECORD\_LEN, the order-specific fields and the first five (5) bits of the RESERVED field shall be encrypted. These fields shall be treated by the encryption procedure as a new single message.

If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT\_MODE<sub>s</sub> equal to binary '10'), the following requirements apply:

- The DATA\_TYPE parameter shall be set to '0'.
- The SYNC parameter shall be set as follows:
  - SYNC[0] = ES\_COUNT

1           - SYNC[1] = MSG\_TYPE = '00000001'

2   5. *Data Burst Message* (see 3.7.3.3.2.4) is encrypted.

3   If BURST\_TYPE is equal to '111110' or '111111', all CHAR<sub>i</sub> fields after the first two  
4   shall be encrypted; otherwise, all CHAR<sub>i</sub> fields shall be encrypted.

5   If the CHAR<sub>i</sub> field consists of a single octet (NUM\_FIELDS field equal to 1), an  
6   additional octet of value '00000000' shall be inserted following the information record  
7   and shall be encrypted as if part of the record. (If the NUM\_FIELDS field is 0, the  
8   information record contains no type-specific fields, and the record contains no  
9   encrypted data).

10   If the Cellular Message Encryption Algorithm is used (ENCRYPT\_MODE<sub>s</sub> equal to  
11   binary '01'), the following requirements apply:

- 12       • If BURST\_TYPE is equal to '000011' (SMS) or '000100' (OTASP), the message  
13       shall be encrypted.
- 14       • For all other values of BURST\_TYPE, the message shall be encrypted only if  
15       encryption is required by the service option standard governing use of the *Data*  
16       *Burst Message*; otherwise, the message shall not be encrypted.

17   If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT\_MODE<sub>s</sub>  
18   equal to binary '10'), the following requirements apply:

- 19       • If BURST\_TYPE is equal to '000100' (OTASP), the DATA\_TYPE parameter shall  
20       be set to '0'. Otherwise, the DATA\_TYPE parameter shall be set to '1'.
- 21       • The SYNC parameter shall be set as follows:  
22       - SYNC[0] = ES\_COUNT  
23       - SYNC[1] = MSG\_TYPE = '00000100'

24   6. *Power Up Function Completion Message* (see 3.7.3.3.2.30) is encrypted.

25   If the LOC\_IND field is set to '1', the fields RESERVED (3 bits), MS\_LAT (22 bits),  
26   MS\_LONG (23 bits), and MS\_LOC\_TSTAMP (24 bits) are encrypted. These fields shall  
27   be treated by the encryption procedure as a new single message.

28   Otherwise, if the LOC\_IND field is set to '0', no fields in this message are encrypted.

29   If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT\_MODE<sub>s</sub>  
30   equal to binary '10'), the following requirements apply:

- 31       • The DATA\_TYPE parameter shall be set to '1'.
- 32       • The SYNC parameter shall be set as follows:  
33       - SYNC[0] = ES\_COUNT  
34       - SYNC[1] = MSG\_TYPE = '00011110'

35   2.3.12.2.2 Encrypted Messages on the r-dsch

36   When encryption is on (ENCRYPT\_MODE<sub>s</sub> equal to binary '01' or '10') the encryptable  
37   fields of the following r-dsch Layer 3 messages, as listed below, shall be encrypted. All

1 other r-dsch messages shall be unencrypted.

2 1. Origination Continuation Message (see 2.7.2.3.2.9) and Enhanced Origination Message  
3 are encrypted.

4 The CHARi fields of the *Origination Continuation Message* and *Enhanced Origination*  
5 *Message* shall be encrypted. These fields shall be treated by the encryption procedure  
6 as a new single message, with the character codes packed into consecutive octets. If  
7 DIGIT\_MODE is '0' and the NUM\_FIELDS field contains an odd number, four bits of  
8 value '0000' shall follow the last digit and shall be included in the encrypted part of  
9 the message. In addition, if ENCRYPT\_MODE<sub>S</sub> is equal to '01', the following  
10 requirement applies

- 11 • If DIGIT\_MODE is '0' and NUM\_FIELDS is less than 3, or if DIGIT\_MODE is '1'  
12 and NUM\_FIELDS is less than 2, an additional eight bits of value '00000000'  
13 shall follow the CHARi fields and shall be included in the encrypted part of the  
14 message.

15 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT\_MODE<sub>S</sub>  
16 equal to binary '10'), the following requirements apply:

- 17 • The DATA\_TYPE parameter shall be set to '0'.
- 18 • The SYNC parameter shall be set as follows:  
19 – SYNC[0] = ES\_COUNT  
20 – SYNC[1] = MSG\_TYPE = '00001001' for *Origination Continuation Message*  
21 – SYNC[1] = MSG\_TYPE = '00011010' for *Enhanced Origination Message*

22 The type-specific fields of all information records (see 2.7.4) in the *Origination*  
23 *Continuation Message* and *Enhanced Origination Message* shall be encrypted. For each  
24 information record, the type-specific fields shall be treated by the encryption  
25 procedure as a new single message. If the type-specific fields of an information record  
26 consist of a single octet (RECORD\_LEN field equal to 1), an additional octet of value  
27 '00000000' shall be inserted following the information record and shall be encrypted as  
28 if part of the record. (If the RECORD\_LEN field is 0, the information record contains no  
29 type-specific fields, and the record contains no encrypted data.)

30 If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT\_MODE<sub>S</sub>  
31 equal to binary '10'), the following requirements apply for each information record:

- 32 • The DATA\_TYPE parameter shall be set to '0'.
- 33 • The SYNC parameter shall be set as follows:  
34 – SYNC[0] = ES\_COUNT  
35 – SYNC[1] = RECORD\_TYPE

36 2. Flash With Information Message (see 2.7.2.3.2.3) and Extended Flash With Information  
37 Message (see 2.7.2.3.2.32) are encrypted.

38 The type-specific fields of all information records (see 2.7.4) shall be encrypted. For  
39 each information record, the type-specific fields shall be treated by the encryption

procedure as a new single message. If the type-specific fields of an information record consist of a single octet (RECORD\_LEN field equal to 1), an additional octet of value '00000000' shall be inserted following the information record and shall be encrypted as if part of the record. (If the RECORD\_LEN field is 0, the information record contains no type-specific fields, and the record contains no encrypted data.)

No other fields in the *Flash With Information Message* and *Extended Flash With Information Message* are encrypted.

If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT\_MODE<sub>S</sub> equal to binary '10'), the following requirements apply for each information record:

- The DATA\_TYPE parameter shall be set to '0'.
- The SYNC parameter shall be set as follows:
  - SYNC[0] = ES\_COUNT
  - SYNC[1] = RECORD\_TYPE

### 3. *Send Burst DTMF Message* (see 2.7.2.3.2.7) is encrypted.

The DIGIT<sub>i</sub> fields of the *Send Burst DTMF Message* shall be encrypted. These fields shall be treated by the encryption procedure as a new single message, with the 4-bit digit codes packed into consecutive octets. If the NUM\_DIGITS field contains an odd number, four bits of value '0000' shall follow the last digit and shall be included in the encrypted message. If NUM\_DIGITS is less than 3, an additional eight bits of value '00000000' shall follow the DIGIT<sub>i</sub> fields and shall be included in the encrypted part of the message.

If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT\_MODE<sub>S</sub> equal to binary '10'), the following requirements apply:

- The DATA\_TYPE parameter shall be set to '0'.
- The SYNC parameter shall be set as follows:
  - SYNC[0] = ES\_COUNT
  - SYNC[1] = MSG\_TYPE = '00000111'

### 4. *Continuous DTMF Tone Order* (see 2.7.2.3.2.1) is encrypted.

The 16 bits comprised of ADD\_RECORD\_LEN, the order-specific fields and the first five (5) bits of the RESERVED field shall be encrypted. These fields shall be treated by the encryption procedure as a new single message.

If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT\_MODE<sub>S</sub> equal to binary '10'), the following requirements apply:

- The DATA\_TYPE parameter shall be set to '0'.
- The SYNC parameter shall be set as follows:
  - SYNC[0] = ES\_COUNT
  - SYNC[1] = MSG\_TYPE = '00000001'

5. *Data Burst Message* (see 2.7.2.3.2.4) is encrypted.

If BURST\_TYPE is equal to '111110' or '111111', all CHAR<sub>i</sub> fields after the first two shall be encrypted; otherwise, all CHAR<sub>i</sub> fields shall be encrypted.

If the CHAR<sub>i</sub> field consists of a single octet (NUM\_FIELDS field equal to 1), an additional octet of value '00000000' shall be inserted following the information record and shall be encrypted as if part of the record. (If the NUM\_FIELDS field is 0, the information record contains no type-specific fields, and the record contains no encrypted data).

If the Cellular Message Encryption Algorithm is used (ENCRYPT\_MODE<sub>s</sub> equal to binary '01'), the following requirements apply:

- If BURST\_TYPE is equal to '000011' (SMS) or '000100' (OTASP), the message shall be encrypted.
- For all other values of BURST\_TYPE, the message shall be encrypted only if encryption is required by the service option standard governing use of the *Data Burst Message*; otherwise, the message shall not be encrypted.

If the Enhanced Cellular Message Encryption Algorithm is used (ENCRYPT\_MODE<sub>s</sub> equal to binary '10'), the following requirements apply:

- If BURST\_TYPE is equal to '000100' (OTASP), the DATA\_TYPE parameter shall be set to '0'. Otherwise, the DATA\_TYPE parameter shall be set to '1'.
- The SYNC parameter shall be set as follows:
  - SYNC[0] = ES\_COUNT
  - SYNC[1] = MSG\_TYPE = '00000100'

### 2.3.12.3 Voice Privacy

Also see [2].

Voice privacy is provided in the CDMA system by means of the private long code mask used for PN spreading.

Voice privacy is provided on the Traffic Channels only. All calls are initiated using the public long code mask for PN spreading. The mobile station user may request voice privacy during call set-up using the *Origination Message* or *Page Response Message*, and during Traffic Channel operation using the *Long Code Transition Request Order*.

The transition to private long code mask shall not be performed if authentication is not performed (AUTH<sub>s</sub> is set to '00' or mobile station unable to perform authentication).

To initiate a transition to the private or public long code mask, either the base station or the mobile station sends a *Long Code Transition Request Order* on the f-dsch or r-dsch. The mobile station actions in response to receipt of this order are specified in 2.6.4, and the base station actions in response to receipt of this order are specified in 3.6.4.

The base station can also cause a transition to the private or public long code mask by sending the *Extended Handoff Direction Message*, the *General Handoff Direction Message*, or the *Universal Handoff Direction Message* with the PRIVATE\_LCM bit set appropriately.

#### 2.3.12.4 Extended Encryption for Signaling Message and User Information

Extended encryption is an encryption framework used for encrypting/decrypting both signaling messages and user information on f/r-dsch, f/r-csch, or f/r-dtch. Signaling message and user information encryption algorithms can be negotiated independently. Signaling message and user information encryption can be turned on or off independently.

Signaling messages or user information shall not be encrypted if authentication is not performed (i.e., when MSG\_INTEGRITY\_SUP<sub>s</sub> is equal to '0' and AUTH<sub>s</sub> is set to '00' (see 2.3.12.1)) or authentication has not been performed (i.e., when MSG\_INTEGRITY\_SUP<sub>s</sub> is equal to '1' and the INT\_KEY[KEY\_ID] is equal to NULL (see 2.3.12.5)).

##### 2.3.12.4.1 Extended Encryption for Signaling Messages

Signaling messages with zero length shall be sent un-encrypted, in which case Layer 3 shall indicate to LAC layer that the messages are sent un-encrypted.

All mini messages shall be sent un-encrypted.

When sending a Registration Accepted Order, Security Mode Command Message, or Base Station Reject Order, the base station should use assured mode.

##### 2.3.12.4.1.1 Extended Encryption for Signaling on f/r-csch

To turn f/r-csch signaling encryption on or off, the base station sends a *Registration Accepted Order* or *Security Mode Command Message* on f-csch, with the C\_SIG\_ENCRYPT\_MODE field set to one of the values specified in Table 3.7.4.5-1. The value of C\_SIG\_ENCRYPT\_MODE<sub>r</sub> is then stored in C\_SIG\_ENCRYPT\_MODE<sub>s</sub>.

If C\_SIG\_ENCRYPT\_MODE<sub>s</sub> is not equal to '000' and ENC\_KEY[KEY\_ID] is not equal to NULL, all f/r-csch signaling messages shall be encrypted based on the value of C\_SIG\_ENCRYPT\_MODE<sub>s</sub> using the procedures specified in 2.3.12.4.1.3; except for the exceptions listed below in the rest of this section.

On the f-csch, *General Page Message*, *Universal Page Message*, *Registration Request Order*, *Authentication Challenge Message*, *Registration Accepted Order*, *Base Station Reject Order*, and *Authentication Request Message* shall be sent un-encrypted. *Channel Assignment Message*, *Extended Channel Assignment Message*, and *Security Mode Command Message* may be sent un-encrypted. All overhead messages and all signaling messages with a broadcast address type shall be sent un-encrypted.

On the r-csch, *Registration Message*, *Page Response Message*, *Reconnect Message* (if sent in response to a *General Page Message* or a *Universal Page Message*), *Authentication Challenge Response Message*, *Security Mode Request Message*, *Authentication Response Message*, *Mobile Station Reject Order* (ORDQ = '00010110', '00011000', '00011001' or '00011010') and *Authentication Resynchronization Message* shall be sent un-encrypted.

When sending an *Origination Message*, if all of the following conditions are true, the mobile station shall not include the dialed digits in the *Origination Message*, and the mobile station shall include the dialed digits in the *Origination Continuation Message*:

- The base station supports extended encryption;
- C\_SIG\_ENCRYPT\_MODE<sub>S</sub> is equal to '000' or ENC\_KEY[KEY\_ID] is equal to NULL;
- C\_SIG\_ENCRYPT\_REQ is set to '1' or D\_SIG\_ENCRYPT\_REQ is set to '1' in the *Origination Message*;
- The mobile station does not recognize that this is an emergency call.

#### 2.3.12.4.1.2 Extended Encryption for Signaling on f/r-dsch

The initial mode of extended encryption for f/r-dsch signaling messages is established by sending a *Channel Assignment Message* or *Extended Channel Assignment Message* with the ENCRYPT\_MODE field set to '11'<sup>17</sup> and the D\_SIG\_ENCRYPT\_MODE field set to one of the values specified in Table 3.7.4.5-1. The value of D\_SIG\_ENCRYPT\_MODE<sub>r</sub> is then stored in D\_SIG\_ENCRYPT\_MODE<sub>S</sub>.

To turn f/r-dsch signaling encryption on or off after channel assignment, the base station sends a *General Handoff Direction Message* or *Universal Handoff Direction Message* with the ENCRYPT\_MODE field and the D\_SIG\_ENCRYPT\_MODE field set accordingly. Alternatively, the base station may send a *Security Mode Command Message* on f-dsch with the D\_SIG\_ENCRYPT\_MODE field set accordingly.

If D\_SIG\_ENCRYPT\_MODE<sub>S</sub> is not equal to '000' and ENC\_KEY[KEY\_ID] is not equal to NULL, all f/r-dsch signaling messages shall be encrypted based on the value of D\_SIG\_ENCRYPT\_MODE<sub>S</sub> using the procedures specified in 2.3.12.4.1.3, except for the exceptions listed below in the rest of this section.

On the f-dsch, the *Security Mode Command Message* may be sent un-encrypted. The *Base Station Reject Order*, *Authentication Challenge Message* and *Authentication Request Message* shall be sent un-encrypted.

On the r-dsch, the *Security Mode Request Message*, *Authentication Challenge Response Message*, *Authentication Response Message*, *Mobile Station Reject Order* (ORDQ = '00010110', '00011000', '00011001' or '00011010') and *Authentication Resynchronization Message* shall be sent un-encrypted.

#### 2.3.12.4.1.3 Signaling Encryption/Decryption Procedures

In order to perform signaling encryption, message integrity, or both, on f/r-csch or f/r-dsch, both the mobile station and the base station shall each maintain the following 32-bit counters:

---

<sup>17</sup> If ENCRYPT\_MODE is set to a value other than '11', see section 2.3.12.2.1.

- 1 • TX\_EXT\_SSEQ[i][j] (the 32-bit crypto-sync for encryption and message integrity.  $i =$   
2 0 and 1,  $j =$  '00' to '11')
- 3 • RX\_EXT\_SEQ[i][j] (the 32-bit crypto-sync for decryption and message integrity.  $i =$   
4 0 and 1,  $j =$  '00' to '11')

5 The above counters in the base station and the mobile station shall only be initialized by a  
6 *Registration Accepted Order*, *Channel Assignment Message*, *Extended Channel Assignment*  
7 *Message*, or *Security Mode Command Message* in response to a *Registration Message*,  
8 *Origination Message*, *Page Response Message*, or *Security Mode Request Message* that  
9 carries a NEW\_SSEQ\_H field with a valid NEW\_SSEQ\_H\_SIG field.<sup>18</sup> The response to a  
10 *Registration Message* is a *Registration Accepted Order*. The response to an *Origination*  
11 *Message* or *Page Response Message* is a *Channel Assignment Message* or *Extended Channel*  
12 *Assignment Message*. The response to a *Security Mode Request Message* is a *Security Mode*  
13 *Command Message*.

14 Upon initialization of the crypto-sync counters, the following initialization shall be  
15 performed at the mobile station: the 24 most significant bits of TX\_EXT\_SSEQ[i][KEY\_ID]  
16 and RX\_EXT\_SSEQ[i][KEY\_ID] shall be initialized by the value of the NEW\_SSEQ\_H field  
17 included in the message for  $i = 0$  and 1.

18 The sender shall perform the following procedures for each Layer 3 PDU (including all  
19 Layer 3 PDU retransmitted by Layer 3) that is to be encrypted:

- 20 1. Append between 0 and 7 inclusive padding bits (set to any random combination of  
21 '0's and '1's) to the Layer 3 PDU such that the padded Layer 3 PDU in bits is an  
22 integer multiple of eight (the padding bits become part of the L3 PDU).
- 23 2. Compute an 8-bit Layer 3 PDU CRC as specified in 2.3.12.1.4 over the un-  
24 encrypted Layer 3 PDU (including the padding bits, if any).
- 25 3. Append the 8-bit CRC to the end of the Layer 3 PDU.
- 26 4. If the PDU is to be transmitted on f/r-csch, let SDU\_ENCRYPT\_MODE equal  
27 C\_SIG\_ENCRYPT\_MODE<sub>S</sub>. If the PDU is to be transmitted on f/r-dsch, let  
28 SDU\_ENCRYPT\_MODE equal D\_SIG\_ENCRYPT\_MODE<sub>S</sub>. If the Layer 3 PDU uses  
29 unassured mode, let  $i = 0$ ; otherwise, let  $i = 1$ .
- 30 5. Let EXT\_SSEQ equal TX\_EXT\_SSEQ[i][KEY\_ID]. Encrypt the concatenated Layer 3  
31 PDU and the 8-bit CRC by using EXT\_SSEQ and the encryption algorithm specified  
32 by SDU\_ENCRYPT\_MODE, in accordance with 2.3.12.4.3.
- 33 6. The sender shall pass the encrypted concatenated Layer 3 PDU, the 8-bit Layer 3  
34 CRC, the 32-bit EXT\_SSEQ, SDU\_ENCRYPT\_MODE, and an indication whether the  
35 Layer 3 PDU shall be integrity-protected to the LAC layer.

---

<sup>18</sup> The mobile station should select a different value of NEW\_SSEQ\_H every time NEW\_SSEQ\_H is included in a message. This is to prevent the re-use of the same 24 most significant bits of the 32-bit crypto-sync.

1        7. Set TX\_EXT\_SSEQ[i][KEY\_ID] to (TX\_EXT\_SSEQ[i][KEY\_ID] + 1) mod  $2^{32}$ .

2        The receiver shall perform the following procedures upon reception of an encrypted  
3        signaling message with an 8-bit SDU\_SSEQ field or a 32-bit EXT\_SSEQ passed by the LAC  
4        Layer (e.g., if SDU\_ENCRYPT\_MODE indicated by LAC Layer is not equal to '000'):

5            1. If the Layer 3 PDU uses unassured mode, let  $i = 0$  and  $N = 8$ ; otherwise, let  $i = 1$   
6            and  $N = 4$ . Let  $V$  be the 8 least significant bits of RX\_EXT\_SSEQ[i][SDU\_KEY\_ID].  
7            Perform the duplicate detection procedures in accordance with 2.3.12.4.1.5 using  
8             $N$  and  $V$ , before proceeding further.

9            2. If SDU\_SSEQ is supplied by the LAC Layer, the mobile station shall construct  
10            EXT\_SSEQ as follows:

11            If (SDU\_SSEQ -  $V$ ) mod 256 < 128:

12                    EXT\_SSEQ = (RX\_EXT\_SSEQ[i][SDU\_KEY\_ID] + (SDU\_SSEQ -  $V$ ) mod 256) mod  
13                     $2^{32}$

14            Else:

15                    EXT\_SSEQ = (RX\_EXT\_SSEQ[i][SDU\_KEY\_ID] - ( $V$  - SDU\_SSEQ) mod 256) mod  
16                     $2^{32}$

17            3. Remove the LAC Layer padding, at the end of the Layer 3 PDU, if any, such that the  
18            Layer 3 PDU is octet aligned.

19            4. Decrypt the concatenated Layer 3 PDU and the 8-bit Layer 3 CRC using EXT\_SSEQ  
20            and the encryption algorithm specified by SDU\_ENCRYPT\_MODE, in accordance  
21            with 2.3.12.4.3.

22            5. Compute an 8-bit CRC as specified in 2.3.12.4.1.4 over the un-encrypted Layer 3  
23            PDU (excluding the received 8-bit CRC).

24            6. Compare the value of the computed CRC with the decrypted 8-bit CRC. If the two  
25            CRCs are equal, the decryption is defined to be successful; otherwise the  
26            decryption is defined to be unsuccessful.

27            7. If the decryption was unsuccessful, the message shall be discarded; otherwise, if  
28            SDU\_SSEQ is supplied by the LAC Layer and ((SDU\_SSEQ -  $V$ ) mod 256) < 128, the  
29            receiver shall set RX\_EXT\_SSEQ[i] to EXT\_SSEQ constructed in step 2 above.

30            8. If the base station can not decrypt an *Origination Message* or the LAC Layer  
31            indicates that the MACI is not valid in an *Origination Message*, the base station  
32            should send a *Base Station Reject Order* (ORDQ = '00000000'). If the base station  
33            can not decrypt any other message or the LAC Layer indicates that the MACI is not  
34            valid for other message, the base station should send a *Base Station Reject Order*  
35            (ORDQ = '00000001').

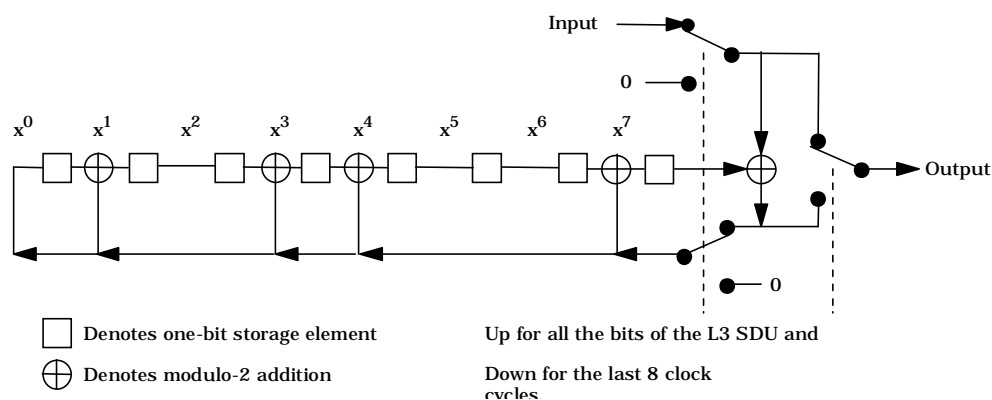

#### 36        2.3.12.4.1.4 Computation of the 8-bit Layer 3 PDU CRC Field

37        The generator polynomials for the 8-bit Layer 3 PDU CRC field shall be as follows:

38                    
$$g(x) = x^8 + x^7 + x^4 + x^3 + x + 1$$

The Layer 3 PDU CRC field shall be computed according to the following procedure using the logic shown in Figures 2.3.12.4.5-1:

- Initially, all shift register elements shall be set to logical one and the switches shall be set in the up position.
- The register shall be clocked a number of times equal to the number bits in the Layer 3 PDU with those bits as input.
- The switches shall be set in the down position so that the output is a modulo-2 addition with a '0' and the successive shift register inputs are '0'.
- The register shall be clocked an additional 8 number of times.
- These additional bits shall be the Layer 3 PDU CRC field indicator bits.
- The bits shall be transmitted in the order calculated.

**Figure 2.3.12.4.1.4-1. 8-Bit Layer 3 SDU CRC Field Calculation**

#### 2.3.12.4.1.5 Duplicate Detection of Security Sequence Number

This section describes the duplicate detection of encrypted signaling messages (see the decryption procedures at the receiver described in 2.3.12.4.1.3).

Given the value of the latest sequence number received,  $V$ , and the window size,  $N$  (see the decryption procedures at the receiver described in 2.3.12.4.1.3), the 8-bit encryption sequence number space at the receiver can be divided into the following three segments as shown in Figure 2.3.12.4.1.5-1:

- Segment #1 - sequence numbers from  $((V - N + 1) \bmod 256)$  to  $V$  inclusive (the anti-replay window)
- Segment #2 - sequence numbers from  $((V + 1) \bmod 256)$  to  $((V + 127) \bmod 256)$  inclusive (future sequence numbers)
- Segment #3 - sequence numbers from  $((V + 128) \bmod 256)$  to  $((V - N) \bmod 256)$  inclusive (past sequence numbers)

**Figure 2.3.12.4.1.5-1 An 8-bit Encryption Sequence Number Space Divided into 3 Segments**

If the received sequence number, SDU\_SSEQ, belongs to segment #1, the receiver shall check whether SDU\_SSEQ has already been received.<sup>19</sup> If SDU\_SSEQ has been received already, the receiver shall discard the message and shall not perform the remaining steps of the decryption procedures described in 2.3.12.4.1.3; otherwise, the receiver shall continue the decryption procedures described in 2.3.12.4.1.3.

If the received sequence number, SDU\_SSEQ, belongs to segment #2, the receiver shall continue the decryption procedures described in 2.3.12.4.1.3.

If the received sequence number, SDU\_SSEQ, belongs to segment #3, the receiver shall discard the message and shall not perform the remaining steps of the decryption procedures described in 2.3.12.4.1.3.

#### 2.3.12.4.2 Extended Encryption for User Information

Extended encryption can be turned on or off independently for each individual service on f/r-dtch.

<sup>19</sup> The actual means of checking is left to implementation. One simple implementation is for the receiver to maintain an  $N$ -bit bitmap,  $w$ , to represent the sequence numbers in segment #1. The order of  $w$  is most significant bit first (i.e.,  $w[N-1]$ ,  $w[N-2]$ , ...,  $w[1]$ ,  $w[0]$ ). Let  $w[0]$  represent  $V$ ,  $w[1]$  represent  $((V - 1) \bmod 256)$ , etc.  $w[i] = '1'$  means sequence number  $i$  has already been received. When a message with sequence number  $i$  has been decrypted successfully,  $w[i]$  is set to '1'. Whenever  $V$  moves from  $V_1$  to  $V_2$ , left-shift  $w$   $((V_2 - V_1) \bmod 256)$  times. Each time  $w$  is left-shifted, stuff a '0' at the eight end of  $w$ . After all the shifting, set  $w(0)$  to '1'.

The initial encryption mode of user information of a service is established by sending a *Security Mode Command Message* on f-csch or by setting the UI\_ENCRYPT\_MODE field in the Service Configuration information record, with the UI\_ENCRYPT\_MODE field set to one of the values specified in 3.7.5.7-3. The value of the UI\_ENCRYPT\_MODE field is then stored in SO\_CON\_REC<sub>s</sub>[j].UI\_ENCRYPT\_MODE, where SO\_CON\_REC<sub>s</sub>[j] is the service option connection record (see 2.6.4.1.12) corresponding to the service.

To turn user information encryption for a service on or off after channel assignment, the base station sends a *Security Mode Command Message* on f-dsch with the UI\_ENCRYPT\_MODE field set accordingly. Explicit action time should be used when sending the *Security Mode Command Message*.

User information shall be encrypted based on the value of SO\_CON\_REC<sub>s</sub>[j].UI\_ENCRYPT\_MODE, where SO\_CON\_REC<sub>s</sub>[j] is the service option connection record (see 2.6.4.1.12) corresponding to the service.

#### 2.3.12.4.2.1 User Information Encryption/Decryption Procedures

If P\_REV\_IN\_USE<sub>s</sub> is less than nine and extended encryption for user information is turned on for a service, the sender shall encrypt each data block (see [3]) from that service, in accordance with 2.3.12.4.3, before passing the data blocks to MAC Layer. On the receiver side, the receiver shall decrypt each data block for that service from MAC Layer, in accordance with 2.3.12.4.3, before passing them to that service.

If P\_REV\_IN\_USE<sub>s</sub> is greater than or equal to nine and extended encryption for user information is turned on for a service, the sender shall encrypt the user data in the service layer before passing it to the MAC Layer. On the receiver side, the receiver shall pass each data block from MAC Layer to that service. Details of encryption are specified in the corresponding service option specification (see [30]).

If P\_REV\_IN\_USE<sub>s</sub> is greater than or equal to nine and extended encryption for user information is turned on for a voice service option<sup>20</sup>, the sender shall encrypt each data block from the voice service, in accordance with 2.3.12.4.3, before passing the data blocks to MAC Layer. On the receiver side, the receiver shall decrypt each data block for the voice service from MAC Layer, in accordance with 2.3.12.4.3, before passing them to that service.

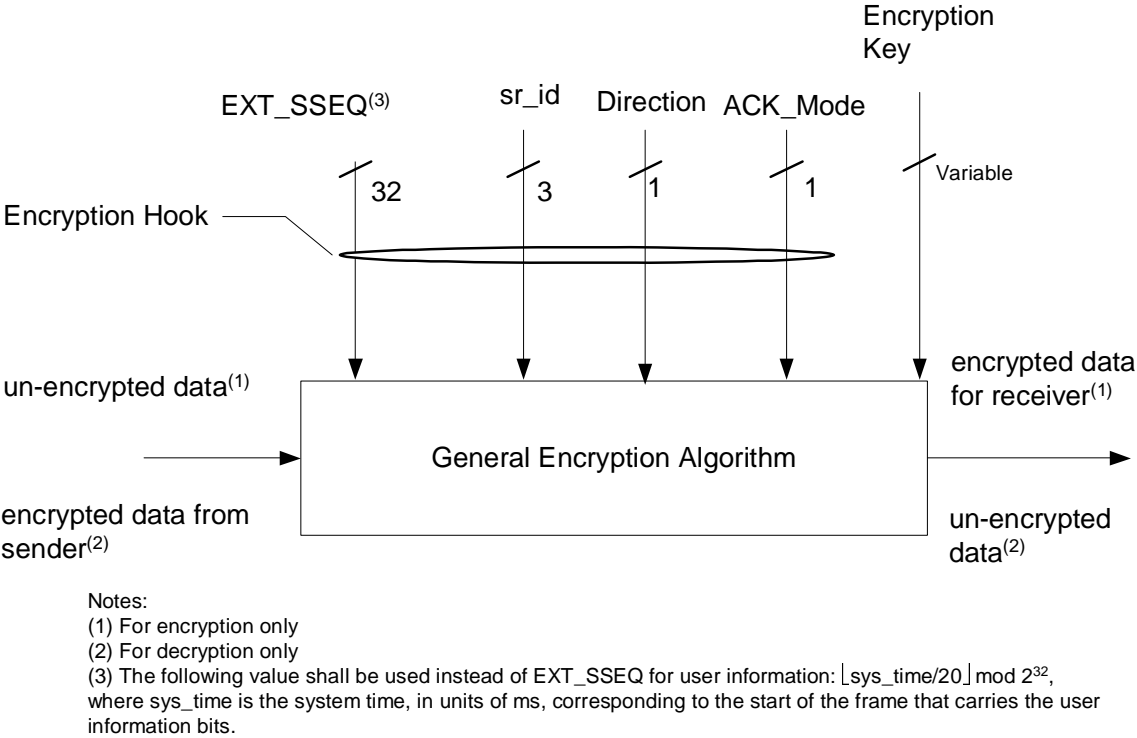

#### 2.3.12.4.3 Interface to the Encryption Algorithms

Figure 2.3.12.4.3-1 shows the structure for encrypting/decrypting both signaling messages and user information. Various encryption algorithms can be used with this structure. The encryption algorithm takes all or part of the following parameters as inputs, as illustrated in Figure 2.3.12.4.3-1. The actual inputs to the algorithm are specified in the rest of this section.

---

<sup>20</sup> Voice service option refers to SO 60, SO 61 or any service option in Service Option Group 0 in [30].

1

2

3

**Figure 2.3.12.4.3-1. Encryption Input Parameters**

4

5 The inputs to the encryption algorithm are described as follows:

- 6 • EXT\_SSEQ - A 32-bit Security Encryption Sequence Number for  
7 encryption/decryption.
- 8 • sr\_id - Service Reference Identifier (see [3]), which identifies the associated service  
9 option instance.
- 10 • Direction - The direction of the data being encrypted/decrypted. This shall be set  
11 to '0' if the data is transmitted on or received on a forward link. Otherwise, it shall  
12 be set to '1'.
- 13 • Encryption Key - Session Key for Encryption. This shall be a result of successful  
14 Session Key Agreement between the base station and the mobile station. The  
15 Encryption Key shall be stored by the mobile station in ENC\_KEY[KEY\_ID].
- 16 • Channel\_id - Channel identifier, which identifies the physical channel that carries  
17 the data to be encrypted or decrypted. This is applicable only to user information  
18 encryption on f/r-dtch. Channel\_id shall be set to, '000' for Fundamental Channel,  
19 '001' for Dedicated Control Channel, '010' for Supplemental Code Channel, '011' for  
20 Supplemental Channel 0, and '101' for Supplemental Channel 1.
- 21 • ACK\_Mode - The delivery mode (unassured or assured) of the signaling message.

1           This shall be set to '0' if the message is delivered using unassured mode;  
2           otherwise, this shall be set to '1'.

3   If the Enhanced Cellular Message Encryption Algorithm is used for encrypting/decrypting  
4   signaling messages, the input parameters of the Enhanced Cellular Message Encryption  
5   Algorithm (see [23]) shall be set as follows:

- 6       • The DATA\_TYPE parameter shall be set to '0'.
- 7       • The SYNC parameter shall be set as follows:
  - 8           – SYNC[0] = EXT\_SSEQ [7:0]<sup>21</sup>.
  - 9           – SYNC[1] = (ACK\_Mode | Direction | EXT\_SSEQ [13:8] ), where “|” denotes  
10           concatenation and EXT\_SSEQ<sub>s</sub> [13:8] is bits 8 through 13 of EXT\_SSEQ (with  
11           the LSB being bit 0).
- 12       • The CMEAKEY[0-7] parameter shall be set to the first 64 bits of ENC\_KEY[KEY\_ID].

13   If the Rijndael Encryption Algorithm is used for encrypting/decrypting signaling  
14   messages, the input parameters of ESP\_AES (see [44]) shall be set as follows:

- 15       • The encryption key parameter shall be set to ENC\_KEY[KEY\_ID].
- 16       • The FRESH parameter shall be set to (ACK\_Mode | sr\_id [2:0] | Direction |  
17       EXT\_SSEQ [31:0] | '000').
- 18       • The FRESHSIZE parameter shall be set to 5.
- 19       • The BUF parameter shall be set to the pointer of the most significant bit of the  
20       buffer<sup>22</sup> that contains the data to be encrypted or decrypted.
- 21       • The BIT\_OFFSET parameter shall be set to the offset between the bit position of the  
22       most significant bit of the data to be encrypted/decrypted and the bit position of  
23       the most significant bit of the buffer (e.g., if the bit position of the most significant  
24       bit of the data to be encrypted/decrypted and the bit position of the most  
25       significant bit of the buffer are equal, BIT\_OFFSET = 0).
- 26       • The BIT\_COUNT parameter shall be set to the number of bits of the data to be  
27       encrypted/decrypted.
- 28       • The full 128 bits of ENC\_KEY[KEY\_ID] shall be used.

29   If the Rijndael Encryption Algorithm is used for encrypting/decrypting user information,  
30   the input parameters of ESP\_AES (see [44]) shall be set as follows:

- 31       • The encryption key parameter shall be set to ENC\_KEY[KEY\_ID].

---

<sup>21</sup> Z [y:x] denotes bit x to bit y of the binary value Z with bit 0 the least significant bit of Z.

<sup>22</sup> “Buffer” refers to the physical memory that stores the data to be encrypted or decrypted. The octets in the buffer are assumed to be most-significant first, and the first bit of the buffer is the most significant bit of the first octet.

- 1       • The FRESH parameter shall be set to  $(\text{sr\_id [2:0]} \mid \text{Direction} \mid \lfloor \text{sys\_time}/20 \rfloor \bmod 2^{32}) \ll 31 \mid \text{Channel\_id [2:0]} \mid '0')$ , where sys\_time is the system time, in units of
- 2       ms, corresponding to the start of the physical layer frame that carries the data
- 3       block(s).
- 4
- 5       • The FRESHSIZE parameter shall be set to 5.
- 6       • The BUF parameter shall be set to the pointer of the most significant bit of the
- 7       buffer<sup>23</sup> that contains the data to be encrypted or decrypted.
- 8       • The BIT\_OFFSET parameter shall be set to the offset between the bit position of the
- 9       most significant bit of the data to be encrypted/decrypted and the bit position of
- 10       the most significant bit of the buffer (e.g., if the bit position of the most significant
- 11       bit of the data to be encrypted/decrypted and the bit position of the most
- 12       significant bit of the buffer are equal, BIT\_OFFSET = 0).
- 13       • The BIT\_COUNT parameter shall be set to the number of bits of the data to be
- 14       encrypted/decrypted.
- 15       • The full 128 bits of ENC\_KEY[KEY\_ID] shall be used.

#### 16   2.3.12.4.4 Encryption Negotiation

17   The mobile station shall indicate to the base station the encryption algorithms supported  
18   by using SIG\_ENCRYPT\_SUP and UI\_ENCRYPT\_SUP in one of the following messages:

- 19       • *Registration Message*
- 20       • *Origination Message*
- 21       • *Page Response Message*
- 22       • *Security Mode Request Message*
- 23       • *Status Response Message* (in Encryption Capability information record)
- 24       • *Extended Status Response Message* (in Encryption Capability information record)

25   The base station may turn on or turn off the encryption of the voice, data services, or  
26   signaling encryption with a *Security Mode Command Message*, *Universal Handoff Direction*  
27   *Message*, or *General Handoff Direction Message* sent on f-dsch or *Security Mode Command*  
28   *Message* sent on f-csch. Similarly, the mobile station may propose to turn on or turn off  
29   the user information encryption or signaling encryption with a *Security Mode Request*  
30   *Message* sent on r-dsch or r-csch.

---

<sup>23</sup> "Buffer" refers to the implementation-dependent physical memory that stores the data to be encrypted or decrypted. The octets in the buffer are assumed to be most-significant first, and the first bit of the buffer is the most significant bit of the first octet.

#### 2.3.12.4.5 Computation of NEW\_SSEQ\_H\_SIG

The NEW\_SSEQ\_H\_SIG field (included in the *Registration Message*, *Origination Message*, *Page Response Message*, and *Security Mode Request Message*) is a signature of the 24 most significant bits of the crypto-sync (NEW\_SSEQ\_H). The mobile station shall compute this 8-bit field as follows:

1. The mobile station shall construct the *message bits* as shown in Figure 2.3.12.4.5-1.  
For messages that are sent on the r-csch, X is set to  $RAND_S$ . For messages that are sent on the r-dsch, X is set to  $(\lfloor \text{sys\_time} / 20000 \rfloor) \bmod 2^{32}$ , where sys\_time is the system time in ms at which the message is assembled.

**Figure 2.3.12.4.5-1. Message Bits**

2. The mobile station shall pad the *message bits* constructed in the previous step, as specified in [38], and compute the 160-bit *message digest* as specified in [38].
3. The mobile station shall store the 8 rightmost (least significant) bits of the *message digest* in NEW\_SSEQ\_H\_SIG.

#### 2.3.12.5 Authentication and Key Set-up Procedures when P\_REV\_IN\_USE<sub>S</sub> >= 10

If P\_REV\_IN\_USE<sub>S</sub> is equal to or greater than ten and MSG\_INTEGRITY\_SUP<sub>S</sub> is equal to '1', then message integrity is performed (see [4]). The mobile station performs authentication in accordance with the procedures in this section. Before any message integrity or extended encryption (see 2.3.12.4) can be performed, the mobile station and base station need to set up the same set of integrity key, encryption key, and security sequence number in a secured manner.

There are two types of keys that the base station could obtain from the network – the CMEA key or the (IK, CK) pair. Each requires a different method to be established. CMEA key is the key generated using CAVE during 2G authentication as described in 2.3.12.1. The (IK, CK) pair is a result of AKA (3G authentication. See [44]).

All base stations with P\_REV greater than or equal to ten shall be able to execute 2G authentication or AKA. Whether the AKA procedures are actually performed on a mobile station depends on various factors such as whether the HLR/AC has enabled AKA, whether the ANSI-41 interfaces between the MSC/VLR and AC supports AKA, etc.

All mobile stations with MOB\_P\_REV greater than or equal to ten shall support 2G authentication, AKA, and message integrity.

1 In general, when an idle mobile station does not have any integrity key and encryption key  
 2 to use, it starts the 2G authentication and key set-up procedures by registering via a  
 3 *Registration Message*, *Origination Message*, or *Page Response Message*.

4 Details of Authentication and Key Set-Up Procedures are described in the rest of this  
 5 section.

6 The mobile station requests (IK, CK) from the UIM. If (IK, CK) are available, the mobile  
 7 station has already performed the 3G authentication and the (IK, CK) may still be valid, in  
 8 which case, the mobile station needs to perform the (IK, CK) restoration procedures in  
 9 2.3.12.5.3 to restore the (IK, CK).

10 If (IK, CK) in the UIM are not available, the mobile station sets KEY\_ID to NULL to indicate  
 11 that the mobile station does not have any integrity key and encryption key and thus not  
 12 authenticated. The mobile station then registers and sends an *ROP*. The *ROP* contains a  
 13 new key id (NEW\_KEY\_ID) and a new security sequence number (NEW\_SSEQ\_H)  
 14 associated with the AUTHR (see [4]) of the message. The mobile station also starts a Key  
 15 Set-Up timer.<sup>24</sup>

16 Since the mobile station does not know beforehand whether the serving base station it  
 17 roams to supports 2G authentication, 3G authentication, or both, the mobile station  
 18 always starts with 2G authentication. When a mobile station sends an *ROP*, it always  
 19 starts with performing the 2G authentication by including an AUTHR (see [4]) in the  
 20 message. If an AKA is performed during a 2G authentication, the mobile station will abort  
 21 the 2G authentication.

22 The types of authentication are distinguished according to what the network provides the  
 23 base station with during the authentication process. If the base station receives a CMEA  
 24 key, 2G authentication is performed (see 2.3.12.5.1). If the base station receives  
 25 Authentication Vectors (AV's), 3G authentication is performed (see 2.3.12.5.2).

26 In the 2G authentication, the mobile station concatenates the CMEA key with a copy of  
 27 itself to form a 128-bit key to be used as both the integrity key, CIK, and the encryption  
 28 key, CCK. The CIK and CCK will be referred to as the (CIK, CCK) pair.

29 In the 3G authentication, the mobile station uses IK as the integrity key and CK as the  
 30 encryption key – referred to as the (IK, CK) pair.

31 The key strength of CCK or CK may be reduced by the “Key Strength Reduction Algorithm”  
 32 (see 2.3.12.5.4), which takes the key and converts it into another key of the same length  
 33 but with the entropy reduced. For simplicity, all the procedures hereafter only mention  
 34 CCK and CK.

---

<sup>24</sup> If the base station knows it is not going to get any keys from the network for whatever reason, the base station should indicate so in the *Registration Accepted Order*, so that the mobile station could stop waiting. However, if there is no current CIK “in use”, the *Registration Accepted Order* could not be MAC'ed, in which case, it is up to the mobile station whether or not to trust the *Registration Accepted Order*.

1 Whenever the key set-up is complete, all the messages shall include a MACI with the  
2 following exceptions:

- 3 • On the f-csch, the *General Page Message*, *Universal Page Message*, *Registration*  
4 *Request Order*, *Authentication Request Message* and *Authentication Challenge*  
5 *Message* shall not include a MACI. The *Extended Channel Assignment Message*  
6 may not include a MACI. All overhead messages and all signaling messages with a  
7 broadcast address type shall not include a MACI.
- 8 • On the f-dsch, the *Authentication Challenge Message* shall not include a MACI.
- 9 • On the r-csch or r-dsch, the *Authentication Response Message*, *Authentication*  
10 *Resynchronization Message* and *Mobile Station Reject Order* (ORDQ = '00010110',  
11 '00011000', '00011001' or '00011010') shall not include a MACI.
- 12 • All mini messages shall not include a MACI.

13 When the mobile station sends a *Registration Message*, *Origination Message*, or *Page*  
14 *Response Message* when RESTORE\_KEYS is equal to '1', Layer 3 shall deliver the message  
15 with a 24-bit number (selected by Layer 3) to LAC. The 24-bit number is used to perform  
16 the MAC-I computation and to initialize TX\_EXT\_SSEQ[i][j] and RX\_EXT\_SSEQ[i][j], where *i*  
17 = '0' or '1', *j* = '00' to '11'.

#### 18 2.3.12.5.1 2G Authentication when P\_REV\_IN\_USE<sub>S</sub> >= 10

19 This section applies to a base station that performs 2G authentication with the mobile  
20 station.

21 If KEY\_ID is equal to NULL and mobile station wants to set up encryption and integrity  
22 keys, it shall start Key Set-Up timer with expiration time of T75m seconds and execute the  
23 key set-up procedure described in this section by sending an *ROP*.

24 If an *ROP* does not include a MACI, it implies that the mobile station does not have an  
25 integrity key, in which case, the base station gets a CMEA key from the network and  
26 authenticates the mobile station's AUTHR (which is always included, see [4]). If the  
27 authentication is successful, when the CMEA key is available at the base station, the base  
28 station uses assured mode to send a *RES* that includes a Message Authentication Code  
29 generated using the pending CIK, and the pending NEW\_SSEQ\_H (proposed by the mobile  
30 station). Upon reception of the *RES*, the mobile station validates the MACI. If the  
31 validation is successful, the pending (CIK, CCK) and NEW\_SSEQ\_H can become "in use" in  
32 the mobile station. The mobile station stores the NEW\_KEY\_ID in KEY\_ID, the CIK in  
33 INT\_KEY[KEY\_ID], and the CCK in ENC\_KEY[KEY\_ID].

34 The mobile station then stops the Key Set-Up timer and sends a *Security Mode Completion*  
35 *Order* using assured mode to the base station that includes a Message Authentication  
36 Code. At this point, if the base station successfully validates the *Security Mode Completion*  
37 *Order* that the mobile station sends, the pending (CIK, CCK) and NEW\_SSEQ\_H can  
38 become "in use" in the base station; otherwise, the base station resends the *RES* until it  
39 receives a valid *Security Mode Completion Order* from the mobile station. If the mobile  
40 station receives a *RES* with an invalid MACI, the mobile station shall enter the *System*  
41 *Determination Substate* with an encryption/message integrity failure indication.

1 Once (CIK, CCK) has been established, the mobile station can perform integrity protection  
2 and encryption.

3 If the Key Set-Up timer expires and the mobile station determines that it is not attempting  
4 to originate an emergency call, the mobile station may go to the *System Determination*  
5 *Substate* with an encryption/message integrity failure indication, which will trigger re-  
6 registrations or the mobile station may continue with normal Layer 3 Signaling  
7 procedures, not to retry key set-up, and not to perform message integrity in both  
8 directions<sup>25</sup>. If the mobile station retries key set-up but still cannot establish the keys  
9 after an implementation dependent number of retries, the mobile station may reject the  
10 serving base station.

11 If the *ROP* includes a MACI in addition to AUTHR, this implies the mobile station has an  
12 integrity key, in which case, the base station has two options. It can either continue using  
13 the current (CIK, CCK) or change to a new pair.

14 If the base station decides to change to a new pair of (CIK, CCK), the base station will  
15 perform the key set-up procedures described above.

16 If the base station decides not to change to any new keys, the base station sends to the  
17 mobile station an *RES* that includes a Message Authentication Code. Upon reception of  
18 the *RES*, the mobile station validates the MACI and if the MAC-I checks, the mobile  
19 station sends a *Security Mode Completion Order* that includes a Message Authentication  
20 Code using assured mode and removes the pending keys, the associated key id, and the  
21 associated NEW\_SSEQ\_H.

22 To minimize race conditions, on the base station side, the base station does not send any  
23 messages that are encrypted or include a Message Authentication Code, and are non-  
24 essential to the key set-up between the time it receives an *ROP* and the time it receives  
25 the *Security Mode Completion Order* of an *RES*, which is always sent using the assured  
26 mode. On the mobile station side, to the same purpose, the mobile station does not send  
27 any messages that are encrypted or include a Message Authentication Code, and are non-  
28 essential to the key set-up between the time it sends an *ROP* and the time it receives an  
29 *RES*. Also, the mobile station does not send another *ROP* between the time it sends an  
30 *ROP* and the time it receives a *RES*.

#### 31 2.3.12.5.2 3G Authentication (AKA) when P\_REV\_IN\_USE<sub>s</sub> >= 10

32 This section applies to a base station that performs 3G authentication (AKA) with the  
33 mobile station. The AKA procedure and related algorithms take mobile station specific  
34 information, data received from base station and the mobile station's subscriber  
35 authentication key as inputs. The subscriber authentication key is 128-bits long. It is  
36 assigned to the mobile station and is stored in the mobile station's permanent security

---

<sup>25</sup> This is to allow the mobile station to operate and accept services from the base station without message integrity protection in case the keys cannot be established for whatever reason (e.g., shared secret root keys in the mobile station and base station do not match).

and identification memory. The subscriber authentication key is known only to the mobile station and to its associated Authentication Center (AC) (see [13]). Refer to Figures 2.3.12.5.2-1, 2.3.12.5.2-2, 2.3.12.5.2-3, and 2.3.12.5.2-4. In these figures, the input K is the mobile station's subscriber authentication key.

The purposes of AKA are to mutually authenticate the mobile station and the serving base station, and to establish a new set of (IK, CK) and UAK, if supported. Upon completion of AKA, CK and IK are stored in the mobile station while UAK, if supported, is stored in the UIM. Mentioning of (IK, CK) hereafter already implicitly implies that UAK is also included, if supported. When extended encryption is turned on, CK is used as the encryption key in the extended encryption described in 2.3.12.4. IK is used as the integrity key to provide message integrity check in the base station. UAK is used to convert the result of message integrity check, MAC-I, into UMAC.

AKA can be initiated by the base station at any time for any reason. For example, when (IK, CK) expires in the mobile station. Also, when the base station receives an *ROP*, the base station checks if the *ROP* contains a MACI or not. If there is no MACI, or the MACI does not check, or can not be checked, the base station may initiate AKA. Regardless of the reasons, if the base station initiates AKA, the following events occur.

The base station invokes the procedure by selecting the next unused AV from the ordered array of AV's stored in the VLR. If an AV is not available in the serving node, one (or more) AV's are requested from the subscriber's home system. The base station sends the mobile station an *Authentication Request Message* which contains the random challenge RANDA and the authentication token for network authentication, AUTN, associated with the selected AV.

Each AV contains the following information (see figure 2.3.12.5.2-1):

- Authentication Random Challenge Number (RANDA)
- Expected Result (XRES)
- Encryption Key (CK)
- Integrity Key (IK)
- UIM Authentication Key (UAK) (support of this field is optional)
- Authentication Token (AUTN), which consists of the Concealed Sequence Number (CON\_SQN), the Authentication Management Function (AMF), and the Message Authentication Code (MAC-A).

Upon reception of the *Authentication Request Message*, the mobile station aborts any pending 2G key set-up, starts the Key Set-Up timer with expiration time of T75m seconds and the UIM computes the expected message authentication code (XMAC). If this is not equal to the MAC-A received in the AUTN, the mobile station shall enter the *System Determination Substate* with an encryption/message integrity failure indication; otherwise, the UIM verifies that the sequence number SQN (see [46]) received in the AUTN is in the correct range (a test of freshness).

If the UIM determines that the received SQN is not in the correct range (see [46]), the mobile station sends an *Authentication Resync Message* to the base station that includes

1 the concealed value of the sequence number stored in the UIM (CON\_MS\_SQN). If the SQN  
 2 is in the correct range, the UIM computes the (IK, CK) pair and the RES and passes the  
 3 (IK, CK) pair and RES to the mobile station. The mobile station then associates a pending  
 4 key id NEW\_KEY\_ID and a pending NEW\_SSEQ\_H with the pending (IK, CK) pair and  
 5 sends an *Authentication Response Message* containing RES to the base station. The  
 6 *Authentication Response Message* shall contain a Message Authentication Code that is  
 7 computed based on the pending NEW\_SSEQ\_H and the pending IK.

8 The mobile station also stores (RANDA, RES, IK, CK, key id, NEW\_SSEQ\_H) in case it  
 9 receives, in the near future, the same retransmitted *Authentication Request Message* that  
 10 requires the mobile station to resend the same *Authentication Response Message*. The UIM  
 11 stores (IK, CK) until the next successful execution of AKA.

12 Upon reception of the *Authentication Response Message*, the base station compares RES  
 13 with the expected response XRES from the selected AV. If XRES equals RES, then the  
 14 authentication of the user has passed and the pending (IK, CK) and the pending  
 15 NEW\_SSEQ\_H can become “in use” in the base station. The base station then confirms the  
 16 AKA completion by sending an *RES* that includes a Message Authentication Code  
 17 generated using the pending IK to confirm the use of the pending (IK, CK). Upon reception  
 18 of this confirmation, the mobile station stops the Key Set-Up timer and the pending (IK,  
 19 CK), NEW\_SSEQ\_H, and key id become “in use” for the mobile station. The mobile station  
 20 stores the NEW\_KEY\_ID in KEY\_ID, the IK in INT\_KEY[KEY\_ID], and the CK in  
 21 ENC\_KEY[KEY\_ID].

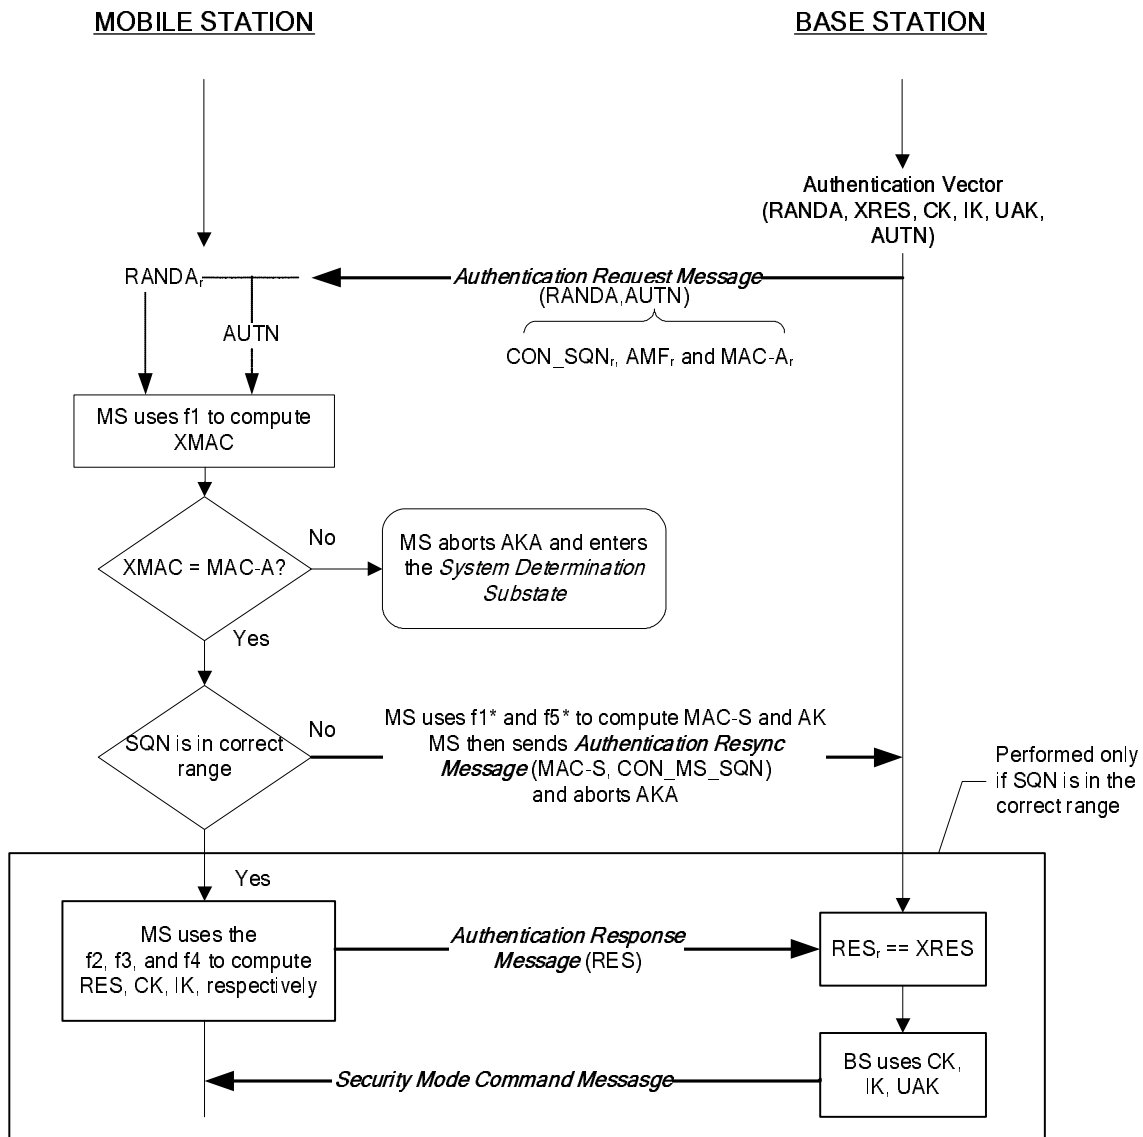

22 Once (IK, CK) has been established, the mobile station may start integrity protection and  
 23 encryption.

24 If the Key Set-Up timer expires and the mobile station determines that it is not attempting  
 25 to originate an emergency call, the mobile station shall go to the *System Determination*  
 26 *Substate* with an encryption/message integrity failure indication, which will trigger re-  
 27 registrations. If the mobile station retries key set-up but still cannot establish the keys  
 28 after an implementation dependent number of retries, the mobile station may reject the  
 29 serving base station.

30 To ensure the base station has agreed to switch to the pending (IK, CK), the mobile station  
 31 keeps sending the *Authentication Response Message* until it gets the *RES* that includes a  
 32 Message Authentication Code generated using the pending IK (or until the Key Set-Up  
 33 timer expires, whichever comes first). Also, if the ME receives the (RANDA, AUTN) that are  
 34 the same as the last received, the ME does not pass the (RANDA, AUTN) to the UIM but  
 35 responds with an *Authentication Response Message* including the corresponding RES.

36 To minimize race conditions, on the base station side, the base station does not send any  
 37 messages that are encrypted or include a Message Authentication Code, and are non-  
 38 essential to the key set-up between the time it sends the *Authentication Request Message*  
 39 and the time it receives the *Authentication Response Message*. On the mobile station side,  
 40 the mobile station does not send any messages that are encrypted or include a Message  
 41 Authentication Code, and are non-essential to the key set-up between the time it receives  
 42 the *Authentication Request Message* and the time it receives the *Security Mode Command*  
 43 *Message* that includes a Message Authentication Code generated using the pending IK.

**Figure 2.3.12.5.2-4. Function used for Calculation of UAK**

### 2.3.12.5.3 Restoring (IK, CK) upon power on

Since (IK, CK) is stored in UIM even when the mobile station is powered off, it is possible for the mobile station, when the mobile station powers on again, to try to restore and use the stored (IK, CK) in order to avoid unnecessary AKA. However, the mobile station will need to re-establish the crypto-sync and key id, which are not stored when the mobile station is powered off.

If the base station no longer has the (IK, CK) available, the base station initiates an AKA and establishes a new (IK, CK) anyway, thus it will not need the following procedures.

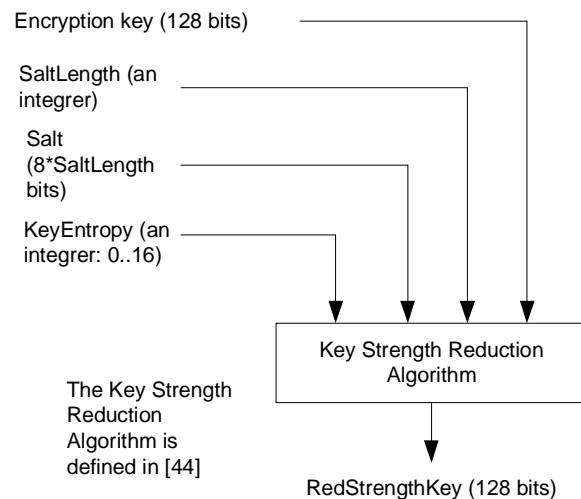

The mobile station could try to restore the key id association with its (IK, CK) via an *ROP* and a subsequent response from the base station. The mobile station sends an *ROP* that includes a Message Authentication Code generated using the stored IK and a pending *NEW\_SSEQ\_H*. The mobile station includes the *NEW\_SSEQ\_H* in the LAC Layer in the *ROP* and sets the *SDU\_KEY\_ID* to a value selected by the mobile station to associate with this (IK, CK). When the base station receives the *ROP*, it validates the MACI using its own IK stored for this mobile station and with the pending *NEW\_SSEQ\_H* provided in the message. If the MACI is valid, the base station sends a *Security Mode Command Message* that includes a Message Authentication Code generated using the stored IK and *NEW\_SSEQ\_H*.

When the mobile station receives the *RES*, the mobile station validates the MACI. If the MACI checks, the mobile station then starts using the key id for the stored (IK, CK) and the (IK, CK) and *NEW\_SSEQ\_H* can become “in use” in the mobile station. The mobile station then sends a *Security Mode Completion Order* that includes a Message Authentication Code using assured mode.

Upon reception of the *Security Mode Completion Order*, base station validates the MACI and if the MACI is valid, the base station starts to set the key id for the (IK, CK) to the value selected by the mobile station (in *NEW\_KEY\_ID* and *SDU\_KEY\_ID*), regardless of the current key id being used at the base station. The (IK, CK) pair and *NEW\_SSEQ\_H* can become in “in use” in the base station. The (IK, CK) pair is now successfully restored. The base station resends the *RES* until it gets the expected *Security Mode Completion Order*.

### 2.3.12.5.4 Key Strength Reduction Algorithm

Due to local security regulations, the base station may ask the mobile station to perform the Key Strength Reduction Algorithm (by setting *ENC\_KEY\_SIZE<sub>r</sub>*) and use the resultant key from the algorithm. The Key Strength Reduction Algorithm uses the encryption key, *RAND*, and *ENC\_KEY\_SIZE<sub>r</sub>* to determine the values of the inputs to the algorithm. The key strength reduction procedure is shown in Figure 2.3.12.5.4-1. The algorithm is defined in [44].

**Figure 2.3.12.5.4-1. Key Strength Reduction**

The input parameters of KeyStrengthRedAlg (see [44]) shall be set as follows:

- KeyLength shall be set to 16.
- OriginalKey shall be set to ENC\_KEY[KEY\_ID].
- SaltLength shall be set to 4.
- Salt shall be set to RAND<sub>S</sub>.
- KeyEntropy shall be set to ENC\_KEY\_SIZE<sub>r</sub>.

The mobile station shall set the ENC\_KEY[KEY\_ID] to RedStrengthKey.

#### 2.3.12.5.5 Message Integrity Check Negotiation and Other Requirements

The base station shall indicate the supported user integrity algorithms in the SIG\_INTEGRITY\_SUP field in the *Extended System Parameters Message* and *ANSI-41 System Parameters Message*.

The mobile station shall indicate to the base station the message integrity algorithms supported and preferred by using SIG\_INTEGRITY\_SUP and SIG\_INTEGRITY\_REQ in one of the following messages:

- *Registration Message*
- *Origination Message*
- *Page Response Message*
- *Security Mode Request Message*
- *Status Response Message* (in Encryption Capability information record)
- *Extended Status Response Message* (in Encryption Capability information record)

In response, the base station shall select the integrity algorithm to be used among the

integrity algorithms that are supported by both the mobile station and the base station, and then compute the MAC-I of a *Registration Accepted Order*, *Extended Channel Assignment Message*, or *Security Mode Command Message* based on the selected algorithm.

If and only if the base station sends a *Registration Accepted Order*, *Extended Channel Assignment Message*, or *Security Mode Command Message* with the CHANGE\_KEYS field<sup>26</sup> set to '1', the base station shall supply the base station LAC layer with the 24-bit value carried in NEW\_SSEQ\_H field and the 2-bit value in the NEW\_KEY\_ID field in the *Registration Message*, *Origination Message*, *Page Response Message*, *Authentication Response Message*, or the *Security Mode Request Message* that the base station is responding to.

### 2.3.13 Lock and Maintenance Required Orders

The mobile station shall have memory to store the lock reason code (LCKRSN\_P<sub>s-p</sub>) received in the *Lock Until Power-Cycled Order*. The data retention time under power-off conditions shall be at least 48 hours.

The mobile station shall have memory to store the maintenance reason code (MAINTRSN<sub>s-p</sub>) received in the *Maintenance Required Order*. The data retention time under power-off conditions shall be at least 48 hours.

There are no requirements on the use of the lock and maintenance reason codes, and interpretation and use are implementation dependent.

### 2.3.14 Mobile Station Revision Identification

The mobile station shall provide memory to store the following parameters sent in the *Status Message*, the *Status Response Message*, or the *Extended Status Response Message* (*Terminal Information* record or *Extended Terminal information* record):

- Mobile manufacturer code (MOB\_MFG\_CODE<sub>p</sub>)
- Manufacturer's model number (MOB\_MODEL<sub>p</sub>)
- Firmware revision number (MOB\_FIRM\_REV<sub>p</sub>)

In addition, the mobile station shall provide memory to store the following parameter for each supported band class:

- Protocol revision number (MOB\_P\_REV<sub>p</sub>)

### 2.3.15 Temporary Mobile Subscriber Identity

#### 2.3.15.1 Overview

The Temporary Mobile Subscriber Identity (TMSI) is a temporary locally assigned number used for addressing the mobile station. The mobile station obtains a TMSI when assigned

---

<sup>26</sup> The base station sets the CHANGE\_KEYS field to '1' to trigger the mobile station to reinitialize the crypto-sync and the keys or to reinitialize just the crypto-sync alone depending on different cases.

by the base station. The TMSI as a number does not have any association with the mobile station's IMSI, ESN, or directory number all of which are permanent identifications.

A TMSI zone is an arbitrary set of base stations for the administrative assignment of TMSIs. A TMSI\_CODE is uniquely assigned to a mobile station inside a TMSI zone. A TMSI zone is identified by the TMSI\_ZONE field. The same TMSI\_CODE may be reused to identify a different mobile station in a different TMSI zone. The pair (TMSI\_ZONE, TMSI\_CODE) is a globally unique identity for the mobile station. This pair is called the full TMSI. The TMSI\_CODE can be two, three, or four octets in length. The TMSI\_ZONE can range from 1 to 8 octets in length. Figure 2.3.15-1 shows an example of a TMSI\_ZONE where the TMSI\_ZONE is a subset of the NID (see 2.6.5.2).

**Figure 2.3.15-1. TMSI Zone Example**

The base station sends a *TMSI Assignment Message* to assign a TMSI. In response, the mobile station sends a *TMSI Assignment Completion Message*. The base station instructs the mobile station to delete the TMSI by sending a *TMSI Assignment Message* with all the bits in the TMSI\_CODE field set equal to '1'.

The TMSI expiration time is used to automatically delete the assigned TMSI. The mobile station obtains the expiration time when the TMSI is assigned in the *TMSI Assignment Message*. The mobile station compares the expiration time to the current System Time when it powers up and periodically during operation.

Whenever the mobile station sends its full TMSI, the mobile station sets a timer, called the full-TMSI timer. If the full-TMSI timer expires, the mobile station deletes the TMSI by setting all bits in the TMSI\_CODE field to '1'.

### 2.3.15.2 TMSI Assignment Memory

The mobile station shall provide memory to store the following parameters:

- 4-bit assigning TMSI zone length (ASSIGNING\_TMSI\_ZONE\_LEN<sub>S-p</sub>)
- 8-octet assigning TMSI zone (ASSIGNING\_TMSI\_ZONE<sub>S-p</sub>)
- 4-octet TMSI code (TMSI\_CODE<sub>S-p</sub>)
- 3-octet TMSI expiration time (TMSI\_EXP\_TIME<sub>S-p</sub>)

## 2.4 Accumulated Statistics

### 2.4.1 Monitored Quantities and Statistics

The mobile station shall store the value described in Table 2.4.1-1.

**Table 2.4.1-1. Monitored Quantities and Statistics**

Quantity Identifier	Length (bits)	Description
OTHER_SYS_TIME	36	The SYS_TIME field from the most recently received <i>Sync Channel Message</i>

### 2.4.2 Accumulated Paging, Broadcast, and Forward Common Control Channel Statistics

The mobile station shall maintain the counters shown in Table 2.4.2-1. The counters shall have the length as specified in Table 2.4.2-1. The mobile station shall initialize each counter described herein to zero upon power-on; the mobile station shall not re-initialize any counter described herein at any other time except upon command from the base station. Each counter shall be maintained modulo  $2^{\text{Length}}$ , where Length is specified in Table 2.4.2-1.

The mobile station shall increment the counter PAG\_6 each time that it declares a loss of the Paging Channel (see 2.6.2.1.1.4). The mobile station shall increment the counter PAG\_7 for each idle handoff it performs. The mobile station shall increment the counter FCCCH\_4 each time that it declares a loss of the Forward Common Control Channel (see 2.6.2.1.1.4). The mobile station shall increment the counter BCCH\_5 each time that it declares a loss of the Broadcast Control Channel (see 2.6.2.1.1.4).

**Table 2.4.2-1. Accumulated PCH/BCCH/F-CCCH Channel Statistics**

Counter Identifier	Length (bits)	Description
PAG_6	16	Number of times that the mobile station declared a loss of the Paging Channel
PAG_7	16	Number of mobile station idle handoffs

FCCCH_4	16	Number of times that the mobile station declared a loss of the Forward Common Control Channel
BCCH_5	16	Number of times that the mobile station declared a loss of the Broadcast Control Channel

## 1    **SECTION (CONTINUED)**

### 2    **2.6 Layer 3 Processing**

3    This section describes mobile station Layer 3 processing. It contains frequent references  
 4    to the messages that flow between the mobile station and base station. While reading this  
 5    section, it may be helpful to refer to the PDU formats (see 2.7 and 3.7), and to the message  
 6    flow examples (see Annex B and Annex C).

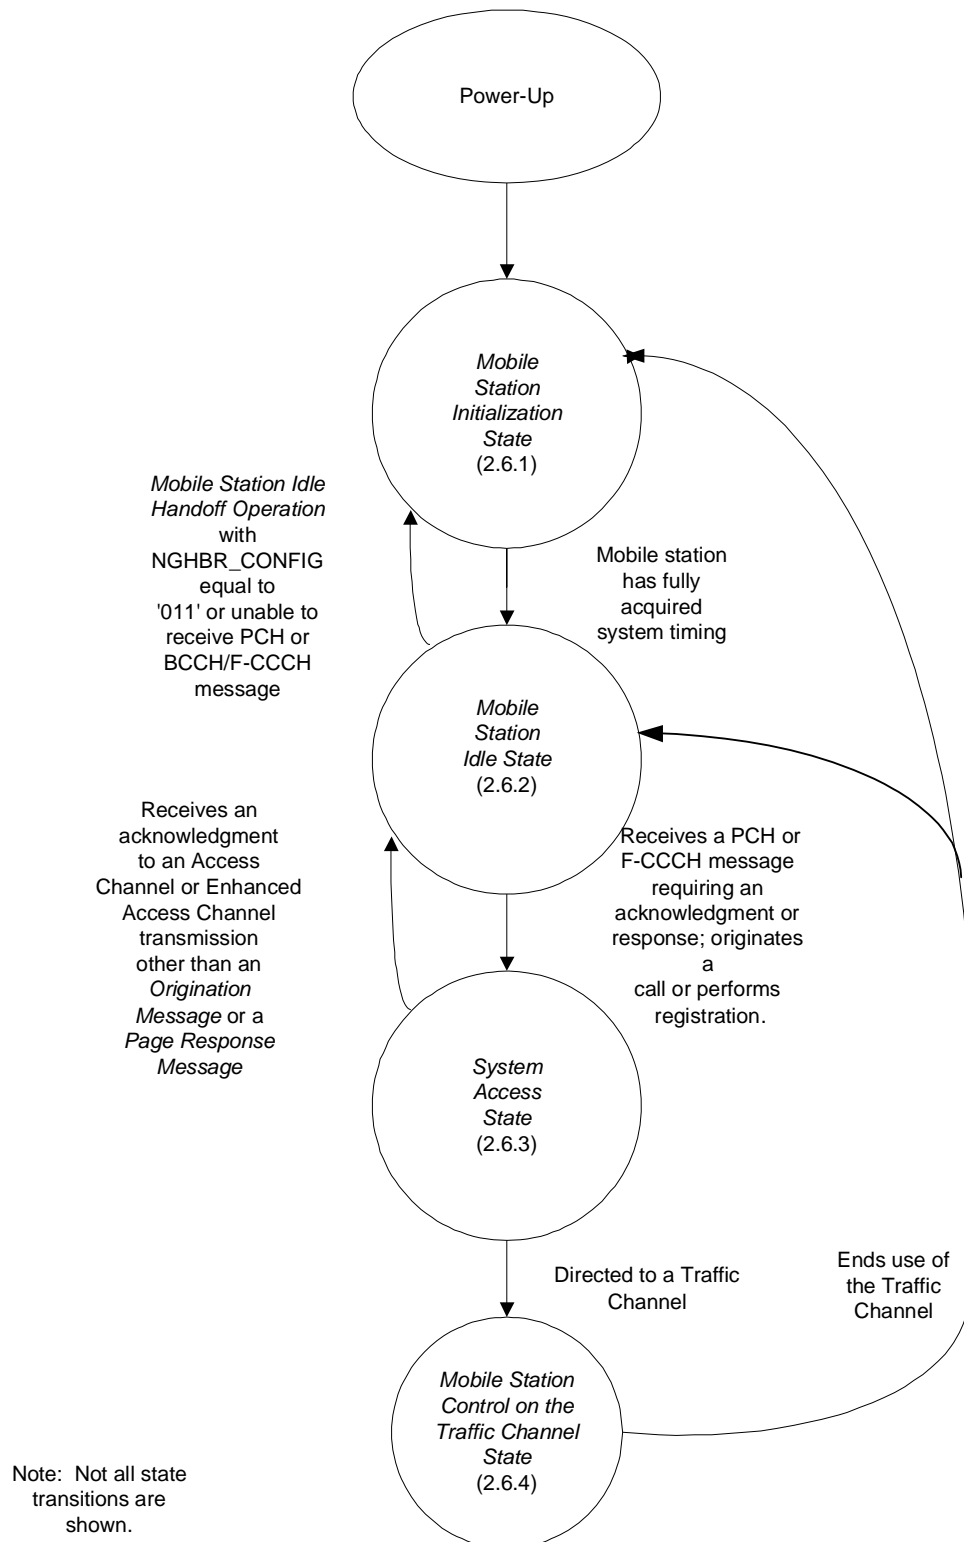

7    The mobile station shall ignore fields at the end of messages that do not exist in the  
 8    protocol revision supported by the mobile station.

9    The values for the time and numerical constants used in this section (e.g.,  $T_{20m}$ ,  $N_{4m}$ ) are  
 10   specified in Annex D.

11   As illustrated in Figure 2.6-1, mobile station Layer 3 processing consists of the following  
 12   states:

- 13       • *Mobile Station Initialization State* - In this state, the mobile station selects and  
 14       acquires a system.
- 15       • *Mobile Station Idle State* - In this state, the mobile station monitors messages on  
 16       the f-csch.
- 17       • *System Access State* - In this state, the mobile station sends messages to the base  
 18       station on the r-csch and receives messages from the base station on the f-csch.
- 19       • *Mobile Station Control on the Traffic Channel State* - In this state, the mobile station  
 20       communicates with the base station using the f/r-dsch and f/r-dtch.

21   After power is applied to the mobile station, it shall enter the *System Determination*  
 22   *Substate* of the *Mobile Station Initialization State* with a power-up indication (see 2.6.1.1).  
 23

**Figure 2.6-1. Mobile Station Layer 3 Processing States**

1    2.6.1 Mobile Station Initialization State

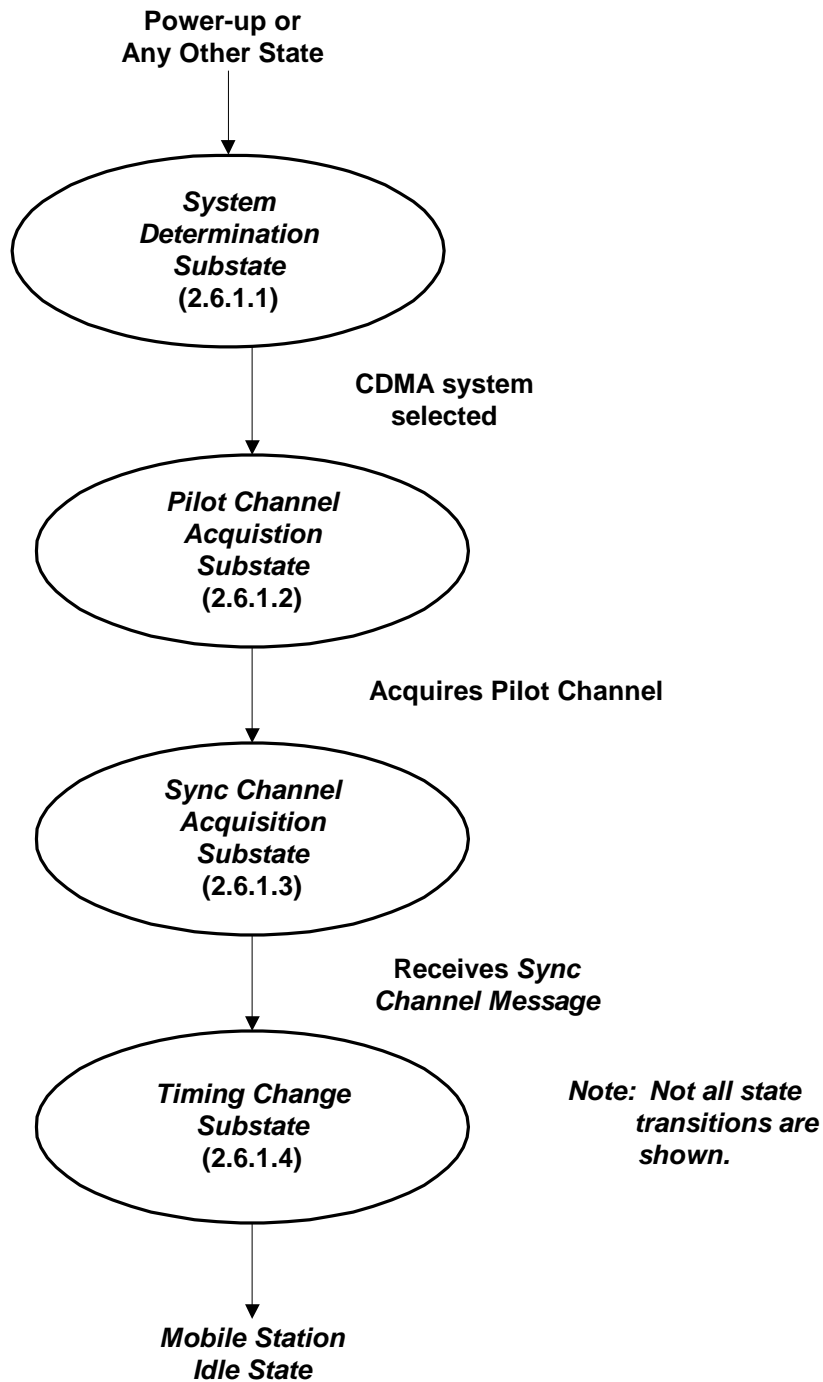

2    In this state, the mobile station first selects a system to use. If the selected system is a  
3    CDMA system, the mobile station proceeds to acquire and then synchronize to the CDMA  
4    system.

5    As illustrated in Figure 2.6.1-1, the *Mobile Station Initialization State* consists of the  
6    following substates:

- 7        • *System Determination Substate* - In this substate, the mobile station selects which  
8        system to use.
- 9        • *Pilot Channel Acquisition Substate* - In this substate, the mobile station acquires the  
10       Pilot Channel of a CDMA system.
- 11       • *Sync Channel Acquisition Substate* - In this substate, the mobile station obtains  
12       system configuration and timing information for a CDMA system.
- 13       • *Timing Change Substate* - In this substate, the mobile station synchronizes its  
14       timing to that of a CDMA system.

15    While in the *Mobile Station Initialization State*, the mobile station shall update all active  
16    registration timers as specified in 2.6.5.5.1.2.

17

**Figure 2.6.1-1. Mobile Station Initialization State**

1  
2  
3

## 1 2.6.1.1 System Determination Substate

2 In this substate, the mobile station selects the system to use.

3 Upon entering the *System Determination Substate*, the mobile station shall initialize the  
4 registration parameters as specified in 2.6.5.5.1.1.

5 If the mobile station enters the *System Determination Substate* with a power-up indication,  
6 the mobile station shall set RAND<sub>S</sub> to 0 (see 2.3.12.1.2), PACA<sub>S</sub> to disabled, PACA\_CANCEL  
7 to '0', the PACA state timer to disabled, NDSS\_ORIG<sub>S</sub> to disabled,  
8 MAX\_REDIRECT\_DELAY<sub>S</sub> to 31, REDIRECTION<sub>S</sub> to disabled, all entries of SDB\_SO\_OMIT<sub>S</sub>  
9 to '0', RER\_MODE\_ENABLED to NO, TKZ\_MODE\_ENABLED to NO, TKZ\_MODE\_PENDING  
10 to NO, RSC\_MODE\_ENABLED to NO, and T\_SLOTTED<sub>S</sub> to T<sub>74m</sub>. The mobile station shall  
11 select a system in accordance with the custom system selection process (see 2.6.1.1.1) and  
12 shall attempt to acquire the selected system (see 2.6.1.1.4).

13 If the mobile station enters the *System Determination Substate* with any indication other  
14 than a power-up indication, and if PACA<sub>S</sub> is equal to enabled, the mobile station shall also  
15 set PACA<sub>S</sub> to disabled, PACA\_CANCEL to '0', the PACA state timer to disabled, and should  
16 indicate to the user that the PACA call has been canceled.

17 If the mobile station enters the *System Determination Substate* with an acquisition failure  
18 indication, the mobile station shall perform the following:

- 19 • If REDIRECTION<sub>S</sub> is equal to enabled, the mobile station shall attempt to select  
20 another system in accordance with the current redirection criteria (see 2.6.1.1.2). If  
21 the mobile station is able to select another system, the mobile station shall attempt  
22 to acquire the selected system (see 2.6.1.1.4). Otherwise, if the mobile station has  
23 exhausted all possible selections using the current redirection criteria, the mobile  
24 station shall perform the following:
  - 25 – The mobile station shall set REDIRECTION<sub>S</sub> to disabled.
  - 26 – The mobile station shall set RETURN\_CAUSE<sub>S</sub> to '0001'.
  - 27 – If RETURN\_IF\_FAIL<sub>S</sub> is equal to '1', the mobile station shall attempt to select the  
28 system from which it was redirected and shall attempt to acquire the selected  
29 system (see 2.6.1.1.4). The precise process for determining how to select the  
30 system from which the mobile station was redirected is left to the mobile station  
31 manufacturer.
  - 32 – If RETURN\_IF\_FAIL<sub>S</sub> is equal to '0', the mobile station shall select a system  
33 other than the system from which it was redirected in accordance with the  
34 custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the  
35 selected system (see 2.6.1.1.4). The precise process that the mobile station  
36 uses to avoid selecting the system from which it was redirected is left to the  
37 mobile station manufacturer.
- 38 • If REDIRECTION<sub>S</sub> is equal to disabled, the mobile station shall select a system in  
39 accordance with the custom system selection process (see 2.6.1.1.1) and shall  
40 attempt to acquire the selected system (see 2.6.1.1.4).

1 If the mobile station enters the *System Determination Substate* with a new system  
 2 indication, the mobile station shall set REDIRECTION<sub>S</sub> to disabled. If NDSS\_ORIG<sub>S</sub> is  
 3 enabled, the mobile station shall set NDSS\_ORIG<sub>S</sub> to disabled and should indicate to the  
 4 user that the call origination has been canceled. The mobile station shall select a system  
 5 in accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt  
 6 to acquire the selected system (see 2.6.1.1.4).

7 If the mobile station enters the *System Determination Substate* with a new band indication,  
 8 the mobile station shall set REDIRECTION<sub>S</sub> to disabled. If NDSS\_ORIG<sub>S</sub> is enabled, the  
 9 mobile station shall set NDSS\_ORIG<sub>S</sub> to disabled and should indicate to the user that the  
 10 call origination has been canceled. The mobile station shall attempt to acquire the system  
 11 found on the frequency and band defined in NEW\_BAND\_RECORD (see 2.6.1.1.4).

12 If the mobile station enters the *System Determination Substate* with a CDMA available  
 13 indication, the mobile station shall set REDIRECTION<sub>S</sub> to disabled. If NDSS\_ORIG<sub>S</sub> is  
 14 enabled, the mobile station shall set NDSS\_ORIG<sub>S</sub> to disabled and should indicate to the  
 15 user that the call origination is canceled. The mobile station should set CDMACH<sub>S</sub> to the  
 16 CDMA Channel (CDMA\_FREQ) specified in the *CDMA Capability Global Action Message*  
 17 and should attempt to acquire a CDMA system on the specified CDMA channel (see  
 18 2.6.1.1.4). If the mobile station does not attempt to acquire a CDMA system on the  
 19 specified CDMA Channel, the mobile station shall select a system in accordance with the  
 20 custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected  
 21 system (see 2.6.1.1.4).

22 If the mobile station enters the *System Determination Substate* with an additional CDMA  
 23 available indication, the mobile station shall set REDIRECTION<sub>S</sub> to disabled. If  
 24 NDSS\_ORIG<sub>S</sub> is enabled, the mobile station shall set NDSS\_ORIG<sub>S</sub> to disabled and should  
 25 indicate to the user that the call origination is canceled. The mobile station should set  
 26 CDMACH<sub>S</sub> to the CDMA Channel (CDMA\_FREQ) specified in the *CDMA Info Order* and  
 27 should attempt to acquire a CDMA system on the specified CDMA channel (see 2.6.1.1.4).  
 28 If the mobile station does not attempt to acquire a CDMA system on the specified CDMA  
 29 Channel, the mobile station shall select a system in accordance with the custom system  
 30 selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see  
 31 2.6.1.1.4).

32 If the mobile station enters the *System Determination Substate* with a reselection  
 33 indication, the mobile station shall set REDIRECTION<sub>S</sub> to disabled. If NDSS\_ORIG<sub>S</sub> is  
 34 enabled, the mobile station shall set NDSS\_ORIG<sub>S</sub> to disabled and should indicate to the  
 35 user that the call origination is canceled. The mobile station shall select a system in  
 36 accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt to  
 37 acquire the selected system (see 2.6.1.1.4).

38 If the mobile station enters the *System Determination Substate* with an  
 39 encryption/message integrity failure indication, the mobile station shall set  
 40 REDIRECTION<sub>S</sub> to disabled, KEY\_ID to '00', D\_SIG\_ENCRYPT\_MODE<sub>S</sub> to '000',  
 41 C\_SIG\_ENCRYPT\_MODE<sub>S</sub> to '000', LAST\_2G\_KEY\_ID<sub>S</sub> to '00', LAST\_3G\_KEY\_ID<sub>S</sub> to '10',  
 42 ENC\_KEY[j] to NULL, INT\_KEY[j] to NULL, TX\_EXT\_SSEQ[i][j] to 0, RX\_EXT\_SSEQ[i][j] to 0,  
 43 where i ranges from '0' to '1' and j ranges from '00' to '11'. If NDSS\_ORIG<sub>S</sub> is enabled, the  
 44 mobile station shall set NDSS\_ORIG<sub>S</sub> to disabled and should indicate to the user that the

1 call origination is canceled. The mobile station shall select a system in accordance with  
 2 the custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the  
 3 selected system (see 2.6.1.1.4).

4 If the mobile station enters the *System Determination Substate* with a system reselection  
 5 indication, the mobile station shall set REDIRECTION<sub>S</sub> to disabled. If NDSS\_ORIG<sub>S</sub> is  
 6 enabled, the mobile station shall set NDSS\_ORIG<sub>S</sub> to disabled and should indicate to the  
 7 user that the call origination is canceled. The mobile station should attempt to select a  
 8 system available for system reselection as specified in 2.6.1.1.3, and should attempt to  
 9 acquire the selected system (see 2.6.1.1.4). The precise process for determining how to  
 10 select such a system is left to the mobile station manufacturer. If the mobile station does  
 11 not attempt to select such a system, the mobile station shall select a system in accordance  
 12 with the custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the  
 13 selected system (see 2.6.1.1.4).

14 If the mobile station enters the *System Determination Substate* with a rescan indication,  
 15 the mobile station shall set REDIRECTION<sub>S</sub> to disabled. If NDSS\_ORIG<sub>S</sub> is enabled, the  
 16 mobile station shall set NDSS\_ORIG<sub>S</sub> to disabled and should indicate to the user that the  
 17 call origination is canceled. The mobile station shall select a system in accordance with  
 18 the custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the  
 19 selected system (see 2.6.1.1.4).

20 If the mobile station enters the *System Determination Substate* with a protocol mismatch  
 21 indication, the mobile station shall perform the following:

- 22 • If REDIRECTION<sub>S</sub> is equal to enabled, the mobile station shall attempt to select  
 23 another system in accordance with the current redirection criteria (see 2.6.1.1.2). If  
 24 the mobile station is able to select another system, the mobile station shall attempt  
 25 to acquire the selected system (see 2.6.1.1.4). Otherwise, if the mobile station has  
 26 exhausted all possible selections using the current redirection criteria, the mobile  
 27 station shall perform the following:
  - 28 – The mobile station shall set REDIRECTION<sub>S</sub> to disabled.
  - 29 – The mobile station shall set RETURN\_CAUSE<sub>S</sub> to '0010'.
  - 30 – If RETURN\_IF\_FAIL<sub>S</sub> is equal to '1', the mobile station shall attempt to select the  
 31 system from which it was redirected and shall attempt to acquire the selected  
 32 system (see 2.6.1.1.4). The precise process for determining how to select the  
 33 system from which the mobile station was redirected is left to the mobile station  
 34 manufacturer.
  - 35 – If RETURN\_IF\_FAIL<sub>S</sub> is equal to '0', the mobile station shall select a system  
 36 other than the system from which it was redirected in accordance with the  
 37 custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the  
 38 selected system (see 2.6.1.1.4). The precise process for determining how to  
 39 avoid the system from which the mobile station was redirected is left to the  
 40 mobile station manufacturer.

- If REDIRECTION<sub>S</sub> is equal to disabled, the mobile station shall select a system in accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see 2.6.1.1.4).

If the mobile station enters the *System Determination Substate* with a system lost indication, the mobile station shall set REDIRECTION<sub>S</sub> to disabled. If NDSS\_ORIG<sub>S</sub> is enabled, the mobile station shall set NDSS\_ORIG<sub>S</sub> to disabled and should indicate to the user that the call origination is canceled. The mobile station should attempt to select the same system that was lost, and should attempt to acquire the selected system (see 2.6.1.1.4). The precise process for determining how to select the same system is left to the mobile station manufacturer. If the mobile station does not attempt to select the same system, the mobile station shall select a system in accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see 2.6.1.1.4).

If the mobile station enters the *System Determination Substate* with a lock indication, the mobile station shall set REDIRECTION<sub>S</sub> to disabled. If NDSS\_ORIG<sub>S</sub> is enabled, the mobile station shall set NDSS\_ORIG<sub>S</sub> to disabled and should indicate to the user that the call origination is canceled. The mobile station shall select a system in accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see 2.6.1.1.4).

If the mobile station enters the *System Determination Substate* with an unlock indication, the mobile station shall set REDIRECTION<sub>S</sub> to disabled. If NDSS\_ORIG<sub>S</sub> is enabled, the mobile station shall set NDSS\_ORIG<sub>S</sub> to disabled and should indicate to the user that the call origination is canceled. The mobile station shall select a system in accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see 2.6.1.1.4).

If the mobile station enters the *System Determination Substate* with an access denied indication, the mobile station shall set REDIRECTION<sub>S</sub> to disabled. If NDSS\_ORIG<sub>S</sub> is enabled, the mobile station shall set NDSS\_ORIG<sub>S</sub> to disabled and should indicate to the user that the call origination is canceled. The mobile station shall select a system in accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see 2.6.1.1.4).

If the mobile station enters the *System Determination Substate* with an ACCT blocked indication, the mobile station shall set REDIRECTION<sub>S</sub> to disabled. If NDSS\_ORIG<sub>S</sub> is enabled, the mobile station shall set NDSS\_ORIG<sub>S</sub> to disabled. The mobile station shall select a system in accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see 2.6.1.1.4).

If the mobile station enters the *System Determination Substate* with an NDSS off indication, the mobile station shall set REDIRECTION<sub>S</sub> to disabled. If NDSS\_ORIG<sub>S</sub> is enabled, the mobile station shall set NDSS\_ORIG<sub>S</sub> to disabled and should indicate to the user that the call origination is canceled. The mobile station shall select a system in accordance with the custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see 2.6.1.1.4).

1 If the mobile station enters the *System Determination Substate* with a release indication  
 2 and REDIRECTION<sub>S</sub> is equal to enabled, the mobile station shall attempt to select the  
 3 same system on which the release occurred and shall attempt to acquire the selected  
 4 system (see 2.6.1.1.4). The precise process for determining how to select the same system  
 5 is left to the mobile station manufacturer. If REDIRECTION<sub>S</sub> is equal to disabled, the  
 6 mobile station shall select a system in accordance with the custom system selection  
 7 process (see 2.6.1.1.1) and shall attempt to acquire the selected system (see 2.6.1.1.4). If  
 8 NDSS\_ORIG<sub>S</sub> is enabled, the mobile station shall set NDSS\_ORIG<sub>S</sub> to disabled.

9 If the mobile station enters the *System Determination Substate* with an error indication, the  
 10 mobile station shall set REDIRECTION<sub>S</sub> to disabled. If NDSS\_ORIG<sub>S</sub> is enabled, the mobile  
 11 station shall set NDSS\_ORIG<sub>S</sub> to disabled and should indicate to the user that the call  
 12 origination is canceled. The mobile station shall select a system in accordance with the  
 13 custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the selected  
 14 system (see 2.6.1.1.4).

15 If the mobile station enters the *System Determination Substate* with a redirection  
 16 indication, the mobile station shall set REDIRECTION<sub>S</sub> to enabled. The mobile station  
 17 shall delete all entries from the ZONE\_LIST<sub>S</sub> and SID\_NID\_LIST<sub>S</sub>. The mobile station shall  
 18 select a system in accordance with the current redirection criteria (see 2.6.1.1.2) and shall  
 19 attempt to acquire the selected system (see 2.6.1.1.4).

20 If the mobile station enters the *System Determination Substate* with a registration rejected  
 21 indication, the mobile station shall perform the following:

- 22 • The mobile station shall delete the newly generated encryption key (if any).
- 23 • If REDIRECTION<sub>S</sub> is equal to enabled, the mobile station shall perform the  
 24 following:
  - 25 – The mobile station shall set REDIRECTION<sub>S</sub> to disabled.
  - 26 – The mobile station shall set RETURN\_CAUSE<sub>S</sub> to '0011'.
  - 27 – If RETURN\_IF\_FAIL<sub>S</sub> is equal to '1', the mobile station shall attempt to select the  
 28 system from which it was redirected and shall attempt to acquire the selected  
 29 system (see 2.6.1.1.4). The precise process for determining how to select the  
 30 system from which the mobile station was redirected is left to the mobile station  
 31 manufacturer.
  - 32 – If RETURN\_IF\_FAIL<sub>S</sub> is equal to '0', the mobile station shall select a system  
 33 other than the system from which it was redirected in accordance with the  
 34 custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the  
 35 selected system (see 2.6.1.1.4). The precise process for determining how to  
 36 avoid the system from which the mobile station was redirected is left to the  
 37 mobile station manufacturer.
- 38 • If REDIRECTION<sub>S</sub> is equal to disabled, the mobile station shall select a system in  
 39 accordance with the custom system selection process (see 2.6.1.1.1) and shall  
 40 attempt to acquire the selected system (see 2.6.1.1.4).

1 If the mobile station enters the *System Determination Substate* with a wrong system  
2 indication, the mobile station shall perform the following:

- 3 • If REDIRECTION<sub>S</sub> is equal to enabled, the mobile station shall attempt to select  
4 another system in accordance with the current redirection criteria (see 2.6.1.1.2). If  
5 the mobile station is able to select another system, the mobile station shall attempt  
6 to acquire the selected system (see 2.6.1.1.4). Otherwise, if the mobile station has  
7 exhausted all possible selections using the current redirection criteria, the mobile  
8 station shall perform the following:
  - 9 – The mobile station shall set REDIRECTION<sub>S</sub> to disabled.
  - 10 – The mobile station shall set RETURN\_CAUSE<sub>S</sub> to '0100'.
  - 11 – If RETURN\_IF\_FAIL<sub>S</sub> is equal to '1', the mobile station shall attempt to select the  
12 system from which it was redirected and shall attempt to acquire the selected  
13 system (see 2.6.1.1.4). The precise process for determining how to select the  
14 system from which the mobile station was redirected is left to the mobile station  
15 manufacturer.
  - 16 – If RETURN\_IF\_FAIL<sub>S</sub> is equal to '0', the mobile station shall select a system  
17 other than the system from which it was redirected in accordance with the  
18 custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the  
19 selected system (see 2.6.1.1.4). The precise process for determining how to  
20 avoid the system from which the mobile station was redirected is left to the  
21 mobile station manufacturer.
- 22 • If REDIRECTION<sub>S</sub> is equal to disabled, the mobile station shall select a system in  
23 accordance with the custom system selection process (see 2.6.1.1.1) and shall  
24 attempt to acquire the selected system (see 2.6.1.1.4).

25 If the mobile station enters the *System Determination Substate* with a wrong network  
26 indication, the mobile station shall perform the following:

- 27 • If REDIRECTION<sub>S</sub> is equal to enabled, the mobile station shall attempt to select  
28 another system in accordance with the current redirection criteria (see 2.6.1.1.2). If  
29 the mobile station is able to select another system, the mobile station shall attempt  
30 to acquire the selected system (see 2.6.1.1.4). Otherwise, if the mobile station has  
31 exhausted all possible selections using the current redirection criteria, the mobile  
32 station shall perform the following:
  - 33 – The mobile station shall set REDIRECTION<sub>S</sub> to disabled.
  - 34 – The mobile station shall set RETURN\_CAUSE<sub>S</sub> to '0101'.
  - 35 – If RETURN\_IF\_FAIL<sub>S</sub> is equal to '1', the mobile station shall attempt to select the  
36 system from which it was redirected and shall attempt to acquire the selected  
37 system (see 2.6.1.1.4). The precise process for determining how to select the  
38 system from which the mobile station was redirected is left to the mobile station  
39 manufacturer.

- 1       – If RETURN\_IF\_FAIL<sub>S</sub> is equal to '0', the mobile station shall select a system
- 2       other than the system from which it was redirected in accordance with the
- 3       custom system selection process (see 2.6.1.1.1) and shall attempt to acquire the
- 4       selected system (see 2.6.1.1.4). The precise process for determining how to
- 5       avoid the system from which the mobile station was redirected is left to the
- 6       mobile station manufacturer.
- 7       • If REDIRECTION<sub>S</sub> is equal to disabled, the mobile station shall select a system in
- 8       accordance with the custom system selection process (see 2.6.1.1.1) and shall
- 9       attempt to acquire the selected system (see 2.6.1.1.4).

#### 10   2.6.1.1.1 Custom System Selection Process

11   The precise process for custom system selection is left to the mobile station manufacturer.

12   The mobile station shall perform the custom system selection process as follows:

- 13       • The mobile station shall determine which system to use.
- 14       • If the mobile station is to use a CDMA system, it shall set CDMABAND<sub>S</sub> to the band
- 15       class (see [30]) for the selected system.
- 16       • If the mobile station is to use a CDMA system with CDMABAND<sub>S</sub> = '00000' or
- 17       CDMABAND<sub>S</sub> = '00011', it shall perform the following:
  - 18           – If the mobile station is to use System A, it shall set SERVSYS<sub>S</sub> to SYS\_A. If the
  - 19           mobile station is to use System B, it shall set SERVSYS<sub>S</sub> to SYS\_B.
  - 20           – The mobile station shall set CDMACH<sub>S</sub> either to the Primary or Secondary
  - 21           CDMA Channel number (see [2]) for the selected serving system (SERVSYS<sub>S</sub>). If
  - 22           the mobile station fails to acquire a CDMA system on the first CDMA Channel it
  - 23           tries, the mobile station should attempt to acquire on the alternate CDMA
  - 24           Channel (Primary or Secondary) before attempting other alternatives.
  - 25       • If the mobile station is to use a CDMA system with CDMABAND<sub>S</sub> other than '00000'
  - 26       or '00011', it shall set CDMACH<sub>S</sub> to the CDMA Channel number (see [2]) for the
  - 27       selected system.

#### 28   2.6.1.1.2 System Selection Using Current Redirection Criteria

29   To perform system selection using current redirection criteria:

- 30       • When a single redirection record is received in a *Service Redirection Message*, a
- 31       *Global Service Redirection Message*, or an *Extended Global Service Redirection*
- 32       *Message*, the mobile station shall use the information received and stored in the
- 33       variable REDIRECT\_REC<sub>S</sub> to perform current system selection as specified in
- 34       2.6.1.1.2.1.
- 35       • If multiple redirection records are received in an *Extended Global Service*
- 36       *Redirection Message*, the mobile station shall process at most *j* sequential
- 37       redirection records, where *j* is equal to the number of redirection records in
- 38       REDIRECT\_REC\_LIST as follows:

- 1       – If the DELETE\_TMSI field of REDIRECT\_REC\_LIST[k] is equal to '1', the mobile  
2       station shall set all the bits of TMSI\_CODE<sub>S-P</sub> to '1'; otherwise the mobile  
3       station shall set TMSI\_CODE<sub>S-P</sub> to TEMP\_TMSI\_CODE.
- 4       – Store the redirection record (REDIRECT\_REC<sub>S</sub> = REDIRECT\_REC\_LIST[k]).
- 5       – If the RECORD\_TYPE field of REDIRECT\_REC\_LIST[k] is equal to '00000001' the  
6       mobile station shall:
  - 7       + Set CDMA\_MODE<sub>S</sub> to '1'.
  - 8       + Set DIGITAL\_REG<sub>S-P</sub> to '00000000'.
  - 9       + Set the maximum delay upon redirection (MAX\_REDIRECT\_DELAY<sub>S</sub> =  
10       MAX\_REDIRECT\_DELAY field of REDIRECT\_REC\_LIST[k]).
- 11      – If the mobile station has not exhausted all possible selections using the  
12      REDIRECT\_REC\_LIST[k], the mobile station shall attempt to select a system  
13      according to 2.6.1.1.2.1; otherwise, if k is not the last record in  
14      REDIRECT\_REC\_LIST, the mobile station shall continue the system selection  
15      with REDIRECT\_REC\_LIST[k+1].

#### 16   2.6.1.1.2.1 System Selection Using Current Redirection Record

17   If the RECORD\_TYPE field of REDIRECT\_REC<sub>S</sub> is equal to '00000001' and the mobile  
18   station supports Band Class 0, the mobile station shall perform system selection as  
19   follows:

- 20      • If the SYS\_ORDERING field is equal to '000', the mobile station shall make  
21      sequential system selections as follows:
  - 22      – The mobile station shall set SERVSYS<sub>S</sub> either to SYS\_A or SYS\_B. The precise  
23      process for determining how many system selections to make and for  
24      determining whether to use SYS\_A or SYS\_B is left to the mobile station  
25      manufacturer.
- 26      • If the SYS\_ORDERING field is equal to '001', the mobile station shall select no more  
27      than one system selection as follows:
  - 28      – The mobile station shall set SERVSYS<sub>S</sub> to SYS\_A.
- 29      • If the SYS\_ORDERING field is equal to '010', the mobile station shall select no more  
30      than one system selection as follows:
  - 31      – The mobile station shall set SERVSYS<sub>S</sub> to SYS\_B.
- 32      • If the SYS\_ORDERING field is equal to '011', the mobile station shall make at most  
33      two sequential system selections as follows:
  - 34      – For the first system selection, the mobile station shall set SERVSYS<sub>S</sub> to SYS\_A.
  - 35      – For the second system selection, the mobile station shall set SERVSYS<sub>S</sub> to  
36      SYS\_B.
- 37      • If the SYS\_ORDERING field is equal to '100', the mobile station shall make at most  
38      2 sequential system selections as follows:

- 1       – For the first system selection, the mobile station shall set  $SERVSYS_S$  to  $SYS\_B$ .
- 2       – For the second system selection, the mobile station shall set  $SERVSYS_S$  to
- 3        $SYS\_A$ .
- 4       • If the  $SYS\_ORDERING$  field is equal to '101', the mobile station shall make at most
- 5       2 sequential system selections as follows:
- 6       – For the first system selection, the mobile station shall set  $SERVSYS_S$  either to
- 7        $SYS\_A$  or  $SYS\_B$ . The precise process for determining whether to use  $SYS\_A$  or
- 8        $SYS\_B$  first is left to the mobile station manufacturer.
- 9       – For the second system selection, the mobile station shall set  $SERVSYS_S$  to
- 10        $SYS\_B$  if  $SYS\_A$  was used for the first selection, or to  $SYS\_A$  if  $SYS\_B$  was used
- 11       for the first selection.

12 If the  $RECORD\_TYPE$  field of  $REDIRECT\_REC_S$  is equal to '00000010', the mobile station  
13 shall perform system selection as follows:

- 14       • If the mobile station supports CDMA mode operation in the band class identified by
- 15       the  $BAND\_CLASS$  field, the mobile station shall make at most  $n$  sequential system
- 16       selections, where  $n$  is equal to the value of the  $NUM\_CHANS$  field, as follows:
- 17       – For the  $i^{th}$  system selection, where  $i$  ranges from 1 to  $n$ :
- 18       + If the mobile station supports operation on the CDMA channel
- 19       associated with the value of the  $i^{th}$  occurrence of the  $CDMA\_CHAN$  field
- 20       and the CDMA channel is supported for at least one band subclass
- 21       listed in the record (when included), the mobile station shall set
- 22        $CDMACH_S$  to the value of the  $i^{th}$  occurrence of the  $CDMA\_CHAN$  field
- 23       and shall set  $CDMABAND_S$  to the value specified in the  $BAND\_CLASS$
- 24       field.
- 25       + Otherwise, the mobile station shall not make the  $i^{th}$  system selection.

#### 26 2.6.1.1.3 System Selection Using System Reselection Criteria

27 The precise process for selecting a system using system reselection criteria is left to the  
28 mobile station manufacturer. The mobile station should use information received in the  
29 *Neighbor List Message*, *Extended Neighbor List Message*, *General Neighbor List Message*, or  
30 the *Universal Neighbor List Message* to perform the system reselection process as follows:

- 31       • If there are pilots in the Neighbor List on a different Frequency Assignment than
- 32       that of the mobile station, the mobile station may select the CDMA system
- 33       consisting of these neighbor pilots. If the mobile station is to use a CDMA system,
- 34       it shall set  $CDMABAND_S$  to the band class (see [30]) for the selected system and
- 35       shall set  $CDMACH_S$  to the CDMA Channel number (see [2]) for the selected system.

#### 36 2.6.1.1.4 Acquiring the Selected System

37 The mobile station shall attempt to acquire the selected system as follows:

- If the selected system is a CDMA system, the mobile station shall enter the *Pilot Channel Acquisition Substate*.

#### 2.6.1.2 Pilot Channel Acquisition Substate

In this substate, the mobile station acquires the Pilot Channel of the selected CDMA system.

Upon entering the *Pilot Channel Acquisition Substate*, the mobile station shall tune to the CDMA Channel number equal to  $CDMACH_s$ , shall set its code channel for the Pilot Channel (see [2]) and shall search for the Pilot Channel for no longer than  $T_{20m}$  seconds (see Annex D). If the mobile station acquires the Pilot Channel, the mobile station shall enter the *Sync Channel Acquisition Substate*.

If the mobile station determines that it is unlikely to acquire the Pilot Channel within  $T_{20m}$  seconds, the mobile station may enter the *System Determination Substate* with an acquisition failure indication (see 2.6.1.1). The time, to either acquire the Pilot Channel or determine that Pilot Channel acquisition is unlikely, shall not exceed  $T_{20m}$  seconds (see Annex D), after which the mobile station shall enter the *System Determination Substate* with an acquisition failure indication (see 2.6.1.1).

#### 2.6.1.3 Sync Channel Acquisition Substate

In this substate, the mobile station receives and processes the *Sync Channel Message* to obtain system configuration and timing information. A valid *Sync Channel Message* is one that passes the CRC check and is in the appropriate format according to the protocol revision of the base station.

Upon entering the *Sync Channel Acquisition Substate*, the mobile station shall set its code channel for the Sync Channel (see [2]).

If the mobile station does not receive a valid *Sync Channel Message* within  $T_{21m}$  seconds, the mobile station shall enter the *System Determination Substate* with an acquisition failure indication.

If the mobile station receives a valid *Sync Channel Message* within  $T_{21m}$  seconds, but the protocol revision level supported by the mobile station ( $MOB\_P\_REV_p$  of the current band class) is less than the minimum protocol revision level supported by the base station ( $MIN\_P\_REV_r$ ), the mobile station shall enter the *System Determination Substate* with a protocol mismatch indication (see 2.6.1.1).

If the mobile station receives a valid *Sync Channel Message* within  $T_{21m}$  seconds, but the values of the  $PRAT_r$ , the  $SR1\_BRAT\_NON\_TD_r$ , the  $SR1\_BRAT\_TD_r$ , or the  $SR3\_BRAT_r$  fields are designated as reserved by the protocol revision level supported by the mobile station ( $MOB\_P\_REV_p$  of the current band class), the mobile station shall enter the *System Determination Substate* with a protocol mismatch indication (see 2.6.1.1).

If the mobile station receives a valid *Sync Channel Message* within  $T_{21m}$  seconds and the protocol revision level supported by the mobile station ( $MOB\_P\_REV_p$  of the current band class) is greater than or equal to the minimum protocol revision level supported by the

base station ( $\text{MIN\_P\_REV}_T$ ), the mobile station shall store the following information from the message:

- Protocol revision level ( $\text{P\_REV}_S = \text{P\_REV}_T$ )
- Minimum protocol revision level ( $\text{MIN\_P\_REV}_S = \text{MIN\_P\_REV}_T$ )
- System identification ( $\text{SID}_S = \text{SID}_T$ )
- Network identification ( $\text{NID}_S = \text{NID}_T$ )
- Pilot PN sequence offset index ( $\text{PILOT\_PN}_S = \text{PILOT\_PN}_T$ )
- Long code state ( $\text{LC\_STATE}_S = \text{LC\_STATE}_T$ )
- System Time ( $\text{SYS\_TIME}_S = \text{SYS\_TIME}_T$ )
- Paging Channel data rate ( $\text{PRAT}_S = \text{PRAT}_T$ )
- Protocol revision level currently in use ( $\text{P\_REV\_IN\_USE}_S =$  the lesser value of  $\text{P\_REV}_S$  and  $\text{MOB\_P\_REV}_P$  of the current band class)
- SR1 Non-TD BCCH support indicator ( $\text{SR1\_BCCH\_NON\_TD\_INCL}_S = \text{SR1\_BCCH\_NON\_TD\_INCL}_T$ )
- SR1 TD BCCH support indicator ( $\text{SR1\_TD\_INCL}_S = \text{SR1\_TD\_INCL}_T$ )
- If  $\text{SR1\_BCCH\_NON\_TD\_INCL}_T$  is equal to '1':
  - $\text{SR1\_BRAT\_NON\_TD}_S = \text{SR1\_BRAT\_NON\_TD}_T$ ;
  - $\text{SR1\_CRAT\_NON\_TD}_S = \text{SR1\_CRAT\_NON\_TD}_T$ ;
  - $\text{BCCH\_CODE\_CHAN\_NON\_TD}_S = \text{SR1\_BCCH\_CODE\_CHAN\_NON\_TD}_T$ .
- If  $\text{SR1\_TD\_INCL}_T$  is included and is equal to '1', and the mobile station supports the Transmit Diversity indicated by  $\text{SR1\_TD\_MODE}_T$ :
  - $\text{SR1\_BRAT\_TD}_S = \text{SR1\_BRAT\_TD}_T$ ;
  - $\text{SR1\_CRAT\_TD}_S = \text{SR1\_CRAT\_TD}_T$ ;
  - $\text{BCCH\_CODE\_CHAN\_TD}_S = \text{SR1\_BCCH\_CODE\_CHAN\_TD}_T$ .
- If the mobile station supports the Transmit Diversity,  $\text{SR1\_BCCH\_NON\_TD\_INCL}_T$  is equal to '1', and  $\text{SR1\_TD\_INCL}_T$  is equal to '0':
  - $\text{SR1\_BRAT\_TD}_S = \text{SR1\_BRAT\_NON\_TD}_T$ ;
  - $\text{SR1\_CRAT\_TD}_S = \text{SR1\_CRAT\_NON\_TD}_T$ ;
  - $\text{BCCH\_CODE\_CHAN\_TD}_S = \text{SR1\_BCCH\_CODE\_CHAN\_NON\_TD}_T$ .
- SR3 support indicator ( $\text{SR3\_INCL}_S = \text{SR3\_INCL}_T$ )

The mobile station shall ignore any fields at the end of the *Sync Channel Message* that are not defined according to the protocol revision level ( $\text{MOB\_P\_REV}_P$  of the current band class) being used by the mobile station.

The mobile station may store the following information from the message:

- 1       • Number of leap seconds that have occurred since the start of System Time  
2       (LP\_SEC<sub>S</sub> = LP\_SEC<sub>T</sub>)
- 3       • Offset of local time from System Time (LTM\_OFF<sub>S</sub> = LTM\_OFF<sub>T</sub>)
- 4       • Daylight savings time indicator (DAYLT<sub>S</sub> = DAYLT<sub>T</sub>)
- 5 If REDIRECTION<sub>S</sub> and NDSS\_ORIG<sub>S</sub> are equal to disabled, the mobile station may enter  
6 the *System Determination Substate* with a reselection indication (see 2.6.1.1).
- 7 If REDIRECTION<sub>S</sub> is equal to enabled, the EXPECTED\_SID field of REDIRECT\_REC<sub>S</sub> is not  
8 equal to 0, and SID<sub>T</sub> is not equal to EXPECTED\_SID, the mobile station shall enter the  
9 *System Determination Substate* with a wrong system indication (see 2.6.1.1). If  
10 REDIRECTION<sub>S</sub> is equal to enabled, the EXPECTED\_NID field of REDIRECT\_REC<sub>S</sub> is not  
11 equal to 65535, and NID<sub>T</sub> is not equal to EXPECTED\_NID, the mobile station shall enter  
12 the *System Determination Substate* with a wrong network indication.
- 13 If P\_REV\_IN\_USE<sub>S</sub> is less than 6, the mobile station shall set POTENTIAL\_CDMACH<sub>S</sub> to  
14 CDMA\_FREQ<sub>T</sub>.
- 15 If P\_REV\_IN\_USE<sub>S</sub> is equal to six, the mobile station shall perform the following:
- 16       • If the mobile station supports the Quick Paging Channel or any radio configuration  
17       in the Radio Configuration Class 2 or 3 (see 1.1.1), the mobile station shall set  
18       POTENTIAL\_CDMACH<sub>S</sub> equal to EXT\_CDMA\_FREQ<sub>T</sub>; otherwise, the mobile station  
19       shall set POTENTIAL\_CDMACH<sub>S</sub> equal to CDMA\_FREQ<sub>T</sub>.
- 20 If P\_REV\_IN\_USE<sub>S</sub> is greater than six, the mobile station shall perform the following:
- 21       • If the mobile station supports Spreading Rate 3 on the common channels and  
22       SR3\_INCL<sub>S</sub> is equal to '1', the mobile station shall set:
  - 23       – BRAT<sub>S</sub> = SR3\_BRAT<sub>T</sub>;
  - 24       – BCCH\_CODE\_RATE<sub>S</sub> = 1/3;
  - 25       – BCCH<sub>S</sub> = SR3\_BCCH\_CODE\_CHAN<sub>T</sub>;
  - 26       – SR3\_PRIMARY\_PILOT<sub>S</sub> = SR3\_PRIMARY\_PILOT<sub>T</sub>;
  - 27       – SR3\_PILOT\_POWER1<sub>S</sub> = SR3\_PILOT\_POWER1<sub>T</sub>;
  - 28       – SR3\_PILOT\_POWER2<sub>S</sub> = SR3\_PILOT\_POWER2<sub>T</sub>;
  - 29       – If SR3\_CENTER\_FREQ\_INCL<sub>T</sub> is equal to '1', POTENTIAL\_CDMACH<sub>S</sub> =  
30       SR3\_CENTER\_FREQ<sub>T</sub>; otherwise, POTENTIAL\_CDMACH<sub>S</sub> = EXT\_CDMA\_FREQ<sub>T</sub>.
- 31       • If the mobile station does not support Spreading Rate 3 on the common channel or  
32       if SR3\_INCL<sub>S</sub> is equal to '0', the mobile station shall perform the following:
  - 33       – If SR1\_TD\_INCL<sub>T</sub> is equal to '1' and the mobile station supports the Transmit  
34       Diversity mode specified by SR1\_TD\_MODE<sub>T</sub>, the mobile station shall set:
    - 35       + SR1\_TD\_MODE<sub>S</sub> = SR1\_TD\_MODE<sub>T</sub>
    - 36       + SR1\_TD\_POWER\_LEVEL<sub>S</sub> = SR1\_TD\_POWER\_LEVEL<sub>T</sub>
    - 37       + BRAT<sub>S</sub> = SR1\_BRAT\_TD<sub>T</sub>

- 1           + BCCH\_CODE\_RATE<sub>S</sub> = SR1\_CRAT\_TD<sub>r</sub>,
- 2           + BCCH<sub>S</sub> = SR1\_BCCH\_CODE\_CHAN\_TD<sub>r</sub>,
- 3           + POTENTIAL\_CDMACH<sub>S</sub> = SR1\_CDMA\_FREQ\_TD<sub>r</sub>
- 4       – Otherwise, if SR1\_BCCH\_NON\_TD\_INCL<sub>r</sub> is equal to '1', the mobile station shall
- 5       set:
- 6           + BRAT<sub>S</sub> = SR1\_BRAT\_NON\_TD<sub>r</sub>
- 7           + BCCH\_CODE\_RATE<sub>S</sub> = SR1\_CRAT\_NON\_TD<sub>r</sub>,
- 8           + BCCH<sub>S</sub> = SR1\_BCCH\_CODE\_CHAN\_NON\_TD<sub>r</sub>,
- 9           + If SR1\_NON\_TD\_FREQ\_INCL<sub>r</sub> is equal to '1', POTENTIAL\_CDMACH<sub>S</sub> =
- 10          SR1\_CDMA\_FREQ\_NON\_TD<sub>r</sub>; otherwise, POTENTIAL\_CDMACH<sub>S</sub> =
- 11          EXT\_CDMA\_FREQ<sub>r</sub>
- 12       – Otherwise, the mobile station shall perform the following:
- 13           + If the mobile station supports the Quick Paging Channel or any radio
- 14           configuration in the Radio Configuration Class 2 or 3 (see 1.1.1), the mobile
- 15           station shall set POTENTIAL\_CDMACH<sub>S</sub> = EXT\_CDMA\_FREQ<sub>r</sub>; otherwise,
- 16           the mobile station shall set POTENTIAL\_CDMACH<sub>S</sub> = CDMA\_FREQ<sub>r</sub>.
- 17   If POTENTIAL\_CDMACH<sub>S</sub> is different from CDMACH<sub>S</sub>, the mobile station shall set
- 18   CDMACH<sub>S</sub> = POTENTIAL\_CDMACH<sub>S</sub> and then tune to the CDMA Channel (CDMACH<sub>S</sub>).
- 19   The mobile station shall enter the *Timing Change Substate*.
- 20   2.6.1.4 Timing Change Substate
- 21   Figure 2.6.1.4-1 illustrates the mobile station timing changes that occur in this substate.
- 22   The mobile station synchronizes its long code timing and system timing to those of the
- 23   CDMA system, using the PILOT\_PN<sub>S</sub>, LC\_STATE<sub>S</sub>, and SYS\_TIME<sub>S</sub> values obtained from
- 24   the received *Sync Channel Message*. SYS\_TIME<sub>S</sub> is equal to the System Time (see [2])
- 25   corresponding to 320 ms past the end of the last 80 ms superframe (see [2]) of the received
- 26   *Sync Channel Message* minus the pilot PN sequence offset. LC\_STATE<sub>S</sub> is equal to the
- 27   system long code state (see [2]) corresponding to SYS\_TIME<sub>S</sub>.
- 28   In the *Timing Change Substate*, the mobile station shall synchronize its long code timing to
- 29   the CDMA system long code timing derived from LC\_STATE<sub>S</sub>, and synchronize its system
- 30   timing to the CDMA system timing derived from SYS\_TIME<sub>S</sub>.
- 31   The mobile station shall perform the following:
- 32       • If SR1\_BCCH\_NON\_TD\_INCL<sub>S</sub> is equal to '1', or if SR1\_TD\_INCL<sub>S</sub> is equal to '1' and
- 33       the mobile supports the transmit diversity mode specified by SR1\_TD\_MODE<sub>S</sub>, or if
- 34       the mobile station supports Spreading Rate 3 on the common channel and
- 35       SR3\_INCL<sub>S</sub> is equal to '1', the mobile station shall:

- 1       – Set the stored message sequence numbers CONFIG\_MSG\_SEQ<sub>S</sub>,  
2       A41\_SYS\_PAR\_MSG\_SEQ<sub>S</sub>, ACC\_MSG\_SEQ<sub>S</sub>, MC\_RR\_PAR\_MSG\_SEQ<sub>S</sub>,  
3       UNI\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub>, EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>S</sub>,  
4       EXT\_CHAN\_LST\_MSG\_SEQ<sub>S</sub>, FD\_CHAN\_LST\_MSG\_SEQ<sub>S</sub>,  
5       USER\_ZONE\_ID\_MSG\_SEQ<sub>S</sub> and PRI\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub> variables to  
6       NULL (see 2.6.2.2);
- 7       – Set the index number of the Primary Broadcast Control Channel (BCN) to 1;
- 8       – Set IMSI\_11\_12<sub>S</sub>, IMSI\_10<sub>S</sub> and MCC<sub>S</sub> to NULL;
- 9       – Perform registration initialization as specified in 2.6.5.5.1.3; and
- 10      – If the bits of TMSI\_CODE<sub>S-p</sub> are not all equal to '1' and if SYS\_TIME<sub>S</sub> exceeds  
11      TMSI\_EXP\_TIME<sub>S-p</sub> × 2<sup>12</sup>, the mobile station shall set all the bits of  
12      TMSI\_CODE<sub>S-p</sub> to '1'.
- 13      • Otherwise, the mobile station shall:
  - 14       – Set PAGECH<sub>S</sub> to the Primary Paging Channel (see [2]);
  - 15       – Set PAGE\_CHAN<sub>S</sub> to '1';
  - 16       – Set the stored message sequence numbers CONFIG\_MSG\_SEQ<sub>S</sub>,  
17       SYS\_PAR\_MSG\_SEQ<sub>S</sub>, ACC\_MSG\_SEQ<sub>S</sub>, NGHBR\_LST\_MSG\_SEQ<sub>S</sub>,  
18       GEN\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub>, EXT\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub>,  
19       CHAN\_LST\_MSG\_SEQ<sub>S</sub>, EXT\_SYS\_PAR\_MSG\_SEQ<sub>S</sub>,  
20       GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>S</sub>, EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>S</sub>,  
21       EXT\_CHAN\_LST\_MSG\_SEQ<sub>S</sub>, FD\_CHAN\_LST\_MSG\_SEQ<sub>S</sub>,  
22       USER\_ZONE\_ID\_MSG\_SEQ<sub>S</sub> and PRI\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub> variables to  
23       NULL (see 2.6.2.2);
  - 24       – Set IMSI\_11\_12<sub>S</sub>, IMSI\_10<sub>S</sub> and MCC<sub>S</sub> to NULL;
  - 25       – Perform registration initialization as specified in 2.6.5.5.1.3; and
  - 26       – If the bits of TMSI\_CODE<sub>S-p</sub> are not all equal to '1' and if SYS\_TIME<sub>S</sub> exceeds  
27       TMSI\_EXP\_TIME<sub>S-p</sub> × 2<sup>12</sup>, the mobile station shall set all the bits of  
28       TMSI\_CODE<sub>S-p</sub> to '1'.
- 29      The mobile station shall enter the *Mobile Station Idle State*.

**Figure 2.6.1.4-1. Mobile Station Internal Timing**

## 2.6.2 Mobile Station Idle State

In this state, the mobile station monitors the Paging Channel or the Quick Paging Channel or Forward Common Control Channel/Primary Broadcast Control Channel. The mobile station can receive messages, receive an incoming call (mobile station terminated call), initiate a call (mobile station originated call), cancel a PACA call, initiate a registration, or initiate a message transmission.

The mobile station may monitor the Quick Paging Channel to determine if it should receive messages from the Paging Channel or Forward Common Control Channel.

Upon entering the *Mobile Station Idle State*, the mobile station shall perform the following if RSC\_MODE\_ENABLED is equal to NO:

- Set SLOTTED<sub>S</sub> to YES if T\_SLOTTED<sub>S</sub> is equal to 0 or if the mobile station does not support the slotted timer; otherwise, enable the T<sub>MS\_Slotted</sub> timer with the duration specified by T\_SLOTTED<sub>S</sub> if it is not already enabled, and set SLOTTED<sub>S</sub> to NO.

Upon entering the *Mobile Station Idle State* from the *Mobile Station Initialization State*, the mobile station shall perform the following:

- If SR1\_BCCH\_NON\_TD\_INCL<sub>S</sub> is equal to '1', or if SR1\_TD\_INCL<sub>S</sub> is equal to '1' and the mobile station supports the transmit diversity mode specified by SR1\_TD\_MODE<sub>S</sub>, or if the mobile station supports Spreading Rate 3 on the common channel and SR3\_INCL<sub>S</sub> is equal to '1', the mobile station shall perform the following:
  - Set its Primary Broadcast Control Channel code channel to BCCH<sub>S</sub>,
  - Set the Primary Broadcast Control Channel data rate as determined by BRAT<sub>S</sub>,
  - Set the Primary Broadcast Control Channel code rate as determined by BCCH\_CODE\_RATE<sub>S</sub>, and
  - Perform common channel supervision as specified in 2.6.2.1.1.4.
- Otherwise, the mobile station shall perform the following:
  - Set its code channel to PAGECH<sub>S</sub>,
  - Set the Paging Channel data rate as determined by PRAT<sub>S</sub>, and
  - Perform Paging Channel supervision as specified in 2.6.2.1.1.4.

Upon entering the *Mobile Station Idle State* from the *Mobile Station Control on the Traffic Channel State*, the mobile station shall perform all of the following:

- Perform common channel supervision as specified in 2.6.2.1.1.4.

If REDIRECTION<sub>S</sub>, PACA<sub>S</sub>, and NDSS\_ORIG<sub>S</sub> are equal to disabled, the mobile station may exit the *Mobile Station Idle State* at any time and enter the *System Determination Substate* of the *Mobile Station Initialization State* with a reselection indication (see 2.6.1.1).

While in the *Mobile Station Idle State*, the mobile station shall perform the following procedures:

- 1 • The mobile station shall perform Paging Channel or Forward Common Control  
2 Channel monitoring procedures as specified in 2.6.2.1.1.
- 3 • The mobile station shall perform message acknowledgment procedures as specified  
4 in [4].
- 5 • The mobile station shall perform registration procedures as specified in 2.6.2.1.3.
- 6 • The mobile station shall perform idle handoff procedures as specified in 2.6.2.1.4.
- 7 • The mobile station shall perform system reselection procedures as specified in  
8 2.6.2.1.6.
- 9 • The mobile station shall perform the *Response to Overhead Information Operation*  
10 as specified in 2.6.2.2 whenever the mobile station receives a system overhead  
11 message (*ANSI-41 System Parameters Message, Enhanced Access Parameters*  
12 *Message, Extended CDMA Channel List Message, MC-RR Parameters Message,*  
13 *Universal Neighbor List Message, ANSI-41 RAND Message, System Parameters*  
14 *Message, Access Point Identification Message, Access Point Identification Text*  
15 *Message, CDMA Channel List Message, Extended System Parameters Message,*  
16 *Neighbor List Message, Extended Neighbor List Message, General Neighbor List*  
17 *Message, Access Point Pilot Information Message, Global Service Redirection*  
18 *Message, Extended Global Service Redirection Message, User Zone Identification*  
19 *Message, Private Neighbor List Message, Access Parameters Message General*  
20 *Overhead Information Message, Flex Duplex CDMA Channel List Message or*  
21 *Alternative Technologies Information Message).*
- 22 • The mobile station shall perform the *Mobile Station Page Match Operation* as  
23 specified in 2.6.2.3 whenever it receives a mobile station-directed page.
- 24 • The mobile station shall perform the *Mobile Station Order and Message Processing*  
25 *Operation* as specified in 2.6.2.4 whenever a message or order directed to the  
26 mobile station is received other than a mobile station-directed page.
- 27 • The mobile station shall set NDSS\_ORIG<sub>S</sub> to disabled if directed by the user to  
28 cancel the call origination.
- 29 • The mobile station shall perform the *Mobile Station Origination Operation* as  
30 specified in 2.6.2.5 if directed by the user to initiate a call, or if NDSS\_ORIG<sub>S</sub> is  
31 equal to enabled.
- 32 • If RETRY\_DELAY<sub>S</sub>[001] or RETRY\_DELAY<sub>S</sub>[101] is not set to 0:
  - 33 – The mobile station shall not send any *Origination Message* containing a packet  
34 data service option<sup>1</sup> or *Reconnect Message* (with ORIG\_IND set to '1') for  
35 connecting a packet data service option until the maximum of the system time  
36 stored in RETRY\_DELAY<sub>S</sub>[001] and RETRY\_DELAY<sub>S</sub>[101].

---

<sup>1</sup> Packet data service option refers to SO 60, SO 61 or any service option in Service Option Group 4 and 5 in [30]

- 1       – At the system time stored in RETRY\_DELAY<sub>S</sub>[001], the mobile station shall reset
- 2       RETRY\_DELAY<sub>S</sub>[001] to 0.
- 3       – At the system time stored in RETRY\_DELAY<sub>S</sub>[101], the mobile station shall reset
- 4       RETRY\_DELAY<sub>S</sub>[101] to 0.
- 5       • The mobile station shall perform the *Mobile Station PACA Cancel Operation* as
- 6       specified in 2.6.2.8, if PACA<sub>S</sub> is equal to enabled and any one of the following
- 7       conditions is met:
  - 8       – PACA\_CANCEL is equal to '1'; or
  - 9       – The mobile station is directed by the user to cancel the PACA call.
- 10      • If the PACA state timer expires, the mobile station shall perform the following:
  - 11      – The mobile station should enter the *Update Overhead Information Substate* of
  - 12      the *System Access State* (see 2.6.3) with an origination indication within T<sub>33m</sub>
  - 13      seconds to re-originate the PACA call.
  - 14      – Otherwise, the mobile station shall perform the *Mobile Station PACA Cancel*
  - 15      *Operation* as specified in 2.6.2.8.
- 16      • If the mobile station supports *Data Burst Message* transmission, it shall perform
- 17      the *Mobile Station Message Transmission Operation* as specified in 2.6.2.6 if
- 18      directed by the user to transmit a message.
- 19      • If the mobile station supports BCMC operation, it shall perform the procedures as
- 20      specified in 2.6.13.
- 21      • If RETRY\_DELAY<sub>S</sub>[100] or RETRY\_DELAY<sub>S</sub>[101] is not set to 0:
  - 22      – The mobile station shall not send any Short Data Burst (see [30], [42]) until the
  - 23      maximum of the system time stored in RETRY\_DELAY<sub>S</sub>[100] and
  - 24      RETRY\_DELAY<sub>S</sub>[101].
  - 25      – At the system time stored in RETRY\_DELAY<sub>S</sub>[100], the mobile station shall reset
  - 26      RETRY\_DELAY<sub>S</sub>[100] to 0.
  - 27      – At the system time stored in RETRY\_DELAY<sub>S</sub>[101], the mobile station shall reset
  - 28      RETRY\_DELAY<sub>S</sub>[101] to 0.
- 29      • If the mobile station supports the *Device Information Message* on the r-csch,
- 30      AUTO\_MSG\_SUPPORTED<sub>S</sub> is equal to '1', and the mobile station has detected a
- 31      change in hook status since the last time when the mobile station sent hook status
- 32      information, the mobile station shall perform the following:
  - 33      – If the autonomous message timer has expired or is disabled, the mobile station
  - 34      shall perform the *Mobile Station Message Transmission Operation* as specified in
  - 35      2.6.2.6.
  - 36      – If the autonomous message timer has not expired, the mobile station shall set
  - 37      the autonomous message timer equal to AUTO\_MSG\_INTERVAL<sub>S</sub> and shall
  - 38      restart the timer.

- 1 • If the mobile station supports the *Fast Call Setup Order* with ORDQ equal to  
2 '00000000' on the r-csch, AUTO\_FCSO\_ALLOWED<sub>s</sub> is equal to '1',  
3 RSC\_MODE\_ENABLED is equal to NO, SLOTTED<sub>s</sub> is equal to YES, and the mobile  
4 station would like to request operation in reduced slot cycle mode, it shall perform  
5 the *Mobile Station Message Transmission Operation* as specified in 2.6.2.6.
- 6 • The mobile station shall perform the *Mobile Station Power-Down Operation* as  
7 specified in 2.6.2.7 if directed by the user to power down.
- 8 • If the bits of TMSI\_CODE<sub>s-p</sub> are not all equal to '1' and if System Time (in 80 ms  
9 units) exceeds TMSI\_EXP\_TIME<sub>s-p</sub> × 2<sup>12</sup>, the mobile station shall set all the bits of  
10 TMSI\_CODE<sub>s-p</sub> to '1' within T<sub>66m</sub> seconds.
- 11 • If the full-TMSI timer expires or has expired, the mobile station shall set all the bits  
12 of TMSI\_CODE<sub>s-p</sub> to '1'. The mobile station shall update the registration variables  
13 as described in 2.6.5.5.2.5.
- 14 • If the key setup timer expires or has expired and mobile station determines that it  
15 is not originating an emergency call, the mobile station may set  
16 REG\_SECURITY\_RESYNC<sup>2</sup> to YES and go to the *System Determination Substate*  
17 with an encryption/message integrity failure indication (see 2.3.12.5 for details).
- 18 • If TKZ\_MODE\_ENABLED is set to YES, the mobile station shall perform the  
19 following:
  - 20 – If TKZ\_ID<sub>s</sub> is not equal to any entry in TKZ\_LIST, TKZ\_SID<sub>s</sub> is equal to SID<sub>s</sub>,  
21 TKZ\_NID<sub>s</sub> is equal to NID<sub>s</sub>, and TKZ\_MODE\_SUPPORTED<sub>s</sub> is equal to '1', the  
22 mobile station shall send a *Radio Environment Message* by performing the  
23 *Mobile Station Message Transmission Operation* as specified in 2.6.2.6.
  - 24 – If the TKZ timer of any entry in TKZ\_LIST has expired, the mobile station shall  
25 delete that entry.
  - 26 – If the tracking zone update timer expires, the mobile station shall disable the  
27 tracking zone update timer and set TKZ\_MODE\_ENABLED to NO.
- 28 • If P\_REV\_IN\_USE<sub>s</sub> is less than 11 after the mobile station performs an idle handoff,  
29 the mobile station shall set TBR\_RAND\_SUPPR\_ENABLE<sub>s</sub> to '0', and shall set  
30 TBR\_RAND\_WINDOW<sub>s</sub> to '11'.

### 31 2.6.2.1 Idle Procedures

#### 32 2.6.2.1.1 Forward Channel Monitoring Procedures

##### 33 2.6.2.1.1.1 General Overview

34 The Paging Channel is divided into 80 ms slots called Paging Channel slots. Paging and  
35 control messages for a mobile station operating in the non-slotted mode can be received in

---

<sup>2</sup> REG\_SECURITY\_RESYNC was formerly called REG\_ENCRYPT\_RESYNC.

any of the Paging Channel slots; therefore, the non-slotted mode of operation requires the mobile station to monitor all slots.

The Forward Common Control Channel is divided into 80 ms slots called Forward Common Control Channel slots. Paging and mobile directed messages for a mobile station operating in the non-slotted mode can be received in any of the Forward Common Control Channel slots. The overhead messages can be received on the Primary Broadcast Control Channel. Therefore, the non-slotted mode of operation requires the mobile station to continuously monitor the Forward Common Control Channel/Primary Broadcast Control Channel.

#### 2.6.2.1.1.1.1 General Overview for Individually Addressed Messages

The Paging Channel or the Forward Common Control Channel protocol provides for scheduling the transmission of messages for a specific mobile station in certain assigned slots. Support of this feature is optional and may be enabled by each mobile station. A mobile station that monitors the Paging Channel or the Forward Common Control Channel only during certain assigned slots is referred to as operating in the slotted mode. During the slots in which the Paging Channel or the Forward Common Control Channel is not being monitored, the mobile station can stop or reduce its processing for power conservation. A mobile station may not operate in the slotted mode in any state except the *Mobile Station Idle State*.

A mobile station operating in the slotted mode generally monitors the Paging Channel or the Forward Common Control Channel for one or two slots per slot cycle. The mobile station can specify its preferred slot cycle using the SLOT\_CYCLE\_INDEX and SIGN\_SLOT\_CYCLE\_INDEX fields in the *Registration Message*, *Origination Message*, or *Page Response Message*. The mobile station can also specify a reduced slot cycle using the RSCI field of the *Fast Call Setup Order*, *Release Order* (ORDQ = '00000011') or *Extended Release Response Message*, which enables the mobile station to operate in the reduced slot cycle mode. The length of the slot cycle, T, in units of 1.28 seconds,<sup>3</sup> is given by

$$T = 2^i,$$

where i is the selected slot cycle index (see 2.6.2.1.1.3) which can take the values -4, -3, -2, -1, 0, 1, 2, 3, 4, 5, 6, and 7.

Using the Terminal Information record of the *Status Response Message* or the *Extended Status Response Message*,

- if P\_REV\_IN\_USE<sub>S</sub> is less than eleven, the mobile station reports max (0, SLOT\_CYCLE\_INDEX\_REG) with the SLOT\_CYCLE\_INDEX field.

---

<sup>3</sup> When SIGN\_SLOT\_CYCLE\_INDEX is equal to '1', the minimum length slot cycle consists of 16 slots of 80 ms each, hence 1.28 seconds. When SIGN\_SLOT\_CYCLE\_INDEX is equal to '0', the minimum length slot cycle consists of one slot of 80 ms, hence 80 ms. When operating in the reduced slot cycle mode, the minimum length slot cycle is also 80 ms.

- 1       • if P\_REV\_IN\_USE<sub>S</sub> is greater than or equal to eleven, the mobile station reports its  
2       last registered slot cycle, SLOT\_CYCLE\_INDEX\_REG with the SLOT\_CYCLE\_INDEX  
3       and SIGN\_SLOT\_CYCLE\_INDEX fields.

4       Using the Extended Terminal Information record of the *Extended Status Response Message*  
5       the mobile station reports its last registered slot cycle, SLOT\_CYCLE\_INDEX\_REG with the  
6       SLOT\_CYCLE\_INDEX and SIGN\_SLOT\_CYCLE\_INDEX fields.

7       When in the *Mobile Station Control on the Traffic Channel State*, using the Terminal  
8       Information record of the *Status Response Message* or the *Status Message*,

- 9       • if P\_REV\_IN\_USE<sub>S</sub> is less than eleven, the mobile station reports max (0,  
10       SLOT\_CYCLE\_INDEX\_REG) with the SLOT\_CYCLE\_INDEX field.
- 11       • if P\_REV\_IN\_USE<sub>S</sub> is greater than or equal to eleven, the mobile station reports its  
12       last registered slot cycle, SLOT\_CYCLE\_INDEX\_REG with the SLOT\_CYCLE\_INDEX  
13       and SIGN\_SLOT\_CYCLE\_INDEX fields.

14       When in the *Mobile Station Control on the Traffic Channel State*, using the Extended  
15       Terminal Information record of the *Status Response Message*, the mobile station reports its  
16       last registered slot cycle, SLOT\_CYCLE\_INDEX\_REG with the SLOT\_CYCLE\_INDEX and  
17       SIGN\_SLOT\_CYCLE\_INDEX fields.

18       A mobile station operating in the slotted mode may optionally monitor additional slots to  
19       receive broadcast messages and/or broadcast pages (see 2.6.2.1.1.3.3 and 2.6.2.1.1.3.4).

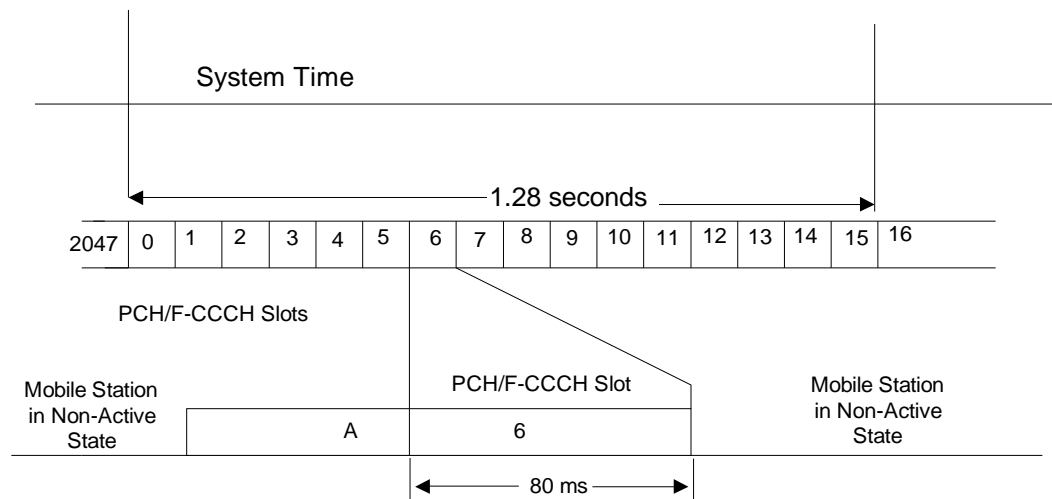

20       There are  $16 \times T$  slots in a slot cycle.

21       SLOT\_NUM is the Paging Channel or the Forward Common Control Channel slot number,  
22       modulo the maximum length slot cycle (2048 slots). That is, the value of SLOT\_NUM is

$$23 \quad \text{SLOT\_NUM} = \lfloor t/4 \rfloor \bmod 2048,$$

24       where  $t$  is the System Time in 20ms frames. For each mobile station, the starting times of  
25       its slot cycles are offset from the slot in which SLOT\_NUM equals zero by a fixed, randomly  
26       selected number of slots as specified in 2.6.2.1.1.3.

27       Figure 2.6.2.1.1.1-1 shows an example for a slot cycle length of 1.28 seconds, in which the  
28       computed value of PGSLOT (see 2.6.2.1.1.3) is equal to 6, so that one of the mobile  
29       station's slot cycles begins when SLOT\_NUM equals 6. The mobile station begins  
30       monitoring the Paging Channel or the Forward Common Control Channel at the start of  
31       the slot in which SLOT\_NUM equals 6. The next slot in which the mobile station must  
32       begin monitoring the Paging Channel or the Forward Common Control Channel is 16 slots  
33       later, i.e., the slot in which SLOT\_NUM is 22.

A - Reacquisition of CDMA System

6 - Mobile Station's Assigned PCH/F-CCCH Slot

**Figure 2.6.2.1.1.1-1. Mobile Station Idle Slotted Mode Structure Example**

#### 2.6.2.1.1.1.1 Overview of Stopping Monitoring via the General Page Message

Layer 3 determines when a mobile station operating in the slotted mode may stop monitoring the Paging Channel or the Forward Common Control Channel based upon indications received from Layer 2 (see [4]). When the *General Page Message* is used, Layer 2 determines whether there is an address mismatch or a broadcast address mismatch, based upon the address information received in the *General Page Message*. Based upon the address mismatch and broadcast address mismatch indications received from Layer 2, Layer 3 can determine when no further messages or records addressed to an individual mobile station will be present in the slot.

A *General Page Message* contains four fields: CLASS\_0\_DONE, CLASS\_1\_DONE, TMSI\_DONE, and ORDERED\_TMSIS, which indicate when a mobile station operating in the slotted mode may stop monitoring the Paging Channel or the Forward Common Control Channel.

When CLASS\_0\_DONE is set to '1' during a mobile station's assigned slot and the mobile station is operating in the slotted mode, no further messages or records addressed by a class 0 IMSI will be directed to the mobile station during the current slot. When CLASS\_1\_DONE is set to '1' during a mobile station's assigned slot and the mobile station is operating in the slotted mode, no further messages or records addressed by a class 1 IMSI will be directed to the mobile station during the current slot. Similarly, when TMSI\_DONE is set to '1' during a mobile station's assigned slot and the mobile station is operating in the slotted mode, no further messages or records addressed by a TMSI will be directed to the mobile station during the current slot.

1 The field ORDERED\_TMSIS, when set to '1' during a mobile station's assigned slot,  
 2 indicates that the base station has ordered TMSI page records directed to mobile stations  
 3 operating in the slotted mode so that the resulting TMSI\_CODE values are in ascending  
 4 order in the *General Page Messages* in the slot.

5 A mobile station which is operating in the slotted mode, has a class 0 IMSI assigned, and  
 6 does not have a TMSI assigned (all the bits of TMSI\_CODE<sub>s-p</sub> are equal to '1'), may stop  
 7 monitoring the Paging Channel or the Forward Common Control Channel after processing  
 8 a *General Page Message* containing CLASS\_0\_DONE equal to '1'. Similarly, a mobile  
 9 station which is operating in the slotted mode, has a class 1 IMSI assigned, and does not  
 10 have a TMSI assigned (all the bits of TMSI\_CODE<sub>s-p</sub> are equal to '1'), may stop monitoring  
 11 the Paging Channel or the Forward Common Control Channel after processing a *General*  
 12 *Page Message* containing CLASS\_1\_DONE equal to '1'.

13 A mobile station which is operating in the slotted mode, has a class 0 IMSI assigned, and  
 14 has a TMSI assigned (the bits of TMSI\_CODE<sub>s-p</sub> are not all equal to '1'), may stop  
 15 monitoring the Paging Channel or the Forward Common Control Channel after processing  
 16 a *General Page Message* containing both CLASS\_0\_DONE equal to '1' and TMSI\_DONE  
 17 equal to '1'. Similarly, a mobile station which is operating in the slotted mode, has a class  
 18 1 IMSI assigned, and has a TMSI assigned (the bits of TMSI\_CODE<sub>s-p</sub> are not all equal to  
 19 '1'), may stop monitoring the Paging Channel or the Forward Common Control Channel  
 20 after processing a *General Page Message* containing both CLASS\_1\_DONE equal to '1' and  
 21 TMSI\_DONE equal to '1'.

22 If ORDERED\_TMSIS is equal to '1' and CLASS\_0\_DONE is equal to '1', a mobile station  
 23 which has a class 0 IMSI assigned, is operating in the slotted mode, and has a TMSI  
 24 assigned (the bits of TMSI\_CODE<sub>s-p</sub> are not all equal to '1'), may stop monitoring the  
 25 Paging Channel or the Forward Common Control Channel after processing a page record  
 26 with a TMSI\_CODE value of higher numerical value than TMSI\_CODE<sub>s-p</sub>.

27 If ORDERED\_TMSIS is equal to '1' and CLASS\_1\_DONE is equal to '1', a mobile station  
 28 which has a class 1 IMSI assigned, is operating in the slotted mode, and has a TMSI  
 29 assigned (the bits of TMSI\_CODE<sub>s-p</sub> are not all equal to '1'), may stop monitoring the  
 30 Paging Channel or the Forward Common Control Channel after processing a page record  
 31 with a TMSI\_CODE value of higher numerical value than TMSI\_CODE<sub>s-p</sub>.

32 The mobile station continues to monitor the Paging Channel or the Forward Common  
 33 Control Channel for one additional slot unless, within its assigned slot, the mobile station  
 34 receives a *General Page Message* containing the appropriate indicator permitting it to stop  
 35 monitoring the Paging Channel or the Forward Common Control Channel  
 36 (CLASS\_0\_DONE, CLASS\_1\_DONE, TMSI\_DONE, or ORDERED\_TMSIS equal to '1',  
 37 whichever is appropriate). This allows the base station to carry over a message begun in  
 38 the assigned slot into the following slot, if necessary.

#### 2.6.2.1.1.1.2 Overview of Stopping Monitoring via the Universal Page Message

Layer 3 determines when a mobile station operating in the slotted mode may stop monitoring the Forward Common Control Channel based upon indications from Layer 2 (see [4]). When the *Universal Page Message* is used on the Forward Common Control Channel, Layer 2 determines whether there is an address mismatch or a broadcast address mismatch, based upon the address information received in the *Universal Page Message*. Based upon the address mismatch and broadcast address mismatch indications received from Layer 2, Layer 3 can determine when no further messages or records addressed to an individual mobile station will be present in the slot.

The *Universal Page Message* contains the READ\_NEXT\_SLOT field, which, when equal to '1' and received in an assigned slot, indicates to a mobile station that it is to monitor the Forward Common Control Channel in time to receive the first bit of the slot following the assigned slot. This allows the base station to use both an assigned slot and the following slot for pages if all of the pages for an assigned slot cannot be fit into the assigned slot. The *Universal Page Message* also contains the READ\_NEXT\_SLOT\_BCAST field, which, when equal to '1' and received in an assigned slot or broadcast slot, indicates to a mobile station configured to receive broadcast messages that it is to monitor the Forward Common Control Channel in time to receive the first bit of the subsequent slot. This allows the base station to use the subsequent slot for enhanced broadcast pages if all of the enhanced broadcast pages for an assigned slot or broadcast slot cannot be fit into the slot.

#### 2.6.2.1.1.1.2 Overview of Broadcast Messages on Paging Channel

The Paging Channel protocol provides two methods for the transmission of broadcast messages. Each method enables mobile stations operating in the slotted mode or in the non-slotted mode to receive broadcast messages. A broadcast message on the Paging Channel is a *Data Burst Message* that has a broadcast address type. A mobile station operating in the slotted mode has assigned slots that it monitors to receive Paging Channel messages (see 2.6.2.1.1.1). A broadcast page is a record within a *General Page Message* that has a broadcast address type. A base station may transmit a broadcast page in an assigned slot to inform mobile stations monitoring that slot that a broadcast message will be transmitted in a predetermined subsequent slot. A slot that a mobile station monitors in order to receive either a broadcast page or a broadcast message is referred to as a broadcast slot.

##### 2.6.2.1.1.1.2.1 Method 1: Multi-Slot Broadcast Message Transmission

According to this method, a broadcast message is sent in a sufficient number of assigned slots such that it may be received by all mobile stations that are operating in the slotted mode.

Figure 2.6.2.1.1.2.1-1 shows an example for the case when the maximum slot cycle index is equal to 0. In this example, the broadcast message fits in a single slot. The *Data Burst Message* is transmitted in 16 consecutive slots.

1

2

3 **Figure 2.6.2.1.1.2.1-1. Multi-Slot Broadcast Message Transmission Example**4 **2.6.2.1.1.2.2 Method 2: Periodic Broadcast Paging**

5 According to this method, mobile stations configured to receive broadcast messages  
 6 monitor a specific broadcast slot (the first slot of a broadcast paging cycle; see  
 7 2.6.2.1.1.3.3). There are two methods of sending broadcast messages used with Periodic  
 8 Broadcast Paging.

9 If all of the broadcast messages to be transmitted fit within the first slot of a broadcast  
 10 paging cycle, they may all be transmitted in this broadcast slot. If there is a single  
 11 broadcast message to be transmitted, it may be transmitted beginning in this broadcast  
 12 slot.

13 Alternately, one or more broadcast pages may be transmitted in the first slot of a broadcast  
 14 paging cycle. Each broadcast page is associated with a subsequent broadcast slot. For  
 15 each broadcast page, an associated broadcast message may be transmitted in the  
 16 associated subsequent broadcast slot. The broadcast slot for the associated broadcast  
 17 message is determined according to the position of the broadcast page within the *General*  
 18 *Page Message* transmitted in the first slot of the broadcast paging cycle.

19 Figure 2.6.2.1.1.2.2-1 shows an example of Periodic Broadcast Paging when the  
 20 broadcast index is set to 1. A *General Page Message* containing three broadcast pages is  
 21 transmitted in the first slot of the broadcast paging cycle. For each of the three broadcast  
 22 pages, a *Data Burst Message* is transmitted in a subsequent slot.

23

**Figure 2.6.2.1.1.2.2-1. Periodic Broadcast Paging Example**

### 2.6.2.1.1.3 Overview of Broadcast Messages on Broadcast Control Channel

The Broadcast Control Channel/Forward Common Control Channel protocol provides two methods for the transmission of broadcast messages. Each method enables mobile stations operating in the slotted mode or in the non-slotted mode to receive broadcast messages on the Broadcast Control Channel when  $NUM\_BCCH\_BCAST_s$  is not equal to '000'. A broadcast message on the Broadcast Control Channel is a *Data Burst Message* that has a broadcast address type. A mobile station operating in the slotted mode has assigned Forward Common Control Channel slots that it monitors to receive Forward Common Control Channel messages (see 2.6.2.1.1.1). A mobile station operating in the slotted mode and configured to receive broadcast messages may also have special assigned Forward Common Control Channel slots, called broadcast slots, that it monitors to receive enhanced broadcast pages. An enhanced broadcast page is a record within a *General Page Message* or a *Universal Page Message* that has a broadcast address type and that includes broadcast message scheduling information. A base station may transmit an enhanced broadcast page in an assigned Forward Common Control Channel slot, or in a broadcast slot, to inform mobile stations that a broadcast message will be transmitted in a specified Broadcast Control Channel slot. The enhanced broadcast page identifies the Broadcast Control Channel and the slot the mobile station is to monitor to receive the broadcast message.

#### 2.6.2.1.1.3.1 Method 1: Multi-Slot Enhanced Broadcast Paging

According to this method, an enhanced broadcast page is sent in a sufficient number of assigned slots on the Forward Common Control Channel such that it may be received by all mobile stations that are operating in the slotted mode.

Figure 2.6.2.1.1.3.1-1 shows an example for the case when the maximum slot cycle index is equal to 0. The enhanced broadcast page is transmitted in 16 consecutive slots.

1

2

3 **Figure 2.6.2.1.1.3.1-1. Multi-Slot Enhanced Broadcast Paging Example**

4

5 **2.6.2.1.1.3.2 Method 2: Periodic Enhanced Broadcast Paging**

6 According to this method, mobile stations configured to receive broadcast messages  
 7 monitor a specific broadcast slot (the first slot of a broadcast paging cycle).

8 One or more enhanced broadcast pages may be transmitted in the first slot of a broadcast  
 9 paging cycle and/or in the subsequent slot. Each enhanced broadcast page is associated  
 10 with a subsequent broadcast slot. The broadcast slot for the associated broadcast  
 11 message is determined according to a time offset specified in the enhanced broadcast page.  
 12 In addition, a broadcast slot for a repeat of the broadcast message can be specified via a  
 13 time offset from the slot of the first broadcast message.

14 **2.6.2.1.1.4 Overview of Broadcast Messages on Forward Common Control Channel**

15 The Forward Common Control Channel protocol provides two methods for the  
 16 transmission of broadcast messages. Each method enables mobile stations operating in  
 17 the slotted mode or in the non-slotted mode to receive broadcast messages on the Forward  
 18 Common Control Channel when NUM\_BCCH\_BCAST<sub>s</sub> equals '000'. A broadcast message  
 19 on the Forward Common Control Channel is a *Data Burst Message* that has a broadcast  
 20 address type. A mobile station operating in the slotted mode has assigned Forward  
 21 Common Control Channel slots that it monitors to receive Forward Common Control  
 22 Channel messages (see 2.6.2.1.1.1). An enhanced broadcast page is a record within a  
 23 *General Page Message* or a *Universal Page Message* that has a broadcast address type. A  
 24 base station may transmit an enhanced broadcast page in an assigned slot to inform  
 25 mobile stations monitoring that slot that a broadcast message will be transmitted in the  
 26 same F-CCCH where the enhanced broadcast page is received. A slot that a mobile station  
 27 monitors in order to receive either an enhanced broadcast page or a broadcast message is  
 28 referred to as a broadcast slot.

#### 2.6.2.1.1.4.1 Method 1: Multi-Slot Broadcast Message Transmission

According to this method, a broadcast message is sent in a sufficient number of assigned slots on the Forward Common Control Channel such that it may be received by all mobile stations that are operating in the slotted mode.

Figure 2.6.2.1.1.4.1-1 shows an example for the case when the maximum slot cycle index is equal to 0. In this example, the broadcast message fits in a single slot. The *Data Burst Message* is transmitted in 16 consecutive slots.

**Figure 2.6.2.1.1.4.1-1. Multi-Slot Broadcast Message Transmission Example**

#### 2.6.2.1.1.4.2 Method 2: Periodic Enhanced Broadcast Paging

According to this method, mobile stations configured to receive broadcast messages monitor a specific broadcast slot (the first slot of a broadcast paging cycle). There are two methods of sending broadcast messages used with Periodic Enhanced Broadcast Paging.

If all of the broadcast messages to be transmitted fit within the first slot of a broadcast paging cycle, they may all be transmitted in this broadcast slot. If there is a single broadcast message to be transmitted, it may be transmitted beginning in this broadcast slot.

Alternately, one or more enhanced broadcast pages may be transmitted in the first slot of a broadcast paging cycle. Each enhanced broadcast page is associated with a subsequent broadcast slot. For each enhanced broadcast page, an associated broadcast message may be transmitted in the associated subsequent broadcast slot. The broadcast slot for the associated broadcast message is determined according to a time offset specified in the enhanced broadcast page. In addition, a broadcast slot for a repeat of the broadcast message can be specified via a time offset from the slot of the first broadcast message.

#### 2.6.2.1.1.2 Non-Slotted Mode Requirements

A mobile station operating in the non-slotted mode shall monitor the Paging Channel or the Forward Common Control Channel/Primary Broadcast Control Channel at all times. If the mobile station declares a loss of the Paging Channel or the Forward Common Control

Channel/Primary Broadcast Control Channel (see 2.6.2.1.1.4), the mobile station shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a system lost indication (see 2.6.1.1).

When a mobile station monitors the Paging Channel or the Forward Common Control Channel in any state other than the *Mobile Station Idle State*, it shall operate in the non-slotted mode.

A mobile station monitoring the Paging Channel shall operate in the non-slotted mode when  $PACA_S$  is equal to enabled.

A mobile station monitoring the Paging Channel shall operate in the non-slotted mode when  $SLOTTED_S$  is equal to NO.

#### 2.6.2.1.1.3 Slotted Mode Requirements

A mobile station monitoring the Paging Channel shall not operate in the slotted mode if any of the following conditions are true:

- $SLOTTED_S$  is equal to NO,
- Bit 5 of the station class mark is set to '0' (see 2.3.3),
- $PACA_S$  is equal to enabled, or
- The mobile station's configuration parameters are not current (see 2.6.2.2).

A mobile station monitoring the Forward Common Control Channel shall not operate in the slotted mode if either of the following conditions is true:

- Bit 5 of the station class mark is set to '0' (see 2.3.3), or
- The mobile station's configuration parameters are not current (see 2.6.2.2).

A mobile station monitoring the Forward Common Control Channel with bit 5 of the station class mark set to '1' shall monitor all Forward Common Control Channel slots (see 2.6.2.1.1.3.1) if either of the following conditions is true:

- $SLOTTED_S$  is equal to NO, or
- $PACA_S$  is equal to enabled.

During operation in the slotted mode, the mobile station shall ensure that its stored configuration parameter values are current (see 2.6.2.2).

If the mobile station declares a loss of the Paging Channel or the Forward Common Control Channel/Primary Broadcast Control Channel (see 2.6.2.1.1.4), the mobile station shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a system lost indication (see 2.6.1.1).

#### 2.6.2.1.1.3.1 Monitoring Assigned Slots

The mobile station shall monitor the Paging Channel or the Forward Common Control Channel in each of its assigned slots, if any of the following conditions is true:

- The mobile station does not support Quick Paging Channel operation, or

- 1 • QPCH\_SUPPORTED<sub>s</sub> is equal to '0', or
- 2 • RSC\_MODE\_ENABLED is equal to YES, IGNORE\_QPCH<sub>s</sub> is equal to '1', and RSCI<sub>s</sub>
- 3 is equal to -3 or -4.

4 If none of the above conditions is true, then for each of its assigned slots, the mobile  
5 station shall perform the following:

- 6 • The mobile station should check its assigned paging indicators in the complete
- 7 Quick Paging Channel slot immediately preceding its assigned Paging Channel or
- 8 Forward Common Control Channel slot, as specified in 2.6.2.1.2.1; the mobile
- 9 station shall monitor the assigned Paging Channel or Forward Common Control
- 10 Channel slot if the paging indicators meet the conditions specified in 2.6.2.1.2.2.
- 11 • If the mobile station does not check its assigned paging indicators, the mobile
- 12 station shall monitor its assigned Paging Channel or Forward Common Control
- 13 Channel slot.

14 If the mobile station supports Quick Paging Channel operation, the mobile station is  
15 configured to receive broadcast messages, BCAST\_INDEX<sub>s</sub> is not equal to '000', and  
16 QPCH\_BI\_SUPPORTED<sub>s</sub> equals '1', then for each of its assigned broadcast slots on the  
17 Forward Common Control Channel or Paging Channel, the mobile station shall perform  
18 the following:

- 19 • The mobile station should check the broadcast indicators in the complete Quick
- 20 Paging Channel broadcast slot immediately preceding its assigned broadcast slot,
- 21 as specified in 2.6.2.1.1.3.3.
- 22 • The mobile station should receive its assigned broadcast slot on the Forward
- 23 Common Control Channel or Paging Channel if the broadcast indicators meet the
- 24 conditions specified in 2.6.2.1.2.1.

25 The mobile station shall monitor each slot following an assigned slot in which the mobile  
26 station received a *Universal Page Message* with READ\_NEXT\_SLOT equal to '1', and shall  
27 begin monitoring the Forward Common Control Channel in time to receive the first bit of  
28 the slot. If the mobile station is configured to receive broadcast messages, it shall monitor  
29 each slot following an assigned slot in which the mobile station received a *Universal Page*  
30 *Message* with READ\_NEXT\_SLOT\_BCAST equal to '1', and shall begin monitoring the  
31 Forward Common Control Channel in time to receive the first bit of the slot.

32 If SLOTTED<sub>s</sub> is equal to NO or PACA<sub>s</sub> is equal to enabled, the mobile station may stop  
33 monitoring a Forward Common Control Channel slot when Layer 3 receives an address  
34 mismatch indication from Layer 2. When the mobile station stops monitoring a Forward  
35 Common Control Channel slot when SLOTTED<sub>s</sub> is equal to NO or PACA<sub>s</sub> is equal to  
36 enabled, the mobile station shall begin monitoring the subsequent Forward Common  
37 Control Channel slot in time to receive the first bit of the slot.

38 If the mobile station monitors a Paging Channel or Forward Common Control Channel slot,  
39 it shall begin monitoring the Paging Channel or the Forward Common Control Channel in  
40 time to receive the first bit of the slot. If the mobile station is not configured to receive  
41 broadcast addresses, the mobile station shall continue to monitor the Paging Channel or  
42 the Forward Common Control Channel until one of the following conditions is satisfied:

- 1       • Layer 3 receives an address mismatch indication from Layer 2 (see [4]); or
- 2       • The mobile station monitors the assigned slot and the slot following the assigned
- 3       slot, and the mobile station receives at least one valid message (see [4]).

4 If the mobile station is configured to receive broadcast addresses and the mobile station is  
 5 monitoring a Paging Channel, the mobile station shall continue to monitor the Paging  
 6 Channel until one of the preceding conditions is satisfied and should monitor the Paging  
 7 Channel until Layer 3 receives a broadcast address mismatch indication from Layer 2 (see  
 8 [4]).

9 If the mobile station is configured to receive broadcast addresses and the mobile station is  
 10 monitoring a Forward Common Control Channel, the mobile station shall continue to  
 11 monitor the Forward Common Control Channel until one of the preceding conditions is  
 12 satisfied and should monitor the Forward Common Control Channel until Layer 3 receives  
 13 a broadcast address mismatch indication from Layer 2 (see [4]).

14 The mobile station shall monitor each slot following a broadcast slot in which the mobile  
 15 station received a *Universal Page Message* with READ\_NEXT\_SLOT\_BCAST equal to '1',  
 16 and shall begin monitoring the Forward Common Control Channel in time to receive the  
 17 first bit of the slot.

18 For each broadcast slot monitored to receive broadcast pages or broadcast messages that  
 19 is not one of its assigned slots, the mobile station should begin monitoring the Paging  
 20 Channel or the Forward Common Control Channel in the first bit of the broadcast slot.  
 21 The mobile station should continue to monitor the Paging Channel or the Forward  
 22 Common Control Channel until one of the following conditions is satisfied:

- 23       • Layer 3 receives a broadcast address mismatch indication from Layer 2; or
- 24       • The mobile station monitors the Paging Channel or the Forward Common Control
- 25       Channel to receive all messages beginning in the broadcast slot and in the slot
- 26       following the broadcast slot, and the mobile station receives at least one valid
- 27       message (see [4]).

28 To determine its assigned slots, the mobile station shall use the hash function specified in  
 29 2.6.7.1 to select a number, PGSLOT, in the range 0 to 2047 (spanning the maximum slot  
 30 cycle length, which is 163.84 seconds). The mobile station's assigned slots shall be those  
 31 slots in which

$$32 \quad (\lfloor t/4 \rfloor - \text{PGSLOT}) \bmod (16 \times T) = 0,$$

33 where  $t$  is the System Time in 20ms frames and  $T$  is the slot cycle length in units of 1.28  
 34 seconds given by

$$35 \quad T = 2^i,$$

36 where  $i$  is the slot cycle index which can take the values -4, -3, -2, -1, 0, 1, 2, 3, 4, 5, 6,  
 37 and 7.

38 For each slot on the Broadcast Control Channel monitored to receive broadcast messages,  
 39 the mobile station should begin monitoring the Broadcast Control Channel in the first bit  
 40 of the slot. The mobile station should continue to monitor the Broadcast Control Channel

until one of the following conditions is satisfied:

- The mobile station has monitored all frames of a Broadcast Control Channel slot and the frame quality for all of the frames of the slot was insufficient; or
- The mobile station monitors the Broadcast Control Channel slot specified by the enhanced broadcast page and the slot did not contain an SCI bit set to '1' (see [4]).
- The mobile station has received a broadcast *Data Burst Message* having the same BURST\_TYPE and broadcast address as the enhanced broadcast page which announced the *Data Burst Message*.

#### 2.6.2.1.1.3.2 Determination of the Slot Cycle Index

When the SID and NID of the current base station (SID<sub>s</sub> and NID<sub>s</sub>, as stored from the *System Parameters Message* or *ANSI-41 System Parameters Message*) do not match any entry of SID\_NID\_LIST<sub>s</sub>, the mobile station shall use a slot cycle index no greater than the smaller of MAX\_SLOT\_CYCLE\_INDEX<sub>s</sub> and 1; otherwise:

- If RSC\_MODE\_ENABLED is equal to YES, the mobile station shall use a slot cycle index no greater than min(RSCI<sub>s</sub>, SLOT\_CYCLE\_INDEX<sub>s</sub>).
- Otherwise, the mobile station shall use a slot cycle index no greater than SLOT\_CYCLE\_INDEX<sub>s</sub> (see 2.6.2.2.1.6).

If the mobile station is directed by the user to modify the preferred slot cycle index (SLOT\_CYCLE\_INDEX<sub>p</sub>), the mobile station shall perform parameter-change registration (see 2.6.5.1.6).

#### 2.6.2.1.1.3.3 Slot Cycles for Broadcast Message Transmission

##### 2.6.2.1.1.3.3.1 Slot Cycles for Broadcast Message Transmission on the Paging Channel

Distribution of broadcast messages relies on specially defined Paging Channel slot cycles. The definitions are as follows:

*Maximum paging cycle:* On the Paging Channel, a maximum paging cycle is a Paging Channel slot cycle (see 2.6.2.1.1.3.1) having a duration of M slots such that:

$$M = 2^i \times 16, 0 \leq i \leq 7$$

where  $i = \text{MAX\_SLOT\_CYCLE\_INDEX}_s$  as received in the *System Parameters Message*.

The first slot of each maximum paging cycle is any Paging Channel slot in which

$$\lfloor t/4 \rfloor \bmod M = 0,$$

where t represents system time in 20ms frames.

*Broadcast paging cycle:* On the Paging Channel, a broadcast paging cycle is a Paging Channel slot cycle (see 2.6.2.1.1.3.1) having a duration of B + 3 slots where:

$$B = 2^i \times 16, 1 \leq i \leq 7$$

where  $i = \text{BCAST\_INDEX}_S$  as received in the *Extended System Parameters Message*, or set by default when the *Extended System Parameters Message* is not sent.

The first slot of each broadcast paging cycle is any Paging Channel slot in which

$$\lfloor t/4 \rfloor \bmod (B + 3) = 0,$$

where  $t$  represents system time in 20ms frames.

#### 2.6.2.1.1.3.3.2 Slot Cycles for Broadcast Message Transmission on the Forward Common Control Channel

Distribution of broadcast messages relies on specially defined Forward Common Control Channel slot cycles. The definitions are as follows:

*Maximum paging cycle:* On the Forward Common Control Channel, a maximum paging cycle is a Forward Common Channel slot cycle (see 2.6.2.1.1.3.1) having a duration of  $M$  slots such that:

$$M = 2^i \times 16, 0 \leq i \leq 7$$

where  $i = \text{MAX\_SLOT\_CYCLE\_INDEX}_S$  as received in the *MC-RR Parameters Message*.

The first slot of each maximum paging cycle is any Forward Common Control Channel slot in which

$$\lfloor t/4 \rfloor \bmod M = 0,$$

where  $t$  represents system time in 20ms frames.

*Broadcast paging cycle:* On the Forward Common Control Channel, a broadcast paging cycle is a Forward Common Control Channel slot cycle (see 2.6.2.1.1.3.1) having a duration of  $B + 7$  slots where:

$$B = 2^{1+i} \times 16, 1 \leq i \leq 7$$

where  $i = \text{BCAST\_INDEX}_S$  as received in the *MC-RR Parameters Message*.

The first slot of each broadcast paging cycle is any Forward Common Control Channel slot in which

$$\lfloor t/4 \rfloor \bmod (B + 7) = 0,$$

where  $t$  represents system time in 20ms frames.

#### 2.6.2.1.1.3.4 Monitoring Paging Channel Broadcasts

The following requirements apply to mobile stations monitoring the Paging Channel and supporting the reception of broadcast messages.

- 1 If  $BCAST\_INDEX_S$  is equal to '000', the mobile station shall monitor only its assigned  
2 Paging Channel slots (see 2.6.2.1.1.3.1).
- 3 If  $BCAST\_INDEX_S$  is not equal to '000', and the mobile station is configured to receive  
4 messages addressed to broadcast addresses, the mobile station should also monitor the  
5 Paging Channel beginning with the first slot of each broadcast paging cycle (see  
6 2.6.2.1.1.3.3).
- 7 If the mobile station receives a broadcast page containing a burst type and broadcast  
8 address for a *Data Burst Message* that the mobile station has been configured to receive  
9 (see 2.6.2.3), the mobile station should monitor the slot in which the corresponding  
10 broadcast Paging Channel message will be sent, determined as follows:
  - 11 • The mobile station shall consider a broadcast page to have been received in the  
12 paging slot in which the *General Page Message* containing the broadcast page  
13 began.
  - 14 • If  $BCAST\_INDEX_S$  is not equal to '000', the paging slot containing the broadcast  
15 page is defined as the reference slot.
  - 16 • Let  $n$  represent the ordinal number of the broadcast page relative to other  
17 broadcast pages that are contained in the same *General Page Message* ( $n = 1, 2,$   
18  $3, \dots$ ). The mobile station should monitor the Paging Channel slot that occurs  $n \times 3$   
19 paging slots after the reference slot.
- 20 After receiving a broadcast message or a broadcast page for a *Data Burst Message* and a  
21 corresponding broadcast Paging Channel message when  $BCAST\_INDEX_S$  is not equal to  
22 '000', the mobile station should discard all further broadcast pages and all further  
23 broadcast Paging Channel messages containing the same  $BURST\_TYPE$  and  $BC\_ADDR$   
24 fields that are received within  $4 \times (B + 3)$  paging slots of the first paging slot in the  
25 broadcast paging cycle in which the broadcast page or broadcast message was first  
26 received. ( $B + 3$  is the duration of the broadcast paging cycle as defined in 2.6.2.1.1.3.3).
- 27 After receiving a broadcast message or a broadcast page for a *Data Burst Message* and a  
28 corresponding broadcast Paging Channel message when  $BCAST\_INDEX_S$  is equal to '000',  
29 the mobile station should discard all further broadcast pages and all further broadcast  
30 Paging Channel messages containing the same  $BURST\_TYPE$  and  $BC\_ADDR$  fields that are  
31 received within  $16 \times 2^{MAX\_SLOT\_CYLCE\_INDEX_S}$  slots of the paging slot in which the  
32 broadcast page or broadcast message was first received.
- 33 If the mobile station receives a broadcast page containing a burst type and broadcast  
34 address for BCMC that the mobile station has been configured to receive (see 2.6.2.3), the  
35 mobile station shall do the following:

- 1 • If the burst type and broadcast address<sup>4</sup> indicates that response to the broadcast  
2 page is required, then the mobile station shall enter the *Update Overhead*  
3 *Information Substate* of the *System Access State* (see 2.6.3.2) with a page response  
4 indication within T<sub>33m</sub> seconds after the page message is received.
- 5 • If the burst type and broadcast address indicates to monitor broadcast messages,  
6 then the mobile station shall continue to monitor the paging channel for a *BCMC*  
7 *Service Parameters Message* containing the BCMC\_FLOW\_ID in the broadcast  
8 address as follows:
  - 9 – The mobile station shall monitor the F-PCH for the duration of four F-PCH slots  
10 from the slot in which the broadcast page was received or until the *BCMC*  
11 *Service Parameters Message* containing the BCMC\_FLOW\_ID is received; if the  
12 mobile station detects the start of the *BCMC Service Parameters Message*, the  
13 mobile station shall monitor the F-PCH until the entire *BCMC Service*  
14 *Parameters Message* is received.

#### 15 2.6.2.1.1.3.5 Support of Broadcast Delivery Options on the Paging Channel

16 A mobile station configured to receive broadcast messages shall support reception of  
17 broadcast messages transmitted using Multi-Slot Broadcast Message Transmission (see  
18 3.6.2.4.1.1.2.1.1).

19 A mobile station configured to receive broadcast messages shall support reception of  
20 broadcast messages transmitted using Periodic Broadcast Paging (see 3.6.2.4.1.1.2.1.2).

#### 21 2.6.2.1.1.3.6 Monitoring the Forward Common Control Channel for the Enhanced 22 Broadcast Page

23 The following requirements apply to mobile stations monitoring the Forward Common  
24 Control Channel and supporting the reception of broadcast messages.

25 If BCAST\_INDEX<sub>S</sub> is equal to '000', the mobile station shall monitor only its assigned  
26 Quick Paging Channel slots or its assigned Forward Common Control Channel slots (see  
27 2.6.2.1.2) for enhanced broadcast pages.

28 If BCAST\_INDEX<sub>S</sub> is not equal to '000', and the mobile station is configured to receive  
29 messages addressed to broadcast addresses, the mobile station should also monitor the  
30 Quick Paging Channel broadcast slots or the Forward Common Control Channel broadcast  
31 slots (see 2.6.2.1.2) beginning with the first slot of each broadcast paging cycle.

32 If the mobile station receives an enhanced broadcast page containing a burst type and  
33 broadcast address for a *Data Burst Message* that the mobile station has been configured to  
34 receive and NUM\_BCCH\_BCAST<sub>S</sub> does not equal '000', the mobile station should monitor  
35 at least one Broadcast Control Channel slot in which the corresponding broadcast  
36 message will be sent, determined as follows:

---

<sup>4</sup> Format of broadcast address for BCMC is defined in BCMC service document (see [30]).

- The mobile station shall monitor the Broadcast Control Channel slot which begins  $40 \text{ ms} \times (1 + \text{TIME\_OFFSET})$  later than the beginning of the slot in which the message containing the enhanced broadcast page began or the Broadcast Control Channel slot which begins  $40 \text{ ms} \times (1 + \text{REPEAT\_TIME\_OFFSET})$  later than the Broadcast Control Channel slot in which the first transmission began.

If the mobile station receives an enhanced broadcast page containing a burst type and broadcast address for a *Data Burst Message* that the mobile station has been configured to receive and  $\text{NUM\_BCCH\_BCAST}_s$  equals '000', the mobile station should monitor the slot in which the corresponding broadcast Forward Common Control Channel message will be sent, determined as follows:

- The mobile station shall consider an enhanced broadcast page to have been received in the Forward Common Control Channel slot in which the *General Page Message* or the *Universal Page Message* containing the enhanced broadcast page began.
- When  $\text{NUM\_BCCH\_BCAST}_s$  equals 0, the mobile station shall monitor the Forward Common Control Channel slot which begins  $40 \text{ ms} \times (1 + \text{TIME\_OFFSET})$  later than the beginning of the slot in which the message containing the enhanced broadcast page began or the Forward Common Control Channel slot which begins  $40 \text{ ms} \times (1 + \text{REPEAT\_TIME\_OFFSET})$  later than the Forward Common Control Channel slot in which the first transmission began.

After receiving an enhanced broadcast page for a *Data Burst Message* and a corresponding broadcast message when  $\text{BCAST\_INDEX}_s$  is not equal to '000', the mobile station should discard all further enhanced broadcast pages containing the same  $\text{BURST\_TYPE}$  and having the same broadcast address that are received within  $4 \times (B + 7)$  slots of the first slot in the broadcast paging cycle in which the enhanced broadcast page was received. ( $B + 7$  is the duration of the broadcast paging cycle as defined in 2.6.2.1.1.3.3.1). The mobile station should ignore broadcast messages for which a corresponding enhanced broadcast page was not received.

After receiving an enhanced broadcast page for a *Data Burst Message* and a corresponding broadcast message when  $\text{BCAST\_INDEX}_s$  is equal to '000', the mobile station should discard all further enhanced broadcast pages containing the same  $\text{BURST\_TYPE}$  and having the same broadcast address that are received within  $16 \times 2^{\text{MAX\_SLOT\_CYLCE\_INDEX}_s}$  slots of the slot in which the enhanced broadcast page was received. The mobile station should ignore broadcast messages for which a corresponding enhanced broadcast page was not received.

If the mobile station received an enhanced broadcast page for a *Data Burst Message* and a corresponding broadcast message, and the broadcast message announced by a pending enhanced broadcast page containing the same  $\text{BURST\_TYPE}$  and having the same broadcast address has not yet been received, the mobile station shall ignore the pending enhanced broadcast page.

If the mobile station receives a broadcast page containing a burst type and broadcast address for BCMC that the mobile station has been configured to receive (see 2.6.2.3), the mobile station shall do the following:

- If the burst type and broadcast address indicates that response to the broadcast page is required, then the mobile station shall enter the *Update Overhead Information Substate* of the *System Access State* (see 2.6.3.2) with a page response indication within  $T_{33m}$  seconds after the page message is received.

- If the burst type and broadcast address indicates to monitor broadcast messages, then the mobile station shall monitor the Primary Broadcast Control Channel slot for a *BCMC Service Parameters Message* containing the BCMC\_FLOW\_ID in the broadcast address, determined as follows:

- The mobile station shall start monitoring the Primary Broadcast Control Channel slot which begins  $40 \text{ ms} \times (1 + \text{TIME\_OFFSET})$  later than the beginning of the slot in which the message containing the enhanced broadcast page began or the Primary Broadcast Control Channel slot which begins  $40 \text{ ms} \times (1 + \text{REPEAT\_TIME\_OFFSET})$  later than the Primary Broadcast Control Channel slot in which the first transmission began.
- The mobile station shall continue to monitor the Primary Broadcast Control Channel for the duration of four F-BCCH slots or until the *BCMC Service Parameters Message* containing the BCMC\_FLOW\_ID is received; if the mobile station detects the start of the *BCMC Service Parameters Message*, the mobile station shall monitor the F-BCCH until the entire *BCMC Service Parameters Message* is received.

#### 2.6.2.1.1.3.7 Support of Broadcast Delivery Options on the Forward Common Control Channel/Broadcast Control Channel when NUM\_BCCH\_BCAST<sub>s</sub> does not equal '000'

A mobile station configured to receive broadcast messages shall support reception of broadcast messages transmitted using Multi-Slot Enhanced Broadcast Paging (see 2.6.2.1.1.1.3.1).

A mobile station configured to receive broadcast messages shall support reception of broadcast messages transmitted using Periodic Enhanced Broadcast Paging (see 2.6.2.1.1.1.3.2).

#### 2.6.2.1.1.3.7.1 Support of Broadcast Delivery Options on the Forward Common Control Channel when NUM\_BCCH\_BCAST<sub>s</sub> equals '000'

A mobile station configured to receive broadcast messages shall support reception of broadcast messages transmitted using Multi-Slot Enhanced Broadcast Message Transmission (see 2.6.2.1.1.1.4.1).

A mobile station configured to receive broadcast messages shall support reception of broadcast messages transmitted using Periodic Enhanced Broadcast Paging (see 2.6.2.1.1.1.4.2).

### 2.6.2.1.1.3.8 Slot Cycles for BSPM Transmission

#### 2.6.2.1.1.3.8.1 BSPM Slot Cycle on the Paging Channel

On the Paging Channel, a BSPM slot cycle is a Paging Channel slot cycle having a duration of  $B + 1$  slots where:

$$B = 2^i \times 16, 0 \leq i \leq 15$$

where  $i = \text{BSPM\_PERIOD\_INDEX}_S$  as received in the *Extended System Parameters Message*.

The first slot of each BSPM slot cycle is any Paging Channel slot in which

$$\lfloor t/4 \rfloor \bmod (B + 1) = 0,$$

where  $t$  represents system time in 20ms frames.

#### 2.6.2.1.1.3.8.2 BSPM Slot Cycle on the Primary Broadcast Control Channel

On the Primary Broadcast Control Channel, a BSPM slot cycle is a Primary Broadcast Control Channel slot cycle having a duration of  $B + 1$  slots where:

$$B = 2^i \times 16, 0 \leq i \leq 15$$

where  $i = \text{BSPM\_PERIOD\_INDEX}_S$  as received in the *MC-RR Parameters Message*.

The first slot of each BSPM slot cycle is any Primary Broadcast Control Channel slot in which

$$\lfloor t/2 \rfloor \bmod (B + 1) = 0, (40\text{ms})$$

$$\lfloor t/4 \rfloor \bmod (B + 1) = 0, (80\text{ms})$$

$$\lfloor t/8 \rfloor \bmod (B + 1) = 0, (160\text{ms})$$

where  $t$  represents system time in 20ms frames and the number in the parenthesis represents the duration of the Primary Broadcast Control Channel slot (see [2]).

#### 2.6.2.1.1.4 Common Channel Supervision

The mobile station shall monitor the Paging Channel, the Forward Common Control Channel, or the Primary Broadcast Control Channel as specified in 2.6.2.1.1. The mobile station shall set a timer for  $T_{30m}$  seconds whenever it begins to monitor the Paging Channel, the Forward Common Control Channel, or the Primary Broadcast Control Channel. The mobile station shall reset the timer for  $T_{30m}$  seconds whenever it gets an indication that a valid message was received on the Paging Channel, the Forward Common

Control Channel, or the Primary Broadcast Control Channel, whether addressed to the mobile station or not (see [4]). The mobile station shall disable the timer when it is not monitoring the Paging Channel, the Forward Common Control Channel, or the Primary Broadcast Control Channel. If the timer expires, the mobile station shall declare a loss of the Paging Channel, the Forward Common Control Channel, or the Primary Broadcast Control Channel.

#### 2.6.2.1.2 Quick Paging Channel Monitoring Procedures

##### 2.6.2.1.2.1 Overview

The Quick Paging Channel is divided into 80 ms slots called Quick Paging Channel slots.

The Quick Paging Channel protocol provides for scheduling the transmission of paging indicators for a mobile station in Quick Paging Channel slots assigned to the mobile station. Support of this feature is optional.

The Quick Paging Channel protocol provides for scheduling the transmission of configuration change indicators for mobile stations in Quick Paging Channel slots. Support of this feature is optional.

The Quick Paging Channel protocol provides for scheduling the transmission of broadcast indicators for mobile stations in Quick Paging Channel broadcast slots. Support of this feature is optional.

If the mobile station is operating in the slotted mode and it supports the Quick Paging Channel, and QPCH\_SUPPORTED<sub>S</sub> is equal to '1', the mobile station monitors paging indicators on the Quick Paging Channel<sup>5</sup> as follows:

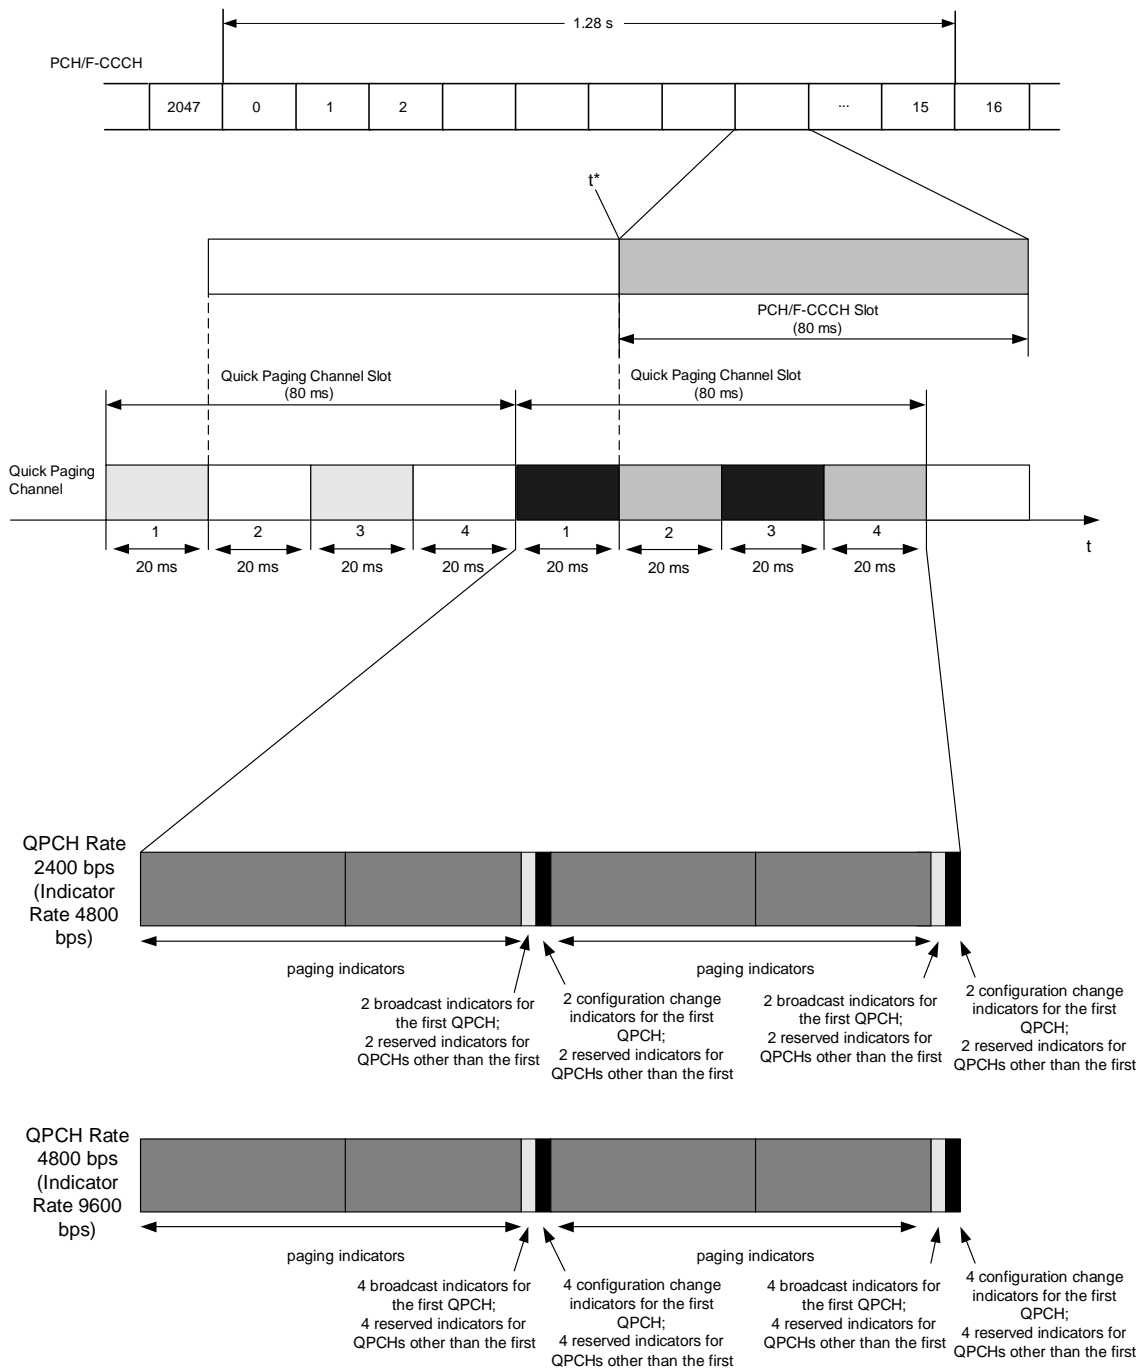

The mobile station's assigned Quick Paging Channel slots are offset from its assigned Paging Channel slots or its assigned Forward Common Control Channel slots by 100 ms, as shown in Figure 2.6.2.1.2.1-1. Two paging indicators are assigned to a mobile station in its assigned Quick Paging Channel slot. In the following,  $t^*$  is the start time of the mobile station's assigned Paging Channel or Forward Common Control Channel slot. According to the hash function specified in 2.6.7.1, paging indicators are assigned as follows:

- The first paging indicator for the mobile station is assigned between  $(t^*-100)$  ms and  $(t^*-80)$  ms (marked as 1 in Figure 2.6.2.1.2.1-1) and the second paging indicator is assigned between  $(t^*-60)$  ms and  $(t^*-40)$  ms (marked as 3 in the figure); or
- The first paging indicator for the mobile station is assigned between  $(t^*-80)$  ms and  $(t^*-60)$  ms (marked as 2 in the figure) and the second paging indicator is assigned between  $(t^*-40)$  ms and  $(t^*-20)$  ms (marked as 4 in the figure).

---

<sup>5</sup> One exception is if the mobile station is operating in the reduced slot cycle mode with a reduced slot cycle index of -3 or -4, and IGNORE\_QPCH<sub>S</sub> is equal to '1'.

- 1 If the mobile station is operating in the slotted mode and it supports the Quick Paging  
2 Channel, the mobile station can, when performing an idle handoff to a base station whose  
3 Paging Channel or Forward Common Control Channel/Primary Broadcast Control Channel  
4 has recently been monitored, monitor one or more configuration change indicators.  
5 Configuration change indicators are scheduled every 40 ms on the first Quick Paging  
6 Channel.
- 7 If the mobile station is operating in the slotted mode, is configured to receive the broadcast  
8 messages, supports the Quick Paging Channel,  $BCAST\_INDEX_S$  is not equal to '000',  
9  $QPCH\_SUPPORTED_S$  is equal to '1', and  $QPCH\_BI\_SUPPORTED_S$  is equal to '1', the mobile  
10 station monitors broadcast indicators on the Quick Paging Channel as follows:
- 11 • The mobile station's assigned Quick Paging Channel broadcast slots are offset from  
12 its assigned Forward Common Control Channel or Paging Channel broadcast slots  
13 by 100 ms, as shown in Figure 2.6.2.1.2.1-1.
  - 14 • The mobile station monitors one or more broadcast indicators in an assigned Quick  
15 Paging Channel broadcast slot.

**Figure 2.6.2.1.2.1-1. Quick Paging Channel Timeline**

### 2.6.2.1.2.2 Requirements

A mobile station operating in the slotted mode should monitor the paging indicators in the mobile station's assigned Quick Paging Channel slot if all of the following conditions hold:

- The mobile station supports the Quick Paging Channel;
- QPCH\_SUPPORTED<sub>S</sub> = '1'; and
- The mobile station is not monitoring the Paging Channel or the Forward Common Control Channel.

The mobile station's assigned Quick Paging Channel slots shall be those slots in which

$$(\lfloor (t+5)/4 \rfloor - \text{PGSLOT}) \bmod (16 \times T) = 0.$$

where  $t$  is the System Time in 20ms frames, PGSLOT is selected in the range 0 to 2047 by using the hash function specified in 2.6.7.1, and  $T$  is the slot cycle length in units of 1.28 seconds such that

$$T = 2^i,$$

and  $i$  is the slot cycle index which can take the values -4, -3, -2, -1, 0, 1, 2, 3, 4, 5, 6, and 7.

To determine the position of the mobile station's two assigned paging indicators relative to the beginning of the mobile station's assigned Quick Paging Channel slot, the mobile station shall use the hash function specified in 2.6.7.1. The R1 and R2 outputs of the hashing algorithm correspond to an indicator bit position relative to the beginning of the Quick Paging Channel slot. The hashing algorithm is so devised that two paging indicators (R1 and R2) for a mobile station will be in the first and third quarter slot or the second and fourth quarter slot.

If the mobile station checks assigned paging indicators, the mobile station shall perform the following:

- If the mobile station detects that one of the paging indicators is set to "OFF", the mobile station need not detect another paging indicator.
- If the mobile station does not detect that at least one of the paging indicators is set to "OFF", the mobile station shall monitor its assigned Paging Channel or Forward Common Control Channel slot immediately following its assigned Quick Paging Channel slot.<sup>6</sup>

When performing an idle handoff to a base station whose Paging Channel or Forward Common Control Channel was previously monitored, a mobile station operating in the

---

<sup>6</sup> A case for which the mobile station may not be able to detect that at least one of the paging indicators is set to "OFF" is for a mobile station that misses a part of or its entire Quick Paging Channel slot during overhead information update. In this case, the mobile station monitors its assigned Paging Channel slot.

1 slotted mode should monitor one or more configuration change indicators on the first  
2 Quick Paging Channel for the new base station if all of the following conditions hold:

- 3 • The mobile station supports the Quick Paging Channel;
- 4 • The mobile station has knowledge that the new base station supports the Quick  
5 Paging Channel;
- 6 • The mobile station has knowledge that the new base station supports configuration  
7 change indicators,
- 8 • The mobile station is not monitoring the Paging Channel or the Forward Common  
9 Control Channel; and
- 10 • No more than  $T_{31m}$  seconds have elapsed since the mobile station last received a  
11 valid message on the new Paging Channel or the new Forward Common Control  
12 Channel.

13 Before monitoring a configuration change indicator, the mobile station shall perform the  
14 following:

- 15 • The mobile station shall set  $ASSIGNED\_QPAGECH_S$  equal to  $QPAGECH_S$ , and
- 16 • The mobile station shall set  $QPAGECH_S$  equal to 1.

17 Before monitoring a paging indicator subsequent to monitoring a configuration change  
18 indicator, the mobile station shall set  $QPAGECH_S$  equal to  $ASSIGNED\_QPAGECH_S$ .

19 If the Quick Paging Channel data rate is 2400 bps (indicator rate is 4800 bps), the bit  
20 positions of the mobile station's first pair of configuration change indicators shall be the  
21 last two bits in the first 40 ms half of a Quick Paging Channel slot. The bit positions of the  
22 mobile station's second pair of configuration change indicators shall be the last two bits in  
23 a Quick Paging Channel slot.

24 If the Quick Paging Channel data rate is 4800 bps (indicator rate is 9600 bps), the bit  
25 positions of the mobile station's first four configuration change indicators shall be the last  
26 four bits in the first 40 ms half of a Quick Paging Channel slot. The bit positions of the  
27 mobile station's second four configuration change indicators shall be the last four bits in a  
28 Quick Paging Channel slot.

29 If the mobile station monitors a configuration change indicator and determines that it is  
30 set to "OFF", the mobile station can enter or remain in the slotted mode after an idle  
31 handoff (see 2.6.2.1.4.2).

32 If a mobile station is operating in the slotted mode and is configured to receive broadcast  
33 messages, it should monitor the broadcast indicators in the mobile station's assigned  
34 Quick Paging Channel broadcast slot if all of the following conditions hold:

- 35 • The mobile station supports the Quick Paging Channel;
- 36 •  $BCAST\_INDEX_S$  is not equal to '000'
- 37 •  $QPCH\_BI\_SUPPORTED_S = '1'$ ; and
- 38 • The mobile station is not monitoring the Forward Common Control Channel, the  
39 Primary Broadcast Control Channel, or the Paging Channel.

The mobile station's assigned Quick Paging Channel broadcast slots shall be those slots in which

$$\lfloor (t+5)/4 \rfloor \bmod (B + 7) = 0.$$

where  $t$  is the System Time in 20ms frames, and  $B$  is the broadcast paging cycle such that  $B = 2^{1+i} \times 16$ ,  $1 \leq i \leq 7$  and  $i = \text{BCAST\_INDEX}_s$  as received in the *MC-RR Parameters Message*.

The mobile station's assigned Quick Paging Channel broadcast slots shall be those slots in which

$$\lfloor (t+5)/4 \rfloor \bmod (B + 3) = 0.$$

where  $t$  is the System Time in 20ms frames, and  $B$  is the broadcast paging cycle such that  $B = 2^i \times 16$ ,  $1 \leq i \leq 7$  and  $i = \text{BCAST\_INDEX}_s$  as received in the *Extended System Parameters Message*.

The mobile station should monitor one or more broadcast indicators on the Quick Paging Channel. If the Quick Paging Channel data rate is 2400 bps (indicator rate is 4800 bps), the bit positions of the mobile station's first pair of broadcast indicators shall be the two bits prior to the last two bits in the first 40 ms half of a Quick Paging Channel slot. The bit positions of the mobile station's second pair of broadcast indicators shall be the two bits prior to the last two bits in a Quick Paging Channel slot.

If the Quick Paging Channel data rate 4800 bps (indicator rate is 9600 bps), the bit positions of the mobile station's first four broadcast indicators shall be the four bits prior to the last four bits in the first 40 ms half of a Quick Paging Channel slot. The bit positions of the mobile station's second four broadcast indicators shall be the four bits prior to the last four bits in a Quick Paging Channel slot.

If the mobile station monitors broadcast indicators and determines that they are not set to "OFF", the mobile station should perform the following:

- The mobile station should receive its assigned broadcast slot on the Forward Common Control Channel or Paging Channel immediately following its assigned Quick Paging Channel broadcast slot.

#### 2.6.2.1.3 Registration

While in the *Mobile Station Idle State*, the mobile station shall perform the registration procedures specified in 2.6.5.5.2.1.

#### 2.6.2.1.4 Idle Handoff

##### 2.6.2.1.4.1 Pilot Search

An idle handoff occurs when a mobile station has moved from the coverage area of one base station into the coverage area of another base station during the *Mobile Station Idle State*. If the mobile station detects a Pilot Channel signal from another base station that is sufficiently stronger than that of the current base station, the mobile station determines that an idle handoff should occur.

If both AP\_IDT\_MSG\_SEQ<sub>s</sub> and INTRA\_FREQ\_HO\_HYS<sub>s</sub> are not set to NULL, the mobile station shall only perform idle handoff to another pilot on the same frequency as the current base station when the following condition is satisfied:

Target Pilot Ec/Io (dB) > (INTRA\_FREQ\_HO\_SLOPE<sub>s</sub>/8) × Current Pilot Ec/Io (dB) + INTRA\_FREQ\_HO\_HYS<sub>s</sub> (dB).

If both AP\_IDT\_MSG\_SEQ<sub>s</sub> and INTER\_FREQ\_HO\_HYS<sub>s</sub> are not set to NULL, the mobile station shall only perform idle handoff to another pilot on a different frequency than that of the current base station when the following condition is satisfied:

Target Pilot Ec/Io (dB) > (INTER\_FREQ\_HO\_SLOPE<sub>s</sub>/8) × Current Pilot Ec/Io (dB) + INTER\_FREQ\_HO\_HYS<sub>s</sub> (dB).

When multiple idle handoff candidates are available, the mobile station should select, if any, a candidate which supports Primary Broadcast Control Channel.

Pilot Channels are identified by their offsets relative to the zero offset pilot PN sequence (see 3.1.3.2.1). Pilot offsets are grouped into sets describing their status with regard to pilot searching.

The following sets of pilot offsets are defined for a mobile station in the *Mobile Station Idle State*. Each pilot offset is a member of only one set.

- Active Set: The pilot offset of the Forward CDMA Channel whose Paging Channel or Forward Common Control Channel is being monitored.
- Neighbor Set: The offsets of the Pilot Channels that are likely candidates for idle handoff. The members of the Neighbor Set are specified in the *Neighbor List Message*, *Extended Neighbor List Message*, and the *General Neighbor List Message* on the Paging Channel, and the *Universal Neighbor List Message* on the Primary Broadcast Control Channel.
- Remaining Set: The set of all possible pilot offsets in the current system (integer multiples of PILOT\_INC<sub>s</sub>) on the current CDMA Frequency Assignment, excluding the pilots in the Neighbor Set and the Active Set.
- Private Neighbor Set: The offsets of the Pilot Channels for the private systems that are likely candidates for idle handoff. The members of the Private Neighbor Set are specified in the *Private Neighbor List Message*.

The mobile station shall support a Neighbor Set size of at least Ng<sub>m</sub> pilots (see Annex D).

In the *Mobile Station Idle State*, the mobile station shall continuously search for the strongest Pilot Channel signal on the corresponding CDMA Frequency Assignment whenever it monitors the Paging Channel or the Forward Common Control Channel.

The mobile station may search other frequencies and band classes. For example, if a pilot in the Neighbor Set or in the Private Neighbor Set is on a different Frequency Assignment than that of the mobile station, this frequency should be included in the search criteria. Search performance criteria are defined in [11]. If both AP\_IDT\_MSG\_SEQ<sub>s</sub> and INTER\_FREQ\_SRCH\_TH<sub>s</sub> are not set to NULL, the MS shall only start searching on

different frequencies than that of the current pilot when its current pilot  $E_c/I_o$  is below  $INTER\_FREQ\_SRCH\_TH_S$ .

This search should be governed by the following:

- **Active Set:** The search window size for the pilot in the Active Set shall be the number of PN chips specified in Table 2.6.6.2.1-1 corresponding to  $SRCH\_WIN\_A_S$ . The mobile station should center the search window for the pilot of the Active Set around the earliest arriving usable multipath component of the pilot. If the mobile station receives a value greater than or equal to 13 for  $SRCH\_WIN\_A_R$ , it may store and use the value 13 in  $SRCH\_WIN\_A_S$ .
- **Neighbor Set:** The search window size for each pilot in the Neighbor Set shall be the number of PN chips specified in Table 2.6.6.2.1-1 corresponding to  $SRCH\_WIN\_NGHBR_S$  field of the  $NGHBR\_REC$  for the pilot. The mobile station should center the search window for each pilot in the Neighbor Set around the pilot's PN sequence offset plus the corresponding  $SRCH\_OFFSET\_NGHBR_S$  (see Table 2.6.6.2.1-2) using timing defined by the mobile station's time reference (see [2]). The mobile station should use the  $SEARCH\_PRIORITY$  field of the  $NGHBR\_REC$  for the corresponding pilot to schedule its neighbor search. If  $ADD\_PILOT\_REC\_INCL$  field of the  $NGHBR\_REC$  for the corresponding pilot is equal to '1', the mobile station shall use the information included in the  $NGHBR\_PILOT\_REC$  field for searching the neighbor.  
If the mobile station supports hopping pilot beacons and the  $TIMING\_INCL$  field of the  $NGHBR\_REC$  for the corresponding pilot is equal to '1', then the mobile station shall use the information included in the  $NGHBR\_TX\_OFFSET$ ,  $NGHBR\_TX\_DURATION$ , and  $NGHBR\_TX\_PERIOD$  fields of the  $NGHBR\_REC$  for the corresponding pilot to schedule the time for searching the neighbor.
- **Remaining Set:** The search window size for each pilot in the Remaining Set shall be the number of PN chips specified in Table 2.6.6.2.1-1 corresponding to  $SRCH\_WIN\_R_S$ . The mobile station should center the search window for each pilot in the Remaining Set around the pilot's PN sequence offset using timing defined by the mobile station's time reference (see [2]). The mobile station should only search for Remaining Set pilots whose pilot PN sequence offset indices are equal to integer multiples of  $PILOT\_INC_S$ .
- **Private Neighbor Set:** The search window size for each pilot in the Private Neighbor Set shall be the number of PN chips specified in Table 2.6.6.2.1-1 corresponding to  $SRCH\_WIN\_PRI\_NGHBR_S$  field of the  $PRI\_NGHBR\_REC$  for the pilot. The mobile station should center the search window for each pilot in the Private Neighbor Set around the pilot's PN sequence offset using timing defined by the mobile station's time reference (see [2]).

If the mobile station determines that one of the Neighbor Set, Private Neighbor Set or Remaining Set Pilot Channel signals is sufficiently stronger (see [11]) than the Pilot Channel of the Active Set, the mobile station should perform an idle handoff as follows:

- If the mobile station is currently monitoring a Forward Supplemental Channel, the mobile station shall perform an idle handoff as specified in 2.6.13.4;

- 1       • Otherwise, the mobile station shall perform an idle handoff as specified in  
2       2.6.2.1.4.2.

3       If RER\_MODE\_ENABLED is equal to YES, the mobile station performs idle handoff to a  
4       Pilot Channel that is not in RER\_PILOT\_LIST (see 2.6.4.4.2 and [4]), RER\_SID<sub>s</sub> is equal to  
5       SID<sub>s</sub>, RER\_NID<sub>s</sub> is equal to NID<sub>s</sub>, and RER\_MODE\_SUPPORTED<sub>s</sub> is equal to '1', the mobile  
6       station shall send a *Radio Environment Message* by performing the *Mobile Station Message*  
7       *Transmission Operation* as specified in 2.6.2.6.

8       A mobile station operating in slotted mode, which is successfully demodulating the Paging  
9       Channel or the Forward Common Control Channel, should not perform an idle handoff  
10      while it is required to monitor its assigned slot (see 2.6.2.1.1.3.1).

#### 11      2.6.2.1.4.2 Idle Handoff Procedures

12      While performing an idle handoff, the mobile station should not begin operating in non-  
13      slotted mode after the idle handoff if all of the following conditions hold:

- 14      • The mobile station supports the Quick Paging Channel;
- 15      • The mobile station has knowledge that the new base station supports configuration  
16      change indicators;
- 17      • The mobile station determines that the Quick Paging Channel configuration change  
18      indicator for the new Quick Paging Channel is set to "OFF" (see 2.6.2.1.2.1); and
- 19      • No more than T<sub>31m</sub> seconds have elapsed since the mobile station last received a  
20      valid message on the new Paging Channel or Forward Common Control  
21      Channel/Primary Broadcast Control Channel.

22      Otherwise, the mobile station shall operate in non-slotted mode until the mobile station  
23      has received at least one valid configuration message or mobile station-addressed page on  
24      the new Paging Channel or Forward Common Control Channel/Primary Broadcast Control  
25      Channel. Following the reception of this message the mobile station may resume slotted  
26      mode operation in accordance with 2.6.2.1.1.3. After performing an idle handoff, the  
27      mobile station shall discard all unprocessed messages received on the old Paging Channel  
28      or Forward Common Control Channel/Primary Broadcast Control Channel.

29      If the new base station is listed in NGHBR\_REC\_LIST for the old base station (see  
30      2.6.2.2.3, 2.6.2.2.7, and 2.6.2.1.4.1), the mobile station shall use the corresponding 3-bit  
31      NGHBR\_CONFIG field to determine the actions required to transition to the new base  
32      station. If the new base station is not listed in NGHBR\_REC\_LIST for the old base station,  
33      the mobile station shall perform the handoff operation using the same procedure as for a  
34      pilot in NGHBR\_REC\_LIST with the NGHBR\_CONFIG field set to '011'.

35      If the mobile station is currently monitoring the Paging Channel and selected a neighbor  
36      base station for idle handoff which supports Primary Broadcast Control Channel, the  
37      mobile station shall perform the following:

- 38      – The mobile station shall enter the *System Determination Substate* of the *Mobile Station*  
39      *Initialization State* with a new system indication, upon performing idle handoff to this  
40      neighbor base station.

- 1    – The mobile station shall not perform any of the remaining procedures in this section.
- 2    If the NGHBR\_CONFIG field is '000', the mobile station shall perform the following:
- 3       • The mobile station shall set ACC\_MSG\_SEQ<sub>s</sub> and CURR\_ACC\_MSG\_SEQ to NULL  
4       (see 2.6.2.2) and shall set PILOT\_PN<sub>s</sub> to the pilot offset index of the base station  
5       transmitting the new Paging Channel or Forward Common Control  
6       Channel/Primary Broadcast Control Channel.
  - 7       • If the mobile station has not stored configuration parameters for the new Paging  
8       Channel or Forward Common Control Channel and Primary Broadcast Control  
9       Channel, or if the stored information is not current, the mobile station shall  
10      perform the following:
    - 11       – If the mobile station has monitored the Paging Channel before the idle handoff,  
12       the mobile station shall set CONFIG\_MSG\_SEQ<sub>s</sub>, SYS\_PAR\_MSG\_SEQ<sub>s</sub>,  
13       NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, EXT\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>,  
14       GEN\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, CHAN\_LST\_MSG\_SEQ<sub>s</sub>,  
15       EXT\_SYS\_PAR\_MSG\_SEQ<sub>s</sub>, GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub>,  
16       EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub>, EXT\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>,  
17       FD\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>, USER\_ZONE\_ID\_MSG\_SEQ<sub>s</sub>, and  
18       PRI\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub> to NULL.
    - 19       – If the mobile station has monitored the Forward Common Control  
20       Channel/Primary Broadcast Control Channel before the idle handoff, the mobile  
21       station shall set CONFIG\_MSG\_SEQ<sub>s</sub>, A41\_SYS\_PAR\_MSG\_SEQ<sub>s</sub>,  
22       UNI\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, MC\_RR\_PAR\_MSG\_SEQ<sub>s</sub>,  
23       EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub>, EXT\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>,  
24       FD\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>, USER\_ZONE\_ID\_MSG\_SEQ<sub>s</sub>, and  
25       PRI\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub> to NULL.
  - 26      • If the stored information for the new Paging Channel or the Forward Common  
27      Control Channel and Primary Broadcast Control Channel is current, the mobile  
28      station shall set CONFIG\_MSG\_SEQ<sub>s</sub> to the stored information for the new Paging  
29      Channel or Forward Common Control Channel and Primary Broadcast Control  
30      Channel, and the mobile station shall set NGHBR\_REC\_LIST to the stored  
31      information for the new Paging Channel or the new Forward Common Control  
32      Channel and Primary Broadcast Control Channel.
  - 33      • If the associated NGHBR\_BAND<sub>s</sub> or NGHBR\_FREQ<sub>s</sub> of the new base station in  
34      NGHBR\_REC\_LIST of the old base station is not equal to CDMABAND<sub>s</sub> and  
35      CDMACH<sub>s</sub> respectively, the mobile station shall set CDMABAND<sub>s</sub> to  
36      NGHBR\_BAND<sub>s</sub>, CDMACH<sub>s</sub> to NGHBR\_FREQ<sub>s</sub>, and tune to the new CDMA  
37      Channel. The mobile station shall begin monitoring the Paging Channel or the  
38      Forward Common Control Channel/Primary Broadcast Control Channel of the new  
39      base station, using the same rate, code rate, and code channel, as applicable.

- 1       • If  $PACA_S$  is equal to enabled, the mobile station shall enter the *Update Overhead*  
2       *Information Substate* of the *System Access State* (see 2.6.3) with an origination  
3       indication within  $T_{33m}$  seconds to re-originate the PACA call using the new base  
4       station.
- 5       If the NGHBR\_CONFIG field is '001', the mobile station shall perform the following:
  - 6       • The mobile station shall set  $ACC\_MSG\_SEQ_S$  and  $CURR\_ACC\_MSG\_SEQ$  to NULL  
7       and shall set  $PILOT\_PN_S$  to the pilot offset index of the base station transmitting  
8       the new Paging Channel.
  - 9       • If the stored information for Primary Paging Channel or any of the Paging Channels  
10       on the associated NGHBR\_FREQ<sub>S</sub> of the new base station in NGHBR\_REC\_LIST of  
11       the old base station is current, the mobile station shall perform the following:
    - 12       - The mobile station shall use the hash algorithm specified in 2.6.7.1 to select a  
13       new Paging Channel number in the range 1 to  $PAGE\_CHAN_S$ , where  
14        $PAGE\_CHAN_S$  is the value stored for the Paging Channel whose stored  
15       information is current. The mobile station shall store the new Paging Channel  
16       number as  $PAGECH_S$ . The mobile station shall perform the following:
      - 17       + If the mobile station has not stored configuration parameters for the new  
18       Paging Channel, or if the stored parameters are not current (see 2.6.2.2), the  
19       mobile station shall set  $CONFIG\_MSG\_SEQ_S$ ,  $SYS\_PAR\_MSG\_SEQ_S$ ,  
20        $NGHBR\_LST\_MSG\_SEQ_S$ ,  $EXT\_NGHBR\_LST\_MSG\_SEQ_S$ ,  
21        $GEN\_NGHBR\_LST\_MSG\_SEQ_S$ ,  $CHAN\_LST\_MSG\_SEQ_S$ ,  
22        $EXT\_SYS\_PAR\_MSG\_SEQ_S$ ,  $USER\_ZONE\_ID\_MSG\_SEQ_S$ ,  
23        $PRI\_NGHBR\_LST\_MSG\_SEQ_S$ , and  $EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ_S$ ,  
24        $EXT\_CHAN\_LST\_MSG\_SEQ_S$ ,  $FD\_CHAN\_LST\_MSG\_SEQ_S$ , and  
25        $GLOB\_SERV\_REDIR\_MSG\_SEQ_S$  to NULL.
      - 26       + If the stored information for the new Paging Channel is current, the mobile  
27       station shall set  $CONFIG\_MSG\_SEQ_S$  to the stored information for the new  
28       Paging Channel and set NGHBR\_REC\_LIST to the stored information for the  
29       new Paging Channel.
    - 30       - If the mobile station has monitored the Forward Common Control  
31       Channel/Primary Broadcast Control Channel before the idle handoff, the mobile  
32       station shall set Paging Channel data rate,  $PRAT_S = '00'$ .
    - 33       - If the associated NGHBR\_BAND<sub>S</sub> or NGHBR\_FREQ<sub>S</sub> of the new base station in  
34       NGHBR\_REC\_LIST of the old base station is not equal to  $CDMABAND_S$  and  
35        $CDMACH_S$  respectively, the mobile station shall set  $CDMABAND_S$  to  
36        $NGHBR\_BAND_S$ ,  $CDMACH_S$  to  $NGHBR\_FREQ_S$ , and tune to the new CDMA  
37       Channel. The mobile station shall begin monitoring the new Paging Channel of  
38       the new base station.

- 1       • If none of the Paging Channel stored information on the associated NGHBR\_FREQ<sub>s</sub>  
2       of the new base station in NGHBR\_REC\_LIST of the old base station are current,  
3       the mobile station shall perform the following:
  - 4       - The mobile station shall set CONFIG\_MSG\_SEQ<sub>s</sub>, SYS\_PAR\_MSG\_SEQ<sub>s</sub>,  
5       NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, EXT\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>,  
6       GEN\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, CHAN\_LST\_MSG\_SEQ<sub>s</sub>,  
7       EXT\_SYS\_PAR\_MSG\_SEQ<sub>s</sub>, GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub>,  
8       EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub>, EXT\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>,  
9       FD\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>, USER\_ZONE\_ID\_MSG\_SEQ<sub>s</sub>, and  
10       PRI\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub> to NULL.
  - 11       - If the mobile station has monitored the Forward Common Control  
12       Channel/Primary Broadcast Control Channel before the idle handoff, the mobile  
13       station shall set Paging Channel data rate, PRAT<sub>s</sub> = '00'.
  - 14       - The mobile station shall set PAGE\_CHAN<sub>s</sub> to '1' and PAGECH<sub>s</sub> to the Primary  
15       Paging Channel. If the associated NGHBR\_BAND<sub>s</sub> or NGHBR\_FREQ<sub>s</sub> of the new  
16       base station in NGHBR\_REC\_LIST of the old base station is not equal to  
17       CDMABAND<sub>s</sub> and CDMACH<sub>s</sub> respectively, the mobile station shall set  
18       CDMABAND<sub>s</sub> to NGHBR\_BAND<sub>s</sub>, CDMACH<sub>s</sub> to NGHBR\_FREQ<sub>s</sub>, and tune to the  
19       new CDMA Channel. The mobile station shall begin monitoring the Primary  
20       Paging Channel of the new base station.
- 21       • If PACA<sub>s</sub> is equal to enabled, the mobile station shall enter the *Update Overhead*  
22       *Information Substate* of the *System Access State* (see 2.6.3) with an origination  
23       indication within T<sub>33m</sub> seconds to re-originate the PACA call using the new base  
24       station.

25 If the NGHBR\_CONFIG field is '010', the mobile station shall perform the following:

- 26       • The mobile station shall set ACC\_MSG\_SEQ<sub>s</sub> and CURR\_ACC\_MSG\_SEQ to NULL  
27       and shall set PILOT\_PN<sub>s</sub> to the pilot offset index of the base station transmitting  
28       the new Paging Channel or Forward Common Control Channel/Primary Broadcast  
29       Control Channel.
- 30       • If the mobile station has monitored the Paging Channel before the idle handoff, the  
31       mobile station shall perform the following:
  - 32       - If the stored information for Primary Paging Channel or any of the Paging  
33       Channels on the target frequency or any of the frequencies of the new base  
34       station is current, the mobile station shall perform the following:
    - 35       + The mobile station shall use the hash algorithm specified in 2.6.7.1 and the  
36       stored value of the number of CDMA channels to determine the new CDMA  
37       Channel and shall set FREQ\_NEW to this new CDMA Channel. The mobile  
38       station shall perform the following:

- o If the stored information for any of the Paging Channels on the CDMA channel specified by `FREQ_NEW` is current, the mobile station shall perform the following:
  - ◇ The mobile station shall use the hash algorithm specified in 2.6.7.1 to select a new Paging Channel number in the range 1 to `PAGE_CHANS`, where `PAGE_CHANS` is the value stored for the Paging Channel whose stored information is current. The mobile station shall store the new Paging Channel number as `PAGECHS`. The mobile station shall perform the following:
    - If the mobile station has not stored configuration parameters for the new Paging Channel, or if the stored parameters are not current (see 2.6.2.2), the mobile station shall set `CONFIG_MSG_SEQS`, `SYS_PAR_MSG_SEQS`, `NGHBR_LST_MSG_SEQS`, `EXT_NGHBR_LST_MSG_SEQS`, `GEN_NGHBR_LST_MSG_SEQS`, `CHAN_LST_MSG_SEQS`, `EXT_SYS_PAR_MSG_SEQS`, `USER_ZONE_ID_MSG_SEQS`, `PRI_NGHBR_LST_MSG_SEQS`, and `EXT_GLOB_SERV_REDIR_MSG_SEQS`, `EXT_CHAN_LST_MSG_SEQS`, `FD_CHAN_LST_MSG_SEQS`, and `GLOB_SERV_REDIR_MSG_SEQS` to NULL.
    - If the stored information for the new Paging Channel is current, the mobile station shall set `CONFIG_MSG_SEQS` to the stored information for the new Paging Channel and set `NGHBR_REC_LIST` to the stored information for the new Paging Channel.
  - ◇ If the band class corresponding to `FREQ_NEW` is not equal to `CDMABANDS` of the old base station or `FREQ_NEW` is not equal to `CDMACHS` of the old base station, the mobile station shall set `CDMABANDS` to band class corresponding to `FREQ_NEW` and shall set `CDMACHS` to `FREQ_NEW`, and tune to the new CDMA Channel. The mobile station shall begin monitoring the new Paging Channel of the new base station.
- o If none of the Paging Channel stored information on the CDMA channel specified by `FREQ_NEW` are current, the mobile station shall perform the following:
  - ◇ The mobile station shall set `CONFIG_MSG_SEQS`, `SYS_PAR_MSG_SEQS`, `NGHBR_LST_MSG_SEQS`, `EXT_NGHBR_LST_MSG_SEQS`, `GEN_NGHBR_LST_MSG_SEQS`, `CHAN_LST_MSG_SEQS`, `EXT_SYS_PAR_MSG_SEQS`, `GLOB_SERV_REDIR_MSG_SEQS`, `EXT_GLOB_SERV_REDIR_MSG_SEQS`, `EXT_CHAN_LST_MSG_SEQS`, `FD_CHAN_LST_MSG_SEQS`, `USER_ZONE_ID_MSG_SEQS`, and `PRI_NGHBR_LST_MSG_SEQS` to NULL.

- 1                   ◇ The mobile station shall set PAGE\_CHAN<sub>S</sub> to '1' and PAGECH<sub>S</sub> to the  
2                   Primary Paging Channel. If the band class corresponding to  
3                   FREQ\_NEW is not equal to CDMABAND<sub>S</sub> of the old base station or  
4                   FREQ\_NEW is not equal to CDMACH<sub>S</sub> of the old base station, the  
5                   mobile station shall set CDMABAND<sub>S</sub> to band class corresponding to  
6                   FREQ\_NEW and shall set CDMACH<sub>S</sub> to FREQ\_NEW, and tune to the  
7                   new CDMA Channel. The mobile station shall begin monitoring the  
8                   Primary Paging Channel of the new base station.
- 9                   - If none of the Paging Channel stored information on any of the frequencies of  
10                  the new base station are current, the mobile station shall perform the following:
- 11               + The mobile station shall set CONFIG\_MSG\_SEQ<sub>S</sub>, SYS\_PAR\_MSG\_SEQ<sub>S</sub>,  
12               NGHBR\_LST\_MSG\_SEQ<sub>S</sub>, EXT\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub>,  
13               GEN\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub>, CHAN\_LST\_MSG\_SEQ<sub>S</sub>,  
14               EXT\_SYS\_PAR\_MSG\_SEQ<sub>S</sub>, GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>S</sub>,  
15               EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>S</sub>, EXT\_CHAN\_LST\_MSG\_SEQ<sub>S</sub>,  
16               FD\_CHAN\_LST\_MSG\_SEQ<sub>S</sub>, USER\_ZONE\_ID\_MSG\_SEQ<sub>S</sub>, and  
17               PRI\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub> to NULL.
- 18               + The mobile station shall set PAGE\_CHAN<sub>S</sub> to '1' and PAGECH<sub>S</sub> to the  
19               Primary Paging Channel. If the associated NGHBR\_BAND<sub>S</sub> or  
20               NGHBR\_FREQ<sub>S</sub> of the new base station in NGHBR\_REC\_LIST of the old base  
21               station is not equal to CDMABAND<sub>S</sub> and CDMACH<sub>S</sub> of the old base station  
22               respectively, the mobile station shall set CDMABAND<sub>S</sub> to NGHBR\_BAND<sub>S</sub>,  
23               and CDMACH<sub>S</sub> to NGHBR\_FREQ<sub>S</sub>; otherwise, the mobile station shall set  
24               CDMACH<sub>S</sub> as follows:
- 25               o If the *Extended CDMA Channel List Message* is being sent on the old  
26               base station, set CDMACH<sub>S</sub> to the first CDMA Channel given in the  
27               *Extended CDMA Channel List Message* for the old base station.
- 28               o Otherwise, set CDMACH<sub>S</sub> to the first CDMA Channel given in the *CDMA*  
29               *Channel List Message* for the old base station.
- 30               Then the mobile station shall tune to the new CDMA channel and begin  
31               monitoring the Primary Paging Channel of the new base station.
- 32               • If the mobile station has monitored the Forward Common Control Channel/Primary  
33               Broadcast Control Channel before the idle handoff, the mobile station shall perform  
34               the following:
- 35               – If the stored information for any of the Forward Common Control Channels and  
36               Primary Broadcast Control Channel on any of the frequencies of the new base  
37               station is current, the mobile station shall perform the following:

- 1           + The mobile station shall use the hash algorithm specified in 2.6.7.1 and the
- 2           stored value of the number of CDMA channels to determine the new CDMA
- 3           Channel and shall set `FREQ_NEW` to this new CDMA Channel. The mobile
- 4           station shall perform the following
- 5           o If the stored information for any of the Forward Common Control
- 6           Channels and Primary Broadcast Control Channel on the CDMA
- 7           channel specified by `FREQ_NEW` is current, the mobile station shall
- 8           perform the following:
- 9           ◇ The mobile station shall use the hash algorithm specified in 2.6.7.1
- 10          to select a new Forward Common Control Channel number in the
- 11          range 1 to `NUM_FCCCHS`, where `NUM_FCCCHS` is the stored value.
- 12          The mobile station shall store the new Forward Common Control
- 13          Channel number as `FCCCH_IDS`.
- 14          ◇ If the stored information for this new Forward Common Control
- 15          Channel and Primary Broadcast Control Channel is current, the
- 16          mobile station shall perform the following:
- 17          – The mobile station shall set `CONFIG_MSG_SEQS` to the stored
- 18          information for this new Forward Common Control Channel and
- 19          Primary Broadcast Control Channel and the mobile station shall
- 20          set `NGHBR_REC_LIST` to the stored information for this new
- 21          Forward Common Control Channel and Primary Broadcast
- 22          Control Channel.
- 23          – If the band class corresponding to `FREQ_NEW` is not equal to
- 24          `CDMABANDS` of the old base station or `FREQ_NEW` is not equal
- 25          to `CDMACHS` of the old base station, the mobile station shall set
- 26          `CDMABANDS` to band class corresponding to `FREQ_NEW` and
- 27          shall set `CDMACHS` to `FREQ_NEW`, and tune to the new CDMA
- 28          Channel. The mobile station shall begin monitoring the new
- 29          Forward Common Control Channel/Primary Broadcast Control
- 30          Channel of the new base station.
- 31          ◇ If the stored information for this new Forward Common Control
- 32          Channel and Primary Broadcast Control Channel is not current, the
- 33          mobile station shall perform the following:
- 34          – The mobile station shall set `CONFIG_MSG_SEQS`,
- 35          `A41_SYS_PAR_MSG_SEQS`, `UNI_NGHBR_LST_MSG_SEQS`,
- 36          `MC_RR_PAR_MSG_SEQS`, `EXT_GLOB_SERV_REDIR_MSG_SEQS`,
- 37          `EXT_CHAN_LST_MSG_SEQS`, `FD_CHAN_LST_MSG_SEQS`,
- 38          `USER_ZONE_ID_MSG_SEQS`, and `PRI_NGHBR_LST_MSG_SEQS`
- 39          to NULL.

- 1                               – If the band class corresponding to `FREQ_NEW` is not equal to  
2                               `CDMABANDS` of the old base station or `FREQ_NEW` is not equal  
3                               to `CDMACHS` of the old base station, the mobile station shall set  
4                               `CDMABANDS` to band class corresponding to `FREQ_NEW` and  
5                               shall set `CDMACHS` to `FREQ_NEW`, and tune to the new CDMA  
6                               Channel. The mobile station shall begin monitoring the Primary  
7                               Broadcast Control Channel of the new base station.
- 8                               o If none of the Forward Common Control Channel and Primary Broadcast  
9                               Control Channel stored information on the CDMA channel specified by  
10                              `FREQ_NEW` are current, the mobile station shall perform the following:
  - 11                            ◇ The mobile station shall set `CONFIG_MSG_SEQS`,  
12                            `A41_SYS_PAR_MSG_SEQS`, `UNI_NGHBR_LST_MSG_SEQS`,  
13                            `MC_RR_PAR_MSG_SEQS`, `EXT_GLOB_SERV_REDIR_MSG_SEQS`,  
14                            `EXT_CHAN_LST_MSG_SEQS`, `FD_CHAN_LST_MSG_SEQS`,  
15                            `USER_ZONE_ID_MSG_SEQS`, and `PRI_NGHBR_LST_MSG_SEQS` to  
16                            NULL.
  - 17                            ◇ If the associated `NGHBR_BANDS` of the new base station in  
18                            `NGHBR_REC_LIST` of the old base station is not equal to  
19                            `CDMABANDS` or the associated `NGHBR_FREQS` of the new base  
20                            station in `NGHBR_REC_LIST` of the old base station is not equal to  
21                            `CDMACHS` of the old base station, the mobile station shall set  
22                            `CDMABANDS` to `NGHBR_BANDS`, `CDMACHS` to `NGHBR_FREQS`, and  
23                            tune to the new CDMA Channel. Otherwise, the mobile station shall  
24                            set `CDMACHS` to the first CDMA Channel given in the *Extended*  
25                            *CDMA Channel List Message* for the old base station and tune to the  
26                            new CDMA channel.
  - 27                            ◇ Then the mobile station shall begin monitoring the Primary  
28                            Broadcast Control Channel of the new base station, using the same  
29                            rate, code rate, and code channel.
- 30                            – If none of the Forward Common Control Channel and Primary Broadcast  
31                            Control Channel stored information on any of the frequencies of the new base  
32                            station are current, the mobile station shall perform the following:
  - 33                            + The mobile station shall set `CONFIG_MSG_SEQS`,  
34                            `A41_SYS_PAR_MSG_SEQS`, `UNI_NGHBR_LST_MSG_SEQS`,  
35                            `MC_RR_PAR_MSG_SEQS`, `EXT_GLOB_SERV_REDIR_MSG_SEQS`,  
36                            `EXT_CHAN_LST_MSG_SEQS`, `FD_CHAN_LST_MSG_SEQS`,  
37                            `USER_ZONE_ID_MSG_SEQS`, and `PRI_NGHBR_LST_MSG_SEQS` to NULL.

- 1           + If the associated NGHBR\_BAND<sub>s</sub> or NGHBR\_FREQ<sub>s</sub> of the new base station  
2           in NGHBR\_REC\_LIST of the old base station is not equal to CDMABAND<sub>s</sub>  
3           and CDMACH<sub>s</sub> of the old base station respectively, the mobile station shall  
4           set CDMABAND<sub>s</sub> to NGHBR\_BAND<sub>s</sub>, CDMACH<sub>s</sub> to NGHBR\_FREQ<sub>s</sub>, and  
5           tune to the new CDMA Channel. Otherwise, the mobile station shall set  
6           CDMACH<sub>s</sub> to the first CDMA Channel given in the *Extended CDMA Channel*  
7           *List Message* for the old base station and tune to the new CDMA channel.
- 8           + Then the mobile station shall begin monitoring the Primary Broadcast  
9           Control Channel of the new base station, using the same rate, code rate,  
10          and code channel.
- 11          • If PACA<sub>s</sub> is equal to enabled, the mobile station shall enter the *Update Overhead*  
12          *Information Substate* of the *System Access State* (see 2.6.3) with an origination  
13          indication within T<sub>33m</sub> seconds to re-originate the PACA call using the new base  
14          station.
- 15    If the NGHBR\_CONFIG field is '011', the mobile station shall perform the following:
- 16          • Enter the *System Determination Substate* of the *Mobile Station Initialization State*  
17          with a new system indication (see 2.6.1.1).
- 18    If the NGHBR\_CONFIG field is '100', the mobile station shall perform the following:
- 19          • The mobile station shall set ACC\_MSG\_SEQ<sub>s</sub> and CURR\_ACC\_MSG\_SEQ to NULL  
20          (see 2.6.2.2) and shall set PILOT\_PN<sub>s</sub> to the pilot offset index of the base station  
21          transmitting the new Forward Common Control Channel/Primary Broadcast  
22          Control Channel.
- 23          • If the stored information for any of the Forward Common Control Channels and  
24          Primary Broadcast Control Channel on the associated NGHBR\_FREQ<sub>s</sub> of the new  
25          base station in NGHBR\_REC\_LIST of the old base station is current, the mobile  
26          station shall perform the following:
- 27               – The mobile station shall use the hash algorithm specified in 2.6.7.1 to select a  
28               new Forward Common Control Channel number in the range 1 to  
29               NUM\_FCCCH<sub>s</sub>, where NUM\_FCCCH<sub>s</sub> is the stored value. The mobile station  
30               shall store the new Forward Common Control Channel number as FCCCH\_ID<sub>s</sub>.
- 31               – If the mobile station has not stored configuration parameters for this new  
32               Forward Common Control Channel and Primary Broadcast Control Channel, or  
33               if the stored information is not current, the mobile station shall perform the  
34               following:
- 35                   + The mobile station shall set CONFIG\_MSG\_SEQ<sub>s</sub>,  
36                   A41\_SYS\_PAR\_MSG\_SEQ<sub>s</sub>, UNI\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>,  
37                   MC\_RR\_PAR\_MSG\_SEQ<sub>s</sub>, EXT\_GLOB\_SERV\_REDIRECT\_MSG\_SEQ<sub>s</sub>,  
38                   EXT\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>, FD\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>,  
39                   USER\_ZONE\_ID\_MSG\_SEQ<sub>s</sub>, and PRI\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub> to NULL.

- 1           + If the associated NGHBR\_BAND<sub>S</sub> or NGHBR\_FREQ<sub>S</sub> of the new base station  
2           in NGHBR\_REC\_LIST of the old base station is not equal to CDMABAND<sub>S</sub>  
3           and CDMACH<sub>S</sub> respectively, the mobile station shall set CDMABAND<sub>S</sub> to  
4           NGHBR\_BAND<sub>S</sub>, CDMACH<sub>S</sub> to NGHBR\_FREQ<sub>S</sub>, and tune to the new CDMA  
5           Channel.
- 6           + Then the mobile station shall begin monitoring the Primary Broadcast  
7           Control Channel of the new base station, using the same rate, code rate,  
8           and code channel.
- 9           - If the stored information for this new Forward Common Control Channel and  
10          Primary Broadcast Control Channel is current, the mobile station shall perform  
11          the following:
  - 12         + The mobile station shall set CONFIG\_MSG\_SEQ<sub>S</sub> to the stored information  
13         for this new Forward Common Control Channel and Primary Broadcast  
14         Control Channel and the mobile station shall set NGHBR\_REC\_LIST to the  
15         stored information for this new Forward Common Control Channel and  
16         Primary Broadcast Control Channel.
  - 17         + If the associated NGHBR\_BAND<sub>S</sub> or NGHBR\_FREQ<sub>S</sub> of the new base station  
18         in NGHBR\_REC\_LIST of the old base station is not equal to CDMABAND<sub>S</sub>  
19         and CDMACH<sub>S</sub> respectively, the mobile station shall set CDMABAND<sub>S</sub> to  
20         NGHBR\_BAND<sub>S</sub>, CDMACH<sub>S</sub> to NGHBR\_FREQ<sub>S</sub>, and tune to the new CDMA  
21         Channel. The mobile station shall begin monitoring the new Forward  
22         Common Control Channel/Primary Broadcast Control Channel of the new  
23         base station.
- 24          • If none of the Forward Common Control Channel and Primary Broadcast Control  
25          Channel stored information on the associated NGHBR\_FREQ<sub>S</sub> of the new base  
26          station in NGHBR\_REC\_LIST of the old base station are current, the mobile station  
27          shall perform the following:
  - 28         - The mobile station shall set CONFIG\_MSG\_SEQ<sub>S</sub>, A41\_SYS\_PAR\_MSG\_SEQ<sub>S</sub>,  
29         UNI\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub>, MC\_RR\_PAR\_MSG\_SEQ<sub>S</sub>,  
30         EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>S</sub>, EXT\_CHAN\_LST\_MSG\_SEQ<sub>S</sub>,  
31         FD\_CHAN\_LST\_MSG\_SEQ<sub>S</sub>, USER\_ZONE\_ID\_MSG\_SEQ<sub>S</sub>, and  
32         PRI\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub> to NULL.
  - 33         - If the associated NGHBR\_BAND<sub>S</sub> or NGHBR\_FREQ<sub>S</sub> of the new base station in  
34         NGHBR\_REC\_LIST of the old base station is not equal to CDMABAND<sub>S</sub> and  
35         CDMACH<sub>S</sub> respectively, the mobile station shall set CDMABAND<sub>S</sub> to  
36         NGHBR\_BAND<sub>S</sub>, CDMACH<sub>S</sub> to NGHBR\_FREQ<sub>S</sub>, and tune to the new CDMA  
37         Channel.

- 1           – The mobile station shall begin monitoring the Primary Broadcast Control
- 2           Channel of the new base station, using the same rate, code rate, and code
- 3           channel.
- 4           • If  $PACA_S$  is equal to enabled, the mobile station shall enter the *Update Overhead*
- 5           *Information Substate* of the *System Access State* (see 2.6.3) with an origination
- 6           indication within  $T_{33m}$  seconds to re-originate the PACA call using the new base
- 7           station.

#### 8   2.6.2.1.5 Primary Broadcast Control Channel Monitoring

##### 9   2.6.2.1.5.1 General Overview

10 The Broadcast Control Channel is divided into 40, 80, or 160 ms slots called the Broadcast  
 11 Control Channel slots (see 3.1.3.5 in [2]). The Primary Broadcast Control Channel will be  
 12 used for control messages. Support for the Primary Broadcast Control Channel is  
 13 mandatory for mobile stations. The Primary Broadcast Control Channel will operate with  
 14 the Forward Common Control Channels and the Quick Paging Channels, or only with the  
 15 Forward Common Control Channels.

16 After a mobile station acquires and synchronizes with a new base station that supports a  
 17 Primary Broadcast Control Channel, the mobile station monitors the Primary Broadcast  
 18 Control Channel to receive overhead information. Once the mobile station has received  
 19 the updated overhead information from the Primary Broadcast Control Channel, the  
 20 mobile station may begin to monitor a Forward Common Control Channel or a Quick  
 21 Paging Channel, if it is supported.

##### 22 2.6.2.1.5.2 Requirements

23 If the base station supports the Primary Broadcast Control Channel, the mobile station  
 24 shall monitor the Primary Broadcast Control Channel for overhead messages. If the mobile  
 25 station determines that the CONFIG\_MSG\_SEQ has changed, the mobile station shall  
 26 monitor the Primary Broadcast Control Channel to receive updated overhead messages.

##### 27 2.6.2.1.6 System Reselection Procedures

28 If the mobile station supports more than one operating mode or the Remaining  
 29 Set/Neighbor Set contains pilots on frequencies different from the current frequency, the  
 30 mobile station shall enter the *System Determination Substate* of the *Mobile Station*  
 31 *Initialization State* with a system reselection indication (see 2.6.1.1) if all of the following  
 32 are true:

- 33           • RESELECT\_INCLUDED<sub>S</sub> is equal to '1';
- 34           • The following inequality is satisfied:
- 35            $-20 \times \log_{10} (E_c/I_0) > EC\_IO\_THRESH_S$
- 36           where  $E_c/I_0$  is the measured  $E_c/I_0$  of the active pilot; and
- 37           • The following inequality is satisfied:

1  $pilot\_power < EC\_THRESH_S - 115$

2 where  $pilot\_power$  (dBm/1.23 MHz) =  $10 \times \log_{10} (PS)$  (dB) + mean input power  
 3 (dBm/1.23 MHz) and PS is the strength of the active pilot, as specified in 2.6.6.2.2.

#### 4 2.6.2.1.7 Slotted Timer Expiration

5 Upon expiration of the slotted  $T_{MS}$  Slotted timer, the mobile station shall disable the timer,  
 6 set  $T\_SLOTTED_S$  to  $T_{74m}$ , and set  $SLOTTED_S$  to YES.

#### 7 2.6.2.1.8 Exiting the Reduced Slot Cycle Mode

8 If  $RSC\_MODE\_ENABLED$  is equal to YES, then at the system time specified by  
 9  $RSC\_END\_TIME$ , the mobile station shall set  $RSC\_MODE\_ENABLED$  to NO and set  
 10  $SLOTTED_S$  to YES.

#### 11 2.6.2.1.9 Radio Environment Report Timer Expiration

12 Upon expiration of the radio environment report timer, the mobile station shall disable the  
 13 timer and set  $RER\_MODE\_ENABLED$  to NO. If  $TKZ\_MODE\_PENDING$  is equal to YES, then  
 14 the mobile station shall perform the following:

- 15 • Set  $TKZ\_MODE\_ENABLED$  to YES and  $TKZ\_MODE\_PENDING$  to NO.
- 16 • Initialize the tracking zone list ( $TKZ\_LIST$ ) to NULL.
- 17 • Enable the tracking zone update timer with an initial value of infinity if  
 18  $TKZ\_UPDATE\_PRD_S$  is equal to '1111'; otherwise, the mobile station shall enable  
 19 the tracking zone update timer with an initial value of  $2^{TKZ\_UPDATE\_PRD_S} + 6$  seconds.

#### 20 2.6.2.2 Response to Overhead Information Operation

21 The overhead messages on the Primary Broadcast Control Channel are:

- 22 • *ANSI-41 System Parameters Message*
- 23 • *MC-RR Parameters Message*
- 24 • *Enhanced Access Parameters Message*
- 25 • *Universal Neighbor List Message*
- 26 • *User Zone Identification Message*
- 27 • *Private Neighbor List Message*
- 28 • *Extended Global Service Redirection Message*
- 29 • *Extended CDMA Channel List Message*
- 30 • *ANSI-41 RAND Message*
- 31 • *BCMC Service Parameters Message*
- 32 • *Access Point Identification Message*
- 33 • *Access Point Identification Text Message*
- 34 • *Access Point Pilot Information Message*

- 1       • *General Overhead Information Message*
- 2       • *Flex Duplex CDMA Channel List Message*
- 3       • *Alternative Technologies Information Message*

4   The overhead messages on the Paging Channel are:

- 5       • *System Parameters Message*
- 6       • *Access Parameters Message*
- 7       • *Neighbor List Message*
- 8       • *CDMA Channel List Message*
- 9       • *Extended System Parameters Message*
- 10      • *Global Service Redirection Message*
- 11      • *Extended Neighbor List Message*
- 12      • *General Neighbor List Message*
- 13      • *User Zone Identification Message*
- 14      • *Private Neighbor List Message*
- 15      • *Extended Global Service Redirection Message*
- 16      • *Extended CDMA Channel List Message*
- 17      • *Access Point Identification Message*
- 18      • *Access Point Identification Text Message*
- 19      • *Access Point Pilot Information Message*
- 20      • *General Overhead Information Message*
- 21      • *Flex Duplex CDMA Channel List Message*
- 22      • *Alternative Technologies Information Message*

23   The *Response to Overhead Information Operation* is performed whenever the mobile station  
 24   receives an overhead message. The mobile station updates internally stored information  
 25   from the received message's data fields.

26   Configuration parameters and access parameters are received in the configuration  
 27   messages and the *Access Parameters Message* or the *Enhanced Access Parameters*  
 28   *Message*.

29   The configuration messages on the Primary Broadcast Control Channel are:

- 30      • *ANSI-41 System Parameters Message*
- 31      • *MC-RR Parameters Message*
- 32      • *Universal Neighbor List Message*
- 33      • *User Zone Identification Message*
- 34      • *Private Neighbor List Message*

- 1 • *Extended Global Service Redirection Message*
- 2 • *Extended CDMA Channel List Message*
- 3 • *Access Point Identification Message*
- 4 • *Access Point Identification Text Message*
- 5 • *Access Point Pilot Information Message*
- 6 • *General Overhead Information Message*
- 7 • *Flex Duplex CDMA Channel List Message*
- 8 • *Alternative Technologies Information Message*

9 The configuration messages on the Paging Channel are:

- 10 • *System Parameters Message*
- 11 • *Neighbor List Message*
- 12 • *CDMA Channel List Message*
- 13 • *Extended System Parameters Message*
- 14 • *Global Service Redirection Message*
- 15 • *Extended Neighbor List Message*
- 16 • *General Neighbor List Message*
- 17 • *User Zone Identification Message*
- 18 • *Private Neighbor List Message*
- 19 • *Extended Global Service Redirection Message*
- 20 • *Extended CDMA Channel List Message*
- 21 • *Access Point Identification Message*
- 22 • *Access Point Identification Text Message*
- 23 • *Access Point Pilot Information Message*
- 24 • *General Overhead Information Message*
- 25 • *Flex Duplex CDMA Channel List Message*
- 26 • *Alternative Technologies Information Message*

27 Associated with the set of configuration messages sent on each Paging Channel or Primary  
 28 Broadcast Control Channel is a configuration message sequence number  
 29 (CONFIG\_MSG\_SEQ). When the contents of one or more of the configuration messages  
 30 change, the configuration message sequence number is incremented. For each of the  
 31 configuration messages received, the mobile station stores the configuration message  
 32 sequence number contained in the configuration message (A41\_SYS\_PAR\_MSG\_SEQ<sub>s</sub>,  
 33 MC\_RR\_PAR\_MSG\_SEQ<sub>s</sub>, SYS\_PAR\_MSG\_SEQ<sub>s</sub>, NGHBR\_LST\_MSG\_SEQ<sub>s</sub>,  
 34 AP\_PILOT\_INFO\_MSG\_SEQ<sub>s</sub>, EXT\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>,  
 35 GEN\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, UNI\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, CHAN\_LST\_MSG\_SEQ<sub>s</sub>,

1 EXT\_SYS\_PAR\_MSG\_SEQ<sub>s</sub>, GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub>,  
2 USER\_ZONE\_ID\_MSG\_SEQ<sub>s</sub>, EXT\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>, FD\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>,  
3 EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub>, PRI\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, AP\_IDT\_MSG\_SEQ<sub>s</sub>,  
4 AP\_ID\_TEXT\_MSG\_SEQ<sub>s</sub>, GOI\_MSG\_SEQ<sub>s</sub> or ATIM\_MSG\_SEQ<sub>s</sub>). The mobile station also  
5 stores the most recently received configuration message sequence number  
6 (CONFIG\_MSG\_SEQ<sub>s</sub>) contained in any message (see 2.6.2.2.1, 2.6.2.2.3, 2.6.2.2.4,  
7 2.6.2.2.5, 2.6.2.2.6, 2.6.2.2.7, 2.6.2.2.8, 2.6.2.2.9, 2.6.2.2.10, 2.6.2.2.11, 2.6.2.2.12,  
8 2.6.2.2.13, 2.6.2.2.14, 2.6.2.2.17, 2.6.2.2.19, 2.6.2.2.20, 2.6.2.2.21, 2.6.2.2.22, 2.6.2.2.23,  
9 2.6.2.2.24 and 2.6.2.3). The mobile station examines the stored values of the  
10 configuration message sequence numbers to determine whether the configuration  
11 parameters stored by the mobile station are current.

12 The field EXT\_SYS\_PARAMETER in the *System Parameters Message*, when set equal to '0',  
13 indicates that the base station is not sending the *Extended System Parameters Message*.  
14 When the mobile station receives the *System Parameters Message* with the  
15 EXT\_SYS\_PARAMETER field set equal to '0', the mobile station shall set  
16 EXT\_SYS\_PAR\_MSG\_SEQ<sub>s</sub> to CONFIG\_MSG\_SEQ<sub>s</sub> to indicate that the *Extended System*  
17 *Parameters Message* is current.

18 The field EXT\_CHAN\_LST in the *System Parameters Message*, when set equal to '0',  
19 indicates that the base station is not sending the *Extended CDMA Channel List Message*.  
20 When the mobile station receives the *System Parameters Message* with the  
21 EXT\_CHAN\_LST field set equal to '0', the mobile station shall set  
22 EXT\_CHAN\_LST\_MSG\_SEQ<sub>s</sub> to CONFIG\_MSG\_SEQ<sub>s</sub> to indicate that the *Extended CDMA*  
23 *Channel List Message* is current.

24 The field GEN\_NGHBR\_LST in the *System Parameters Message*, when set equal to '0',  
25 indicates that the base station is not sending the *General Neighbor List Message*. When  
26 the mobile station receives the *System Parameters Message* with the GEN\_NGHBR\_LST  
27 field set equal to '0', the mobile station shall set the GEN\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub> to  
28 CONFIG\_MSG\_SEQ<sub>s</sub> to indicate that the *General Neighbor List Message* is current.

29 The field EXT\_NGHBR\_LST in the *System Parameters Message*, when set equal to '0',  
30 indicates that the base station is not sending the *Extended Neighbor List Message*. When  
31 the mobile station receives the *System Parameters Message* with the EXT\_NGHBR\_LST  
32 field set equal to '0', the mobile station shall set EXT\_NGHBR\_LIST\_MSG\_SEQ<sub>s</sub> to  
33 CONFIG\_MSG\_SEQ<sub>s</sub> to indicate that the *Extended Neighbor List Message* is current.

34 The field GLOBAL\_REDIRECT in the *System Parameters Message*, when set equal to '0',  
35 indicates that the base station is not sending the *Global Service Redirection Message*.  
36 When the mobile station receives the *System Parameters Message* with the  
37 GLOBAL\_REDIRECT field set equal to '0', the mobile station shall set  
38 GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub> to CONFIG\_MSG\_SEQ<sub>s</sub> to indicate that the *Global Service*  
39 *Redirection Message* is current.

40 The field EXT\_GLOBAL\_REDIRECT in the *System Parameters Message* or *MC-RR*  
41 *Parameters Message*, when set equal to '0', indicates that the base station is not sending  
42 the *Extended Global Service Redirection Message*. When the mobile station receives the  
43 *System Parameters Message* or *MC-RR Parameters Message* with the

- 1 EXT\_GLOBAL\_REDIRECT field set equal to '0', the mobile station shall set  
 2 EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>S</sub> to CONFIG\_MSG\_SEQ<sub>S</sub> to indicate that the  
 3 *Extended Global Service Redirection Message* is current.
- 4 The field USER\_ZONE\_ID in the *System Parameters Message* or *MC-RR Parameters*  
 5 *Message*, when set equal to '0', indicates that the base station is not sending the *User Zone*  
 6 *Identification Message*. When the mobile station receives the *System Parameters Message*  
 7 or *MC-RR Parameters Message* with the USER\_ZONE\_ID field set equal to '0', the mobile  
 8 station shall set USER\_ZONE\_ID\_MSG\_SEQ<sub>S</sub> to CONFIG\_MSG\_SEQ<sub>S</sub> to indicate that the  
 9 *User Zone Identification Message* is current.
- 10 The field PRI\_NGHBR\_LST in the *System Parameters Message* or *MC-RR Parameters*  
 11 *Message*, when set equal to '0', indicates that the base station is not sending the *Private*  
 12 *Neighbor List Message*. When the mobile station receives the *System Parameters Message*  
 13 or *MC-RR Parameters Message* with the PRI\_NGHBR\_LST field set equal to '0', the mobile  
 14 station shall set PRI\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub> to CONFIG\_MSG\_SEQ<sub>S</sub> to indicate that the  
 15 *Private Neighbor List Message* is current.
- 16 The field ATIM\_IND in the *System Parameters Message* or *MC-RR Parameters Message*,  
 17 when set equal to '0' or if ATIM\_IND is omitted, indicates that the base station is not  
 18 sending the *Alternative Technologies Information Message*. When the mobile station receives  
 19 the *System Parameters Message* or *MC-RR Parameters Message* with the ATIM\_IND field set  
 20 equal to '0', or if the ATIM\_IND field is omitted in the *System Parameters Message* or *MC-RR*  
 21 *Parameters Message*, the mobile station shall set ATIM\_MSG\_SEQ<sub>S</sub> to CONFIG\_MSG\_SEQ<sub>S</sub>  
 22 to indicate that the *Alternative Technologies Information Message* is current.
- 23 The field AP\_PILOT\_INFO in the *System Parameters Message* or *MC-RR Parameters*  
 24 *Message*, when set equal to '0' or if AP\_PILOT\_INFO is omitted, indicates that the base  
 25 station is not sending the *Access Point Pilot Information Message*. When the mobile station  
 26 receives the *System Parameters Message* or *MC-RR Parameters Message* with the  
 27 AP\_PILOT\_INFO field set equal to '0', or if the AP\_PILOT\_INFO field is omitted in the *System*  
 28 *Parameters Message* or *MC-RR Parameters Message*, the mobile station shall set  
 29 AP\_PILOT\_INFO\_MSG\_SEQ<sub>S</sub> to CONFIG\_MSG\_SEQ<sub>S</sub> to indicate that the *Access Point Pilot*  
 30 *Information Message* is current.
- 31 The field AP\_IDT in the *System Parameters Message* or *MC-RR Parameters Message*, when  
 32 set equal to '0' or if AP\_IDT is omitted, indicates that the base station is not sending the  
 33 *Access Point Identification Message*. When the mobile station receives the *System*  
 34 *Parameters Message* or *MC-RR Parameters Message* with the AP\_IDT field set equal to '0',  
 35 or if the field AP\_IDT is omitted in the *System Parameters Message* or *MC-RR Parameters*  
 36 *Message*, the mobile station shall set AP\_IDT\_MSG\_SEQ<sub>S</sub> to CONFIG\_MSG\_SEQ<sub>S</sub> to  
 37 indicate that the *Access Point Identification Message* is current.
- 38 The field AP\_ID\_TEXT in the *System Parameters Message* or *MC-RR Parameters Message*,  
 39 when set equal to '0' or if AP\_ID\_TEXT is omitted, indicates that the base station is sending  
 40 the *Access Point Identification Text Message*. When the mobile station receives the *System*  
 41 *Parameters Message* or *MC-RR Parameters Message* with the AP\_ID\_TEXT field set equal to  
 42 '0', or if the field AP\_ID\_TEXT is omitted in the *System Parameters Message* or *MC-RR*  
 43 *Parameters Message*, the mobile station shall set AP\_ID\_TEXT\_MSG\_SEQ<sub>S</sub> to

1 CONFIG\_MSG\_SEQ<sub>s</sub> to indicate that the *Access Point Identification Text Message* is  
2 current.

3 The field GEN\_OVHD\_INF\_IND in the *System Parameters Message* or *MC-RR Parameters*  
4 *Message*, when set equal to '0' or if GEN\_OVHD\_INF\_IND is omitted, indicates that the base  
5 station is not sending the *General Overhead Information Message*. When the mobile station  
6 receives the *System Parameters Message* or *MC-RR Parameters Message* with the  
7 GEN\_OVHD\_INF\_IND field set equal to '0', or if the GEN\_OVHD\_INF\_IND field is omitted in the  
8 *System Parameters Message* or *MC-RR Parameters Message*, the mobile station shall set  
9 GOI\_MSG\_SEQ<sub>s</sub> to CONFIG\_MSG\_SEQ<sub>s</sub> to indicate that the *General Overhead Information*  
10 *Message* is current.

11 The field FD\_CHAN\_LST\_IND in the *System Parameters Message* or *MC-RR Parameters*  
12 *Message*, when set equal to '0' or if FD\_CHAN\_LST\_IND is omitted, indicates that the base  
13 station is not sending the *Flex Duplex CDMA Channel List Message*. When the mobile  
14 station receives the *System Parameters Message* or *MC-RR Parameters Message* with the  
15 FD\_CHAN\_LST\_IND field set equal to '0', or if the FD\_CHAN\_LST\_MSG\_SEQ<sub>s</sub> field is  
16 omitted in the *System Parameters Message* or *MC-RR Parameters Message*, the mobile  
17 station shall set FD\_CHAN\_LST\_MSG\_SEQ<sub>s</sub> to CONFIG\_MSG\_SEQ<sub>s</sub> to indicate that the  
18 *Flex Duplex CDMA Channel List Message* is current.

19 The configuration message sequence number is also included in the *General Page Message*  
20 and the *Universal Page Message*. This allows the mobile station to determine whether the  
21 stored configuration parameters are current without waiting for a configuration message.

22 *Access Parameters Messages* or *Enhanced Access Parameters Messages* are independently  
23 sequence-numbered by the ACC\_MSG\_SEQ field. The mobile station stores the most  
24 recently received *Access Parameters Message* or *Enhanced Access Parameters Messages*  
25 sequence number (ACC\_MSG\_SEQ<sub>s</sub>).

26 Paging Channels, Broadcast Control Channels, and Forward Common Control Channels  
27 shall be considered different if they are transmitted by different base stations, if they are  
28 transmitted on different code channels, or if they are transmitted on different CDMA  
29 Channels. Configuration and access parameters from one Paging Channel or Primary  
30 Broadcast Control Channel shall not be used while monitoring a different Paging Channel  
31 or Primary Broadcast Control Channel/Forward Common Control Channel except for  
32 registration and authentication parameters while the mobile station is performing an  
33 access probe handoff or access handoff. The mobile station shall ignore any overhead  
34 message whose PILOT\_PN<sub>r</sub> field is not equal to the pilot offset index (PILOT\_PN<sub>s</sub>) of the  
35 base station whose Paging Channel or Primary Broadcast Control Channel is being  
36 monitored.

37 The mobile station may store the configuration parameters from Paging Channels or  
38 Primary Broadcast Control Channel it has recently monitored. When a mobile station  
39 starts monitoring a Paging Channel or a Primary Broadcast Control Channel/Forward  
40 Common Control Channel that it has recently monitored, the mobile station can determine  
41 whether the stored parameters are current by examining the CONFIG\_MSG\_SEQ<sub>s</sub> in a  
42 configuration message or a page message.

The mobile station shall use a special value, NULL, to be stored in place of sequence numbers for messages that have not been received or are marked as not current. The special value NULL shall be unequal to any valid message sequence number.

The mobile station shall consider the stored configuration parameters to be current only if all of the following conditions are true:

- If the mobile station is monitoring the Paging Channel, the following stored configuration message sequence numbers (SYS\_PAR\_MSG\_SEQ<sub>s</sub>, NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, EXT\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, CHAN\_LST\_MSG\_SEQ<sub>s</sub>, EXT\_SYS\_PAR\_MSG\_SEQ<sub>s</sub>, GEN\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, AP\_IDT\_MSG\_SEQ<sub>s</sub>, AP\_ID\_TEXT\_MSG\_SEQ<sub>s</sub>, USER\_ZONE\_ID\_MSG\_SEQ<sub>s</sub>, PRI\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, EXT\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>, EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub> and GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub>) are equal to CONFIG\_MSG\_SEQ<sub>s</sub>; and
- If the mobile station is monitoring the Forward Common Control Channel/ Primary Broadcast Control Channel, the following stored configuration message sequence numbers (A41\_SYS\_PAR\_MSG\_SEQ<sub>s</sub>, MC\_RR\_PAR\_MSG\_SEQ<sub>s</sub>, UNI\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, AP\_IDT\_MSG\_SEQ<sub>s</sub>, AP\_ID\_TEXT\_MSG\_SEQ<sub>s</sub>, USER\_ZONE\_ID\_MSG\_SEQ<sub>s</sub>, PRI\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, EXT\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>, FD\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>, and EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub>) are equal to CONFIG\_MSG\_SEQ<sub>s</sub>; and
- If the mobile station supports flexible spacing between forward and reverse channels, stored configuration message sequence number FD\_CHAN\_LST\_MSG\_SEQ<sub>s</sub> is equal to CONFIG\_MSG\_SEQ<sub>s</sub>; and
- CONFIG\_MSG\_SEQ<sub>s</sub> is not equal to NULL; and
- No more than T<sub>31m</sub> seconds (see Annex D) have elapsed since the mobile station last received a valid message on the Paging Channel or the Primary Broadcast Control Channel/Forward Common Control Channel for which the parameters were stored.

If the configuration parameters are not current, the mobile station shall process the stored parameters upon receipt of the configuration messages as described in 2.6.2.2.1, 2.6.2.2.3, 2.6.2.2.4, 2.6.2.2.5, 2.6.2.2.6, 2.6.2.2.7, 2.6.2.2.8, 2.6.2.2.9, 2.6.2.2.10, 2.6.2.2.11, 2.6.2.2.12, 2.6.2.2.13, 2.6.2.2.14, 2.6.2.2.17, 2.6.2.2.19, 2.6.2.2.20, 2.6.2.2.21, 2.6.2.2.22, 2.6.2.2.23 and 2.6.2.2.24.

#### 2.6.2.2.1 System Parameters Message

Whenever a *System Parameters Message* is received on the Paging Channel, the configuration message sequence number, CONFIG\_MSG\_SEQ<sub>r</sub>, shall be compared to that stored in SYS\_PAR\_MSG\_SEQ<sub>s</sub>. If the comparison results in a match, the mobile station may ignore the message. If the comparison results in a mismatch, then the mobile station shall process the remaining fields in the message as described in 2.6.2.2.1.1, 2.6.2.2.1.2, 2.6.2.2.1.3, 2.6.2.2.1.4, 2.6.2.2.1.5, 2.6.2.2.1.6, 2.6.2.2.1.7, 2.6.2.2.1.8, and 2.6.2.2.1.9.

If PAGE\_CHAN, REG\_PRD, BASE\_LAT, BASE\_LONG, or PWR\_REP\_THRESH are not within the valid ranges specified in 3.7.2.3.2.1, then the mobile station shall ignore the *System Parameters Message* that contains them.

If BAND\_CLASS is equal to '00001' and if EXT\_SYS\_PARAMETERS<sub>T</sub> is not equal to '1', the mobile station shall ignore the *System Parameters Message* containing these fields.

#### 2.6.2.2.1.1 Stored Parameters

The mobile station shall store the following parameters:

- Configuration message sequence number  
(CONFIG\_MSG\_SEQ<sub>S</sub> = CONFIG\_MSG\_SEQ<sub>T</sub>,  
SYS\_PAR\_MSG\_SEQ<sub>S</sub> = CONFIG\_MSG\_SEQ<sub>T</sub>)
- Base station identification (BASE\_ID<sub>S</sub> = BASE\_ID<sub>T</sub>)
- Base station class (BASE\_CLASS<sub>S</sub> = BASE\_CLASS<sub>T</sub>)
- Maximum slot cycle index  
(MAX\_SLOT\_CYCLE\_INDEX<sub>S</sub> = MAX\_SLOT\_CYCLE\_INDEX<sub>T</sub>)
- Home registration indicator (HOME\_REG<sub>S</sub> = HOME\_REG<sub>T</sub>)
- SID roamer registration indicator (FOR\_SID\_REG<sub>S</sub> = FOR\_SID\_REG<sub>T</sub>)
- NID roamer registration indicator (FOR\_NID\_REG<sub>S</sub> = FOR\_NID\_REG<sub>T</sub>)
- Power-up registration indicator (POWER\_UP\_REG<sub>S</sub> = POWER\_UP\_REG<sub>T</sub>)
- Power-down registration indicator (POWER\_DOWN\_REG<sub>S</sub> = POWER\_DOWN\_REG<sub>T</sub>)
- Parameter-change registration indicator (PARAMETER\_REG<sub>S</sub> = PARAMETER\_REG<sub>T</sub>)
- Search window size for the Active Set and Candidate Set  
(SRCH\_WIN\_A<sub>S</sub> = SRCH\_WIN\_A<sub>T</sub>)
- Search window size for the Neighbor Set (SRCH\_WIN\_N<sub>S</sub> = SRCH\_WIN\_N<sub>T</sub>)
- Search window size for the Remaining Set (SRCH\_WIN\_R<sub>S</sub> = SRCH\_WIN\_R<sub>T</sub>)
- Maximum age for retention of Neighbor Set members  
(NGHBR\_MAX\_AGE<sub>S</sub> = NGHBR\_MAX\_AGE<sub>T</sub>)
- Power control reporting threshold (PWR\_REP\_THRESH<sub>S</sub> = PWR\_REP\_THRESH<sub>T</sub>)
- Power control reporting frame count (PWR\_REP\_FRAMES<sub>S</sub> = PWR\_REP\_FRAMES<sub>T</sub>)
- Threshold report mode indicator  
(PWR\_THRESH\_ENABLE<sub>S</sub> = PWR\_THRESH\_ENABLE<sub>T</sub>)
- Periodic report mode indicator (PWR\_PERIOD\_ENABLE<sub>S</sub> =  
PWR\_PERIOD\_ENABLE<sub>T</sub>).
- Power report delay (PWR\_REP\_DELAY<sub>S</sub> = PWR\_REP\_DELAY<sub>T</sub>)
- Pilot detection threshold (T\_ADD<sub>S</sub> = T\_ADD<sub>T</sub>)
- Pilot drop threshold (T\_DROP<sub>S</sub> = T\_DROP<sub>T</sub>)

- 1 • Active Set versus Candidate Set comparison threshold ( $T\_COMP_S = T\_COMP_T$ )
- 2 • Drop timer value ( $T\_TDROP_S = T\_TDROP_T$ )
- 3 • Drop timer range value ( $T\_TDROP\_RANGE_S = T\_TDROP\_RANGE_T$ ) if
- 4  $T\_TDROP\_RANGE\_INCL_T$  is equal to '1'; otherwise,  $T\_TDROP\_RANGE_S = '0000'$
- 5 • *Extended System Parameters Message* sent
- 6 ( $EXT\_SYS\_PARAMETER_S = EXT\_SYS\_PARAMETER_T$ )
- 7 • *Global Service Redirection Message* sent
- 8 ( $GLOBAL\_REDIRECT_S = GLOBAL\_REDIRECT_T$ )
- 9 • *Extended Global Service Redirection Message* sent
- 10 ( $EXT\_GLOBAL\_REDIRECT_S = EXT\_GLOBAL\_REDIRECT_T$ )
- 11 • *Extended Neighbor List Message* sent
- 12 ( $EXT\_NGHBR\_LST_S = EXT\_NGHBR\_LST_T$ )
- 13 • *General Neighbor List Message* sent
- 14 ( $GEN\_NGHBR\_LST_S = GEN\_NGHBR\_LST_T$ )
- 15 • *User Zone Identification Message* sent
- 16 ( $USER\_ZONE\_ID_S = USER\_ZONE\_ID_T$ )
- 17 • *Private Neighbor List Message* sent
- 18 ( $PRI\_NGHBR\_LST_S = PRI\_NGHBR\_LST_T$ )
- 19 • *Extended CDMA Channel List Message* sent
- 20 ( $EXT\_CHAN\_LST_S = EXT\_CHAN\_LST_T$ )
- 21 • If  $NEG\_SLOT\_CYCLE\_INDEX\_SUP_T$  is included and equal to '1', the mobile station
- 22 shall set  $MIN\_SLOT\_CYCLE\_INDEX$  to -4; otherwise, the mobile station shall set
- 23  $MIN\_SLOT\_CYCLE\_INDEX$  to 0.
- 24 • *Call Recovery Request Message* supported indicator
- 25 ( $CRRM\_MSG\_IND_S = CRRM\_MSG\_IND_T$ ).
- 26 The mobile station shall also store the following parameters:
  - 27 • If the mobile station is not in the *Origination Attempt Substate*, or *Page Response*
  - 28 *Substate*, the mobile station shall store the following prior to storing the remaining
  - 29 parameters:
    - 30 – Registered system identification ( $REG\_SID_S = SID_S$ ).
    - 31 – Registered network identification ( $REG\_NID_S = NID_S$ ).
    - 32 – Registered registration zone ( $REG\_REG\_ZONE_S = REG\_ZONE_S$ ).
    - 33 – Registered zone timer length ( $REG\_ZONE\_TIMER_S = ZONE\_TIMER_T$ ).
  - 34 • System identification ( $SID_S = SID_T$ )
  - 35 • Network identification ( $NID_S = NID_T$ )
  - 36 • Registration zone ( $REG\_ZONE_S = REG\_ZONE_T$ )
  - 37 • Number of registration zones to be retained ( $TOTAL\_ZONES_S = TOTAL\_ZONES_T$ )

- 1 • Zone timer length ( $\text{ZONE\_TIMER}_S = \text{ZONE\_TIMER}_T$ )
- 2 • Multiple SID storage indicator ( $\text{MULT\_SIDS}_S = \text{MULT\_SIDS}_T$ )
- 3 • Multiple NID storage indicator ( $\text{MULT\_NIDS}_S = \text{MULT\_NIDS}_T$ )
- 4 • Registration period ( $\text{REG\_PRD}_S = \text{REG\_PRD}_T$ )
- 5 • Base station latitude ( $\text{BASE\_LAT}_S = \text{BASE\_LAT}_T$ )
- 6 • Base station longitude ( $\text{BASE\_LONG}_S = \text{BASE\_LONG}_T$ )
- 7 • Registration distance ( $\text{REG\_DIST}_S = \text{REG\_DIST}_T$ )
- 8 • Base station horizontal location uncertainty ( $\text{LOC\_UNC\_H}_S = \text{LOC\_UNC\_H}_T$ )
- 9 • Base station height ( $\text{HEIGHT}_S = \text{HEIGHT}_T$ )
- 10 • Base station vertical location uncertainty ( $\text{LOC\_UNC\_V}_S = \text{LOC\_UNC\_V}_T$ )
- 11 If  $\text{EXT\_SYS\_PARAMETER}_S$  is equal to '0', then the mobile station shall perform the
- 12 following:
  - 13 • Set  $\text{EXT\_SYS\_PAR\_MSG\_SEQ}_S$  to  $\text{CONFIG\_MSG\_SEQ}_S$ ,
  - 14 • Set  $\text{BCAST\_INDEX}_S$  to  $\text{MAX\_SLOT\_CYCLE\_INDEX}_S$ ,
  - 15 • Set  $\text{IMSI\_O}$  to  $\text{IMSI\_M}$  by setting  $\text{IMSI\_O\_S}_S$  to  $\text{IMSI\_M\_S}_P$  (i.e., setting  $\text{IMSI\_O\_S1}_S$
  - 16 to  $\text{IMSI\_M\_S1}_P$  and  $\text{IMSI\_O\_S2}_S$  to  $\text{IMSI\_M\_S2}_P$ ),  $\text{MCC\_O}_S$  to  $\text{MCC\_M}_P$ ,
  - 17  $\text{IMSI\_O\_11\_12}_S$  to  $\text{IMSI\_M\_11\_12}_P$ , and  $\text{IMSI\_O\_ADDR\_NUM}_S$  to
  - 18  $\text{IMSI\_M\_ADDR\_NUM}_P$ ,
  - 19 • Set  $\text{RESELECT\_INCLUDED}_S$  to '0',
  - 20 • For Band Class 0, if the mobile station determines it is operating in Korea, set
  - 21  $\text{P\_REV}_S$  to '00000010'; otherwise, set  $\text{P\_REV}_S$  to '00000011'. For Band Class 3, set
  - 22  $\text{P\_REV}_S$  to '00000011'. For Band Class 1 and Band Class 4, set  $\text{P\_REV}_S$  to
  - 23 '00000001', and
  - 24 • Set  $\text{P\_REV\_IN\_USE}_S$  to the lesser value of  $\text{P\_REV}_S$  and  $\text{MOB\_P\_REV}_P$  of the current
  - 25 band class.
- 26 If  $\text{EXT\_CHAN\_LST}_S$  is equal to '0', then the mobile station shall set
- 27  $\text{EXT\_CHAN\_LST\_MSG\_SEQ}_S$  to  $\text{CONFIG\_MSG\_SEQ}_S$ .
- 28 If  $\text{GLOBAL\_REDIRECT}_S$  is equal to '0', then the mobile station shall set  $\text{GLOB\_SERV\_}$
- 29  $\text{REDIR\_MSG\_SEQ}_S$  to  $\text{CONFIG\_MSG\_SEQ}_S$ .
- 30 If  $\text{EXT\_GLOBAL\_REDIRECT}_S$  is equal to '0', then the mobile station shall set
- 31  $\text{EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ}_S$  to  $\text{CONFIG\_MSG\_SEQ}_S$ .
- 32 If  $\text{EXT\_NGHBR\_LST}_S$  is equal to '0', then the mobile station shall set
- 33  $\text{EXT\_NGHBR\_LST\_MSG\_SEQ}_S$  to  $\text{CONFIG\_MSG\_SEQ}_S$ .
- 34 If  $\text{GEN\_NGHBR\_LST}_S$  is equal to '0', then the mobile station shall perform the following:
  - 35 • Set  $\text{GEN\_NGHBR\_LST\_MSG\_SEQ}_S$  to  $\text{CONFIG\_MSG\_SEQ}_S$ .
  - 36 • Set the  $\text{SRCH\_WIN\_NGHBR}$  field of  $\text{NGHBR\_REC}$  to  $\text{SRCH\_WIN\_N}_S$  for all entries.

- 1       • Set the SRCH\_OFFSET\_NGHR field of NGHR\_REC to '000' for all entries.
- 2       • Set the TIMING\_INCL field of NGHR\_REC to '0' for all entries.
- 3       • Set RESQ\_ENABLED<sub>S</sub> to '0'.
- 4       • Set the NGHR\_RESQ\_CONFIGURED field of NGHR\_REC to '0' for all entries.
- 5       • If EXT\_NGHR\_LST<sub>S</sub> is equal to '0':
  - 6           – Set the SEARCH\_PRIORITY field of the NGHR\_REC to '10' (high) for all entries.
  - 7           – Set the NGHR\_BAND field of the NGHR\_REC to CDMABAND<sub>S</sub> for all entries.
  - 8           – Set the NGHR\_FREQ field of the NGHR\_REC to CDMACH<sub>S</sub> for all entries.
- 9 If GEN\_NGHR\_LST<sub>S</sub> is equal to '1', GEN\_NGHR\_LST\_MSG\_SEQ<sub>S</sub> is equal to  
10 CONFIG\_MSG\_SEQ<sub>S</sub>, and SETTING\_SEARCH\_WIN is equal to '1', the mobile station shall  
11 perform the following:
  - 12       • Set the SRCH\_WIN\_NGHR field of each NGHR\_REC to SEARCH\_WIN\_N<sub>S</sub> for all  
13       NGHR\_SET\_SIZE<sub>S</sub> entries.
  - 14       • Set SETTING\_SEARCH\_WIN to '0'.
- 15 If USER\_ZONE\_ID<sub>S</sub> is equal to '0', then the mobile station shall perform the following:
  - 16       • Set USER\_ZONE\_ID\_MSG\_SEQ<sub>S</sub> to CONFIG\_MSG\_SEQ<sub>S</sub>.
  - 17       • Set the UZID field of the UZ\_REC to '0000000000000000' for all entries.
  - 18       • Set the UZ\_REV field of the UZ\_REC to '0000' for all entries.
  - 19       • Set the TEMP\_SUB field of the UZ\_REC to '0' for all entries.
- 20 If USER\_ZONE\_ID<sub>S</sub> is equal to '1' and the mobile station does not support Tiered Services,  
21 then the mobile station shall set USER\_ZONE\_ID\_MSG\_SEQ<sub>S</sub> to CONFIG\_MSG\_SEQ<sub>S</sub>.
- 22 If PRI\_NGHR\_LST<sub>S</sub> is equal to '0', then the mobile station shall set  
23 PRI\_NGHR\_LST\_MSG\_SEQ<sub>S</sub> to CONFIG\_MSG\_SEQ<sub>S</sub>.
- 24 If PRI\_NGHR\_LST<sub>S</sub> is equal to '1' and the mobile station does not support Tiered Services,  
25 then the mobile station shall set PRI\_NGHR\_LST\_MSG\_SEQ<sub>S</sub> to CONFIG\_MSG\_SEQ<sub>S</sub>.
- 26 The mobile station shall also store the following parameters:
  - 27       • *Access Point Pilot Information Message* sent  
28       (AP\_PILOT\_INFO<sub>S</sub> = AP\_PILOT\_INFO<sub>r</sub>) if included; otherwise, AP\_PILOT\_INFO<sub>S</sub> = '0'  
29       If the APPIM\_PERIOD\_INDEX is included in the message APPIM\_PERIOD\_INDEX<sub>S</sub> =  
30       APPIM\_PERIOD\_INDEX<sub>r</sub>. Otherwise, APPIM\_PERIOD\_INDEX<sub>S</sub> = 0.
  - 31       • *Access Point Identification Message* sent  
32       (AP\_IDT<sub>S</sub> = AP\_IDT<sub>r</sub>) if included; otherwise, AP\_IDT<sub>S</sub> = '0'
  - 33       • *Access Point Identification Text Message* sent  
34       (AP\_ID\_TEXT<sub>S</sub> = AP\_ID\_TEXT<sub>r</sub>) if included; otherwise, AP\_ID\_TEXT<sub>S</sub> = '0'

- 1       • *General Overhead Information Message* sent  
2       (GEN\_OVHD\_INF\_IND<sub>S</sub> = GEN\_OVHD\_INF\_IND<sub>T</sub>) if included; otherwise,  
3       GEN\_OVHD\_INF\_IND<sub>S</sub> = '0'
- 4       If the GEN\_OVHD\_CYCLE\_INDEX is included in the message  
5       GEN\_OVHD\_CYCLE\_INDEX<sub>S</sub> = GEN\_OVHD\_CYCLE\_INDEX<sub>T</sub>. Otherwise,  
6       GEN\_OVHD\_CYCLE\_INDEX<sub>S</sub> = 0.
- 7       • *Flex Duplex CDMA Channel List Message* sent  
8       (FD\_CHAN\_LST\_IND<sub>S</sub> = FD\_CHAN\_LST\_IND<sub>T</sub>) if included; otherwise,  
9       FD\_CHAN\_LST\_IND<sub>S</sub> = '0'.
- 10       • *Alternative Technologies Information Message* sent  
11       (ATIM\_IND<sub>S</sub> = ATIM\_IND<sub>T</sub>) if included; otherwise, ATIM\_IND<sub>S</sub> = '0'
- 12       If the ATIM\_CYCLE\_INDEX is included in the message ATIM\_CYCLE\_INDEX<sub>S</sub> =  
13       ATIM\_CYCLE\_INDEX<sub>T</sub>. Otherwise, ATIM\_CYCLE\_INDEX<sub>S</sub> = 0.
- 14       The mobile station shall ignore any fields at the end of the *System Parameters Message*  
15       that are not defined according to the protocol revision level (MOB\_P\_REV<sub>P</sub> of the current  
16       band class) being used by the mobile station.

#### 17   2.6.2.2.1.2 Paging Channel Assignment Change

18   If the number of Paging Channels specified in the *System Parameters Message*  
19   (PAGE\_CHAN<sub>T</sub>) is different from PAGE\_CHAN<sub>S</sub>, the mobile station shall use the hash  
20   algorithm specified in 2.6.7.1 to select a new Paging Channel number in the range 1 to  
21   PAGE\_CHAN<sub>T</sub>. The mobile station shall store the new Paging Channel number as  
22   PAGECH<sub>S</sub>. The mobile station shall then set PAGE\_CHAN<sub>S</sub> to PAGE\_CHAN<sub>T</sub>. The mobile  
23   station shall set ACC\_MSG\_SEQ<sub>S</sub> to NULL. If the mobile station has not stored  
24   configuration parameters for the new Paging Channel, or if the stored parameters are not  
25   current (see 2.6.2.2), the mobile station shall set CONFIG\_MSG\_SEQ<sub>S</sub>, SYS\_PAR\_MSG-  
26   \_SEQ<sub>S</sub>, NGHBR\_LST\_MSG\_SEQ<sub>S</sub>, EXT\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub>,  
27   GEN\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub>, CHAN\_LST\_MSG\_SEQ<sub>S</sub>, EXT\_SYS\_PAR\_MSG\_SEQ<sub>S</sub>,  
28   USER\_ZONE\_ID\_MSG\_SEQ<sub>S</sub>, PRI\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub>, and  
29   EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>S</sub>, EXT\_CHAN\_LST\_MSG\_SEQ<sub>S</sub>,  
30   FD\_CHAN\_LST\_MSG\_SEQ<sub>S</sub>, and GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>S</sub> to NULL. The mobile  
31   station shall then begin monitoring the new Paging Channel as specified in 2.6.2.1.1.

#### 32   2.6.2.2.1.3 RESCAN Parameter

33   If the RESCAN<sub>T</sub> field in the *System Parameters Message* equals '1', the mobile station shall  
34   enter the *System Determination Substate* of the *Mobile Station Initialization State* with a  
35   rescan indication (see 2.6.1.1).

#### 36   2.6.2.2.1.4 Roaming Status

37   The mobile station shall determine the roaming status for the mobile station (see 2.6.5.3).  
38   The mobile station should indicate to the user whether the mobile station is roaming.

## 2.6.2.2.1.5 Registration

The mobile station shall update stored variables and perform other registration procedures as specified in 2.6.5.5.2.2.

## 2.6.2.2.1.6 Slot Cycle Index

The mobile station shall set  $SLOT\_CYCLE\_INDEX_S$  to :

$$\max \left( \begin{array}{l} MIN\_SLOT\_CYCLE\_INDEX_S, \\ \min(SLOT\_CYCLE\_INDEX\_REG, MAX\_SLOT\_CYCLE\_INDEX_S) \end{array} \right).$$

Where,  $SLOT\_CYCLE\_INDEX\_REG$  is computed based on the slot cycle index value included in the last registration attempt (see 2.6.5.5.3.1 and 2.6.5.5.3.2).

If the mobile station is operating in the slotted mode, it shall set its slot cycle length as described in 2.6.2.1.1.3.

## 2.6.2.2.1.7 PACA Disable for SID Change

If  $PACA_S$  is equal to enabled, and  $SID_S$  is not equal to  $PACA\_SID_S$ , the mobile station shall set  $PACA_S$  to disabled and  $PACA\_CANCEL$  to '0', shall disable the PACA state timer, and should indicate to the user that the PACA call has been canceled.

## 2.6.2.2.1.8 Retry Delay Disable for Packet Zone ID or SID/NID Change

The mobile station shall set  $RETRY\_DELAY_S[RETRY\_TYPE]$  to 0 when the mobile station determines that the Packet Zone Identification or the System Identification/Network Identification (SID/NID pair) has been changed, where  $RETRY\_TYPE$  is equal to '001', '010', '011', '100', or '101'.

## 2.6.2.2.1.9 Encryption key reset for SID/NID Change

When the mobile station determines that the System Identification/Network Identification (SID/NID pair) has been changed, it shall perform the following:

- The mobile station shall disable the key setup timer if the timer is running.
- If there is an entry in the mobile station's  $SID\_NID\_LIST_S$  that matches the previous SID/NID pair, the mobile station shall perform the following:
  - The mobile station shall save the following encryption/integrity related parameters associated with previous SID/NID pair:
    - +  $KEY\_ID$ ,
    - +  $ENC\_KEY[KEY\_ID]$  and  $INT\_KEY[KEY\_ID]$ ,
    - +  $TX\_EXT\_SSEQ[0][KEY\_ID]$ ,  $TX\_EXT\_SSEQ[1][KEY\_ID]$ ,  
 $RX\_EXT\_SSEQ[0][KEY\_ID]$ , and  $RX\_EXT\_SSEQ[1][KEY\_ID]$  and
    - +  $C\_SIG\_ENCRYPT\_MODE_S$ .

- 1       – If there are more than one SID/NID pairs in the SID\_NID\_LIST<sub>S</sub> for which there
- 2       are associated encryption/integrity related parameters saved, the mobile station
- 3       may remove the parameters associated with the SID/NID pair that was visited
- 4       at the earliest time.
- 5       • If there is an entry in the mobile station's SID\_NID\_LIST<sub>S</sub> that matches the base
- 6       station's SID and NID and the following encryption/integrity related parameters
- 7       last used in that system (SID/NID pair) are stored in the mobile station, the mobile
- 8       station shall restore them:
  - 9       – KEY\_ID,
  - 10      – ENC\_KEY[KEY\_ID] and INT\_KEY[KEY\_ID],
  - 11      – TX\_EXT\_SSEQ[0][KEY\_ID], TX\_EXT\_SSEQ[1][KEY\_ID],
  - 12      RX\_EXT\_SSEQ[0][KEY\_ID], and RX\_EXT\_SSEQ[1][KEY\_ID] and
  - 13      – C\_SIG\_ENCRYPT\_MODE<sub>S</sub>.
- 14      • Otherwise, the mobile station shall set ENC\_KEY['00'], ENC\_KEY['01'],
- 15      INT\_KEY['00'], and INT\_KEY['01'] to NULL.

#### 16   2.6.2.2.2 Access Parameters Message

17   Whenever an *Access Parameters Message* is received on the Paging Channel, the sequence  
 18   number, ACC\_MSG\_SEQ<sub>R</sub>, shall be compared to ACC\_MSG\_SEQ<sub>S</sub>. If the comparison  
 19   results in a match, the mobile station may ignore the message. If the comparison results  
 20   in a mismatch, then the mobile station shall process the remaining fields in the message  
 21   as follows.

22   If PROBE\_PN\_RAN, MAX\_REQ\_SEQ, or MAX\_RSP\_SEQ are not within the valid ranges  
 23   specified in 3.7.2.3.2.2, then the mobile station shall ignore the *Access Parameters*  
 24   *Message* that contains them.

25   The mobile station shall store the following parameters:

- 26      • *Access Parameters Message* sequence number  
 27        (ACC\_MSG\_SEQ<sub>S</sub> = ACC\_MSG\_SEQ<sub>R</sub>)
- 28      • Number of Access Channels (ACC\_CHAN<sub>S</sub> = ACC\_CHAN<sub>R</sub>)
- 29      • Nominal transmit power offset (NOM\_PWR<sub>S</sub> = NOM\_PWR<sub>R</sub>)
- 30      • Initial power offset for access (INIT\_PWR<sub>S</sub> = INIT\_PWR<sub>R</sub>)
- 31      • Power increment (PWR\_STEP<sub>S</sub> = PWR\_STEP<sub>R</sub>)
- 32      • Number of access probes (NUM\_STEP<sub>S</sub> = NUM\_STEP<sub>R</sub>)
- 33      • Maximum Access Channel message capsule size (MAX\_CAP\_SZ<sub>S</sub> = MAX\_CAP\_SZ<sub>R</sub>)
- 34      • Access Channel preamble length (PAM\_SZ<sub>S</sub> = PAM\_SZ<sub>R</sub>)
- 35      • Persistence modifier for Access Channel attempts for registrations which are not
- 36        responses to the *Registration Request Order* (REG\_PSIST<sub>S</sub> = REG\_PSIST<sub>R</sub>)

- 1       • Persistence modifier for Access Channel attempts for message transmissions  
2       (MSG\_PSIST<sub>S</sub> = MSG\_PSIST<sub>R</sub>)
- 3       • If PSIST\_EMG\_INCL<sub>R</sub> is equal to '0', the mobile station shall set the persistence  
4       modifier for emergency calls from mobile stations in access overload classes 0 to 9  
5       (PSIST\_EMG<sub>S</sub>) to '000'; otherwise, the mobile station shall set PSIST\_EMG<sub>S</sub> equal  
6       to PSIST\_EMG<sub>R</sub>.
- 7       • Time randomization for Access Channel probes  
8       (PROBE\_PN\_RAN<sub>S</sub> = PROBE\_PN\_RAN<sub>R</sub>)
- 9       • Acknowledgment timeout (ACH\_ACC\_TMO<sub>S</sub> = ACC\_TMO<sub>R</sub>)
- 10      • Access Channel probe backoff range (PROBE\_BKOFF<sub>S</sub> = PROBE\_BKOFF<sub>R</sub>)
- 11      • Access Channel probe sequence backoff range (BKOFF<sub>S</sub> = BKOFF<sub>R</sub>)
- 12      • Maximum number of probe sequences for an Access Channel request  
13      (MAX\_REQ\_SEQ<sub>S</sub> = MAX\_REQ\_SEQ<sub>R</sub>)
- 14      • Maximum number of probe sequences for an Access Channel response  
15      (MAX\_RSP\_SEQ<sub>S</sub> = MAX\_RSP\_SEQ<sub>R</sub>)
- 16      • If CDMABAND<sub>S</sub> is equal to '0', the mobile station shall set extended nominal  
17      transmit power NOM\_PWR\_EXT<sub>S</sub> to '0'; otherwise, the mobile station shall store  
18      extended nominal transmit power (NOM\_PWR\_EXT<sub>S</sub> = NOM\_PWR\_EXT<sub>R</sub>).
- 19      • IC threshold (IC\_THRESH<sub>S</sub> = -7)
- 20      The mobile station shall also store the following parameters:
- 21      • Authentication mode (if AUTH<sub>R</sub> is equal to '00' or '01', then AUTH<sub>S</sub> = AUTH<sub>R</sub>;  
22      otherwise AUTH<sub>S</sub> = '01')
- 23      • Random challenge value (RAND<sub>S</sub> = RAND<sub>R</sub>)
- 24      The mobile station shall ignore any fields at the end of the *Access Parameters Message*  
25      which are not defined according to the protocol revision level (MOB\_P\_REV<sub>p</sub> of the current  
26      band class) being used by the mobile station.
- 27      The mobile station shall store the persistence parameter number according to the following  
28      rule: If the mobile station's access overload class is in the range 0-9, set PSIST<sub>S</sub> equal to  
29      PSIST(0-9)<sub>R</sub>; otherwise set PSIST<sub>S</sub> equal to PSIST(n)<sub>R</sub>, where n is equal to the mobile station  
30      access overload class.
- 31      The mobile station shall store the Access Control based on Call Type (ACCT) information  
32      as follows:
- 33      • Set ACCT\_SO\_LIST to NULL.
- 34      • Set ACCT\_SO\_GRP\_LIST to NULL.
- 35      • If ACCT\_INCL<sub>R</sub> is equal to '1' and ACCOLC<sub>p</sub> is in the range 0 to 9, then the mobile  
36      station shall perform the following:  
37      – Set ACCT\_INCL\_EMG<sub>S</sub> to ACCT\_INCL\_EMG<sub>R</sub>.

- 1       – If ACCT\_SO\_INCL<sub>r</sub> is equal to '1', then for each ACCT\_SO<sub>r</sub> included in this
- 2       message:
- 3       + If ACCT\_AOC\_BITMAP\_INCL<sub>r</sub> is equal to '0', or if ACCT\_AOC\_BITMAP\_INCL<sub>r</sub>
- 4       is equal to '1' and the bit in the associated ACCT\_AOC\_BITMAP1<sub>r</sub>
- 5       corresponding to the mobile station's ACCOLC<sub>p</sub> (see Table 3.7.2.3.2.2-1) is
- 6       equal to '1', then add ACCT\_SO<sub>r</sub> to ACCT\_SO\_LIST.
- 7       – If ACCT\_SO\_GRP\_INCL<sub>r</sub> is equal to '1', then for each ACCT\_SO\_GRP<sub>r</sub> included
- 8       in this message:
- 9       + If ACCT\_AOC\_BITMAP\_INCL<sub>r</sub> is equal to '0', or if ACCT\_AOC\_BITMAP\_INCL<sub>r</sub>
- 10      is equal to '1' and the bit in the associated ACCT\_AOC\_BITMAP2<sub>r</sub>
- 11      corresponding to the mobile station's ACCOLC<sub>p</sub> (see Table 3.7.2.3.2.2-1) is
- 12      equal to '1', then add ACCT\_SO\_GRP<sub>r</sub> to ACCT\_SO\_GRP\_LIST.

13 The mobile station shall set CURR\_ACC\_MSG\_SEQ equal to ACC\_MSG\_SEQ<sub>s</sub>.

#### 14 2.6.2.2.3 Neighbor List Message

15 Whenever a valid *Neighbor List Message* is received on the current Paging Channel  
 16 (PAGECH<sub>s</sub>), the configuration message sequence number, CONFIG\_MSG\_SEQ<sub>r</sub>, shall be  
 17 compared to that stored in NGHBR\_LST\_MSG\_SEQ<sub>s</sub>. If the comparison results in a match,  
 18 the mobile station may ignore the message. If the comparison results in a mismatch, then  
 19 the mobile station shall process the remaining fields in the message as follows.

20 If the PILOT\_INC field is not within the valid range specified in 3.7.2.3.2.3, then the mobile  
 21 station shall ignore the *Neighbor List Message* that contains it.

22 The mobile station shall store the following parameters:

- 23       • Configuration message sequence number
- 24       (CONFIG\_MSG\_SEQ<sub>s</sub> = CONFIG\_MSG\_SEQ<sub>r</sub>,
- 25       NGHBR\_LST\_MSG\_SEQ<sub>s</sub> = CONFIG\_MSG\_SEQ<sub>r</sub>)
- 26       • Pilot PN sequence offset increment (PILOT\_INC<sub>s</sub> = PILOT\_INC<sub>r</sub>)

27 The mobile station shall set NGHBR\_SET\_SIZE<sub>s</sub> to the number of neighboring base  
 28 stations contained in the *Neighbor List Message*.

29 For each of the neighboring base stations contained in the *Neighbor List Message*, the  
 30 mobile station shall perform the following:

- 31       • If the *i*<sup>th</sup> occurrence of NGHBR\_CONFIG<sub>r</sub> is equal to '000', '001', or '010', set the
- 32       NGHBR\_CONFIG field of NGHBR\_REC[i] to the *i*<sup>th</sup> occurrence of NGHBR\_CONFIG<sub>r</sub>;
- 33       otherwise, set the NGHBR\_CONFIG field of NGHBR\_REC [i] to '011'.
- 34       • Set the NGHBR\_PN field of NGHBR\_REC [i] to the *i*<sup>th</sup> occurrence of NGHBR\_PN<sub>r</sub>.

35 If GEN\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub> is not equal to CONFIG\_MSG\_SEQ<sub>s</sub>, the mobile station  
 36 shall perform the following:

- 37       • Set the SEARCH\_PRIORITY field of the NGHBR\_REC to '10' (high) for all
- 38       NGHBR\_SET\_SIZE<sub>s</sub> entries.

- 1       • Set the NGHBR\_BAND field of NGHBR\_REC to CDMABAND<sub>S</sub> for all
- 2       NGHBR\_SET\_SIZE<sub>S</sub> entries.
- 3       • If NGHBR\_CONFIG<sub>r</sub> equals '010', set the NGHBR\_FREQ field of NGHBR\_REC to the
- 4       first CDMA Channel listed in the *CDMA Channel List Message* or *Extended CDMA*
- 5       *Channel List Message* transmitted by the current base station for all
- 6       NGHBR\_SET\_SIZE<sub>S</sub> entries; otherwise, set the NGHBR\_FREQ field of NGHBR\_REC
- 7       to CDMACH<sub>S</sub> for all NGHBR\_SET\_SIZE<sub>S</sub> entries.
- 8       • Set the SRCH\_WIN\_NGHBR field of NGHBR\_REC to SRCH\_WIN\_N<sub>S</sub> for all
- 9       NGHBR\_SET\_SIZE<sub>S</sub> entries.
- 10      • Set the SRCH\_OFFSET\_NGHBR field of NGHBR\_REC to '000' for all entries.
- 11      The mobile station shall set the ACCESS\_ENTRY\_HO field of the NGHBR\_REC to '0' for all
- 12      NGHBR\_SET\_SIZE<sub>S</sub> entries if any of the following conditions are met:
- 13      • EXT\_SYS\_PARAMETER<sub>S</sub> is equal to '0',
- 14      • NGHBR\_SET\_ENTRY\_INFO<sub>S</sub> is equal to '0', or
- 15      • EXT\_SYS\_PAR\_MSG\_SEQ<sub>S</sub> is not equal to CONFIG\_MSG\_SEQ<sub>S</sub>.
- 16      The mobile station shall set the ACCESS\_HO\_ALLOWED field of the NGHBR\_REC to '0' for
- 17      all NGHBR\_SET\_SIZE<sub>S</sub> entries if any of the following conditions are met:
- 18      • EXT\_SYS\_PARAMETER<sub>S</sub> is equal to '0',
- 19      • NGHBR\_SET\_ACCESS\_INFO<sub>S</sub> is equal to '0', or
- 20      • EXT\_SYS\_PAR\_MSG\_SEQ<sub>S</sub> is not equal to CONFIG\_MSG\_SEQ<sub>S</sub>.
- 21      The mobile station shall update the idle handoff Neighbor Set (see 2.6.2.1.4) so that it
- 22      consists only of pilot offsets listed in the *Neighbor List Message*. If the *Neighbor List*
- 23      *Message* contains more pilot offsets than the mobile station can store, the mobile station
- 24      shall store the pilot offsets beginning at the start of the *Neighbor List Message*, up to the
- 25      limits of the mobile station's Neighbor Set storage capacity.
- 26      2.6.2.2.4 CDMA Channel List Message
- 27      Whenever a *CDMA Channel List Message* is received on the Paging Channel, the
- 28      configuration message sequence number, CONFIG\_MSG\_SEQ<sub>r</sub>, shall be compared to that
- 29      stored in CHAN\_LST\_MSG\_SEQ<sub>S</sub>. If the comparison results in a match, the mobile station
- 30      may ignore the message. If the comparison results in a mismatch, then the mobile station
- 31      shall process the remaining fields in the message as follows.
- 32      The mobile station shall store the following parameters:
- 33      • Configuration message sequence number
- 34        (CONFIG\_MSG\_SEQ<sub>S</sub> = CONFIG\_MSG\_SEQ<sub>r</sub>,
- 35        CHAN\_LST\_MSG\_SEQ<sub>S</sub> = CONFIG\_MSG\_SEQ<sub>r</sub>)
- 36      The mobile station shall perform the following:
- 37      • If SYS\_PAR\_MSG\_SEQ<sub>S</sub>, EXT\_SYS\_PAR\_MSG\_SEQ<sub>S</sub>, and
- 38      FD\_CHAN\_LST\_MSG\_SEQ<sub>S</sub> are current,

- 1       – If EXT\_CHAN\_LST<sub>s</sub> is equal to '1', the mobile station shall ignore this message.
- 2       – If EXT\_CHAN\_LST<sub>s</sub> is equal to '0', the mobile station shall process this message
- 3       as described below.
- 4       • Otherwise,
- 5       – if the mobile station does not support flexible spacing between forward and
- 6       reverse channels the mobile station shall process this message after
- 7       SYS\_PAR\_MSG\_SEQ<sub>s</sub> and EXT\_SYS\_PAR\_MSG\_SEQ<sub>s</sub> are current.
- 8       – Otherwise, the mobile station shall process this message after
- 9       SYS\_PAR\_MSG\_SEQ<sub>s</sub>, EXT\_SYS\_PAR\_MSG\_SEQ<sub>s</sub>, and FD\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>
- 10      become current.

11 If the FD\_CHAN\_LST\_SEQ<sub>s</sub> is current and the mobile station supports at least one  
 12 bandclass listed by the base station in the *Flex Duplex CDMA Channel List Message*, the  
 13 mobile station shall ignore this message. Otherwise, mobile station shall process this  
 14 message as follows:

15 The mobile station shall use the hash algorithm specified in 2.6.7.1 and the number of  
 16 channels listed in the *CDMA Channel List Message* to determine the CDMA Channel  
 17 (Frequency Assignment) for its Paging Channel. If the CDMA Frequency Assignment has  
 18 changed (the computed CDMA Channel is different from CDMACH<sub>s</sub>), the mobile station  
 19 shall perform the following actions:

- 20      • Set CDMACH<sub>s</sub> to the new CDMA Channel.
- 21      • Set PAGE\_CHAN<sub>s</sub> to '1'.
- 22      • Set PAGECH<sub>s</sub> to the Primary Paging Channel.
- 23      • If the stored configuration parameters is not current (see 2.6.2.2) for the
- 24      corresponding base station and frequency assignment, set CONFIG\_MSG\_SEQ<sub>s</sub>,
- 25      SYS\_PAR\_MSG\_SEQ<sub>s</sub>, NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, CHAN\_LST\_MSG\_SEQ<sub>s</sub>,
- 26      EXT\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, GEN\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>,
- 27      EXT\_SYS\_PAR\_MSG\_SEQ<sub>s</sub>, GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub>, USER\_ZONE\_ID-
- 28      MSG\_SEQ<sub>s</sub>, PRI\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, EXT\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>,
- 29      FD\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>, EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub>, and
- 30      ACC\_MSG\_SEQ<sub>s</sub> to NULL.
- 31      • Tune to the new CDMA Channel.

#### 32 2.6.2.2.5 Extended System Parameters Message

33 Whenever an *Extended System Parameters Message* is received on the Paging Channel, the  
 34 configuration message sequence number, CONFIG\_MSG\_SEQ<sub>r</sub>, shall be compared to that  
 35 stored in EXT\_SYS\_PAR\_MSG\_SEQ<sub>s</sub>. If the comparison results in a match, the mobile  
 36 station may ignore the message. If the comparison results in a mismatch, then the mobile  
 37 station shall process the remaining fields in the message as follows.

38 If the protocol revision level supported by the mobile station (MOB\_P\_REV<sub>p</sub>) is less than  
 39 the minimum protocol revision level supported by the base station (MIN\_P\_REV<sub>r</sub>), the  
 40 mobile station shall enter the *System Determination Substate* of the *Mobile Station*

1 *Initialization State* with a protocol mismatch indication (see 2.6.1.1). Otherwise, the mobile  
 2 station shall store the following parameters:

- 3 • Configuration message sequence number  
 4 (CONFIG\_MSG\_SEQ<sub>S</sub> = CONFIG\_MSG\_SEQ<sub>R</sub>,  
 5 EXT\_SYS\_PAR\_MSG\_SEQ<sub>S</sub> = CONFIG\_MSG\_SEQ<sub>R</sub>)
- 6 • Preferred Access Channel MSID type (PREF\_MSID\_TYPE<sub>S</sub> = PREF\_MSID\_TYPE<sub>R</sub>)
- 7 • Extended Preferred Access Channel MSID type  
 8 (EXT\_PREF\_MSID\_TYPE<sub>S</sub> = EXT\_PREF\_MSID\_TYPE<sub>R</sub>) if included; otherwise, set  
 9 EXT\_PREF\_MSID\_TYPE<sub>S</sub> to NULL.
- 10 • MEID Required indicator (MEID\_REQD<sub>S</sub> = MEID\_REQD<sub>R</sub>) if included; otherwise, set  
 11 MEID\_REQD<sub>S</sub> to '0'
- 12 • Broadcast slot cycle index (BCAST\_INDEX<sub>S</sub> = BCAST\_INDEX<sub>R</sub>)
- 13 • The mobile station shall set its operational IMSI, IMSI<sub>O</sub>, as follows:
  - 14 – If IMSI\_T\_SUPPORTED<sub>R</sub> is equal to '0', the mobile station shall set IMSI<sub>O</sub> to  
 15 IMSI<sub>Mp</sub>.
  - 16 – If IMSI\_T\_SUPPORTED<sub>R</sub> is equal to '1' and the mobile station's IMSI<sub>Tp</sub> has  
 17 been programmed, the mobile station shall set IMSI<sub>O</sub> to IMSI<sub>Tp</sub>.
  - 18 – If IMSI\_T\_SUPPORTED<sub>R</sub> is equal to '1' and the mobile station's IMSI<sub>Tp</sub> has not  
 19 been programmed, the mobile station shall set IMSI<sub>O</sub> to IMSI<sub>Mp</sub>.
- 20 • If MCC<sub>R</sub> = '111111111' and IMSI\_11\_12<sub>R</sub> = '111111', the mobile station shall set  
 21 the IMSI<sub>O</sub> to IMSI<sub>Mp</sub> and store:
  - 22 – Mobile Country Code (MCC<sub>S</sub> = MCC<sub>Mp</sub>) and
  - 23 – IMSI 11th and 12th digits (IMSI\_11\_12<sub>S</sub> = IMSI<sub>M</sub>\_11\_12<sub>p</sub>);
  - 24 otherwise, the mobile station shall store:
    - 25 – Mobile Country Code (MCC<sub>S</sub> = MCC<sub>R</sub>) and
    - 26 – IMSI 11th and 12th digits (IMSI\_11\_12<sub>S</sub> = IMSI\_11\_12<sub>R</sub>).
- 27 • Least significant digit of MNC (IMSI\_10<sub>S</sub> = IMSI\_10<sub>R</sub>), if included.
- 28 • If IMSI<sub>O</sub> is set to the IMSI<sub>M</sub>, the mobile station shall set:
  - 29 – IMSI<sub>O</sub>\_S<sub>S</sub> to IMSI<sub>M</sub>\_S<sub>p</sub> (i.e., IMSI<sub>O</sub>\_S1<sub>S</sub> to IMSI<sub>M</sub>\_S1<sub>p</sub> and IMSI<sub>O</sub>\_S2<sub>S</sub> to  
 30 IMSI<sub>M</sub>\_S2<sub>p</sub>)
  - 31 – IMSI<sub>O</sub>\_11\_12<sub>S</sub> to IMSI<sub>M</sub>\_11\_12<sub>p</sub>
  - 32 – MCC<sub>O</sub><sub>S</sub> to MCC<sub>Mp</sub>
  - 33 – IMSI<sub>O</sub>\_ADDR\_NUM<sub>S</sub> to IMSI<sub>M</sub>\_ADDR\_NUM<sub>p</sub>
- 34 • If IMSI<sub>O</sub> is set to the IMSI<sub>T</sub>, the mobile station shall set:
  - 35 – IMSI<sub>O</sub>\_S<sub>S</sub> to IMSI<sub>T</sub>\_S<sub>p</sub> (i.e., IMSI<sub>O</sub>\_S1<sub>S</sub> to IMSI<sub>T</sub>\_S1<sub>p</sub> and IMSI<sub>O</sub>\_S2<sub>S</sub> to  
 36 IMSI<sub>T</sub>\_S2<sub>p</sub>).

- 1        - IMSI\_O\_11\_12<sub>s</sub> to IMSI\_T\_11\_12<sub>p</sub>
- 2        - MCC\_O<sub>s</sub> to MCC\_T<sub>p</sub>
- 3        - IMSI\_O\_ADDR\_NUM<sub>s</sub> to IMSI\_T\_ADDR\_NUM<sub>p</sub>
- 4        • If IMSI\_O has been changed, the mobile station shall set SYS\_PAR\_MSG\_SEQ<sub>s</sub>,  
5        CHAN\_LST\_MSG\_SEQ<sub>s</sub>, EXT\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>, FD\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>  
6        to NULL, and set PAGE\_CHAN<sub>s</sub> to '1', and set PAGECH<sub>s</sub> to the Primary Paging  
7        Channel.
- 8        • Protocol revision level (P\_REV<sub>s</sub> = P\_REV<sub>r</sub>) if included in the message; otherwise, set  
9        P\_REV<sub>s</sub> as follows:
  - 10       - For Band Class 0, if the mobile station determines it is operating in Korea, set  
11       P\_REV<sub>s</sub> to '00000010'; otherwise, set P\_REV<sub>s</sub> to '00000011'.
  - 12       - For Band Class 3, set P\_REV<sub>s</sub> to '00000011'.
  - 13       - For Band Class 1 and Band Class 4, set P\_REV<sub>s</sub> to '00000001'.
- 14       • Minimum protocol revision level (MIN\_P\_REV<sub>s</sub> = MIN\_P\_REV<sub>r</sub>) if included in the  
15       message; otherwise, MIN\_P\_REV<sub>s</sub> = '00000010' for Band Class 0, MIN\_P\_REV<sub>s</sub> =  
16       '00000001' for Band Class 1 and Band Class 4, and MIN\_P\_REV<sub>s</sub> = '00000011' for  
17       Band Class 3.
- 18       • Protocol revision level currently in use (P\_REV\_IN\_USE<sub>s</sub> = the lesser value of  
19       P\_REV<sub>s</sub> and MOB\_P\_REV<sub>p</sub> of the current band class)
- 20       • Slope of the handoff add/drop criterion (SOFT\_SLOPE<sub>s</sub> = SOFT\_SLOPE<sub>r</sub>) if included  
21       in the message; otherwise, SOFT\_SLOPE<sub>s</sub> = '000000'.
- 22       • Intercept of the handoff add criterion (ADD\_INTERCEPT<sub>s</sub> = ADD\_INTERCEPT<sub>r</sub>)
- 23       • Intercept of the handoff drop criterion (DROP\_INTERCEPT<sub>s</sub> = DROP\_INTERCEPT<sub>r</sub>)
- 24       • Delete foreign TMSI (DELETE\_FOR\_TMSI<sub>s</sub> = DELETE\_FOR\_TMSI<sub>r</sub>)
- 25       • Use TMSI (USE\_TMSI<sub>s</sub> = USE\_TMSI<sub>r</sub>)
- 26       • TMSI zone length (TMSI\_ZONE\_LEN<sub>s</sub> = TMSI\_ZONE\_LEN<sub>r</sub>)
- 27       • TMSI zone number (TMSI\_ZONE<sub>s</sub> = TMSI\_ZONE<sub>r</sub>)
- 28       • Maximum number of alternative service options (MAX\_NUM\_ALT\_SO<sub>s</sub> =  
29       MAX\_NUM\_ALT\_SO<sub>r</sub>).
- 30       • System reselection indicator (RESELECT\_INCLUDED<sub>s</sub> = RESELECT\_INCLUDED<sub>r</sub>) if  
31       included in the message; otherwise, RESELECT\_INCLUDED<sub>s</sub> = '0'.
- 32       • Pilot reporting indicator (PILOT\_REPORT<sub>s</sub> = PILOT\_REPORT<sub>r</sub>)
- 33       • Neighbor Set access entry handoff information indicator  
34       (NGHBR\_SET\_ENTRY\_INFO<sub>s</sub> = NGHBR\_SET\_ENTRY\_INFO<sub>r</sub>) if included in the  
35       message; otherwise, NGHBR\_SET\_ENTRY\_INFO<sub>s</sub> = '0'.

- 1 • Neighbor Set access handoff information indicator (NGHBR\_SET\_ACCESS\_INFO<sub>S</sub> =  
2 NGHBR\_SET\_ACCESS\_INFO<sub>T</sub>) if included in the message; otherwise,  
3 NGHBR\_SET\_ACCESS\_INFO<sub>S</sub> = '0'.
- 4 • Short Data Burst supported indicator (SDB\_SUPPORTED<sub>S</sub> = SDB\_SUPPORTED<sub>T</sub>)
- 5 • Nominal reverse traffic channel output power offset relative to Reverse Pilot  
6 Channel power (RLGAIN\_TRAFFIC\_PILOT<sub>S</sub> = RLGAIN\_TRAFFIC\_PILOT<sub>T</sub>)
- 7 • Broadcast GPS Assist Indicator (BROADCAST\_GPS\_ASST<sub>S</sub> =  
8 BROADCAST\_GPS\_ASST<sub>T</sub>)
- 9 • Reverse Power Control Delay (REV\_PWR\_CNTL\_DELAY<sub>S</sub> =  
10 REV\_PWR\_CNTL\_DELAY<sub>T</sub>) if included
- 11 • Permission for the mobile station to request QoS settings in the *Origination*  
12 *Message*, *Origination Continuation Message*, or *Enhanced Origination Message*  
13 (MOB\_QOS<sub>S</sub> = MOB\_QOS<sub>T</sub>)
- 14 • If ENC\_SUPPORTED<sub>T</sub> is equal to '1', the mobile station shall store:
  - 15 – Signaling encryption supported indicator (SIG\_ENCRYPT\_SUP<sub>S</sub> =  
16 SIG\_ENCRYPT\_SUP<sub>T</sub>)
  - 17 – User information encryption supported indicator (UI\_ENCRYPT\_SUP<sub>S</sub> =  
18 UI\_ENCRYPT\_SUP<sub>T</sub>)
- 19 • Sync ID supported indicator (USE\_SYNC\_ID<sub>S</sub> = USE\_SYNC\_ID<sub>T</sub>)
- 20 • Concurrent services supported indicator (CS\_SUPPORTED<sub>S</sub> = CS\_SUPPORTED<sub>T</sub>)
- 21 • Maximum number of additional service reference identifiers allowed in origination  
22 (MAX\_ADD\_SERV\_INSTANCE<sub>S</sub> = MAX\_ADD\_SERV\_INSTANCE<sub>T</sub>), if included;  
23 otherwise, the mobile station shall set MAX\_ADD\_SERV\_INSTANCE<sub>S</sub> to 0.
- 24 • Primary Broadcast Control Channel supported indicator (BCCH\_SUPPORTED<sub>S</sub> =  
25 BCCH\_SUPPORTED<sub>T</sub>).
- 26 • Pilot information request supported indicator (PILOT\_INFO\_REQ\_SUPPORTED<sub>S</sub> =  
27 PILOT\_INFO\_REQ\_SUPPORTED<sub>T</sub>).
- 28 • Message integrity supported indicator (MSG\_INTEGRITY\_SUP<sub>S</sub> =  
29 MSG\_INTEGRITY\_SUP<sub>T</sub>), if P\_REV\_IN\_USE<sub>S</sub> is greater than or equal to 10;  
30 otherwise, MSG\_INTEGRITY\_SUP<sub>S</sub> = 0.
- 31 • If MSG\_INTEGRITY\_SUP<sub>T</sub> is equal to '1' and SIG\_INTEGRITY\_SUP\_INCL<sub>T</sub> is equal to  
32 '1', the mobile station shall store the message integrity algorithms that the base  
33 station supports (SIG\_INTEGRITY\_SUP<sub>S</sub> = SIG\_INTEGRITY\_SUP<sub>T</sub>); otherwise, the  
34 mobile station shall set SIG\_INTEGRITY\_SUP<sub>S</sub> to '00000000'.
- 35 • Band class information request indicator (BAND\_CLASS\_INFO\_REQ<sub>S</sub> =  
36 BAND\_CLASS\_INFO\_REQ<sub>T</sub>)
- 37 • Alternate CDMA band class (ALT\_BAND\_CLASS<sub>S</sub> = ALT\_BAND\_CLASS<sub>T</sub>), if  
38 BAND\_CLASS\_INFO\_REQ<sub>T</sub> is equal to '1'.

- 1 • CDMA off time report supported indicator  
2 (CDMA\_OFF\_TIME\_REP\_SUP\_IND<sub>S</sub> = CDMA\_OFF\_TIME\_REP\_SUP\_IND<sub>T</sub>)
- 3 • If CDMA\_OFF\_TIME\_REP\_SUP\_IND<sub>T</sub> is equal to '1', the mobile station shall store:  
4 – CDMA off time report threshold (CDMA\_OFF\_TIME\_REP\_THRESHOLD<sub>S</sub> =  
5 CDMA\_OFF\_TIME\_REP\_THRESHOLD<sub>T</sub> in units specified by  
6 CDMA\_OFF\_TIME\_REP\_UNIT<sub>T</sub>)
- 7 • Control Hold Mode supported indicator (CHM\_SUPPORTED<sub>S</sub> = CHM\_SUPPORTED<sub>T</sub>)  
8 if included; otherwise, the mobile station shall perform the following:  
9 – If P\_REV\_IN\_USE<sub>S</sub> is less than six, set CHM\_SUPPORTED<sub>S</sub> to '0'.  
10 – Otherwise, set CHM\_SUPPORTED<sub>S</sub> to '1'.
- 11 • Release to Idle State allowed indicator (RELEASE\_TO\_IDLE\_IND<sub>S</sub> =  
12 RELEASE\_TO\_IDLE\_IND<sub>T</sub>).
- 13 • *Reconnect Message* supported indicator  
14 (RECONNECT\_MSG\_IND<sub>S</sub> = RECONNECT\_MSG\_IND<sub>T</sub>).
- 15 • Short Data Burst allowed in *Reconnect Message* allowed indicator  
16 (SDB\_IN\_RCNM\_IND<sub>S</sub> = SDB\_IN\_RCNM\_IND<sub>T</sub>), if included; otherwise, set  
17 SDB\_IN\_RCNM\_IND<sub>S</sub> to '0'.
- 18 • Forward Packet Data Channel supported Indicator (FOR\_PDCH\_SUPPORTED<sub>S</sub> =  
19 FOR\_PDCH\_SUPPORTED<sub>T</sub>).
- 20 • PDCH Control Hold Mode supported indicator (PDCH\_CHM\_SUPPORTED<sub>S</sub> =  
21 PDCH\_CHM\_SUPPORTED<sub>T</sub>) if included; otherwise, set PDCH\_CHM\_SUPPORTED<sub>S</sub>  
22 to '0'.
- 23 • If RER\_MODE\_SUPPORTED<sub>T</sub> is not included, the mobile station shall set  
24 RER\_MODE\_SUPPORTED<sub>S</sub> to '0'; otherwise, the mobile station shall set  
25 RER\_MODE\_SUPPORTED<sub>S</sub> to RER\_MODE\_SUPPORTED<sub>T</sub>.
- 26 • If TKZ\_MODE\_SUPPORTED<sub>T</sub> is not included, the mobile station shall set  
27 TKZ\_MODE\_SUPPORTED<sub>S</sub> to '0'; otherwise, the mobile station shall set  
28 TKZ\_MODE\_SUPPORTED<sub>S</sub> to TKZ\_MODE\_SUPPORTED<sub>T</sub>. If  
29 TKZ\_MODE\_SUPPORTED<sub>S</sub> is equal to '1', the mobile station shall store the tracking  
30 zone identifier (TKZ\_ID<sub>S</sub> = TKZ\_ID<sub>T</sub>).
- 31 • If AUTO\_FCSO\_ALLOWED<sub>T</sub> is not included, the mobile station shall set  
32 AUTO\_FCSO\_ALLOWED<sub>S</sub> to '0'; otherwise, the mobile station shall set  
33 AUTO\_FCSO\_ALLOWED<sub>S</sub> to AUTO\_FCSO\_ALLOWED<sub>T</sub>.
- 34 • If CAND\_BAND\_INFO\_REQ<sub>T</sub> is included, the mobile station shall set  
35 CAND\_BAND\_INFO\_REQ<sub>S</sub> to CAND\_BAND\_INFO\_REQ<sub>T</sub>; otherwise, the mobile  
36 station shall set CAND\_BAND\_INFO\_REQ<sub>S</sub> to '0'.

- 1       • If BYPASS\_REG\_IND<sub>r</sub> is included, the mobile station shall set BYPASS\_REG\_IND<sub>s</sub>  
2       to BYPASS\_REG\_IND<sub>r</sub>; otherwise, the mobile station shall set BYPASS\_REG\_IND<sub>s</sub>  
3       to '00'.
- 4 If BCCH\_SUPPORTED<sub>s</sub> equals '1', the mobile station shall enter the *System Determination*  
5 *Substate of the Mobile Station Initialization State* with a new system indication.
- 6 If P\_REV\_IN\_USE<sub>s</sub> has been changed, the mobile station shall set ACC\_MSG\_SEQ<sub>s</sub>,  
7 CURR\_ACC\_MSG\_SEQ, SYS\_PAR\_MSG\_SEQ<sub>s</sub>, EXT\_NGHR\_LST\_MSG\_SEQ<sub>s</sub>,  
8 GEN\_NGHR\_LST\_MSG\_SEQ<sub>s</sub>, and GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub> to NULL.
- 9 If NGHR\_SET\_ENTRY\_INFO is equal to '1', the mobile station shall store the access entry  
10 handoff in order and message processing operation indicator (ACC\_ENT\_HO\_ORDER<sub>s</sub> =  
11 ACC\_ENT\_HO\_ORDER<sub>r</sub>).
- 12 If the mobile station supports packet data service options, the mobile station shall store  
13 the packet data services zone identifier (PACKET\_ZONE\_ID<sub>s</sub> = PACKET\_ZONE\_ID<sub>r</sub>);  
14 otherwise, the mobile station shall set PACKET\_ZONE\_ID<sub>s</sub> to '00000000'.
- 15 If the mobile station supports packet data service options and the PZ\_HYST\_ENABLED  
16 field is included, the mobile station shall store the packet zone hysteresis enabled  
17 indicator (PZ\_HYST\_ENABLED<sub>s</sub> = PZ\_HYST\_ENABLED<sub>r</sub>); otherwise, the mobile station  
18 shall set PZ\_HYST\_ENABLED<sub>s</sub> to '1'.
- 19 If the mobile station supports packet data service options and the PZ\_HYST\_LIST\_LEN field  
20 is included, the mobile station shall store the packet zone hysteresis list length  
21 (PZ\_HYST\_LIST\_LEN<sub>s</sub> = PZ\_HYST\_LIST\_LEN<sub>r</sub>); otherwise, the mobile station shall set  
22 PZ\_HYST\_LIST\_LEN<sub>s</sub> to 4.
- 23 If the mobile station supports packet data service options and the PZ\_HYST\_ACT\_TIMER  
24 field is included, the mobile station shall store the packet zone hysteresis activation timer  
25 (PZ\_HYST\_ACT\_TIMER<sub>s</sub> = PZ\_HYST\_ACT\_TIMER<sub>r</sub>); otherwise, the mobile station shall set  
26 PZ\_HYST\_ACT\_TIMER<sub>s</sub> to 30 seconds.
- 27 If the mobile station supports packet data service options and the PZ\_HYST\_TIMER\_MUL  
28 field and the PZ\_HYST\_TIMER\_EXP field are included, the mobile station shall store the  
29 packet zone hysteresis timer (PZ\_HYST\_TIMER<sub>s</sub> = PZ\_HYST\_TIMER\_MUL<sub>r</sub> × 8 ^  
30 PZ\_HYST\_TIMER\_EXP<sub>r</sub>); otherwise, the mobile station shall set PZ\_HYST\_TIMER<sub>s</sub> to 60  
31 seconds.
- 32 If RESELECT\_INCLUDED<sub>s</sub> is equal to '1', the mobile station shall store:
  - 33       • Pilot power threshold (EC\_THRESH<sub>s</sub> = EC\_THRESH<sub>r</sub>)
  - 34       • Pilot E<sub>c</sub>/I<sub>0</sub> threshold (EC\_I0\_THRESH<sub>s</sub> = EC\_I0\_THRESH<sub>r</sub>)
- 35 If NGHR\_SET\_ACCESS\_INFO<sub>s</sub> is equal to '1', the mobile station shall store:
  - 36       • Access handoff permitted indicator (ACCESS\_HO<sub>s</sub> = ACCESS\_HO<sub>r</sub>)
  - 37       • Access probe handoff permitted indicator (ACCESS\_PROBE\_HO<sub>s</sub> =  
38       ACCESS\_PROBE\_HO<sub>r</sub>)
  - 39       • If ACCESS\_PROBE\_HO<sub>s</sub> is equal to '1', access handoff list update permitted  
40       indicator (ACC\_HO\_LIST\_UPD<sub>s</sub> = ACC\_HO\_LIST\_UPD<sub>r</sub>)

- 1       • Maximum number of times that the mobile station is permitted to perform an  
2       access probe handoff ( $\text{MAX\_NUM\_PROBE\_HO}_S = \text{MAX\_NUM\_PROBE\_HO}_T$ )
- 3       • Access handoff permitted for message response indicator ( $\text{ACCESS\_HO\_MSG\_RSP}_S$   
4       =  $\text{ACCESS\_HO\_MSG\_RSP}_T$ )
- 5       • Access probe handoff permitted for other messages indicator  
6       ( $\text{ACC\_PROBE\_HO\_OTHER\_MSG}_S = \text{ACC\_PROBE\_HO\_OTHER\_MSG}_T$ )
- 7       If  $\text{NGHBR\_SET\_ENTRY\_INFO}_S$  or  $\text{NGHBR\_SET\_ACCESS\_INFO}_S$  is equal to '1', the mobile  
8       station shall store the size of the Neighbor Set ( $\text{NGHBR\_SET\_SIZE}_S = \text{NGHBR\_SET\_SIZE}_T$ ).
- 9       If  $\text{NGHBR\_SET\_ENTRY\_INFO}_S$  is equal to '0', then for all  $\text{NGHBR\_SET\_SIZE}_S$  occurrences  
10      of  $\text{ACCESS\_ENTRY\_HO}$ , the mobile station shall set the  $\text{ACCESS\_ENTRY\_HO}$  field of  
11       $\text{NGHBR\_REC}[i]$  to '0'.
- 12      If  $\text{NGHBR\_SET\_ENTRY\_INFO}_S$  is equal to '1', then for all  $\text{NGHBR\_SET\_SIZE}_S$  occurrences  
13      of  $\text{ACCESS\_ENTRY\_HO}$ , the mobile station shall set the  $\text{ACCESS\_ENTRY\_HO}$  field of  
14       $\text{NGHBR\_REC}[i]$  to the  $i^{\text{th}}$  occurrence of  $\text{ACCESS\_ENTRY\_HO}_T$ .
- 15      If  $\text{NGHBR\_SET\_ACCESS\_INFO}_S$  is equal to '0', then for all  $\text{NGHBR\_SET\_SIZE}_S$  occurrences  
16      of  $\text{ACCESS\_HO\_ALLOWED}$ , the mobile station shall set the  $\text{ACCESS\_HO\_ALLOWED}$  field  
17      of  $\text{NGHBR\_REC}[i]$  to '0'.
- 18      If  $\text{NGHBR\_SET\_ACCESS\_INFO}_S$  is equal to '1', then for all  $\text{NGHBR\_SET\_SIZE}_S$  occurrences  
19      of  $\text{ACCESS\_HO\_ALLOWED}$ , the mobile station shall set the  $\text{ACCESS\_HO\_ALLOWED}$  field  
20      of  $\text{NGHBR\_REC}[i]$  to the  $i^{\text{th}}$  occurrence of  $\text{ACCESS\_HO\_ALLOWED}_T$ .
- 21      The mobile station shall set all bits of  $\text{TMSI\_CODE}_{S-p}$  to '1' if all of the following conditions  
22      are met:
  - 23       • The bits of  $\text{TMSI\_CODE}_{S-p}$  are not all equal to '1',
  - 24       •  $\text{DELETE\_FOR\_TMSI}_S$  is equal to '1', and
  - 25       •  $\text{ASSIGNING\_TMSI\_ZONE\_LEN}_{S-p}$  is not equal to  $\text{TMSI\_ZONE\_LEN}_S$ , or the least  
26       significant  $\text{ASSIGNING\_TMSI\_ZONE\_LEN}_{S-p}$  octets of  $\text{ASSIGNING\_TMSI\_ZONE}_{S-p}$   
27       are not equal to  $\text{TMSI\_ZONE}_S$ .
- 28      If the mobile station supports the Quick Paging Channel operation:
  - 29       • The mobile station shall set  $\text{QPCH\_SUPPORTED}_S$  to  $\text{QPCH\_SUPPORTED}_T$ .
  - 30       • If  $\text{QPCH\_SUPPORTED}_T = '1'$ :
    - 31          – The mobile station shall set  $\text{QPCH\_RATE}_S$  to  $\text{QPCH\_RATE}_T$ .
    - 32          – If the number of Quick Paging Channels specified in the received message  
33          ( $\text{NUM\_QPCH}_T$ ) is different from  $\text{NUM\_QPCH}_S$ , the mobile station shall use the  
34          hash algorithm specified in 2.6.7.1 to select a new Quick Paging Channel  
35          number in the range 1 to  $\text{NUM\_QPCH}_T$ . The mobile station shall store the new  
36          Quick Paging Channel number as  $\text{QPAGECH}_S$  and as  $\text{ASSIGNED\_QPAGECH}_S$ .  
37          The mobile station shall then set  $\text{NUM\_QPCH}_S$  to  $\text{NUM\_QPCH}_T$ .

- 1       – The mobile station shall set QPCH\_POWER\_LEVEL\_PAGE<sub>S</sub> to  
2       QPCH\_POWER\_LEVEL\_PAGE<sub>R</sub>.
- 3       – The mobile station shall set QPCH\_CCI\_SUPPORTED<sub>S</sub> to  
4       QPCH\_CCI\_SUPPORTED<sub>R</sub>.
- 5       – If QPCH\_CCI\_SUPPORTED<sub>R</sub> = '1', the mobile station shall set  
6       QPCH\_POWER\_LEVEL\_CONFIG<sub>S</sub> to QPCH\_POWER\_LEVEL\_CONFIG<sub>R</sub>.
- 7       • The mobile station shall set QPCH\_BI\_SUPPORTED<sub>S</sub> to QPCH\_BI\_SUPPORTED<sub>R</sub>, if  
8       included.
- 9       • If QPCH\_BI\_SUPPORTED<sub>R</sub> = '1', the mobile station shall set  
10      QPCH\_POWER\_LEVEL\_BCAST<sub>S</sub> to QPCH\_POWER\_LEVEL\_BCAST<sub>R</sub>.
- 11   If the mobile station supports the *Device Information Message* on the r-csch, the mobile  
12   station shall store:
- 13      • Autonomous message supported indicator  
14      (AUTO\_MSG\_SUPPORTED<sub>S</sub> = AUTO\_MSG\_SUPPORTED<sub>R</sub>)
- 15   If AUTO\_MSG\_SUPPORTED<sub>R</sub> is equal to '1' and the mobile station supports the *Device*  
16   *Information Message* on the r-csch, the mobile station shall store:
- 17      • Autonomous message interval  
18      (AUTO\_MSG\_INTERVAL<sub>S</sub> = AUTO\_MSG\_INTERVAL<sub>R</sub>)
- 19   The mobile station shall store mobile station initiated position location determination  
20   supported indicator (MS\_INIT\_POS\_LOC\_SUP\_IND<sub>S</sub> = MS\_INIT\_POS\_LOC\_SUP\_IND<sub>R</sub>).
- 21   The mobile station shall set FOR\_PDCH\_COMMON\_PARMS<sub>S</sub> = '0'.
- 22   If both FOR\_PDCH\_SUPPORTED<sub>R</sub> and PDCH\_PARMS\_INCL<sub>R</sub> are included and equal to '1',  
23   the mobile station shall perform the following:
- 24      • If FOR\_PDCH\_RLGAIN\_INCL<sub>R</sub> is included and equal to '1', the mobile station shall  
25      set:
- 26          – (RLGAIN\_ACKCH\_PILOT<sub>S</sub> = RLGAIN\_ACKCH\_PILOT<sub>R</sub>).
- 27          – (RLGAIN\_CQICH\_PILOT<sub>S</sub> = RLGAIN\_CQICH\_PILOT<sub>R</sub>).
- 28      • The mobile station shall set  
29      NUM\_SOFT\_SWITCHING\_FRAMES<sub>S</sub> = NUM\_SOFT\_SWITCHING\_FRAMES<sub>R</sub> + 1, and  
30      NUM\_SOFTER\_SWITCHING\_FRAMES<sub>S</sub> = NUM\_SOFTER\_SWITCHING\_FRAMES<sub>R</sub> +  
31      1.
- 32      • The mobile station shall set  
33      NUM\_SOFT\_SWITCHING\_FRAMES\_CHM<sub>S</sub> = NUM\_SOFT\_SWITCHING\_FRAMES<sub>R</sub> +  
34      1, and NUM\_SOFTER\_SWITCHING\_FRAMES\_CHM<sub>S</sub> =  
35      NUM\_SOFTER\_SWITCHING\_FRAMES<sub>R</sub> + 1.
- 36      • The mobile station shall set NUM\_SOFT\_SWITCHING\_SLOTS<sub>S</sub> according to Table  
37      3.7.2.3.2.21-9 based on the value of NUM\_SOFT\_SWITCHING\_SLOTS<sub>R</sub>.
- 38      • The mobile station shall set NUM\_SOFTER\_SWITCHING\_SLOTS<sub>S</sub> according to Table  
39      3.7.2.3.2.21-9 based on the value of NUM\_SOFTER\_SWITCHING\_SLOTS<sub>R</sub>.

- 1     • The mobile station shall set  $\text{PDCH\_SOFT\_SWITCHING\_DELAY}_S$  to
- 2        $\text{PDCH\_SOFT\_SWITCHING\_DELAY}_T + 1$ , and  $\text{PDCH\_SOFTER\_SWITCHING\_DELAY}_S$
- 3       to  $\text{PDCH\_SOFTER\_SWITCHING\_DELAY}_T + 1$ .
- 4     • The mobile station shall set  $\text{FOR\_PDCH\_COMMON\_PARMS}_S = '1'$ .
- 5     • The mobile station shall set  $\text{WALSH\_TABLE\_ID}_S = \text{WALSH\_TABLE\_ID}_T$ .
- 6     • The mobile station shall set  $\text{NUM\_PDCCH}_S = \text{NUM\_PDCCH}_T$ .
- 7     • The mobile station shall store  $\text{FOR\_PDCCH\_WALSH}_S[i]$  to the  $i^{\text{th}}$  occurrence of
- 8        $\text{FOR\_PDCCH\_WALSH}_T$ .
- 9     If  $\text{FOR\_PDCH\_SUPPORTED}_T$  is included and equal to '1', then the mobile station shall set
- 10    Reverse Packet Data Channel supported indicator ( $\text{REV\_PDCH\_SUPPORTED}_S =$
- 11     $\text{REV\_PDCH\_SUPPORTED}_T$ ).
- 12    If  $\text{REV\_PDCH\_PARMS\_INCL}_T$  is not included, or if it is included and equal to '0', the
- 13    mobile station shall set  $\text{REV\_PDCH\_PARMS\_INCL}_S$  to '0'; otherwise, the mobile station
- 14    shall set  $\text{REV\_PDCH\_PARMS\_INCL}_S$  to '1' and perform the following:
- 15     • If  $\text{REV\_PDCH\_RLGAIN\_INCL}_T$  is equal to '1', the mobile station shall set:
- 16       –  $(\text{RLGAIN\_SPICH\_PILOT}_S = \text{RLGAIN\_SPICH\_PILOT}_T)$ .
- 17       –  $(\text{RLGAIN\_REQCH\_PILOT}_S = \text{RLGAIN\_REQCH\_PILOT}_T)$ .
- 18       –  $(\text{RLGAIN\_PDCCH\_PILOT}_S = \text{RLGAIN\_PDCCH\_PILOT}_T)$ .
- 19     • If  $\text{REV\_PDCH\_PARMS\_1\_INCL}_T$  is equal to '1', the mobile station shall set:
- 20       –  $(\text{REV\_PDCH\_TABLE\_SEL}_S = \text{REV\_PDCH\_TABLE\_SEL}_T)$ .
- 21       –  $(\text{REV\_PDCH\_MAX\_AUTO\_TPR}_S \text{ to } \text{REV\_PDCH\_MAX\_AUTO\_TPR}_T)$ .
- 22       –  $(\text{REV\_PDCH\_NUM\_ARQ\_ROUNDS\_NORMAL}_S =$
- 23          $\text{REV\_PDCH\_NUM\_ARQ\_ROUNDS\_NORMAL}_T + 1)$ .
- 24     • If  $\text{REV\_PDCH\_OPER\_PARMS\_INCL}_T$  is equal to '1', the mobile station shall set:
- 25       –  $(\text{REV\_PDCH\_MAX\_SIZE\_ALLOWED\_ENCODER\_PACKET}_S$
- 26          $= \text{REV\_PDCH\_MAX\_SIZE\_ALLOWED\_ENCODER\_PACKET}_T + 1)$ .
- 27       –  $(\text{REV\_PDCH\_DEFAULT\_PERSISTENCE}_S =$
- 28          $\text{REV\_PDCH\_DEFAULT\_PERSISTENCE}_T)$ .
- 29       –  $(\text{REV\_PDCH\_RESET\_PERSISTENCE}_S = \text{REV\_PDCH\_RESET\_PERSISTENCE}_T)$ .
- 30       –  $(\text{REV\_PDCH\_GRANT\_PRECEDENCE}_S = \text{REV\_PDCH\_GRANT\_PRECEDENCE}_T)$ .
- 31       –  $(\text{REV\_PDCH\_MSIB\_SUPPORTED}_S = \text{REV\_PDCH\_MSIB\_SUPPORTED}_T)$ .
- 32       –  $(\text{REV\_PDCH\_SOFT\_SWITCHING\_RESET\_IND}_S =$
- 33          $\text{REV\_PDCH\_SOFT\_SWITCHING\_RESET\_IND}_T)$ .

1 The mobile station shall store the following parameters:

- 2 • *BCMC Service Parameters Message* sent  
3 (SENDING\_BSPM<sub>S</sub> = SENDING\_BSPM<sub>R</sub>), if included; otherwise, set  
4 SENDING\_BSPM<sub>S</sub> to '0'.
- 5 • *BCMC Service Parameters Message* transmission periodicity index  
6 (BSPM\_PERIOD\_INDEX<sub>S</sub> = BSPM\_PERIOD\_INDEX<sub>R</sub>) if SENDING\_BSPM<sub>R</sub> equals '1';  
7 otherwise, BSPM\_PERIOD\_INDEX<sub>S</sub> = NULL.
- 8 • If BSPM\_PERIOD\_INDEX<sub>S</sub> is not equal to NULL, the mobile station shall set  
9 BSPM\_WAIT\_TIME to  $(B + 1) \times 160\text{ms}$ , where

$$10 \quad B = 2^i \times 16, 0 \leq i \leq 15$$

11 and  $i = \text{BSPM\_PERIOD\_INDEX}_S$ .

12 If CAND\_BAND\_INFO\_REQ<sub>R</sub> is set to '1', the mobile station shall store the number of  
13 candidate band classes minus one ( $\text{NUM\_CAND\_BAND\_CLASS}_S =$   
14  $\text{NUM\_CAND\_BAND\_CLASS}_R$ ).

15 If CAND\_BAND\_INFO\_REQ<sub>R</sub> is set to '1', the mobile station shall perform the following for  
16 each occurrence of the CAND\_BAND\_CLASS record:

- 17 • Set the CAND\_BAND\_CLASS field of CAND\_BAND\_CLASS\_REC[i] to the  $i^{\text{th}}$   
18 occurrence of CAND\_BAND\_CLASS<sub>R</sub>.
- 19 • Set the SUBCLASS\_INFO\_INCL field of CAND\_BAND\_CLASS\_REC[i] to the  $i^{\text{th}}$   
20 occurrence of SUBCLASS\_INFO\_INCL<sub>R</sub>.
- 21 • If the  $i^{\text{th}}$  occurrence of SUBCLASS\_INFO\_INCL<sub>R</sub> is set to '1', set the  
22 SUBCLASS\_REC\_LEN field of CAND\_BAND\_CLASS\_REC[i] to the  $i^{\text{th}}$  occurrence of  
23 SUBCLASS\_REC\_LEN<sub>R</sub>.
- 24 • If the  $i^{\text{th}}$  occurrence of SUBCLASS\_INFO\_INCL<sub>R</sub> is set to '1', the mobile station shall  
25 perform the following for each band subclass indicator received:
  - 26 – Set the BAND\_SUBCLASS\_IND\_REC[j] field of CAND\_BAND\_CLASS\_REC[i] to  
27 the  $j^{\text{th}}$  occurrence of BAND\_SUBCLASS\_IND<sub>R</sub>.

28 If TX\_PWR\_LIMIT\_INCL<sub>R</sub> is set to '1' and the mobile station is operating in the 1915MHz –  
29 1920MHz block of the PCS band, the mobile station shall store the transmit power limit  
30  $\text{TX\_PWR\_LIMIT}_S = (\text{TX\_PWR\_LIMIT}_R - 30\text{dBm})$ ; otherwise, the mobile station shall set  
31  $\text{TX\_PWR\_LIMIT}_S$  to the limit defined in [11].

#### 32 2.6.2.2.6 Global Service Redirection Message

33 Whenever a *Global Service Redirection Message* is received on the Paging Channel, the  
34 configuration message sequence number, CONFIG\_MSG\_SEQ<sub>R</sub>, shall be compared to that  
35 stored in GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>S</sub>. If the comparison results in a match or if

1 SYS\_PAR\_MSG\_SEQ<sub>S</sub> is not current, the mobile station may ignore the message;  
 2 otherwise, the mobile station shall store the following parameters:

- 3 • Configuration message sequence number  
 4 (CONFIG\_MSG\_SEQ<sub>S</sub> = CONFIG\_MSG\_SEQ<sub>R</sub>,  
 5 GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>S</sub> = CONFIG\_MSG\_SEQ<sub>R</sub>)
- 6 • The mobile station shall ignore this message, if any of the following conditions is  
 7 true:
  - 8 – EXT\_GLOBAL\_REDIRECT<sub>S</sub> = '1'
  - 9 – EXCL\_P\_REV\_MS<sub>R</sub> = '1'
  - 10 – Type of redirection as specified by RECORD\_TYPE<sub>R</sub> is not supported
  - 11 – BAND\_CLASS<sub>R</sub> is not supported (RECORD\_TYPE<sub>R</sub> = '00000010')
  - 12 – None of the included CDMA\_CHAN<sub>R</sub> are supported (RECORD\_TYPE<sub>R</sub> =  
 13 '00000010')

14 If the subfield corresponding to the access overload class, ACCOLC<sub>P</sub>, of the mobile station  
 15 is set equal to '1' in the REDIRECT\_ACCOLC<sub>R</sub> field of the received message, the mobile  
 16 station shall store the following parameters and then shall enter the *System Determination*  
 17 *Substate of the Mobile Station Initialization State* with a redirection indication (see 2.6.1.1):

- 18 • Return if fail indicator (RETURN\_IF\_FAIL<sub>S</sub> = RETURN\_IF\_FAIL<sub>R</sub>)
- 19 • If DELETE\_TMSI<sub>R</sub> is equal to '1', the mobile station shall set all the bits of  
 20 TMSI\_CODE<sub>S-P</sub> to '1'
- 21 • Redirection record (REDIRECT\_REC<sub>S</sub> = redirection record from received message)
- 22 • If RECORD\_TYPE<sub>R</sub> = '00000001', the mobile station shall:
  - 23 – Set CDMA\_MODE<sub>S</sub> to '1'
  - 24 – Set DIGITAL\_REG<sub>S-P</sub> to '00000000'
  - 25 – Set the maximum delay upon redirection (MAX\_REDIRECT\_DELAY<sub>S</sub> =  
 26 MAX\_REDIRECT\_DELAY<sub>R</sub>)

#### 27 2.6.2.2.7 Extended Neighbor List Message

28 Whenever a valid *Extended Neighbor List Message* is received on the current Paging  
 29 Channel (PAGECH<sub>S</sub>), the configuration message sequence number, CONFIG\_MSG\_SEQ<sub>R</sub>,  
 30 shall be compared to that stored in EXT\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub>. If the comparison  
 31 results in a match, the mobile station may ignore the message. If the comparison results  
 32 in a mismatch, then the mobile station shall process the remaining fields in the message  
 33 as follows.

34 If the PILOT\_INC field is not within the valid range specified in 3.7.2.3.2.14, then the  
 35 mobile station shall ignore the *Extended Neighbor List Message* that contains it.

1 The mobile station shall store the following parameters:

- 2 • Configuration message sequence number  
3 (CONFIG\_MSG\_SEQ<sub>S</sub> = CONFIG\_MSG\_SEQ<sub>R</sub>,  
4 EXT\_NGHRB\_LST\_MSG\_SEQ<sub>S</sub> = CONFIG\_MSG\_SEQ<sub>R</sub>,  
5 NGHRB\_LST\_MSG\_SEQ<sub>S</sub> = CONFIG\_MSG\_SEQ<sub>R</sub>)
- 6 • Pilot PN sequence offset increment (PILOT\_INC<sub>S</sub> = PILOT\_INC<sub>R</sub>)

7 The mobile station shall set NGHRB\_SET\_SIZE<sub>S</sub> to the number of neighboring base  
8 stations contained in the *Extended Neighbor List Message*.

9 For each of the neighboring base stations contained in the *Extended Neighbor List*  
10 *Message*, if FREQ\_INCL<sub>R</sub> equals '0', or if FREQ\_INCL<sub>R</sub> equals '1' and NGHRB\_BAND<sub>R</sub> is  
11 supported, the mobile station shall perform the following:

- 12 • If the *i*<sup>th</sup> occurrence of NGHRB\_CONFIG<sub>R</sub> is equal to '000', '001', or '010', set the  
13 NGHRB\_CONFIG field of NGHRB\_REC[i] to the *i*<sup>th</sup> occurrence of NGHRB\_CONFIG<sub>R</sub>;  
14 otherwise, set the NGHRB\_CONFIG field of NGHRB\_REC [i] to '011'.
- 15 • Set the NGHRB\_PN field of NGHRB\_REC[i] to the *i*<sup>th</sup> occurrence of NGHRB\_PN<sub>R</sub>.
- 16 • Set the SEARCH\_PRIORITY field of NGHRB\_REC[i] to the *i*<sup>th</sup> occurrence of  
17 SEARCH\_PRIORITY<sub>R</sub>.

18 For each of the neighboring base stations contained in the *Extended Neighbor List*  
19 *Message*, if FREQ\_INCL<sub>R</sub> equals '1' and NGHRB\_BAND<sub>R</sub> is supported, the mobile station  
20 shall also perform the following:

- 21 • Set the NGHRB\_BAND field of NGHRB\_REC[i] to the *i*<sup>th</sup> occurrence of  
22 NGHRB\_BAND<sub>R</sub>.
- 23 • Set the NGHRB\_FREQ field of NGHRB\_REC[i] to the *i*<sup>th</sup> occurrence of  
24 NGHRB\_FREQ<sub>R</sub>.

25 For each of the neighboring base stations contained in the *Extended Neighbor List*  
26 *Message*, if FREQ\_INCL<sub>R</sub> equals '0', the mobile station shall also perform the following:

- 27 • Set the NGHRB\_BAND field of NGHRB\_REC[i] to CDMABAND<sub>S</sub>.
- 28 • If NGHRB\_CONFIG<sub>R</sub> equals '010', set the NGHRB\_FREQ field of NGHRB\_REC[i] to  
29 the first CDMA Channel listed in the *CDMA Channel List Message or Extended*  
30 *CDMA Channel List Message* transmitted by the current base station; otherwise, set  
31 the NGHRB\_FREQ field of NGHRB\_REC[i] to CDMACH<sub>S</sub>.

32 If GEN\_NGHRB\_LST\_MSG\_SEQ<sub>S</sub> is not equal to CONFIG\_MSG\_SEQ<sub>S</sub>, the mobile station  
33 shall perform the following:

- 34 • Set the SRCH\_WIN\_NGHRB field of NGHRB\_REC to SRCH\_WIN\_N<sub>S</sub> for all  
35 NGHRB\_SET\_SIZE<sub>S</sub> entries.
- 36 • Set the SRCH\_OFFSET\_NGHRB field of NGHRB\_REC to '000' for all entries.

37 The mobile station shall set the ACCESS\_ENTRY\_HO field of the NGHRB\_REC to '0' for all  
38 NGHRB\_SET\_SIZE<sub>S</sub> entries if any of the following conditions are met:

- 1       • EXT\_SYS\_PARAMETER<sub>S</sub> is equal to '0',
- 2       • NGHBR\_SET\_ENTRY\_INFO<sub>S</sub> is equal to '0', or
- 3       • EXT\_SYS\_PAR\_MSG\_SEQ<sub>S</sub> is not equal to CONFIG\_MSG\_SEQ<sub>S</sub>.

4       The mobile station shall set the ACCESS\_HO\_ALLOWED field of the NGHBR\_REC to '0' for  
5       all NGHBR\_SET\_SIZE<sub>S</sub> entries if any of the following conditions are met:

- 6       • EXT\_SYS\_PARAMETER<sub>S</sub> is equal to '0',
- 7       • NGHBR\_SET\_ACCESS\_INFO<sub>S</sub> is equal to '0', or
- 8       • EXT\_SYS\_PAR\_MSG\_SEQ<sub>S</sub> is not equal to CONFIG\_MSG\_SEQ<sub>S</sub>.

9       The mobile station shall update the idle handoff Neighbor Set (see 2.6.2.1.4) so that it  
10       consists only of pilot offsets listed in the *Extended Neighbor List Message*. If the *Extended*  
11       *Neighbor List Message* contains more pilot offsets than the mobile station can store, the  
12       mobile station shall store the pilot offsets beginning at the start of the *Extended Neighbor*  
13       *List Message*, up to the limits of the mobile station's Neighbor Set storage capacity.

#### 14   2.6.2.2.8 General Neighbor List Message

15       Whenever a valid *General Neighbor List Message* is received on the current Paging Channel  
16       (PAGECH<sub>S</sub>), the configuration message sequence number, CONFIG\_MSG\_SEQ<sub>R</sub>, shall be  
17       compared to that stored in GEN\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub>. If the comparison results in a  
18       match, the mobile station may ignore the message. If the comparison results in a  
19       mismatch, then the mobile station shall process the remaining fields in the message as  
20       follows.

21       If the PILOT\_INC field is not within the valid range specified in 3.7.2.3.2.22, then the  
22       mobile station shall ignore the *General Neighbor List Message* that contains it.

23       The mobile station shall store the following parameters:

- 24       • Configuration message sequence number  
25        (CONFIG\_MSG\_SEQ<sub>S</sub> = CONFIG\_MSG\_SEQ<sub>R</sub>,  
26        GEN\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub> = CONFIG\_MSG\_SEQ<sub>R</sub>).
- 27       • Pilot PN sequence offset increment (PILOT\_INC<sub>S</sub> = PILOT\_INC<sub>R</sub>).

28       If NGHBR\_CONFIG\_PN\_INCL<sub>R</sub> is equal to '1' and FREQ\_FIELDS\_INCL<sub>R</sub> is equal to '1', the  
29       mobile station shall store the following parameters:

- 30       • Configuration message sequence number  
31        (EXT\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub> = CONFIG\_MSG\_SEQ<sub>R</sub>,  
32        NGHBR\_LST\_MSG\_SEQ<sub>S</sub> = CONFIG\_MSG\_SEQ<sub>R</sub>).

33       The mobile station shall set NGHBR\_SET\_SIZE<sub>S</sub> to the number of neighboring base  
34       stations contained in the *General Neighbor List Message*.

35       For each of the neighboring base stations contained in the *General Neighbor List Message*,  
36       if FREQ\_INCL<sub>R</sub> equal '0', or if FREQ\_INCL<sub>R</sub> equal '1' and NGHBR\_BAND<sub>R</sub> is supported, the  
37       mobile station shall perform the following:

- 1       • If NGHBR\_CONFIG\_PN\_INCL<sub>r</sub> is equal to '1', set the NGHBR\_CONFIG and  
2       NGHBR\_PN fields as follows:
  - 3           – If the *i*<sup>th</sup> occurrence of NGHBR\_CONFIG<sub>r</sub> is equal to '000', '001', or '010', set the  
4           NGHBR\_CONFIG field of NGHBR\_REC[i] to the *i*<sup>th</sup> occurrence of  
5           NGHBR\_CONFIG<sub>r</sub>; otherwise, set the NGHBR\_CONFIG field of NGHBR\_REC[i] to  
6           '011'.
  - 7           – Set the NGHBR\_PN field of NGHBR\_REC[i] to the *i*<sup>th</sup> occurrence of NGHBR\_PN<sub>r</sub>.
- 8       • If NGHBR\_SRCH\_MODE<sub>r</sub> = '00' or '10' and EXT\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub> is not  
9       equal to CONFIG\_MSG\_SEQ<sub>r</sub>, set SEARCH\_PRIORITY field of each NGHBR\_REC to  
10       '10' (high) for all NGHBR\_SET\_SIZE<sub>s</sub> entries.
- 11       • If NGHBR\_SRCH\_MODE<sub>r</sub> = '01' or '11', set the SEARCH\_PRIORITY field of  
12       NGHBR\_REC[i] to the *i*<sup>th</sup> occurrence of SEARCH\_PRIORITY<sub>r</sub>.
- 13       • If NGHBR\_SRCH\_MODE<sub>r</sub> = '00' or '01', set the SRCH\_WIN\_NGHBR field of each  
14       NGHBR\_REC to SEARCH\_WIN<sub>s</sub> for all NGHBR\_SET\_SIZE<sub>s</sub> entries if  
15       SYS\_PAR\_MSG\_SEQ<sub>s</sub> is equal to CONFIG\_MSG\_SEQ<sub>s</sub>; otherwise, set  
16       SETTING\_SEARCH\_WIN to '1'.
- 17       • If NGHBR\_SRCH\_MODE<sub>r</sub> = '00' or '01', set the SRCH\_OFFSET\_NGHBR field of each  
18       NGHBR\_REC to '000'.
- 19       • If NGHBR\_SRCH\_MODE<sub>r</sub> = '10' or '11':
  - 20           – set the SRCH\_WIN\_NGHBR field of NGHBR\_REC[i] to the *i*<sup>th</sup> occurrence of  
21           SRCH\_WIN\_NGHBR<sub>r</sub>
  - 22           – if SRCH\_OFFSET\_INCL<sub>r</sub> equals '1', set the SRCH\_OFFSET\_NGHBR field of  
23           NGHBR\_REC[i] to the *i*<sup>th</sup> occurrence of SRCH\_OFFSET\_NGHBR<sub>r</sub>, and
  - 24           – if SRCH\_OFFSET\_INCL<sub>r</sub> equals '0', set the SRCH\_OFFSET\_NGHBR field of each  
25           NGHBR\_REC to '000'.
- 26       • If USE\_TIMING<sub>r</sub> is equal to '1', set the TIMING\_INCL field of NGHBR\_REC[i] to the  
27       *i*<sup>th</sup> occurrence of TIMING\_INCL<sub>r</sub>; otherwise, set the TIMING\_INCL field of  
28       NGHBR\_REC to '0' for all entries.
- 29       • If BCCH\_IND\_INCL<sub>r</sub> is equal to '1', set the BCCH\_SUPPORT field of NGHBR\_REC[i]  
30       to the *i*<sup>th</sup> occurrence of BCCH\_SUPPORT<sub>r</sub>; otherwise, set the BCCH\_IND\_INCL field  
31       of NGHBR\_REC to '0' for all entries.
- 32       • Set the NGHBR\_PDCH\_SUPPORTED field of NGHBR\_REC[i] to the *i*<sup>th</sup> occurrence of  
33       NGHBR\_PDCH\_SUPPORTED<sub>r</sub> if included; otherwise, set the  
34       NGHBR\_PDCH\_SUPPORTED field of NGHBR\_REC to '0' for all entries.
- 35       • The mobile station shall set RESQ\_ENABLED<sub>s</sub> = RESQ\_ENABLED<sub>r</sub>. If  
36       RESQ\_ENABLED<sub>s</sub> is equal to '1', then the mobile station shall store:
  - 37           – Call rescue delay timer value (RESQ\_DELAY\_TIME<sub>s</sub> = RESQ\_DELAY\_TIME<sub>r</sub>)

- 1       – Call rescue allowed timer value ( $\text{RESQ\_ALLOWED\_TIME}_S =$   
2        $\text{RESQ\_ALLOWED\_TIME}_T$ )
- 3       – Call rescue attempt timer value ( $\text{RESQ\_ATTEMPT\_TIME}_S =$   
4        $\text{RESQ\_ATTEMPT\_TIME}_T$ )
- 5       – Code channel index for call rescue ( $\text{RESQ\_CODE\_CHAN}_S =$   
6        $\text{RESQ\_CODE\_CHAN}_T$ )
- 7       – Quasi-Orthogonal Function mask identifier for call rescue ( $\text{RESQ\_QOF}_S =$   
8        $\text{RESQ\_QOF}_T$ )
- 9       – Minimum time between consecutive rescues ( $\text{RESQ\_MIN\_PERIOD}_S =$   
10        $\text{RESQ\_MIN\_PERIOD}_T + 1$ ) if  $\text{RESQ\_MIN\_PERIOD\_INCL}_T$  is equal to '1'; otherwise,  
11        $\text{RESQ\_MIN\_PERIOD}_S = '00000'$ .
- 12       – The required number of transmissions of a regular PDU before declaring L2  
13       Acknowledgment Failure when Call Rescue is enabled  
14       ( $\text{RESQ\_NUM\_TOT\_TRANS\_20MS}_S = \text{RESQ\_NUM\_TOT\_TRANS\_20MS}_T$ ) if  
15       included; otherwise, set  $\text{RESQ\_NUM\_TOT\_TRANS\_20MS}_S$  to  $N_{1m}$ .
- 16       – The required number of transmissions of a mini PDU before declaring L2  
17       Acknowledgment Failure when Call Rescue is enabled  
18       ( $\text{RESQ\_NUM\_TOT\_TRANS\_5MS}_S = \text{RESQ\_NUM\_TOT\_TRANS\_5MS}_T$ ) if included;  
19       otherwise, set  $\text{RESQ\_NUM\_TOT\_TRANS\_5MS}_S$  to  $N_{15m}$ .
- 20       – The Traffic Channel preamble length for Call Rescue Soft Handoff when  
21       operating in Radio Configuration 1 or 2 ( $\text{RESQ\_NUM\_PREAMBLE\_RC1\_RC2}_S =$   
22        $\text{RESQ\_NUM\_PREAMBLE\_RC1\_RC2}_T$ ).
- 23       – The Traffic Channel preamble length for Call Rescue Soft Handoff when  
24       operating in Radio Configuration greater than 2 ( $\text{RESQ\_NUM\_PREAMBLE}_S =$   
25        $\text{RESQ\_NUM\_PREAMBLE}_T$ ).
- 26       – The power level adjustment to be applied to the last closed-loop power level  
27       when re-enabling the transmitter for call rescue soft handoff  
28       ( $\text{RESQ\_POWER\_DELTA}_S = \text{RESQ\_POWER\_DELTA}_T$ ).
- 29       – Set the  $\text{NGHBR\_RESQ\_CONFIGURED}$  field of  $\text{NGHBR\_REC}[i]$  to the  $i^{\text{th}}$   
30       occurrence of  $\text{NGHBR\_RESQ\_CONFIGURED}_T$ .
- 31       For each of the neighboring base stations contained in the *General Neighbor List Message*,  
32       if  $\text{FREQ\_FIELDS\_INCL}_T$  equals '1',  $\text{FREQ\_INCL}_T$  equals '1', and  $\text{NGHBR\_BAND}_T$  is  
33       supported, the mobile station shall also perform the following:
  - 34           • Set the  $\text{NGHBR\_BAND}$  field of  $\text{NGHBR\_REC}[i]$  to the  $i^{\text{th}}$  occurrence of  
35            $\text{NGHBR\_BAND}_T$ .
  - 36           • Set the  $\text{NGHBR\_FREQ}$  field of  $\text{NGHBR\_REC}[i]$  to the  $i^{\text{th}}$  occurrence of  
37            $\text{NGHBR\_FREQ}_T$ .
- 38       For each of the neighboring base stations contained in the *General Neighbor List Message*,  
39       if  $\text{USE\_TIMING}_T$  is equal to '1' and  $\text{TIMING\_INCL}_T$  equals '1', the mobile station shall also  
40       perform the following:

- 1       • Set the NGHBR\_TX\_OFFSET field of NGHBR\_REC[i] to the  $i^{\text{th}}$  occurrence of  
2       NGHBR\_TX\_OFFSET<sub>r</sub>.
- 3       • If GLOBAL\_TIMING\_INCL<sub>r</sub> is equal to '1', then the mobile station shall:  
4       – Set the NGHBR\_TX\_DURATION field of NGHBR\_REC to  
5       GLOBAL\_TX\_DURATION<sub>r</sub> for all entries.  
6       – Set the NGHBR\_TX\_PERIOD field of NGHBR\_REC to GLOBAL\_TX\_PERIOD<sub>r</sub> for  
7       all entries.
- 8       • If GLOBAL\_TIMING\_INCL<sub>r</sub> is equal to '0', then the mobile station shall:  
9       – Set the NGHBR\_TX\_DURATION field of NGHBR\_REC[i] to the  $i^{\text{th}}$  occurrence of  
10      NGHBR\_TX\_DURATION<sub>r</sub>.  
11      – Set the NGHBR\_TX\_PERIOD field of NGHBR\_REC[i] to the  $i^{\text{th}}$  occurrence of  
12      NGHBR\_TX\_PERIOD<sub>r</sub>.
- 13      For each of the neighboring base stations contained in the *General Neighbor List Message*,  
14      if FREQ\_FIELDS\_INCL<sub>r</sub> equals '1' and FREQ\_INCL<sub>r</sub> equals '0', or if FREQ\_FIELDS\_INCL<sub>r</sub>  
15      equals '0' and EXT\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub> is not equal to CONFIG\_MSG\_SEQ<sub>r</sub>, the  
16      mobile station shall also perform the following:  
17      • Set the NGHBR\_BAND field of NGHBR\_REC[i] to CDMABAND<sub>s</sub>.  
18      • If NGHBR\_CONFIG<sub>r</sub> equals '010', set the NGHBR\_FREQ field of NGHBR\_REC[i] to  
19      the first CDMA Channel listed in the *CDMA Channel List Message or Extended*  
20      *CDMA Channel List Message* transmitted by the current base station; otherwise, set  
21      the NGHBR\_FREQ field of NGHBR\_REC[i] to CDMACH<sub>s</sub>.
- 22      The mobile station shall set the ACCESS\_ENTRY\_HO field of the NGHBR\_REC to '0' for all  
23      NGHBR\_SET\_SIZE<sub>s</sub> entries if any of the following conditions are met:  
24      • EXT\_SYS\_PARAMETER<sub>s</sub> is equal to '0'  
25      • NGHBR\_SET\_ENTRY\_INFO<sub>s</sub> is equal to '0', or  
26      • EXT\_SYS\_PAR\_MSG\_SEQ<sub>s</sub> is not equal to CONFIG\_MSG\_SEQ<sub>s</sub>.
- 27      The mobile station shall set the ACCESS\_HO\_ALLOWED field of the NGHBR\_REC to '0' for  
28      all NGHBR\_SET\_SIZE<sub>s</sub> entries if any of the following conditions are met:  
29      • EXT\_SYS\_PARAMETER<sub>s</sub> is equal to '0'  
30      • NGHBR\_SET\_ACCESS\_INFO<sub>s</sub> is equal to '0', or  
31      • EXT\_SYS\_PAR\_MSG\_SEQ<sub>s</sub> is not equal to CONFIG\_MSG\_SEQ<sub>s</sub>.
- 32      The mobile station shall update the idle handoff Neighbor Set (see 2.6.2.1.4) so that it  
33      consists only of pilot offsets listed in the *General Neighbor List Message*. If the *General*  
34      *Neighbor List Message* contains more pilot offsets than the mobile station can store, the  
35      mobile station shall store the pilot offsets beginning at the start of the *General Neighbor*  
36      *List Message*, up to the limits of the mobile station's Neighbor Set storage capacity.
- 37      For each of the neighboring base stations contained in the *General Neighbor List Message*,  
38      the mobile station shall set the ADD\_PILOT\_REC\_INCL field of NGHBR\_REC[i] to the  $i^{\text{th}}$

occurrence of ADD\_PILOT\_REC\_INCL<sub>r</sub>. If ADD\_PILOT\_REC\_INCL<sub>r</sub> equals '1', for each pilot included in the message, the mobile station shall also perform the following:

- Set the NGHBR\_PILOT\_REC\_TYPE field of NGHBR\_PILOT\_REC to NGHBR\_PILOT\_REC\_TYPE<sub>r</sub>.
- If NGHBR\_PILOT\_REC\_TYPE<sub>r</sub> is equal to '000'. The mobile station shall:
  - Set the TD\_POWER\_LEVEL field of NGHBR\_PILOT\_REC to TD\_POWER\_LEVEL<sub>r</sub>.
  - Set the TD\_MODE field of NGHBR\_PILOT\_REC to TD\_MODE<sub>r</sub>.
- If NGHBR\_PILOT\_REC\_TYPE<sub>r</sub> is equal to '001', the mobile station shall:
  - Set the AUX\_PILOT\_QOF field of NGHBR\_PILOT\_REC to QOF<sub>r</sub>.
  - Set the AUX\_PILOT\_WALSH\_CODE field of NGHBR\_PILOT\_REC to AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by WALSH\_LENGTH<sub>r</sub>.
- If NGHBR\_PILOT\_REC\_TYPE<sub>r</sub> is equal to '010', the mobile station shall:
  - Set the AUX\_PILOT\_QOF field of NGHBR\_PILOT\_REC to QOF<sub>r</sub>.
  - Set the AUX\_PILOT\_WALSH\_CODE field of NGHBR\_PILOT\_REC to AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by WALSH\_LENGTH<sub>r</sub>.
  - Set the AUX\_TD\_POWER\_LEVEL field of NGHBR\_PILOT\_REC to AUX\_TD\_POWER\_LEVEL<sub>r</sub>.
  - Set the TD\_MODE field of NGHBR\_PILOT\_REC to TD\_MODE<sub>r</sub>.
- If NGHBR\_PILOT\_REC\_TYPE<sub>r</sub> is equal to '011', the mobile station shall:
  - Set the SR3\_PRIMARY\_PILOT field of NGHBR\_PILOT\_REC to SR3\_PRIMARY\_PILOT<sub>r</sub>.
  - Set the SR3\_PILOT\_POWER1 field of NGHBR\_PILOT\_REC to SR3\_PILOT\_POWER1<sub>r</sub>.
  - Set the SR3\_PILOT\_POWER2 field of NGHBR\_PILOT\_REC to SR3\_PILOT\_POWER2<sub>r</sub>.
- If NGHBR\_PILOT\_REC\_TYPE<sub>r</sub> is equal to '100', the mobile station shall:
  - Set the SR3\_PRIMARY\_PILOT field of NGHBR\_PILOT\_REC to SR3\_PRIMARY\_PILOT<sub>r</sub>.
  - Set the SR3\_PILOT\_POWER1 field of NGHBR\_PILOT\_REC to SR3\_PILOT\_POWER1<sub>r</sub>.
  - Set the SR3\_PILOT\_POWER2 field of NGHBR\_PILOT\_REC to SR3\_PILOT\_POWER2<sub>r</sub>.
  - Set the AUX\_PILOT\_QOF field of NGHBR\_PILOT\_REC to QOF<sub>r</sub>.

- 1       – Set the AUX\_PILOT\_WALSH\_CODE field of NGHBR\_PILOT\_REC to  
2       AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by  
3       WALSH\_LENGTH<sub>r</sub>.
- 4       – If ADD\_INFO\_INCL1<sub>r</sub> is equal to '1', set the AUX\_PILOT\_QOF1 field of  
5       NGHBR\_PILOT\_REC to QOF1<sub>r</sub> and set the AUX\_PILOT\_WALSH\_CODE1 field of  
6       NGHBR\_PILOT\_REC to AUX\_PILOT\_WALSH1<sub>r</sub> with the Walsh Code length  
7       specified by WALSH\_LENGTH1<sub>r</sub>.
- 8       – Otherwise, set the AUX\_PILOT\_QOF1 field of NGHBR\_PILOT\_REC to QOF<sub>r</sub> and  
9       set the AUX\_PILOT\_WALSH\_CODE1 field of NGHBR\_PILOT\_REC to  
10      AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by  
11      WALSH\_LENGTH<sub>r</sub>.
- 12      – If ADD\_INFO\_INCL2<sub>r</sub> is equal to '1', set the AUX\_PILOT\_QOF2 field of  
13      NGHBR\_PILOT\_REC to QOF2<sub>r</sub> and set the AUX\_PILOT\_WALSH\_CODE2 field of  
14      NGHBR\_PILOT\_REC to AUX\_PILOT\_WALSH2<sub>r</sub> with the Walsh Code length  
15      specified by WALSH\_LENGTH2<sub>r</sub>.
- 16      – Otherwise, set the AUX\_PILOT\_QOF2 field of NGHBR\_PILOT\_REC to QOF<sub>r</sub> and  
17      set the AUX\_PILOT\_WALSH\_CODE2 field of NGHBR\_PILOT\_REC to  
18      AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by  
19      WALSH\_LENGTH<sub>r</sub>.

20 If HRPD\_NGHBR\_INCL<sub>r</sub> equals '1', the mobile station shall set NUM\_HRPD\_NGHBR<sub>s</sub> to  
21 NUM\_HRPD\_NGHBR<sub>r</sub>, the number of neighboring HRPD systems contained in the *General*  
22 *Neighbor List Message*. For each of the neighboring HRPD systems contained in the  
23 *General Neighbor List Message*, the mobile station shall perform the following:

- 24      • Set the PN field of HRPD\_NGHBR\_LIST[i] to the i<sup>th</sup> occurrence of NGHBR\_PN<sub>r</sub>.
- 25      • Set the BAND\_CLASS field of HRPD\_NGHBR\_LIST[i] to the i<sup>th</sup> occurrence of  
26      NGHBR\_BAND<sub>r</sub> if NGHBR\_FREQ\_INCL<sub>r</sub> equals '1'; otherwise, set the BAND\_CLASS  
27      field of HRPD\_NGHBR\_LIST[i] to CDMABAND<sub>s</sub>.
- 28      • Set the CDMA\_FREQ field of HRPD\_NGHBR\_LIST[i] to the i<sup>th</sup> occurrence of  
29      NGHBR\_FREQ<sub>r</sub> if NGHBR\_FREQ\_INCL<sub>r</sub> equals '1'; otherwise, set the BAND\_CLASS  
30      field of HRPD\_NGHBR\_LIST[i] to CDMACH<sub>s</sub>.
- 31      • Set the PN\_ASSOCIATION field of HRPD\_NGHBR\_LIST[i] to the i<sup>th</sup> occurrence of  
32      PN\_ASSOCIATION\_IND<sub>r</sub>.
- 33      • Set the DATA\_ASSOCIATION field of HRPD\_NGHBR\_LIST[i] to the i<sup>th</sup> occurrence of  
34      DATA\_ASSOCIATION\_IND<sub>r</sub>.

#### 35 2.6.2.2.9 User Zone Identification Message

36 Whenever a *User Zone Identification Message* is received on the Paging Channel or Primary  
37 Broadcast Control Channel, and if the mobile station supports Tiered Services, the mobile  
38 station shall compare the configuration message sequence number, CONFIG\_MSG\_SEQ<sub>r</sub>,  
39 to that stored in USER\_ZONE\_ID\_MSG\_SEQ<sub>s</sub>. If the comparison results in a match, the  
40 mobile station may ignore the message. If the comparison results in a mismatch, then the

1 mobile station shall process the remaining fields in the message as follows.

2 The mobile station shall store the following parameters:

- 3 • Configuration message sequence number  
4 (CONFIG\_MSG\_SEQ<sub>S</sub> = CONFIG\_MSG\_SEQ<sub>R</sub>,  
5 USER\_ZONE\_ID\_MSG\_SEQ<sub>S</sub> = CONFIG\_MSG\_SEQ<sub>R</sub>)
- 6 • UZ\_EXIT\_RCVD<sub>S</sub> = UZ\_EXIT<sub>R</sub>

7 The mobile station shall set NUM\_UZID<sub>S</sub> to the number of User Zones contained in the  
8 *User Zone Identification Message*.

9 For each User Zone contained in the *User Zone Identification Message*, the mobile station  
10 shall perform the following:

- 11 • Set the UZID field of UZ\_REC(i) to the i<sup>th</sup> occurrence of UZID<sub>R</sub>.
- 12 • Set the UZ\_REV field of the UZ\_REC(i) to the i<sup>th</sup> occurrence of UZ\_REV<sub>R</sub>.
- 13 • Set the TEMP\_SUB field of the UZ\_REC(i) to the i<sup>th</sup> occurrence of TEMP\_SUB<sub>R</sub>.

#### 14 2.6.2.2.10 Private Neighbor List Message

15 Whenever a *Private Neighbor List Message* is received on the Paging Channel or Primary  
16 Broadcast Control Channel, and if the mobile station supports Tiered Services, the mobile  
17 station shall compare the configuration message sequence number, CONFIG\_MSG\_SEQ<sub>R</sub>,  
18 to that stored in PRI\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub>. If the comparison results in a match, the  
19 mobile station may ignore the message. If the comparison results in a mismatch, then the  
20 mobile station shall process the remaining fields in the message as follows.

21 The mobile station shall store the following parameters:

- 22 • Configuration message sequence number  
23 (CONFIG\_MSG\_SEQ<sub>S</sub> = CONFIG\_MSG\_SEQ<sub>R</sub>,  
24 PRI\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub> = CONFIG\_MSG\_SEQ<sub>R</sub>)
- 25 • Common configuration included indicator (COMMON\_INCL<sub>S</sub> = COMMON\_INCL<sub>R</sub>)

26 The mobile station shall set NUM\_PRI\_NGHBR<sub>S</sub> to the number of Private Neighbor base  
27 stations contained in the *Private Neighbor List Message*.

28 For each Private Neighbor base station contained in the *Private Neighbor List Message* the  
29 mobile station shall perform the following:

- 30 • Set the SRCH\_WIN\_PRI\_NGHBR field of PRI\_NGHBR\_REC(i) to SRCH\_WIN\_PN<sub>R</sub>.
- 31 • Set the SID field of PRI\_NGHBR\_REC(i) to the i<sup>th</sup> occurrence SID<sub>R</sub>.
- 32 • Set the NID field of PRI\_NGHBR\_REC(i) to the i<sup>th</sup> occurrence NID<sub>R</sub>.
- 33 • Set the PRI\_NGHBR\_PN field of PRI\_NGHBR\_REC(i) to the i<sup>th</sup> occurrence  
34 PRI\_NGHBR\_PN<sub>R</sub>.
- 35 • If COMMON\_INCL<sub>R</sub> is equal to '1', then the mobile station shall:  
36 – Set the BAND\_CLASS field of PRI\_NGHBR\_REC(i) to COMMON\_BAND\_CLASS<sub>R</sub>.

- 1       – Set the NGHBR\_FREQ field of PRI\_NGHBR\_REC(i) to COMMON\_NGHBR\_FREQ<sub>r</sub>.
- 2       • If COMMON\_INCL<sub>r</sub> is equal to '0', then the mobile station shall:
  - 3       – Set the BAND\_CLASS field of PRI\_NGHBR\_REC(i) to the i<sup>th</sup> occurrence of
  - 4       BAND\_CLASS<sub>r</sub>.
  - 5       – Set the NGHBR\_FREQ field of PRI\_NGHBR\_REC(i) to the i<sup>th</sup> occurrence of
  - 6       NGHBR\_FREQ<sub>r</sub>.
  - 7       • If i<sup>th</sup> occurrence of UZID\_INCL<sub>r</sub> is equal to '0', then the mobile station shall set the
  - 8       PS\_NUM\_UZID field of PRI\_NGHBR\_REC(i) to '0000'.
  - 9       • If i<sup>th</sup> occurrence of UZID\_INCL<sub>r</sub> is equal to '1', then the mobile station shall set the
  - 10       PS\_NUM\_UZID field of PRI\_NGHBR\_REC(i) to the NUM\_UZID<sub>r</sub> associated with the i<sup>th</sup>
  - 11       occurrence of UZID\_INCL<sub>r</sub>.
  - 12       • For each User Zone supported by the i<sup>th</sup> private system, the mobile station shall
  - 13       perform the following:
    - 14       – Set the PS\_UZID(j) field of PRI\_NGHBR\_REC(i) to the j<sup>th</sup> occurrence of UZID<sub>r</sub>.
    - 15       – Set the PS\_UZ\_REV(j) field of PRI\_NGHBR\_REC(i) to the j<sup>th</sup> occurrence of
    - 16       UZ\_REV<sub>r</sub>.
    - 17       – Set the PS\_TEMP\_SUB(j) field of PRI\_NGHBR\_REC(i) to the j<sup>th</sup> occurrence of
    - 18       TEMP\_SUB<sub>r</sub>.

#### 19 2.6.2.2.11 Extended Global Service Redirection Message

20 Whenever an *Extended Global Service Redirection Message* is received on the Paging  
 21 Channel or Primary Broadcast Control Channel, the configuration message sequence  
 22 number, CONFIG\_MSG\_SEQ<sub>r</sub>, shall be compared to that stored in  
 23 EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub>. If the comparison results in a match, the mobile  
 24 station may ignore the message. If the comparison results in a mismatch, the mobile  
 25 station shall store the following parameters:

- 26       • Configuration message sequence number  
 27       (CONFIG\_MSG\_SEQ<sub>s</sub> = CONFIG\_MSG\_SEQ<sub>r</sub>,  
 28       GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub> = CONFIG\_MSG\_SEQ<sub>r</sub>,  
 29       EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub> = CONFIG\_MSG\_SEQ<sub>r</sub>)

30

31 The mobile station shall perform the following:

- 32       • The mobile station shall set (RETURN\_IF\_FAIL<sub>s</sub> = RETURN\_IF\_FAIL<sub>r</sub>),  
 33       TEMP\_TMSI\_CODE to TMSI\_CODE<sub>s-p</sub>, and clear the REDIRECT\_REC\_LIST. For i  
 34       = 1 to (NUM\_ADD\_RECORD<sub>r</sub> + 1), the mobile station shall perform the following:
  - 35       – If all the following conditions are satisfied from the i<sup>th</sup> redirection record:
    - 36       + The subfield corresponding to the access overload class, ACCOLC<sub>p</sub>, of the
    - 37       mobile station is set equal to '1' in the REDIRECT\_ACCOLC<sub>r</sub> field or
    - 38       ADD\_REDIRECT\_ACCOLC<sub>r</sub> of the i<sup>th</sup> redirection record.

- 1           + MOB\_P\_REV<sub>p</sub> is in the redirection mobile protocol revision range associated
- 2           with the *i*<sup>th</sup> redirection record (REDIRECT\_P\_REV\_INCL<sub>r</sub> = '1' and
- 3           EXCL\_P\_REV\_IND<sub>r</sub> = '0', and (REDIRECT\_P\_MIN<sub>r</sub> ≤ MOB\_P\_REV<sub>p</sub> ≤
- 4           REDIRECT\_P\_MAX<sub>r</sub>) where *i* is equal to 1).
- 5           + MOB\_P\_REV<sub>p</sub> is not in any of the excluded mobile protocol revision range
- 6           associated with the *i*<sup>th</sup> redirection record (REDIRECT\_P\_REV\_INCL<sub>r</sub> = '1' and
- 7           EXCL\_P\_REV\_IND<sub>r</sub> = '1' and (MOB\_P\_REV<sub>p</sub> < REDIRECT\_P\_MIN<sub>r</sub> or
- 8           MOB\_P\_REV<sub>p</sub> > REDIRECT\_P\_MAX<sub>r</sub>)).
- 9           + Type of redirection as specified by RECORD\_TYPE<sub>r</sub> (*i* is equal to 1) or
- 10          ADD\_RECORD\_TYPE<sub>r</sub> is supported.
- 11          + BAND\_CLASS<sub>r</sub> is supported (RECORD\_TYPE<sub>r</sub> = '00000010' or
- 12          ADD\_RECORD\_TYPE<sub>r</sub> = '00000010').
- 13          + At least one of the CDMA\_CHAN<sub>r</sub> is supported for at least one band
- 14          subclass (when included) corresponding to REDIRECT\_SUBCLASS<sub>r</sub> = '1'.
- 15          (RECORD\_TYPE<sub>r</sub> = '00000010' or ADD\_RECORD\_TYPE<sub>r</sub> = '00000010').
- 16          then mobile station shall store the following parameters from the redirection record:
- 17          + Set DELETE\_TMSI field of REDIRECT\_REC\_LIST[*j*] to DELETE\_TMSI<sub>r</sub> (*i* is
- 18          equal to 1) or ADD\_DELETE\_TMSI<sub>r</sub>, where *j* (i.e., the initial *j* value is set to
- 19          0) is incremented by 1 whenever the *i*<sup>th</sup> redirection record satisfies the
- 20          redirection record selection conditions above.
- 21          + Set REDIRECT\_REC\_LIST[*j*] to the *i*<sup>th</sup> redirection record from the received
- 22          message.
- 23          + Set RECORD\_TYPE field of REDIRECT\_REC\_LIST[*j*] to RECORD\_TYPE<sub>r</sub> (*i* is
- 24          equal to 1) or ADD\_RECORD\_TYPE<sub>r</sub>.
- 25          + If RECORD\_TYPE<sub>r</sub> = '00000001' (*i* is equal to 1) or ADD\_RECORD\_TYPE<sub>r</sub> =
- 26          '00000001', the mobile station shall:
- 27               ○ Set CDMA\_MODE<sub>s</sub> to '1'
- 28               ○ Set DIGITAL\_REG field of REDIRECT\_REC\_LIST[*j*] to '00000000'.
- 29               ○ Set MAX\_REDIRECT\_DELAY field of REDIRECT\_REC\_LIST[*j*] to
- 30               MAX\_REDIRECT\_DELAY<sub>r</sub>.
- 31          + If LAST\_SEARCH\_RECORD\_IND<sub>r</sub> or ADD\_LAST\_SEARCH\_RECORD\_IND<sub>r</sub> is
- 32          equal to '1', the mobile station shall ignore the rest of the message.
- 33          • If REDIRECT\_REC\_LIST[*j*] is not empty, the mobile station shall enter the *System*
- 34          *Determination Substate* of the *Mobile Station Initialization State* with a redirection
- 35          indication (see 2.6.1.1); otherwise, the mobile station shall ignore the *Extended*
- 36          *Global Service Redirection Message*.

#### 2.6.2.2.12 Extended CDMA Channel List Message Overview

The mobile station may receive the *Extended CDMA Channel List Message* from the Paging Channel or from the Primary Broadcast Control Channel. The mobile station shall follow requirements defined in 2.6.2.2.12.1 or 2.6.2.2.12.2 to process the *Extended CDMA Channel List Message*.

##### 2.6.2.2.12.1 Extended CDMA Channel List Message on Paging Channel

Whenever an *Extended CDMA Channel List Message* is received on the Paging Channel, the mobile station shall compare the configuration message sequence number, CONFIG\_MSG\_SEQ<sub>r</sub>, to that stored in EXT\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>. If the comparison results in a match, the mobile station may ignore the message. If the comparison results in a mismatch, then the mobile station shall process the remaining fields in the message as follows:

If the *Extended CDMA Channel List Message* lists CDMA channels from more than one band class and the mobile station hashes to a band class other than the current band class, the mobile station shall process this message after NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, EXT\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub> and GEN\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub> become current.

The mobile station shall store the following parameters:

- Configuration message sequence number  
(CONFIG\_MSG\_SEQ<sub>s</sub> = CONFIG\_MSG\_SEQ<sub>r</sub>,  
EXT\_CHAN\_LST\_MSG\_SEQ<sub>s</sub> = CONFIG\_MSG\_SEQ<sub>r</sub>,  
CHAN\_LST\_MSG\_SEQ<sub>s</sub> = CONFIG\_MSG\_SEQ<sub>r</sub>).

The mobile station shall process this message if FD\_CHAN\_LST\_SEQ<sub>s</sub> is current and the mobile station does not support any bandclass listed by the base station in the *Flex Duplex CDMA Channel List Message* or if the mobile station does not support flexible spacing between forward and reverse channels. Otherwise, the mobile station shall ignore this message.

The mobile station shall determine the CDMA Channel (Frequency Assignment) for its Paging Channel as follows:

- Starting from an empty list, the mobile station shall generate the first CDMA Channel list from the *Extended CDMA Channel List Message* as follows:
  - For each band class record included in this message, the mobile station shall perform the following:
    - + If band subclass information is included for this band class record (SUBCLASS\_INFO\_INCL<sub>r</sub> = '1' or ADD\_SUBCLASS\_INFO\_INCL<sub>r</sub> = '1'), the mobile station shall add only those channels belonging to the band class and band subclasses that are supported by both the mobile station and the

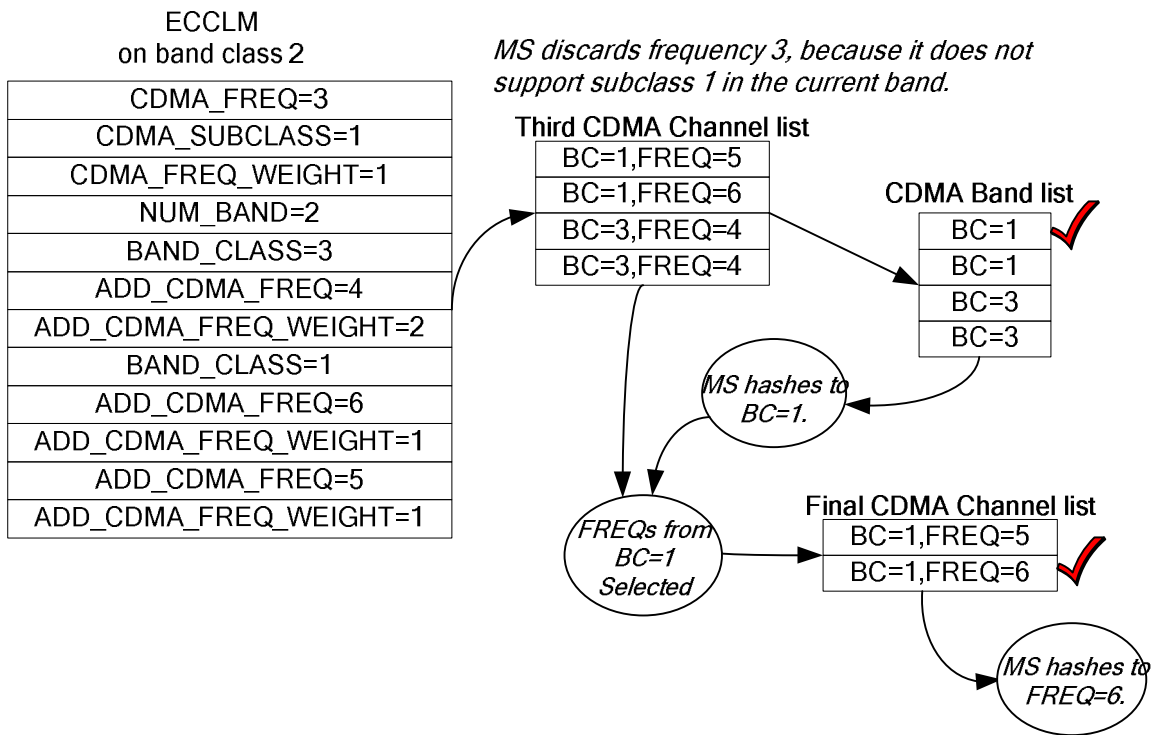

- 1 base station, in the order they appear in the *Extended CDMA Channel List*  
 2 *Message*<sup>7</sup>.
- 3 + Otherwise (SUBCLASS\_INFO\_INCL<sub>r</sub> = '0', ADD\_SUBCLASS\_INFO\_INCL<sub>r</sub> = '0'  
 4 or P\_REV\_IN\_USE<sub>s</sub> is less than 11), the mobile station shall add only those  
 5 channels that it supports for the associated band class, in the order they  
 6 appear in the *Extended CDMA Channel List Message*.
- 7 – If P\_REV\_IN\_USE<sub>s</sub> is greater than or equal to 11, the mobile station shall sort  
 8 the channels first by the ascending order of band class value, as specified in  
 9 [30], then by the ascending order of CDMA\_FREQ within each band class.
- 10 • If RC\_QPCH\_SEL\_INCL<sub>r</sub> is equal to '1' and the mobile station is capable of RC  
 11 greater than 2 or capable of supporting Quick Paging Channel, the mobile station  
 12 shall eliminate the channels with RC\_QPCH\_HASH\_IND<sub>r</sub> equal to '0' from the first  
 13 CDMA Channel list to generate the second CDMA Channel list while preserving the  
 14 order in the first CDMA Channel list. Otherwise, the mobile station shall set the  
 15 second CDMA Channel list to be equal to the first CDMA Channel list.
- 16 • The mobile station shall generate the third CDMA Channel list as follows.
- 17 – If CDMA\_FREQ\_WEIGHT\_INCL<sub>r</sub> is equal to '0', the mobile station shall set the  
 18 third CDMA Channel list to be equal to the second CDMA Channel list.
- 19 – If CDMA\_FREQ\_WEIGHT\_INCL<sub>r</sub> is equal to '1', starting with an empty third  
 20 CDMA Channel list, for each entry "E" in the second CDMA Channel list in the  
 21 order they appear, the mobile station shall append N consecutive entries "E" at  
 22 the end of the third CDMA Channel list, where N is the weight of "E" and equals  
 23 either CDMA\_FREQ\_WEIGHT<sub>r+1</sub> or ADD\_CDMA\_FREQ\_WEIGHT<sub>r+1</sub>  
 24 appropriately.
- 25 • The mobile station shall generate a CDMA band list as follows. Starting with an  
 26 empty CDMA band list, for each channel in the third CDMA Channel list in the  
 27 order they appear, the mobile station shall append an entry equal to the band class  
 28 of that channel, at the end of the CDMA band list.
- 29 • The mobile station shall use the hash algorithm specified in 2.6.7.1 and the size of  
 30 the CDMA band list to compute the band class for its Paging Channel.
- 31 • The mobile station shall eliminate those channels which are not in the computed  
 32 band class from the third CDMA channel list to generate the final CDMA channel  
 33 list.

---

<sup>7</sup> The mobile station will not discard frequencies as long as they belong to a subclass that is both listed in the message and supported by the mobile station. If the base station does not list any subclass, the mobile station assumes that all subclasses are supported by the base station. The subclass to frequency mapping is not provided in the *Extended CDMA Channel List Message*; the mobile station needs to refer to [45] to find the mapping.

- If the final CDMA Channel list is empty, the mobile station shall enter the *System Determination Substate* with an acquisition failure indication.
- The mobile station shall then use the hash algorithm specified in 2.6.7.1 and the size of the final CDMA channel list to determine the CDMA Channel (Frequency Assignment) for its Paging Channel.

Figure 2.6.2.2.12.1-1 shows an example of the hashing procedure.

**Figure 2.6.2.2.12.1-1. Hashing Example**

If the CDMA Frequency Assignment has changed but the band class is the same (the computed CDMA Channel is different from CDMACH<sub>s</sub> but the computed CDMA band class is the same as CDMABAND<sub>s</sub>), the mobile station shall perform the following actions:

- If the stored configuration parameters is not current (see 2.6.2.2) for the corresponding base station and frequency assignment, the mobile station shall perform the following actions:
  - Set CDMACH<sub>s</sub> to the new CDMA Channel.
  - Set PAGE\_CHAN<sub>s</sub> to '1'.
  - Set PAGECH<sub>s</sub> to the Primary Paging Channel.

- 1       o Set CONFIG\_MSG\_SEQ<sub>s</sub>, SYS\_PAR\_MSG\_SEQ<sub>s</sub>, NGHBR\_LST\_MSG\_SEQ<sub>s</sub>,  
2       CHAN\_LST\_MSG\_SEQ<sub>s</sub>, EXT\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>,  
3       FD\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>, EXT\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>,  
4       GEN\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, EXT\_SYS\_PAR\_MSG\_SEQ<sub>s</sub>,  
5       GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub>, EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub>,  
6       USER\_ZONE\_IDMSG\_SEQ<sub>s</sub>, PRI\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, and  
7       ACC\_MSG\_SEQ<sub>s</sub> to NULL. The mobile station shall keep the parameters  
8       associated with the current overhead messages until they are updated on the  
9       new Paging Channel<sup>8</sup>.
- 10       o Tune to the new CDMA Channel.
- 11       • Otherwise, the mobile station shall perform the following actions:  
12       – Set CDMACH<sub>s</sub> to the new CDMA Channel.  
13       – The mobile station shall use the hash algorithm specified in 2.6.7.1 to select a  
14       new Paging Channel number in the range 1 to PAGE\_CHAN<sub>s</sub>, where  
15       PAGE\_CHAN<sub>s</sub> is the value stored for the Paging Channel whose stored  
16       information is current. The mobile station shall store the new Paging Channel  
17       number as PAGECH<sub>s</sub>.  
18       – Tune to the new CDMA Channel and shall begin monitoring the new Paging  
19       Channel.
- 20   If the band class has changed (the computed CDMA band class is different than  
21   CDMABAND<sub>s</sub>), the mobile station shall perform the following actions:  
22       • If BYPASS\_SYS\_DET\_IND<sub>s</sub> is equal to '0' for this CDMA channel, the mobile station  
23       shall perform the following:  
24       – Set NEW\_BAND\_RECORD.NEW\_BAND\_CLASS to the computed band class  
25       – Set NEW\_BAND\_RECORD.NEW\_FREQ to the computed CDMA Channel  
26       – The mobile station shall enter the *System Determination Substate* of the *Mobile*  
27       *Station Initialization State* with a new band indication.  
28       • If BYPASS\_SYS\_DET\_IND<sub>s</sub> is equal to '1' for this CDMA channel, the mobile station  
29       shall perform the following:  
30       – If the stored configuration parameters is not current (see 2.6.2.2) for the  
31       corresponding base station and frequency assignment, the mobile station shall  
32       perform the following actions:  
33       + Set CDMACH<sub>s</sub> to the new CDMA Channel.

---

<sup>8</sup> This is primarily needed when hashing to a band with a different coverage footprint than the current band. The current neighbor list is to be used to search for pilots in the hashed-to band. The search priorities are to be adjusted to take into account the hashed-to frequency (e.g., the pilots in the hashed-to frequency should have the highest priority).

- 1           + Set CDMABAND<sub>S</sub> to the new band class.
- 2           + Set PAGE\_CHAN<sub>S</sub> to '1'.
- 3           + Set PAGECH<sub>S</sub> to the Primary Paging Channel.
- 4           + Set CONFIG\_MSG\_SEQ<sub>S</sub>, SYS\_PAR\_MSG\_SEQ<sub>S</sub>, NGHBR\_LST\_MSG\_SEQ<sub>S</sub>,
- 5           CHAN\_LST\_MSG\_SEQ<sub>S</sub>, EXT\_CHAN\_LST\_MSG\_SEQ<sub>S</sub>,
- 6           FD\_CHAN\_LST\_MSG\_SEQ<sub>S</sub>, EXT\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub>,
- 7           GEN\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub>, EXT\_SYS\_PAR\_MSG\_SEQ<sub>S</sub>,
- 8           GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>S</sub>, EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>S</sub>,
- 9           USER\_ZONE\_IDMSG\_SEQ<sub>S</sub>, PRI\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub>, and
- 10          ACC\_MSG\_SEQ<sub>S</sub> to NULL. The mobile station shall keep the parameters
- 11          associated with the current overhead messages until they are updated on
- 12          the new Paging Channel<sup>9</sup>.
- 13          + Tune to the new CDMA Channel.
- 14          – Otherwise, the mobile station shall perform the following actions:
- 15           + Set CDMACH<sub>S</sub> to the new CDMA Channel.
- 16           + Set CDMABAND<sub>S</sub> to the new band class.
- 17           + The mobile station shall use the hash algorithm specified in 2.6.7.1 to select
- 18           a new Paging Channel number in the range 1 to PAGE\_CHAN<sub>S</sub>, where
- 19           PAGE\_CHAN<sub>S</sub> is the value stored for the Paging Channel whose stored
- 20           information is current. The mobile station shall store the new Paging
- 21           Channel number as PAGECH<sub>S</sub>.
- 22           + Tune to the new CDMA Channel and shall begin monitoring the new Paging
- 23           Channel.
- 24   2.6.2.2.12.2 Extended CDMA Channel List Message on Primary Broadcast Control
- 25   Channel
- 26   Whenever the *Extended CDMA Channel List Message* is received on the Primary Broadcast
- 27   Control Channel, the mobile station shall compare the configuration message sequence
- 28   number, CONFIG\_MSG\_SEQ<sub>r</sub>, to that stored in CONFIG\_MSG\_SEQ<sub>S</sub>. If the comparison
- 29   results in a match, the mobile station may ignore the message. If the comparison results
- 30   in a mismatch, the mobile station shall process the remaining fields in the message as
- 31   follows:
- 32   If the *Extended CDMA Channel List Message* lists CDMA channels from more than one
- 33   band class and the mobile station hashes to a band class other than the current band

---

<sup>9</sup> This is primarily needed when hashing to a band with a different coverage footprint than the current band. The current neighbor list is to be used to search for pilots in the hashed-to band. The search priorities are to be adjusted to take into account the hashed-to frequency (e.g., the pilots in the hashed-to frequency should have the highest priority).

1 class, the mobile station shall process this message after UNI\_NGHRBR\_LST\_MSG\_SEQ<sub>S</sub>  
2 becomes current.

3 The mobile station shall store the following parameters:

- 4 • Configuration message sequence number  
5 (CONFIG\_MSG\_SEQ<sub>S</sub> = CONFIG\_MSG\_SEQ<sub>R</sub>,  
6 EXT\_CHAN\_LST\_MSG\_SEQ<sub>S</sub> = CONFIG\_MSG\_SEQ<sub>R</sub>).

7 The mobile station shall process this message if FD\_CHAN\_LST\_SEQ<sub>S</sub> is current and the  
8 mobile station does not support any bandclass listed by the base station in the *Flex Duplex*  
9 *CDMA Channel List Message* or if the mobile station does not support flexible spacing  
10 between forward and reverse channels. Otherwise, the mobile station shall ignore this  
11 message.

12 To determine the CDMA Channel (Frequency Assignment) for its Primary Broadcast  
13 Control Channel, the mobile station shall first select a subset of CDMA channels from the  
14 *Extended CDMA Channel List Message* that will be used for channel hashing. The  
15 attributes for channel selection are support for that frequency, the band subclass (if  
16 included), RC greater than 2, Quick Paging Channel and transmit diversity. The mobile  
17 station shall first select the entire CDMA channel list for channel hashing. Starting from  
18 an empty list, the mobile station shall then select the first CDMA Channel list as follows:

- 19 • For each band class record included in this message, the mobile station shall  
20 perform the following:
  - 21 – If band subclass information is included for this band class record  
22 (SUBCLASS\_INFO\_INCL<sub>R</sub> = '1' or ADD\_SUBCLASS\_INFO\_INCL<sub>R</sub> = '1'), the mobile  
23 station shall add only those channels belonging to the band class and band  
24 subclasses that are supported by both the mobile station and the base station,  
25 in the order they appear in the *Extended CDMA Channel List Message*<sup>10</sup>.
  - 26 – Otherwise (SUBCLASS\_INFO\_INCL<sub>R</sub> = '0', ADD\_SUBCLASS\_INFO\_INCL<sub>R</sub> = '0' or  
27 P\_REV\_IN\_USE<sub>S</sub> is less than 11), the mobile station shall add only those  
28 channels that it supports for the associated band class, in the order they  
29 appear in the *Extended CDMA Channel List Message*.
- 30 • If P\_REV\_IN\_USE<sub>S</sub> is greater than or equal to 11, the mobile station shall sort the  
31 channels first by the ascending order of band class value as specified in [30], then  
32 by the ascending order of CDMA\_FREQ within each band class.
- 33 • If TD\_SEL\_INCL<sub>R</sub> is equal to '1', the mobile station shall perform the following:

---

<sup>10</sup> The mobile station will not discard frequencies as long as they belong to a subclass that is both listed in the message and supported by the mobile station. If the base station does not list any subclass, the mobile station assumes that all subclasses are supported by the base station. The subclass to frequency mapping is not provided in the *Extended CDMA Channel List Message*; the mobile station needs to refer to [45] to find the mapping.

- 1       – If the mobile station is capable of supporting the transmit diversity mode  
2       specified by  $TD\_MODE_r$ , the mobile station shall select those CDMA channels  
3       that have  $TD\_HASH\_IND_r$  set to '1' from the CDMA channel list for the first  
4       CDMA Channel list while preserving the order.
- 5       – If the mobile station is not capable of supporting the transmit diversity mode  
6       specified by  $TD\_MODE_r$ , the mobile station shall select those CDMA channels  
7       that have  $TD\_HASH\_IND_r$  set to '0' from the CDMA channel list for the first  
8       CDMA Channel list while preserving the order.
- 9       • If  $TD\_SEL\_INCL_r$  is equal to '0', the mobile station shall select the entire list for the  
10      first CDMA Channel list.

11 From this first CDMA Channel list, the mobile station shall select the second CDMA  
12 Channel list as follows:

- 13      • If  $RC\_QPCH\_SEL\_INCL_r$  is equal to '1' and the mobile station is capable of RC  
14      greater than 2 or capable of supporting QPCH, the mobile station shall select those  
15      CDMA channels with  $RC\_QPCH\_HASH\_IND_r$  set to '1' for the second CDMA  
16      Channel list for CDMA channel hashing while preserving the order. If this list is  
17      empty, the mobile station shall use the first CDMA Channel list as the second  
18      CDMA Channel list for CDMA channel hashing.
- 19      • Otherwise, the mobile station shall use the first CDMA Channel list as the second  
20      CDMA Channel list for CDMA channel hashing.

21 From this second CDMA Channel list, the mobile station shall select the third CDMA  
22 Channel listsubset as follows:

- 23      • If  $CDMA\_FREQ\_WEIGHT\_INCL_r$  is equal to '0', the mobile station shall set the third  
24      CDMA Channel list to be equal to the second CDMA Channel list
- 25      • If  $CDMA\_FREQ\_WEIGHT\_INCL_r$  is equal to '1', starting with an empty third CDMA  
26      Channel list, for each entry "E" in the second CDMA Channel list in the order they  
27      appear, the mobile station shall append N consecutive entries "E" at the end of the  
28      third CDMA Channel, where N is the weight of "E" and equals either  
29       $CDMA\_FREQ\_WEIGHT_{r+1}$  or  $ADD\_CDMA\_FREQ\_WEIGHT_{r+1}$  appropriately

30 The mobile station shall determine the band class for its Primary Broadcast Control  
31 Channel as follows:

- 32      • The mobile station shall generate a CDMA band list as follows. Starting with an  
33      empty CDMA band list, for each channel in the third CDMA Channel list in the  
34      order they appear, the mobile station shall append an entry equal to the band class  
35      of that channel, at the end of the CDMA band list
- 36      • The mobile station shall use the hash algorithm specified in 2.6.7.1 and the size of  
37      the CDMA band list to compute the band class for its Primary Broadcast Control  
38      Channel.

1 After the band class has been selected, the mobile station shall determine the CDMA  
2 Channel (Frequency Assignment) for its Primary Broadcast Control Channel as follows:

- 3 • The mobile station shall eliminate those channels which are not in the computed  
4 band class from the third CDMA Channel list to generate the final CDMA Channel  
5 list.
- 6 • If the final CDMA Channel list is empty, the mobile station shall enter the *System*  
7 *Determination Substate* with an acquisition failure indication
- 8 • The mobile station shall then use the hash algorithm specified in 2.6.7.1 with the  
9 number of channels in the final CDMA Channel list to determine the CDMA  
10 Channel (Frequency Assignment) for its Primary Broadcast Control Channel.

11 If the CDMA Frequency Assignment has changed but the band class is the same (the  
12 computed CDMA Channel is different from CDMACH<sub>S</sub> but the computed CDMA band class  
13 is CDMABAND<sub>S</sub>), the mobile station shall perform the following:

- 14 • Set CDMACH<sub>S</sub> to the new CDMA Channel.
- 15 • Set CONFIG\_MSG\_SEQ<sub>S</sub>, A41\_SYS\_PAR\_MSG\_SEQ<sub>S</sub>, MC\_RR\_PAR\_MSG\_SEQ<sub>S</sub>,  
16 UNI\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub>, EXT\_CHAN\_LST\_MSG\_SEQ<sub>S</sub>,  
17 FD\_CHAN\_LST\_MSG\_SEQ<sub>S</sub>, USER\_ZONE\_ID\_MSG\_SEQ<sub>S</sub>, and  
18 PRI\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub> and ACC\_MSG\_SEQ<sub>S</sub> to NULL. The mobile station  
19 shall keep the parameters associated with the current overhead messages until  
20 they are updated on the new Primary Broadcast Control Channel<sup>11</sup>.
- 21 • If the mobile station is operating in the Spreading Rate 1:
  - 22 – If the assigned CDMA channel supports transmit diversity, the mobile station  
23 shall set the following fields corresponding to the assigned CDMA channel:
    - 24 + SR1\_TD\_POWER\_LEVEL<sub>S</sub> = TD\_POWER\_LEVEL<sub>r</sub>.
    - 25 + SR1\_TD\_MODE<sub>S</sub> = TD\_MODE<sub>r</sub>.
    - 26 + BRAT<sub>S</sub> = SR1\_BRAT\_TD<sub>S</sub>.
    - 27 + BCCH\_CODE\_RATE<sub>S</sub> = SR1\_CRAT\_TD<sub>S</sub>.
    - 28 + BCCH<sub>S</sub> = BCCH\_CODE\_CHAN\_TD<sub>S</sub>.
  - 29 – Otherwise, the mobile station shall set the following fields corresponding to the  
30 assigned CDMA channel:
    - 31 + BRAT<sub>S</sub> = SR1\_BRAT\_NON\_TD<sub>S</sub>,
    - 32 + BCCH\_CODE\_RATE<sub>S</sub> = SR1\_CRAT\_NON\_TD<sub>S</sub>,

---

<sup>11</sup> This is primarily needed when hashing to a band with a different coverage footprint than the current band. The current neighbor list is to be used to search for pilots in the hashed-to band. The search priorities are to be adjusted to take into account the hashed-to frequency (e.g., the pilots in the hashed-to frequency should have the highest priority).

- 1           +   BCCH<sub>S</sub> = BCCH\_CODE\_CHAN\_NON\_TD<sub>S</sub>,
- 2       •   Tune to the new CDMA Channel
- 3   If the band class has changed (the computed CDMA band class is different than
- 4   CDMABAND<sub>S</sub>), the mobile station shall perform the following actions:
- 5       •   If BYPASS\_SYS\_DET\_IND<sub>R</sub> is equal to '0' for this CDMA channel, the mobile station
- 6       shall perform the following:
- 7           –   Set NEW\_BAND\_RECORD.NEW\_BAND\_CLASS to the computed band class.
- 8           –   Set NEW\_BAND\_RECORD.NEW\_FREQ to the computed CDMA Channel.
- 9           –   The mobile station shall enter the *System Determination Substate* of the *Mobile*
- 10          *Station Initialization State* with a new band indication.
- 11       •   If BYPASS\_SYS\_DET\_IND<sub>R</sub> is equal to '1' for this CDMA channel, the mobile station
- 12       shall perform the following:
- 13           –   Set CDMACH<sub>S</sub> to the new CDMA Channel.
- 14           –   Set CDMABAND<sub>S</sub> to the new band class.
- 15           o   Set CONFIG\_MSG\_SEQ<sub>S</sub>, A41\_SYS\_PAR\_MSG\_SEQ<sub>S</sub>, MC\_RR\_PAR\_MSG\_SEQ<sub>S</sub>,
- 16           UNI\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub>, EXT\_CHAN\_LST\_MSG\_SEQ<sub>S</sub>,
- 17           FD\_CHAN\_LST\_MSG\_SEQ<sub>S</sub>, USER\_ZONE\_ID\_MSG\_SEQ<sub>S</sub>, and
- 18           PRI\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub> and ACC\_MSG\_SEQ<sub>S</sub> to NULL. The mobile
- 19           station shall keep the parameters associated with the current overhead
- 20           messages until they are updated on the new Primary Broadcast Control
- 21           Channel<sup>12</sup>.
- 22       o   If the mobile station is operating in the Spreading Rate 1:
- 23           +   If the assigned CDMA channel supports transmit diversity, the mobile
- 24           station shall set the following fields corresponding to the assigned CDMA
- 25           channel:
- 26               o   SR1\_TD\_POWER\_LEVEL<sub>S</sub> = TD\_POWER\_LEVEL<sub>R</sub>.
- 27               o   SR1\_TD\_MODE<sub>S</sub> = TD\_MODE<sub>R</sub>.
- 28               o   BRAT<sub>S</sub> = SR1\_BRAT\_TD<sub>S</sub>.
- 29               o   BCCH\_CODE\_RATE<sub>S</sub> = SR1\_CRAT\_TD<sub>S</sub>.
- 30               o   BCCH<sub>S</sub> = BCCH\_CODE\_CHAN\_TD<sub>S</sub>.

---

<sup>12</sup> This is primarily needed when hashing to a band with a different coverage footprint than the current band. The current neighbor list is to be used to search for pilots in the hashed-to band. The search priorities are to be adjusted to take into account the hashed-to frequency (e.g., the pilots in the hashed-to frequency should have the highest priority).

- 1       – Otherwise, the mobile station shall set the following fields corresponding to the
- 2       assigned CDMA channel:
- 3       +  $BRAT_S = SR1\_BRAT\_NON\_TD_S$ ,
- 4       +  $BCCH\_CODE\_RATE_S = SR1\_CRAT\_NON\_TD_S$ ,
- 5       +  $BCCH_S = BCCH\_CODE\_CHAN\_NON\_TD_S$ ,
- 6       – Tune to the new CDMA Channel

#### 7   2.6.2.2.13 ANSI-41 System Parameters Message

8   Whenever an *ANSI-41 System Parameters Message* is received, the configuration message  
 9   sequence number,  $CONFIG\_MSG\_SEQ_R$ , shall be compared to that stored in  
 10  $A41\_SYS\_PAR\_MSG\_SEQ_S$ . If the comparison results in a match, the mobile station may  
 11 ignore the message. If the comparison results in a mismatch, then the mobile station shall  
 12 process the remaining fields in the message as described in 2.6.2.2.13.1, 2.6.2.2.13.2,  
 13 2.6.2.2.13.3, and 2.6.2.2.13.4.

14 If  $REG\_PRD$  is not within the valid range specified in 3.7.2.3.2.31, then the mobile station  
 15 shall ignore the *ANSI-41 System Parameters Message* that contains it.

#### 16   2.6.2.2.13.1 Stored Parameters

17   The mobile station shall store the following parameters:

- 18       • Configuration message sequence number  
 19       ( $CONFIG\_MSG\_SEQ_S = CONFIG\_MSG\_SEQ_R$ ,  
 20        $A41\_SYS\_PAR\_MSG\_SEQ_S = CONFIG\_MSG\_SEQ_R$ )
- 21       • Home registration indicator ( $HOME\_REG_S = HOME\_REG_R$ )
- 22       • SID roamer registration indicator ( $FOR\_SID\_REG_S = FOR\_SID\_REG_R$ )
- 23       • NID roamer registration indicator ( $FOR\_NID\_REG_S = FOR\_NID\_REG_R$ )
- 24       • Power-up registration indicator ( $POWER\_UP\_REG_S = POWER\_UP\_REG_R$ )
- 25       • Power-down registration indicator ( $POWER\_DOWN\_REG_S = POWER\_DOWN\_REG_R$ )
- 26       • Parameter-change registration indicator ( $PARAMETER\_REG_S = PARAMETER\_REG_R$ )
- 27       • Preferred Enhanced Access Channel MSID type  
 28       ( $PREF\_MSID\_TYPE_S = PREF\_MSID\_TYPE_R$ )
- 29       • Extended Preferred Enhanced Access Channel MSID type  
 30       ( $EXT\_PREF\_MSID\_TYPE_S = EXT\_PREF\_MSID\_TYPE_R$ ), if included; otherwise, set  
 31        $EXT\_PREF\_MSID\_TYPE_S$  to NULL.
- 32       • MEID Required indicator is included ( $MEID\_REQD_S = MEID\_REQD_R$ ), if included;  
 33       otherwise, set  $MEID\_REQD_S$  to '0'
- 34       • The mobile station shall set its operational IMSI,  $IMSI\_O$ , as follows:
- 35       – If  $IMSI\_T\_SUPPORTED_R$  is equal to '0', the mobile station shall set  $IMSI\_O$  to  
 36        $IMSI\_M_P$ .

- 1        - If IMSI\_T\_SUPPORTED<sub>r</sub> is equal to '1' and the mobile station's IMSI\_T<sub>p</sub> has  
2           been programmed, the mobile station shall set IMSI\_O to IMSI\_T<sub>p</sub>.
  - 3        - If IMSI\_T\_SUPPORTED<sub>r</sub> is equal to '1' and the mobile station's IMSI\_T<sub>p</sub> has not  
4           been programmed, the mobile station shall set IMSI\_O to IMSI\_M<sub>p</sub>.
  - 5        - If IMSI\_O has been changed, the mobile station shall set  
6           MC\_RR\_PAR\_MSG\_SEQ<sub>s</sub>, EXT\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>,  
7           FD\_CHAN\_LST\_MSG\_SEQ<sub>s</sub> to NULL and set NUM\_FCCCH<sub>s</sub> to '1' and  
8           FCCCH\_ID<sub>s</sub> to '1'.
  - 9        • If OTHER\_INFO\_INCL<sub>r</sub> is set to '1', the mobile station shall store:  
10          - Base station identification (BASE\_ID<sub>s</sub> = BASE\_ID<sub>r</sub>)  
11          - If MCC<sub>r</sub> = '1111111111' and IMSI\_11\_12<sub>r</sub> = '1111111', the mobile station shall  
12           set the IMSI\_O to IMSI\_M<sub>p</sub> and store:  
13           + Mobile Country Code (MCC<sub>s</sub> = MCC\_M<sub>p</sub>) and  
14           + IMSI 11th and 12th digits (IMSI\_11\_12<sub>s</sub> = IMSI\_M\_11\_12<sub>p</sub>);  
15          - Otherwise, the mobile station shall store:  
16           + Mobile Country Code (MCC<sub>s</sub> = MCC<sub>r</sub>) and  
17           + IMSI 11th and 12th digits (IMSI\_11\_12<sub>s</sub> = IMSI\_11\_12<sub>r</sub>).  
18          - Broadcast GPS assist indicator (BROADCAST\_GPS\_ASST<sub>s</sub> =  
19           BROADCAST\_GPS\_ASST<sub>r</sub>)  
20          - Signaling encryption supported indicator (SIG\_ENCRYPT\_SUP<sub>s</sub> =  
21           SIG\_ENCRYPT\_SUP<sub>r</sub>)  
22        • Least significant digit of MNC (IMSI\_10<sub>s</sub> = IMSI\_10<sub>r</sub>), if included.  
23        • If IMSI\_O is set to the IMSI\_M, the mobile station shall set:  
24          - IMSI\_O\_S<sub>s</sub> to IMSI\_M\_S<sub>p</sub> (i.e., IMSI\_O\_S1<sub>s</sub> to IMSI\_M\_S1<sub>p</sub> and IMSI\_O\_S2<sub>s</sub> to  
25           IMSI\_M\_S2<sub>p</sub>)  
26          - IMSI\_O\_11\_12<sub>s</sub> to IMSI\_M\_11\_12<sub>p</sub>  
27          - MCC\_O<sub>s</sub> to MCC\_M<sub>p</sub>  
28          - IMSI\_O\_ADDR\_NUM<sub>s</sub> to IMSI\_M\_ADDR\_NUM<sub>p</sub>  
29        • If IMSI\_O is set to the IMSI\_T, the mobile station shall set:  
30          - IMSI\_O\_S<sub>s</sub> to IMSI\_T\_S<sub>p</sub> (i.e., IMSI\_O\_S1<sub>s</sub> to IMSI\_T\_S1<sub>p</sub> and IMSI\_O\_S2<sub>s</sub> to  
31           IMSI\_T\_S2<sub>p</sub>).  
32          - IMSI\_O\_11\_12<sub>s</sub> to IMSI\_T\_11\_12<sub>p</sub>  
33          - MCC\_O<sub>s</sub> to MCC\_T<sub>p</sub>  
34          - IMSI\_O\_ADDR\_NUM<sub>s</sub> to IMSI\_T\_ADDR\_NUM<sub>p</sub>  
35        • Delete foreign TMSI (DELETE\_FOR\_TMSI<sub>s</sub> = DELETE\_FOR\_TMSI<sub>r</sub>)

- 1       • Use TMSI ( $USE\_TMSI_S = USE\_TMSI_T$ )
- 2       • TMSI zone length ( $TMSI\_ZONE\_LEN_S = TMSI\_ZONE\_LEN_T$ )
- 3       • TMSI zone number ( $TMSI\_ZONE_S = TMSI\_ZONE_T$ )
- 4       • Maximum number of alternative service options ( $MAX\_NUM\_ALT\_SO_S =$
- 5        $MAX\_NUM\_ALT\_SO_T$ ).
- 6       • The mobile station shall set all bits of  $TMSI\_CODE_{S-p}$  to '1' if all of the following
- 7       conditions are met:
  - 8       – The bits of  $TMSI\_CODE_{S-p}$  are not all equal to '1',
  - 9       –  $DELETE\_FOR\_TMSI_S$  is equal to '1', and
  - 10      –  $ASSIGNING\_TMSI\_ZONE\_LEN_{S-p}$  is not equal to  $TMSI\_ZONE\_LEN_S$ , or the least
  - 11      significant  $ASSIGNING\_TMSI\_ZONE\_LEN_{S-p}$  octets of
  - 12       $ASSIGNING\_TMSI\_ZONE_{S-p}$  are not equal to  $TMSI\_ZONE_S$ .
- 13      • Message integrity supported indicator ( $MSG\_INTEGRITY\_SUP_S =$
- 14       $MSG\_INTEGRITY\_SUP_T$ ), if  $P\_REV\_IN\_USE_S$  is greater than or equal to 10;
- 15      otherwise,  $MSG\_INTEGRITY\_SUP_S = 0$ .
- 16      • If  $MSG\_INTEGRITY\_SUP_T$  is equal to '1' and  $SIG\_INTEGRITY\_SUP\_INCL_T$  is equal to
- 17      '1', the mobile station shall store the message integrity algorithms that the base
- 18      station supports ( $SIG\_INTEGRITY\_SUP_S = SIG\_INTEGRITY\_SUP_T$ ); otherwise, the
- 19      mobile station shall set  $SIG\_INTEGRITY\_SUP_S$  to '00000000'.
- 20    If the mobile station supports packet data service options, the mobile station shall store
- 21    the packet data services zone identifier ( $PACKET\_ZONE\_ID_S = PACKET\_ZONE\_ID_T$ );
- 22    otherwise, the mobile station shall set  $PACKET\_ZONE\_ID_S$  to '00000000'.
- 23    If the mobile station supports packet data service options and the  $PZ\_HYST\_ENABLED$
- 24    field is included, the mobile station shall store the packet zone hysteresis enabled
- 25    indicator ( $PZ\_HYST\_ENABLED_S = PZ\_HYST\_ENABLED_T$ ); otherwise, the mobile station
- 26    shall set  $PZ\_HYST\_ENABLED_S$  to '1'.
- 27    If the mobile station supports packet data service options and the  $PZ\_HYST\_LIST\_LEN$  field
- 28    is included, the mobile station shall store the packet zone hysteresis list length
- 29    ( $PZ\_HYST\_LIST\_LEN_S = PZ\_HYST\_LIST\_LEN_T$ ); otherwise, the mobile station shall set
- 30     $PZ\_HYST\_LIST\_LEN_S$  to 4.
- 31    If the mobile station supports packet data service options and the  $PZ\_HYST\_ACT\_TIMER$
- 32    field is included, the mobile station shall store the packet zone hysteresis activation timer
- 33    ( $PZ\_HYST\_ACT\_TIMER_S = PZ\_HYST\_ACT\_TIMER_T$ ); otherwise, the mobile station shall set
- 34     $PZ\_HYST\_ACT\_TIMER_S$  to 30 seconds.
- 35    If the mobile station supports packet data service options and the  $PZ\_HYST\_TIMER\_MUL$
- 36    field and the  $PZ\_HYST\_TIMER\_EXP$  field are included, the mobile station shall store the
- 37    packet zone hysteresis timer ( $PZ\_HYST\_TIMER_S = PZ\_HYST\_TIMER\_MUL_T \times 8 \wedge$
- 38     $PZ\_HYST\_TIMER\_EXP_T$ ); otherwise, the mobile station shall set  $PZ\_HYST\_TIMER_S$  to 60
- 39    seconds.
- 40    If the mobile station supports the *Device Information Message* on the r-csch, the mobile

- 1 station shall store:
  - 2 • Autonomous message supported indicator
  - 3 (AUTO\_MSG\_SUPPORTED<sub>S</sub> = AUTO\_MSG\_SUPPORTED<sub>T</sub>)
- 4 If AUTO\_MSG\_SUPPORTED<sub>T</sub> is equal to '1' and the mobile station supports *the Device*
- 5 *Information Message* on the r-csch, the mobile station shall store:
  - 6 • Autonomous message interval
  - 7 (AUTO\_MSG\_INTERVAL<sub>S</sub> = AUTO\_MSG\_INTERVAL<sub>T</sub>)
- 8 The mobile station shall store concurrent service supported indicator (CS\_SUPPORTED<sub>S</sub>=
- 9 CS\_SUPPORTED<sub>T</sub>).
- 10 Maximum number of additional service reference identifiers allowed in origination
- 11 (MAX\_ADD\_SERV\_INSTANCE<sub>S</sub> = MAX\_ADD\_SERV\_INSTANCE<sub>T</sub>), if included; otherwise, the
- 12 mobile station shall set MAX\_ADD\_SERV\_INSTANCE<sub>S</sub> to 0.
- 13 The mobile station shall store mobile station initiated position location determination
- 14 supported indicator (MS\_INIT\_POS\_LOC\_SUP\_IND<sub>S</sub> = MS\_INIT\_POS\_LOC\_SUP\_IND<sub>T</sub>).
- 15 The mobile station shall also perform the following:
  - 16 • If the mobile station is not in the *Origination Attempt Substate*, or *Page Response*
  - 17 *Substate*, the mobile station shall store the following prior to storing the remaining
  - 18 parameters:
    - 19 – Registered system identification (REG\_SID<sub>S</sub> = SID<sub>S</sub>).
    - 20 – Registered network identification (REG\_NID<sub>S</sub> = NID<sub>S</sub>).
    - 21 – Registered registration zone (REG\_REG\_ZONE<sub>S</sub> = REG\_ZONE<sub>S</sub>).
    - 22 – Registered zone timer length (REG\_ZONE\_TIMER<sub>S</sub> = ZONE\_TIMER<sub>T</sub>).
  - 23 • System identification (SID<sub>S</sub> = SID<sub>T</sub>)
  - 24 • Network identification (NID<sub>S</sub> = NID<sub>T</sub>)
  - 25 • Registration zone (REG\_ZONE<sub>S</sub> = REG\_ZONE<sub>T</sub>)
  - 26 • Number of registration zones to be retained (TOTAL\_ZONES<sub>S</sub> = TOTAL\_ZONES<sub>T</sub>)
  - 27 • Zone timer length (ZONE\_TIMER<sub>S</sub> = ZONE\_TIMER<sub>T</sub>)
  - 28 • Multiple SID storage indicator (MULT\_SIDS<sub>S</sub> = MULT\_SIDS<sub>T</sub>)
  - 29 • Multiple NID storage indicator (MULT\_NIDS<sub>S</sub> = MULT\_NIDS<sub>T</sub>)
  - 30 • Registration period (REG\_PRD<sub>S</sub> = REG\_PRD<sub>T</sub>)
  - 31 • If DIST\_REG\_INCL is equal to '1', the mobile station shall store:
    - 32 – Registration distance (REG\_DIST<sub>S</sub> = REG\_DIST<sub>T</sub>)
  - 33 • If DIST\_REG\_INCL is equal to '0', then the mobile station shall set REG\_DIST<sub>S</sub>
  - 34 equal to '000000000000'.

- 1       • If TKZ\_MODE\_SUPPORTED<sub>r</sub> is not included, the mobile station shall set
- 2       TKZ\_MODE\_SUPPORTED<sub>s</sub> to '0'; otherwise, the mobile station shall set
- 3       TKZ\_MODE\_SUPPORTED<sub>s</sub> to TKZ\_MODE\_SUPPORTED<sub>r</sub>. If
- 4       TKZ\_MODE\_SUPPORTED<sub>s</sub> is equal to '1', the mobile station shall store the tracking
- 5       zone identifier (TKZ\_ID<sub>s</sub> = TKZ\_ID<sub>r</sub>).

6       The mobile station shall ignore any fields at the end of the *ANSI-41 System Parameters*  
 7       *Message* that are not defined according to the protocol revision level (MOB\_P\_REV<sub>p</sub> of the  
 8       current band class) being used by the mobile station.

#### 9       2.6.2.2.13.2 Roaming Status

- 10      The mobile station shall determine the roaming status for the mobile station (see 2.6.5.3).
- 11      The mobile station should indicate to the user whether the mobile station is roaming.

#### 12     2.6.2.2.13.3 Registration

- 13      The mobile station shall update stored variables and perform other registration procedures
- 14      as specified in 2.6.5.5.2.2.

#### 15     2.6.2.2.13.4 PACA Disable for SID Change

- 16      If PACA<sub>s</sub> is equal to enabled, and SID<sub>s</sub> is not equal to PACA\_SID<sub>s</sub>, the mobile station shall
- 17      set PACA<sub>s</sub> to disabled and PACA\_CANCEL to '0', shall disable the PACA state timer, and
- 18      should indicate to the user that the PACA call has been canceled

#### 19     2.6.2.2.14 MC-RR Parameters Message

- 20      Whenever an *MC-RR Parameters Message* is received, the configuration message sequence
- 21      number, CONFIG\_MSG\_SEQ<sub>r</sub>, shall be compared to that stored in
- 22      MC\_RR\_PAR\_MSG\_SEQ<sub>s</sub>. If the comparison results in a match, the mobile station may
- 23      ignore the message. If the comparison results in a mismatch, then the mobile station shall
- 24      process the remaining fields in the message as described in 2.6.2.2.14.1, 2.6.2.2.14.2, and
- 25      2.6.2.2.14.3.

- 26      If the protocol revision level supported by the mobile station (MOB\_P\_REV<sub>p</sub>) is less than
- 27      the minimum protocol revision level supported by the base station (MIN\_P\_REV<sub>r</sub>), the
- 28      mobile station shall enter the *System Determination Substate* of the *Mobile Station*
- 29      *Initialization State* with a protocol mismatch indication (see 2.6.1.1).

- 30      If BASE\_LAT, BASE\_LONG, or PWR\_REP\_THRESH is not within the valid ranges specified
- 31      in 3.7.2.3.2.31, then the mobile station shall ignore the *MC-RR Parameters Message* that
- 32      contains them.

- 33      If the mobile station supports Spreading Rate 3 on the common channel and SR3\_INCL<sub>s</sub> is
- 34      equal to '1', the mobile station shall set:

- 35       • BRAT<sub>s</sub> = SR3\_BRAT<sub>r</sub>,
- 36       • BCCH<sub>s</sub> = SR3\_BCCH\_CODE\_CHAN<sub>r</sub>;
- 37       • BCCH\_CODE\_RATE<sub>s</sub> = 1/3;

- 1 •  $SR3\_PRIMARY\_PILOT_S = SR3\_PRIMARY\_PILOT_T$ ;
- 2 •  $SR3\_PILOT\_POWER1_S = SR3\_PILOT\_POWER1_T$ ;
- 3 •  $SR3\_PILOT\_POWER2_S = SR3\_PILOT\_POWER2_T$ ;
- 4 • If  $SR3\_CENTER\_FREQ\_INCL_T$  is equal to '1',  $POTENTIAL\_CDMACH_S =$
- 5  $SR3\_CENTER\_FREQ_T$ .
- 6 If  $POTENTIAL\_CDMACH_S$  is different from  $CDMACH_S$ , the mobile station shall set
- 7  $CDMACH_S = POTENTIAL\_CDMACH_S$  and then tune to the CDMA Channel ( $CDMACH_S$ ).

#### 8 2.6.2.2.14.1 Stored Parameters

9 The mobile station shall store the following parameters:

- 10 • Configuration message sequence number
- 11 ( $CONFIG\_MSG\_SEQ_S = CONFIG\_MSG\_SEQ_T$ ,
- 12  $MC\_RR\_PAR\_MSG\_SEQ_S = CONFIG\_MSG\_SEQ_T$ )
- 13 • Base station identification ( $BASE\_ID_S = BASE\_ID_T$ )
- 14 • Protocol revision level ( $P\_REV_S = P\_REV_T$ )
- 15 • Protocol revision level currently in use ( $P\_REV\_IN\_USE_S =$  the lesser value of
- 16  $P\_REV_S$  and  $MOB\_P\_REV_P$  of the current band class)
- 17 • Minimum protocol revision level ( $MIN\_P\_REV_S = MIN\_P\_REV_T$ ).
- 18 • Search window size for the Active Set and Candidate Set
- 19 ( $SRCH\_WIN\_A_S = SRCH\_WIN\_A_T$ )
- 20 • Search window size for the Remaining Set ( $SRCH\_WIN\_R_S = SRCH\_WIN\_R_T$ )
- 21 • Pilot detection threshold ( $T\_ADD_S = T\_ADD_T$ )
- 22 • Pilot drop threshold ( $T\_DROP_S = T\_DROP_T$ )
- 23 • Active Set versus Candidate Set comparison threshold ( $T\_COMP_S = T\_COMP_T$ )
- 24 • Drop timer value ( $T\_TDROP_S = T\_TDROP_T$ )
- 25 • Drop timer range value ( $T\_TDROP\_RANGE_S = T\_TDROP\_RANGE_T$ ) if
- 26  $T\_TDROP\_RANGE\_INCL_T$  is equal to '1'; otherwise,  $T\_TDROP\_RANGE_S = '0000'$
- 27 • Maximum age for retention of Neighbor Set members
- 28 ( $NGHBR\_MAX\_AGE_S = NGHBR\_MAX\_AGE_T$ )
- 29 • Slope of the handoff add/drop criterion ( $SOFT\_SLOPE_S = SOFT\_SLOPE_T$ )
- 30 • Intercept of the handoff add criterion ( $ADD\_INTERCEPT_S = ADD\_INTERCEPT_T$ )
- 31 • Intercept of the handoff drop criterion ( $DROP\_INTERCEPT_S = DROP\_INTERCEPT_T$ )
- 32 • If  $ENC\_SUPPORTED_T$  is equal to '1', the mobile station shall store:
- 33 – Signaling encryption supported indicator ( $SIG\_ENCRYPT\_SUP_S =$
- 34  $SIG\_ENCRYPT\_SUP_T$ )

- 1           – User information encryption supported indicator (UI\_ENCRYPT\_SUP<sub>S</sub> =  
2           UI\_ENCRYPT\_SUP<sub>r</sub>)
- 3   If P\_REV\_IN\_USE<sub>S</sub> has been changed, the mobile station shall set ACC\_MSG\_SEQ<sub>S</sub>,  
4   CURR\_ACC\_MSG\_SEQ, A41\_SYS\_PAR\_MSG\_SEQ<sub>S</sub>, UNI\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub>, and  
5   EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>S</sub> to NULL.
- 6   If CCH\_INFO\_INCL<sub>r</sub> is equal to '1', the mobile station shall store:
- 7       • If MCC<sub>r</sub> = '111111111' and IMSI\_11\_12<sub>r</sub> = '111111', the mobile station shall set  
8       the IMSI\_O to IMSI\_M<sub>p</sub> and store:
    - 9           – Mobile Country Code (MCC<sub>S</sub> = MCC\_M<sub>p</sub>) and
    - 10          – IMSI 11th and 12th digits (IMSI\_11\_12<sub>S</sub> = IMSI\_M\_11\_12<sub>p</sub>);
  - 11      • Otherwise, the mobile station shall store:
    - 12          – Mobile Country Code (MCC<sub>S</sub> = MCC<sub>r</sub>) and
    - 13          – IMSI 11th and 12th digits (IMSI\_11\_12<sub>S</sub> = IMSI\_11\_12<sub>r</sub>).
  - 14      • Least significant digit of MNC (IMSI\_10<sub>S</sub> = IMSI\_10<sub>r</sub>), if included.
  - 15      • If IMSI\_O has been changed, the mobile station shall set  
16      EXT\_CHAN\_LST\_MSG\_SEQ<sub>S</sub>, FD\_CHAN\_LST\_MSG\_SEQ<sub>S</sub> to NULL, and set  
17      NUM\_FCCCH<sub>S</sub> to '1' and FCCCH\_ID<sub>S</sub> to '1'.
  - 18      • *Extended Global Service Redirection Message* sent  
19      (EXT\_GLOBAL\_REDIRECT<sub>S</sub> = EXT\_GLOBAL\_REDIRECT<sub>r</sub>) if included; otherwise,  
20      EXT\_GLOBAL\_REDIRECT<sub>S</sub> = '0'
  - 21      • *User Zone Identification Message* sent  
22      (USER\_ZONE\_ID<sub>S</sub> = USER\_ZONE\_ID<sub>r</sub>) if included; otherwise, USER\_ZONE\_ID<sub>S</sub> = '0'
  - 23      • *Private Neighbor List Message* sent  
24      (PRI\_NGHBR\_LST<sub>S</sub> = PRI\_NGHBR\_LST<sub>r</sub>) if included; otherwise,  
25      PRI\_NGHBR\_LST<sub>S</sub> = '0'
  - 26      • *ANSI-41 RAND Message* sent  
27      (SENDING\_RAND<sub>S</sub> = SENDING\_RAND<sub>r</sub>) if included; otherwise,  
28      SENDING\_RAND<sub>S</sub> = '0'
  - 29      • *Access Point Pilot Information Message* sent  
30      (AP\_PILOT\_INFO<sub>S</sub> = AP\_PILOT\_INFO<sub>r</sub>) if included; otherwise, AP\_PILOT\_INFO<sub>S</sub> = '0'
  - 31      If the APPIM\_PERIOD\_INDEX is included in the message APPIM\_PERIOD\_INDEX<sub>S</sub> =  
32      APPIM\_PERIOD\_INDEX<sub>r</sub>. Otherwise, APPIM\_PERIOD\_INDEX<sub>S</sub> = 0.
  - 33      • *Access Point Identification Message* sent  
34      (AP\_IDT<sub>S</sub> = AP\_IDT<sub>r</sub>) if included; otherwise, AP\_IDT<sub>S</sub> = '0'
  - 35      • *Access Point Identification Text Message* sent  
36      (AP\_ID\_TEXT<sub>S</sub> = AP\_ID\_TEXT<sub>r</sub>) if included; otherwise, AP\_ID\_TEXT<sub>S</sub> = '0'

- 1       • *General Overhead Information Message* sent  
2       (GEN\_OVHD\_INF\_IND<sub>S</sub> = GEN\_OVHD\_INF\_IND<sub>T</sub>) if included; otherwise,  
3       GEN\_OVHD\_INF\_IND<sub>S</sub> = '0'
- 4       If the GEN\_OVHD\_CYCLE\_INDEX is included in the message  
5       GEN\_OVHD\_CYCLE\_INDEX<sub>S</sub> = GEN\_OVHD\_CYCLE\_INDEX<sub>T</sub>. Otherwise,  
6       GEN\_OVHD\_CYCLE\_INDEX<sub>S</sub> = 0.
- 7       • *Flex Duplex CDMA Channel List Message* sent  
8       (FD\_CHAN\_LST\_IND<sub>S</sub> = FD\_CHAN\_LST\_IND<sub>T</sub>) if included; otherwise,  
9       FD\_CHAN\_LST\_IND<sub>S</sub> = '0'.
- 10      • *Alternative Technologies Information Message* sent  
11      (ATIM\_IND<sub>S</sub> = ATIM\_IND<sub>T</sub>) if included; otherwise, ATIM\_IND<sub>S</sub> = '0'
- 12      If the ATIM\_CYCLE\_INDEX is included in the message ATIM\_CYCLE\_INDEX<sub>S</sub> =  
13      ATIM\_CYCLE\_INDEX<sub>T</sub>.  
14      Otherwise, ATIM\_CYCLE\_INDEX<sub>S</sub> = 0.
- 15      • Maximum slot cycle index  
16      (MAX\_SLOT\_CYCLE\_INDEX<sub>S</sub> = MAX\_SLOT\_CYCLE\_INDEX<sub>T</sub>)
- 17      • *BCMC Service Parameters Message* sent  
18      (SENDING\_BSPM<sub>S</sub> = SENDING\_BSPM<sub>T</sub>), if included; otherwise, set  
19      SENDING\_BSPM<sub>S</sub> to '0'.
- 20      • *BCMC Service Parameters Message* transmission periodicity index  
21      (BSPM\_PERIOD\_INDEX<sub>S</sub> = BSPM\_PERIOD\_INDEX<sub>T</sub>) if SENDING\_BSPM<sub>T</sub> equals '1';  
22      otherwise, BSPM\_PERIOD\_INDEX<sub>S</sub> = NULL.
- 23      • BSPM\_PERIOD\_INDEX<sub>S</sub> is not equal to NULL, the mobile station shall set  
24      BSPM\_WAIT\_TIME to  $(B + 1) \times 160\text{ms}$  where
- 25                  $B = 2^i \times 16, 0 \leq i \leq 15$
- 26                 and  $i = \text{BSPM\_PERIOD\_INDEX}_S$ .
- 27      • Power control reporting threshold (PWR\_REP\_THRESH<sub>S</sub> = PWR\_REP\_THRESH<sub>T</sub>)
- 28      • Power control reporting frame count (PWR\_REP\_FRAMES<sub>S</sub> = PWR\_REP\_FRAMES<sub>T</sub>)
- 29      • Threshold report mode indicator  
30      (PWR\_THRESH\_ENABLE<sub>S</sub> = PWR\_THRESH\_ENABLE<sub>T</sub>)
- 31      • Periodic report mode indicator (PWR\_PERIOD\_ENABLE<sub>S</sub> =  
32      PWR\_PERIOD\_ENABLE<sub>T</sub>).
- 33      • Power report delay (PWR\_REP\_DELAY<sub>S</sub> = PWR\_REP\_DELAY<sub>T</sub>)
- 34      • System reselection indicator (RESELECT\_INCLUDED<sub>S</sub> = RESELECT\_INCLUDED<sub>T</sub>).
- 35      • Pilot reporting indicator (PILOT\_REPORT<sub>S</sub> = PILOT\_REPORT<sub>T</sub>)
- 36      • Short Data Burst supported indicator (SDB\_SUPPORTED<sub>S</sub> = SDB\_SUPPORTED<sub>T</sub>)

- 1 • Broadcast GPS Assist Indicator ( $BROADCAST\_GPS\_ASST_S =$   
2  $BROADCAST\_GPS\_ASST_T$ )
- 3 • Nominal reverse traffic channel output power offset relative to Reverse Pilot  
4 Channel power ( $RLGAIN\_TRAFFIC\_PILOT_S = RLGAIN\_TRAFFIC\_PILOT_T$ )
- 5 • If  $NUM\_FCCCH_T$  is not equal to '0':
  - 6 – Number of the Forward Common Control Channels ( $NUM\_FCCCH_S =$   
7  $NUM\_FCCCH_T$ )
  - 8 – Data rate for the Forward Common Control Channels ( $FCCCH\_RATE_S =$   
9  $FCCCH\_RATE_T$ )
  - 10 – Code rate for the Forward Common Control Channels ( $FCCCH\_CODE\_RATE_S =$   
11  $FCCCH\_CODE\_RATE_T$ )
  - 12 – For  $i = 0$  to  $NUM\_FCCCH_T - 1$ , store the channel code index for each Forward  
13 Common Control Channel ( $FCCCH\_CODE\_CHAN_S[i] = FCCCH\_CODE\_CHAN_T$ )
- 14 • Broadcast index ( $BCAST\_INDEX_S = BCAST\_INDEX_T$ )
- 15 • The number of Broadcast Control Channels ( $NUM\_BCCH\_BCAST_S =$   
16  $NUM\_BCCH\_BCAST_T$ )
- 17 • If  $NUM\_BCCH\_BCAST_T$  is greater than '000',  $i$  occurrences of the following fields,  
18 where  $i$  ranges from 1 to  $NUM\_BCCH\_BCAST_T$ :
  - 19 – Set the Broadcast Control Channel Number (BCN) to  $i+1$
  - 20 – BCCH Walsh code index ( $BCCH\_CODE\_CHAN[BCN]_S = BCCH\_CODE\_CHAN[i]_T$ )
  - 21 – BCCH data rate ( $BRAT[BCN]_S = BRAT[i]_T$ )
  - 22 – BCCH code rate ( $BCCH\_CODE\_RATE[BCN]_S = BCCH\_CODE\_RATE[i]_T$ )
- 23 • Sync ID supported indicator ( $USE\_SYNC\_ID_S = USE\_SYNC\_ID_T$ )
- 24 • Pilot information request supported indicator ( $PILOT\_INFO\_REQ\_SUPPORTED_S =$   
25  $PILOT\_INFO\_REQ\_SUPPORTED_T$ ).
- 26 • Band class information request indicator ( $BAND\_CLASS\_INFO\_REQ_S =$   
27  $BAND\_CLASS\_INFO\_REQ_T$ )
- 28 • Alternate CDMA band class ( $ALT\_BAND\_CLASS_S = ALT\_BAND\_CLASS_T$ ), if  
29  $BAND\_CLASS\_INFO\_REQ_T$  is equal to '1'.
- 30 • Access entry handoff in order and message processing operation indicator  
31 ( $ACC\_ENT\_HO\_ORDER_S = ACC\_ENT\_HO\_ORDER_T$ ).
- 32 • If  $REV\_PWR\_CNTL\_DELAY\_INCL$  is equal to '1', reverse power control delay  
33 ( $REV\_PWR\_CNTL\_DELAY_S = REV\_PWR\_CNTL\_DELAY_T$ )
- 34 • Permission indicator for the mobile station to request QoS settings in the  
35 *Origination Message*, *Origination Continuation Message*, or *Enhanced Origination*  
36 *Message* ( $MOB\_QOS_S = MOB\_QOS_T$ )
- 37 • If  $RESELECT\_INCLUDED_S$  is equal to '1', the mobile station shall store:

- 1           – Pilot power threshold ( $EC\_THRESH_S = EC\_THRESH_T$ )
- 2           – Pilot  $E_c/I_0$  threshold ( $EC\_I0\_THRESH_S = EC\_I0\_THRESH_T$ )
- 3       • Access handoff permitted indicator ( $ACCESS\_HO_S = ACCESS\_HO_T$ )
- 4       • Access probe handoff permitted indicator ( $ACCESS\_PROBE\_HO_S =$
- 5        $ACCESS\_PROBE\_HO_T$ )
- 6       • If  $ACCESS\_PROBE\_HO_S$  is equal to '1', access handoff list update permitted
- 7       indicator ( $ACC\_HO\_LIST\_UPD_S = ACC\_HO\_LIST\_UPD_T$ )
- 8       • Maximum number of times that the mobile station is permitted to perform an
- 9       access probe handoff ( $MAX\_NUM\_PROBE\_HO_S = MAX\_NUM\_PROBE\_HO_T$ )
- 10      • Access handoff permitted for message response indicator ( $ACCESS\_HO\_MSG\_RSP_S$
- 11       $= ACCESS\_HO\_MSG\_RSP_T$ )
- 12      • Access probe handoff permitted for other messages indicator
- 13      ( $ACC\_PROBE\_HO\_OTHER\_MSG_S = ACC\_PROBE\_HO\_OTHER\_MSG_T$ )
- 14      • If  $USER\_ZONE\_ID_S$  is equal to '0', then the mobile station shall perform the
- 15      following:
  - 16          – Set  $USER\_ZONE\_ID\_MSG\_SEQ_S$  to  $CONFIG\_MSG\_SEQ_S$ .
  - 17          – Set the UZID field of the UZ\_REC to '0000000000000000' for all entries.
  - 18          – Set the UZ\_REV field of the UZ\_REC to '0000' for all entries.
  - 19          – Set the TEMP\_SUB field of the UZ\_REC to '0' for all entries.
- 20      • If  $USER\_ZONE\_ID_S$  is equal to '1' and the mobile station does not support Tiered
- 21      Services, then the mobile station shall set  $USER\_ZONE\_ID\_MSG\_SEQ_S$  to
- 22       $CONFIG\_MSG\_SEQ_S$ .
- 23      • If  $PRI\_NGHBR\_LST_S$  is equal to '0', then the mobile station shall set
- 24       $PRI\_NGHBR\_LST\_MSG\_SEQ_S$  to  $CONFIG\_MSG\_SEQ_S$ .
- 25      • If  $PRI\_NGHBR\_LST_S$  is equal to '1' and the mobile station does not support Tiered
- 26      Services, then the mobile station shall set  $PRI\_NGHBR\_LST\_MSG\_SEQ_S$  to
- 27       $CONFIG\_MSG\_SEQ_S$ .
- 28      • If  $EXT\_GLOBAL\_REDIRECT_S$  is equal to '0', then the mobile station shall set
- 29       $EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ_S$  to  $CONFIG\_MSG\_SEQ_S$ .
- 30      • The mobile station shall perform the following:
  - 31          – If  $SENDING\_RAND_S$  is equal to '1', the mobile station shall set  $AUTH_S$  to '01';
  - 32          otherwise, the mobile station shall set  $AUTH_S$  to '00'.
- 33      • The mobile station shall store the following:
  - 34          – Base station latitude ( $BASE\_LAT_S = BASE\_LAT_T$ )
  - 35          – Base station longitude ( $BASE\_LONG_S = BASE\_LONG_T$ )

- 1     • If CAND\_BAND\_INFO\_REQ<sub>r</sub> is included, the mobile station shall set  
2     CAND\_BAND\_INFO\_REQ<sub>s</sub> to CAND\_BAND\_INFO\_REQ<sub>r</sub>; otherwise, the mobile  
3     station shall set CAND\_BAND\_INFO\_REQ<sub>s</sub> to '0'.
- 4     • If CAND\_BAND\_INFO\_REQ<sub>r</sub> is set to '1', the mobile station shall store the number  
5     of candidate band classes minus one (NUM\_CAND\_BAND\_CLASS<sub>s</sub> =  
6     NUM\_CAND\_BAND\_CLASS<sub>r</sub>).
- 7     • If CAND\_BAND\_INFO\_REQ<sub>r</sub> is set to '1', the mobile station shall perform the  
8     following for each occurrence of the CAND\_BAND\_CLASS record:
  - 9       – Set the CAND\_BAND\_CLASS field of CAND\_BAND\_CLASS\_REC[i] to the i<sup>th</sup>  
10      occurrence of CAND\_BAND\_CLASS<sub>r</sub>.
  - 11      – Set the SUBCLASS\_REC\_LEN field of CAND\_BAND\_CLASS\_REC[i] to the i<sup>th</sup>  
12      occurrence of SUBCLASS\_REC\_LEN<sub>r</sub>.
  - 13      – If the i<sup>th</sup> occurrence of SUBCLASS\_REC\_LEN<sub>r</sub> field is non-zero, the mobile  
14      station shall perform the following for each band subclass indicator received:
    - 15       o Set the BAND\_SUBCLASS\_IND\_REC[j] field of CAND\_BAND\_CLASS\_REC[i]  
16       to the j<sup>th</sup> occurrence of BAND\_SUBCLASS\_IND<sub>r</sub>.
- 17   If TX\_PWR\_LIMIT\_INCL<sub>r</sub> is set to '1' and the mobile station is operating in the 1915MHz –  
18   1920MHz block of the PCS band, the mobile station shall store the transmit power limit  
19   TX\_PWR\_LIMIT<sub>s</sub> = (TX\_PWR\_LIMIT<sub>r</sub> - 30dB); otherwise, the mobile station shall set  
20   TX\_PWR\_LIMIT<sub>s</sub> to the limit defined in [11].
- 21   If CCH\_INFO\_INCL<sub>r</sub> is equal to '1' and the mobile station supports the Quick Paging  
22   Channel operation:
  - 23      • The mobile station shall set QPCH\_SUPPORTED<sub>s</sub> to QPCH\_SUPPORTED<sub>r</sub>.
  - 24      • If QPCH\_SUPPORTED<sub>r</sub> = '1':
    - 25       – The mobile station shall set QPCH\_RATE<sub>s</sub> to QPCH\_RATE<sub>r</sub>.
    - 26       – If the mobile station is monitoring the Primary Broadcast Control Channel in  
27       Spreading Rate 1 and the number of Quick Paging Channels specified in the  
28       received message (NUM\_QPCH<sub>r</sub>) is different from NUM\_QPCH<sub>s</sub>, the mobile  
29       station shall use the hash algorithm specified in 2.6.7.1 to select a new Quick  
30       Paging Channel number in the range 1 to NUM\_QPCH<sub>r</sub>. The mobile station  
31       shall store the new Quick Paging Channel number as QPAGECH<sub>s</sub> and as  
32       ASSIGNED\_QPAGECH<sub>s</sub>. The mobile station shall then set NUM\_QPCH<sub>s</sub> to  
33       NUM\_QPCH<sub>r</sub>.
    - 34       – If the mobile station is monitoring the Primary Broadcast Control Channel in  
35       Spreading Rate 3 and the number of Quick Paging Channels specified in the  
36       received message (NUM\_QPCH<sub>r</sub>) is different from NUM\_QPCH<sub>s</sub>, the mobile  
37       station shall perform the following:
      - 38          + The mobile station shall use the hash algorithm specified in 2.6.7.1 to select  
39          a new Quick Paging Channel number in the range 1 to NUM\_QPCH<sub>r</sub>.

- 1           + The mobile station shall store the new Quick Paging Channel number as
- 2           QPAGECH<sub>S</sub> and as ASSIGNED\_QPAGECH<sub>S</sub>.
- 3           + For  $i = 0$  to NUM\_QPCH<sub>S</sub> - 1, store the channel code index for each Quick
- 4           Paging Channel (QPCH\_CODE\_CHAN<sub>S</sub>[ $i$ ] = QPCH\_CODE\_CHAN<sub>R</sub>).
- 5       • The mobile station shall set QPCH\_POWER\_LEVEL\_PAGE<sub>S</sub> to
- 6       QPCH\_POWER\_LEVEL\_PAGE<sub>R</sub>.
- 7       • The mobile station shall set QPCH\_CCI\_SUPPORTED<sub>S</sub> to QPCH\_CCI\_SUPPORTED<sub>R</sub>.
- 8       • If QPCH\_CCI\_SUPPORTED<sub>R</sub> = '1', the mobile station shall set
- 9       QPCH\_POWER\_LEVEL\_CONFIG<sub>S</sub> to QPCH\_POWER\_LEVEL\_CONFIG<sub>R</sub>.
- 10      • The mobile station shall set QPCH\_BI\_SUPPORTED<sub>S</sub> to QPCH\_BI\_SUPPORTED<sub>R</sub>.
- 11      • If QPCH\_BI\_SUPPORTED<sub>R</sub> = '1', the mobile station shall set
- 12      QPCH\_POWER\_LEVEL\_BCAST<sub>S</sub> to QPCH\_POWER\_LEVEL\_BCAST<sub>R</sub>.
- 13   The mobile station shall store the following:
- 14      • CDMA off time report supported indicator
- 15        (CDMA\_OFF\_TIME\_REP\_SUP\_IND<sub>S</sub> = CDMA\_OFF\_TIME\_REP\_SUP\_IND<sub>R</sub>)
- 16      • If CDMA\_OFF\_TIME\_REP\_SUP\_IND<sub>R</sub> is equal to '1', the mobile station shall store:
- 17        – CDMA off time report threshold (CDMA\_OFF\_TIME\_REP\_THRESHOLD<sub>S</sub> =
- 18        CDMA\_OFF\_TIME\_REP\_THRESHOLD<sub>R</sub> in units specified by
- 19        CDMA\_OFF\_TIME\_REP\_UNIT<sub>R</sub>)
- 20      • Control Hold Mode supported indicator (CHM\_SUPPORTED<sub>S</sub> = CHM\_SUPPORTED<sub>R</sub>)
- 21        if included; otherwise, set CHM\_SUPPORTED<sub>S</sub> to '1'.
- 22      • Release to Idle State allowed indicator (RELEASE\_TO\_IDLE\_IND<sub>S</sub> =
- 23        RELEASE\_TO\_IDLE\_IND<sub>R</sub>).
- 24      • *Reconnect Message* supported indicator
- 25        (RECONNECT\_MSG\_IND<sub>S</sub> = RECONNECT\_MSG\_IND<sub>R</sub>).
- 26      • Short Data Burst allowed in *Reconnect Message* allowed indicator
- 27        (SDB\_IN\_RCNM\_IND<sub>S</sub> = SDB\_IN\_RCNM\_IND<sub>R</sub>), if included; otherwise, set
- 28        SDB\_IN\_RCNM\_IND<sub>S</sub> to '0'.
- 29      • Forward Packet Data Channel supported indicator (FOR\_PDCH\_SUPPORTED<sub>S</sub> =
- 30        FOR\_PDCH\_SUPPORTED<sub>R</sub>).
- 31      • PDCH Control Hold Mode supported indicator (PDCH\_CHM\_SUPPORTED<sub>S</sub> =
- 32        PDCH\_CHM\_SUPPORTED<sub>R</sub>) if included; otherwise, set PDCH\_CHM\_SUPPORTED<sub>S</sub>
- 33        to '0'.
- 34   The mobile station shall set FOR\_PDCH\_COMMON\_PARMS<sub>S</sub> = '0'.
- 35   If both FOR\_PDCH\_SUPPORTED<sub>R</sub> and PDCH\_PARMS\_INCL<sub>R</sub> are included and equal to '1',
- 36   the mobile station shall perform the following:

- 1     • If FOR\_PDCH\_RLGAIN\_INCL<sub>r</sub> is included and equal to '1', the mobile station shall
- 2       set:
- 3       – (RLGAIN\_ACKCH\_PILOT<sub>s</sub> = RLGAIN\_ACKCH\_PILOT<sub>r</sub>).
- 4       – (RLGAIN\_CQICH\_PILOT<sub>s</sub> = RLGAIN\_CQICH\_PILOT<sub>r</sub>).
- 5     • The mobile station shall set
- 6       NUM\_SOFT\_SWITCHING\_FRAMES<sub>s</sub> = NUM\_SOFT\_SWITCHING\_FRAMES<sub>r</sub> + 1, and
- 7       NUM\_SOFTER\_SWITCHING\_FRAMES<sub>s</sub> = NUM\_SOFTER\_SWITCHING\_FRAMES<sub>r</sub> +
- 8       1.
- 9     • The mobile station shall set
- 10       NUM\_SOFT\_SWITCHING\_FRAMES\_CHM<sub>s</sub> = NUM\_SOFT\_SWITCHING\_FRAMES<sub>r</sub> +
- 11       1, and NUM\_SOFTER\_SWITCHING\_FRAMES\_CHM<sub>s</sub> =
- 12       NUM\_SOFTER\_SWITCHING\_FRAMES<sub>r</sub> + 1.
- 13    • The mobile station shall set NUM\_SOFT\_SWITCHING\_SLOTS<sub>s</sub> according to Table
- 14       3.7.2.3.2.21-9 based on the value of NUM\_SOFT\_SWITCHING\_SLOTS<sub>r</sub>.
- 15    • The mobile station shall set NUM\_SOFTER\_SWITCHING\_SLOTS<sub>s</sub> according to Table
- 16       3.7.2.3.2.21-9 based on the value of NUM\_SOFTER\_SWITCHING\_SLOTS<sub>r</sub>.
- 17    • The mobile station shall set PDCH\_SOFT\_SWITCHING\_DELAY<sub>s</sub> to
- 18       PDCH\_SOFT\_SWITCHING\_DELAY<sub>r</sub> + 1, and PDCH\_SOFTER\_SWITCHING\_DELAY<sub>s</sub>
- 19       to PDCH\_SOFTER\_SWITCHING\_DELAY<sub>r</sub> + 1.
- 20    • The mobile station shall set FOR\_PDCH\_COMMON\_PARMS<sub>s</sub> = '1'.
- 21    • The mobile station shall set WALSH\_TABLE\_ID<sub>s</sub> = WALSH\_TABLE\_ID<sub>r</sub>.
- 22    • The mobile station shall set NUM\_PDCCH<sub>s</sub> = NUM\_PDCCH<sub>r</sub>.
- 23    • The mobile station shall store FOR\_PDCCH\_WALSH<sub>s</sub>[i] to the i<sup>th</sup> occurrence of
- 24       FOR\_PDCCH\_WALSH<sub>r</sub>.
- 25    The mobile station shall store the following:
- 26    • If NEG\_SLOT\_CYCLE\_INDEX\_SUP<sub>r</sub> is included and equal to '1', the mobile station
- 27       shall set MIN\_SLOT\_CYCLE\_INDEX to -4; otherwise, the mobile station shall set
- 28       MIN\_SLOT\_CYCLE\_INDEX to 0.
- 29    • If RER\_MODE\_SUPPORTED<sub>r</sub> is not included, the mobile station shall set
- 30       RER\_MODE\_SUPPORTED<sub>s</sub> to '0'; otherwise, the mobile station shall set
- 31       RER\_MODE\_SUPPORTED<sub>s</sub> to RER\_MODE\_SUPPORTED<sub>r</sub>.
- 32    • If AUTO\_FCSO\_ALLOWED<sub>r</sub> is not included, the mobile station shall set
- 33       AUTO\_FCSO\_ALLOWED<sub>s</sub> to '0'; otherwise, the mobile station shall set
- 34       AUTO\_FCSO\_ALLOWED<sub>s</sub> to AUTO\_FCSO\_ALLOWED<sub>r</sub>.
- 35    If FOR\_PDCH\_SUPPORTED<sub>r</sub> is equal to '1', then the mobile station shall set Reverse
- 36    Packet Data Channel supported indicator (REV\_PDCH\_SUPPORTED<sub>s</sub> =
- 37    REV\_PDCH\_SUPPORTED<sub>r</sub>).
- 38    If REV\_PDCH\_PARMS\_INCL<sub>r</sub> is not included, or if it is included and equal to '0', the
- 39    mobile station shall set REV\_PDCH\_PARMS\_INCL<sub>s</sub> to '0'; otherwise, the mobile station

shall set REV\_PDCH\_PARMS\_INCL<sub>S</sub> to '1' and perform the following:

- If REV\_PDCH\_RLGAIN\_INCL<sub>T</sub> is equal to '1', the mobile station shall set:
  - (RLGAIN\_SPICH\_PILOT<sub>S</sub> = RLGAIN\_SPICH\_PILOT<sub>T</sub>).
  - (RLGAIN\_REQCH\_PILOT<sub>S</sub> = RLGAIN\_REQCH\_PILOT<sub>T</sub>).
  - (RLGAIN\_PDCCH\_PILOT<sub>S</sub> = RLGAIN\_PDCCH\_PILOT<sub>T</sub>).
- If REV\_PDCH\_PARMS\_1\_INCL<sub>T</sub> is equal to '1', the mobile station shall set:
  - (REV\_PDCH\_TABLE\_SEL<sub>S</sub> = REV\_PDCH\_TABLE\_SEL<sub>T</sub>).
  - (REV\_PDCH\_MAX\_AUTO\_TPR<sub>S</sub> to REV\_PDCH\_MAX\_AUTO\_TPR<sub>T</sub>).
  - (REV\_PDCH\_NUM\_ARQ\_ROUNDS\_NORMAL<sub>S</sub> = REV\_PDCH\_NUM\_ARQ\_ROUNDS\_NORMAL<sub>T</sub>+1).
- If REV\_PDCH\_OPER\_PARMS\_INCL<sub>T</sub> is equal to '1', the mobile station shall set:
  - (REV\_PDCH\_MAX\_SIZE\_ALLOWED\_ENCODER\_PACKET<sub>S</sub> = REV\_PDCH\_MAX\_SIZE\_ALLOWED\_ENCODER\_PACKET<sub>T</sub>+1).
  - (REV\_PDCH\_DEFAULT\_PERSISTENCE<sub>S</sub> = REV\_PDCH\_DEFAULT\_PERSISTENCE<sub>T</sub>).
  - (REV\_PDCH\_RESET\_PERSISTENCE<sub>S</sub> = REV\_PDCH\_RESET\_PERSISTENCE<sub>T</sub>).
  - (REV\_PDCH\_GRANT\_PRECEDENCE<sub>S</sub> = REV\_PDCH\_GRANT\_PRECEDENCE<sub>T</sub>).
  - (REV\_PDCH\_MSIB\_SUPPORTED<sub>S</sub> = REV\_PDCH\_MSIB\_SUPPORTED<sub>T</sub>).
  - (REV\_PDCH\_SOFT\_SWITCHING\_RESET\_IND<sub>S</sub> = REV\_PDCH\_SOFT\_SWITCHING\_RESET\_IND<sub>T</sub>).

The mobile station shall store the following:

- If BYPASS\_REG\_IND<sub>T</sub> is included, the mobile station shall set BYPASS\_REG\_IND<sub>S</sub> to BYPASS\_REG\_IND<sub>T</sub>; otherwise, the mobile station shall set BYPASS\_REG\_IND<sub>S</sub> to '00'.
- *Call Recovery Request Message* supported indicator (CRRM\_MSG\_IND<sub>S</sub> = CRRM\_MSG\_IND<sub>T</sub>).
- Base station horizontal location uncertainty (LOC\_UNC\_H<sub>S</sub> = LOC\_UNC\_H<sub>T</sub>)
- Base station height (HEIGHT<sub>S</sub> = HEIGHT<sub>T</sub>)
- Base station vertical location uncertainty (LOC\_UNC\_V<sub>S</sub> = LOC\_UNC\_V<sub>T</sub>)

The mobile station shall ignore any fields at the end of the *MC-RR Parameters Message* that are not defined according to the protocol revision level (MOB\_P\_REV<sub>P</sub> of the current band class) being used by the mobile station.

#### 2.6.2.2.14.2 Slot Cycle Index

The mobile station shall set SLOT\_CYCLE\_INDEX<sub>S</sub> to:

$$\max \left( \begin{array}{l} \text{MIN\_SLOT\_CYCLE\_INDEX}_S, \\ \min(\text{SLOT\_CYCLE\_INDEX\_REG}, \text{MAX\_SLOT\_CYCLE\_INDEX}_S) \end{array} \right).$$

Where, SLOT\_CYCLE\_INDEX\_REG is computed based on the slot cycle index value included in the last registration attempt (see 2.6.5.5.3.1 and 2.6.5.5.3.2).

If the mobile station is operating in the slotted mode, it shall set its slot cycle length as described in 2.6.2.1.1.3.

#### 2.6.2.2.14.3 Forward Common Control Channel Assignment Change

If the number of Forward Common Control Channels specified in the *MC-RR Parameters Message* (NUM\_FCCCH<sub>R</sub>) is not equal to '0' and is different from NUM\_FCCCH<sub>S</sub>, the mobile station shall use the hash algorithm specified in 2.6.7.1 to select a new Forward Common Control Channel number in the range 1 to NUM\_FCCCH<sub>R</sub> and shall store this value as FCCCH\_ID<sub>S</sub>. If NUM\_FCCCH<sub>R</sub> is not equal to '0', the mobile station shall store the FCCCH rate (FCCCH\_RATE<sub>S</sub> = FCCCH\_RATE<sub>R</sub>), the FCCCH code rate (FCCCH\_CODE\_RATE<sub>S</sub> = FCCCH\_CODE\_RATE<sub>R</sub>), and store FCCCH\_CODE\_CHAN<sub>R</sub> of the corresponding Forward Common Control Channel as FCCCH\_CODE\_CHAN<sub>S</sub>. The mobile station shall then set NUM\_FCCCH<sub>S</sub> to NUM\_FCCCH<sub>R</sub>.

The mobile station shall set ACC\_MSG\_SEQ<sub>S</sub> to NULL.

#### 2.6.2.2.14.4 RESCAN Parameter

If the RESCAN<sub>R</sub> field in the *MC-RR Parameters Message* equals '1', the mobile station shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a rescan indication (see 2.6.1.1).

#### 2.6.2.2.15 Enhanced Access Parameters Message

Whenever an *Enhanced Access Parameters Message* is received on the f-csch, the sequence number, ACC\_MSG\_SEQ<sub>R</sub>, shall be compared to ACC\_MSG\_SEQ<sub>S</sub>. If the comparison results in a match, the mobile station may ignore the message. If the comparison results in a mismatch, then the mobile station shall process the remaining fields in the message as follows:

If MAX\_REQ\_SEQ or MAX\_RSP\_SEQ are not within the valid ranges specified in 3.7.2.3.2.2, then the mobile station shall ignore the *Enhanced Access Parameters Message* that contains them.

The mobile station shall store the following parameters:

- *Enhanced Access Parameters Message* sequence number (ACC\_MSG\_SEQ<sub>S</sub> = ACC\_MSG\_SEQ<sub>R</sub>)
- Persistence related parameters:
  - If PSIST\_PARMS\_INCL is equal to '1', store the following:
    - + Persistence parameter number according to the following rule: If the mobile station's access overload class is in the range 0-9 inclusive, set PSIST<sub>S</sub> equal to PSIST(0-9)\_EACH<sub>R</sub>; otherwise set PSIST<sub>S</sub> equal to PSIST(n)\_EACH<sub>R</sub>,

- 1 where n is equal to the mobile station access overload class.
- 2 + Persistence modifier for Enhanced Access Channel attempts for  
 3 registrations which are not responses to the *Registration Request Order*  
 4 (REG\_PSIST<sub>S</sub> = REG\_PSIST\_EACH<sub>r</sub>).
- 5 + Persistence modifier for Enhanced Access Channel attempts for message  
 6 transmissions (MSG\_PSIST<sub>S</sub> = MSG\_PSIST\_EACH<sub>r</sub>).
- 7 + Persistence modifier for emergency calls by the mobile stations in access  
 8 overload classes 0 to 9 (PSIST\_EMG<sub>S</sub> = PSIST\_EMG<sub>r</sub>).
- 9 – If PSIST\_PARMS\_INCL<sub>r</sub> is equal to '0', store the following:
- 10 + Set PSIST<sub>S</sub> to 0.
- 11 + Persistence modifier for emergency calls by a mobile station in access  
 12 overload classes 0 to 9 (PSIST\_EMG<sub>S</sub> = '000').
- 13 + Persistence modifier for Enhanced Access Channel attempts for message  
 14 transmissions (MSG\_PSIST<sub>S</sub> = '000').
- 15 + Persistence modifier for Enhanced Access Channel attempts for  
 16 registrations which are not responses to the *Registration Request Order*  
 17 (REG\_PSIST<sub>S</sub> = '000').
- 18 • The mobile station shall store the Access Control based on Call Type (ACCT)  
 19 information as follows:
- 20 – Set ACCT\_SO\_LIST to NULL.
- 21 – Set ACCT\_SO\_GRP\_LIST to NULL.
- 22 – If ACCT\_INCL<sub>r</sub> is equal to '1' and ACCOLC<sub>p</sub> is in the range 0 to 9, then the  
 23 mobile station shall perform the following:
- 24 + Set ACCT\_INCL\_EMG<sub>S</sub> to ACCT\_INCL\_EMG<sub>r</sub>.
- 25 + If ACCT\_SO\_INCL<sub>r</sub> is equal to '1', then for each ACCT\_SO<sub>r</sub> included in this  
 26 message:
- 27 o If ACCT\_AOC\_BITMAP\_INCL<sub>r</sub> is equal to '0', or if  
 28 ACCT\_AOC\_BITMAP\_INCL<sub>r</sub> is equal to '1' and the bit in the associated  
 29 ACCT\_AOC\_BITMAP1<sub>r</sub> corresponding to the mobile station's ACCOLC<sub>p</sub>  
 30 (see Table 3.7.2.3.2.2-1) is equal to '1', then add ACCT\_SO<sub>r</sub> to  
 31 ACCT\_SO\_LIST.
- 32 + If ACCT\_SO\_GRP\_INCL<sub>r</sub> is equal to '1', then for each ACCT\_SO\_GRP<sub>r</sub>  
 33 included in this message:
- 34 o If ACCT\_AOC\_BITMAP\_INCL<sub>r</sub> is equal to '0', or if  
 35 ACCT\_AOC\_BITMAP\_INCL<sub>r</sub> is equal to '1' and the bit in the associated  
 36 ACCT\_AOC\_BITMAP2<sub>r</sub> corresponding to the mobile station's ACCOLC<sub>p</sub>  
 37 (see Table 3.7.2.3.2.2-1) is equal to '1', then add ACCT\_SO\_GRP<sub>r</sub> to  
 38 ACCT\_SO\_GRP\_LIST.

- 1     • Link Access Control related parameters:
- 2         – Acknowledgment timeout ( $EACH\_ACC\_TMO_S = ACC\_TMO_R$ )
- 3         – Maximum number of probe sequences for an Enhanced Access Channel request
- 4             ( $MAX\_REQ\_SEQ_S = MAX\_REQ\_SEQ_R$ )
- 5         – Maximum number of probe sequences for an Enhanced Access Channel
- 6             response ( $MAX\_RSP\_SEQ_S = MAX\_RSP\_SEQ_R$ )
- 7     • Mode Selection Table:
- 8          $NUM\_MODE\_SELECTION\_ENTRIES_S = (NUM\_MODE\_SELECTION\_ENTRIES_R + 1)$
- 9         For  $i = 1$  to  $NUM\_MODE\_SELECTION\_ENTRIES_S$ :
- 10             –  $MODE\_SELECTION_S[i].ACCESS\_MODE = ACCESS\_MODE$  field of the  $i^{th}$
- 11                 occurrence of the record
- 12             –  $MODE\_SELECTION_S[i].MIN\_DURATION = ACCESS\_MODE\_MIN\_DURATION$
- 13                 field of the  $i^{th}$  occurrence of the record
- 14             –  $MODE\_SELECTION_S[i].MAX\_DURATION = ACCESS\_MODE\_MAX\_DURATION$
- 15                 field of the  $i^{th}$  occurrence of the record
- 16     • Reverse gain adjustment of the Enhanced Access Channel or Reverse Common
- 17         Control Channel relative to the Reverse Pilot Channel ( $RLGAIN\_COMMON\_PILOT_S =$
- 18              $RLGAIN\_COMMON\_PILOT_R$ )
- 19     • The threshold level at which the interference correction begins to be applied
- 20         ( $IC\_THRESH_S = IC\_THRESH_R$ )
- 21     • The maximum interference correction that can be applied ( $IC\_MAX_S = IC\_MAX_R$ )
- 22     • Mode-specific parameters for the Enhanced Access Channel:
- 23         For  $i = 1$  to  $NUM\_MODE\_PARAM\_REC + 1$ :
- 24             For  $j = 0$  to  $7$ :
- 25                 If the  $(j+1)^{th}$  subfield of  $APPLICABLE\_MODES$  is equal to '1', store the
- 26                 following parameters:
- 27                     – Nominal transmit power offset on the Enhanced Access Channel
- 28                         ( $MODE\_PARMS_S[j].EACH\_NOM\_PWR = EACH\_NOM\_PWR$  field of the  $i^{th}$
- 29                         occurrence of the record)
- 30                     – Initial power offset for access on the Enhanced Access Channel
- 31                         ( $MODE\_PARMS_S[j].EACH\_INIT\_PWR = EACH\_INIT\_PWR$  field of the  $i^{th}$
- 32                         occurrence of the record)
- 33                     – Power increment on the Enhanced Access Channel
- 34                         ( $MODE\_PARMS_S[j].EACH\_PWR\_STEP = EACH\_PWR\_STEP$  field of the  $i^{th}$
- 35                         occurrence of the record )
- 36                     – Number of access probes on the Enhanced Access Channel
- 37                         ( $MODE\_PARMS_S[j].EACH\_NUM\_STEP = EACH\_NUM\_STEP$  field of the  $i^{th}$

- 1 occurrence of the record)
- 2 – Preamble enabled indicator on the Enhanced Access Channel  
 3 (MODE\_PARMS<sub>S</sub>[j].EACH\_PREAMBLE\_ENABLED = EACH\_PREAMBLE\_E  
 4 NABLED field of the i<sup>th</sup> occurrence of the record)
- 5 – Number of preamble fractions sent on the Enhanced Access Channel if  
 6 MODE\_PARMS<sub>S</sub>[j].EACH\_PREAMBLE\_ENABLED is equal to '1'  
 7 (MODE\_PARMS<sub>S</sub>[j].EACH\_PREAMBLE\_NUM\_FRAC =  
 8 EACH\_PREAMBLE\_NUM\_FRAC field of the i<sup>th</sup> occurrence of the record)
- 9 – Fractional preamble duration on the Enhanced Access Channel if  
 10 MODE\_PARMS<sub>S</sub>[j].EACH\_PREAMBLE\_ENABLED is equal to '1'  
 11 (MODE\_PARMS<sub>S</sub>[j].EACH\_PREAMBLE\_FRAC\_DURATION = EACH\_PREA  
 12 MBLE\_FRAC\_DURATION field of the i<sup>th</sup> occurrence of the record)
- 13 – Preamble gated-off duration on the Enhanced Access Channel if  
 14 MODE\_PARMS<sub>S</sub>[j].EACH\_PREAMBLE\_ENABLED is equal to '1'  
 15 (MODE\_PARMS<sub>S</sub>[j].EACH\_PREAMBLE\_OFF\_DURATION = EACH\_PREAM  
 16 BLE\_OFF\_DURATION field of the i<sup>th</sup> occurrence of the record)
- 17 – Additional preamble duration on the Enhanced Access Channel if  
 18 MODE\_PARMS<sub>S</sub>[j].EACH\_PREAMBLE\_ENABLED is equal to '1'  
 19 (MODE\_PARMS<sub>S</sub>[j].EACH\_PREAMBLE\_ADD\_DURATION =  
 20 EACH\_PREAMBLE\_ADD\_DURATION field of the i<sup>th</sup> occurrence of the  
 21 record)
- 22 – Enhanced Access Channel probe backoff range  
 23 (MODE\_PARMS<sub>S</sub>[j].EACH\_PROBE\_BKOFF = EACH\_PROBE\_BKOFF field  
 24 of the i<sup>th</sup> occurrence of the record)
- 25 – Enhanced Access Channel probe sequence backoff range  
 26 (MODE\_PARMS<sub>S</sub>[j].EACH\_BKOFF = EACH\_BKOFF field of the i<sup>th</sup>  
 27 occurrence of the record)
- 28 – Enhanced Access Channel slot (MODE\_PARMS<sub>S</sub>[j].EACH\_SLOT = 1 +  
 29 EACH\_SLOT field of the i<sup>th</sup> occurrence of the record)
- 30 – Enhanced Access Channel first slot offset  
 31 (MODE\_PARMS<sub>S</sub>[j].EACH\_SLOT\_OFFSET1 = EACH\_SLOT\_OFFSET1 field  
 32 of the i<sup>th</sup> occurrence of the record)
- 33 – Enhanced Access Channel second slot offset  
 34 (MODE\_PARMS<sub>S</sub>[j].EACH\_SLOT\_OFFSET2 = EACH\_SLOT\_OFFSET2 field  
 35 of the i<sup>th</sup> occurrence of the record)
- 36 • Additional parameters for the Basic Access Mode:
- 37 If BA\_PARMS\_LEN<sub>r</sub> is equal to '000', set the Basic Access Mode supported  
 38 indicator, BA\_SUPPORTED<sub>S</sub>, to '0'; otherwise store the following parameters:
- 39 – Basic Access Mode supported indicator (BA\_SUPPORTED<sub>S</sub> = '1')
- 40 – Number of Enhanced Access Channels (NUM\_EACH\_BA<sub>S</sub> = (NUM\_EACH\_BA<sub>r</sub> +

- 1           1))
- 2           – Rate words supported on the Enhanced Access Channels
- 3           (EACH\_BA\_RATES\_SUPPORTED<sub>S</sub> = EACH\_BA\_RATES\_SUPPORTED<sub>R</sub>)
- 4           • Additional parameters for the Reservation Access Mode:
- 5           If RA\_PARMS\_LEN<sub>R</sub> is equal to '00000', set the Reservation Access Mode supported
- 6           indicator, RA\_SUPPORTED<sub>S</sub>, to '0'; otherwise store the following parameters, if
- 7           included in the message:
- 8           – Reservation Access Mode supported indicator (RA\_SUPPORTED<sub>S</sub> = '1')
- 9           – Number of Enhanced Access Channels (NUM\_EACH\_RA<sub>S</sub> = (NUM\_EACH\_RA<sub>R</sub> +
- 10           1))
- 11           – Number of Common Assignment Channels (NUM\_CACH<sub>S</sub> = (NUM\_CACH<sub>R</sub> + 1))
- 12           – Code rate of Common Assignment Channels (CACH\_CODE\_RATE<sub>S</sub> =
- 13           CACH\_CODE\_RATE<sub>R</sub>)
- 14           – For i = 0 to NUM\_CACH<sub>S</sub> - 1, store the channel code index for each Common
- 15           Assignment Channel (CACH\_CODE\_CHAN<sub>S</sub>[i] = CACH\_CODE\_CHAN<sub>R</sub>).
- 16           – Number of Reverse Common Control Channels (NUM\_RCCCH<sub>S</sub> = (NUM\_RCCCH<sub>R</sub>
- 17           + 1))
- 18           – Rate words supported on the Reverse Common Control Channels
- 19           (RCCCH\_RATES\_SUPPORTED<sub>S</sub> = RCCCH\_RATES\_SUPPORTED<sub>R</sub>)
- 20           – Preamble enabled indicator on the Reverse Common Control Channels
- 21           (RCCCH\_PREAMBLE\_ENABLED<sub>S</sub> = RCCCH\_PREAMBLE\_ENABLED<sub>R</sub>)
- 22           – Number of preamble fractions sent on the Reverse Common Control Channel if
- 23           RCCCH\_PREAMBLE\_ENABLED<sub>R</sub> is equal to '1'
- 24           (RCCCH\_PREAMBLE\_NUM\_FRAC<sub>S</sub> = RCCCH\_PREAMBLE\_NUM\_FRAC<sub>R</sub>)
- 25           – Fractional preamble duration on the Reverse Common Control Channel if
- 26           RCCCH\_PREAMBLE\_ENABLED<sub>R</sub> is equal to '1'
- 27           (RCCCH\_PREAMBLE\_FRAC\_DURATION<sub>S</sub> =
- 28           RCCCH\_PREAMBLE\_FRAC\_DURATION<sub>R</sub>)
- 29           – Preamble gated-off duration on the Reverse Common Control Channel if
- 30           RCCCH\_PREAMBLE\_ENABLED<sub>R</sub> is equal to '1'
- 31           (RCCCH\_PREAMBLE\_OFF\_DURATION<sub>S</sub> =
- 32           RCCCH\_PREAMBLE\_OFF\_DURATION<sub>R</sub>)
- 33           – Additional preamble duration on the Reverse Common Control Channel if
- 34           RCCCH\_PREAMBLE\_ENABLED<sub>R</sub> is equal to '1'
- 35           (RCCCH\_PREAMBLE\_ADD\_DURATION<sub>S</sub> =
- 36           RCCCH\_PREAMBLE\_ADD\_DURATION<sub>R</sub>)
- 37           – Slot duration on the Reverse Common Control Channel (RCCCH\_SLOT<sub>S</sub> = 1 +
- 38           RCCCH\_SLOT<sub>R</sub>)
- 39           – First slot offset of the Reverse Common Control Channel

- 1 (RCCCH\_SLOT\_OFFSET1<sub>S</sub> = RCCCH\_SLOT\_OFFSET1<sub>T</sub>)
- 2 – Second slot offset of the Reverse Common Control Channel
- 3 (RCCCH\_SLOT\_OFFSET2<sub>S</sub> = RCCCH\_SLOT\_OFFSET2<sub>T</sub>)
- 4 – Nominal transmit power offset on the Reverse Common Control Channel
- 5 (RCCCH\_NOM\_PWR<sub>S</sub> = RCCCH\_NOM\_PWR<sub>T</sub>)
- 6 – Initial power offset for access on the Reverse Common Control Channel
- 7 (RCCCH\_INIT\_PWR<sub>S</sub> = RCCCH\_INIT\_PWR<sub>T</sub>)
- 8 – Power Control delay for the Reservation Access Mode
- 9 (RA\_PC\_DELAY<sub>S</sub> = RA\_PC\_DELAY<sub>T</sub>)
- 10 – Maximum delay to receive the *Early Acknowledgment Channel Assignment*
- 11 *Message* on the Common Assignment Channel
- 12 (EACAM\_CACH\_DELAY<sub>S</sub> = EACAM\_CACH\_DELAY<sub>T</sub>)
- 13 – Indicator for handoff supported on the Reverse Common Control Channels
- 14 (RCCCH\_HO\_SUPPORTED<sub>S</sub> = RCCCH\_HO\_SUPPORTED<sub>T</sub>)
- 15 – Threshold for handoff on the Reverse Common Control Channels if
- 16 RCCCH\_HO\_SUPPORTED<sub>T</sub> is equal to '1'
- 17 (RCCCH\_HO\_THRESH<sub>S</sub> = RCCCH\_HO\_THRESH<sub>T</sub>)
- 18 – Maximum delay to receive the *Early Acknowledgment Channel Assignment*
- 19 *Message* and the *Power Control Channel Assignment Message* if
- 20 RCCCH\_HO\_SUPPORTED<sub>T</sub> is equal to '1'
- 21 (EACAM\_PCCAM\_DELAY<sub>S</sub> = EACAM\_PCCAM\_DELAY<sub>T</sub>)
- 22 – Number of Common Power Control Channels (NUM\_CPCCH<sub>S</sub> = (NUM\_CPCCH<sub>T</sub> +
- 23 1))
- 24 – Power control rate for the Common Power Control Channels
- 25 (CPCCH\_RATE<sub>S</sub> = CPCCH\_RATE<sub>T</sub>)
- 26 – For i = 0 to NUM\_CPCCH<sub>S</sub> - 1, store the channel code index for each Common
- 27 Power Control Channel (CPCCH\_CODE\_CHAN<sub>S</sub>[i] = CPCCH\_CODE\_CHAN<sub>T</sub>).
- 28 – Number of Power Control Subchannels for the Reservation Access Mode
- 29 (NUM\_PCSCH\_RA<sub>S</sub> = (NUM\_PCSCH\_RA<sub>T</sub> + 1))
- 30 The mobile station shall set CURR\_ACC\_MSG\_SEQ equal to ACC\_MSG\_SEQ<sub>S</sub>.
- 31 2.6.2.2.16 ANSI-41 RAND Message
- 32 Whenever an *ANSI-41 RAND Message* is received, the mobile station shall process the
- 33 fields in the message as follows.
- 34 The mobile station shall store the following parameters:
- 35 • Random challenge value (RAND<sub>S</sub> = RAND<sub>T</sub>)
- 36 • Current *Enhanced Access Parameters Message* Sequence Number
- 37 (CURR\_ACC\_MSG\_SEQ = ACC\_MSG\_SEQ<sub>T</sub>).

- 1       • Pilot PN sequence offset increment ( $PILOT\_PN_S = PILOT\_PN_R$ )

2       The mobile station shall also compare the *Enhanced Access Parameters Message* sequence  
3       number,  $ACC\_MSG\_SEQ_R$ , with that stored in  $ACC\_MSG\_SEQ_S$ . If the comparison results  
4       in a mismatch, then the mobile station shall set  $ACC\_MSG\_SEQ_S$  to NULL (see 2.6.2.2).

5       The mobile station shall ignore any fields at the end of the *ANSI-41 RAND Message* which  
6       are not defined according to the protocol revision level ( $MOB\_P\_REV_P$  of the current band  
7       class) being used by the mobile station.

#### 8       2.6.2.2.17 Universal Neighbor List Message

9       Whenever a valid *Universal Neighbor List Message* is received on the Primary Broadcast  
10       Control Channel, the configuration message sequence number,  $CONFIG\_MSG\_SEQ_R$  shall  
11       be compared to that stored in  $UNIV\_NGHBR\_LST\_MSG\_SEQ_S$ . If the comparison results in  
12       a mismatch, then the mobile station shall process the remaining fields in the message as  
13       described below.

14       The mobile station shall store the following parameters:

- 15       • Configuration message sequence number  
16         ( $CONFIG\_MSG\_SEQ_S = CONFIG\_MSG\_SEQ_R$ ,  
17          $UNIV\_NGHBR\_LST\_MSG\_SEQ_S = CONFIG\_MSG\_SEQ_R$ ).

18       If  $RADIO\_INTERFACE\_TYPE_R$  is equal to '0000' but the  $PILOT\_INC$  field is not within the  
19       valid range specified in 3.7.2.3.2.33, then the mobile station shall ignore the entire record  
20       that contains it.

21       If  $RADIO\_INTERFACE\_TYPE_R$  is equal to '0000' and the  $PILOT\_INC$  field is within the valid  
22       range specified in 3.7.2.3.2.33, the mobile station shall perform the following:

23       The mobile station shall store the Pilot PN sequence offset increment ( $PILOT\_INC_S =$   
24        $PILOT\_INC_R$ ).

25       The mobile station shall set  $NGHBR\_SET\_SIZE_S$  to  $NUM\_NGHBR_R$ .

26       For each of the neighboring base stations contained in the *Universal Neighbor List*  
27       *Message*, if  $FREQ\_INCL_R$  is equal to '0', or if  $FREQ\_INCL_R$  is equal to '1' and  
28        $NGHBR\_BAND_R$  is supported, the mobile station shall perform the following:

- 29       • If the  $i^{th}$  occurrence of  $NGHBR\_CONFIG_R$  is equal to '000', '001', '010', or '100', set  
30         the  $NGHBR\_CONFIG$  field of  $NGHBR\_REC[i]$  to the  $i^{th}$  occurrence of  
31          $NGHBR\_CONFIG_R$ ; otherwise, set the  $NGHBR\_CONFIG$  field of  $NGHBR\_REC[i]$  to  
32         '011'.
- 33       • Set the  $NGHBR\_PN$  field of  $NGHBR\_REC[i]$  to the  $i^{th}$  occurrence of  $NGHBR\_PN_R$ .
- 34       • If  $NGHBR\_CONFIG_R$  is equal to '011', set the  $BCCH\_SUPPORT$  field of  
35          $NGHBR\_REC[i]$  to  $BCCH\_SUPPORT_R$  of the corresponding record.
- 36       • Set the  $ADD\_PILOT\_REC\_INCL$  field of  $NGHBR\_REC[i]$  to the  $i^{th}$  occurrence of  
37          $ADD\_PILOT\_REC\_INCL_R$ . If  $ADD\_PILOT\_REC\_INCL_R$  equals '1', for each pilot  
38         included in the message, the mobile station shall also perform the following:

- 1       – Set the NGHBR\_PILOT\_REC\_TYPE field of NGHBR\_PILOT\_REC to  
2       NGHBR\_PILOT\_REC\_TYPE<sub>r</sub>.
- 3       – If NGHBR\_PILOT\_REC\_TYPE<sub>r</sub> is equal to '000'. The mobile station shall:
  - 4       + Set the TD\_POWER\_LEVEL field of NGHBR\_PILOT\_REC to  
5       TD\_POWER\_LEVEL<sub>r</sub>.
  - 6       + Set the TD\_MODE field of NGHBR\_PILOT\_REC to TD\_MODE<sub>r</sub>.
- 7       – If NGHBR\_PILOT\_REC\_TYPE<sub>r</sub> is equal to '001', the mobile station shall:
  - 8       + Set the AUX\_PILOT\_QOF field of NGHBR\_PILOT\_REC to QOF<sub>r</sub>.
  - 9       + Set the AUX\_PILOT\_WALSH\_CODE field of NGHBR\_PILOT\_REC to  
10       AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by  
11       WALSH\_LENGTH<sub>r</sub>.
- 12      – If NGHBR\_PILOT\_REC\_TYPE<sub>r</sub> is equal to '010', the mobile station shall:
  - 13      + Set the AUX\_PILOT\_QOF field of NGHBR\_PILOT\_REC to QOF<sub>r</sub>.
  - 14      + Set the AUX\_PILOT\_WALSH\_CODE field of NGHBR\_PILOT\_REC to  
15      AUX\_WALSH<sub>r</sub> with the Walsh Code length specified by WALSH\_LENGTH<sub>r</sub>.
  - 16      + Set the AUX\_TD\_POWER\_LEVEL field of NGHBR\_PILOT\_REC to  
17      AUX\_TD\_POWER\_LEVEL<sub>r</sub>.
  - 18      + Set the TD\_MODE field of NGHBR\_PILOT\_REC to TD\_MODE<sub>r</sub>.
- 19      – If NGHBR\_PILOT\_REC\_TYPE<sub>r</sub> is equal to '011', the mobile station shall:
  - 20      + Set the SR3\_PRIMARY\_PILOT field of NGHBR\_PILOT\_REC to  
21      SR3\_PRIMARY\_PILOT<sub>r</sub>.
  - 22      + Set the SR3\_PILOT\_POWER1 field of NGHBR\_PILOT\_REC to  
23      SR3\_PILOT\_POWER1<sub>r</sub>.
  - 24      + Set the SR3\_PILOT\_POWER2 field of NGHBR\_PILOT\_REC to  
25      SR3\_PILOT\_POWER2<sub>r</sub>.
- 26      – If NGHBR\_PILOT\_REC\_TYPE<sub>r</sub> is equal to '100', the mobile station shall:
  - 27      + Set the SR3\_PRIMARY\_PILOT field of NGHBR\_PILOT\_REC to  
28      SR3\_PRIMARY\_PILOT<sub>r</sub>.
  - 29      + Set the SR3\_PILOT\_POWER1 field of NGHBR\_PILOT\_REC to  
30      SR3\_PILOT\_POWER1<sub>r</sub>.
  - 31      + Set the SR3\_PILOT\_POWER2 field of NGHBR\_PILOT\_REC to  
32      SR3\_PILOT\_POWER2<sub>r</sub>.
  - 33      + Set the AUX\_PILOT\_QOF field of NGHBR\_PILOT\_REC to QOF<sub>r</sub>.
  - 34      + Set the AUX\_PILOT\_WALSH\_CODE field of NGHBR\_PILOT\_REC to  
35      AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by  
36      WALSH\_LENGTH<sub>r</sub>.

- 1           + If ADD\_INFO\_INCL1<sub>r</sub> is equal to '1', set the AUX\_PILOT\_QOF1 field of  
2           NGHBR\_PILOT\_REC to QOF1<sub>r</sub> and set the AUX\_PILOT\_WALSH\_CODE1 field  
3           of NGHBR\_PILOT\_REC to AUX\_PILOT\_WALSH1<sub>r</sub> with the Walsh Code length  
4           specified by WALSH\_LENGTH1<sub>r</sub>; otherwise, set the AUX\_PILOT\_QOF1 field  
5           of NGHBR\_PILOT\_REC to QOF<sub>r</sub> and set the AUX\_PILOT\_WALSH\_CODE1  
6           field of NGHBR\_PILOT\_REC to AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code  
7           length specified by WALSH\_LENGTH<sub>r</sub>.
- 8           + If ADD\_INFO\_INCL2<sub>r</sub> is equal to '1', set the AUX\_PILOT\_QOF2 field of  
9           NGHBR\_PILOT\_REC to QOF2<sub>r</sub> and set the AUX\_PILOT\_WALSH\_CODE2 field  
10          of NGHBR\_PILOT\_REC to AUX\_PILOT\_WALSH2<sub>r</sub> with the Walsh Code length  
11          specified by WALSH\_LENGTH2<sub>r</sub>; otherwise, set the AUX\_PILOT\_QOF2 field  
12          of NGHBR\_PILOT\_REC to QOF<sub>r</sub> and set the AUX\_PILOT\_WALSH\_CODE2  
13          field of NGHBR\_PILOT\_REC to AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code  
14          length specified by WALSH\_LENGTH<sub>r</sub>.
- 15          • If NGHBR\_SRCH\_MODE<sub>r</sub> = '00' or '10', set the SEARCH\_PRIORITY field of each  
16          NGHBR\_REC to '10' (high) for all NGHBR\_SET\_SIZE<sub>s</sub> entries.
- 17          • If NGHBR\_SRCH\_MODE<sub>r</sub> = '01' or '11', set the SEARCH\_PRIORITY field of  
18          NGHBR\_REC[i] to the i<sup>th</sup> occurrence of SEARCH\_PRIORITY<sub>r</sub>.
- 19          • If NGHBR\_SRCH\_MODE<sub>r</sub> = '00' or '01', set the SRCH\_WIN\_NGHBR field of each  
20          NGHBR\_REC to SRCH\_WIN\_N<sub>r</sub> for all NGHBR\_SET\_SIZE<sub>s</sub> entries.
- 21          • If NGHBR\_SRCH\_MODE<sub>r</sub> = '00' or '01', set the SRCH\_OFFSET\_NGHBR field of each  
22          NGHBR\_REC to '000'.
- 23          • If NGHBR\_SRCH\_MODE<sub>r</sub> = '10' or '11':
- 24           – set the SRCH\_WIN\_NGHBR field of NGHBR\_REC[i] to the i<sup>th</sup> occurrence of  
25           SRCH\_WIN\_NGHBR<sub>r</sub>
- 26           – if SRCH\_OFFSET\_INCL<sub>r</sub> equals '1', set the SRCH\_OFFSET\_NGHBR field of  
27           NGHBR\_REC[i] to the i<sup>th</sup> occurrence of SRCH\_OFFSET\_NGHBR<sub>r</sub>, and
- 28           – if SRCH\_OFFSET\_INCL<sub>r</sub> equals '0', set the SRCH\_OFFSET\_NGHBR field of each  
29           NGHBR\_REC to '000'.
- 30          • If USE\_TIMING<sub>r</sub> is equal to '1', set the TIMING\_INCL field of NGHBR\_REC[i] to the  
31          i<sup>th</sup> occurrence of TIMING\_INCL<sub>r</sub>; otherwise, set the TIMING\_INCL field of  
32          NGHBR\_REC to '0' for all entries.
- 33          • Set the NGHBR\_PDCH\_SUPPORTED field of NGHBR\_REC[i] to the i<sup>th</sup> occurrence of  
34          NGHBR\_PDCH\_SUPPORTED<sub>r</sub> if included; otherwise, set the  
35          NGHBR\_PDCH\_SUPPORTED field of NGHBR\_REC to '0' for all entries.
- 36          • The mobile station shall set RESQ\_ENABLED<sub>s</sub> = RESQ\_ENABLED<sub>r</sub>. If  
37          RESQ\_ENABLED<sub>s</sub> is equal to '1', then the mobile station shall store:
- 38           – Call rescue delay timer value (RESQ\_DELAY\_TIME<sub>s</sub> = RESQ\_DELAY\_TIME<sub>r</sub>)

- 1       – Call rescue allowed timer value ( $\text{RESQ\_ALLOWED\_TIME}_S =$   
2        $\text{RESQ\_ALLOWED\_TIME}_T$ )
- 3       – Call rescue attempt timer value ( $\text{RESQ\_ATTEMPT\_TIME}_S =$   
4        $\text{RESQ\_ATTEMPT\_TIME}_T$ )
- 5       – Code channel index for call rescue ( $\text{RESQ\_CODE\_CHAN}_S =$   
6        $\text{RESQ\_CODE\_CHAN}_T$ )
- 7       – Quasi-Orthogonal Function mask identifier for call rescue ( $\text{RESQ\_QOF}_S =$   
8        $\text{RESQ\_QOF}_T$ )
- 9       – Minimum time between consecutive rescues ( $\text{RESQ\_MIN\_PERIOD}_S =$   
10        $\text{RESQ\_MIN\_PERIOD}_T + 1$ ) if  $\text{RESQ\_MIN\_PERIOD\_INCL}_T$  is equal to '1'; otherwise,  
11        $\text{RESQ\_MIN\_PERIOD}_S = \text{'00000'}$ .
- 12       – The required number of transmissions of a regular PDU before declaring L2  
13       Acknowledgment Failure when Call Rescue is enabled  
14       ( $\text{RESQ\_NUM\_TOT\_TRANS\_20MS}_S = \text{RESQ\_NUM\_TOT\_TRANS\_20MS}_T$ ) if  
15       included; otherwise, set  $\text{RESQ\_NUM\_TOT\_TRANS\_20MS}_S$  to  $N_{1m}$ .
- 16       – The required number of transmissions of a mini PDU before declaring L2  
17       Acknowledgment Failure when Call Rescue is enabled  
18       ( $\text{RESQ\_NUM\_TOT\_TRANS\_5MS}_S = \text{RESQ\_NUM\_TOT\_TRANS\_5MS}_T$ ) if included;  
19       otherwise, set  $\text{RESQ\_NUM\_TOT\_TRANS\_5MS}_S$  to  $N_{15m}$ .
- 20       – The Traffic Channel preamble length for Call Rescue Soft Handoff when  
21       operating in Radio Configuration 1 or 2 ( $\text{RESQ\_NUM\_PREAMBLE\_RC1\_RC2}_S =$   
22        $\text{RESQ\_NUM\_PREAMBLE\_RC1\_RC2}_T$ ).
- 23       – The Traffic Channel preamble length for Call Rescue Soft Handoff when  
24       operating in Radio Configuration greater than 2 ( $\text{RESQ\_NUM\_PREAMBLE}_S =$   
25        $\text{RESQ\_NUM\_PREAMBLE}_T$ ).
- 26       – The power level adjustment to be applied to the last closed-loop power level  
27       when re-enabling the transmitter for call rescue soft handoff  
28       ( $\text{RESQ\_POWER\_DELTA}_S = \text{RESQ\_POWER\_DELTA}_T$ ).
- 29       – Set the  $\text{NGHBR\_RESQ\_CONFIGURED}$  field of  $\text{NGHBR\_REC}[i]$  to the  $i^{\text{th}}$   
30       occurrence of  $\text{NGHBR\_RESQ\_CONFIGURED}_T$ .
- 31       For each of the neighboring base stations contained in the *Universal Neighbor List*  
32       *Message*, if  $\text{FREQ\_FIELDS\_INCL}_T$  equals '1',  $\text{FREQ\_INCL}_T$  equals '1', and  $\text{NGHBR\_BAND}_T$  is  
33       supported, the mobile station shall also perform the following:
  - 34           • Set the  $\text{NGHBR\_BAND}$  field of  $\text{NGHBR\_REC}[i]$  to the  $i^{\text{th}}$  occurrence of  
35            $\text{NGHBR\_BAND}_T$ .
  - 36           • Set the  $\text{NGHBR\_FREQ}$  field of  $\text{NGHBR\_REC}[i]$  to the  $i^{\text{th}}$  occurrence of  
37            $\text{NGHBR\_FREQ}_T$ .
- 38       For each of the neighboring base stations contained in the *Universal Neighbor List*  
39       *Message*, if  $\text{USE\_TIMING}_T$  is equal to '1' and  $\text{TIMING\_INCL}_T$  equals '1', the mobile station  
40       shall also perform the following:

- 1       • Set the NGHBR\_TX\_OFFSET field of NGHBR\_REC[i] to the  $i^{\text{th}}$  occurrence of  
2       NGHBR\_TX\_OFFSET<sub>r</sub>.
- 3       • If GLOBAL\_TIMING\_INCL<sub>r</sub> is equal to '1', then the mobile station shall:
  - 4       – Set the NGHBR\_TX\_DURATION field of NGHBR\_REC to  
5       GLOBAL\_TX\_DURATION<sub>r</sub> for all entries.
  - 6       – Set the NGHBR\_TX\_PERIOD field of NGHBR\_REC to GLOBAL\_TX\_PERIOD<sub>r</sub> for  
7       all entries.
- 8       • If GLOBAL\_TIMING\_INCL<sub>r</sub> is equal to '0', then the mobile station shall:
  - 9       – Set the NGHBR\_TX\_DURATION field of NGHBR\_REC[i] to the  $i^{\text{th}}$  occurrence of  
10       NGHBR\_TX\_DURATION<sub>r</sub>.
  - 11       – Set the NGHBR\_TX\_PERIOD field of NGHBR\_REC[i] to the  $i^{\text{th}}$  occurrence of  
12       NGHBR\_TX\_PERIOD<sub>r</sub>.

13 For each of the neighboring base stations contained in the *Universal Neighbor List*  
14 *Message*, if FREQ\_FIELDS\_INCL<sub>r</sub> equals '1' and FREQ\_INCL<sub>r</sub> equals '0', the mobile station  
15 shall also perform the following:

- 16       • Set the NGHBR\_BAND field of NGHBR\_REC[i] to CDMABAND<sub>s</sub>.
- 17       • If NGHBR\_CONFIG<sub>r</sub> equals '010', set the NGHBR\_FREQ field of NGHBR\_REC[i] to  
18       the first CDMA Channel listed in the *CDMA Channel List Message or Extended*  
19       *CDMA Channel List Message* transmitted by the current base station; otherwise, set  
20       the NGHBR\_FREQ field of NGHBR\_REC[i] to CDMACH<sub>s</sub>.

21 If NGHBR\_SET\_ENTRY\_INFO<sub>r</sub> is equal to '0', then for all NGHBR\_SET\_SIZE<sub>s</sub> occurrences  
22 of ACCESS\_ENTRY\_HO, the mobile station shall set the ACCESS\_ENTRY\_HO field of  
23 NGHBR\_REC[i] to '0'.

24 If NGHBR\_SET\_ENTRY\_INFO<sub>r</sub> is equal to '1', then for all NGHBR\_SET\_SIZE<sub>s</sub> occurrences  
25 of ACCESS\_ENTRY\_HO, the mobile station shall set the ACCESS\_ENTRY\_HO field of  
26 NGHBR\_REC[i] to the  $i^{\text{th}}$  occurrence of ACCESS\_ENTRY\_HO<sub>r</sub>.

27 If NGHBR\_SET\_ACCESS\_INFO<sub>r</sub> is equal to '0', then for all NGHBR\_SET\_SIZE<sub>s</sub> occurrences  
28 of ACCESS\_HO\_ALLOWED, the mobile station shall set the ACCESS\_HO\_ALLOWED field  
29 of NGHBR\_REC[i] to '0'.

30 If NGHBR\_SET\_ACCESS\_INFO<sub>r</sub> is equal to '1', then for all NGHBR\_SET\_SIZE<sub>s</sub> occurrences  
31 of ACCESS\_HO\_ALLOWED, the mobile station shall set the ACCESS\_HO\_ALLOWED field  
32 of NGHBR\_REC[i] to the  $i^{\text{th}}$  occurrence of ACCESS\_HO\_ALLOWED<sub>r</sub>.

33 The mobile station shall update the idle handoff Neighbor Set (see 2.6.2.1.4) so that it  
34 consists only of pilot offsets listed in the *Universal Neighbor List Message*. If the *Universal*  
35 *Neighbor List Message* contains more pilot offsets than the mobile station can store, the  
36 mobile station shall store the pilot offsets beginning at the start of the *Universal Neighbor*  
37 *List Message*, up to the limits of the mobile station's Neighbor Set storage capacity.

38 If RADIO\_INTERFACE\_TYPE<sub>r</sub> is equal to '0001', the mobile station shall process the fields  
39 contained in the record as follows:

If RADIO\_INTERFACE\_TYPE<sub>r</sub> is equal to '0010', the mobile station shall process the fields contained in the record as follows:

The mobile station shall set NUM\_HRPD\_NGHBR<sub>s</sub> to NUM\_HRPD\_NGHBR<sub>r</sub>, the number of neighboring HRPD systems contained in the *Universal Neighbor List Message*. For each of the neighboring HRPD systems contained in the *Universal Neighbor List Message*, the mobile station shall perform the following:

- Set the PN field of HRPD\_NGHBR\_LIST[i] to the i<sup>th</sup> occurrence of NGHBR\_PN<sub>r</sub>.
- Set the BAND\_CLASS field of HRPD\_NGHBR\_LIST[i] to the i<sup>th</sup> occurrence of NGHBR\_BAND<sub>r</sub> if NGHBR\_FREQ\_INCL<sub>r</sub> equals '1'; otherwise, set the BAND\_CLASS field of HRPD\_NGHBR\_LIST[i] to CDMABAND<sub>s</sub>.
- Set the CDMA\_FREQ field of HRPD\_NGHBR\_LIST[i] to the i<sup>th</sup> occurrence of NGHBR\_FREQ<sub>r</sub> if NGHBR\_FREQ\_INCL<sub>r</sub> equals '1'; otherwise, set the BAND\_CLASS field of HRPD\_NGHBR\_LIST[i] to CDMACH<sub>s</sub>.
- Set the PN\_ASSOCIATION field of HRPD\_NGHBR\_LIST[i] to the i<sup>th</sup> occurrence of PN\_ASSOCIATION\_IND<sub>r</sub>.
- Set the DATA\_ASSOCIATION field of HRPD\_NGHBR\_LIST[i] to the i<sup>th</sup> occurrence of DATA\_ASSOCIATION\_IND<sub>r</sub>.

#### 2.6.2.2.18 BC MC Service Parameters Message

The mobile station may receive the *BC MC Service Parameters Message* on the Paging Channel or on the Primary Broadcast Control Channel.

When the mobile station desires to receive the *BC MC Service Parameters Message* on the Paging Channel, the mobile station shall monitor the F-PCH for the duration of four F-PCH slots from the first slot of a BSPM slot cycle (see 2.6.2.1.1.3.8.1) for the start of the *BC MC Service Parameters Message* transmission or until the *BC MC Service Parameters Message* with DIFF\_BSPM<sub>r</sub> equal to '0' is received; if the mobile station detects the start of the *BC MC Service Parameters Message*, the mobile station shall monitor the F-PCH until the entire *BC MC Service Parameters Message* is received.

When the mobile station desires to receive the *BC MC Service Parameters Message* on the Primary Broadcast Control Channel, the mobile station shall monitor the F-BCCH for the duration of four F-BCCH slots from the first slot of a BSPM slot cycle (see 2.6.2.1.1.3.8.2) for the start of the *BC MC Service Parameters Message* transmission or until the *BC MC Service Parameters Message* with DIFF\_BSPM<sub>r</sub> equal to '0' is received; if the mobile station detects the start of the *BC MC Service Parameters Message*, the mobile station shall monitor the F-BCCH until the entire *BC MC Service Parameters Message* is received.

Whenever the *BC MC Service Parameters Message* is received, the mobile station shall compare the BSPM sequence number, BSPM\_MSG\_SEQ<sub>r</sub>, to that stored in BSPM\_MSG\_SEQ<sub>s</sub>. If the comparison results in a match and FULL\_BSPM\_IND = '1', the mobile station may ignore the message. If the comparison results in a mismatch, the mobile station shall process the remaining fields in the message as follows:

1 The mobile station shall perform the following:

- 2 • If DIFF\_BSPM<sub>r</sub> equals '0', the mobile station shall perform the following:
  - 3 - The mobile station shall delete the currently stored *BCMC Service Parameters*
  - 4 *Message* parameters and shall store the parameters received in this *BCMC*
  - 5 *Service Parameters Message* as described below.
  - 6 - The mobile station shall set FULL\_BSPM\_IND to '1'.
- 7 • If DIFF\_BSPM<sub>r</sub> equals '1',
  - 8 - If (BSPM\_MSG\_SEQ<sub>r</sub> - BSPM\_MSG\_SEQ<sub>s</sub>) modulo 64 is greater than one,
  - 9 the mobile station shall perform the following:
    - 10 o The mobile station shall delete the currently stored *BCMC Service*
    - 11 *Parameters Message* parameters and shall store the parameters received
    - 12 in this *BCMC Service Parameters Message* as described below.
    - 13 o The mobile station shall set FULL\_BSPM\_IND to '0'.
  - 14 - Otherwise, the mobile station shall perform the following:
    - 15 o The mobile station shall update the currently stored *BCMC Service*
    - 16 *Parameters Message* parameters with the parameters received in this
    - 17 *BCMC Service Parameters Message* as described below.
- 18 The mobile station shall delete BCMC\_RETRY\_DELAY\_LIST<sub>s</sub>[i] from BCMC Retry Delay List
- 19 if BCMC\_RETRY\_DELAY\_LIST<sub>s</sub>[i].BCMC\_FLOW\_ID is included in the *BCMC Service*
- 20 *Parameters Message*.
- 21 The mobile station shall store the following parameters:
  - 22 • BSPM sequence number (BSPM\_MSG\_SEQ<sub>s</sub> = BSPM\_MSG\_SEQ<sub>r</sub>).
  - 23 • Frequency change registration required indication (FREQ\_CHG\_REG\_REQUIRED<sub>s</sub>
  - 24 = FREQ\_CHG\_REG\_REQUIRED<sub>r</sub>).
  - 25 • Frequency change registration timer
  - 26 (FREQ\_CHG\_REG\_TIMER<sub>s</sub> = FREQ\_CHG\_REG\_TIMER<sub>r</sub>) if
  - 27 FREQ\_CHG\_REG\_TIMER\_IND<sub>r</sub> equals '1'; otherwise, set
  - 28 FREQ\_CHG\_REG\_TIMER<sub>s</sub> to NULL.
  - 29 • Autonomous BCMC request allowed indicator
  - 30 (AUTO\_REQ\_ALLOWED\_IND<sub>s</sub> = AUTO\_REQ\_ALLOWED\_IND<sub>r</sub>).
  - 31 • If USE\_TIME<sub>r</sub> is set to '1' set the BSPM\_ACTION\_TIME<sub>s</sub> = ACTION\_TIME<sub>r</sub>;
  - 32 otherwise, set the BSPM\_ACTION\_TIME<sub>s</sub> = NULL. A BSPM with an explicit action
  - 33 time shall take effect when System Time (in 80 ms units) modulo 64 becomes equal

- 1 to BSPM\_ACTION\_TIME<sub>S</sub>.
- 2 • BCMC on traffic channel supported indicator  
3 (BCMC\_ON\_TRAFFIC\_SUP<sub>S</sub> = BCMC\_ON\_TRAFFIC\_SUP<sub>r</sub>).
- 4 • Length of time stamp for use on r-csch  
5 (ACH\_TIME\_STAMP\_SHORT\_LENGTH<sub>S</sub> = ACH\_TIME\_STAMP\_SHORT\_LENGTH<sub>r</sub>) if  
6 NON\_DEFAULT\_VALUE\_INCLUDED<sub>r</sub> equals '1'; otherwise,  
7 ACH\_TIME\_STAMP\_SHORT\_LENGTH<sub>S</sub> shall be set to 10.
- 8 • Length of time stamp  
9 (TIME\_STAMP\_LONG\_LENGTH<sub>S</sub> = TIME\_STAMP\_LONG\_LENGTH<sub>r</sub>) if  
10 NON\_DEFAULT\_VALUE\_INCLUDED<sub>r</sub> equals '1'; otherwise,  
11 TIME\_STAMP\_LONG\_LENGTH<sub>S</sub> shall be set to 52.
- 12 • Unit for time stamp length (TIME\_STAMP\_UNIT<sub>S</sub> = TIME\_STAMP\_UNIT<sub>r</sub>) if  
13 NON\_DEFAULT\_VALUE\_INCLUDED<sub>r</sub> equals '1'; otherwise,  
14 TIME\_STAMP\_UNIT<sub>S</sub> shall be set to 6.
- 15 • If REGISTRATION\_REQ\_FLAG\_INCL<sub>r</sub> equals '1', the mobile station shall compute  
16 and store a BCMC registration required timer expiration value:  
17 
$$\text{REGISTRATION\_REQ\_TIMER\_MAX} = (2^{\text{REGISTRATION\_REQ\_TIMER\_PERIOD}_r} \times 80 \text{ ms}).$$
- 18 • For i=1 to NUM\_FSCH<sub>r</sub>, store the following:
- 19 - FBSCH\_LIST<sub>S</sub>[i].FSCH\_ID = the position where this Forward Supplemental  
20 Channel is listed in this message (i.e. First Forward Supplemental Channel  
21 listed is given FSCH\_ID of '001', second one is given FSCH\_ID of '010', and so  
22 on).
- 23 - FBSCH\_LIST<sub>S</sub>[i].FSCH\_BAND\_CLASS = ith occurrence of FSCH\_BAND\_CLASS<sub>r</sub>  
24 (Band class of the Forward Supplemental Channel) if  
25 FSCH\_BAND\_CLASS\_INCL<sub>r</sub> equals '1'; otherwise,  
26 FBSCH\_LIST<sub>S</sub>[i].FSCH\_BAND\_CLASS = CDMABAND<sub>S</sub>.
- 27 - FBSCH\_LIST<sub>S</sub>[i].FSCH\_FREQ = ith occurrence of FSCH\_FREQ<sub>r</sub> (Frequency  
28 assignment of the forward broadcast supplemental channel) if  
29 FSCH\_FREQ\_INCL<sub>r</sub> equals '1'; otherwise, FBSCH\_LIST<sub>S</sub>[i].FSCH\_FREQ =  
30 CDMACH<sub>S</sub>.
- 31 - FBSCH\_LIST<sub>S</sub>[i].FSCH\_CODE\_CHAN = ith occurrence of FSCH\_CODE\_CHAN<sub>r</sub>  
32 (Code channel index of the forward broadcast supplemental channel)
- 33 - FBSCH\_LIST<sub>S</sub>[i].FSCH\_PLCM (Public Long code mask of the Forward Broadcast  
34 Supplemental Channel) shall be set as follows:

- 1           + If FSCH\_PLCM\_SCHEME\_INDr equals '00',  
2           FBSCH\_LISTs[i].FSCH\_PLCM shall be set to PLCM\_42 as specified in  
3           2.6.13.10.1.
- 4           + If FSCH\_PLCM\_SCHEME\_INDr equals '01',  
5           FBSCH\_LISTs[i].FSCH\_PLCM shall be set to PLCM\_42 as specified in  
6           2.6.13.10.2.
- 7           + If FSCH\_PLCM\_SCHEME\_INDr equals '10', the mobile station shall perform  
8           the following:
  - 9           o If FSCH\_PLCM\_INDr equals '0', FBSCH\_LISTs[i].FSCH\_PLCM shall be set  
10           to PLCM\_42 as specified in 2.6.13.10.1.
  - 11           o If FSCH\_PLCM\_INDr equals '1', FBSCH\_LISTs[i].FSCH\_PLCM shall be set  
12           to PLCM\_42 as specified in 2.6.13.10.2.
- 13          - FBSCH\_LISTs[i].FSCH\_MUX\_OPTION = ith occurrence of FSCH\_MUX\_OPTION<sub>r</sub>  
14          (Multiplex Option of the Forward Broadcast Supplemental Channel).
- 15          - FBSCH\_LISTs[i].FSCH\_RC = ith occurrence of FSCH\_RC<sub>r</sub> (Radio configuration of  
16          the forward broadcast supplemental channel).
- 17          - FBSCH\_LISTs[i].FSCH\_CODING = ith occurrence of FSCH\_CODING<sub>r</sub> (Coding  
18          type of the Forward Broadcast Supplemental Channel).
- 19          - FBSCH\_LISTs[i].FSCH\_OUTERCODE\_RATE = ith occurrence of  
20          FSCH\_OUTERCODE\_RATE<sub>r</sub> (Outer Code Rate of the Forward Broadcast  
21          Supplemental Channel) if FSCH\_OUTERCODE\_INCL<sub>r</sub> equals '1'; otherwise,  
22          FBSCH\_LISTs[i].FSCH\_OUTERCODE\_RATE = NULL.
- 23          - FBSCH\_LISTs[i].FSCH\_OUTERCODE\_OFFSET = ith occurrence of  
24          FSCH\_OUTERCODE\_OFFSET<sub>r</sub> (Outer Coding Buffer Offset of the Forward  
25          Broadcast Supplemental Channel) if FSCH\_OUTERCODE\_INCL<sub>r</sub> equals '1';  
26          otherwise, FBSCH\_LISTs[i].FSCH\_OUTERCODE\_OFFSET = NULL.
- 27          - FBSCH\_LISTs[i].FSCH\_NUM\_BITS\_IDX = ith occurrence of  
28          FSCH\_NUM\_BITS\_IDX<sub>r</sub> (Number of information bits index of the forward  
29          broadcast supplemental channel).
- 30          - FBSCH\_LISTs[i].FSCH\_FRAME\_40\_USED = ith occurrence of  
31          FSCH\_FRAME\_40\_USED<sub>r</sub> (40ms frame used indicator of the forward broadcast  
32          supplemental channel).
- 33          - FBSCH\_LISTs[i].FSCH\_FRAME\_80\_USED = ith occurrence of  
34          FSCH\_FRAME\_80\_USED<sub>r</sub> (80ms frame used indicator of the forward broadcast  
35          supplemental channel).

- 1        - FBSCH\_LIST<sub>S</sub>[i].TDM\_STRUCTURE\_IND = ith occurrence of TDM\_  
2        STRUCTURE\_IND<sub>r</sub> (TDM structure used indicator).
- 3        + FBSCH\_LIST<sub>S</sub>[i].TDM\_SLOT\_LENGTH = ith occurrence of  
4        TDM\_SLOT\_LENGTH<sub>r</sub> (TDM slot length).
- 5        + If TDM\_SUPER\_PERIOD\_MASK\_LEN<sub>r</sub> is included, FBSCH\_LIST<sub>S</sub>[i].  
6        TDM\_SUPER\_PERIOD\_MASK\_LEN = ith occurrence of  
7        TDM\_SUPER\_PERIOD\_MASK\_LEN<sub>r</sub> (TDM super period mask length  
8        indicator). Otherwise, set  
9        FBSCH\_LIST<sub>S</sub>[i].TDM\_SUPER\_PERIOD\_MASK\_LEN as specified in Table  
10       3.7.2.3.2.38-3, based on FSCH\_OUTERCODE\_RATE field corresponding to  
11       FSCH\_ID field included in this record
- 12       + If TDM\_MEGA\_PERIOD\_MASK\_LEN<sub>r</sub> is included, FBSCH\_LIST<sub>S</sub>[i].  
13       TDM\_MEGA\_PERIOD\_MASK\_LEN = ith occurrence of  
14       TDM\_MEGA\_PERIOD\_MASK\_LEN<sub>r</sub> (TDM mega period mask length  
15       indicator). Otherwise, set FBSCH\_LIST<sub>S</sub>[i].  
16       TDM\_MEGA\_PERIOD\_MASK\_LEN as specified in Table 3.7.2.3.2.38-6.
- 17       • For i=1 to the number of flows included in this message, store the following:
- 18       - BCMC\_FLOW\_LIST<sub>S</sub>[i].BCMC\_FLOW\_ID = ith occurrence of BCMC\_FLOW\_ID  
19       (BCMC flow identifier). See section 2.6.13.11.
- 20       - If REGISTRATION\_REQ\_FLAG\_INCL<sub>r</sub> equals '1', and ith occurrence of  
21       FLOW\_INFO\_ON\_OTHER\_FREQ<sub>r</sub> equals '0',  
22       BCMC\_FLOW\_LIST<sub>S</sub>[i].REGISTRATION\_REQ\_FLAG = ith occurrence of  
23       REGISTRATION\_REQ\_FLAG<sub>r</sub> (Registration required flag).
- 24       - If AUTH\_SIGNATURE\_REQUIRED<sub>r</sub> equals '1',  
25       BCMC\_FLOW\_LIST<sub>S</sub>[i].AUTH\_SIGNATURE\_REQ\_IND = ith occurrence of  
26       AUTH\_SIGNATURE\_REQ\_IND<sub>r</sub> (Authorization signature required indication).
- 27       - If BCMC\_ON\_TRAFFIC\_SUP<sub>r</sub> is set to '1',  
28       BCMC\_FLOW\_LIST<sub>S</sub>[i].BCMC\_FLOW\_ON\_TRAFFIC\_IND = ith occurrence of  
29       BCMC\_FLOW\_ON\_TRAFFIC\_IND<sub>r</sub> (BCMC flow on traffic channel supported  
30       identifier); otherwise, BCMC\_FLOW\_LIST<sub>S</sub>[i].BCMC\_FLOW\_ON\_TRAFFIC\_IND =  
31       '0'.
- 32       - If the ith occurrence of NUM\_LPM\_ENTRIES<sub>r</sub> equals '000', then  
33       BCMC\_FLOW\_LIST<sub>S</sub>[i].BCMC\_FLOW\_ON\_IND = 0; otherwise,  
34       BCMC\_FLOW\_LIST<sub>S</sub>[i].BCMC\_FLOW\_ON\_IND = 1 (BCMC flow On or Off  
35       Indicator).
- 36       - For j=1 to NUM\_LPM\_ENTRIES<sub>r</sub>, store the following:

- 1 + BCMC\_FLOW\_LIST<sub>S</sub>[i].LPM\_INFO[j].FSCH\_ID = jth occurrence of FSCH\_ID<sub>r</sub>  
2 (Forward broadcast supplemental channel identifier).
- 3 + If jth occurrence of TDM\_USED\_IND<sub>r</sub> is set to 1, the mobile station shall  
4 store the following:
  - 5 o BCMC\_FLOW\_LIST<sub>S</sub>[i].LPM\_INFO[j].TDM\_MASK = jth occurrence of  
6 TDM\_MASK<sub>r</sub> (TDM mask).
  - 7 o If TDM\_SUPER\_PERIOD\_MASK\_INCL<sub>r</sub> is set to '1',  
8 BCMC\_FLOW\_LIST<sub>S</sub>[i].LPM\_INFO[j].TDM\_SUPER\_PERIOD\_MASK = jth  
9 occurrence of TDM\_SUPER\_PERIOD\_MASK<sub>r</sub> (TDM super period mask).  
10 Otherwise, set all bits of  
11 BCMC\_FLOW\_LIST<sub>S</sub>[i].LPM\_INFO[j].TDM\_SUPER\_PERIOD\_MASK to '1'.
  - 12 o If TDM\_MEGA\_PERIOD\_MASK\_INCL<sub>r</sub> is set to '1',  
13 BCMC\_FLOW\_LIST<sub>S</sub>[i].LPM\_INFO[j].TDM\_MEGA\_PERIOD\_MASK = jth  
14 occurrence of TDM\_MEGA\_PERIOD\_MASK<sub>r</sub> (TDM mega period mask).  
15 Otherwise, set all bits of  
16 BCMC\_FLOW\_LIST<sub>S</sub>[i].LPM\_INFO[j].TDM\_MEGA\_PERIOD\_MASK to '1'.
  - 17 o TDM period for BCMC flow identified by  
18 BCMC\_FLOW\_LIST<sub>S</sub>[i].BCMC\_FLOW\_ID on Forward Supplemental  
19 Channel identified by BCMC\_FLOW\_LIST<sub>S</sub>[i].LPM\_INFO[j].FSCH\_ID is  
20 aligned at system time (t) as specified in section 2.6.13.12.
- 21 + BCMC\_FLOW\_LIST<sub>S</sub>[i].LPM\_INFO[j].BSR\_ID = jth occurrence of BSR\_ID<sub>r</sub>  
22 (BCMC Service Reference identifier).
- 23 + For k=0 to NUM\_NGHR<sub>r</sub>, store the following:
  - 24 o BCMC\_FLOW\_LIST<sub>S</sub>[i].LPM\_INFO[j].NGHR\_INFO[k].NGHR\_PN = kth  
25 occurrence of NGHR\_PN<sub>r</sub> (Neighbor pilot PN sequence offset index).
  - 26 o BCMC\_FLOW\_LIST<sub>S</sub>[i].LPM\_INFO[j].NGHR\_INFO[k].  
27 NGHR\_BCMC\_CONFIG = kth occurrence of NGHR\_BCMC\_CONFIG<sub>r</sub>  
28 (Neighbor BCMC flow configuration).
  - 29 o If NGHR\_BCMC\_CONFIG<sub>r</sub> equals '000', BCMC\_FLOW\_LIST<sub>S</sub>[i].  
30 LPM\_INFO[j].NGHR\_INFO[k].NGHR\_FSCH\_BAND\_CLASS = NULL;  
31 otherwise, the mobile station shall store the following:

- 1                   ◇ If NGHBR\_BCMC\_CONFIG<sub>r</sub> equals '010' or NGHBR\_BCMC\_CONFIG<sub>r</sub>  
2                   equals '001' and NGHBR\_FSCH\_BAND\_CLASS\_INCL<sub>r</sub> equals '0',  
3                   BCMC\_FLOW\_LIST<sub>s</sub>[i].LPM\_INFO[j].NGHBR\_INFO[k].  
4                   NGHBR\_FSCH\_BAND\_CLASS =  
5                   FBSCH\_LIST<sub>s</sub>[i].NGHBR\_FSCH\_BAND\_CLASS where i corresponds  
6                   to the entry of FBSCH\_LIST<sub>s</sub> where FBSCH\_LIST<sub>s</sub>[i].FSCH\_ID equals  
7                   FSCH\_ID of this Forward Supplemental Channel.
- 8                   ◇ Otherwise, BCMC\_FLOW\_LIST<sub>s</sub>[i].LPM\_INFO[j].NGHBR\_INFO[k].  
9                   NGHBR\_FSCH\_BAND\_CLASS = kth occurrence of NGHBR\_  
10                   FSCH\_BAND\_CLASS<sub>r</sub> (Band class of the Forward Supplemental  
11                   Channel in the neighbor base station).
- 12                  o If NGHBR\_BCMC\_CONFIG<sub>r</sub> equals '000',  
13                   BCMC\_FLOW\_LIST<sub>s</sub>[i].LPM\_INFO[j].NGHBR\_INFO[k].  
14                   NGHBR\_FSCH\_CDMA\_FREQ = NULL; otherwise, the mobile station shall  
15                   store the following:
- 16                   ◇ If NGHBR\_BCMC\_CONFIG<sub>r</sub> equals '010' or NGHBR\_BCMC\_CONFIG<sub>r</sub>  
17                   equals '001' and NGHBR\_FSCH\_FREQ\_INCL<sub>r</sub> equals '0',  
18                   BCMC\_FLOW\_LIST<sub>s</sub>[i].LPM\_INFO[j].NGHBR\_INFO[k].  
19                   NGHBR\_FSCH\_CDMA\_FREQ =  
20                   FBSCH\_LIST<sub>s</sub>[i].FSCH\_CDMA\_FREQ where i corresponds to the  
21                   entry of FBSCH\_LIST<sub>s</sub> where FBSCH\_LIST<sub>s</sub>[i].FSCH\_ID equals  
22                   FSCH\_ID of this Forward Supplemental Channel.
- 23                   ◇ Otherwise, BCMC\_FLOW\_LIST<sub>s</sub>[i].LPM\_INFO[j].NGHBR\_INFO[k].  
24                   NGHBR\_FSCH\_CDMA\_FREQ = kth occurrence of  
25                   NGHBR\_FSCH\_CDMA\_FREQ<sub>r</sub> (Neighbor Frequency assignment of  
26                   the forward broadcast supplemental channel).
- 27                  o If NGHBR\_BCMC\_CONFIG<sub>r</sub> equals '000',  
28                   BCMC\_FLOW\_LIST<sub>s</sub>[i].LPM\_INFO[j].NGHBR\_INFO[k].  
29                   NGHBR\_FSCH\_CODE\_CHAN = NULL; otherwise, the mobile station shall  
30                   store the following:
- 31                   ◇ If NGHBR\_BCMC\_CONFIG<sub>r</sub> equals '001' or '010' and  
32                   NGHBR\_FSCH\_CODE\_CHAN\_INCL<sub>r</sub> equals '0',  
33                   BCMC\_FLOW\_LIST<sub>s</sub>[i].LPM\_INFO[j].NGHBR\_INFO[k].  
34                   NGHBR\_FSCH\_CODE\_CHAN =  
35                   FBSCH\_LIST<sub>s</sub>[i].FSCH\_CODE\_CHAN where i corresponds to the  
36                   entry of FBSCH\_LIST<sub>s</sub> where FBSCH\_LIST<sub>s</sub>[i].FSCH\_ID equals  
37                   FSCH\_ID of this Forward Supplemental Channel.

- 1                   ◇ Otherwise,  $\text{BMC\_FLOW\_LIST}_S[i].\text{LPM\_INFO}[j].\text{NGHBR\_INFO}[k].$   
2                    $\text{NGHBR\_FSCH\_CODE\_CHAN} = k$ th occurrence of  
3                    $\text{NGHBR\_FSCH\_CODE\_CHAN}_r$  (Neighbor pilot forward broadcast  
4                   supplemental channel code channel index).
- 5                   o If  $\text{NGHBR\_BMC\_CONFIG}_r$  equals '000',  
6                    $\text{BMC\_FLOW\_LIST}_S[i].\text{LPM\_INFO}[j].\text{NGHBR\_INFO}[k].$   
7                    $\text{NGHBR\_FSCH\_PLCM} = \text{NULL}$ ; otherwise, the mobile station shall store  
8                   the following:
- 9                   ◇ If  $\text{NGHBR\_BMC\_CONFIG}_r$  equals '010' or  $\text{NGHBR\_BMC\_CONFIG}_r$   
10                   equals '001' and  $\text{NGHBR\_FSCH\_PARMS\_INCL}_r$  equals '0',  
11                    $\text{BMC\_FLOW\_LIST}_S[i].\text{LPM\_INFO}[j].\text{NGHBR\_INFO}[k].$   
12                    $\text{NGHBR\_FSCH\_PLCM} = \text{FBSCH\_LIST}_S[i].\text{FSCH\_PLCM}$  where  $i$   
13                   corresponds to the entry of  $\text{FBSCH\_LIST}_S$  where  
14                    $\text{FBSCH\_LIST}_S[i].\text{FSCH\_ID}$  equals  $\text{FSCH\_ID}$  of this FORWARD  
15                   SUPPLEMENTAL CHANNEL.
- 16                   ◇ Otherwise, the mobile station shall perform the following:
- 17                   o If  $\text{NGHBR\_FSCH\_PLCM\_IND}_r$  equals '0'  
18                    $\text{BMC\_FLOW\_LIST}_S[i].\text{LPM\_INFO}[j].\text{NGHBR\_INFO}[k].$   
19                    $\text{NGHBR\_FSCH\_PLCM}$  shall be set to  $\text{PLCM\_42}$  as specified in  
20                   2.6.13.10.1.
- 21                   o If  $\text{NGHBR\_FSCH\_PLCM\_IND}_r$  equals '1'  
22                    $\text{BMC\_FLOW\_LIST}_S[i].\text{LPM\_INFO}[j].\text{NGHBR\_INFO}[k].$   
23                    $\text{NGHBR\_FSCH\_PLCM}$  shall be set to  $\text{PLCM\_42}$  as specified in  
24                   2.6.13.10.2.
- 25                   o If  $\text{NGHBR\_BMC\_CONFIG}_r$  equals '000',  
26                    $\text{BMC\_FLOW\_LIST}_S[i].\text{LPM\_INFO}[j].\text{NGHBR\_INFO}[k].$   
27                    $\text{NGHBR\_FSCH\_MUX\_OPTION} = \text{NULL}$ ; otherwise, the mobile station  
28                   shall store the following:
- 29                   ◇ If  $\text{NGHBR\_BMC\_CONFIG}_r$  equals '010' or  $\text{NGHBR\_BMC\_CONFIG}_r$   
30                   equals '001' and  $\text{NGHBR\_FSCH\_PARMS\_INCL}_r$  equals '0',  
31                    $\text{BMC\_FLOW\_LIST}_S[i].\text{LPM\_INFO}[j].\text{NGHBR\_INFO}[k].$   
32                    $\text{NGHBR\_FSCH\_MUX\_OPTION} =$   
33                    $\text{FBSCH\_LIST}_S[i].\text{FSCH\_MUX\_OPTION}$  where  $i$  corresponds to the  
34                   entry of  $\text{FBSCH\_LIST}_S$  where  $\text{FBSCH\_LIST}_S[i].\text{FSCH\_ID}$  equals  
35                    $\text{FSCH\_ID}$  of this Forward Supplemental Channel.
- 36                   ◇ Otherwise,  $\text{BMC\_FLOW\_LIST}_S[i].\text{LPM\_INFO}[j].\text{NGHBR\_INFO}[k].$   
37                    $\text{NGHBR\_FSCH\_MUX\_OPTION} = k$ th occurrence of  
38                    $\text{NGHBR\_FSCH\_MUX\_OPTION}_r$  (Multiplex Option of the Forward  
39                   Broadcast Supplemental Channel in the neighbor base station).

- 1                   o If NGHBR\_BCMC\_CONFIG<sub>r</sub> equals '000',  
2                    BCMC\_FLOW\_LIST<sub>s</sub>[i].LPM\_INFO[j].NGHBR\_INFO[k]. NGHBR\_FSCH\_RC  
3                    = NULL; otherwise, the mobile station shall store the following:  
  
4                    ◇ If NGHBR\_BCMC\_CONFIG<sub>r</sub> equals '010' or NGHBR\_BCMC\_CONFIG<sub>r</sub>  
5                    equals '001' and NGHBR\_FSCH\_PARAMS\_INCL<sub>r</sub> equals '0',  
6                    BCMC\_FLOW\_LIST<sub>s</sub>[i].LPM\_INFO[j].NGHBR\_INFO[k].  
7                    NGHBR\_FSCH\_RC = FBSCH\_LIST<sub>s</sub>[i].FSCH\_RC where i corresponds  
8                    to the entry of FBSCH\_LIST<sub>s</sub> where FBSCH\_LIST<sub>s</sub>[i].FSCH\_ID equals  
9                    FSCH\_ID of this Forward Supplemental Channel.  
  
10                  ◇ Otherwise, BCMC\_FLOW\_LIST<sub>s</sub>[i].LPM\_INFO[j].NGHBR\_INFO[k].  
11                  NGHBR\_FSCH\_RC = kth occurrence of NGHBR\_FSCH\_RC<sub>r</sub> (Neighbor  
12                  Radio configuration of the forward broadcast supplemental channel).  
  
13                  o If NGHBR\_BCMC\_CONFIG<sub>r</sub> equals '000',  
14                  BCMC\_FLOW\_LIST<sub>s</sub>[i].LPM\_INFO[j].NGHBR\_INFO[k].NGHBR\_FSCH\_CO  
15                  DING = NULL; otherwise, the mobile station shall store the following:  
  
16                  ◇ If NGHBR\_BCMC\_CONFIG<sub>r</sub> equals '010' or NGHBR\_BCMC\_CONFIG<sub>r</sub>  
17                  equals '001' and NGHBR\_FSCH\_PARAMS\_INCL<sub>r</sub> equals '0',  
18                  BCMC\_FLOW\_LIST<sub>s</sub>[i].LPM\_INFO[j].NGHBR\_INFO[k].NGHBR\_FSCH\_  
19                  CODING = FBSCH\_LIST<sub>s</sub>[i].NGHBR\_FSCH\_CODING where i  
20                  corresponds to the entry of FBSCH\_LIST<sub>s</sub> where  
21                  FBSCH\_LIST<sub>s</sub>[i].FSCH\_ID equals FSCH\_ID of this Forward  
22                  Supplemental Channel.  
  
23                  ◇ Otherwise,  
24                  BCMC\_FLOW\_LIST<sub>s</sub>[i].LPM\_INFO[j].NGHBR\_INFO[k].NGHBR\_FSCH\_  
25                  CODING = kth occurrence of NGHBR\_FSCH\_CODING<sub>r</sub> (Coding type  
26                  of the Forward Broadcast Supplemental Channel in this neighbor  
27                  base station).  
  
28                  o If NGHBR\_BCMC\_CONFIG<sub>r</sub> equals '000',  
29                  BCMC\_FLOW\_LIST<sub>s</sub>[i].LPM\_INFO[j].NGHBR\_INFO[k].NGHBR\_FSCH\_OU  
30                  TERCODE\_RATE = NULL; otherwise, the mobile station shall store the  
31                  following:  
  
32                  ◇ If NGHBR\_BCMC\_CONFIG<sub>r</sub> equals '010' or NGHBR\_BCMC\_CONFIG<sub>r</sub>  
33                  equals '001' and NGHBR\_FSCH\_PARAMS\_INCL<sub>r</sub> equals '0',  
34                  BCMC\_FLOW\_LIST<sub>s</sub>[i].LPM\_INFO[j].NGHBR\_INFO[k].NGHBR\_FSCH\_  
35                  OUTERCODE\_RATE =  
36                  FBSCH\_LIST<sub>s</sub>[i].NGHBR\_FSCH\_OUTERCODE\_RATE where i  
37                  corresponds to the entry of FBSCH\_LIST<sub>s</sub> where  
38                  FBSCH\_LIST<sub>s</sub>[i].FSCH\_ID equals FSCH\_ID of this Forward  
39                  Supplemental Channel.

1                   ◇ Otherwise,  
2                    BCMC\_FLOW\_LIST<sub>s</sub>[i].LPM\_INFO[j].NGHBR\_INFO[k].NGHBR\_FSCH\_  
3                    OUTERCODE\_RATE = kth occurrence of  
4                    NGHBR\_FSCH\_OUTERCODE\_RATE<sub>r</sub> (Outer Code Rate of the  
5                    Forward Broadcast Supplemental Channel in this neighbor base  
6                    station) if NGHBR\_FSCH\_OUTERCODE\_INCL<sub>r</sub> equals '1' ; otherwise,  
7                    BCMC\_FLOW\_LIST<sub>s</sub>[i].LPM\_INFO[j].NGHBR\_INFO[k].NGHBR\_FSCH\_  
8                    OUTERCODE\_RATE = NULL.

9                   o If NGHBR\_BCMC\_CONFIG<sub>r</sub> equals '000',  
10                    BCMC\_FLOW\_LIST<sub>s</sub>[i].LPM\_INFO[j].NGHBR\_INFO[k].NGHBR\_FSCH\_OU  
11                    TERCODE\_OFFSET = NULL; otherwise, the mobile station shall store  
12                    the following:

13                   ◇ If NGHBR\_BCMC\_CONFIG<sub>r</sub> equals '010' or NGHBR\_BCMC\_CONFIG<sub>r</sub>  
14                    equals '001' and NGHBR\_FSCH\_PARMS\_INCL<sub>r</sub> equals '0',  
15                    BCMC\_FLOW\_LIST<sub>s</sub>[i].LPM\_INFO[j].NGHBR\_INFO[k].NGHBR\_FSCH\_  
16                    OUTERCODE\_OFFSET =  
17                    FBSCH\_LIST<sub>s</sub>[i].NGHBR\_FSCH\_OUTERCODE\_OFFSET where i  
18                    corresponds to the entry of FBSCH\_LIST<sub>s</sub> where  
19                    FBSCH\_LIST<sub>s</sub>[i].FSCH\_ID equals FSCH\_ID of this Forward  
20                    Supplemental Channel.

21                   ◇ Otherwise,  
22                    BCMC\_FLOW\_LIST<sub>s</sub>[i].LPM\_INFO[j].NGHBR\_INFO[k].NGHBR\_FSCH\_  
23                    OUTERCODE\_OFFSET = kth occurrence of  
24                    NGHBR\_FSCH\_OUTERCODE\_OFFSET<sub>r</sub> (Outer Coding Buffer Offset  
25                    of the Forward Broadcast Supplemental Channel in this neighbor  
26                    base station) if NGHBR\_FSCH\_OUTERCODE\_INCL<sub>r</sub> equals '1' ;  
27                    otherwise,  
28                    BCMC\_FLOW\_LIST<sub>s</sub>[i].LPM\_INFO[j].NGHBR\_INFO[k].NGHBR\_FSCH\_  
29                    OUTERCODE\_OFFSET = NULL.

30                   o If NGHBR\_BCMC\_CONFIG<sub>r</sub> equals '000',  
31                    BCMC\_FLOW\_LIST<sub>s</sub>[i].LPM\_INFO[j].NGHBR\_INFO[k].  
32                    NGHBR\_FSCH\_NUM\_BITS\_IDX = NULL; otherwise, the mobile station  
33                    shall store the following:

34                   ◇ If NGHBR\_BCMC\_CONFIG<sub>r</sub> equals '010' or NGHBR\_BCMC\_CONFIG<sub>r</sub>  
35                    equals '001' and NGHBR\_FSCH\_PARMS\_INCL<sub>r</sub> equals '0',  
36                    BCMC\_FLOW\_LIST<sub>s</sub>[i].LPM\_INFO[j].NGHBR\_INFO[k].  
37                    NGHBR\_FSCH\_NUM\_BITS\_IDX =  
38                    FBSCH\_LIST<sub>s</sub>[i].FSCH\_NUM\_BITS\_IDX where i corresponds to the  
39                    entry of FBSCH\_LIST<sub>s</sub> where FBSCH\_LIST<sub>s</sub>[i].FSCH\_ID equals  
40                    FSCH\_ID of this Forward Supplemental Channel.

- 1                   ◇ Otherwise,  $\text{BMC\_FLOW\_LIST}_S[i].\text{LPM\_INFO}[j].\text{NGHBR\_INFO}[k].$   
2                    $\text{NGHBR\_FSCH\_NUM\_BITS\_IDX} = k$ th occurrence of  
3                    $\text{NGHBR\_FSCH\_NUM\_BITS\_IDX}_r$  (Neighbor Number of information  
4                   bits index of the forward broadcast supplemental channel).
- 5                   o If  $\text{NGHBR\_BMC\_CONFIG}_r$  equals '000',  
6                    $\text{BMC\_FLOW\_LIST}_S[i].\text{LPM\_INFO}[j].\text{NGHBR\_INFO}[k].$   
7                    $\text{NGHBR\_FSCH\_FRAME\_40\_USED} = \text{NULL}$ ; otherwise, the mobile station  
8                   shall store the following:
- 9                   ◇ If  $\text{NGHBR\_BMC\_CONFIG}_r$  equals '010' or  $\text{NGHBR\_BMC\_CONFIG}_r$   
10                   equals '001' and  $\text{NGHBR\_FSCH\_PARMS\_INCL}_r$  equals '0',  
11                    $\text{BMC\_FLOW\_LIST}_S[i].\text{LPM\_INFO}[j].\text{NGHBR\_INFO}[k].$   
12                    $\text{NGHBR\_FSCH\_FRAME\_40\_USED} =$   
13                    $\text{FBSCH\_LIST}_S[i].\text{FSCH\_FRAME\_40\_USED}$  where  $i$  corresponds to the  
14                   entry of  $\text{FBSCH\_LIST}_S$  where  $\text{FBSCH\_LIST}_S[i].\text{FSCH\_ID}$  equals  
15                    $\text{FSCH\_ID}$  of this FORWARD SUPPLEMENTAL CHANNEL.
- 16                   ◇ Otherwise,  $\text{BMC\_FLOW\_LIST}_S[i].\text{LPM\_INFO}[j].\text{NGHBR\_INFO}[k].$   
17                    $\text{NGHBR\_FSCH\_FRAME\_40\_USED} = k$ th occurrence of  
18                    $\text{NGHBR\_FSCH\_FRAME\_40\_USED}_r$  (Neighbor 40ms frame used  
19                   indicator of the forward broadcast supplemental channel).
- 20                   o If  $\text{NGHBR\_BMC\_CONFIG}_r$  equals '000',  
21                    $\text{BMC\_FLOW\_LIST}_S[i].\text{LPM\_INFO}[j].\text{NGHBR\_INFO}[k].$   
22                    $\text{NGHBR\_FSCH\_FRAME\_80\_USED} = \text{NULL}$ ; otherwise, the mobile station  
23                   shall store the following:
- 24                   ◇ If  $\text{NGHBR\_BMC\_CONFIG}_r$  equals '010' or  $\text{NGHBR\_BMC\_CONFIG}_r$   
25                   equals '001' and  $\text{NGHBR\_FSCH\_PARMS\_INCL}_r$  equals '0',  
26                    $\text{BMC\_FLOW\_LIST}_S[i].\text{LPM\_INFO}[j].\text{NGHBR\_INFO}[k].$   
27                    $\text{NGHBR\_FSCH\_FRAME\_80\_USED} =$   
28                    $\text{FBSCH\_LIST}_S[i].\text{FSCH\_FRAME\_80\_USED}$  where  $i$  corresponds to the  
29                   entry of  $\text{FBSCH\_LIST}_S$  where  $\text{FBSCH\_LIST}_S[i].\text{FSCH\_ID}$  equals  
30                    $\text{FSCH\_ID}$  of this FORWARD SUPPLEMENTAL CHANNEL.
- 31                   ◇ Otherwise,  $\text{BMC\_FLOW\_LIST}_S[i].\text{LPM\_INFO}[j].\text{NGHBR\_INFO}[k].$   
32                    $\text{NGHBR\_FSCH\_FRAME\_80\_USED} = k$ th occurrence of  
33                    $\text{NGHBR\_FSCH\_FRAME\_80\_USED}_r$  (Neighbor 80ms frame used  
34                   indicator of the forward broadcast supplemental channel).
- 35 For each of the neighboring base stations contained in the *BCMC Service Parameters*  
36 *Message* and supports the broadcast control channel, the mobile station shall store the  
37 following informations from the message:
- 38                   • SR1 Non-TD BCCH support indicator ( $\text{BMC\_SR1\_BCCH\_NON\_TD\_INCL}_S =$   
39                    $\text{BMC\_SR1\_BCCH\_NON\_TD\_INCL}_r$ )

- 1 • SR1 TD BCCH support indicator ( $\text{BCMC\_SR1\_TD\_INCL}_S = \text{BCMC\_SR1\_TD\_INCL}_R$ )
- 2 • If  $\text{BCMC\_SR1\_BCCH\_NON\_TD\_INCL}_R$  is equal to '1':
- 3     –  $\text{BCMC\_SR1\_BRAT\_NON\_TD}_S = \text{BCMC\_SR1\_BRAT\_NON\_TD}_R$ ;
- 4     –  $\text{BCMC\_SR1\_CRAT\_NON\_TD}_S = \text{BCMC\_SR1\_CRAT\_NON\_TD}_R$ ;
- 5     –  $\text{BCMC\_BCCH\_CODE\_CHAN\_NON\_TD}_S =$
- 6          $\text{BCMC\_SR1\_BCCH\_CODE\_CHAN\_NON\_TD}_R$ .
- 7 • If  $\text{BCMC\_SR1\_TD\_INCL}_R$  is included and is equal to '1', and the mobile station
- 8     supports the Transmit Diversity indicated by  $\text{BCMC\_SR1\_TD\_MODE}_R$ :
- 9     –  $\text{BCMC\_SR1\_BRAT\_TD}_S = \text{BCMC\_SR1\_BRAT\_TD}_R$ ;
- 10    –  $\text{BCMC\_SR1\_CRAT\_TD}_S = \text{BCMC\_SR1\_CRAT\_TD}_R$ ;
- 11    –  $\text{BCMC\_BCCH\_CODE\_CHAN\_TD}_S = \text{BCMC\_SR1\_BCCH\_CODE\_CHAN\_TD}_R$ .
- 12 • If the mobile station supports the Transmit Diversity,
- 13      $\text{BCMC\_SR1\_BCCH\_NON\_TD\_INCL}_R$  is equal to '1', and  $\text{SR1\_TD\_INCL}_R$  is equal to '0':
- 14     –  $\text{BCMC\_SR1\_BRAT\_TD}_S = \text{BCMC\_SR1\_BRAT\_NON\_TD}_R$ ;
- 15     –  $\text{BCMC\_SR1\_CRAT\_TD}_S = \text{BCMC\_SR1\_CRAT\_NON\_TD}_R$ ;
- 16     –  $\text{BCMC\_BCCH\_CODE\_CHAN\_TD}_S = \text{BCMC\_SR1\_BCCH\_CODE\_CHAN\_NON\_TD}_R$ .

#### 17 2.6.2.2.19 Access Point Pilot Information Message

18 Whenever an *Access Point Pilot Information Message* is received on the Paging Channel or  
 19 the Primary Broadcast Control Channel, the configuration message sequence number,  
 20  $\text{CONFIG\_MSG\_SEQ}_R$ , shall be compared to that stored in  $\text{AP\_PILOT\_INFO\_MSG\_SEQ}_S$ . If  
 21 the comparison results in a match, the mobile station may refresh the lifetime that the  
 22 information in the message remains valid to  $\text{LIFETIME}_S$  minutes after the reception of the  
 23 message. If the comparison results in a mismatch, then the mobile station shall process  
 24 the remaining fields in the message as follows.

25 The mobile station shall store the following parameters:

- 26 • Configuration message sequence number
- 27     ( $\text{CONFIG\_MSG\_SEQ}_S = \text{CONFIG\_MSG\_SEQ}_R$ ,
- 28      $\text{AP\_PILOT\_INFO\_MSG\_SEQ}_S = \text{CONFIG\_MSG\_SEQ}_R$ )
- 29 • Lifetime of the message
- 30     ( $\text{LIFETIME}_S = \text{LIFETIME}_R$ ),

31 For each of the Access Point Pilot Information record contained in the *Access Point Pilot*  
 32 *Information Message*, the mobile station shall perform the following:

- 33 • Set the  $\text{AP\_ASSN\_TYPE}$  field of  $\text{AP\_NGHBR\_REC}_S[i]$  to the  $\text{AP\_ASSN\_TYPE}$  field of
- 34     the  $i^{\text{th}}$  occurrence of  $\text{APPI\_REC}_R$ .
- 35 • If the  $\text{AP\_SID\_SAME\_AS\_PREVIOUS}$  field of the  $i^{\text{th}}$  occurrence of  $\text{APPI\_REC}_R$  is set

to '1', set the AP\_SID field of AP\_NGHBR\_REC<sub>S</sub>[i] to the value of AP\_SID field of AP\_NGHBR\_REC<sub>S</sub>[i-1]. Otherwise, set the AP\_SID field of AP\_NGHBR\_REC[i]<sub>S</sub> to the AP\_SID field of the *i*<sup>th</sup> occurrence of APPI\_REC<sub>R</sub>.

- If the AP\_NID\_SAME\_AS\_PREVIOUS field of the *i*<sup>th</sup> occurrence of APPI\_REC<sub>R</sub> is set to '1', set the AP\_NID field of AP\_NGHBR\_REC<sub>S</sub>[i] to the value of AP\_NID field of AP\_NGHBR\_REC<sub>S</sub>[i-1]. Otherwise, set the AP\_NID field of AP\_NGHBR\_REC[i]<sub>S</sub> to the AP\_NID field of the *i*<sup>th</sup> occurrence of APPI\_REC<sub>R</sub>.

- If the AP\_BAND\_SAME\_AS\_PREVIOUS field of the *i*<sup>th</sup> occurrence of APPI\_REC<sub>R</sub> is set to '1', set the AP\_BAND field of AP\_NGHBR\_REC<sub>S</sub>[i] to the value of AP\_BAND field of AP\_NGHBR\_REC<sub>S</sub>[i-1]. Otherwise, set the AP\_BAND field of AP\_NGHBR\_REC[i]<sub>S</sub> to the AP\_BAND field of the *i*<sup>th</sup> occurrence of APPI\_REC<sub>R</sub>.

- If the AP\_FREQ\_SAME\_AS\_PREVIOUS field of the *i*<sup>th</sup> occurrence of APPI\_REC<sub>R</sub> is set to '1', set the AP\_FREQ field of AP\_NGHBR\_REC<sub>S</sub>[i] to the value of AP\_FREQ field of AP\_NGHBR\_REC<sub>S</sub>[i-1]. Otherwise, set the AP\_FREQ field of AP\_NGHBR\_REC<sub>S</sub>[i] to the AP\_FREQ field of the *i*<sup>th</sup> occurrence of APPI\_REC<sub>R</sub>.

- If the AP\_PN\_REC\_SAME\_AS\_PREVIOUS field of the *i*<sup>th</sup> occurrence of APPI\_REC<sub>R</sub> is set to '1', set the AP\_PN\_REC array values of AP\_NGHBR\_REC<sub>S</sub>[i] to the values of AP\_PN\_REC array of AP\_NGHBR\_REC<sub>S</sub>[i-1]. Otherwise, set the AP\_PN\_REC array values (of length AP\_PN\_COUNT) of AP\_NGHBR\_REC<sub>S</sub>[i] as follows:

- If AP\_PN\_REC\_TYPE field of the *i*<sup>th</sup> occurrence of APPI\_REC<sub>R</sub> is set to '000', set the *k*<sup>th</sup> value of the AP\_PN\_REC array of AP\_NGHBR\_REC<sub>S</sub>[i] to the *k*<sup>th</sup> value of AP\_PN field in the *i*<sup>th</sup> occurrence of APPI\_REC<sub>R</sub>, where *k* is between 0 and AP\_PN\_COUNT-1.

- If AP\_PN\_REC\_TYPE field of the *i*<sup>th</sup> occurrence of APPI\_REC<sub>R</sub> is set to '001', set the *k*<sup>th</sup> value of the AP\_PN\_REC array of AP\_NGHBR\_REC<sub>S</sub>[i] to the AP\_PN\_START + (*k* x AP\_PN\_INC), where AP\_PN\_START and AP\_PN\_INC are fields in the *i*<sup>th</sup> occurrence of APPI\_REC<sub>R</sub>, where *k* is between 0 and AP\_PN\_COUNT-1.

The mobile station may store and use the information in the message if no *Access Point Pilot Information Message* is received within LIFETIME<sub>S</sub> minutes of the reception of the *Access Point Pilot Information Message* that the information is obtained. The mobile station shall not use the information after LIFETIME<sub>S</sub> minutes of the reception of the last *Access Point Pilot Information Message*.

#### 2.6.2.2.20 Access Point Identification Message

Whenever an *Access Point Identification Message* is received on the Paging Channel or the Primary Broadcast Control Channel, the configuration message sequence number, CONFIG\_MSG\_SEQ<sub>R</sub>, shall be compared to that stored in AP\_IDT\_MSG\_SEQ<sub>S</sub>. If the comparison results in a match, the mobile station may ignore the message. If the comparison results in a mismatch, then the mobile station shall process the remaining fields in the message as follows.

1 The mobile station shall store the following parameters:

- 2 • Configuration message sequence number

3 (CONFIG\_MSG\_SEQ<sub>S</sub> = CONFIG\_MSG\_SEQ<sub>R</sub>,

4 AP\_IDT\_MSG\_SEQ<sub>S</sub> = CONFIG\_MSG\_SEQ<sub>R</sub>)

- 5 • ASSTN\_TYPE<sub>S</sub> = ASSTN\_TYPE<sub>R</sub>

- 6 • System identification (SID<sub>S</sub> = SID<sub>R</sub>)

- 7 • Network identification (NID<sub>S</sub> = NID<sub>R</sub>)

- 8 • Access Point identification (AP\_ID<sub>S</sub> = AP\_ID<sub>R</sub>)

- 9 • Access Point identification mask (AP\_ID\_MASK<sub>S</sub> = AP\_ID\_MASK<sub>R</sub>)

- 10 • MSC identification of the base station (IOS\_MSC\_ID<sub>S</sub> = IOS\_MSC\_ID<sub>R</sub>)

- 11 • Cell identification of the base station IOS\_CELL\_ID<sub>S</sub> = IOS\_CELL\_ID<sub>R</sub>)

12 If the HRPD\_ACQ\_REC\_INCL field in the message is set to '1', then the mobile station shall  
13 store the following fields:

- 14 • High Rate Packet Data PN (HRPD\_PN<sub>S</sub> = HRPD\_PN<sub>R</sub>)

- 15 • High Rate Packet Data band class (HRPD\_BAND\_CLASS<sub>S</sub> = HRPD\_BAND\_CLASS<sub>R</sub>)

- 16 • High Rate Packet Data channel number (HRPD\_CHANNEL<sub>S</sub> = HRPD\_CHANNEL<sub>R</sub>)

17 Otherwise, the mobile station shall set the HRPD\_BAND\_CLASS<sub>S</sub> and HRPD\_CHANNEL<sub>S</sub>  
18 fields to NULL.

19 If the LOC\_REC\_TYPE field in the message is set to '001' the mobile station shall store the  
20 following:

- 21 • Base station latitude (BASE\_LAT<sub>S</sub> = BASE\_LAT<sub>R</sub>)

- 22 • Base station longitude (BASE\_LONG<sub>S</sub> = BASE\_LONG<sub>R</sub>)

- 23 • Base station height (BASE\_HEIGHT<sub>S</sub> = BASE\_HEIGHT<sub>R</sub>)

- 24 • Base station horizontal uncertainty (LOC\_UNC\_H<sub>S</sub> = LOC\_UNC\_H<sub>R</sub>)

- 25 • Base station horizontal uncertainty (LOC\_UNC\_V<sub>S</sub> = LOC\_UNC\_V<sub>R</sub>)

26 Otherwise, the mobile station shall set the BASE\_LAT<sub>S</sub>, BASE\_LONG<sub>S</sub>, BASE\_HEIGHT<sub>S</sub>,  
27 LOC\_UNC\_H<sub>S</sub> and LOC\_UNC\_V<sub>S</sub> fields to NULL.

28 If the INTRA\_FREQ\_HO\_HYS\_INCL field in the message is set to '1', then the mobile station  
29 shall store the following field:

- 30 • Intra-frequency idle handoff hysteresis (INTRA\_FREQ\_HO\_HYS<sub>S</sub> =  
31 INTRA\_FREQ\_HO\_HYS<sub>R</sub>)

32 Otherwise, the mobile station shall set the INTRA\_FREQ\_HO\_HYS<sub>S</sub> field to NULL.

33 If the INTRA\_FREQ\_HO\_SLOPE\_INCL field in the message is set to '1', then the mobile  
34 station shall store the following field:

• Intra-frequency idle handoff slope ( $\text{INTRA\_FREQ\_HO\_SLOPE}_S = \text{INTRA\_FREQ\_HO\_SLOPE}_T$ )

Otherwise, the mobile station shall set the  $\text{INTRA\_FREQ\_HO\_SLOPE}_S$  field to 8.

If the  $\text{INTER\_FREQ\_HO\_HYS\_INCL}$  field in the message is set to '1', then the mobile station shall store the following field:

• Inter-frequency idle handoff hysteresis ( $\text{INTER\_FREQ\_HO\_HYS}_S = \text{INTER\_FREQ\_HO\_HYS}_T$ )

Otherwise, the mobile station shall set the  $\text{INTER\_FREQ\_HO\_HYS}_S$  field to NULL.

If the  $\text{INTER\_FREQ\_HO\_SLOPE\_INCL}$  field in the message is set to '1', then the mobile station shall store the following field:

• Inter-frequency idle handoff slope ( $\text{INTER\_FREQ\_HO\_SLOPE}_S = \text{INTER\_FREQ\_HO\_SLOPE}_T$ )

Otherwise, the mobile station shall set the  $\text{INTER\_FREQ\_HO\_SLOPE}_S$  field to 8. If the  $\text{INTER\_FREQ\_SRCH\_TH\_INCL}$  field in the message is set to '1', then the mobile station shall store the following field:

• Inter-frequency idle search threshold ( $\text{INTER\_FREQ\_SRCH\_TH}_S = \text{INTER\_FREQ\_SRCH\_TH}_T$ )

Otherwise, the mobile station shall set the  $\text{INTER\_FREQ\_SRCH\_TH}_S$  field to NULL.

#### 2.6.2.2.21 Access Point Identification Text Message

Whenever an *Access Point Identification Text Message* is received on the Paging Channel or the Primary Broadcast Control Channel, the configuration message sequence number,  $\text{CONFIG\_MSG\_SEQ}_T$ , shall be compared to that stored in  $\text{AP\_ID\_TEXT\_MSG\_SEQ}_S$ . If the comparison results in a match, the mobile station may ignore the message. If the comparison results in a mismatch, then the mobile station shall process the remaining fields in the message as follows.

The mobile station shall store the following parameters:

- Configuration message sequence number

( $\text{CONFIG\_MSG\_SEQ}_S = \text{CONFIG\_MSG\_SEQ}_T$ ,

$\text{AP\_ID\_TEXT\_MSG\_SEQ}_S = \text{CONFIG\_MSG\_SEQ}_T$ )

- Message Encoding ( $\text{MSG\_ENCODING}_S = \text{MSG\_ENCODING}_T$ )

- Mobile station shall store  $i^{\text{th}}$  occurrence of the  $\text{CHAR}_i$  field as follows

$\text{CHAR}_S[i] = \text{CHAR}_i$

#### 2.6.2.2.22 General Overhead Information Message

Whenever a *General Overhead Information Message* is received on the Paging Channel or the Primary Broadcast Control Channel, the configuration message sequence number,  $\text{CONFIG\_MSG\_SEQ}_T$ , shall be compared to that stored in  $\text{GOI\_MSG\_SEQ}_S$ . If the comparison results in a match, the mobile station may ignore the message. If the

1 comparison results in a mismatch, then the mobile station shall process the remaining  
2 fields in the message as follows.

3 The mobile station shall store the following parameters:

- 4 • Configuration message sequence number  
5 (CONFIG\_MSG\_SEQ<sub>S</sub> = CONFIG\_MSG\_SEQ<sub>R</sub>,  
6 GOI\_MSG\_SEQ<sub>S</sub> = CONFIG\_MSG\_SEQ<sub>R</sub>)

7 For each of the General *Overhead* Information record contained in the *General Overhead*  
8 *Information Message*, the mobile station shall perform the following:

- 9 • Set the GOI\_REC\_TYPE<sub>S</sub>[*i*] to the GOI\_REC\_TYPE field of the *i*<sup>th</sup> occurrence of  
10 GOI\_REC\_TYPE<sub>R</sub>.
- 11 • Set the GOI\_REC<sub>S</sub>[*i*] to the GOI\_REC field of the *i*<sup>th</sup> occurrence of GOI\_REC<sub>R</sub>.

#### 12 2.6.2.2.23 Flex Duplex CDMA Channel List Message Overview

13 The mobile station may receive the *Flex Duplex CDMA Channel List Message* from the  
14 Paging Channel or from the Primary Broadcast Control Channel. Whenever a *Flex Duplex*  
15 *CDMA Channel List Message* is received on the Paging Channel, the mobile station shall  
16 compare the configuration message sequence number, CONFIG\_MSG\_SEQ<sub>R</sub>, to that stored  
17 in FD\_CHAN\_LST\_MSG\_SEQ<sub>S</sub>. If the comparison results in a match, the mobile station  
18 may ignore the message. If the comparison results in a mismatch, then the mobile station  
19 shall process the remaining fields in the message as follows:

20 If the *Flex Duplex CDMA Channel List Message* lists CDMA channels from more than one  
21 band class and the mobile station hashes to a band class other than the current band  
22 class, the mobile station shall process this message after NGHBR\_LST\_MSG\_SEQ<sub>S</sub>,  
23 EXT\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub> and GEN\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub> become current.

24 If any of the REMAINING\_FIELD\_INCL fields included in this message is set to '0', the  
25 mobile station shall process the remaining message after EXT\_CHAN\_LST\_MSG\_SEQ<sub>S</sub> is  
26 current.

27 The mobile station shall store the following parameters:

- 28 • Configuration message sequence number  
29 (CONFIG\_MSG\_SEQ<sub>S</sub> = CONFIG\_MSG\_SEQ<sub>R</sub>,  
30 FD\_CHAN\_LST\_MSG\_SEQ<sub>S</sub> = CONFIG\_MSG\_SEQ<sub>R</sub>).
- 31 • If CAND\_BAND\_INFO\_REQ<sub>R</sub> is included, the mobile station shall set  
32 CAND\_BAND\_INFO\_REQ<sub>S</sub> to CAND\_BAND\_INFO\_REQ<sub>R</sub>; otherwise, the mobile  
33 station shall set CAND\_BAND\_INFO\_REQ<sub>S</sub> to '0'.
- 34 • The mobile station shall perform the following for each occurrence of the  
35 CAND\_BAND\_CLASS record:
  - 36 • Set the CAND\_BAND\_CLASS field of CAND\_BAND\_CLASS\_REC[*i*] to the *i*<sup>th</sup>  
37 occurrence of CAND\_BAND\_CLASS<sub>R</sub>.

- 1       • Set the SUBCLASS\_INFO\_INCL field of CAND\_BAND\_CLASS\_REC[i] to the  $i^{\text{th}}$   
2       occurrence of SUBCLASS\_INFO\_INCL<sub>r</sub>.
- 3       • If the  $i^{\text{th}}$  occurrence of SUBCLASS\_INFO\_INCL<sub>r</sub> is set to '1', set the  
4       SUBCLASS\_REC\_LEN field of CAND\_BAND\_CLASS\_REC[i] to the  $i^{\text{th}}$  occurrence  
5       of SUBCLASS\_REC\_LEN<sub>r</sub>.
- 6       • If the  $i^{\text{th}}$  occurrence of SUBCLASS\_INFO\_INCL<sub>r</sub> is set to '1', the mobile  
7       station shall perform the following for each band subclass indicator  
8       received:
  - 9           – Set the BAND\_SUBCLASS\_IND\_REC[j] field of  
10           CAND\_BAND\_CLASS\_REC[i] to the  $j^{\text{th}}$  occurrence of  
11           BAND\_SUBCLASS\_IND<sub>r</sub> in the  $i^{\text{th}}$  CAND\_BAND\_CLASS\_REC record.
- 12      • Set the TD\_MODE field of CAND\_BAND\_CLASS\_REC[i] to the  $i^{\text{th}}$  occurrence of  
13      TD\_MODE<sub>r</sub>
- 14      • Set the BYPASS\_SYS\_DET\_IND field of CAND\_BAND\_CLASS\_REC[i] to the  $i^{\text{th}}$   
15      occurrence of BYPASS\_SYS\_DET\_IND<sub>r</sub>.
- 16      • Set the NUM\_FREQ field of CAND\_BAND\_CLASS\_REC[i] to the  $i^{\text{th}}$  occurrence of  
17      NUM\_FREQ<sub>r</sub>.
- 18      • For each FREQ record included in the CAND\_BAND\_CLASS\_REC[i], the mobile  
19      station shall store the following:
  - 20          • Set the CDMA\_FREQ[j] field of CAND\_BAND\_CLASS\_REC[i] to the  $j^{\text{th}}$   
21          occurrence of CDMA\_FREQ<sub>r</sub>.
  - 22          • If the  $j^{\text{th}}$  occurrence of REMAINING\_FIELD\_INCL field of the  
23          CAND\_BAND\_CLASS\_REC[i] is set to '1', the mobile station shall store the  
24          following:
    - 25              • Set the REV\_CDMA\_FREQ[j] field of CAND\_BAND\_CLASS\_REC[i] to the  
26               $j^{\text{th}}$  occurrence of REV\_CDMA\_FREQ<sub>r</sub> in the  $i^{\text{th}}$   
27              CAND\_BAND\_CLASS\_REC record.
    - 28              • Set the RC\_QPCH\_HASH\_IND[j] field of CAND\_BAND\_CLASS\_REC[i] to  
29              the  $j^{\text{th}}$  occurrence of RC\_QPCH\_HASH\_IND<sub>r</sub> if the field corresponding to  
30              the CDMA\_FREQ[j] field of the  $i^{\text{th}}$  CAND\_BAND\_CLASS\_REC record is  
31              included, otherwise set it to '0'.
    - 32              • Set the TD\_HASH\_IND[j] field of CAND\_BAND\_CLASS\_REC[i] to the  $j^{\text{th}}$   
33              occurrence of TD\_HASH\_IND<sub>r</sub> if the field corresponding to the  
34              CDMA\_FREQ[j] field of the  $i^{\text{th}}$  CAND\_BAND\_CLASS\_REC record is  
35              included, otherwise set it to '0'.
    - 36              • Set the TD\_POWER\_LEVEL[j] field of CAND\_BAND\_CLASS\_REC[i] to the  
37               $j^{\text{th}}$  occurrence of TD\_POWER\_LEVEL<sub>r</sub> if the field corresponding to the  
38              CDMA\_FREQ[j] field of the  $i^{\text{th}}$  CAND\_BAND\_CLASS\_REC record is  
39              included, otherwise set it to '0'.

- 1                   • Set the CDMA\_FREQ\_WEIGHT[j] field of CAND\_BAND\_CLASS\_REC[i] to  
2                   the  $j^{\text{th}}$  occurrence of CDMA\_FREQ\_WEIGHT<sub>r</sub> if the field corresponding  
3                   to the CDMA\_FREQ[j] field of the  $i^{\text{th}}$  CAND\_BAND\_CLASS\_REC record is  
4                   included, otherwise set it to '0'.
- 5                   • Otherwise, the mobile station should set these fields as follows:
- 6                   • If the base station is sending the *Extended CDMA Channel List Message*  
7                   and includes CDMA\_FREQ[j] and CAND\_BAND\_CLASS pair the mobile  
8                   station shall store the following:
  - 9                   • Set the REV\_CDMA\_FREQ[j] field of CAND\_BAND\_CLASS\_REC[i]  
10                   according to [45].
  - 11                   • If the RC\_QPCH\_HASH\_IND<sub>r</sub> field corresponding to the  
12                   CDMA\_FREQ[j] and CAND\_BAND\_CLASS pair in the *Extended CDMA*  
13                   *Channel List Message* is included, set the RC\_QPCH\_HASH\_IND[j]  
14                   field of CAND\_BAND\_CLASS\_REC[i] to this value, Otherwise, set it to  
15                   '0'.
  - 16                   • If the TD\_HASH\_IND<sub>r</sub> field corresponding to the CDMA\_FREQ[j] and  
17                   CAND\_BAND\_CLASS pair in the *Extended CDMA Channel List*  
18                   *Message* is included, set the TD\_HASH\_IND[j] field of  
19                   CAND\_BAND\_CLASS\_REC[i] to this value, Otherwise, set it to '0'.
  - 20                   • If the TD\_POWER\_LEVEL<sub>r</sub> field corresponding to the CDMA\_FREQ[j]  
21                   and CAND\_BAND\_CLASS pair in the *Extended CDMA Channel List*  
22                   *Message* is included, set the TD\_POWER\_LEVEL[j] field of  
23                   CAND\_BAND\_CLASS\_REC[i] to this value, Otherwise, set it to '0'.
  - 24                   • If the CDMA\_FREQ\_WEIGHT<sub>r</sub> field corresponding to the  
25                   CDMA\_FREQ[j] and CAND\_BAND\_CLASS pair in the *Extended CDMA*  
26                   *Channel List Message* is included, set the CDMA\_FREQ\_WEIGHT[j]  
27                   field of CAND\_BAND\_CLASS\_REC[i] to this value, Otherwise, set it to  
28                   '0'.
- 29                   • If the base station is not sending the *Extended CDMA Channel List*  
30                   *Message* or if the CDMA\_FREQ[j] and CAND\_BAND\_CLASS pair is not  
31                   included in the *Extended CDMA Channel List Message* the mobile station  
32                   shall set store the following:
  - 33                   • Set the REV\_CDMA\_FREQ[j] field of CAND\_BAND\_CLASS\_REC[i]  
34                   according to [45].
  - 35                   • Set the RC\_QPCH\_HASH\_IND[j] field of CAND\_BAND\_CLASS\_REC[i]  
36                   to '0'.
  - 37                   • Set the TD\_HASH\_IND[j] field of CAND\_BAND\_CLASS\_REC[i] to '0'.
  - 38                   • Set the TD\_POWER\_LEVEL[j] field of CAND\_BAND\_CLASS\_REC[i] to  
39                   '0'.
- 40                   • Set the CDMA\_FREQ\_WEIGHT[j] field of CAND\_BAND\_CLASS\_REC[i] to '0'.

1 If this message is received on the Paging Channel, the mobile station shall process it as  
 2 specified in the section 2.6.2.2.23.1. Otherwise the mobile station shall process the  
 3 message as specified in section 2.6.2.2.23.2.

#### 4 2.6.2.2.23.1 Flex Duplex CDMA Channel List Message on Paging Channel

5 The mobile station shall determine the CDMA Channel (Frequency Assignment) for its  
 6 Paging Channel as follows:

- 7 • Starting from an empty list, the mobile station shall generate the first CDMA  
 8 Channel list from the *Flex Duplex CDMA Channel List Message* as follows:
  - 9 – For each band class record included in this message, the mobile station shall  
 10 perform the following:
    - 11 + If band subclass information is included for this band class record  
 12 (SUBCLASS\_INFO\_INCL<sub>S</sub> = '1'), the mobile station shall add only those  
 13 channels belonging to the band class and band subclasses that are  
 14 supported by both the mobile station and the base station, in the order they  
 15 appear in the *Flex Duplex CDMA Channel List Message*<sup>13</sup>.
    - 16 + Otherwise (SUBCLASS\_INFO\_INCL<sub>S</sub> = '0' or P\_REV\_IN\_USE<sub>S</sub> is less than 11),  
 17 the mobile station shall add only those channels that it supports for the  
 18 associated band class, in the order they appear in the *Flex Duplex CDMA*  
 19 *Channel List Message*.
  - 20 – If P\_REV\_IN\_USE<sub>S</sub> is greater than or equal to 11, the mobile station shall sort the  
 21 channels first by the ascending order of band class value, as specified in [30], then  
 22 by the ascending order of CDMA\_FREQ within each band class.
- 23 • If RC\_QPCH\_SEL\_INCL<sub>R</sub> is equal to '1' and the mobile station is capable of RC  
 24 greater than 2 or capable of supporting Quick Paging Channel, the mobile station  
 25 shall eliminate the channels with RC\_QPCH\_HASH\_IND<sub>S</sub> equal to '0' from the first  
 26 CDMA Channel list to generate the second CDMA Channel list while preserving the  
 27 order in the first CDMA Channel list. Otherwise, the mobile station shall set the  
 28 second CDMA Channel list to be equal to the first CDMA Channel list.
- 29 • The mobile station shall generate the third CDMA Channel list as follows.
  - 30 – If CDMA\_FREQ\_WEIGHT\_INCL<sub>R</sub> is equal to '0', the mobile station shall set the  
 31 third CDMA Channel list to be equal to the second CDMA Channel list.

---

<sup>13</sup> The mobile station will not discard frequencies as long as they belong to a subclass that is both listed in the message and supported by the mobile station. If the base station does not list any subclass, the mobile station assumes that all subclasses are supported by the base station. The subclass to frequency mapping is not provided in the *Extended CDMA Channel List Message*; the mobile station needs to refer to [45] to find the mapping.

- 1       – If CDMA\_FREQ\_WEIGHT\_INCL<sub>r</sub> is equal to '1', starting with an empty third
- 2       CDMA Channel list, for each entry "E" in the second CDMA Channel list in the
- 3       order they appear, the mobile station shall append N consecutive entries "E" at
- 4       the end of the third CDMA Channel list, where N is the weight of "E" and equals
- 5       CDMA\_FREQ\_WEIGHT<sub>S</sub>+1.
- 6       • The mobile station shall generate a CDMA band list as follows. Starting with an
- 7       empty CDMA band list, for each channel in the third CDMA Channel list in the
- 8       order they appear, the mobile station shall append an entry equal to the band class
- 9       of that channel, at the end of the CDMA band list.
- 10      • The mobile station shall use the hash algorithm specified in 2.6.7.1 and the size of
- 11      the CDMA band list to compute the band class for its Paging Channel.
- 12      • The mobile station shall eliminate those channels which are not in the computed
- 13      band class from the third CDMA channel list to generate the final CDMA channel
- 14      list.
- 15      • If the final CDMA Channel list is empty, the mobile station shall proceed with the
- 16      processing of *Extended CDMA Channel List message* and the *CDMA Channel List*
- 17      *message*.
- 18      • The mobile station shall then use the hash algorithm specified in 2.6.7.1 and the
- 19      size of the final CDMA channel list to determine the CDMA Channel (Frequency
- 20      Assignment) for its Paging Channel.

21      Figure 2.6.2.2.12.1-1 shows an example of the hashing procedure.

22      If the CDMA Frequency Assignment has changed but the band class is the same (the  
 23      computed CDMA Channel is different from CDMACH<sub>S</sub> but the computed CDMA band class  
 24      is the same as CDMABAND<sub>S</sub>), the mobile station shall perform the following actions:

- 25      • If the stored configuration parameters is not current (see 2.6.2.2) for the
- 26      corresponding base station and frequency assignment, the mobile station shall
- 27      perform the following actions:
- 28      – Set CDMACH<sub>S</sub> to the new CDMA Channel.
- 29      – Set REVCDMACH<sub>S</sub> to the Reverse CDMA Channel.
- 30      – Set PAGE\_CHAN<sub>S</sub> to '1'.
- 31      – Set PAGECH<sub>S</sub> to the Primary Paging Channel.

- 1       o Set CONFIG\_MSG\_SEQ<sub>s</sub>, SYS\_PAR\_MSG\_SEQ<sub>s</sub>, NGHBR\_LST\_MSG\_SEQ<sub>s</sub>,  
2       CHAN\_LST\_MSG\_SEQ<sub>s</sub>, EXT\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>,  
3       FD\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>, EXT\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>,  
4       GEN\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, EXT\_SYS\_PAR\_MSG\_SEQ<sub>s</sub>,  
5       GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub>, EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub>,  
6       USER\_ZONE\_IDMSG\_SEQ<sub>s</sub>, PRI\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, and  
7       ACC\_MSG\_SEQ<sub>s</sub> to NULL. The mobile station shall keep the parameters  
8       associated with the current overhead messages until they are updated on the  
9       new Paging Channel<sup>14</sup>
- 10      o Tune to the new CDMA Channel.
- 11      • Otherwise, the mobile station shall perform the following actions:  
12      – Set CDMACH<sub>s</sub> to the new CDMA Channel.  
13      – The mobile station shall use the hash algorithm specified in 2.6.7.1 to select a  
14      new Paging Channel number in the range 1 to PAGE\_CHAN<sub>s</sub>, where  
15      PAGE\_CHAN<sub>s</sub> is the value stored for the Paging Channel whose stored  
16      information is current. The mobile station shall store the new Paging Channel  
17      number as PAGECH<sub>s</sub>.  
18      – Tune to the new CDMA Channel and shall begin monitoring the new Paging  
19      Channel.
- 20   If the band class has changed (the computed CDMA band class is different than  
21   CDMABAND<sub>s</sub>), the mobile station shall perform the following actions:  
22      • If BYPASS\_SYS\_DET\_IND<sub>s</sub> is equal to '0' for this CDMA channel, the mobile station  
23      shall perform the following:  
24      – Set NEW\_BAND\_RECORD.NEW\_BAND\_CLASS to the computed band class  
25      – Set NEW\_BAND\_RECORD.NEW\_FREQ to the computed CDMA Channel  
26      – The mobile station shall enter the *System Determination Substate* of the *Mobile*  
27      *Station Initialization State* with a new band indication.  
28      • If BYPASS\_SYS\_DET\_IND<sub>s</sub> is equal to '1' for this CDMA channel, the mobile station  
29      shall perform the following:  
30      – If the stored configuration parameters is not current (see 2.6.2.2) for the  
31      corresponding base station and frequency assignment, the mobile station shall  
32      perform the following actions:  
33      + Set CDMACH<sub>s</sub> to the new CDMA Channel.

---

<sup>14</sup> This is primarily needed when hashing to a band with a different coverage footprint than the current band. The current neighbor list is to be used to search for pilots in the hashed-to band. The search priorities are to be adjusted to take into account the hashed-to frequency (e.g., the pilots in the hashed-to frequency should have the highest priority).

- 1           + Set REVCDMACH<sub>S</sub> to the Reverse CDMA Channel.
- 2           + Set CDMABAND<sub>S</sub> to the new band class.
- 3           + Set PAGE\_CHAN<sub>S</sub> to '1'.
- 4           + Set PAGECH<sub>S</sub> to the Primary Paging Channel.
- 5           + Set CONFIG\_MSG\_SEQ<sub>S</sub>, SYS\_PAR\_MSG\_SEQ<sub>S</sub>, NGHBR\_LST\_MSG\_SEQ<sub>S</sub>,  
6           CHAN\_LST\_MSG\_SEQ<sub>S</sub>, EXT\_CHAN\_LST\_MSG\_SEQ<sub>S</sub>,  
7           FD\_CHAN\_LST\_MSG\_SEQ<sub>S</sub>, EXT\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub>,  
8           GEN\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub>, EXT\_SYS\_PAR\_MSG\_SEQ<sub>S</sub>,  
9           GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>S</sub>, EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>S</sub>,  
10          USER\_ZONE\_IDMSG\_SEQ<sub>S</sub>, PRI\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub>, and  
11          ACC\_MSG\_SEQ<sub>S</sub> to NULL. The mobile station shall keep the parameters  
12          associated with the current overhead messages until they are updated on  
13          the new Paging Channel<sup>15</sup>.
- 14          + Tune to the new CDMA Channel.
- 15          – Otherwise, the mobile station shall perform the following actions:
- 16           + Set CDMACH<sub>S</sub> to the new CDMA Channel.
- 17           + Set CDMABAND<sub>S</sub> to the new band class.
- 18           + The mobile station shall use the hash algorithm specified in 2.6.7.1 to select  
19           a new Paging Channel number in the range 1 to PAGE\_CHAN<sub>S</sub>, where  
20           PAGE\_CHAN<sub>S</sub> is the value stored for the Paging Channel whose stored  
21           information is current. The mobile station shall store the new Paging  
22           Channel number as PAGECH<sub>S</sub>.
- 23          + Tune to the new CDMA Channel and shall begin monitoring the new Paging  
24          Channel.

#### 25   2.6.2.2.23.2 Flex Duplex CDMA Channel List Message on Primary Broadcast Control 26   Channel

27   To determine the CDMA Channel (Frequency Assignment) for its Primary Broadcast  
28   Control Channel, the mobile station shall first select a subset of CDMA channels from the  
29   *Flex Duplex CDMA Channel List Message* that will be used for channel hashing. The  
30   attributes for channel selection are support for that frequency, the band subclass (if  
31   included), RC greater than 2, Quick Paging Channel and transmit diversity. The mobile  
32   station shall first select the entire CDMA channel list for channel hashing. Starting from  
33   an empty list, the mobile station shall then select the first CDMA Channel list as follows:

---

<sup>15</sup> This is primarily needed when hashing to a band with a different coverage footprint than the current band. The current neighbor list is to be used to search for pilots in the hashed-to band. The search priorities are to be adjusted to take into account the hashed-to frequency (e.g., the pilots in the hashed-to frequency should have the highest priority).

- 1       – For each band class record included in this message, the mobile station shall
- 2       perform the following:
- 3       – If band subclass information is included for this band class record
- 4       (SUBCLASS\_INFO\_INCL<sub>S</sub> = '1'), the mobile station shall add only those channels
- 5       belonging to the band class and band subclasses that are supported by both
- 6       the mobile station and the base station, in the order they appear in the *Flex*
- 7       *Duplex CDMA Channel List Message*<sup>16</sup>.
- 8       – Otherwise (SUBCLASS\_INFO\_INCL<sub>S</sub> = '0' or P\_REV\_IN\_USE<sub>S</sub> is less than 11),
- 9       the mobile station shall add only those channels that it supports for the
- 10       associated band class, in the order they appear in the *Flex Duplex CDMA*
- 11       *Channel List Message*.
- 12       • If P\_REV\_IN\_USE<sub>S</sub> is greater than or equal to 11, the mobile station shall sort the
- 13       channels first by the ascending order of band class value as specified in [30], then
- 14       by the ascending order of CDMA\_FREQ within each band class.
- 15       • If TD\_SEL\_INCL<sub>R</sub> is equal to '1', the mobile station shall perform the following:
- 16       – If the mobile station is capable of supporting the transmit diversity mode
- 17       specified by TD\_MODE<sub>S</sub>, the mobile station shall select those CDMA channels
- 18       that have TD\_HASH\_IND<sub>S</sub> set to '1' from the CDMA channel list for the first
- 19       CDMA Channel list while preserving the order.
- 20       – If the mobile station is not capable of supporting the transmit diversity mode
- 21       specified by TD\_MODE<sub>S</sub>, the mobile station shall select those CDMA channels
- 22       that have TD\_HASH\_IND<sub>S</sub> set to '0' from the CDMA channel list for the first
- 23       CDMA Channel list while preserving the order.
- 24       • If TD\_SEL\_INCL<sub>R</sub> is equal to '0', the mobile station shall select the entire list for the
- 25       first CDMA Channel list.
- 26       From this first CDMA Channel list, the mobile station shall select the second CDMA
- 27       Channel list as follows:
- 28       • If RC\_QPCH\_SEL\_INCL<sub>R</sub> is equal to '1' and the mobile station is capable of RC
- 29       greater than 2 or capable of supporting QPCH, the mobile station shall select those
- 30       CDMA channels with RC\_QPCH\_HASH\_IND<sub>S</sub> set to '1' for the second CDMA
- 31       Channel list for CDMA channel hashing while preserving the order. If this list is
- 32       empty, the mobile station shall use the first CDMA Channel list as the second

---

<sup>16</sup> The mobile station will not discard frequencies as long as they belong to a subclass that is both listed in the message and supported by the mobile station. If the base station does not list any subclass, the mobile station assumes that all subclasses are supported by the base station. The subclass to frequency mapping is not provided in the *Extended CDMA Channel List Message*; the mobile station needs to refer to [45] to find the mapping.

1 CDMA Channel list for CDMA channel hashing.

- 2 • Otherwise, the mobile station shall use the first CDMA Channel list as the second  
3 CDMA Channel list for CDMA channel hashing.

4 From this second CDMA Channel list, the mobile station shall select the third CDMA  
5 Channel listsubset as follows:

- 6 • If CDMA\_FREQ\_WEIGHT\_INCL<sub>r</sub> is equal to '0', the mobile station shall set the third  
7 CDMA Channel list to be equal to the second CDMA Channel list  
8 • If CDMA\_FREQ\_WEIGHT\_INCL<sub>r</sub> is equal to '1', starting with an empty third CDMA  
9 Channel list, for each entry "E" in the second CDMA Channel list in the order they  
10 appear, the mobile station shall append N consecutive entries "E" at the end of the  
11 third CDMA Channel, where N is the weight of "E" and equals  
12 CDMA\_FREQ\_WEIGHT<sub>s</sub>+1.

13 The mobile station shall determine the band class for its Primary Broadcast Control  
14 Channel as follows:

- 15 • The mobile station shall generate a CDMA band list as follows. Starting with an  
16 empty CDMA band list, for each channel in the third CDMA Channel list in the  
17 order they appear, the mobile station shall append an entry equal to the band class  
18 of that channel, at the end of the CDMA band list  
19 • The mobile station shall use the hash algorithm specified in 2.6.7.1 and the size of  
20 the CDMA band list to compute the band class for its Primary Broadcast Control  
21 Channel.

22 After the band class has been selected, the mobile station shall determine the CDMA  
23 Channel (Frequency Assignment) for its Primary Broadcast Control Channel as follows:

- 24 • The mobile station shall eliminate those channels which are not in the computed  
25 band class from the third CDMA Channel list to generate the final CDMA Channel  
26 list.  
27 • If the final CDMA Channel list is empty, the mobile station shall proceed with the  
28 processing of the *Extended CDMA Channel List message*.  
29 • The mobile station shall then use the hash algorithm specified in 2.6.7.1 with the  
30 number of channels in the final CDMA Channel list to determine the CDMA  
31 Channel (Frequency Assignment) for its Primary Broadcast Control Channel.

32 If the CDMA Frequency Assignment has changed but the band class is the same (the  
33 computed CDMA Channel is different from CDMACH<sub>s</sub> but the computed CDMA band class  
34 is CDMABAND<sub>s</sub>), the mobile station shall perform the following:

- 35 • Set CDMACH<sub>s</sub> to the new CDMA Channel.  
36 • Set REVCDMACH<sub>s</sub> to the new Reverse CDMA Channel.

- 1     • Set CONFIG\_MSG\_SEQ<sub>S</sub>, A41\_SYS\_PAR\_MSG\_SEQ<sub>S</sub>, MC\_RR\_PAR\_MSG\_SEQ<sub>S</sub>,  
2       UNI\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub>, EXT\_CHAN\_LST\_MSG\_SEQ<sub>S</sub>,  
3       FD\_CHAN\_LST\_MSG\_SEQ<sub>S</sub>, USER\_ZONE\_ID\_MSG\_SEQ<sub>S</sub>, and  
4       PRI\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub> and ACC\_MSG\_SEQ<sub>S</sub> to NULL. The mobile station  
5       shall keep the parameters associated with the current overhead messages until  
6       they are updated on the new Primary Broadcast Control Channel<sup>17</sup>.
  - 7     • If the mobile station is operating in the Spreading Rate 1:
    - 8       – If the assigned CDMA channel supports transmit diversity, the mobile station  
9         shall set the following fields corresponding to the assigned CDMA channel:
      - 10          + SR1\_TD\_POWER\_LEVEL<sub>S</sub> = TD\_POWER\_LEVEL<sub>R</sub>.
      - 11          + SR1\_TD\_MODE<sub>S</sub> = TD\_MODE<sub>R</sub>.
      - 12          + BRAT<sub>S</sub> = SR1\_BRAT\_TD<sub>S</sub>.
      - 13          + BCCH\_CODE\_RATE<sub>S</sub> = SR1\_CRAT\_TD<sub>S</sub>.
      - 14          + BCCH<sub>S</sub> = BCCH\_CODE\_CHAN\_TD<sub>S</sub>.
    - 15       – Otherwise, the mobile station shall set the following fields corresponding to the  
16         assigned CDMA channel:
      - 17          + BRAT<sub>S</sub> = SR1\_BRAT\_NON\_TD<sub>S</sub>,
      - 18          + BCCH\_CODE\_RATE<sub>S</sub> = SR1\_CRAT\_NON\_TD<sub>S</sub>,
      - 19          + BCCH<sub>S</sub> = BCCH\_CODE\_CHAN\_NON\_TD<sub>S</sub>,
  - 20     • Tune to the new CDMA Channel
- 21 If the band class has changed (the computed CDMA band class is different than  
22 CDMABAND<sub>S</sub>), the mobile station shall perform the following actions:
- 23     • If BYPASS\_SYS\_DET\_IND<sub>S</sub> is equal to '0' for this CDMA channel, the mobile station  
24       shall perform the following:
    - 25       – Set NEW\_BAND\_RECORD.NEW\_BAND\_CLASS to the computed band class.
    - 26       – Set NEW\_BAND\_RECORD.NEW\_FREQ to the computed CDMA Channel.
    - 27       – The mobile station shall enter the *System Determination Substate* of the *Mobile*  
28         *Station Initialization State* with a new band indication.
  - 29     • If BYPASS\_SYS\_DET\_IND<sub>S</sub> is equal to '1' for this CDMA channel, the mobile station  
30       shall perform the following:
    - 31       – Set CDMACH<sub>S</sub> to the new CDMA Channel.

---

<sup>17</sup> This is primarily needed when hashing to a band with a different coverage footprint than the current band. The current neighbor list is to be used to search for pilots in the hashed-to band. The search priorities are to be adjusted to take into account the hashed-to frequency (e.g., the pilots in the hashed-to frequency should have the highest priority).

- 1       – Set REVCDMACH<sub>S</sub> to the new Reverse CDMA Channel.
- 2       – Set CDMABAND<sub>S</sub> to the new band class.
- 3       – Set CONFIG\_MSG\_SEQ<sub>S</sub>, A41\_SYS\_PAR\_MSG\_SEQ<sub>S</sub>, MC\_RR\_PAR\_MSG\_SEQ<sub>S</sub>,
- 4       UNI\_NGHR\_LST\_MSG\_SEQ<sub>S</sub>, EXT\_CHAN\_LST\_MSG\_SEQ<sub>S</sub>,
- 5       FD\_CHAN\_LST\_MSG\_SEQ<sub>S</sub>, USER\_ZONE\_ID\_MSG\_SEQ<sub>S</sub>, and
- 6       PRI\_NGHR\_LST\_MSG\_SEQ<sub>S</sub> and ACC\_MSG\_SEQ<sub>S</sub> to NULL. The mobile
- 7       station shall keep the parameters associated with the current overhead
- 8       messages until they are updated on the new Primary Broadcast Control
- 9       Channel<sup>18</sup>.
- 10      – If the mobile station is operating in the Spreading Rate 1:
  - 11       + If the assigned CDMA channel supports transmit diversity, the mobile
  - 12       station shall set the following fields corresponding to the assigned CDMA
  - 13       channel:
    - 14       o SR1\_TD\_POWER\_LEVEL<sub>S</sub> = TD\_POWER\_LEVEL<sub>R</sub>.
    - 15       o SR1\_TD\_MODE<sub>S</sub> = TD\_MODE<sub>R</sub>.
    - 16       o BRAT<sub>S</sub> = SR1\_BRAT\_TD<sub>S</sub>.
    - 17       o BCCH\_CODE\_RATE<sub>S</sub> = SR1\_CRAT\_TD<sub>S</sub>.
    - 18       o BCCH<sub>S</sub> = BCCH\_CODE\_CHAN\_TD<sub>S</sub>.
  - 19       – Otherwise, the mobile station shall set the following fields corresponding to the
  - 20       assigned CDMA channel:
    - 21       + BRAT<sub>S</sub> = SR1\_BRAT\_NON\_TD<sub>S</sub>,
    - 22       + BCCH\_CODE\_RATE<sub>S</sub> = SR1\_CRAT\_NON\_TD<sub>S</sub>,
    - 23       + BCCH<sub>S</sub> = BCCH\_CODE\_CHAN\_NON\_TD<sub>S</sub>,
- 24      – Tune to the new CDMA Channel

#### 25   2.6.2.2.24 Alternative Technologies Information Message

26   Whenever a *Alternative Technologies Information Message* is received on the Paging Channel  
 27   or the Primary Broadcast Control Channel, the configuration message sequence number,  
 28   CONFIG\_MSG\_SEQ<sub>R</sub>, shall be compared to that stored in ATIM\_MSG\_SEQ<sub>S</sub>. If the  
 29   comparison results in a match, the mobile station may ignore the message. If the  
 30   comparison results in a mismatch, then the mobile station shall process the remaining  
 31   fields in the message as follows.

---

<sup>18</sup> This is primarily needed when hashing to a band with a different coverage footprint than the current band. The current neighbor list is to be used to search for pilots in the hashed-to band. The search priorities are to be adjusted to take into account the hashed-to frequency (e.g., the pilots in the hashed-to frequency should have the highest priority).

1 The mobile station shall store the following parameters:

- 2 • Configuration message sequence number
- 3 (CONFIG\_MSG\_SEQ<sub>S</sub> = CONFIG\_MSG\_SEQ<sub>R</sub>,
- 4 ATIM\_MSG\_SEQ<sub>S</sub> = CONFIG\_MSG\_SEQ<sub>R</sub>)

5 The mobile station shall store all the Radio Interface records contained in the *Alternative*  
6 *Technologies Information Message*.

### 7 2.6.2.3 Mobile Station Page Match Operation

8 The *Mobile Station Page Match Operation* is performed whenever the mobile station receives  
9 a mobile-station-addressed page or a broadcast page. If the mobile station receives a  
10 mobile-station-addressed page that contains the IMSI or TMSI assigned to the mobile  
11 station (see [4]) on the Paging Channel, the mobile station transmits a *Page Response*  
12 *Message* on the Access Channel. If the mobile station receives a mobile-station-addressed  
13 page that contains the IMSI or TMSI assigned to the mobile station (see [4]) on the Forward  
14 Common Control Channel, the mobile station transmits a *Page Response Message* on the  
15 r-csch. If the mobile station is configured to receive broadcast messages and it receives a  
16 *General Page Message* that contains a burst type and broadcast address that the mobile  
17 station has been configured to receive (see [4]) on the Paging Channel, the mobile station  
18 performs the broadcast page procedures as described in 2.6.2.1.1.3.4. If the mobile station  
19 is configured to receive broadcast messages and it receives a *General Page Message* or a  
20 *Universal Page Message* that contains a burst type and broadcast address that the mobile  
21 station has been configured to receive (see [4]) on the Forward Common Control Channel,  
22 the mobile station performs the enhanced broadcast page procedures as described in  
23 2.6.2.1.1.3.6.

24 When the mobile station receives a page message, it shall compare the configuration  
25 message sequence number, CONFIG\_MSG\_SEQ<sub>R</sub>, to CONFIG\_MSG\_SEQ<sub>S</sub>. If the  
26 comparison results in a mismatch, then the mobile station shall set CONFIG\_MSG\_SEQ<sub>S</sub>  
27 to CONFIG\_MSG\_SEQ<sub>R</sub>. The mobile station shall also compare the *Access Parameters*  
28 *Message* or the *Enhanced Access Parameters Message* sequence number, ACC\_MSG\_SEQ<sub>R</sub>,  
29 with that stored in ACC\_MSG\_SEQ<sub>S</sub>. If the comparison results in a mismatch, then the  
30 mobile station shall set ACC\_MSG\_SEQ<sub>S</sub> to NULL (see 2.6.2.2). The mobile station shall  
31 set CURR\_ACC\_MSG\_SEQ to ACC\_MSG\_SEQ<sub>S</sub>.

32 The mobile station shall process each record for which it declares a page match (see [4]).

33 If the mobile station receives a broadcast page that contains a burst type and broadcast  
34 address that the mobile station has been configured to receive on the Paging Channel, the  
35 mobile station should perform the broadcast page procedures described in 2.6.2.1.1.3.4. If  
36 the mobile station receives a broadcast page that contains a burst type and broadcast  
37 address that the mobile station has been configured to receive on the Forward Common  
38 Control Channel, the mobile station should perform the enhanced broadcast page  
39 procedures as described in 2.6.2.1.1.3.6.

40 If a page match is declared, the mobile station shall perform the following:

- 1       • The mobile station shall enter the *Update Overhead Information Substate* of the
- 2       *System Access State* (see 2.6.3.2) with a page response indication within  $T_{33m}$
- 3       seconds after the page message is received.

4   If a page match is declared and the mobile station determines that it should be monitoring

5   a neighboring base station, the mobile station may perform an access entry handoff to the

6   neighboring base station, if all of the following conditions hold:

- 7       • The neighboring base station is listed in NGHBR\_REC.
- 8       • The ACCESS\_ENTRY\_HO field of the NGHBR\_REC corresponding to the
- 9       neighboring base station is equal to '1'.
- 10      • If the mobile station performs an access entry handoff on the Access Channel, none
- 11      of CONFIG\_MSG\_SEQ<sub>s</sub>, SYS\_PAR\_MSG\_SEQ<sub>s</sub>, NGHBR\_LST\_MSG\_SEQ<sub>s</sub>,
- 12      EXT\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, GEN\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>,
- 13      CHAN\_LST\_MSG\_SEQ<sub>s</sub>, EXT\_SYS\_PAR\_MSG\_SEQ<sub>s</sub>, EXT\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>,
- 14      FD\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>, USER\_ZONE\_ID\_MSG\_SEQ<sub>s</sub>, and
- 15      PRI\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub> are equal to NULL.
- 16      • If the mobile station performs an access entry handoff on the Enhanced Access
- 17      Channel, none of CONFIG\_MSG\_SEQ<sub>s</sub>, A41\_SYS\_PAR\_MSG\_SEQ<sub>s</sub>,
- 18      MC\_RR\_PAR\_MSG\_SEQ<sub>s</sub>, UNI\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>,
- 19      EXT\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>, FD\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>,
- 20      USER\_ZONE\_ID\_MSG\_SEQ<sub>s</sub>, and PRI\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub> are equal to NULL.

21   Otherwise, the mobile station shall not perform an access entry handoff to the neighboring

22   base station.

23   The mobile station need not perform an access entry handoff to a base station operating on

24   another frequency.

25   If the mobile station performs an access entry handoff, it shall follow the procedures

26   specified in 2.6.2.1.4.2 and shall perform the access entry handoff before entering the

27   *Update Overhead Information Substate* of the *System Access State* (see 2.6.3.2).

28   If PACA is enabled, and if the mobile station performs an access entry handoff, the mobile

29   station shall respond to the mobile-station-addressed page first and shall then re-originate

30   the PACA call on the new base station.

#### 31   2.6.2.4 Mobile Station Order and Message Processing Operation

32   During the *Mobile Station Order and Message Processing Operation*, the mobile station

33   processes all messages except overhead messages (see 2.6.2.2) and page messages (see

34   2.6.2.3).

35   The mobile station shall set CURR\_ACC\_MSG\_SEQ to NULL.

36   The mobile station shall perform address matching as described in [4].

37   If Layer 3 receives a message that requires acknowledgment, the mobile station shall enter

38   the *Update Overhead Information Substate* of the *System Access State* with an

39   order/message response indication within  $T_{33m}$  seconds, unless otherwise specified for a

40   particular message.

If Layer 3 receives a message that does not require acknowledgment, the mobile station shall transmit a response only if it is required by the message or order. If a response is required, the mobile station shall enter the *Update Overhead Information Substate* of the *System Access State* with an order/message response indication within T<sub>33m</sub> seconds, unless otherwise specified for a particular message.

If the mobile station is to enter the *Update Overhead Information Substate* of the *System Access State* with an order/message response indication and the mobile station determines that it should be monitoring a neighboring base station, the mobile station may perform an access entry handoff to the neighboring base station, if all of the following conditions hold:

- The neighboring base station is listed in NGHBR\_REC.
- The ACCESS\_ENTRY\_HO field of the NGHBR\_REC corresponding to the neighboring base station is equal to '1'.
- ACC\_ENT\_HO\_ORDER<sub>s</sub> is equal to '1'.
- If the mobile station performs an access entry handoff on the Access Channel, none of CONFIG\_MSG\_SEQ<sub>s</sub>, SYS\_PAR\_MSG\_SEQ<sub>s</sub>, NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, EXT\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, GEN\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, CHAN\_LST\_MSG\_SEQ<sub>s</sub>, EXT\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>, FD\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>, USER\_ZONE\_ID\_MSG\_SEQ<sub>s</sub>, PRI\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, and EXT\_SYS\_PAR\_MSG\_SEQ<sub>s</sub> are equal to NULL.
- If the mobile station performs an access entry handoff on the Enhanced Access Channel, none of CONFIG\_MSG\_SEQ<sub>s</sub>, A41\_SYS\_PAR\_MSG\_SEQ<sub>s</sub>, MC\_RR\_PAR\_MSG\_SEQ<sub>s</sub>, UNI\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, EXT\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>, FD\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>, USER\_ZONE\_ID\_MSG\_SEQ<sub>s</sub>, and PRI\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub> are equal to NULL.

Otherwise, the mobile station shall not perform an access entry handoff to the neighboring base station.

The mobile station need not perform an access entry handoff to a base station operating on another frequency.

If the mobile station performs an access entry handoff, it shall follow the procedures specified in 2.6.2.1.4.2 and shall perform the access entry handoff before entering the *Update Overhead Information Substate* of the *System Access State* (see 2.6.3.2). If PACA is enabled and the mobile station performs an access entry handoff, the mobile station shall respond to the order/message first and then re-originate the PACA call in the new base station.

The following directed messages and orders can be received. If any field value of the message or order is outside its permissible range, the mobile station shall send a *Mobile Station Reject Order* with ORDQ equal to '00000100' (message field not in valid range).

1. *Abbreviated Alert Order*: The mobile station may alert the user.
2. *Audit Order*

- 1       3. *Authentication Challenge Message*: The mobile station shall process the message  
2       and shall respond with an *Authentication Challenge Response Message* as specified  
3       in 2.3.12.1.4, regardless of the value of  $AUTH_S$ . The mobile station shall enter the  
4       *Update Overhead Information Substate* of the *System Access State* with an  
5       order/message response indication within  $T_{32m}$  seconds.
- 6       4. *Authentication Request Message*: The mobile station shall process the message  
7       and shall respond as specified in 2.3.12.5.2. The mobile station shall enter the  
8       *Update Overhead Information Substate* of the *System Access State* with an  
9       order/message response indication within  $T_{32m}$  seconds.
- 10      5. *Base Station Challenge Confirmation Order*: The mobile station shall process the  
11      message and shall respond with an *SSD Update Confirmation Order* or *SSD Update*  
12      *Rejection Order* as specified in 2.3.12.1.5. The mobile station shall enter the  
13      *Update Overhead Information Substate* of the *System Access State* with an  
14      order/message response indication within  $T_{32m}$  seconds.
- 15      6. *Base Station Reject Order*: The mobile station shall perform the procedures as  
16      specified in 2.6.11.5.
- 17      7. *Channel Assignment Message*: The mobile station shall process the message as  
18      follows:
  - 19       • If  $ASSIGN\_MODE_R$  equals '001', the mobile station shall perform the following  
20       actions:
    - 21       - If the message requires acknowledgment, the mobile station shall wait until  
22       Layer 3 receives an indication from Layer 2 that the acknowledgment to the  
23       message has been sent and acknowledged.
    - 24       - If a CDMA channel ( $CDMA\_FREQ$ ) is specified in the assignment, the mobile  
25       station shall set  $CDMACH_S = CDMA\_FREQ_R$ , tune to the new Frequency  
26       Assignment, and measure the strength of each pilot listed in the assignment  
27       using the Neighbor Set search procedures specified in 2.6.6.2.1 and  
28       2.6.6.2.2.
    - 29       - The mobile station shall set  $CONFIG\_MSG\_SEQ_S$  and  $ACC\_MSG\_SEQ_S$  to  
30       NULL (see 2.6.2.2) and shall set  $PILOT\_PN_S$  to the pilot PN sequence offset of  
31       the strongest pilot in the list ( $PILOT\_PN_R$ ).

- 1        - If the mobile station has not stored configuration parameters for the Primary  
2        Paging Channel of the new base station, or if the stored information is not  
3        current (see 2.6.2.2), the mobile station shall set SYS\_PAR\_MSG\_SEQ<sub>s</sub>,  
4        NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, EXT\_NGHRBR\_LST\_MSG\_SEQ<sub>s</sub>,  
5        GEN\_NGHRBR\_LST\_MSG\_SEQ<sub>s</sub>, CHAN\_LST\_MSG\_SEQ<sub>s</sub>,  
6        EXT\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>, FD\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>,  
7        EXT\_SYS\_PAR\_MSG\_SEQ<sub>s</sub>, USER\_ZONE\_ID\_MSG\_SEQ<sub>s</sub>,  
8        PRI\_NGHRBR\_LST\_MSG\_SEQ<sub>s</sub>, GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub>, and  
9        EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub> to NULL. The mobile station shall set  
10        PAGE\_CHAN<sub>s</sub> to '1' and PAGECH<sub>s</sub> to the Primary Paging Channel. The  
11        mobile station shall then begin monitoring the Primary Paging Channel of  
12        the selected base station.
- 13       • If ASSIGN\_MODE<sub>r</sub> equals '101' and FREQ\_INCL<sub>r</sub> equals '0', the mobile station  
14       shall perform the following actions:

  - 15       - If the message requires acknowledgment, the mobile station shall wait until  
16       Layer 3 receives an indication from Layer 2 that the acknowledgment to the  
17       message has been sent and acknowledged.
  - 18       - The mobile station shall measure the strength of each pilot listed in the  
19       assignment using the Neighbor Set search procedures specified in 2.6.6.2.1  
20       and 2.6.6.2.2, set PILOT\_PN<sub>s</sub> to the pilot PN sequence offset of the strongest  
21       pilot in the list (PILOT\_PN<sub>r</sub>), and set CONFIG\_MSG\_SEQ<sub>s</sub> and  
22       ACC\_MSG\_SEQ<sub>s</sub> to NULL (see 2.6.2.2).
  - 23       - If the mobile station has not stored configuration parameters for the Primary  
24       Paging Channel of the new base station, or if the stored information is not  
25       current (see 2.6.2.2), the mobile station shall set SYS\_PAR\_MSG\_SEQ<sub>s</sub>,  
26       NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, EXT\_NGHRBR\_LST\_MSG\_SEQ<sub>s</sub>,  
27       GEN\_NGHRBR\_LST\_MSG\_SEQ<sub>s</sub>, CHAN\_LST\_MSG\_SEQ<sub>s</sub>,  
28       EXT\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>, FD\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>,  
29       EXT\_SYS\_PAR\_MSG\_SEQ<sub>s</sub>, USER\_ZONE\_ID\_MSG\_SEQ<sub>s</sub>,  
30       PRI\_NGHRBR\_LST\_MSG\_SEQ<sub>s</sub>, GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub>, and  
31       EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub> to NULL. The mobile station shall set  
32       PAGE\_CHAN<sub>s</sub> to '1' and PAGECH<sub>s</sub> to the Primary Paging Channel. The  
33       mobile station shall then begin monitoring the Primary Paging Channel of  
34       the selected base station.
- 35       • If ASSIGN\_MODE<sub>r</sub> equals '101', FREQ\_INCL<sub>r</sub> equals '1', and the band class is  
36       not supported by the mobile station, the mobile station shall enter the *Update*  
37       *Overhead Information Substate* of the *System Access State* with an  
38       order/message response indication within T<sub>33m</sub> seconds and send a *Mobile*  
39       *Station Reject Order* with ORDQ field set to '00000110' (capability not supported  
40       by the mobile station).
- 41       • If ASSIGN\_MODE<sub>r</sub> equals '101', FREQ\_INCL<sub>r</sub> equals '1', and the band class is  
42       supported by the mobile station, the mobile station shall perform the following  
43       actions:

- 1           - If the message requires acknowledgment, the mobile station shall wait until
- 2           Layer 3 receives an indication from Layer 2 that the acknowledgment to the
- 3           message has been sent and acknowledged.
- 4           - The mobile station shall set  $CDMACH_S = CDMA\_FREQ_R$  and  $CDMABAND_S =$
- 5            $BAND\_CLASS_R$ . Then the mobile station shall tune to the new Frequency
- 6           Assignment, measure the strength of each pilot listed in the assignment
- 7           using the Neighbor Set search procedures specified in 2.6.6.2.1 and
- 8           2.6.6.2.2, set  $PILOT\_PN_S$  to the pilot PN sequence offset of the strongest
- 9           pilot in the list ( $PILOT\_PN_R$ ), and set  $CONFIG\_MSG\_SEQ_S$  and
- 10           $ACC\_MSG\_SEQ_S$  to NULL (see 2.6.2.2).
- 11          - If the mobile station has not stored configuration parameters for the Primary
- 12          Paging Channel of the new base station, or if the stored information is not
- 13          current (see 2.6.2.2), the mobile station shall set  $SYS\_PAR\_MSG\_SEQ_S$ ,
- 14           $NGHBR\_LST\_MSG\_SEQ_S$ ,  $EXT\_NGHBR\_LST\_MSG\_SEQ_S$ ,
- 15           $GEN\_NGHBR\_LST\_MSG\_SEQ_S$ ,  $CHAN\_LST\_MSG\_SEQ_S$ ,
- 16           $EXT\_CHAN\_LST\_MSG\_SEQ_S$ ,  $FD\_CHAN\_LST\_MSG\_SEQ_S$ ,
- 17           $EXT\_SYS\_PAR\_MSG\_SEQ_S$ ,  $USER\_ZONE\_ID\_MSG\_SEQ_S$ ,
- 18           $PRI\_NGHBR\_LST\_MSG\_SEQ_S$ ,  $GLOB\_SERV\_REDIR\_MSG\_SEQ_S$ , and
- 19           $EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ_S$  to NULL. The mobile station shall set
- 20           $PAGE\_CHAN_S$  to '1' and  $PAGECH_S$  to the Primary Paging Channel. The
- 21          mobile station shall then begin monitoring the Primary Paging Channel of
- 22          the selected base station.
- 23          • If  $ASSIGN\_MODE_R$  is not equal to '001' or '101', the mobile station shall enter
- 24          the *Update Overhead Information Substate* of the *System Access State* with an
- 25          order/message response indication within  $T_{33m}$  seconds and send a *Mobile*
- 26          *Station Reject Order* with  $ORDQ$  field set to '00000010' (message not accepted in
- 27          this state).
- 28      8. *Data Burst Message*
- 29      9. *Extended Channel Assignment Message*: The mobile station shall process the
- 30      message as follows:
- 31          • If  $ASSIGN\_MODE_R$  equals '001',  $FREQ\_INCL_R$  equals '0', the mobile station shall
- 32          perform the following actions:
- 33              - If the message requires acknowledgment, the mobile station shall wait until
- 34              Layer 3 receives an indication from Layer 2 that the acknowledgment to the
- 35              message has been sent and acknowledged.
- 36              - The mobile station shall measure the strength of each pilot listed in the
- 37              assignment using the Neighbor Set search procedures specified in 2.6.6.2.1
- 38              and 2.6.6.2.2 set  $PILOT\_PN_S$  to the pilot PN sequence offset of the strongest
- 39              pilot in the list ( $PILOT\_PN_R$ ), and set  $CONFIG\_MSG\_SEQ_S$  and
- 40               $ACC\_MSG\_SEQ_S$  to NULL (see 2.6.2.2).

- 1           - If the mobile station has not stored configuration parameters for the Primary  
2           Paging Channel of the new base station, or if the stored information is not  
3           current (see 2.6.2.2), the mobile station shall set SYS\_PAR\_MSG\_SEQ<sub>S</sub>,  
4           NGHBR\_LST\_MSG\_SEQ<sub>S</sub>, EXT\_NGHRBR\_LST\_MSG\_SEQ<sub>S</sub>,  
5           GEN\_NGHRBR\_LST\_MSG\_SEQ<sub>S</sub>, CHAN\_LST\_MSG\_SEQ<sub>S</sub>,  
6           EXT\_CHAN\_LST\_MSG\_SEQ<sub>S</sub>, FD\_CHAN\_LST\_MSG\_SEQ<sub>S</sub>,  
7           EXT\_SYS\_PAR\_MSG\_SEQ<sub>S</sub>, USER\_ZONE\_ID\_MSG\_SEQ<sub>S</sub>,  
8           PRI\_NGHRBR\_LST\_MSG\_SEQ<sub>S</sub>, GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>S</sub>, and  
9           EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>S</sub> to NULL. The mobile station shall set  
10          PAGE\_CHAN<sub>S</sub> to '1' and PAGECH<sub>S</sub> to the Primary Paging Channel. If the  
11          mobile station was monitoring Forward Common Control Channel, the  
12          mobile station shall set the PRAT<sub>S</sub> to '00'. The mobile station shall then  
13          begin monitoring the Primary Paging Channel of the selected base station.
- 14          • If ASSIGN\_MODE<sub>R</sub> equals '001', FREQ\_INCL<sub>R</sub> equals '1', and the band class is  
15          not supported by the mobile station, the mobile station shall enter the *Update*  
16          *Overhead Information Substate* of the *System Access State* with an  
17          order/message response indication within T<sub>33m</sub> seconds and send a *Mobile*  
18          *Station Reject Order* with ORDQ field set to '00000110' (capability not supported  
19          by the mobile station).
- 20          • If ASSIGN\_MODE<sub>R</sub> equals '001', FREQ\_INCL<sub>R</sub> equals '1', and the band class is  
21          supported by the mobile station, the mobile station shall perform the following  
22          actions:
- 23               - If the message requires acknowledgment, the mobile station shall wait until  
24               Layer 3 receives an indication from Layer 2 that the acknowledgment to the  
25               message has been sent and acknowledged.
- 26               - The mobile station shall set CDMACH<sub>S</sub> = CDMA\_FREQ<sub>R</sub> and CDMABAND<sub>S</sub> =  
27               BAND\_CLASS<sub>R</sub>. The mobile station shall set CONFIG\_MSG\_SEQ<sub>S</sub> and  
28               ACC\_MSG\_SEQ<sub>S</sub> to NULL (see 2.6.2.2). Then the mobile station shall tune  
29               to the new Frequency Assignment, measure the strength of each pilot listed  
30               in the assignment using the Neighbor Set search procedures specified in  
31               2.6.6.2.1 and 2.6.6.2.2, and set PILOT\_PN<sub>S</sub> to the pilot PN sequence offset of  
32               the strongest pilot in the list (PILOT\_PN<sub>R</sub>).

- 1           - If the mobile station has not stored configuration parameters for the Primary  
2           Paging Channel of the new base station, or if the stored information is not  
3           current (see 2.6.2.2), the mobile station shall set SYS\_PAR\_MSG\_SEQ<sub>s</sub>,  
4           NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, EXT\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>,  
5           GEN\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, CHAN\_LST\_MSG\_SEQ<sub>s</sub>,  
6           EXT\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>, FD\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>,  
7           EXT\_SYS\_PAR\_MSG\_SEQ<sub>s</sub>, USER\_ZONE\_ID\_MSG\_SEQ<sub>s</sub>,  
8           PRI\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub>, and  
9           EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub> to NULL. The mobile station shall set  
10          PAGE\_CHAN<sub>s</sub> to '1' and PAGECH<sub>s</sub> to the Primary Paging Channel. If the  
11          mobile station was monitoring Forward Common Control Channel, the  
12          mobile station shall set the PRAT<sub>s</sub> to '00'. The mobile station shall then  
13          begin monitoring the Primary Paging Channel of the selected base station.
- 14       • If ASSIGN\_MODE<sub>r</sub> equals '100' or '101', the mobile station shall perform the  
15       following actions:
- 16           - If DIRECT\_CH\_ASSIGN\_IND<sub>r</sub> is included and is set to '1', the mobile station  
17           shall process the message as defined below in the order specified:
- 18               + The mobile station shall set CONFIG\_MSG\_SEQ<sub>s</sub> to  
19               CONFIG\_MSG\_SEQ<sub>r</sub>.
- 20               + If RESPOND\_IND<sub>r</sub> is equal to '1', the mobile station shall process the  
21               message as specified in section 2.6.3.3<sup>19</sup>; otherwise, the mobile station  
22               shall enter the *Update Overhead Information Substate* of the *System*  
23               *Access State* with a direct channel assignment update overhead  
24               indication within T<sub>33m</sub> seconds.
- 25           - Otherwise, the mobile station shall enter the *Update Overhead Information*  
26           *Substate* of the *System Access State* with an order/message response  
27           indication within T<sub>33m</sub> seconds and send a *Mobile Station Reject Order* with  
28           ORDQ field set to '00000010' (message not accepted in this state).
- 29       • If ASSIGN\_MODE<sub>r</sub> is not equal to '001', '100' or '101', the mobile station shall  
30       enter the *Update Overhead Information Substate* of the *System Access State* with  
31       an order/message response indication within T<sub>33m</sub> seconds and send a *Mobile*  
32       *Station Reject Order* with ORDQ field set to '00000010' (message not accepted in  
33       this state).
- 34       10. *Feature Notification Message*
- 35       11. *Local Control Order*
- 36       12. *Lock Until Power-Cycled Order*: The mobile station shall record the reason for the

---

<sup>19</sup> The mobile station processes the message as defined in section 2.6.3.3, but no requirements other than the *Extended Channel Assignment Message* processing requirements in section 2.6.3.3 are applicable.

1        *Lock Until Power-Cycled Order* in the mobile station's semi-permanent memory  
 2        (LCKRSN\_P<sub>S-p</sub> equals the least significant four bits of ORDQ<sub>r</sub>). After a mobile  
 3        station receives this order, it shall not enter the *System Access State* (see 2.6.3)  
 4        until it has received an *Unlock Order* or until after power-cycling the mobile station  
 5        (i.e., after the next mobile station power-up). This requirement shall take  
 6        precedence over any other mobile station requirement specifying entry to the  
 7        *System Access State*. The mobile station should notify the user of the locked  
 8        condition. The mobile station shall exit the *Mobile Station Idle State* and enter the  
 9        *System Determination Substate* of the *Mobile Station Initialization State* with a lock  
 10        indication (see 2.6.1.1). This allows the mobile station to operate in an alternate  
 11        operating mode while locked.

12        13. *Maintenance Required Order*: The mobile station shall record the reason for the  
 13        *Maintenance Required Order* in the mobile station's semi-permanent memory  
 14        (MAINTRSN<sub>S-p</sub> equals the least significant four bits of ORDQ<sub>r</sub>). If the mobile  
 15        station has previously received a *Lock Until Power-Cycled Order*, it shall remain in  
 16        the locked condition; otherwise the mobile station shall remain in the unlocked  
 17        condition. The mobile station should notify the user of the maintenance required  
 18        condition.

19        14. *PACA Message*: If P\_REV\_IN\_USE<sub>S</sub> is less than or equal to four, and if the mobile  
 20        station does not support PACA capability, the mobile station shall send a *Mobile*  
 21        *Station Reject Order* with the ORDQ field set to '00000110' (message requires a  
 22        capability that is not supported by the mobile station); otherwise, the mobile  
 23        station shall process the message as follows:

- 24        • If PACA<sub>S</sub> is equal to disabled, the mobile station shall enter the *Update*  
 25        *Overhead Information Substate* of the *System Access State* with an  
 26        order/message response indication within T<sub>33m</sub> seconds and shall send a  
 27        *Mobile Station Reject Order* with the ORDQ field set to '00000010' (message not  
 28        accepted in this state).
- 29        • If PACA<sub>S</sub> is equal to enabled, the mobile station shall perform the following:
  - 30        – If the purpose of the message is to respond to an *Origination Message*  
 31        (PURPOSE<sub>r</sub> is equal to '0000'), the mobile station shall enter the *Update*  
 32        *Overhead Information Substate* of the *System Access State* with an  
 33        order/message response indication within T<sub>33m</sub> seconds and send a *Mobile*  
 34        *Station Reject Order* with the ORDQ field set to '00000010' (message not  
 35        accepted in this state).
  - 36        – If the purpose of the message is to provide the queue position of the PACA  
 37        call (PURPOSE<sub>r</sub> is equal to '0001'), the mobile station shall set the PACA  
 38        state timer to the duration shown in Table 3.7.2.3.2.20-2, corresponding to  
 39        the value of PACA\_TIMEOUT<sub>S</sub>, should indicate to the user that the PACA  
 40        call is still queued, and should indicate the current queue position (Q\_POS<sub>r</sub>)  
 41        of the call.

- 1           – If the purpose of the message is to instruct the mobile station to re-originate  
2           the PACA call (PURPOSE<sub>r</sub> is equal to '0010'), the mobile station shall set the  
3           PACA state timer to the duration shown in Table 3.7.2.3.2.20-2  
4           corresponding to the value of PACA\_TIMEOUT<sub>s</sub>, and the mobile station shall  
5           enter the *Update Overhead Information Substate* of the *System Access State*  
6           (see 2.6.3) with a PACA response indication within T<sub>33m</sub> seconds to re-  
7           originate the PACA call.
- 8           – If the purpose of the message is to cancel the PACA call (PURPOSE<sub>r</sub> is equal  
9           to '0011'), the mobile station shall set PACA<sub>s</sub> to disabled and PACA\_CANCEL  
10          to '0', shall disable the PACA state timer, and should indicate to the user  
11          that the PACA call has been canceled.
- 12       15. *Registration Accepted Order*: The mobile station shall perform the procedures as  
13       specified in 2.6.11.1.
- 14       16. *Registration Rejected Order*: This order indicates that normal service is not  
15       available on this system. The mobile station shall disable the full-TMSI timer. If  
16       the received order specifies to delete the TMSI (ORDQ = '00000100'), the mobile  
17       station shall set all the bits of the TMSI\_CODE<sub>s-p</sub> to '1'. The mobile station shall  
18       enter the *System Determination Substate* of the *Mobile Station Initialization State*  
19       with a registration rejected indication (see 2.6.1.1).
- 20       17. *Registration Request Order*: The mobile station shall process the message and  
21       perform registration procedures as specified in 2.6.5.5.2.3.
- 22       18. *Security Mode Command Message*: The mobile station shall perform the  
23       procedures as specified in 2.6.11.4.
- 24       19. *Service Redirection Message*: The mobile station shall process the message as  
25       follows:
- 26       • If the mobile station is directed to an unsupported operation mode or band  
27       class, the mobile station shall respond with a *Mobile Station Reject Order* with  
28       ORDQ equal to '00000110' (message requires a capability that is not supported  
29       by the mobile station).
  - 30       • If DELETE\_TMSI<sub>r</sub> is equal to '1', the mobile station shall set all the bits of  
31       TMSI\_CODE<sub>s-p</sub> to '1'. The mobile station shall disable the full-TMSI timer.
  - 32       • The mobile station shall set RETURN\_IF\_FAIL<sub>s</sub> = RETURN\_IF\_FAIL<sub>r</sub>.
  - 33       • If RECORD\_TYPE<sub>r</sub> is equal to '00000000', the mobile station shall enter the  
34       *System Determination Substate* of the *Mobile Station Initialization State* with an  
35       NDSS off indication (see 2.6.1.1); otherwise, the mobile station shall store the  
36       redirection record received in the message as REDIRECT\_REC<sub>s</sub> and shall enter  
37       the *System Determination Substate* of the *Mobile Station Initialization State* with  
38       a redirection indication (see 2.6.1.1).
- 39       20. *Retry Order*: The mobile station shall process the message as follows:

- 1       • If  $\text{RETRY\_TYPE}_R$  is equal to '000', the mobile station shall set
- 2        $\text{RETRY\_DELAY}_S[\text{RETRY\_TYPE}]$  to 0, where  $\text{RETRY\_TYPE}$  is equal to '001', '010',
- 3       '011', '100', or '101'.
- 4       • If  $\text{RETRY\_TYPE}_R$  is equal to '001', , '100', or '101', the mobile station shall
- 5       perform the following:
- 6       – If  $\text{RETRY\_DELAY}_R$  is equal to '00000000', then the mobile station shall set
- 7        $\text{RETRY\_DELAY}_S[\text{RETRY\_TYPE}_R]$  to 0.
- 8       – If  $\text{RETRY\_DELAY}_R$  is not equal to '00000000', the mobile station shall set
- 9        $\text{RETRY\_DELAY}_S[\text{RETRY\_TYPE}_R]$  as follows:
- 10       + If the most significant bit of the  $\text{RETRY\_DELAY}_R$  is '0', set
- 11        $\text{RETRY\_DELAY\_UNIT}_S$  to 1000ms. If the most significant bit of the
- 12        $\text{RETRY\_DELAY}_R$  is '1', set  $\text{RETRY\_DELAY\_UNIT}_S$  to 60000ms.
- 13       + The mobile station shall set  $\text{RETRY\_DELAY\_VALUE}_S$  to the seven least
- 14       significant bits of  $\text{RETRY\_DELAY}_R$ .
- 15       + The mobile station shall store the next system time 80 ms boundary +
- 16        $\text{RETRY\_DELAY\_VALUE}_S \times \text{RETRY\_DELAY\_UNIT}_S$  ms as
- 17        $\text{RETRY\_DELAY}_S[\text{RETRY\_TYPE}_R]$ .

- 18       21. *Slotted Mode Order*: After receiving this order, the mobile station shall set
- 19        $\text{SLOTTED}_S$  to YES. The mobile station shall disable the  $T_{\text{MS\_Slotted}}$  timer.
- 20       22. *SSD Update Message*: The mobile station shall process the message and shall
- 21       respond with a *Base Station Challenge Order* as specified in 2.3.12.1.5. The
- 22       mobile station shall enter the *Update Overhead Information Substate* of the *System*
- 23       *Access State* with an order/message response indication within  $T_{32m}$  seconds.
- 24       23. *Status Request Message*: The mobile station shall process the message. If
- 25        $\text{P\_REV\_IN\_USE}_S$  is less than or equal to three, the mobile station shall respond
- 26       with a *Status Response Message*. If  $\text{P\_REV\_IN\_USE}_S$  is greater than three, the
- 27       mobile station shall respond with an *Extended Status Response Message*. The
- 28       mobile station shall enter the *Update Overhead Information Substate* of the *System*
- 29       *Access State* with an order/message response indication within  $T_{33m}$  seconds. If
- 30       the message does not specify any qualification information ( $\text{QUAL\_INFO\_TYPE}_R$  is
- 31       equal to '00000000'), the mobile station shall include the requested information
- 32       records in the response. If the message specifies a band class ( $\text{QUAL\_INFO\_TYPE}_R$
- 33       is equal to '00000001'), the mobile station shall only include the requested
- 34       information records for the specified band class ( $\text{BAND\_CLASS}_R$ ) in the response.
- 35       If the message specifies a band class and an operating mode ( $\text{QUAL\_INFO\_TYPE}_R$
- 36       is equal to '00000010'), the mobile station shall only include the requested
- 37       information records for the specified band class ( $\text{BAND\_CLASS}_R$ ) and operating
- 38       mode ( $\text{OP\_MODE}_R$ ) in the response. If the message specifies a band class or a
- 39       band class and an operating mode which is not supported by the mobile station,
- 40       the mobile station shall send a *Mobile Station Reject Order* with  $\text{ORDQ}$  set to
- 41       '00000110' (message requires a capability that is not supported by the mobile
- 42       station). If the response to this message exceeds the allowable length, the mobile

station shall send a *Mobile Station Reject Order* with ORDQ set to '00001000' (response message would exceed the allowable length). If the message specifies an information record which is not supported by the mobile station for the specified band class and operating mode, the mobile station shall send a *Mobile Station Reject Order* with ORDQ set to '00001001' (information record is not supported for the specified band class and operating mode).

24. *TMSI Assignment Message*: The mobile station shall store the TMSI zone and code as follows:

- The mobile station shall store the length of the TMSI zone field by setting ASSIGNING\_TMSI\_ZONE\_LEN<sub>s-p</sub> to TMSI\_ZONE\_LEN<sub>r</sub>,
- The mobile station shall store the assigning TMSI zone number by setting the ASSIGNING\_TMSI\_ZONE\_LEN<sub>s-p</sub> least significant octets of ASSIGNING\_TMSI\_ZONE<sub>s-p</sub> to TMSI\_ZONE<sub>r</sub>, and
- The mobile station shall store the TMSI code by setting TMSI\_CODE<sub>s-p</sub> to TMSI\_CODE<sub>r</sub>.

The mobile station shall set the TMSI expiration time by setting TMSI\_EXP\_TIME<sub>s-p</sub> to TMSI\_EXP\_TIME<sub>r</sub>. The mobile station shall disable the full-TMSI timer. The mobile station shall then respond with a *TMSI Assignment Completion Message* within T<sub>56m</sub> seconds.

25. *Unlock Order*: After receiving this order, the mobile station is no longer locked. The mobile station should notify the user that the locked condition has been removed. The mobile station shall enter the *System Determination Substate of the Mobile Station Initialization State* with an *unlock indication* (see 2.6.1.1).

26. *User Zone Reject Message*

27. *Fast Call Setup Order*:

- If ORDQ<sub>r</sub> is equal to '00000000', the mobile station shall process the message and respond with a *Fast Call Setup Order* as specified in 2.6.12.1. The mobile station shall enter the *Update Overhead Information Substate of the System Access State* with an order/message response indication within T<sub>32m</sub> seconds.
- If ORDQ<sub>r</sub> is equal to '00000001', the mobile station shall process the message as specified in 2.6.12.1.

28. *General Extension Message*: The mobile station shall process this message as specified in section 2.6.18.

The mobile station shall ignore all other messages and orders.

#### 2.6.2.5 Mobile Station Origination Operation

The *Mobile Station Origination Operation* is performed when the mobile station is directed by the user to initiate a call, or if the *Mobile Station Idle State* is entered with NDSS\_ORIG<sub>s</sub> enabled.

1 If the mobile station is directed by the user to initiate a call, the mobile station shall  
2 perform the following:

- 3 • If PACA<sub>S</sub> is equal to enabled, the mobile station shall set PACA<sub>S</sub> to disabled and  
4 PACA\_CANCEL to '0', shall disable the PACA state timer, and should indicate to the  
5 user that the PACA call has been canceled.
- 6 • The mobile station shall set CURR\_ACC\_MSG\_SEQ to NULL.

7 The mobile station shall enter the *Update Overhead Information Substate* of the *System*  
8 *Access State* (see 2.6.3) with an origination indication within T<sub>33m</sub> seconds.

#### 9 2.6.2.6 Mobile Station Message Transmission Operation

10 Support of this operation is optional. If the mobile station supports the *Mobile Station*  
11 *Message Transmission Operation*, the operation is performed when the user directs the  
12 mobile station to transmit a *Data Burst Message*, or when the mobile station detects a  
13 change in hook status since the last time when the mobile station sent hook status  
14 information and the mobile station supports the *Device Information Message* on the r-csch,  
15 or when the mobile station determines that a *Radio Environment Message* is to be  
16 transmitted on the r-csch, or when the mobile station requests to operate in reduced slot  
17 cycle mode.

18 If the mobile station supports this operation, the mobile station shall set  
19 CURR\_ACC\_MSG\_SEQ to NULL.

20 If the mobile station supports this operation and the operation is performed when the user  
21 directs the mobile station to transmit a *Data Burst Message*, the mobile station shall enter  
22 the *Update Overhead Information Substate* of the *System Access State* (see 2.6.3.2) with a  
23 message transmission indication within T<sub>33m</sub> seconds.

24 If the mobile station supports this operation and the operation is performed when the  
25 mobile station detects a change in hook status since the last time when the mobile station  
26 sent hook status information, the mobile station shall enter the *Update Overhead*  
27 *Information Substate* of the *System Access State* (see 2.6.3.2) with a hook status indication  
28 within T<sub>33m</sub> seconds.

29 If the mobile station supports this operation and the operation is performed when the  
30 mobile station determines that a *Radio Environment Message* is to be transmitted on the r-  
31 csch, the mobile station shall perform the following:

- 32 • If RER\_MODE\_ENABLED is set to YES, the mobile station shall enter the *Update*  
33 *Overhead Information Substate* of the *System Access State* (see 2.6.3.2) with a radio  
34 environment report indication within T<sub>33m</sub> seconds.
- 35 • Otherwise, if TKZ\_MODE\_ENABLED is set to YES, the mobile station shall enter  
36 the *Update Overhead Information Substate* of the *System Access State* (see 2.6.3.2)  
37 with a tracking zone indication within T<sub>33m</sub> seconds.

38 If the mobile station supports this operation and the operation is performed when the  
39 mobile station requests to operate in reduced slot cycle mode, the mobile station shall  
40 enter the *Update Overhead Information Substate* of the *System Access State* (see 2.6.3.2)

1 with a fast call setup indication within  $T_{33m}$  seconds.

## 2 2.6.2.7 Mobile Station Power-Down Operation

3 The *Mobile Station Power-Down Operation* is performed when the user directs the mobile  
4 station to power down.

5 The mobile station shall update stored parameters and perform other registration  
6 procedures as specified in 2.6.5.5.2.4.

7 If no power-down registration is performed (see 2.6.5.5.2.4), the mobile station may power  
8 down.

## 9 2.6.2.8 Mobile Station PACA Cancel Operation

10 The *Mobile Station PACA Cancel Operation* is performed when the user directs the mobile  
11 station to cancel a PACA call.

12 If  $PACA_S$  is equal to enabled, the mobile station shall perform the following:

- 13 • The mobile station shall set  $PACA_S$  to disabled.
- 14 • The mobile station shall set  $PACA\_CANCEL$  to '0', if  $PACA\_CANCEL$  is equal to '1'.
- 15 • The mobile station shall disable the PACA state timer.
- 16 • The mobile station should indicate to the user that the PACA call has been  
17 canceled.
- 18 • The mobile station shall set  $CURR\_ACC\_MSG\_SEQ$  to NULL.
- 19 • The mobile station shall enter the *Update Overhead Information Substate* of the  
20 *System Access State* (see 2.6.3) with a PACA cancel indication within  $T_{33m}$   
21 seconds.

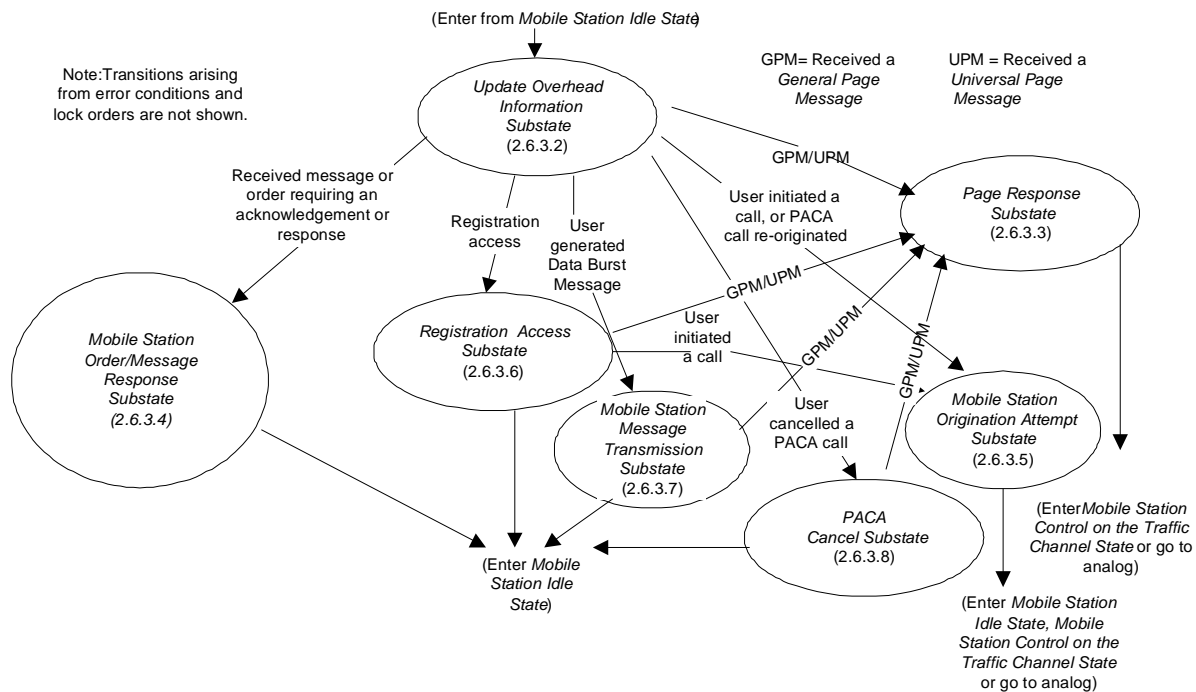

## 22 2.6.3 System Access State

23 In this state, the mobile station sends messages to the base station on the r-csch and  
24 receives messages from the base station on the f-csch.

25 As illustrated in Figure 2.6.3-1, the *System Access State* consists of the following  
26 substates:

- 27 • *Update Overhead Information Substate* - In this substate, if the base station  
28 supports the Primary Broadcast Control Channel for Spreading Rate 1 or if both the  
29 base station and mobile station supports the Primary Broadcast Control Channel  
30 for Spreading Rate 3 and if the protocol revision level in use is greater than six, the  
31 mobile station will monitor the Primary Broadcast Control Channel until it has  
32 received a current set of overhead messages; otherwise, the mobile station will  
33 monitor the Paging Channel until it has a current set of overhead messages.
- 34 • *Mobile Station Origination Attempt Substate* - In this substate, the mobile station  
35 sends an *Origination Message*, *Call Recovery Request Message* or a *Reconnect*  
36 *Message* (with  $ORIG\_IND$  set to '1') to the base station.

- *Page Response Substate* - In this substate, the mobile station sends a *Page Response Message* or a *Reconnect Message* (with ORIG\_IND set to '0') to the base station.
- *Mobile Station Order/Message Response Substate* - In this substate, the mobile station sends a response to a message received from the base station.
- *Registration Access Substate* - In this substate, the mobile station sends a *Registration Message* to the base station.
- *Mobile Station Message Transmission Substate* - In this substate, the mobile station sends a *Data Burst Message* or a *Device Information Message* to the base station.
- *PACA Cancel Substate* - In this substate, the mobile station sends a *PACA Cancel Message* to the base station.

**Figure 2.6.3-1. System Access State**

### 2.6.3.1 Access Procedures

#### 2.6.3.1.1 Access Attempts

If the mobile station monitors the Paging Channel, the mobile station transmits on the Access Channel using a random access procedure. Many parameters of the random access procedure are supplied by the base station in the *Access Parameters Message*. The random access procedure is described in [4] and [3].

If the mobile station monitors the Forward Common Control Channel/ Primary Broadcast Control Channel, the mobile station transmits on the Enhanced Access Channel using a random access procedure. Many parameters of the random access procedure are supplied by the base station in the *Enhanced Access Parameters Message*.

If Layer 3 receives an indication from Layer 2 that the system access is denied, the mobile station shall update its registration variables using  $SID_S$ ,  $NID_S$ ,  $REG\_ZONE_S$ , and  $ZONE\_TIMER_S$  that were stored from the first base station to which the mobile station sent an Access Probe, as specified in 2.6.5.5.3.2, and enter the *System Determination Substate* of the *Mobile Station Initialization State* with an access denied indication (see 2.6.1.1).

If Layer 3 receives an indication from Layer 2 that the system is lost, the mobile station shall update its registration variables using  $SID_S$ ,  $NID_S$ ,  $REG\_ZONE_S$ , and  $ZONE\_TIMER_S$  that were stored from the first base station to which the mobile station transmitted an Access Probe, as specified in 2.6.5.5.3.2 and enter the *System Determination Substate* of the *Mobile Station Initialization State* with a system lost indication (see 2.6.1.1)

#### 2.6.3.1.2 Reserved

#### 2.6.3.1.3 Handoffs

While in the *System Access State*, the mobile station shall continue its pilot search (see 2.6.3.1.3.1), and may perform access handoffs (see 2.6.3.1.3.2) and/or access probe handoffs (see 2.6.3.1.3.3).

If the mobile station performs access handoffs and/or access probe handoffs, the mobile station shall maintain the following variables:

- $CURRENT\_ACTIVE\_PILOT_S$
- $PREVIOUS\_ACTIVE\_PILOT_S$
- $FIRST\_ACTIVE\_PILOT_S$

Upon entering the *System Access State* the mobile station shall set  $CURRENT\_ACTIVE\_PILOT_S$ ,  $PREVIOUS\_ACTIVE\_PILOT_S$  and  $FIRST\_ACTIVE\_PILOT_S$  to NULL. Prior to starting an access attempt, the mobile station shall set  $CURRENT\_ACTIVE\_PILOT_S$  and  $PREVIOUS\_ACTIVE\_PILOT_S$  to NULL. When the mobile station selects a base station for transmission of an access probe, the mobile station shall proceed as follows:

- If  $CURRENT\_ACTIVE\_PILOT_S$  is not the same as the pilot of the selected base station, the mobile station shall set  $PREVIOUS\_ACTIVE\_PILOT_S$  to the value of  $CURRENT\_ACTIVE\_PILOT_S$ .
- The mobile station shall set  $CURRENT\_ACTIVE\_PILOT_S$  to the identity of the pilot corresponding to the selected base station.
- If  $FIRST\_ACTIVE\_PILOT_S$  is NULL, the mobile station shall set  $FIRST\_ACTIVE\_PILOT_S$  to the value of  $CURRENT\_ACTIVE\_PILOT_S$ .

Before the mobile station transmits an access probe to a new base station on the Access Channel, the mobile station shall update parameters based on the *System Parameters Message*, the *Access Parameters Message* and the *Extended System Parameters Message* on the associated new Paging Channel and process parameters from the messages (see 2.6.2.2.1, 2.6.2.2.2, and 2.6.2.2.5).

Before the mobile station transmits an access probe to a new base station on the Enhanced Access Channel, the mobile station shall update parameters based on the *ANSI-41 System Parameters Message*, the *Enhanced Access Parameters Message*, and the *MC-RR Parameters Message* on the associated new Primary Broadcast Control Channel and process parameters from the messages (see 2.6.2.2.13, 2.6.2.2.14, and 2.6.2.2.15).

If the mobile station monitors the Paging Channel, the mobile station shall update parameters based on the *Neighbor List Message*, the *Extended Neighbor List Message*, or the *General Neighbor List Message* on the associated new Paging Channel and process parameters from the message (see 2.6.2.2.3, 2.6.2.2.7, and 2.6.2.2.8).

If the mobile station monitors the Forward Common Control Channel/ Primary Broadcast Control Channel, the mobile station shall update parameters based on the *Universal Neighbor List Message* on the associated new Primary Broadcast Control Channel and process parameters from the message (see 2.6.2.2.17).

If the mobile station receives the *User Zone Identification Message* or the *Private Neighbor List Message*, the mobile station shall update parameters based on these messages on the associated new Paging Channel or Primary Broadcast Control Channel and process parameters from the messages (see 2.6.2.2.9 and 2.6.2.2.10). If the mobile station receives a *Global Service Redirection Message* (see 2.6.2.2.6) which directs the mobile station away from the new base station, the mobile station shall not access the new base station. If the mobile station receives an *Extended Global Service Redirection Message* (see 2.6.2.2.11) which directs the mobile station away from the new base station, the mobile station shall not access the new base station. The mobile station shall process these messages only once after each access handoff.

#### 2.6.3.1.3.1 Pilot Search

The following sets of pilot offsets are defined for a mobile station in the *System Access State*. Each pilot offset is a member of only one set.

- Active Set: The pilot offset of the Forward CDMA Channel whose Paging Channel or Forward Common Control Channel/ Primary Broadcast Control Channel is being monitored.
- Neighbor Set: The pilots that are not currently in the Active Set and are likely candidates for access handoff or access probe handoff. The members of the Neighbor Set are specified in the *Neighbor List Message*, the *Extended Neighbor List Message*, and the *General Neighbor List Message on the Paging Channel*. The members of the Neighbor Set are specified in the *Universal Neighbor List Message* on the Primary Broadcast Control Channel.

- 1       • Remaining Set: The set of all possible pilot offsets in the current system (integer  
2       multiples of  $\text{PILOT\_INC}_S$ ) on the current CDMA Frequency Assignment, excluding  
3       the pilots in the Neighbor Set and the Active Set.

#### 4   2.6.3.1.3.2 Access Handoff

5   The mobile station is permitted to perform an access handoff to use the Paging Channel  
6   with the best pilot strength and an associated Access Channel. The mobile station is  
7   permitted to perform an access handoff to use the Forward Common Control Channel with  
8   the best pilot strength and an associated Enhanced Access Channel. The mobile station  
9   is permitted to perform an access handoff when waiting for a response from the base  
10   station or before sending a response to the base station. An access handoff is permitted  
11   after an access attempt while the mobile station is in the *Page Response Substate* or the  
12   *Mobile Station Origination Attempt Substate*.

13   When the mobile station declares a loss of the Paging Channel or the Forward Common  
14   Control Channel while waiting for a response from the base station in the *Page Response*  
15   *Substate* or in the *Mobile Station Origination Attempt Substate*, the mobile station shall  
16   perform an access handoff, if all of the following conditions hold:

- 17       • The pilot corresponding to the new base station is in the list  $\text{ACCESS\_HO\_LIST}$ ,
- 18       •  $\text{ACCESS\_HO}_S$  is equal to '1', and
- 19       • The mobile station is not already in the process of performing an access attempt.

20   When the mobile station declares a loss of the Paging Channel or the Forward Common  
21   Control Channel, after receiving a message but before responding to that message while in  
22   the *Page Response Substate* or in the *Mobile Station Origination Attempt Substate*, the  
23   mobile station shall perform an access handoff if the following conditions hold:

- 24       • The pilot corresponding to the new base station is in the list  $\text{ACCESS\_HO\_LIST}$ ,
- 25       •  $\text{ACCESS\_HO}_S$  is equal to '1',
- 26       •  $\text{ACCESS\_HO\_MSG\_RSP}_S$  is equal to '1', and
- 27       • The mobile station is not already in the process of performing an access attempt.

28   When the mobile station declares an insufficiency of the Paging Channel<sup>20</sup> or the Forward  
29   Common Control Channel, while waiting for a response from the base station in the *Page*  
30   *Response Substate* or in the *Mobile Station Origination Attempt Substate*, the mobile station  
31   may perform an access handoff if all of the following conditions hold:

- 32       • The pilot corresponding to the new base station is in the list  $\text{ACCESS\_HO\_LIST}$ ,
- 33       •  $\text{ACCESS\_HO}_S$  is equal to '1', and
- 34       • The mobile station is not already in the process of performing an access attempt.

---

<sup>20</sup> Insufficiency of the Paging Channel and the Forward Common Control Channel is implementor-defined.

When the mobile station declares an insufficiency of the Paging Channel<sup>21</sup> or the Forward Common Control Channel, after receiving a message but before responding to that message while in the *Page Response Substate* or in the *Mobile Station Origination Attempt Substate*, the mobile station may perform an access handoff if all of the following conditions hold:

- The pilot corresponding to the new base station is in the list ACCESS\_HO\_LIST,
- ACCESS\_HO<sub>S</sub> is equal to '1',
- ACCESS\_HO\_MSG\_RSP<sub>S</sub> is equal to '1', and
- The mobile station is not already in the process of performing an access attempt.

If ACCESS\_PROBE\_HO<sub>S</sub> is equal to '0' and ACCESS\_HO<sub>S</sub> is equal to '1', and the mobile station declares a loss of the Paging Channel or the Forward Common Control Channel during an access attempt, after sending at least one complete access probe, the mobile station may monitor other Paging Channels or the Forward Common Control Channels which are in ACCESS\_HO\_LIST for T<sub>42m</sub> seconds after the loss of the Paging Channel or the Forward Common Control Channel on which the access attempt was made<sup>22</sup>.

#### 2.6.3.1.3.3 Access Probe Handoff

The mobile station is permitted to perform an access probe handoff when the mobile station is in the *Page Response Substate* or the *Mobile Station Origination Attempt Substate*.

The mobile station may perform an access probe handoff during an access attempt to a pilot in ACCESS\_HO\_LIST when the message being sent is the *Origination Message*, *Reconnect Message*, *Call Recovery Request Message* or the *Page Response Message*, if all of the following conditions hold:

- ACCESS\_PROBE\_HO<sub>S</sub> is equal to '1',
- The mobile station is in the *Page Response Substate* or the *Mobile Station Origination Attempt Substate*, and
- The mobile station has performed fewer than (MAX\_NUM\_PROBE\_HO<sub>S</sub> + 1) access probe handoffs during the current access attempt.

The mobile station may also perform an access probe handoff during an access attempt to a pilot in ACCESS\_HO\_LIST when the message being sent is a message other than the *Origination Message*, *Reconnect Message*, *Call Recovery Request Message* or the *Page Response Message*, if all of the preceding conditions hold and ACC\_PROBE\_HO\_OTHER\_MSG<sub>S</sub> is equal to '1'.

---

<sup>21</sup> Insufficiency of the Paging Channel and the Forward Common Control Channel is implementor-defined.

<sup>22</sup> The mobile station would be waiting for a response to the message transmitted in the access probe.

1 The mobile station may also perform an access probe handoff during an access attempt to  
 2 a pilot not in ACCESS\_HO\_LIST when the message being sent is the *Origination Message*,  
 3 *Reconnect Message*, *Call Recovery Request Message* or the *Page Response Message*, if all of  
 4 the following conditions hold:

- 5 • ACC\_HO\_LIST\_UPD<sub>S</sub> is equal to '1',
- 6 • ACCESS\_PROBE\_HO<sub>S</sub> is equal to '1',
- 7 • The new pilot is stronger than any pilot in ACCESS\_HO\_LIST,
- 8 • The new pilot has the corresponding ACCESS\_HO\_ALLOWED field in the  
 9 NGHBR\_REC equal to '1',
- 10 • Inclusion of the new pilot in ACCESS\_HO\_LIST does not cause the Access Channel  
 11 or Enhanced Access Channel message to exceed the maximum capsule size,
- 12 • Inclusion of the new pilot in ACCESS\_HO\_LIST does not cause the number of  
 13 members to exceed N<sub>13m</sub>,
- 14 • The mobile station is in the *Page Response Substate* or the *Mobile Station*  
 15 *Origination Attempt Substate*, and
- 16 • The mobile station has performed fewer than (MAX\_NUM\_PROBE\_HO<sub>S</sub> + 1) access  
 17 probe handoffs during the current access attempt.

18 The mobile station may also perform an access probe handoff during an access attempt to  
 19 a pilot not in ACCESS\_HO\_LIST when the message being sent is a message other than the  
 20 *Origination Message*, *Reconnect Message*, *Call Recovery Request Message* or the *Page*  
 21 *Response Message*, if all of the preceding conditions hold and  
 22 ACC\_PROBE\_HO\_OTHER\_MSG<sub>S</sub> is equal to '1'.

23 If the above conditions are met, the mobile station may perform an access probe handoff  
 24 when the mobile station declares a loss of the Paging Channel or Forward Common  
 25 Control Channel (see 2.6.3.1.8); the mobile station may also perform an access probe  
 26 handoff after getting an indication that the TA timer expired (see [4]) and the mobile  
 27 station declares an insufficiency of the Paging Channel<sup>23</sup> or the Forward Common Control  
 28 Channel.

29 If the mobile station performs an access probe handoff, the mobile station shall suspend  
 30 the access attempt on the old pilot and shall restart the access attempt on the new pilot  
 31 (i.e. starting with the first probe of the first probe sequence of the access sub-attempt), as  
 32 specified in [4]. The mobile station shall record the identity of the pilots to which access  
 33 probes have been transmitted within the current access attempt.

34 The mobile station shall not reset its access probe handoff count until the access attempt  
 35 ends.

---

<sup>23</sup> Insufficiency of the Paging Channel and the Forward Common Control Channel is implementor-defined.

Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to cancel the access attempt if the length of the message to be sent exceeds MAX\_CAP\_SIZE of the new base station. The mobile station may monitor other Paging Channels or Forward Common Control Channels which are in ACCESS\_HO\_LIST for  $T_{42m}$  seconds after aborting the access attempt<sup>24</sup>.

#### 2.6.3.1.4 System Access State Exit Procedures

Upon exiting the *System Access State*, the mobile station shall direct Layer 2 to cancel (see [4]) any access attempt in progress and discard the associated message. The mobile station shall then disable the *System Access State* timer.

#### 2.6.3.1.5 Reserved

#### 2.6.3.1.6 Full-TMSI Timer

Whenever the mobile station sends its full TMSI, the mobile station enables a timer, called the full-TMSI timer. If the full-TMSI timer expires, the mobile station deletes the TMSI by setting all of the bits in the TMSI\_CODE<sub>s-p</sub> field to '1'.

The mobile station shall maintain the full-TMSI timer. The mobile station shall provide a means for enabling or disabling the full-TMSI timer.

If the mobile station sends a message with an address including the ASSIGNING\_TMSI\_ZONE<sub>s-p</sub> and the full-TMSI timer is disabled, the mobile station shall enable the full-TMSI timer with a duration equal to  $T_{69m} + 2.56 \times 2^i$  seconds where  $i$  is equal to SLOT\_CYCLE\_INDEX<sub>s</sub>.

#### 2.6.3.1.7 Monitoring Pilots

The mobile station assists the base station in the Traffic Channel assignment process by monitoring and reporting (see [4]) the pilot strength of the pilot in the mobile station's Paging Channel or Forward Common Control Channel Active Set (see 2.6.3.1.3.1). The mobile station can also monitor and report (see [4]) other pilots on the same frequency; in such cases, the mobile station shall create ACCESS\_HO\_LIST and OTHER\_REPORTED\_LIST and shall monitor the pilots on those lists, if any.

For each monitored pilot, the mobile station shall record the pilot PN phase and the pilot strength PS, using the most recent measurements from the searcher element (see [2]), as they become available. The mobile station shall identify each pilot through its pilot PN phase (the phase of the pilot PN sequence, in units of one chip, relative to the zero offset pilot PN sequence of the pilot (see 2.6.6.2.4)). The mobile station shall determine the pilot strength, PS, as specified in 2.6.6.2.2.

---

<sup>24</sup> The mobile station would be waiting for a response to the message transmitted in the access probe.

#### 2.6.3.1.7.1 Generation of the Initial Access Handoff List

ACCESS\_HO\_LIST is created immediately before transmitting the first access probe after entering the *System Access State*. When it is created, ACCESS\_HO\_LIST is defined as a set of at most  $N_{13m}$  pilots, having the greatest pilot strength in comparison with other qualifying pilots and for which all of the following apply:

- The strength of each member exceeds  $T_{ADD_S}$ .
- Each member, other than the Active Set pilot, has the corresponding ACCESS\_HO\_ALLOWED field in the NGHBR\_REC equal to '1'.
- The Active Set pilot that the mobile station monitors when the mobile station enters the *System Access State* is a member.
- All members can be contained in the Access Channel or Enhanced Access Channel message without exceeding the maximum capsule size.

#### 2.6.3.1.7.2 Update of the Access Handoff List

When the mobile station performs an access probe handoff to a pilot which was not previously included in ACCESS\_HO\_LIST (see 2.6.3.1.3.3), it adds the pilot to ACCESS\_HO\_LIST.

If ACC\_HO\_LIST\_UPD<sub>S</sub> is equal to '1', the mobile station can update ACCESS\_HO\_LIST, as follows:

- The mobile station can add one or more new pilots other than the Active Set pilot to ACCESS\_HO\_LIST before transmitting an access probe.
- The mobile station can also drop from ACCESS\_HO\_LIST pilots to which access probes have not been transmitted since entering the *System Access State* and whose strength have fallen below  $T_{ADD_S}$ .

When it is updated before transmitting a subsequent access probe, ACCESS\_HO\_LIST is defined as a set of at most  $N_{13m}$  pilots, having the greatest pilot strength in comparison with other qualifying pilots and for which all of the following apply:

- The strength of each member to which access probes have not been transmitted exceeds  $T_{ADD_S}$ .
- Each member other than the pilot to which the first access probe in the *System Access State* was transmitted has the corresponding ACCESS\_HO\_ALLOWED field in the NGHBR\_REC equal to '1'.
- The Active Set pilot to which the next access probe is to be transmitted is a member.
- All pilots to which access probes have been transmitted since entering the *System Access State* are members.
- All members can be contained in the Access Channel or Enhanced Access Channel message without exceeding the maximum capsule size.

#### 2.6.3.1.7.3 Generation of the Other Reported List

OTHER\_REPORTED\_LIST (specified by NUM\_ADD\_PILOTS and NUM\_AUX\_PILOTS, see [4]) is defined as a set of no more than  $N_{13m}$  minus the number of pilots in ACCESS\_HO\_LIST pilots, having the greatest pilot strength in comparison with other qualifying pilots and for which all of the following apply:

- The strength of each member exceeds  $T_{ADD_s}$ .
- No member is included in ACCESS\_HO\_LIST.
- All members can be contained in the Access Channel or Enhanced Access Channel message without exceeding the maximum capsule size.

#### 2.6.3.1.7.4 Update of OTHER\_REPORTED\_LIST

Before transmitting each access probe, the mobile station shall generate OTHER\_REPORTED\_LIST according to section 2.6.3.1.7.3, using the most recent pilot strength information available from its searcher element (see [2]). If the mobile station updates ACCESS\_HO\_LIST before transmitting an access probe, it shall update OTHER\_REPORTED\_LIST after updating ACCESS\_HO\_LIST.

#### 2.6.3.1.8 Paging Channel and Forward Common Control Channel/ Primary Broadcast Control Channel Monitoring

When in the *System Access State*, the mobile station shall monitor the Paging Channel or the Forward Common Control Channel/ Primary Broadcast Control Channel at all times.

The mobile station shall set a timer for  $T_{72m}$  seconds, when it begins to monitor the Paging Channel or the Forward Common Control Channel/ Primary Broadcast Control Channel and whenever it gets an indication that a valid message was received on the Paging Channel or the Forward Common Control Channel/ Primary Broadcast Control Channel, whether addressed to the mobile station or not (see [4]).

If the  $T_{72m}$  timer expires:

- The mobile station shall first finish transmitting the access probe in progress, if any.
- If by declaring a loss of the Paging Channel or the Forward Common Control Channel, the eligibility requirements for performing access handoff are met (see 2.6.3.1.3.2), then the mobile station shall declare a loss of the Paging Channel or the Forward Common Control Channel, and perform an access handoff. If by declaring a loss of the Paging Channel or the Forward Common Control Channel, the eligibility requirements for performing access probe handoff are met (see 2.6.3.1.3.3), then the mobile station may declare a loss of the Paging Channel or the Forward Common Control Channel, and perform an access probe handoff. If the mobile station performs an access handoff or an access probe handoff, the mobile station restarts the Paging Channel or the Forward Common Control Channel/ Primary Broadcast Control Channel monitoring procedure for the new base station.

- 1       • If an access attempt was in progress when the timer expired and that access  
2       attempt had already been suspended and resumed previously (see below), the  
3       mobile station shall declare a loss of the Paging Channel<sup>25</sup> or the Forward Common  
4       Control Channel and shall disable its transmitter.
- 5       • If an access attempt was in progress when the timer expired and that access  
6       attempt had not been suspended and resumed before and the mobile station does  
7       not perform access probe handoff, the mobile station shall declare a temporary loss  
8       of the Paging Channel or the Forward Common Control Channel, shall direct Layer  
9       2 to suspend the access attempt (see [4]), and shall perform the following:
  - 10      – The mobile station shall set the timer to (T<sub>40m</sub>-T<sub>72m</sub>) seconds.
  - 11      – If the mobile station receives an indication that a valid message on the Paging  
12      Channel or the Forward Common Control Channel, whether addressed to the  
13      mobile station or not, was received (see [4]) prior to the expiration of the (T<sub>40m</sub>-  
14      T<sub>72m</sub>) timer, the mobile station shall re-enable the transmitter, shall direct  
15      Layer 2 to resume operation from the beginning of the interrupted access probe  
16      sequence of the access sub-attempt (see [4]), and shall transmit the first probe  
17      of the new access probe sequence immediately after re-enabling the transmitter.
  - 18      – If the (T<sub>40m</sub>-T<sub>72m</sub>) timer expires, the mobile station shall direct Layer 2 to  
19      cancel any access attempt (see [4]) and shall declare a loss of the Paging  
20      Channel or the Forward Common Control Channel.
- 21       • If an access attempt was not in progress when the timer expired and the mobile  
22       station does not perform access handoff, the mobile station shall perform the  
23       following:
  - 24      – The mobile station shall set the timer to (T<sub>40m</sub>-T<sub>72m</sub>) seconds.
  - 25      – If the (T<sub>40m</sub>-T<sub>72m</sub>) timer expires, the mobile station shall declare a loss of the  
26      Paging Channel or the Forward Common Control Channel/ Primary Broadcast  
27      Control Channel.

#### 28   2.6.3.2 Update Overhead Information Substate

29   In this substate, if the base station supports the Primary Broadcast Control Channel for  
30   Spreading Rate 1, or if both the mobile station and base station support Spreading Rate 3  
31   on the common channels, then the mobile station shall monitor the Primary Broadcast  
32   Control Channel until it has received the current configuration messages; otherwise, the  
33   mobile station shall monitor the Paging Channel until it has received the current  
34   configuration messages. The mobile station compares sequence numbers to determine  
35   whether all of the configuration messages are up-to-date. To make sure it has the latest  
36   access parameters, the mobile station receives at least one message containing the

---

<sup>25</sup> Requirements for processing the loss of Paging Channel are given separately for each substate of the *System Access State*, in the sections describing the substates.

ACC\_MSG\_SEQ field (except in case where the mobile station enters this substate with a page response indication, since the initiating page contains ACC\_MSG\_SEQ), and waits, if necessary, for an *Access Parameters Message* or an *Enhanced Access Parameters Message*. In addition, if the mobile station is monitoring the Primary Broadcast Control Channel and SENDING\_RAND<sub>s</sub> is equal to '1', then it shall also wait for an *ANSI-41 RAND Message*.

Upon entering the *Update Overhead Information Substate*, the mobile station shall set the *System Access State* timer to a value of T<sub>41m</sub> seconds. The mobile station shall set PAGED to NO.

If the *System Access State* timer expires while in this substate, the mobile station shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a system lost indication (see 2.6.1.1).

If the mobile station declares a loss of the Paging Channel or the Primary Broadcast Control Channel (see 2.6.3.1.8), the mobile station shall perform the following:

- If PACA<sub>s</sub> is equal to enabled, the mobile station shall set PACA<sub>s</sub> to disabled and PACA\_CANCEL to '0', shall disable the PACA state timer, and should indicate to the user that the PACA call has been canceled.
- The mobile station shall declare an access attempt failure and update its registration variables as specified in 2.6.5.5.3.2.
- The mobile station shall enter the *Mobile Station Idle State*.

If PACA<sub>s</sub> is equal to enabled, the mobile station shall set PACA\_CANCEL to '1' when the user directs the mobile station to cancel a PACA call.

If the mobile station receives any of the following messages, it shall process the message as follows:

1. *System Parameters Message*: The mobile station shall process the parameters from the message (see 2.6.2.2.1).
2. *Access Parameters Message*: The mobile station shall process the parameters from the message (see 2.6.2.2.2).
3. *Neighbor List Message*: The mobile station shall process the parameters from the message (see 2.6.2.2.3).
4. *CDMA Channel List Message*: The mobile station shall process the parameters from the message (see 2.6.2.2.4).
5. *Extended System Parameters Message*: The mobile station shall process the parameters from the message (see 2.6.2.2.5).
6. *Global Service Redirection Message*: The mobile station shall process the parameters from the message (see 2.6.2.2.6).
7. *Extended Neighbor List Message*: The mobile station shall process the parameters from the message (see 2.6.2.2.7).
8. *General Neighbor List Message*: The mobile station shall process the parameters from the message (see 2.6.2.2.8).

- 1       9. *Lock Until Power-Cycled Order*: The mobile station shall record the reason for the  
2       *Lock Until Power-Cycled Order* in the mobile station's semi-permanent memory  
3       (LCKRSN\_P<sub>S-P</sub> equals the least-significant four bits of ORDQ<sub>R</sub>). The mobile station  
4       should notify the user of the locked condition. The mobile station shall then enter  
5       the *System Determination Substate* of the *Mobile Station Initialization State* with a  
6       lock indication (see 2.6.1.1), and shall not enter the *System Access State* again  
7       until after the next mobile station power-up or until it has received an *Unlock*  
8       *Order*. This requirement shall take precedence over any other mobile station  
9       requirement specifying entry to the *System Access State*.
- 10      10. *General Page Message* or *Universal Page Message*: If CURR\_ACC\_MSG\_SEQ is  
11      equal to NULL, the mobile station shall set CURR\_ACC\_MSG\_SEQ to  
12      ACC\_MSG\_SEQ<sub>R</sub>. The mobile station shall compare CONFIG\_MSG\_SEQ<sub>S</sub> to  
13      CONFIG\_MSG\_SEQ<sub>R</sub>. If the comparison results in a mismatch, the mobile station  
14      shall set CONFIG\_MSG\_SEQ<sub>S</sub> to CONFIG\_MSG\_SEQ<sub>R</sub>. The mobile station may  
15      ignore the rest of the message. If this substate was not entered with an origination  
16      indication, page response indication, direct channel assignment update overhead  
17      indication, direct channel assignment respond indication, or direct channel  
18      assignment failure indication, the mobile station may also determine whether  
19      there is a page match. If the mobile station attempts to determine whether there is  
20      a page match, it shall use the procedure as defined in 2.6.2.3. If a match is  
21      declared, the mobile station shall set PAGED to YES.
- 22      11. *User Zone Identification Message*: The mobile station shall process the parameters  
23      from the message (see 2.6.2.2.9).
- 24      12. *Private Neighbor List Message*: The mobile station shall process the parameters  
25      from the message (see 2.6.2.2.10).
- 26      13. *Extended Global Service Redirection Message*: The mobile station shall process the  
27      parameters from the message (see 2.6.2.2.11).
- 28      14. *Extended CDMA Channel List Message*: The mobile station shall process the  
29      parameters from the message (see 2.6.2.2.12).
- 30      15. *ANSI-41 System Parameters Message*: The mobile station shall process the  
31      parameters from the message (see 2.6.2.2.13).
- 32      16. *MC-RR Parameters Message*: The mobile station shall process the parameters from  
33      the message (see 2.6.2.2.14).
- 34      17. *Enhanced Access Parameters Message*: The mobile station shall process the  
35      parameters from the message (see 2.6.2.2.15).
- 36      18. *ANSI-41 RAND Message*: The mobile station shall process the parameters from the  
37      message (see 2.6.2.2.16).
- 38      19. *Universal Neighbor List Message*: The mobile station shall process the parameters  
39      from the message (see 2.6.2.2.17).
- 40      20. *Extended Channel Assignment Message*: If this substate was entered with an  
41      origination indication, or a direct channel assignment update overhead indication,

or a direct channel assignment respond indication, or a direct channel assignment failure indication, or if the `DIRECT_CH_ASSIGN_INDr` is not included, or the `DIRECT_CH_ASSIGN_INDr` is included and is set to '0', the mobile station shall ignore this message. Otherwise, the mobile station shall process the message as follows:

- If `RESPOND_INDr` is equal to '0', the mobile station shall perform the following in the order specified:
  - The mobile station shall set `CONFIG_MSG_SEQs` to `CONFIG_MSG_SEQr`.
  - The mobile station shall wait till stored configuration parameters are current (see 2.6.2.2).
  - Once the stored configuration parameters are current, the mobile station shall disable the System Access State timer and process the message as specified in section 2.6.3.3.
- If `RESPOND_INDr` is equal to '1', the mobile station shall perform the following in the order specified:
  - The mobile station shall set `CONFIG_MSG_SEQs` to `CONFIG_MSG_SEQr`.
  - When all of the following conditions are met:
    - + the stored configuration parameters are current (see 2.6.2.2)
    - + `CURR_ACC_MSG_SEQs` and `ACC_MSG_SEQs` are equal and are not NULL, and
    - + if the mobile station is monitoring the Primary Broadcast Control Channel and `SENDING_RANDs` is equal to '1', the *ANSI-41 RAND Message* has been received,
  - the mobile station shall disable the System Access State timer and process the message as specified in section 2.6.3.3.

21. *General Extension Message*: The mobile station shall process this message as specified in section 2.6.18.

If the mobile station receives a message which is not included in the above list, the mobile station shall ignore the message.

If this substate was entered with a direct channel assignment update overhead indication, the mobile station shall perform the following in the order specified:

- The mobile station shall wait till the stored configuration parameters are current (see 2.6.2.2).
- Once the stored configuration parameters are current, the mobile station shall perform the following:
  - The mobile station shall disable the System Access State timer.
  - The mobile station shall process the *Extended Channel Assignment Message* received in *Mobile Station Idle State* as specified in section 2.6.3.3.

1 When all of the following conditions are met:

- 2 • The stored configuration parameters are current (see 2.6.2.2)
- 3 • CURR\_ACC\_MSG\_SEQ<sub>s</sub> and ACC\_MSG\_SEQ<sub>s</sub> are equal and are not NULL, and
- 4 • If the mobile station is monitoring the Primary Broadcast Control Channel and
- 5 SENDING\_RAND<sub>s</sub> is equal to '1', the *ANSI-41 RAND Message* has been received,

6 then the mobile station shall disable the System Access State timer and shall perform one  
7 of the following:

- 8 • If PAGED is equal to YES, the mobile station shall determine whether the message  
9 resulting in the page match was received on the current Paging Channel or Forward  
10 Common Control Channel. If the message was received on the current Paging  
11 Channel or Forward Common Control Channel, the mobile station shall enter the  
12 *Page Response Substate*; otherwise, the mobile station shall enter the *Mobile*  
13 *Station Idle State*.
- 14 • If this substate was entered with a page response indication, direct channel  
15 assignment respond indication, or direct channel assignment failure indication,  
16 and the mobile station has not performed an access entry handoff, the mobile  
17 station shall determine whether the message resulting in the page response was  
18 received on the current Paging Channel or Forward Common Control Channel. If  
19 the message was received on the current Paging Channel or Forward Common  
20 Control Channel, the mobile station shall enter the *Page Response Substate*;  
21 otherwise, the mobile station shall enter the *Mobile Station Idle State* with the  
22 corresponding indication.
- 23 • If this substate was entered with a page response indication, direct channel  
24 assignment respond indication, or direct channel assignment failure indication,  
25 and the mobile station has performed an access entry handoff, the mobile station  
26 shall enter the *Page Response Substate* with the corresponding indication.
- 27 • If this substate was entered with a page response retransmission indication, the  
28 mobile station shall enter the *Page Response Substate*.
- 29 • If this substate was entered with an origination indication, the mobile station shall  
30 enter the *Mobile Station Origination Attempt Substate* with an origination indication.
- 31 • If this substate was entered with a PACA response indication, the mobile station  
32 shall enter the *Mobile Station Origination Attempt Substate* with a PACA response  
33 indication.
- 34 • If this substate was entered with an order/message response indication and the  
35 mobile station has not performed an access entry handoff, the mobile station shall  
36 determine whether the message resulting in the response was received on the  
37 current Paging Channel or Forward Common Control Channel. If the message was  
38 received on the current Paging Channel or Forward Common Control Channel, the  
39 mobile station shall enter the *Mobile Station Order/Message Response Substate*;  
40 otherwise, the mobile station shall discard the response and enter the *Mobile*  
41 *Station Idle State*.

- 1 • If this substate was entered with an order/message response indication and the  
2 mobile station has performed an access entry handoff, the mobile station shall  
3 enter the *Mobile Station Order/Message Response Substate*.
- 4 • If this substate was entered with a registration indication, the mobile station shall  
5 enter the *Registration Access Substate*.
- 6 • If this substate was entered with a message transmission indication, the mobile  
7 station shall enter the *Mobile Station Message Transmission Substate* with a  
8 message transmission indication.
- 9 • If this substate was entered with a hook status indication, the mobile station shall  
10 enter the *Mobile Station Message Transmission Substate* with a hook status  
11 indication.
- 12 • If this substate was entered with a PACA cancel indication, the mobile station shall  
13 enter the *PACA Cancel Substate*.
- 14 • If this substate was entered with a radio environment report indication, the mobile  
15 station shall enter the *Mobile Station Message Transmission Substate* with a radio  
16 environment report indication.
- 17 • If this substate was entered with a tracking zone indication, the mobile station  
18 shall enter the *Mobile Station Message Transmission Substate* with a tracking zone  
19 indication.
- 20 • If this substate was entered with a fast call setup indication, the mobile station  
21 shall enter the *Mobile Station Message Transmission Substate* with a fast call setup  
22 indication.

### 23 2.6.3.3 Page Response Substate

24 In this substate, the mobile station sends a *Page Response Message* or a *Reconnect*  
25 *Message* in response to a mobile-station-addressed page or direct channel assignment  
26 from a base station. If the mobile station sends a *Reconnect Message*, it shall set the  
27 ORIG\_IND field of the message to '0'.

28 If directed by the user to transmit a message, the mobile station may perform either of the  
29 following:

- 30 • The mobile station may transmit a *Data Burst Message* to the base station in this  
31 substate if all of the following conditions are true:
  - 32 – The mobile station has received confirmation of delivery of the *Page Response*  
33 *Message* or a *Reconnect Message*, and
  - 34 – ACCT is not enabled for the service option number associated with the *Data*  
35 *Burst Message* as follows:
    - 36 + The service option number associated with the *Data Burst Message* is not  
37 equal to any ACCT\_SO entry in ACCT\_SO\_LIST, and
    - 38 + The service option group number of the service option associated with the  
39 *Data Burst Message* is not equal to any ACCT\_SO\_GRP entry in

1 ACCT\_SO\_GRP\_LIST.

2 • If the mobile station sends a *Reconnect Message* in assured mode in this substate,  
 3 the mobile station may include a Short Data Burst (see [30]) in the *Reconnect*  
 4 *Message* by setting the SDB\_INCL field to '1', if all of the following conditions are  
 5 true:

6 – SDB\_SUPPORTED<sub>s</sub> and SDB\_IN\_RCNM\_IND<sub>s</sub> are equal to '1', and

7 – ACCT is not enabled for the service option number associated with the Short  
 8 Data Burst as follows:

9 + The service option number associated with the Short Data Burst is not  
 10 equal to any ACCT\_SO entry in ACCT\_SO\_LIST, and

11 + The service option group number of the service option associated with the  
 12 Short Data Burst is not equal to any ACCT\_SO\_GRP entry in  
 13 ACCT\_SO\_GRP\_LIST.

14 The mobile station shall not send the *Reconnect Message* if RECONNECT\_MSG\_IND<sub>s</sub>  
 15 equals '0' or if this message is not being sent to reconnect a dormant packet data service  
 16 instance.

17 If a base station responds to the *Page Response Message* or the *Reconnect Message* with  
 18 an authentication request, the mobile station responds in this substate.

19 If a message received from the base station requires a Layer 2 acknowledgment and does  
 20 not require a Layer 3 response, Layer 3 shall indicate to Layer 2 that no response is  
 21 outstanding (see [4]).

22 If a message received from the base station requires a Layer 2 acknowledgment and also a  
 23 Layer 3 response, Layer 3 shall indicate to Layer 2 that a response is outstanding (see [4]).

24 When transmitting a response to a message received from the base station, Layer 3 shall  
 25 indicate to Layer 2 that the type of the message is a response (see [4]).

26 When transmitting an autonomous message (i.e., a message that is not sent as a response  
 27 to a message received from the base station) other than the *Data Burst Message*, Layer 3  
 28 shall indicate to Layer 2 that the type of the message is a request other than a registration  
 29 request or a message transmission request (see [4]).

30 When transmitting an autonomous *Data Burst Message*, Layer 3 shall indicate to Layer 2  
 31 that the type of the message is a message transmission request (see [4]).

32 If the mobile station has a stored service configuration (that is, parameters conveyed by  
 33 both the Service Configuration information record and the Non-negotiable Service  
 34 Configuration information record) and corresponding SYNC\_ID with associated SID and  
 35 NID that are equal to the SID<sub>s</sub> and NID<sub>s</sub> respectively, and USE\_SYNC\_ID<sub>s</sub> is equal to '1',  
 36 the mobile station may include the SYNC\_ID field in the *Page Response Message* or the  
 37 *Reconnect Message* and, if included, shall set it to the SYNC\_ID corresponding to the  
 38 stored service configuration. If the mobile station includes SYNC\_ID field in the *Page*  
 39 *Response Message* or the *Reconnect Message*, the mobile station shall store the value of  
 40 the SYNC\_ID field in SYNC\_ID<sub>s</sub>.

1 If the mobile station enters the *Page Response Substate* with a direct channel assignment  
 2 respond indication, the mobile station shall perform the following:

- 3 • The mobile station shall send a *Page Response Message* or a *Reconnect Message* in  
 4 unassured mode, and shall then enter the *Traffic Channel Initialization Substate* of  
 5 the *Mobile Station Control on the Traffic Channel State*,
- 6 • While in the *Page Response Substate*, the mobile station shall ignore all received  
 7 messages, and
- 8 • The mobile station shall not perform any other procedures in this section.

9 Upon entering the *Page Response Substate* for any reason other than with a direct channel  
 10 assignment respond indication, the mobile station shall perform the following:

- 11 • Set RL\_GAIN\_ADJ<sub>S</sub> to '0000'.
- 12 • If P\_REV\_IN\_USE<sub>S</sub> is less than 11, set PLCM\_TYPE<sub>S</sub> to '0000'; otherwise set  
 13 PLCM\_TYPE<sub>S</sub> to '0100'.
- 14 • Send a *Page Response Message* or a *Reconnect Message*.

15 While in this substate, the mobile station shall monitor the Paging Channel or the Forward  
 16 Common Control Channel. The mobile station may perform an access probe handoff or  
 17 access handoff as described in 2.6.3.1.3.2 and 2.6.3.1.3.3. If the mobile station declares a  
 18 loss of the Paging Channel or the Forward Common Control Channel (see 2.6.3.1.8) during  
 19 an access attempt, the mobile station may perform an access probe handoff; otherwise, it  
 20 shall declare an access attempt failure and shall perform the following actions:

- 21 • The mobile station shall update its registration variables as specified in 2.6.5.5.3.2,
- 22 • If the mobile station is monitoring the Paging Channel, the mobile station shall set  
 23 SYS\_PAR\_MSG\_SEQ<sub>S</sub> and ACC\_MSG\_SEQ<sub>S</sub> to NULL,
- 24 • If the mobile station is monitoring the Forward Common Control Channel, the  
 25 mobile station shall set MC\_RR\_PAR\_MSG\_SEQ<sub>S</sub> and ACC\_MSG\_SEQ<sub>S</sub> to NULL.
- 26 • If PACA<sub>S</sub> is equal to enabled, the mobile station shall set PACA<sub>S</sub> to disabled and  
 27 PACA\_CANCEL to '0', shall disable the PACA state timer, and should indicate to the  
 28 user that the PACA call has been canceled.
- 29 • The mobile station shall disable its transmitter, and
- 30 • The mobile station shall enter the *Mobile Station Idle State*.

31 If the mobile station receives confirmation of delivery of any message sent by the mobile  
 32 station in this substate, the mobile station shall perform an access handoff if all of the  
 33 following conditions hold:

- 34 • The mobile station declares a loss of the Paging Channel or the Forward Common  
 35 Control Channel, and
- 36 • The mobile station is permitted to perform an access handoff (see 2.6.3.1.3.2), and  
 37 there are pilots other than the active pilot in the access handoff list (see  
 38 2.6.3.1.3.2).

If the mobile station declares a loss of the Paging Channel or the Forward Common Control Channel and does not perform an access handoff, the mobile station shall perform the following:

- If the mobile station is monitoring the Paging Channel, the mobile station shall set SYS\_PAR\_MSG\_SEQ<sub>S</sub> and ACC\_MSG\_SEQ<sub>S</sub> to NULL.
- If the mobile station is monitoring the Forward Common Control Channel, the mobile station shall set MC\_RR\_PAR\_MSG\_SEQ<sub>S</sub> and ACC\_MSG\_SEQ<sub>S</sub> to NULL.
- If PACA<sub>S</sub> is equal to enabled, the mobile station shall set PACA<sub>S</sub> to disabled and PACA\_CANCEL to 0, shall disable the PACA state timer, and should indicate to the user that the PACA call has been canceled,
- The mobile station shall disable its transmitter, and
- The mobile station shall enter the *Mobile Station Idle State*.

If PACA<sub>S</sub> is equal to enabled, the mobile station shall set PACA\_CANCEL to '1' when the user directs the mobile station to cancel a PACA call.

If the mobile station receives confirmation of delivery of the *Page Response Message* or the *Reconnect Message* sent in this substate, the mobile station shall update its registration variables with respect to the base station to which the first access probe was transmitted after entering the *System Access State*, as specified in 2.6.5.5.3.1.

If the *System Access State* timer expires while in this substate, the mobile station shall perform the following:

- If PACA<sub>S</sub> is equal to enabled, the mobile station shall set PACA<sub>S</sub> to disabled and PACA\_CANCEL to '0', shall disable the PACA state timer, and should indicate to the user that the PACA call has been canceled.
- If the mobile station is monitoring the Paging Channel, the mobile station shall set SYS\_PAR\_MSG\_SEQ<sub>S</sub> and ACC\_MSG\_SEQ<sub>S</sub> to NULL, and shall enter the *Mobile Station Idle State*.
- If the mobile station is monitoring the Forward Common Control Channel, the mobile station shall set MC\_RR\_PAR\_MSG\_SEQ<sub>S</sub> and ACC\_MSG\_SEQ<sub>S</sub> to NULL and enter the *Mobile Station Idle State*.

The mobile station shall set and disable the *System Access State* timer as follows:

- The mobile station shall disable the timer whenever it begins an access attempt.
- The mobile station shall set the timer to T<sub>42m</sub> seconds whenever it ends an access attempt.
- The mobile station shall disable the timer whenever it exits the *System Access State*.

If the mobile station receives a *Channel Assignment Message* or the *Extended Channel Assignment Message*, Layer 3 shall send a *dedicated channel assignment* indication to Layer 2 (see [4]). If the mobile station has not received confirmation of delivery of the *Page Response Message* or the *Reconnect Message*, before receiving the *Channel Assignment*

1 *Message* or the *Extended Channel Assignment Message*, the mobile station shall update its  
 2 registration variables with respect to the base station to which the first access probe was  
 3 transmitted after entering the *System Access State*, as specified in 2.6.5.5.3.1. If the mobile  
 4 station has not received confirmation of delivery of a *Data Burst Message* before receiving  
 5 the *Channel Assignment Message* or the *Extended Channel Assignment Message*, Layer 3  
 6 shall send an L2-Supervision.Request primitive to Layer 2 to abort any access attempt in  
 7 progress and the mobile station may store the *Data Burst Message* for later transmission  
 8 on the r-dsch.

9 If the mobile station is to exit the *System Access State* as a result of processing Layer 3  
 10 fields of a message requiring an acknowledgment, the mobile station shall exit the *System*  
 11 *Access State* after Layer 3 receives an indication from Layer 2 that the acknowledgment to  
 12 the message has been sent and acknowledged.

13 If Layer 3 receives a message other than a *Channel Assignment Message* or an *Extended*  
 14 *Channel Assignment Message* with an indication from Layer 2 that an access attempt for a  
 15 message being transmitted was not terminated as a result of processing the Layer 2 fields  
 16 of the received message, the mobile station shall ignore the received message.

17 The following directed messages and orders can be received. If any field value of the  
 18 message or order is outside its permissible range, the mobile station may send a *Mobile*  
 19 *Station Reject Order* with ORDQ equal to '00000100' (message field not in valid range).

- 20 1. *Authentication Challenge Message*: The mobile station shall respond to the  
 21 message as specified in 2.3.12.1.4, regardless of the value of AUTH<sub>S</sub>.
- 22 2. *Authentication Request Message*: The mobile station shall process the message and  
 23 shall respond as specified in 2.3.12.5.2.
- 24 3. *Base Station Challenge Confirmation Order*: The mobile station shall respond to the  
 25 message as specified in 2.3.12.1.5.
- 26 4. *Base Station Reject Order*: The mobile station shall perform the procedures as  
 27 specified in 2.6.11.5.
- 28 5. *Channel Assignment Message*: The mobile station shall process the message as  
 29 follows:
  - 30 • If ASSIGN\_MODE<sub>r</sub> equals '000', the mobile station shall perform the following  
 31 actions:
    - 32 – The mobile station shall set CH\_IND<sub>S</sub> to '01'.
    - 33 – The mobile station shall store the frame offset (FRAME\_OFFSET<sub>S</sub> =  
 34 FRAME\_OFFSET<sub>r</sub>), the message encryption mode indicator  
 35 (ENCRYPT\_MODE<sub>S</sub> = ENCRYPT\_MODE<sub>r</sub>), and, if FREQ\_INCL<sub>r</sub> equals '1', the  
 36 Frequency Assignment (CDMACH<sub>S</sub> = CDMA\_FREQ<sub>r</sub>).
    - 37 – The mobile station shall set SERV\_NEG<sub>S</sub> to disabled.
    - 38 – If PACA<sub>S</sub> is equal to enabled, the mobile station shall set PACA<sub>S</sub> to disabled  
 39 and PACA\_CANCEL to '0', shall disable the PACA state timer, and should  
 40 indicate to the user that the PACA call has been canceled.

- 1           – The mobile station shall initialize CODE\_CHAN\_LIST as described in 2.6.8.
- 2           – If the mobile station is currently monitoring the Paging Channel, the mobile
- 3           station shall set IDLE\_BCCH\_CHAN to '0'; otherwise, the mobile station
- 4           shall set IDLE\_BCCH\_CHAN to '1'. The mobile station shall set
- 5           IDLE\_CDMA\_CHAN to CDMACH<sub>S</sub>, IDLE\_CDMABAND to CDMABAND<sub>S</sub>,
- 6           IDLE\_SID to SID<sub>S</sub>, IDLE\_NID to NID<sub>S</sub>, and IDLE\_P\_REV to P\_REV<sub>S</sub>.
- 7           – The mobile station shall enter the *Traffic Channel Initialization Substate* of
- 8           the *Mobile Station Control on the Traffic Channel State*.
- 9           • If ASSIGN\_MODE<sub>r</sub> equals '001', the mobile station shall perform the following
- 10          actions:
- 11          – If FREQ\_INCL<sub>r</sub> equals '1', the mobile station shall perform the following:
- 12           + If the message requires acknowledgment, the mobile station shall wait
- 13           until Layer 3 receives an indication from Layer 2 that the
- 14           acknowledgment to the message has been sent and acknowledged.
- 15           + The mobile station shall set CDMACH<sub>S</sub> to CDMA\_FREQ<sub>r</sub>, tune to the
- 16           new Frequency Assignment, and measure the strength of each pilot
- 17           listed in the assignment using the Neighbor Set search procedures
- 18           specified in 2.6.6.2.1 and 2.6.6.2.2.
- 19          – The mobile station shall set CONFIG\_MSG\_SEQ<sub>S</sub> and ACC\_MSG\_SEQ<sub>S</sub> to
- 20          NULL (see 2.6.2.2) and shall set PILOT\_PN<sub>S</sub> to the pilot PN sequence offset of
- 21          the strongest pilot in the list (PILOT\_PN<sub>r</sub>).
- 22          – If the mobile station has not stored configuration parameters for the Primary
- 23          Paging Channel of the new base station, or if the stored information is not
- 24          current (see 2.6.2.2), the mobile station shall set SYS\_PAR\_MSG\_SEQ<sub>S</sub>,
- 25          NGHBR\_LST\_MSG\_SEQ<sub>S</sub>, EXT\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub>,
- 26          GEN\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub>, USER\_ZONE\_ID\_MSG\_SEQ<sub>S</sub>,
- 27          PRI\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub>, CHAN\_LST\_MSG\_SEQ<sub>S</sub>,
- 28          EXT\_CHAN\_LST\_MSG\_SEQ<sub>S</sub>, FD\_CHAN\_LST\_MSG\_SEQ<sub>S</sub> EQ<sub>S</sub>,
- 29          EXT\_SYS\_PAR\_MSG\_SEQ<sub>S</sub>, GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>S</sub>, and
- 30          EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>S</sub> to NULL.
- 31          – The mobile station shall set PAGE\_CHAN<sub>S</sub> to '1' and PAGECH<sub>S</sub> to the
- 32          Primary Paging Channel. The mobile station shall then begin monitoring
- 33          the Primary Paging Channel of the selected base station.
- 34          – If RESPOND<sub>r</sub> is equal to '1', the mobile station shall enter the *Update*
- 35          *Overhead Information Substate* with a page response retransmission
- 36          indication within T<sub>34m</sub> seconds after receiving the *Channel Assignment*
- 37          *Message*.
- 38          – If RESPOND<sub>r</sub> is equal to '0', the mobile station shall enter the *Mobile Station*
- 39          *Idle State* within T<sub>34m</sub> seconds after receiving the *Channel Assignment*
- 40          *Message*.

- 1       • If ASSIGN\_MODE<sub>r</sub> equals '100', the mobile station shall perform the following  
2       actions:
  - 3       – The mobile station shall set CH\_IND<sub>s</sub> to '01'.
  - 4       – If PACA<sub>s</sub> is equal to enabled, the mobile station shall set PACA<sub>s</sub> to disabled  
5       and PACA\_CANCEL to '0', shall disable the PACA state timer, and should  
6       indicate to the user that the PACA call has been canceled.
  - 7       – If GRANTED\_MODE<sub>r</sub> equals '00', and the multiplex option and radio  
8       configuration combination specified in the DEFAULT\_CONFIG field is not  
9       supported by the mobile station, the mobile station shall send a *Mobile*  
10      *Station Reject Order* with ORDQ field set to '00000110' (capability not  
11      supported by the mobile station) and remain in the *Page Response Substate*.
  - 12      – If FREQ\_INCL<sub>r</sub> equals '0', the mobile station shall perform the following  
13      actions:
    - 14      + The mobile station shall store the frame offset (FRAME\_OFFSET<sub>s</sub> =  
15      FRAME\_OFFSET<sub>r</sub>), the message encryption mode indicator  
16      (ENCRYPT\_MODE<sub>s</sub> = ENCRYPT\_MODE<sub>r</sub>), the granted mode  
17      (GRANTED\_MODE<sub>s</sub> = GRANTED\_MODE<sub>r</sub>), and default configuration  
18      (DEFAULT\_CONFIG<sub>s</sub> = DEFAULT\_CONFIG<sub>r</sub>).
    - 19      + The mobile station shall set SERV\_NEG<sub>s</sub> to enabled.
    - 20      + If the mobile station is currently monitoring the Paging Channel, the  
21      mobile station shall set IDLE\_BCCH\_CHAN to '0'; otherwise, the mobile  
22      station shall set IDLE\_BCCH\_CHAN to '1'. The mobile station shall set  
23      IDLE\_CDMA\_CHAN to CDMACH<sub>s</sub>, IDLE\_CDMABAND to CDMABAND<sub>s</sub>,  
24      IDLE\_SID to SID<sub>s</sub>, IDLE\_NID to NID<sub>s</sub>, and IDLE\_P\_REV to P\_REV<sub>s</sub>.
    - 25      + The mobile station shall initialize CODE\_CHAN\_LIST as described in  
26      2.6.8 and shall then enter the *Traffic Channel Initialization Substate* of  
27      the *Mobile Station Control on the Traffic Channel State*.
  - 28      – If FREQ\_INCL<sub>r</sub> equals '1', the mobile station shall perform the following  
29      actions:
    - 30      + If the band class is not supported by the mobile station, the mobile  
31      station shall send a *Mobile Station Reject Order* with ORDQ field set to  
32      '00000110' (capability not supported by the mobile station) and shall  
33      remain in the *Page Response Substate*.
    - 34      + If the band class is supported by the mobile station, the mobile station  
35      shall perform the following actions:

- 1                   o The mobile station shall store the frame offset ( $\text{FRAME\_OFFSET}_S =$   
2                    $\text{FRAME\_OFFSET}_T$ ), the message encryption mode indicator  
3                   ( $\text{ENCRYPT\_MODE}_S = \text{ENCRYPT\_MODE}_T$ ), the bypass indicator  
4                   ( $\text{BYPASS\_ALERT\_ANSWER}_S = \text{BYPASS\_ALERT\_ANSWER}_T$ ), the  
5                   granted mode ( $\text{GRANTED\_MODE}_S = \text{GRANTED\_MODE}_T$ ), the default  
6                   configuration ( $\text{DEFAULT\_CONFIG}_S = \text{DEFAULT\_CONFIG}_T$ ), the idle  
7                   Frequency Assignment ( $\text{IDLE\_CDMA\_CHAN} = \text{CDMACH}_S$ ), the idle  
8                   band class ( $\text{IDLE\_CDMABAND} = \text{CDMABAND}_S$ ), the band class  
9                   ( $\text{CDMABAND}_S = \text{BAND\_CLASS}_T$ ), and the Frequency Assignment  
10                  ( $\text{CDMACH}_S = \text{CDMA\_FREQ}_T$ ).
- 11               o The mobile station shall initialize  $\text{CODE\_CHAN\_LIST}$  as described in  
12               2.6.8, and shall set  $\text{SERV\_NEG}_S$  to enabled.
- 13               o If the mobile station is currently monitoring the Paging Channel, the  
14               mobile station shall set  $\text{IDLE\_BCCH\_CHAN}$  to '0'; otherwise, the  
15               mobile station shall set  $\text{IDLE\_BCCH\_CHAN}$  to '1'. The mobile station  
16               shall set  $\text{IDLE\_SID}$  to  $\text{SID}_S$ ,  $\text{IDLE\_NID}$  to  $\text{NID}_S$ , and  $\text{IDLE\_P\_REV}$  to  
17                $\text{P\_REV}_S$ .
- 18               o The mobile station shall then tune to the new Frequency Assignment  
19               and shall enter the *Traffic Channel Initialization Substate* of the  
20               *Mobile Station Control on the Traffic Channel State*.
- 21       • If  $\text{ASSIGN\_MODE}_T$  equals '101', the mobile station shall perform the following  
22       actions:
  - 23       – If  $\text{FREQ\_INCL}_T$  equals '0', the mobile station shall perform the following  
24       actions:
    - 25       + If the message requires acknowledgment, the mobile station shall wait  
26       until Layer 3 receives an indication from Layer 2 that the  
27       acknowledgment to the message has been sent and acknowledged.
    - 28       + The mobile station shall set  $\text{CONFIG\_MSG\_SEQ}_S$  and  $\text{ACC\_MSG\_SEQ}_S$   
29       to NULL (see 2.6.2.2) and shall set  $\text{PILOT\_PN}_S$  to the pilot PN sequence  
30       offset of the strongest pilot in the list ( $\text{PILOT\_PN}_T$ ).
    - 31       + If the mobile station has not stored configuration parameters for the  
32       Primary Paging Channel of the new base station, or if the stored  
33       information is not current (see 2.6.2.2), the mobile station shall set  
34        $\text{SYS\_PAR\_MSG\_SEQ}_S$ ,  $\text{NGHBR\_LST\_MSG\_SEQ}_S$ ,  
35        $\text{EXT\_NGHBR\_LST\_MSG\_SEQ}_S$ ,  $\text{GEN\_NGHBR\_LST\_MSG\_SEQ}_S$ ,  
36        $\text{USER\_ZONE\_ID\_MSG\_SEQ}_S$ ,  $\text{PRI\_NGHBR\_LST\_MSG\_SEQ}_S$ ,  
37        $\text{CHAN\_LST\_MSG\_SEQ}_S$ ,  $\text{EXT\_CHAN\_LST\_MSG\_SEQ}_S$ ,  
38        $\text{FD\_CHAN\_LST\_MSG\_SEQ}_S$ ,  $\text{EXT\_SYS\_PAR\_MSG\_SEQ}_S$ ,  
39        $\text{GLOB\_SERV\_REDIR\_MSG\_SEQ}_S$ , and  
40        $\text{EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ}_S$  to NULL.

- 1           + The mobile station shall set PAGE\_CHAN<sub>s</sub> to '1' and PAGECH<sub>s</sub> to the
- 2           Primary Paging Channel. The mobile station shall then begin
- 3           monitoring the Primary Paging Channel of the selected base station.
- 4           + If RESPOND<sub>r</sub> is equal to '1', the mobile station shall perform the
- 5           following:
- 6           o If the *Channel Assignment Message* does not require an
- 7           acknowledgment, the mobile station shall enter the *Update Overhead*
- 8           *Information Substate* with a page response retransmission indication
- 9           within T<sub>34m</sub> seconds after receiving the *Channel Assignment*
- 10          *Message*.
- 11          o If the *Channel Assignment Message* requires an acknowledgment,
- 12          the mobile station shall enter the *Update Overhead Information*
- 13          *Substate* with a page response retransmission indication within
- 14          T<sub>34m</sub> seconds after Layer 3 receives an indication from Layer 2 that
- 15          the acknowledgment to the *Channel Assignment Message* has been
- 16          sent and acknowledged.
- 17          + If RESPOND<sub>r</sub> is equal to '0', the mobile station shall perform the
- 18          following:
- 19          o If the *Channel Assignment Message* does not require an
- 20          acknowledgment, the mobile station shall enter the *Mobile Station*
- 21          *Idle State* within T<sub>34m</sub> seconds after receiving the *Channel*
- 22          *Assignment Message*.
- 23          o If the *Channel Assignment Message* requires an acknowledgment,
- 24          the mobile station shall enter the *Mobile Station Idle State* within
- 25          T<sub>34m</sub> seconds after Layer 3 receives an indication from Layer 2 that
- 26          the acknowledgment to the *Channel Assignment Message* has been
- 27          sent and acknowledged.
- 28          – If FREQ\_INCL<sub>r</sub> equals '1', the mobile station shall perform the following
- 29          actions:
- 30          + If the band class is not supported by the mobile station, the mobile
- 31          station shall send a *Mobile Station Reject Order* with ORDQ field set to
- 32          '00000110' (capability not supported by the mobile station) and shall
- 33          remain in the *Page Response Substate*.
- 34          + If the band class is supported by the mobile station, the mobile station
- 35          shall perform the following actions:
- 36          o If the message requires acknowledgment, the mobile station shall
- 37          wait until Layer 3 receives an indication from Layer 2 that the
- 38          acknowledgment to the message has been sent and acknowledged.

- 1           o The mobile station shall set CDMACH<sub>S</sub> to CDMA\_FREQ<sub>r</sub> and

2           CDMABAND<sub>S</sub> to BAND\_CLASS<sub>r</sub>. Then the mobile station shall tune

3           to the new Frequency Assignment, measure the strength of each

4           pilot listed in the assignment using the Neighbor Set search

5           procedures specified in 2.6.6.2.1 and 2.6.6.2.2, set PILOT\_PN<sub>S</sub> to the

6           pilot PN sequence offset of the strongest pilot in the list (PILOT\_PN<sub>r</sub>),

7           and set CONFIG\_MSG\_SEQ<sub>S</sub> and ACC\_MSG\_SEQ<sub>S</sub> to NULL (see

8           2.6.2.2).
- 9           o If the mobile station has not stored configuration parameters for the

10          Primary Paging Channel of the new base station, or if the stored

11          information is not current (see 2.6.2.2), the mobile station shall set

12          SYS\_PAR\_MSG\_SEQ<sub>S</sub>, NGHBR\_LST\_MSG\_SEQ<sub>S</sub>,

13          EXT\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub>, GEN\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub>,

14          USER\_ZONE\_ID\_MSG\_SEQ<sub>S</sub>, PRI\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub>,

15          CHAN\_LST\_MSG\_SEQ<sub>S</sub>, EXT\_CHAN\_LST\_MSG\_SEQ<sub>S</sub>,

16          FD\_CHAN\_LST\_MSG\_SEQ<sub>S</sub>, EXT\_SYS\_PAR\_MSG\_SEQ<sub>S</sub>,

17          GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>S</sub>, and

18          EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>S</sub> to NULL.
- 19          o The mobile station shall set PAGE\_CHAN<sub>S</sub> to '1' and PAGECH<sub>S</sub> to the

20          Primary Paging Channel. The mobile station shall then begin

21          monitoring the Primary Paging Channel of the selected base station.
- 22          o If RESPOND<sub>r</sub> is equal to '1', the mobile station shall perform the

23          following:

  - 24               ◇ If the *Channel Assignment Message* does not require an

25               acknowledgment, the mobile station shall enter the *Update*

26               *Overhead Information Substate* with a page response

27               retransmission indication within T<sub>34m</sub> seconds after receiving

28               the *Channel Assignment Message*.
  - 29               ◇ If the *Channel Assignment Message* requires an acknowledgment,

30               the mobile station shall enter the *Update Overhead Information*

31               *Substate* with a page response retransmission indication within

32               T<sub>34m</sub> seconds after Layer 3 receives an indication from Layer 2

33               that the acknowledgment to the *Channel Assignment Message*

34               has been sent and acknowledged.
- 35          o If RESPOND<sub>r</sub> is equal to '0', the mobile station perform the following:

  - 36               ◇ If the *Channel Assignment Message* does not require an

37               acknowledgment, the mobile station shall enter the *Mobile*

38               *Station Idle State* within T<sub>34m</sub> seconds after receiving the

39               *Channel Assignment Message*.

- 1                   ◇ If the *Channel Assignment Message* requires an acknowledgment,  
 2                   the mobile station shall enter the *Mobile Station Idle State* within  
 3                   T<sub>34m</sub> seconds after Layer 3 receives an indication from Layer 2  
 4                   that the acknowledgment to the *Channel Assignment Message*  
 5                   has been sent and acknowledged.

## 6. *Data Burst Message*

### 7. *Extended Channel Assignment Message*: The mobile station shall process the message as follows:

- 9           • If the *Extended Channel Assignment Message* requires an acknowledgment and  
 10           the mobile station is to enter the *Mobile Station Control on the Traffic Channel*  
 11           *State* as a result of processing Layer 3 fields of this message, the mobile station  
 12           shall enter the *Mobile Station Control on the Traffic Channel State* only after  
 13           Layer 3 receives an indication from Layer 2 that the acknowledgment to the  
 14           message has been sent and acknowledged.
- 15          • The mobile station shall set RTC\_NOM\_PWR\_USE\_IND to '0'.
- 16          • The mobile station shall set DIRECT\_CH\_ASSIGN\_RECOVER\_IND<sub>S</sub> to '0'.
- 17          • If the mobile station is in *Page Response Substate* and has sent<sup>26</sup> a *Page*  
 18           *Response Message* or a *Reconnect Message* the mobile station shall set  
 19           RESPOND\_IND<sub>S</sub> to '0'; otherwise the mobile station shall set RESPOND\_IND<sub>S</sub> to  
 20           RESPOND\_IND<sub>R</sub>.
- 21          • If ASSIGN\_MODE<sub>R</sub> equals '000', the mobile station shall perform the following  
 22           actions:
  - 23           – The mobile station shall set CH\_IND<sub>S</sub> to '01'.
  - 24           – If PACA<sub>S</sub> is equal to enabled, the mobile station shall set PACA<sub>S</sub> to disabled  
 25           and PACA\_CANCEL to '0', shall disable the PACA state timer, and should  
 26           indicate to the user that the PACA call has been canceled.
  - 27           – If GRANTED\_MODE<sub>R</sub> equals '00', and the multiplex option and radio  
 28           configuration specified in the DEFAULT\_CONFIG field are not supported by  
 29           the mobile station, the mobile station shall send a *Mobile Station Reject*  
 30           *Order* with ORDQ field set to '00000110' (capability not supported by the  
 31           mobile station) and shall remain in the current state<sup>27</sup>.

---

<sup>26</sup> A message is considered sent when the mobile station transmits the message at least once, no matter whether the L2 acknowledgment is received or not.

<sup>27</sup> The current state may be *Page Response Substate* or *Mobile Station Idle State*. The mobile station remains in the state in which *Extended Channel Assignment Message* is received.

- 1           – If GRANTED\_MODE<sub>r</sub> is equal to '00' and DEFAULT\_CONFIG<sub>r</sub> is not equal to
- 2           '100', the mobile station shall send a *Mobile Station Reject Order* with ORDQ
- 3           field set to '00001110' (RC does not match with DEFAULT\_CONFIG<sub>r</sub>) and
- 4           shall remain in the current state if any of the following conditions is true:
- 5           + FOR\_FCH\_RC<sub>r</sub> is not equal to the RC associated with
- 6           DEFAULT\_CONFIG<sub>r</sub> (see Table 3.7.2.3.2.21-2).
- 7           + REV\_FCH\_RC<sub>r</sub> is not equal to the RC associated with
- 8           DEFAULT\_CONFIG<sub>r</sub> (see Table 3.7.2.3.2.21-2).
- 9           – If the mobile station does not support either of the Fundamental Channel
- 10          Radio Configurations (FOR\_FCH\_RC or REV\_FCH\_RC), the mobile shall
- 11          send a *Mobile Station Reject Order* with the ORDQ field set to '00000110'
- 12          (capability not supported by the mobile station) and remain in the current
- 13          state.
- 14          – If PLCM\_TYPE<sub>r</sub> equals '0010' and IMSI\_O is derived from IMSI\_T, or if
- 15          PLCM\_TYPE<sub>r</sub> equals '0011' and IMSI\_O is derived from IMSI\_M, the mobile
- 16          station shall send a *Mobile Station Reject Order* with the ORDQ field
- 17          set to '00011100' (PLCM\_TYPE mismatch) and remain in the current state.
- 18          – If P\_REV\_IN\_USE<sub>s</sub> is equal to or greater than 6, the mobile station shall
- 19          store the Forward Fundamental Channel Radio Configuration
- 20          (FOR\_FCH\_RC<sub>s</sub> = FOR\_FCH\_RC<sub>r</sub>) and the Reverse Fundamental Channel
- 21          Radio Configuration (REV\_FCH\_RC<sub>s</sub> = REV\_FCH\_RC<sub>r</sub>).
- 22          – If FREQ\_INCL<sub>r</sub> equals '0', and the band class is supported by the mobile
- 23          station, the mobile station shall perform the following actions:
- 24          + The mobile station shall store the frame offset (FRAME\_OFFSET<sub>s</sub> =
- 25          FRAME\_OFFSET<sub>r</sub>); the message encryption mode indicator
- 26          (ENCRYPT\_MODE<sub>s</sub> = ENCRYPT\_MODE<sub>r</sub>); the bypass indicator
- 27          (BYPASS\_ALERT\_ANSWER<sub>s</sub> = BYPASS\_ALERT\_ANSWER<sub>r</sub>); the granted
- 28          mode (GRANTED\_MODE<sub>s</sub> = GRANTED\_MODE<sub>r</sub>); the default
- 29          configuration (DEFAULT\_CONFIG<sub>s</sub> = DEFAULT\_CONFIG<sub>r</sub>); and the
- 30          occurrences of PILOT\_PN and PWR\_COMB for each included member of
- 31          the Active Set.
- 32          + The mobile station shall perform the procedures in 2.6.11.2.
- 33          + If C\_SIG\_ENCRYPT\_MODE is included, the mobile station shall set
- 34          C\_SIG\_ENCRYPT\_MODE<sub>s</sub> to C\_SIG\_ENCRYPT\_MODE<sub>r</sub>.
- 35          + The mobile station shall initialize CODE\_CHAN\_LIST as described in
- 36          2.6.8, and shall set SERV\_NEG<sub>s</sub> to enabled.

- 1           + The mobile station shall set FPC\_FCH\_INIT\_SETPT<sub>S</sub> to
- 2           FPC\_FCH\_INIT\_SETPT<sub>R</sub>, FPC\_FCH\_CURR\_SETPT<sub>S</sub> to
- 3           FPC\_FCH\_INIT\_SETPT<sub>S</sub>, FPC\_FCH\_FER<sub>S</sub> to FPC\_FCH\_FER<sub>R</sub>,
- 4           FPC\_FCH\_MIN\_SETPT<sub>S</sub> to FPC\_FCH\_MIN\_SETPT<sub>R</sub>,
- 5           FPC\_FCH\_MAX\_SETPT<sub>S</sub> to FPC\_FCH\_MAX\_SETPT<sub>R</sub>, and
- 6           FPC\_PRI\_CHAN<sub>S</sub> to '0' if the mobile station supports any Radio
- 7           Configuration greater than 2.
- 8           + The mobile station shall set FPC\_SUBCHAN\_GAIN<sub>S</sub> to
- 9           FPC\_SUBCHAN\_GAIN<sub>R</sub>.
- 10          + The mobile station shall set RLGAIN\_ADJ<sub>S</sub> to RLGAIN\_ADJ<sub>R</sub>.
- 11          + The mobile station shall set REV\_FCH\_GATING\_MODE<sub>S</sub> to
- 12          REV\_FCH\_GATING\_MODE<sub>R</sub>.
- 13          + The mobile station shall set REV\_PWR\_CNTL\_DELAY<sub>S</sub> to
- 14          REV\_PWR\_CNTL\_DELAY<sub>R</sub> if REV\_PWR\_CNTL\_DELAY\_INCL<sub>R</sub> is equal to
- 15          '1'.
- 16          + The mobile station shall set PLCM\_TYPE<sub>S</sub> to PLCM\_TYPE<sub>R</sub> if
- 17          PLCM\_TYPE\_INCL<sub>R</sub> is equal to '1'; otherwise, the mobile station shall set
- 18          PLCM\_TYPE<sub>S</sub> as follows:
  - 19           o If P\_REV\_IN\_USE<sub>S</sub> is less than 11, set PLCM\_TYPE<sub>S</sub> to '0000';
  - 20           otherwise set PLCM\_TYPE<sub>S</sub> to '0100'.
- 21          + The mobile station shall set PLCM\_39<sub>S</sub> to PLCM\_39<sub>R</sub> if PLCM\_TYPE<sub>R</sub> is
- 22          equal to '0001'.
- 23          + If the mobile station is currently monitoring the Paging Channel, the
- 24          mobile station shall set IDLE\_BCCH\_CHAN to '0'; otherwise, the mobile
- 25          station shall set IDLE\_BCCH\_CHAN to '1'. The mobile station shall set
- 26          IDLE\_CDMA\_CHAN to CDMACH<sub>S</sub>, IDLE\_CDMABAND to CDMABAND<sub>S</sub>,
- 27          IDLE\_SID to SID<sub>S</sub>, IDLE\_NID to NID<sub>S</sub>, and IDLE\_P\_REV to P\_REV<sub>S</sub>.
- 28          + The mobile station shall then enter the *Traffic Channel Initialization*
- 29          *Substate* of the *Mobile Station Control on the Traffic Channel State*.
- 30          – If FREQ\_INCL<sub>R</sub> equals '1', and the band class is not supported by the mobile
- 31          station, the mobile station shall send a *Mobile Station Reject Order* with
- 32          ORDQ field set to '00000110' (capability not supported by the mobile
- 33          station) and remain in the current state.
- 34          – If FREQ\_INCL<sub>R</sub> equals '1', and the band class is supported by the mobile
- 35          station, the mobile station shall perform the following actions:

- 1           + The mobile station shall store the frame offset ( $FRAME\_OFFSET_S =$   
2            $FRAME\_OFFSET_R$ ); the message encryption mode indicator  
3           ( $ENCRYPT\_MODE_S = ENCRYPT\_MODE_R$ ); the bypass indicator  
4           ( $BYPASS\_ALERT\_ANSWER_S = BYPASS\_ALERT\_ANSWER_R$ ); the granted  
5           mode ( $GRANTED\_MODE_S = GRANTED\_MODE_R$ ); the default  
6           configuration ( $DEFAULT\_CONFIG_S = DEFAULT\_CONFIG_R$ ); the idle  
7           Frequency Assignment ( $IDLE\_CDMA\_CHAN = CDMACH_S$ ); the idle band  
8           class ( $IDLE\_CDMABAND = CDMABAND_S$ ); the band class ( $CDMABAND_S$   
9            $= BAND\_CLASS_R$ ); the Frequency Assignment  
10          ( $CDMACH_S = CDMA\_FREQ_R$ ); and the occurrences of  $PILOT\_PN$  and  
11           $PWR\_COMB\_IND$  for each included member of the Active Set.
- 12         + The mobile station shall perform the procedures in 2.6.11.2.
- 13         + The mobile station shall set  $FPC\_FCH\_INIT\_SETPT_S$  to  
14          $FPC\_FCH\_INIT\_SETPT_R$ ,  $FPC\_FCH\_CURR\_SETPT_S$  to  
15          $FPC\_FCH\_INIT\_SETPT_S$ ,  $FPC\_FCH\_FER_S$  to  $FPC\_FCH\_FER_R$ ,  
16          $FPC\_FCH\_MIN\_SETPT_S$  to  $FPC\_FCH\_MIN\_SETPT_R$ ,  
17          $FPC\_FCH\_MAX\_SETPT_S$  to  $FPC\_FCH\_MAX\_SETPT_R$ , and  
18          $FPC\_PRI\_CHAN_S$  to '0' if the mobile station supports any Radio  
19         Configuration greater than 2.
- 20         + The mobile station shall set  $FPC\_SUBCHAN\_GAIN_S$  to  
21          $FPC\_SUBCHAN\_GAIN_R$ .
- 22         + The mobile station shall set  $RLGAIN\_ADJ_S$  to  $RLGAIN\_ADJ_R$ .
- 23         + The mobile station shall set  $REV\_FCH\_GATING\_MODE_S$  to  
24          $REV\_FCH\_GATING\_MODE_R$ .
- 25         + The mobile station shall set  $REV\_PWR\_CNTL\_DELAY_S$  to  
26          $REV\_PWR\_CNTL\_DELAY_R$  if  $REV\_PWR\_CNTL\_DELAY\_INCL_R$  is equal to  
27         '1'.
- 28         + The mobile station shall set  $PLCM\_TYPE_S$  to  $PLCM\_TYPE_R$  if  
29          $PLCM\_TYPE\_INCL_R$  is equal to '1'; otherwise, the mobile station shall set  
30          $PLCM\_TYPE_S$  as follows:
  - 31           o If  $P\_REV\_IN\_USE_S$  is less than 11, set  $PLCM\_TYPE_S$  to '0000';  
32           otherwise set  $PLCM\_TYPE_S$  to '0100'.
- 33         + The mobile station shall set  $PLCM\_39_S$  to  $PLCM\_39_R$  if  $PLCM\_TYPE_R$  is  
34         equal to '0001'.
- 35         + The mobile station shall initialize  $CODE\_CHAN\_LIST$  as described in  
36         2.6.8, and shall set  $SERV\_NEG_S$  to enabled.
- 37         + If the mobile station is currently monitoring the Paging Channel, the  
38         mobile station shall set  $IDLE\_BCCH\_CHAN$  to '0'; otherwise, the mobile  
39         station shall set  $IDLE\_BCCH\_CHAN$  to '1'. The mobile station shall set  
40          $IDLE\_SID$  to  $SID_S$ ,  $IDLE\_NID$  to  $NID_S$ , and  $IDLE\_P\_REV$  to  $P\_REV_S$ .

- 1           + The mobile station shall then tune to the new Frequency Assignment
- 2           and shall enter the *Traffic Channel Initialization Substate* of the *Mobile*
- 3           *Station Control on the Traffic Channel State*.
- 4       • If ASSIGN\_MODE<sub>r</sub> equals '001', the mobile station shall perform the following
- 5       actions:
- 6       – If FREQ\_INCL<sub>r</sub> equals '0', the mobile station shall perform the following
- 7       actions:
- 8       + If the message requires acknowledgment, the mobile station shall wait
- 9       until Layer 3 receives an indication from Layer 2 that the
- 10       acknowledgment to the message has been sent and acknowledged.
- 11       + The mobile station shall set CONFIG\_MSG\_SEQ<sub>s</sub> and ACC\_MSG\_SEQ<sub>s</sub>
- 12       to NULL (see 2.6.2.2) and shall set PILOT\_PN<sub>s</sub> to the pilot PN sequence
- 13       offset of the strongest pilot in the list (PILOT\_PN<sub>r</sub>).
- 14       + If the mobile station has not stored configuration parameters for the
- 15       Primary Paging Channel of the new base station, or if the stored
- 16       information is not current (see 2.6.2.2), the mobile station shall set
- 17       SYS\_PAR\_MSG\_SEQ<sub>s</sub>, NGHBR\_LST\_MSG\_SEQ<sub>s</sub>,
- 18       EXT\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, GEN\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>,
- 19       USER\_ZONE\_ID\_MSG\_SEQ<sub>s</sub>, PRI\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>
- 20       CHAN\_LST\_MSG\_SEQ<sub>s</sub>, EXT\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>,
- 21       FD\_CHAN\_LST\_MSG\_SEQ<sub>s</sub> EXT\_SYS\_PAR\_MSG\_SEQ<sub>s</sub>,
- 22       GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub>, and
- 23       EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub> to NULL.
- 24       + The mobile station shall set PAGE\_CHAN<sub>s</sub> to '1' and PAGECH<sub>s</sub> to the
- 25       Primary Paging Channel. If the mobile station was monitoring the
- 26       Forward Common Control Channel, the mobile station shall set the
- 27       PRAT<sub>s</sub> to '00'. The mobile station shall then begin monitoring the
- 28       Primary Paging Channel of the selected base station.
- 29       + If RESPOND<sub>r</sub> is equal to '1', the mobile station shall perform the
- 30       following:
- 31       o If the *Extended Channel Assignment Message* does not require an
- 32       acknowledgment, the mobile station shall enter the *Update Overhead*
- 33       *Information Substate* with a page response retransmission indication
- 34       within T<sub>34m</sub> seconds after receiving the *Extended Channel*
- 35       *Assignment Message*.
- 36       o If the *Extended Channel Assignment Message* requires an
- 37       acknowledgment, the mobile station shall enter the *Update Overhead*
- 38       *Information Substate* with a page response retransmission indication
- 39       within T<sub>34m</sub> seconds after Layer 3 receives an indication from Layer
- 40       2 that the acknowledgment to the *Extended Channel Assignment*
- 41       *Message* has been sent and acknowledged.

- 1           + If RESPOND<sub>r</sub> is equal to '0', the mobile station shall perform the
- 2           following:
- 3           o If the *Extended Channel Assignment Message* does not require an
- 4           acknowledgment, the mobile station shall enter the *Mobile Station*
- 5           *Idle State* within T<sub>34m</sub> seconds after receiving the *Extended Channel*
- 6           *Assignment Message*.
- 7           o If the *Extended Channel Assignment Message* requires an
- 8           acknowledgment, the mobile station shall enter the *Mobile Station*
- 9           *Idle State* within T<sub>34m</sub> seconds after Layer 3 receives an indication
- 10          from Layer 2 that the acknowledgment to the *Extended Channel*
- 11          *Assignment Message* has been sent and acknowledged.
- 12        – If FREQ\_INCL<sub>r</sub> equals '1', and the band class is not supported by the mobile
- 13        station, the mobile station shall send a *Mobile Station Reject Order* with
- 14        ORDQ field set to '00000110' (capability not supported by the mobile
- 15        station) and remain in the current state.
- 16        – If FREQ\_INCL<sub>r</sub> equals '1', and the band class is supported by the mobile
- 17        station, the mobile station shall perform the following actions:
- 18           + If the message requires acknowledgment, the mobile station shall wait
- 19           until Layer 3 receives an indication from Layer 2 that the
- 20           acknowledgment to the message has been sent and acknowledged.
- 21           + The mobile station shall set CDMACH<sub>s</sub> to CDMA\_FREQ<sub>r</sub> and
- 22           CDMABAND<sub>s</sub> to BAND\_CLASS<sub>r</sub>. Then the mobile station shall tune to
- 23           the new Frequency Assignment, measure the strength of each pilot
- 24           listed in the assignment using the Neighbor Set search procedures
- 25           specified in 2.6.6.2.1 and 2.6.6.2.2, set PILOT\_PN<sub>s</sub> to the pilot PN
- 26           sequence offset of the strongest pilot in the list (PILOT\_PN<sub>r</sub>), and set
- 27           CONFIG\_MSG\_SEQ<sub>s</sub> and ACC\_MSG\_SEQ<sub>s</sub> to NULL (see 2.6.2.2).
- 28           + If the mobile station has not stored configuration parameters for the
- 29           Primary Paging Channel of the new base station, or if the stored
- 30           information is not current (see 2.6.2.2), the mobile station shall set
- 31           SYS\_PAR\_MSG\_SEQ<sub>s</sub>, NGHBR\_LST\_MSG\_SEQ<sub>s</sub>,
- 32           EXT\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, GEN\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>,
- 33           USER\_ZONE\_ID\_MSG\_SEQ<sub>s</sub>, PRI\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>
- 34           CHAN\_LST\_MSG\_SEQ<sub>s</sub>, EXT\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>,
- 35           FD\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>, EXT\_SYS\_PAR\_MSG\_SEQ<sub>s</sub>,
- 36           GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub>, and
- 37           EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub> to NULL.
- 38           + The mobile station shall set PAGE\_CHAN<sub>s</sub> to '1' and PAGECH<sub>s</sub> to the
- 39           Primary Paging Channel. If the mobile station was monitoring Forward
- 40           Common Control Channel, the mobile station shall set the PRAT<sub>s</sub> to '00'.
- 41           The mobile station shall then begin monitoring the Primary Paging
- 42           Channel of the selected base station.

- 1           + If RESPOND<sub>r</sub> is equal to '1', the mobile station shall perform the
- 2           following:
- 3           o If the *Extended Channel Assignment Message* does not require an
- 4           acknowledgment, the mobile station shall enter the *Update Overhead*
- 5           *Information Substate* with a page response retransmission indication
- 6           within T<sub>34m</sub> seconds after receiving the *Extended Channel*
- 7           *Assignment Message*.
- 8           o If the *Extended Channel Assignment Message* requires an
- 9           acknowledgment, the mobile station shall enter the *Update Overhead*
- 10          *Information Substate* with a page response retransmission indication
- 11          within T<sub>34m</sub> seconds after Layer 3 receives an indication from Layer
- 12          2 that the acknowledgment to the *Extended Channel Assignment*
- 13          *Message* has been sent and acknowledged.
- 14       + If RESPOND<sub>r</sub> is equal to '0', the mobile station shall perform the
- 15       following:
- 16       o If the *Extended Channel Assignment Message* does not require an
- 17       acknowledgment, the mobile station shall enter the *Mobile Station*
- 18       *Idle State* within T<sub>34m</sub> seconds after receiving the *Extended Channel*
- 19       *Assignment Message*.
- 20       o If the *Extended Channel Assignment Message* requires an
- 21       acknowledgment, the mobile station shall enter the *Mobile Station*
- 22       *Idle State* within T<sub>34m</sub> seconds after Layer 3 receives an indication
- 23       from Layer 2 that the acknowledgment to the *Extended Channel*
- 24       *Assignment Message* has been sent and acknowledged.
- 25   • If ASSIGN\_MODE<sub>r</sub> equals '100', the mobile station shall perform the following
- 26   actions:
- 27   – If PACA<sub>s</sub> is equal to enabled, the mobile station shall set PACA<sub>s</sub> to disabled and
- 28   PACA\_CANCEL to '0', shall disable the PACA state timer, and should indicate to
- 29   the user that the PACA call has been canceled.
- 30   – If GRANTED\_MODE<sub>r</sub> equals '00' and the multiplex option and radio
- 31   configuration specified in the DEFAULT\_CONFIG<sub>r</sub> field are not supported by the
- 32   mobile station, the mobile station shall send a *Mobile Station Reject Order* with
- 33   ORDQ field set to '00000110' (capability not supported by the mobile station)
- 34   and shall remain in the current state.
- 35   – If GRANTED\_MODE<sub>r</sub> equals '11', P\_REV\_IN\_USE<sub>s</sub> is less than 11, and the
- 36   mobile station did not include a SYNC\_ID field in the *Page Response Message*
- 37   or *Reconnect Message* that was transmitted in this substate, the mobile station
- 38   shall send a *Mobile Station Reject Order* with ORDQ field set to '00000110'
- 39   (capability not supported by the mobile station) and shall remain in the current
- 40   state.

- 1       – If SYNC\_ID\_INCL<sub>r</sub> is included and equals '1', and the mobile station does not  
2       have a stored service configuration corresponding to SYNC\_ID<sub>r</sub> for the current  
3       SID<sub>s</sub> and NID<sub>s</sub> pair, the mobile station shall send a *Mobile Station Reject Order*  
4       with ORDQ field set to '00011011' (Requested stored service configuration is  
5       not available) and shall remain in the current state.
- 6       – If GRANTED\_MODE<sub>r</sub> equals '11', SR\_ID\_RESTORE<sub>r</sub> is not equal to '111', and a  
7       service option connection record corresponding to SR\_ID\_RESTORE<sub>r</sub> is not  
8       contained in the stored service configuration, the mobile station shall send a  
9       *Mobile Station Reject Order* with ORDQ field set to '00000110' (capability not  
10      supported by the mobile station) and shall remain in the current state.
- 11      – If GRANTED\_MODE<sub>r</sub> equals '00' and DEFAULT\_CONFIG<sub>r</sub> is not equal to '100',  
12      the mobile station shall send a *Mobile Station Reject Order* with ORDQ field set  
13      to '00001110' (RC does not match with DEFAULT\_CONFIG) and shall remain in  
14      the current state if one of the following conditions is true:
  - 15       + FOR\_RC<sub>r</sub> is not equal to the RC associated with DEFAULT\_CONFIG<sub>r</sub> as  
16       specified in Table 3.7.2.3.2.21-2.
  - 17       + REV\_RC<sub>r</sub> is not equal to the RC associated with DEFAULT\_CONFIG<sub>r</sub> as  
18       specified in Table 3.7.2.3.2.21-2.
- 19      – If the mobile station does not support either of the Radio Configurations  
20      (FOR\_RC or REV\_RC), the mobile station shall send a *Mobile Station Reject*  
21      *Order* with the ORDQ field set to '00000110' (capability not supported by the  
22      mobile station) and remain in the current state.
- 23      – If CH\_IND<sub>r</sub> = '01' and the mobile station does not support Fundamental  
24      Channel, the mobile station shall send a *Mobile Station Reject Order* with the  
25      ORDQ field set to '00000110' (capability not supported by the mobile station)  
26      and remain in the current state.
- 27      – If CH\_IND<sub>r</sub> = '10' and the mobile station does not support the Dedicated Control  
28      Channel, the mobile station shall send a *Mobile Station Reject Order* with the  
29      ORDQ field set to '00000110' (capability not supported by the mobile station)  
30      and remain in the current state.
- 31      – If CH\_IND<sub>r</sub> = '11' and the mobile station does not support the Dedicated Control  
32      Channel and Fundamental Channel concurrently, the mobile station shall send  
33      a *Mobile Station Reject Order* with the ORDQ field set to '00000110' (capability  
34      not supported by the mobile station) and remain in the current state.
- 35      – If FREQ\_INCL<sub>r</sub> equals '1' and if the band class (BAND\_CLASS<sub>r</sub>) is not supported  
36      by the mobile station, the mobile station shall send a *Mobile Station Reject*  
37      *Order* with ORDQ field set to '00000110' (capability not supported by the mobile  
38      station) and remain in the current state.

- 1       – If  $PLCM\_TYPE_r$  equals '0010' and  $IMSI\_O$  is derived from  $IMSI\_T$ , or if  
2        $PLCM\_TYPE_r$  equals '0011' and  $IMSI\_O$  is derived from  $IMSI\_M$ , the mobile  
3       station shall send a *Mobile Station Reject Order* with the  $ORDQ$  field set to  
4       '00011100' ( $PLCM\_TYPE$  mismatch) and remain in the current state.
- 5       – If  $FUNDICATED\_BCMC\_IND_r$  equals '1', and the mobile station does not  
6       support BCMC reception on the Forward Fundicated Channels assigned in this  
7       message, the mobile station shall send a *Mobile Station Reject Order* with the  
8        $ORDQ$  field set to '00000110' (capability not supported by the mobile station)  
9       and remain in the current state.
- 10      – If the mobile station does not send a Mobile Station Reject Order as specified  
11      above, it shall continue to perform the actions specified below.
- 12      – The mobile station shall set
  - 13       +  $IDLE\_CDMABAND = CDMABAND_s$
  - 14       +  $IDLE\_CDMACH = CDMACH_s$
- 15      – If  $FREQ\_INCL_r$  equals '1', the mobile station shall set
  - 16       +  $CDMABAND_s = BAND\_CLASS_r$
  - 17       +  $CDMACH_s = CDMA\_FREQ_r$
- 18      – The mobile station shall store the bypass indicator ( $BYPASS\_ALERT\_ANSWER_s$   
19      =  $BYPASS\_ALERT\_ANSWER_r$ ).
- 20      – The mobile station shall store granted mode ( $GRANTED\_MODE_s =$   
21       $GRANTED\_MODE_r$ ). If  $GRANTED\_MODE_r$  equals '11', the mobile station shall  
22      perform the following:
  - 23       + The mobile station shall store the service reference to be restored  
24       ( $SR\_ID\_RESTORE_s = SR\_ID\_RESTORE_r$ ).
  - 25       + If  $SR\_ID\_RESTORE_r$  equals '000', the mobile station shall store bitmap of  
26       service reference identifiers to be restored ( $SR\_ID\_RESTORE\_BITMAP_s =$   
27        $SR\_ID\_RESTORE\_BITMAP_r$ ).
  - 28       + If  $SYNC\_ID\_INCL_r$  is included and equals '1', the mobile station shall store  
29       the service configuration synchronization identifier ( $SYNC\_ID_s =$   
30        $SYNC\_ID_r$ ).
- 31      – The mobile station shall store the default configuration ( $DEFAULT\_CONFIG_s =$   
32       $DEFAULT\_CONFIG_r$ ).
- 33      – The mobile station shall store the Forward Traffic Channel Radio Configuration  
34      ( $FOR\_RC_s = FOR\_RC_r$ ) and the Reverse Traffic Channel Radio Configuration  
35      ( $REV\_RC_s = REV\_RC_r$ ).
- 36      – The mobile station shall store the frame offset ( $FRAME\_OFFSET_s =$   
37       $FRAME\_OFFSET_r$ ).

- 1       – The mobile station shall store the message encryption mode indicator  
2       (ENCRYPT\_MODE<sub>S</sub> = ENCRYPT\_MODE<sub>R</sub>).
- 3       – The mobile station shall perform the procedures in 2.6.11.2.
- 4       – The mobile station shall store the Forward power control subchannel relative  
5       gain [FPC\_SUBCHAN\_GAIN<sub>S</sub> = FPC\_SUBCHAN\_GAIN<sub>R</sub>].
- 6       – The mobile station shall set RL\_GAIN\_ADJ<sub>S</sub> to RL\_GAIN\_ADJ<sub>R</sub>.
- 7       – The mobile station shall set PLCM\_TYPE<sub>S</sub> to PLCM\_TYPE<sub>R</sub> if PLCM\_TYPE\_INCL<sub>R</sub>  
8       is equal to '1'; otherwise, the mobile station shall set PLCM\_TYPE<sub>S</sub> as follows:
  - 9       + If P\_REV\_IN\_USE<sub>S</sub> is less than 11, set PLCM\_TYPE<sub>S</sub> to '0000'; otherwise set  
10       PLCM\_TYPE<sub>S</sub> to '0100'.
- 11      – The mobile station shall set PLCM\_39<sub>S</sub> to PLCM\_39<sub>R</sub> if PLCM\_TYPE<sub>R</sub> is equal to  
12      '0001'.
- 13      – If FIXED\_PREAMBLE\_TRANSMIT\_IND<sub>R</sub> is included, the mobile station shall set  
14      FIXED\_PREAMBLE\_TRANSMIT\_IND<sub>S</sub> to FIXED\_PREAMBLE\_TRANSMIT\_IND<sub>R</sub>;  
15      otherwise, the mobile station shall set FIXED\_PREAMBLE\_TRANSMIT\_IND<sub>S</sub> to  
16      '0'. If FIXED\_PREAMBLE\_TRANSMIT\_IND<sub>S</sub> equals '1', the mobile station shall  
17      set FIXED\_NUM\_PREAMBLE<sub>S</sub> to FIXED\_NUM\_PREAMBLE<sub>R</sub>.
- 18      – The mobile station shall set REV\_FCH\_GATING\_MODE<sub>S</sub> to  
19      REV\_FCH\_GATING\_MODE<sub>R</sub>.
- 20      – The mobile station shall set REV\_PWR\_CNTL\_DELAY<sub>S</sub> to  
21      REV\_PWR\_CNTL\_DELAY<sub>R</sub> if REV\_PWR\_CNTL\_DELAY\_INCL<sub>R</sub> is equal to '1'.
- 22      – If 3XFL\_1XRL\_INCL<sub>R</sub> is equal to '1', the mobile station shall set  
23      1XRL\_FREQ\_OFFSET<sub>S</sub> to 1XRL\_FREQ\_OFFSET<sub>R</sub>.
- 24      – If DIRECT\_CH\_ASSIGN\_IND<sub>R</sub> is equal to '1', the mobile station shall perform the  
25      following:
  - 26      + The mobile station shall set RTC\_NOM\_PWR<sub>S</sub> to RTC\_NOM\_PWR<sub>R</sub>.
  - 27      + If the mobile station has not received confirmation of delivery of the *Page*  
28      *Response Message* or the *Reconnect Message* sent in this substate, the  
29      mobile station shall perform the following:
    - 30      o Set RTC\_NOM\_PWR\_USE\_IND to '1'.
    - 31      o Set DIRECT\_CH\_ASSIGN\_RECOVER\_IND<sub>S</sub> to  
32      DIRECT\_CH\_ASSIGN\_RECOVER\_IND<sub>R</sub>.
- 33      – The mobile station shall set EARLY\_RL\_TRANSMIT\_IND<sub>S</sub> to  
34      EARLY\_RL\_TRANSMIT\_IND<sub>R</sub>.
- 35      – If TX\_PWR\_LIMIT\_INCL<sub>R</sub> is set to '1', the mobile station shall perform the  
36      following:

- 1           + If the mobile station is being assigned to operate in the 1915MHz –
- 2           1920MHz block of the PCS band, the mobile station shall store the transmit
- 3           power limit  $TX\_PWR\_LIMIT_S = (TX\_PWR\_LIMIT_R - 30dB)$ ;
- 4           + Otherwise, the mobile station shall set  $TX\_PWR\_LIMIT_S$  to the limit defined
- 5           in [11] for the target base station.
- 6       – The mobile station shall store the channel indicator ( $CH\_IND_S = CH\_IND_R$ ) and
- 7       the mobile station shall perform the following actions:
- 8           + If  $CH\_IND_R$  equals '01', the mobile station shall set  $FPC\_FCH\_INIT\_SETPT_S$
- 9           to  $FPC\_FCH\_INIT\_SETPT_R$ ,  $FPC\_FCH\_CURR\_SETPT_S$  to
- 10           $FPC\_FCH\_INIT\_SETPT_S$ ,  $FPC\_FCH\_FER_S$  to  $FPC\_FCH\_FER_R$ ,
- 11           $FPC\_FCH\_MIN\_SETPT_S$  to  $FPC\_FCH\_MIN\_SETPT_R$ ,  $FPC\_FCH\_MAX\_SETPT_S$
- 12          to  $FPC\_FCH\_MAX\_SETPT_R$ , and  $FPC\_PRI\_CHAN_S$  to '0' if the mobile station
- 13          supports any Radio Configuration greater than 2. Then for each included
- 14          member of the Active Set, the mobile station shall store the following:
- 15           o Set the  $PILOT\_PN$  field to  $PILOT\_PN_R$ .
- 16           o Set the  $ADD\_PILOT\_REC\_INCL$  field to  $ADD\_PILOT\_REC\_INCL_R$ . If
- 17            $ADD\_PILOT\_REC\_INCL_R$  equals '1', the mobile station shall store the
- 18           following:
- 19           ◇ Set the  $PILOT\_REC\_TYPE$  field of  $PILOT\_REC$  to  $PILOT\_REC\_TYPE_R$ .
- 20           ◇ If  $PILOT\_REC\_TYPE_R$  equals '000', the mobile station shall set the
- 21            $TD\_POWER\_LEVEL$  field of  $PILOT\_REC$  to  $TD\_POWER\_LEVEL_R$  and
- 22           set the  $TD\_MODE$  field of  $PILOT\_REC$  to  $TD\_MODE_R$ .
- 23           ◇ If  $PILOT\_REC\_TYPE_R$  is equal to '001', the mobile station shall.
- 24           – Set the  $AUX\_PILOT\_QOF$  field of  $PILOT\_REC$  to  $QOF_R$ .
- 25           – Set the  $AUX\_PILOT\_WALSH\_CODE$  field of  $PILOT\_REC$  to
- 26            $AUX\_PILOT\_WALSH_R$  with the Walsh Code length specified by
- 27            $WALSH\_LENGTH_R$ .
- 28           ◇ If  $PILOT\_REC\_TYPE_R$  is equal to '010', the mobile station shall:
- 29           – Set the  $AUX\_PILOT\_TD\_QOF$  field of  $PILOT\_REC$  to  $QOF_R$ .
- 30           – Set the  $AUX\_PILOT\_WALSH\_CODE$  field of  $PILOT\_REC$  to
- 31            $AUX\_WALSH_R$  with the Walsh Code length specified by
- 32            $WALSH\_LENGTH_R$ .
- 33           – Set the  $AUX\_TD\_POWER\_LEVEL$  field of  $PILOT\_REC$  to
- 34            $AUX\_TD\_POWER\_LEVEL_R$ .
- 35           – Set the  $TD\_MODE$  field of  $NGHBR\_PILOT\_REC$  to  $TD\_MODE_R$ .
- 36           ◇ If  $PILOT\_REC\_TYPE_R$  is equal to '011', the mobile station shall:
- 37           – Set the  $SR3\_PRIMARY\_PILOT$  field of  $PILOT\_REC$  to
- 38            $SR3\_PRIMARY\_PILOT_R$ .

- 1                   – Set the SR3\_PILOT\_POWER1 field of PILOT\_REC to
- 2                   SR3\_PILOT\_POWER1<sub>r</sub>.
- 3                   – Set the SR3\_PILOT\_POWER2 field of PILOT\_REC to
- 4                   SR3\_PILOT\_POWER2<sub>r</sub>.
- 5           ◇ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '100', the mobile station shall:
- 6                   – Set the SR3\_PRIMARY\_PILOT field of PILOT\_REC to
- 7                   SR3\_PRIMARY\_PILOT<sub>r</sub>.
- 8                   – Set the SR3\_PILOT\_POWER1 field of PILOT\_REC to
- 9                   SR3\_PILOT\_POWER1<sub>r</sub>.
- 10                  – Set the SR3\_PILOT\_POWER2 field of PILOT\_REC to
- 11                  SR3\_PILOT\_POWER2<sub>r</sub>.
- 12                  – Set the AUX\_PILOT\_QOF field of PILOT\_REC to QOF<sub>r</sub>.
- 13                  – Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to
- 14                  AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by
- 15                  WALSH\_LENGTH<sub>r</sub>.
- 16                  – If ADD\_INFO\_INCL1<sub>r</sub> is equal to '1', set the AUX\_PILOT\_QOF1
- 17                  field of PILOT\_REC to QOF1<sub>r</sub> and set the
- 18                  AUX\_PILOT\_WALSH\_CODE1 field of PILOT\_REC to
- 19                  AUX\_PILOT\_WALSH1<sub>r</sub> with the Walsh Code length specified by
- 20                  WALSH\_LENGTH1<sub>r</sub>.
- 21                  – Otherwise, set the AUX\_PILOT\_QOF1 field of PILOT\_REC to QOF<sub>r</sub>
- 22                  and set the AUX\_PILOT\_WALSH\_CODE1 field of PILOT\_REC to
- 23                  AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by
- 24                  WALSH\_LENGTH<sub>r</sub>.
- 25                  – If ADD\_INFO\_INCL2<sub>r</sub> is equal to '1', set the AUX\_PILOT\_QOF2
- 26                  field of PILOT\_REC to QOF2<sub>r</sub> and set the
- 27                  AUX\_PILOT\_WALSH\_CODE2 field of PILOT\_REC to
- 28                  AUX\_PILOT\_WALSH2<sub>r</sub> with the Walsh Code length specified by
- 29                  WALSH\_LENGTH2<sub>r</sub>.
- 30                  – Otherwise, set the AUX\_PILOT\_QOF2 field of PILOT\_REC to QOF<sub>r</sub>
- 31                  and set the AUX\_PILOT\_WALSH\_CODE2 field of PILOT\_REC to
- 32                  AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by
- 33                  WALSH\_LENGTH<sub>r</sub>.
- 34           ○ Set the PWR\_COMB\_IND field to PWR\_COMB\_IND<sub>r</sub>.
- 35           ○ Set the CODE\_CHAN\_FCH field to CODE\_CHAN\_FCH<sub>r</sub>.
- 36           ○ Set the QOF\_MASK\_ID\_FCH field to QOF\_MASK\_ID\_FCH<sub>r</sub>.
- 37   + If CH\_IND<sub>r</sub> equals '01' and 3X\_FCH\_INFO\_INCL<sub>r</sub> equals '1', for each
- 38   included member of the Active Set, the mobile station store the following:

- 1           o If  $3X\_FCH\_LOW\_INCL_r$  equals '1', set the  $QOF\_MASK\_ID\_FCH\_LOW$  field
- 2           to  $QOF\_MASK\_ID\_FCH\_LOW_r$  and the  $CODE\_CHAN\_FCH\_LOW$  field to
- 3            $CODE\_CHAN\_FCH\_LOW_r$ . Otherwise, set the  $QOF\_MASK\_ID\_FCH\_LOW$
- 4           field to  $QOF\_MASK\_ID\_FCH_r$  and the  $CODE\_CHAN\_FCH\_LOW$  to
- 5            $CODE\_CHAN\_FCH_r$ .
- 6           o If  $3X\_FCH\_HIGH\_INCL_r$  equals '1', set the  $QOF\_MASK\_ID\_FCH\_HIGH$
- 7           field to  $QOF\_MASK\_ID\_FCH\_HIGH_r$  and the  $CODE\_CHAN\_FCH\_HIGH$
- 8           field to  $CODE\_CHAN\_FCH\_HIGH_r$ . Otherwise, set the
- 9            $QOF\_MASK\_ID\_FCH\_HIGH$  field to  $QOF\_MASK\_ID\_FCH_r$  and the
- 10           $CODE\_CHAN\_FCH\_HIGH$  to  $CODE\_CHAN\_FCH_r$ .
- 11       + If  $CH\_IND_r$  equals '10', the mobile station shall set  $FPC\_DCCH\_INIT\_SETPT_s$
- 12       to  $FPC\_DCCH\_INIT\_SETPT_r$ ,  $FPC\_DCCH\_CURR\_SETPT_s$  to
- 13        $FPC\_DCCH\_INIT\_SETPT_s$ ,  $FPC\_DCCH\_FER_s$  to  $FPC\_DCCH\_FER_r$ ,
- 14        $FPC\_DCCH\_MIN\_SETPT_s$  to  $FPC\_DCCH\_MIN\_SETPT_r$ ,
- 15        $FPC\_DCCH\_MAX\_SETPT_s$  to  $FPC\_DCCH\_MAX\_SETPT_r$ ,
- 16        $FUNDICATED\_BCMC\_IND_s$  to  $FUNDICATED\_BCMC\_IND_r$ , and
- 17        $FPC\_PRI\_CHAN_s$  to '1' if the mobile station supports any Radio
- 18       Configuration greater than 2. Then for each included member of the Active
- 19       Set, the mobile station shall store the following:
- 20       o Set the  $PILOT\_PN$  to  $PILOT\_PN_r$ .
- 21       o Set the  $ADD\_PILOT\_REC\_INCL$  field to  $ADD\_PILOT\_REC\_INCL_r$ . If
- 22        $ADD\_PILOT\_REC\_INCL$  is equal to '1', the mobile station shall store the
- 23       following:
- 24       ◇ Set the  $PILOT\_REC\_TYPE$  field of  $PILOT\_REC$  to  $PILOT\_REC\_TYPE_r$ .
- 25       ◇ If  $PILOT\_REC\_TYPE_r$  equals '000', the mobile station shall set the
- 26        $TD\_POWER\_LEVEL$  field of  $PILOT\_REC$  to  $TD\_POWER\_LEVEL_r$  and
- 27       set the  $TD\_MODE$  field of  $PILOT\_REC$  to  $TD\_MODE_r$ .
- 28       ◇ If  $PILOT\_REC\_TYPE_r$  is equal to '001', the mobile station shall.
- 29       – Set the  $AUX\_PILOT\_QOF$  field of  $PILOT\_REC$  to  $QOF_r$ .
- 30       – Set the  $AUX\_PILOT\_WALSH\_CODE$  field of  $PILOT\_REC$  to
- 31        $AUX\_PILOT\_WALSH_r$  with the Walsh Code length specified by
- 32        $WALSH\_LENGTH_r$ .
- 33       ◇ If  $PILOT\_REC\_TYPE_r$  is equal to '010', the mobile station shall:
- 34       – Set the  $AUX\_PILOT\_TD\_QOF$  field of  $PILOT\_REC$  to  $QOF_r$ .
- 35       – Set the  $AUX\_PILOT\_WALSH\_CODE$  field of  $PILOT\_REC$  to
- 36        $AUX\_WALSH_r$  with the Walsh Code length specified by
- 37        $WALSH\_LENGTH_r$ .
- 38       – Set the  $AUX\_TD\_POWER\_LEVEL$  field of  $PILOT\_REC$  to
- 39        $AUX\_TD\_POWER\_LEVEL_r$ .
- 40       – Set the  $TD\_MODE$  field of  $PILOT\_REC$  to  $TD\_MODE_r$ .

- 1                   ◇ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '011', the mobile station shall:
- 2                   – Set the SR3\_PRIMARY\_PILOT field of PILOT\_REC to
- 3                   SR3\_PRIMARY\_PILOT<sub>r</sub>.
- 4                   – Set the SR3\_PILOT\_POWER1 field of PILOT\_REC to
- 5                   SR3\_PILOT\_POWER1<sub>r</sub>.
- 6                   – Set the SR3\_PILOT\_POWER2 field of PILOT\_REC to
- 7                   SR3\_PILOT\_POWER2<sub>r</sub>.
- 8                   ◇ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '100', the mobile station shall:
- 9                   – Set the SR3\_PRIMARY\_PILOT field of PILOT\_REC to
- 10                  SR3\_PRIMARY\_PILOT<sub>r</sub>.
- 11                  – Set the SR3\_PILOT\_POWER1 field of PILOT\_REC to
- 12                  SR3\_PILOT\_POWER1<sub>r</sub>.
- 13                  – Set the SR3\_PILOT\_POWER2 field of PILOT\_REC to
- 14                  SR3\_PILOT\_POWER2<sub>r</sub>.
- 15                  – Set the AUX\_PILOT\_QOF field of PILOT\_REC to QOF<sub>r</sub>.
- 16                  – Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to
- 17                  AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by
- 18                  WALSH\_LENGTH<sub>r</sub>.
- 19                  – If ADD\_INFO\_INCL1<sub>r</sub> is equal to '1', set the AUX\_PILOT\_QOF1
- 20                  field of PILOT\_REC to QOF1<sub>r</sub> and set the
- 21                  AUX\_PILOT\_WALSH\_CODE1 field of PILOT\_REC to
- 22                  AUX\_PILOT\_WALSH1<sub>r</sub> with the Walsh Code length specified by
- 23                  WALSH\_LENGTH1<sub>r</sub>.
- 24                  – Otherwise, set the AUX\_PILOT\_QOF1 field of PILOT\_REC to QOF<sub>r</sub>
- 25                  and set the AUX\_PILOT\_WALSH\_CODE1 field of PILOT\_REC to
- 26                  AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by
- 27                  WALSH\_LENGTH<sub>r</sub>.
- 28                  – If ADD\_INFO\_INCL2<sub>r</sub> is equal to '1', set the AUX\_PILOT\_QOF2
- 29                  field of PILOT\_REC to QOF2<sub>r</sub> and set the
- 30                  AUX\_PILOT\_WALSH\_CODE2 field of PILOT\_REC to
- 31                  AUX\_PILOT\_WALSH2<sub>r</sub> with the Walsh Code length specified by
- 32                  WALSH\_LENGTH2<sub>r</sub>.
- 33                  – Otherwise, set the AUX\_PILOT\_QOF2 field of PILOT\_REC to QOF<sub>r</sub>
- 34                  and set the AUX\_PILOT\_WALSH\_CODE2 field of PILOT\_REC to
- 35                  AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by
- 36                  WALSH\_LENGTH<sub>r</sub>.
- 37                  ○ Set the PWR\_COMB\_IND field to PWR\_COMB\_IND<sub>r</sub>.
- 38                  ○ Set the CODE\_CHAN\_FCH field to CODE\_CHAN\_FCH<sub>r</sub>.
- 39                  ○ Set the QOF\_MASK\_ID\_FCH field to QOF\_MASK\_ID\_FCH<sub>r</sub>.

- 1           o Set the DCCH\_INCL field to DCCH\_INCL<sub>r</sub>. If DCCH\_INCL<sub>r</sub> equals '1', the
- 2           mobile station shall store the following:
- 3           ◇ Set the CODE\_CHAN\_DCCH field to CODE\_CHAN\_DCCH<sub>r</sub>.
- 4           ◇ Set the QOF\_MASK\_ID\_DCCH field to QOF\_MASK\_ID\_DCCH<sub>r</sub>.
- 5       + If CH\_IND<sub>r</sub> equals '10' and 3X\_DCCH\_INFO\_INCL<sub>r</sub> equals '1', for each
- 6       included member of the Active Set, the mobile station store the following:
- 7           o If 3X\_DCCH\_LOW\_INCL<sub>r</sub> equals '1', set the QOF\_MASK\_ID\_DCCH\_LOW
- 8           field to QOF\_MASK\_ID\_DCCH\_LOW<sub>r</sub> and the CODE\_CHAN\_DCCH\_LOW
- 9           field to CODE\_CHAN\_DCCH\_LOW<sub>r</sub>. Otherwise, set the
- 10          QOF\_MASK\_ID\_DCCH\_LOW field to QOF\_MASK\_ID\_FCH<sub>r</sub> and the
- 11          CODE\_CHAN\_DCCH\_LOW to CODE\_CHAN\_FCH<sub>r</sub>.
- 12          o If 3X\_DCCH\_HIGH\_INCL<sub>r</sub> equals '1', set the
- 13          QOF\_MASK\_ID\_DCCH\_HIGH field to QOF\_MASK\_ID\_DCCH\_HIGH<sub>r</sub> and
- 14          the CODE\_CHAN\_DCCH\_HIGH field to CODE\_CHAN\_DCCH\_HIGH<sub>r</sub>.
- 15          Otherwise, set the QOF\_MASK\_ID\_DCCH\_HIGH field to
- 16          QOF\_MASK\_ID\_FCH<sub>r</sub> and the CODE\_CHAN\_DCCH\_HIGH to
- 17          CODE\_CHAN\_FCH<sub>r</sub>.
- 18       + If CH\_IND<sub>r</sub> equals '10', and FUNDICATED\_BCNC\_IND<sub>r</sub> equals '1', for each
- 19       included member of the Active Set, the mobile station shall store the
- 20       following:
- 21           o Set FOR\_CPCCH\_WALSH<sub>s</sub> to FOR\_CPCCH\_WALSH<sub>r</sub>.
- 22           o Set FOR\_CPCSCH<sub>s</sub> to FOR\_CPCSCH<sub>r</sub>.
- 23       + If CH\_IND<sub>r</sub> equals '11', the mobile station shall set FPC\_FCCH\_INIT\_SETPT<sub>s</sub>
- 24       to FPC\_FCH\_INIT\_SETPT<sub>r</sub>, FPC\_FCH\_CURR\_SETPT<sub>s</sub> to
- 25       FPC\_FCH\_INIT\_SETPT<sub>s</sub>, FPC\_FCH\_FER<sub>s</sub> to FPC\_FCH\_FER<sub>r</sub>,
- 26       FPC\_FCH\_MIN\_SETPT<sub>s</sub> to FPC\_FCH\_MIN\_SETPT<sub>r</sub>, FPC\_FCH\_MAX\_SETPT<sub>s</sub>
- 27       to FPC\_FCH\_MAX\_SETPT<sub>r</sub>, FPC\_DCCH\_INIT\_SETPT<sub>s</sub> to
- 28       FPC\_DCCH\_INIT\_SETPT<sub>r</sub>, FPC\_DCCH\_CURR\_SETPT<sub>s</sub> to
- 29       FPC\_DCCH\_INIT\_SETPT<sub>s</sub>, FPC\_DCCH\_FER<sub>s</sub> to FPC\_DCCH\_FER<sub>r</sub>,
- 30       FPC\_DCCH\_MIN\_SETPT<sub>s</sub> to FPC\_DCCH\_MIN\_SETPT<sub>r</sub>,
- 31       FPC\_DCCH\_MAX\_SETPT<sub>s</sub> to FPC\_DCCH\_MAX\_SETPT<sub>r</sub>, FPC\_PRI\_CHAN<sub>s</sub> to
- 32       FPC\_PRI\_CHAN<sub>r</sub>, and FUNDICATED\_BCNC\_IND<sub>s</sub> to
- 33       FUNDICATED\_BCNC\_IND<sub>r</sub>. Then for each included member of the Active
- 34       Set, the mobile station shall store the following:
- 35           o Set the PILOT\_PN to PILOT\_PN<sub>r</sub>.
- 36           o Set the ADD\_PILOT\_REC\_INCL field to ADD\_PILOT\_REC. If
- 37           ADD\_PILOT\_REC\_INCL is equal to '1', the mobile station shall store the
- 38           following:
- 39           ◇ Set the PILOT\_REC\_TYPE field of PILOT\_REC to PILOT\_REC\_TYPE<sub>r</sub>.

- 1                   ◇ If PILOT\_REC\_TYPE<sub>r</sub> equals '000', the mobile station shall set the  
2                   TD\_POWER\_LEVEL field of PILOT\_REC to TD\_POWER\_LEVEL<sub>r</sub> and  
3                   set the TD\_MODE field of PILOT\_REC to TD\_MODE<sub>r</sub>.
- 4                   ◇ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '001', the mobile station shall:  
5                   – Set the AUX\_PILOT\_QOF field of PILOT\_REC to QOF<sub>r</sub>.  
6                   – Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to  
7                   AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by  
8                   WALSH\_LENGTH<sub>r</sub>.
- 9                   ◇ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '010', the mobile station shall:  
10                  – Set the AUX\_PILOT\_TD\_QOF field of PILOT\_REC to QOF<sub>r</sub>.  
11                  – Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to  
12                  AUX\_WALSH<sub>r</sub> with the Walsh Code length specified by  
13                  WALSH\_LENGTH<sub>r</sub>.  
14                  – Set the AUX\_TD\_POWER\_LEVEL field of PILOT\_REC to  
15                  AUX\_TD\_POWER\_LEVEL<sub>r</sub>.  
16                  – Set the TD\_MODE field of PILOT\_REC to TD\_MODE<sub>r</sub>.
- 17                  ◇ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '011', the mobile station shall:  
18                  – Set the SR3\_PRIMARY\_PILOT field of PILOT\_REC to  
19                  SR3\_PRIMARY\_PILOT<sub>r</sub>.  
20                  – Set the SR3\_PILOT\_POWER1 field of PILOT\_REC to  
21                  SR3\_PILOT\_POWER1<sub>r</sub>.  
22                  – Set the SR3\_PILOT\_POWER2 field of PILOT\_REC to  
23                  SR3\_PILOT\_POWER2<sub>r</sub>.
- 24                  ◇ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '100', the mobile station shall:  
25                  – Set the SR3\_PRIMARY\_PILOT field of PILOT\_REC to  
26                  SR3\_PRIMARY\_PILOT<sub>r</sub>.  
27                  – Set the SR3\_PILOT\_POWER1 field of PILOT\_REC to  
28                  SR3\_PILOT\_POWER1<sub>r</sub>.  
29                  – Set the SR3\_PILOT\_POWER2 field of PILOT\_REC to  
30                  SR3\_PILOT\_POWER2<sub>r</sub>.  
31                  – Set the AUX\_PILOT\_QOF field of PILOT\_REC to QOF<sub>r</sub>.  
32                  – Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to  
33                  AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by  
34                  WALSH\_LENGTH<sub>r</sub>.

- 1                   – If ADD\_INFO\_INCL1<sub>r</sub> is equal to '1', set the AUX\_PILOT\_QOF1  
2                   field of PILOT\_REC to QOF1<sub>r</sub> and set the  
3                   AUX\_PILOT\_WALSH\_CODE1 field of PILOT\_REC to  
4                   AUX\_PILOT\_WALSH1<sub>r</sub> with the Walsh Code length specified by  
5                   WALSH\_LENGTH1<sub>r</sub>.
- 6                   – Otherwise, set the AUX\_PILOT\_QOF1 field of PILOT\_REC to QOF<sub>r</sub>  
7                   and set the AUX\_PILOT\_WALSH\_CODE1 field of PILOT\_REC to  
8                   AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by  
9                   WALSH\_LENGTH<sub>r</sub>.
- 10                  – If ADD\_INFO\_INCL2<sub>r</sub> is equal to '1', set the AUX\_PILOT\_QOF2  
11                  field of PILOT\_REC to QOF2<sub>r</sub> and set the  
12                  AUX\_PILOT\_WALSH\_CODE2 field of PILOT\_REC to  
13                  AUX\_PILOT\_WALSH2<sub>r</sub> with the Walsh Code length specified by  
14                  WALSH\_LENGTH2<sub>r</sub>.
- 15                  – Otherwise, set the AUX\_PILOT\_QOF2 field of PILOT\_REC to QOF<sub>r</sub>  
16                  and set the AUX\_PILOT\_WALSH\_CODE2 field of PILOT\_REC to  
17                  AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by  
18                  WALSH\_LENGTH<sub>r</sub>.
- 19                  o Set the PWR\_COMB\_IND field to PWR\_COMB\_IND<sub>r</sub>.
- 20                  o Set the CODE\_CHAN\_FCH field to CODE\_CHAN\_FCH<sub>r</sub>.
- 21                  o Set the QOF\_MASK\_ID\_FCH field to QOF\_MASK\_ID\_FCH<sub>r</sub>.
- 22                  o Set the CODE\_CHAN\_DCCH field to CODE\_CHAN\_DCCH<sub>r</sub>.
- 23                  o Set the QOF\_MASK\_ID\_DCCH field to QOF\_MASK\_ID\_DCCH.
- 24                  + If CH\_IND<sub>r</sub> equals '11' and 3X\_FCH\_INFO\_INCL<sub>r</sub> equals '1', for each  
25                  included member of the Active Set, the mobile station store the following:
  - 26                  o If 3X\_FCH\_LOW\_INCL<sub>r</sub> equals '1', set the QOF\_MASK\_ID\_FCH\_LOW field  
27                  to QOF\_MASK\_ID\_FCH\_LOW<sub>r</sub> and the CODE\_CHAN\_FCH\_LOW field to  
28                  CODE\_CHAN\_FCH\_LOW<sub>r</sub>. Otherwise, set the QOF\_MASK\_ID\_FCH\_LOW  
29                  field to QOF\_MASK\_ID\_FCH<sub>r</sub> and the CODE\_CHAN\_FCH\_LOW to  
30                  CODE\_CHAN\_FCH<sub>r</sub>.
  - 31                  o If 3X\_FCH\_HIGH\_INCL<sub>r</sub> equals '1', set the QOF\_MASK\_ID\_FCH\_HIGH  
32                  field to QOF\_MASK\_ID\_FCH\_HIGH<sub>r</sub> and the CODE\_CHAN\_FCH\_HIGH  
33                  field to CODE\_CHAN\_FCH\_HIGH<sub>r</sub>. Otherwise, set the  
34                  QOF\_MASK\_ID\_FCH\_HIGH field to QOF\_MASK\_ID\_FCH<sub>r</sub> and the  
35                  CODE\_CHAN\_FCH\_HIGH to CODE\_CHAN\_FCH<sub>r</sub>.
- 36                  + If CH\_IND<sub>r</sub> equals '11' and 3X\_DCCH\_INFO\_INCL<sub>r</sub> equals '1', for each  
37                  included member of the Active Set, the mobile station store the following:

- 1           o If 3X\_DCCH\_LOW\_INCL<sub>r</sub> equals '1', set the QOF\_MASK\_ID\_DCCH\_LOW
- 2           field to QOF\_MASK\_ID\_DCCH\_LOW<sub>r</sub> and the CODE\_CHAN\_DCCH\_LOW
- 3           field to CODE\_CHAN\_DCCH\_LOW<sub>r</sub>. Otherwise, set the
- 4           QOF\_MASK\_ID\_DCCH\_LOW field to QOF\_MASK\_ID\_FCH<sub>r</sub> and the
- 5           CODE\_CHAN\_DCCH\_LOW to CODE\_CHAN\_FCH<sub>r</sub>.
- 6           o If 3X\_DCCH\_HIGH\_INCL<sub>r</sub> equals '1', set the
- 7           QOF\_MASK\_ID\_DCCH\_HIGH field to QOF\_MASK\_ID\_DCCH\_HIGH<sub>r</sub> and
- 8           the CODE\_CHAN\_DCCH\_HIGH field to CODE\_CHAN\_DCCH\_HIGH<sub>r</sub>.
- 9           Otherwise, set the QOF\_MASK\_ID\_DCCH\_HIGH field to
- 10          QOF\_MASK\_ID\_FCH<sub>r</sub> and the CODE\_CHAN\_DCCH\_HIGH to
- 11          CODE\_CHAN\_FCH<sub>r</sub>.
- 12       + If CH\_IND<sub>r</sub> equals '11' and FUNDICATED\_BCMC\_IND<sub>r</sub> equals '1', the mobile
- 13       station shall store the following:
- 14       o Set REV\_FCH\_ASSIGNED<sub>s</sub> to REV\_FCH\_ASSIGNED<sub>r</sub>.
- 15       + If CH\_IND<sub>r</sub> equals '11' and FUNDICATED\_BCMC\_IND<sub>r</sub> equals '1', the mobile
- 16       station shall set FCH\_BCMC\_IND to '1'; otherwise, the mobile station shall
- 17       set FCH\_BCMC\_IND to '0'.
- 18       + If CH\_IND<sub>r</sub> equals '11' and FUNDICATED\_BCMC\_IND<sub>r</sub> equals '1' and
- 19       FOR\_CPCCH\_INFO\_INCL<sub>r</sub> is included and is set to '1', for each included
- 20       member of the Active Set, the mobile station shall store the following:
- 21       o Set FOR\_CPCCH\_WALSH<sub>s</sub> to FOR\_CPCCH\_WALSH<sub>r</sub>.
- 22       o Set FOR\_CPCSCH<sub>s</sub> to FOR\_CPCSCH<sub>r</sub>.
- 23       + If CH\_IND<sub>r</sub> equals '11' and FUNDICATED\_BCMC\_IND<sub>r</sub> equals '1' and
- 24       ADD\_PLCM\_FOR\_FCH\_INCL<sub>r</sub> is included and is set to '1', the mobile station
- 25       shall store the following:
- 26       o Set ADD\_PLCM\_FOR\_FCH\_TYPE<sub>s</sub> to ADD\_PLCM\_FOR\_FCH\_TYPE<sub>r</sub>.
- 27       o Set ADD\_PLCM\_FOR\_FCH\_39<sub>s</sub> to ADD\_PLCM\_FOR\_FCH\_39<sub>r</sub> if
- 28       ADD\_PLCM\_FOR\_FCH\_TYPE<sub>r</sub> is equal to '1'.
- 29       – The mobile station shall initialize CODE\_CHAN\_LIST as described in 2.6.8, and
- 30       shall set SERV\_NEG<sub>s</sub> to enabled.
- 31       – If the mobile station is currently monitoring the Paging Channel, the mobile
- 32       station shall set IDLE\_BCCH\_CHAN to '0'; otherwise, the mobile station shall
- 33       set IDLE\_BCCH\_CHAN to '1'. The mobile station shall set IDLE\_SID to SID<sub>s</sub>,
- 34       IDLE\_NID to NID<sub>s</sub>, and IDLE\_P\_REV to P\_REV<sub>s</sub>.
- 35       – If FREQ\_INCL<sub>r</sub> equals '1', the mobile station shall then tune to the new
- 36       frequency assignment.
- 37       – If DIRECT\_CH\_ASSIGN\_IND<sub>r</sub> is equal to '1' and RESPOND\_IND<sub>r</sub> is equal to '1',
- 38       the mobile station shall perform the following:
- 39       + If the mobile station is in *Mobile Station Idle State*, then the mobile station

shall enter the *Update Overhead Information Substate* of the *System Access State* (see 2.6.3.2) with a direct channel assignment respond indication within  $T_{33m}$  seconds after the *Extended Channel Assignment Message* is received; otherwise, the mobile station shall enter the *Page Response Substate* with a direct channel assignment respond indication.

Otherwise, the mobile station shall enter the *Traffic Channel Initialization Substate* of the *Mobile Station Control on the Traffic Channel State*.

- If  $ASSIGN\_MODE_r$  equals '101', the mobile station shall perform the following actions:
  - If  $PACA_s$  is equal to enabled, the mobile station shall set  $PACA_s$  to disabled and  $PACA\_CANCEL$  to '0', shall disable the PACA state timer, and should indicate to the user that the PACA call has been canceled.
  - If  $GRANTED\_MODE_r$  equals '11',  $P\_REV\_IN\_USE_s$  is less than 11, and the mobile station did not include a  $SYNC\_ID$  field in the *Page Response Message* or *Reconnect Message* that was transmitted in this substate, the mobile station shall send a *Mobile Station Reject Order* with  $ORDQ$  field set to '00000110' (capability not supported by the mobile station) and shall remain in this state.
  - If  $GRANTED\_MODE_r$  equals '11',  $SR\_ID\_RESTORE_r$  is not equal to '111', and a service option connection record corresponding to  $SR\_ID\_RESTORE_r$  or  $SR\_ID\_RESTORE\_BITMAP_r$  is not contained in the stored service configuration, the mobile station shall send a *Mobile Station Reject Order* with  $ORDQ$  field set to '00000110' (capability not supported by the mobile station) and shall remain in the current state,.
  - If  $SYNC\_ID\_INCL_r$  is included and equals '1', and the mobile station does not have stored service configuration corresponding to  $SYNC\_ID_r$  for the current  $SID_s$  and  $NID_s$  pair, the mobile station shall send a *Mobile Station Reject Order* with  $ORDQ$  field set to '00011011' (Requested stored service configuration is not available) and shall remain in the current state.
  - If the mobile station does not support any of the specified Radio Configurations ( $FOR\_PDCH\_RC$ ,  $FOR\_FCH\_DCCH\_RC$  or  $REV\_FCH\_DCCH\_RC$ ), the mobile station shall send a *Mobile Station Reject Order* with the  $ORDQ$  field set to '00000110' (capability not supported by the mobile station) and remain in the current state.
  - If  $EXT\_CH\_IND_r$  signals the allocation of a F-FCH or R-FCH and the mobile station does not support the Fundamental Channel, the mobile station shall send a *Mobile Station Reject Order* with the  $ORDQ$  field set to '00000110' (capability not supported by the mobile station) and remain in the current state.
  - If  $EXT\_CH\_IND_r$  signals the allocation of a F-DCCH or R-DCCH and the mobile station does not support the Dedicated Control Channel, the mobile station shall send a *Mobile Station Reject Order* with the  $ORDQ$  field set to '00000110' (capability not supported by the mobile station) and remain in the current state.

- 1       – If  $FREQ\_INCL_r$  equals '1' and if the band class ( $BAND\_CLASS_r$ ) is not supported
- 2       by the mobile station, the mobile station shall send a *Mobile Station Reject*
- 3       *Order* with  $ORDQ$  field set to '00000110' (capability not supported by the mobile
- 4       station) and remain in the current state.
- 5       – If  $PLCM\_TYPE_r$  equals '0010' and  $IMSI\_O$  is derived from  $IMSI\_T$ , or if
- 6        $PLCM\_TYPE_r$  equals '0011' and  $IMSI\_O$  is derived from  $IMSI\_M$ , the mobile
- 7       station shall send a *Mobile Station Reject Order* with the  $ORDQ$  field set to
- 8       '00011100' ( $PLCM\_TYPE$  mismatch) and remain in the current state.
- 9       – If  $FUNDICATED\_BCMC\_IND_r$  equals '1', and the mobile station does not
- 10      support  $BCMC$  reception on the Forward Fundicated Channels assigned in this
- 11      message, the mobile station shall send a *Mobile Station Reject Order* with the
- 12       $ORDQ$  field set to '00000110' (capability not supported by the mobile station)
- 13      and remain in the current state.
- 14      – If the mobile station does not send a *Mobile Station Reject Order* as specified
- 15      above, it shall continue to perform the actions specified below.
- 16      – Layer 3 shall send  $SIG\text{-}HandoffPDCH\text{-}Indication$  ( $handoff\_type = ASSIGN$ ) to the
- 17      MAC layer.
- 18      – If  $FREQ\_INCL_r$  equals '1', the mobile station shall set
- 19          +  $CDMABAND_s = BAND\_CLASS_r$
- 20          +  $CDMACH_s = CDMA\_FREQ_r$
- 21      – The mobile station shall store the bypass indicator ( $BYPASS\_ALERT\_ANSWER_s$
- 22      =  $BYPASS\_ALERT\_ANSWER_r$ ).
- 23      – The mobile station shall store the granted mode indicator ( $GRANTED\_MODE_s =$
- 24       $GRANTED\_MODE_r$ ). Furthermore, if  $GRANTED\_MODE_r$  equals '11', the mobile
- 25      station shall store service reference to be restored ( $SR\_ID\_RESTORE_s =$
- 26       $SR\_ID\_RESTORE_r$ ).
- 27      – If  $SR\_ID\_RESTORE_r$  equals '000', the mobile station shall store bitmap of
- 28      service reference identifiers to be restored ( $SR\_ID\_RESTORE\_BITMAP_s =$
- 29       $SR\_ID\_RESTORE\_BITMAP_r$ ).
- 30      – If  $SYNC\_ID\_INCL_r$  is included and equals '1', the mobile station shall store the
- 31      service configuration synchronization identifier ( $SYNC\_ID_s = SYNC\_ID_r$ ).
- 32      – The mobile station shall store the frame offset ( $FRAME\_OFFSET_s =$
- 33       $FRAME\_OFFSET_r$ ).
- 34      – The mobile station shall store the message encryption mode indicator
- 35      ( $ENCRYPT\_MODE_s = ENCRYPT\_MODE_r$ ).
- 36      – The mobile station shall perform the following procedures in the order listed
- 37      below:
- 38          + If  $D\_SIG\_ENCRYPT\_MODE_r$  is included, the mobile station shall perform the
- 39          following:

- 1           o If D\_SIG\_ENCRYPT\_MODE<sub>r</sub> is equal to '000', the mobile station shall set  
2           D\_SIG\_ENCRYPT\_MODE<sub>s</sub> to C\_SIG\_ENCRYPT\_MODE<sub>s</sub>; otherwise, the  
3           mobile station shall set D\_SIG\_ENCRYPT\_MODE<sub>s</sub> to  
4           D\_SIG\_ENCRYPT\_MODE<sub>r</sub>, ENC\_KEY<sub>s</sub> to the most recently generated  
5           CMEAKEY in the mobile station associated with AUTHR of the *Page*  
6           *Response Message*, and EXT\_ENCRYPT\_SEQ[0] and  
7           EXT\_ENCRYPT\_SEQ[1] to 256 × ENC\_SEQ\_H (the ENC\_SEQ\_H field in  
8           the *Page Response Message*).
- 9           + If ENC\_KEY\_SIZE<sub>r</sub> is included, the mobile station shall set ENC\_KEY\_SIZE<sub>s</sub>  
10          to ENC\_KEY\_SIZE<sub>r</sub>.
- 11          + If C\_SIG\_ENCRYPT\_MODE is included, the mobile station shall set  
12          C\_SIG\_ENCRYPT\_MODE<sub>s</sub> to C\_SIG\_ENCRYPT\_MODE<sub>r</sub>.
- 13          – The mobile station shall set EXT\_CH\_IND<sub>s</sub> to EXT\_CH\_IND<sub>r</sub>.
- 14          – The mobile station shall set CH\_IND<sub>s</sub> to '00'.
- 15          – If EXT\_CH\_IND<sub>r</sub> signals the allocation of a F-FCH or a F-DCCH, the mobile  
16          station shall store the Forward power control subchannel relative gain  
17          [FPC\_SUBCHAN\_GAIN<sub>s</sub> = FPC\_SUBCHAN\_GAIN<sub>r</sub>).
- 18          – The mobile station shall set RLGAIN\_ADJ<sub>s</sub> to RLGAIN\_ADJ<sub>r</sub>.
- 19          – The mobile station shall set PLCM\_TYPE<sub>s</sub> to PLCM\_TYPE<sub>r</sub> if PLCM\_TYPE\_INCL<sub>r</sub>  
20          is equal to '1'; otherwise, the mobile station shall set PLCM\_TYPE<sub>s</sub> as follows:  
21          + If P\_REV\_IN\_USE<sub>s</sub> is less than 11, set PLCM\_TYPE<sub>s</sub> to '0000'; otherwise set  
22          PLCM\_TYPE<sub>s</sub> to '0100'.
- 23          – The mobile station shall set PLCM\_39<sub>s</sub> to PLCM\_39<sub>r</sub> if PLCM\_TYPE<sub>r</sub> is equal to  
24          '0001'.
- 25          – The mobile station shall set FUNDICATED\_BCMC\_IND<sub>s</sub> to  
26          FUNDICATED\_BCMC\_IND<sub>r</sub>. If FUNDICATED\_BCMC\_IND<sub>r</sub> equals '1' and the  
27          EXT\_CH\_IND<sub>r</sub> signals the allocation of a F-FCH, the mobile station shall set  
28          FCH\_BCMC\_IND to '1'; otherwise, the mobile station shall set FCH\_BCMC\_IND  
29          to '0'.
- 30          – If FUNDICATED\_BCMC\_IND<sub>r</sub> equals '1' and ADD\_PLCM\_FOR\_FCH\_INCL<sub>r</sub> is  
31          included and is set to '1', the mobile station shall store the following:  
32          + Set ADD\_PLCM\_FOR\_FCH\_TYPE<sub>s</sub> to ADD\_PLCM\_FOR\_FCH\_TYPE<sub>r</sub>.
- 33          + Set ADD\_PLCM\_FOR\_FCH\_39<sub>s</sub> to ADD\_PLCM\_FOR\_FCH\_39<sub>r</sub> if  
34          ADD\_PLCM\_FOR\_FCH\_TYPE<sub>r</sub> is equal to '1'.
- 35          – If EXT\_CH\_IND<sub>r</sub> signals the allocation of R-FCH, the mobile station shall set  
36          REV\_FCH\_GATING\_MODE<sub>s</sub> to REV\_FCH\_GATING\_MODE<sub>r</sub>.
- 37          – The mobile station shall set REV\_PWR\_CNTL\_DELAY<sub>s</sub> to  
38          REV\_PWR\_CNTL\_DELAY<sub>r</sub> if REV\_PWR\_CNTL\_DELAY\_INCL<sub>r</sub> is equal to '1'.

- 1       – The mobile station shall set FULL\_CI\_FEEDBACK\_IND<sub>S</sub> to
- 2       FULL\_CI\_FEEDBACK\_IND<sub>R</sub>.
- 3       – If EXT\_CH\_IND<sub>R</sub> equals '01000', the mobile station shall set
- 4       FOR\_CPCCH\_RATE<sub>S</sub> to FOR\_CPCCH\_RATE<sub>R</sub>, and FOR\_CPCCH\_UPDATE\_RATE<sub>S</sub>
- 5       to FOR\_CPCCH\_UPDATE\_RATE<sub>R</sub>; otherwise, the mobile station shall set
- 6       FOR\_CPCCH\_RATE<sub>S</sub> to '00', and FOR\_CPCCH\_UPDATE\_RATE<sub>S</sub> to '00'.
- 7       – The mobile station shall set REV\_CQICH\_FRAME\_OFFSET<sub>S</sub> to
- 8       REV\_CQICH\_FRAME\_OFFSET<sub>R</sub>.
- 9       – The mobile station shall set REV\_CQICH\_REPS<sub>S</sub> to REV\_CQICH\_REPS<sub>R</sub>.
- 10      – The mobile station shall set REV\_ACKCH\_REPS<sub>S</sub> to REV\_ACKCH\_REPS<sub>R</sub>.
- 11      – The mobile station shall set FOR\_PDCH\_RC<sub>S</sub> to FOR\_PDCH\_RC<sub>R</sub>.
- 12      – If EXT\_CH\_IND<sub>R</sub> signals the allocation of a R-PDCH, the mobile station shall set
- 13      REV\_PDCH\_RC<sub>S</sub> to REV\_PDCH\_RC<sub>R</sub>.
- 14      – If EXT\_CH\_IND<sub>R</sub> signals the allocation of a F-FCH, the mobile station shall set
- 15      FOR\_FCH\_RC<sub>S</sub> to FOR\_FCH\_DCCH\_RC<sub>R</sub>.
- 16      – If EXT\_CH\_IND<sub>R</sub> signals the allocation of a F-DCCH, the mobile station shall set
- 17      FOR\_DCCH\_RC<sub>S</sub> to FOR\_FCH\_DCCH\_RC<sub>R</sub>.
- 18      – If EXT\_CH\_IND<sub>R</sub> signals the allocation of a R-FCH, the mobile station shall set
- 19      REV\_FCH\_RC<sub>S</sub> to REV\_FCH\_DCCH\_RC<sub>R</sub>.
- 20      – If EXT\_CH\_IND<sub>R</sub> signals the allocation of a R-DCCH, the mobile station shall set
- 21      REV\_DCCH\_RC<sub>S</sub> to REV\_FCH\_DCCH\_RC<sub>R</sub>.
- 22      – If EXT\_CH\_IND<sub>R</sub> signals the allocation of a F-FCH and a F-DCCH, the mobile
- 23      station shall set FPC\_PRI\_CHAN<sub>S</sub> to FPC\_PRI\_CHAN<sub>R</sub>.
- 24      – If EXT\_CH\_IND<sub>R</sub> signals the allocation of a F-FCH, the mobile station shall set
- 25      FPC\_FCH\_INIT\_SETPT<sub>S</sub> to FPC\_FCH\_INIT\_SETPT<sub>R</sub>, FPC\_FCH\_CURR\_SETPT<sub>S</sub> to
- 26      FPC\_FCH\_INIT\_SETPT<sub>S</sub>, FPC\_FCH\_FER<sub>S</sub> to FPC\_FCH\_FER<sub>R</sub>,
- 27      FPC\_FCH\_MIN\_SETPT<sub>S</sub> to FPC\_FCH\_MIN\_SETPT<sub>R</sub>, FPC\_FCH\_MAX\_SETPT<sub>S</sub> to
- 28      FPC\_FCH\_MAX\_SETPT<sub>R</sub>.
- 29      – If EXT\_CH\_IND<sub>R</sub> signals the allocation of a F-DCCH, the mobile station shall set
- 30      FPC\_DCCH\_INIT\_SETPT<sub>S</sub> to FPC\_DCCH\_INIT\_SETPT<sub>R</sub>,
- 31      FPC\_DCCH\_CURR\_SETPT<sub>S</sub> to FPC\_DCCH\_INIT\_SETPT<sub>S</sub>, FPC\_DCCH\_FER<sub>S</sub> to
- 32      FPC\_DCCH\_FER<sub>R</sub>, FPC\_DCCH\_MIN\_SETPT<sub>S</sub> to FPC\_DCCH\_MIN\_SETPT<sub>R</sub>,
- 33      FPC\_DCCH\_MAX\_SETPT<sub>S</sub> to FPC\_DCCH\_MAX\_SETPT<sub>R</sub>.
- 34      – If EARLY\_RL\_TRANSMIT\_IND<sub>R</sub> is included, the mobile station shall set
- 35      EARLY\_RL\_TRANSMIT\_IND<sub>S</sub> to EARLY\_RL\_TRANSMIT\_IND<sub>R</sub>; otherwise, the
- 36      mobile station shall set EARLY\_RL\_TRANSMIT\_IND<sub>S</sub> to '0'.

- 1       – If the FIXED\_PREAMBLE\_TRANSMIT\_IND<sub>R</sub> is included, the mobile station shall
- 2       set FIXED\_PREAMBLE\_TRANSMIT\_IND<sub>S</sub> to
- 3       FIXED\_PREAMBLE\_TRANSMIT\_IND<sub>R</sub>; otherwise, the mobile station shall set
- 4       FIXED\_PREAMBLE\_TRANSMIT\_IND<sub>S</sub> to '0'. If
- 5       FIXED\_PREAMBLE\_TRANSMIT\_IND<sub>S</sub> equals '1', the mobile station shall store
- 6       FIXED\_NUM\_PREAMBLE<sub>S</sub> to FIXED\_NUM\_PREAMBLE<sub>R</sub>.
- 7       – If TX\_PWR\_LIMIT\_INCL<sub>R</sub> is set to '1', the mobile station shall perform the
- 8       following:
  - 9       + If the mobile station is being assigned to operate in the 1915MHz –
  - 10       1920MHz block of the PCS band, the mobile station shall store the transmit
  - 11       power limit TX\_PWR\_LIMIT<sub>S</sub> = (TX\_PWR\_LIMIT<sub>R</sub> - 30dB);
  - 12       + Otherwise, the mobile station shall set TX\_PWR\_LIMIT<sub>S</sub> to the limit defined
  - 13       in [11] for the target base station.
- 14       – If FOR\_PDCH\_PARMs\_INCL<sub>R</sub> is equal to '1', the mobile station shall set
- 15       FOR\_PDCH\_COMMON\_PARMs<sub>S</sub> = '0'; otherwise, if
- 16       FOR\_PDCH\_COMMON\_PARMs<sub>S</sub> is equal to '0', the mobile station shall send a
- 17       *Mobile Station Reject Order* with ORDQ equal to '00000011' (message structure
- 18       not acceptable) and remain in the current state.
- 19       – If FOR\_PDCH\_RLGAIN\_INCL<sub>R</sub> is included and equal to '1', the mobile station
- 20       shall set RLGAIN\_ACKCH\_PILOT<sub>S</sub> to RLGAIN\_ACKCH\_PILOT<sub>R</sub>, and
- 21       RLGAIN\_CQICH\_PILOT<sub>S</sub> to RLGAIN\_CQICH\_PILOT<sub>R</sub>.
- 22       – If FOR\_PDCH\_PARMs\_INCL<sub>R</sub> is equal to '1', the mobile station shall set
- 23       NUM\_SOFT\_SWITCHING\_FRAMES<sub>S</sub> to NUM\_SOFT\_SWITCHING\_FRAMES<sub>R</sub> + 1,
- 24       and NUM\_SOFT\_SWITCHING\_FRAMES<sub>S</sub> to
- 25       NUM\_SOFT\_SWITCHING\_FRAMES<sub>R</sub> + 1.
- 26       – If CHM\_SWITCHING\_PARMs\_INCL<sub>R</sub> is included and equal to '1', the mobile
- 27       station shall set NUM\_SOFT\_SWITCHING\_FRAMES\_CHM<sub>S</sub> to
- 28       NUM\_SOFT\_SWITCHING\_FRAMES\_CHM<sub>R</sub> + 1, and
- 29       NUM\_SOFT\_SWITCHING\_FRAMES\_CHM<sub>S</sub> to
- 30       NUM\_SOFT\_SWITCHING\_FRAMES\_CHM<sub>R</sub> + 1.
- 31       – If CHM\_SWITCHING\_PARMs\_INCL<sub>R</sub> is included and equal to '0', the mobile
- 32       station shall set NUM\_SOFT\_SWITCHING\_FRAMES\_CHM<sub>S</sub> to
- 33       NUM\_SOFT\_SWITCHING\_FRAMES<sub>R</sub> + 1, and
- 34       NUM\_SOFT\_SWITCHING\_FRAMES\_CHM<sub>S</sub> to
- 35       NUM\_SOFT\_SWITCHING\_FRAMES<sub>R</sub> + 1.
- 36       – If FOR\_PDCH\_PARMs\_INCL<sub>R</sub> is equal to '1', the mobile station shall set
- 37       NUM\_SOFT\_SWITCHING\_SLOTS<sub>S</sub> according to Table 3.7.2.3.2.21-9 based on
- 38       the value of NUM\_SOFT\_SWITCHING\_SLOTS<sub>R</sub>.
- 39       – If FOR\_PDCH\_PARMs\_INCL<sub>R</sub> is equal to '1', the mobile station shall set
- 40       NUM\_SOFT\_SWITCHING\_SLOTS<sub>S</sub> according to Table 3.7.2.3.2.21-9 based on
- 41       the value of NUM\_SOFT\_SWITCHING\_SLOTS<sub>R</sub>.

- 1       – If CHM\_SWITCHING\_PARMES\_INCL<sub>r</sub> is included and equal to '1', the mobile  
2       station shall:
  - 3       + Set NUM\_SOFT\_SWITCHING\_SLOTS\_CHM<sub>s</sub> according to Table 3.7.2.3.2.21-  
4       9 based on the value of NUM\_SOFT\_SWITCHING\_SLOTS\_CHM<sub>r</sub>.
  - 5       + Set NUM\_SOFTER\_SWITCHING\_SLOTS\_CHM<sub>s</sub> according to Table  
6       3.7.2.3.2.21-9 based on the value of  
7       NUM\_SOFTER\_SWITCHING\_SLOTS\_CHM<sub>r</sub>.
- 8       – If CHM\_SWITCHING\_PARMES\_INCL<sub>r</sub> is included and equal to '0', the mobile  
9       station shall:
  - 10      + Set NUM\_SOFT\_SWITCHING\_SLOTS\_CHM<sub>s</sub> according to Table 3.7.2.3.2.21-  
11      9 based on the value of NUM\_SOFT\_SWITCHING\_SLOTS<sub>r</sub>.
  - 12      + Set NUM\_SOFTER\_SWITCHING\_SLOTS\_CHM<sub>s</sub> according to Table  
13      3.7.2.3.2.21-9 based on the value of NUM\_SOFTER\_SWITCHING\_SLOTS<sub>r</sub>.
- 14      – If FOR\_PDCH\_PARMES\_INCL<sub>r</sub> is equal to '1', the mobile station shall set  
15      PDCH\_SOFT\_SWITCHING\_DELAY<sub>s</sub> to PDCH\_SOFT\_SWITCHING\_DELAY<sub>r</sub> + 1,  
16      and PDCH\_SOFTER\_SWITCHING\_DELAY<sub>s</sub> to  
17      PDCH\_SOFTER\_SWITCHING\_DELAY<sub>r</sub> + 1.
- 18      – If TX\_DISABLED\_TIMER\_INCL<sub>r</sub> is equal to '1', the mobile station shall set  
19      TX\_DISABLED\_TIMER<sub>s</sub> to TX\_DISABLED\_TIMER<sub>r</sub>; otherwise, the mobile station  
20      shall set TX\_DISABLED\_TIMER<sub>s</sub> to T<sub>81m</sub>.
- 21      – If EXT\_CH\_IND<sub>r</sub> signals the allocation of a R-PDCH, the mobile station shall:
  - 22      + Set FOR\_GCH\_ASSIGNED<sub>s</sub> to FOR\_GCH\_ASSIGNED<sub>r</sub>.
  - 23      + Set FOR\_RCCH\_ASSIGNED<sub>s</sub> to FOR\_RCCH\_ASSIGNED<sub>r</sub>.
  - 24      + If FOR\_RCCH\_ASSIGNED<sub>s</sub> is equal to '1', the mobile station shall:
    - 25      o Set FOR\_RCCH\_DRC\_MODE<sub>s</sub> to FOR\_RCCH\_DRC\_MODE<sub>r</sub>.
    - 26      o Set FOR\_RCCH\_REPETITION<sub>s</sub> to FOR\_RCCH\_REPETITION<sub>r</sub>.
    - 27      o Set FOR\_RCCH\_UPDATE\_RATE<sub>s</sub> to FOR\_RCCH\_UPDATE\_RATE<sub>r</sub>.
  - 28      + If FOR\_ACKCH\_ASSIGNED<sub>r</sub> is equal to '1', the mobile station shall set  
29      FOR\_ACKCH\_MODE<sub>s</sub> to FOR\_ACKCH\_MODE<sub>r</sub>.
  - 30      + If FOR\_ACKCH\_COMB\_SEL<sub>r</sub> is included, the mobile station shall set  
31      FOR\_ACKCH\_COMB\_SEL<sub>s</sub> to FOR\_ACKCH\_COMB\_SEL<sub>r</sub>; otherwise, the  
32      mobile station shall set FOR\_ACKCH\_COMB\_SEL<sub>s</sub> to '0'.
  - 33      + If REV\_PDCH\_RLGAIN\_INCL<sub>r</sub> is included and equal to '1', the mobile station  
34      shall perform the following:
    - 35      o The mobile station shall set RLGAIN\_SPICH\_PILOT<sub>s</sub> to  
36      RLGAIN\_SPICH\_PILOT<sub>r</sub>.
    - 37      o The mobile station shall set RLGAIN\_REQCH\_PILOT<sub>s</sub> to  
38      RLGAIN\_REQCH\_PILOT<sub>r</sub>.

- 1           o The mobile station shall set  $RLGAIN\_PDCCH\_PILOT_S$  to
- 2            $RLGAIN\_PDCCH\_PILOT_R$ .
- 3           + If  $REV\_PDCH\_PARMS\_1\_INCL_R$  is included and equal to '1', the mobile
- 4           station shall perform the following:
- 5           o The mobile station shall set  $REV\_PDCH\_TABLE\_SEL_S$  to
- 6            $REV\_PDCH\_TABLE\_SEL_R$ .
- 7           o The mobile station shall set  $REV\_PDCH\_MAX\_AUTO\_TPR_S$  to
- 8            $REV\_PDCH\_MAX\_AUTO\_TPR_R$ .
- 9           – Otherwise, the mobile station shall:
- 10          + Set  $FOR\_GCH\_ASSIGNED_S$  to NULL.
- 11          + Set  $FOR\_RCCH\_ASSIGNED_S$  to NULL.
- 12          – For each included member of the Active Set, the mobile station shall store the
- 13          following:
- 14          + Set the  $PILOT\_PN$  field to  $PILOT\_PN_R$ .
- 15          + Set the  $ADD\_PILOT\_REC\_INCL$  field to  $ADD\_PILOT\_REC\_INCL_R$ . If
- 16           $ADD\_PILOT\_REC\_INCL_R$  equals '1', the mobile station shall store the
- 17          following:
- 18          o Set the  $PILOT\_REC\_TYPE$  field of  $PILOT\_REC$  to  $PILOT\_REC\_TYPE_R$ .
- 19          o If  $PILOT\_REC\_TYPE_R$  equals '000', the mobile station shall set the
- 20           $TD\_POWER\_LEVEL$  field of  $PILOT\_REC$  to  $TD\_POWER\_LEVEL_R$  and set
- 21          the  $TD\_MODE$  field of  $PILOT\_REC$  to  $TD\_MODE_R$ .
- 22          o If  $PILOT\_REC\_TYPE_R$  is equal to '001', the mobile station shall.
- 23            ◇ Set the  $AUX\_PILOT\_QOF$  field of  $PILOT\_REC$  to  $QOF_R$ .
- 24            ◇ Set the  $AUX\_PILOT\_WALSH\_CODE$  field of  $PILOT\_REC$  to
- 25             $AUX\_PILOT\_WALSH_R$  with the Walsh Code length specified by
- 26             $WALSH\_LENGTH_R$ .
- 27          o If  $PILOT\_REC\_TYPE_R$  is equal to '010', the mobile station shall:
- 28            ◇ Set the  $AUX\_PILOT\_TD\_QOF$  field of  $PILOT\_REC$  to  $QOF_R$ .
- 29            ◇ Set the  $AUX\_PILOT\_WALSH\_CODE$  field of  $PILOT\_REC$  to
- 30             $AUX\_WALSH_R$  with the Walsh Code length specified by
- 31             $WALSH\_LENGTH_R$ .
- 32            ◇ Set the  $AUX\_TD\_POWER\_LEVEL$  field of  $PILOT\_REC$  to
- 33             $AUX\_TD\_POWER\_LEVEL_R$ .
- 34            ◇ Set the  $TD\_MODE$  field of  $NGHBR\_PILOT\_REC$  to  $TD\_MODE_R$ .
- 35          o Set  $FOR\_PDCH\_INCL_S$  to  $FOR\_PDCH\_INCL_R$ .
- 36          o If  $FOR\_PDCH\_INCL_R$  is equal to '1', the mobile station shall perform the
- 37          following:

- 1                   ◇ If FOR\_PDCH\_PARMS\_INCL<sub>R</sub> is equal to '1', the mobile station shall
- 2                   store the following parameters:
- 3                   – The mobile station shall set WALSH\_TABLE\_ID<sub>S</sub> to
- 4                   WALSH\_TABLE\_ID<sub>R</sub>.
- 5                   – The mobile station shall set NUM\_PDCCH<sub>S</sub> to NUM\_PDCCH<sub>R</sub>.
- 6                   – The mobile station shall store FOR\_PDCCH\_WALSH<sub>S</sub>[i] to the i<sup>th</sup>
- 7                   occurrence of FOR\_PDCCH\_WALSH<sub>R</sub>.
- 8                   ◇ The mobile station shall set MAC\_ID<sub>S</sub> to MAC\_ID<sub>R</sub>.
- 9                   ◇ The mobile station shall set REV\_CQICH\_COVER<sub>S</sub> to
- 10                  REV\_CQICH\_COVER<sub>R</sub>.
- 11                  ◇ If EXT\_CH\_IND<sub>R</sub> signals the allocation of a F-CPCCH, the mobile
- 12                  station shall set FOR\_CPCCH\_WALSH<sub>S</sub> to FOR\_CPCCH\_WALSH<sub>R</sub>,
- 13                  and, FOR\_CPCSCH<sub>S</sub> to FOR\_CPCSCH<sub>R</sub>.
- 14                  ◇ The mobile station shall store FOR\_PDCCH\_WALSH<sub>S</sub>[i] to the i<sup>th</sup>
- 15                  occurrence of FOR\_PDCCH\_WALSH<sub>R</sub>.
- 16                  o The mobile station shall set PWR\_COMB\_IND<sub>S</sub> to PWR\_COMB\_IND<sub>R</sub>.
- 17                  o If PDCH\_GROUP\_IND\_INCL<sub>R</sub> is equal to '1', the mobile station shall set
- 18                  PDCH\_GROUP\_IDENTIFIER<sub>S</sub> as follows:
- 19                  ◇ If this is the first pilot in the list that has a F-PDCH assignment, the
- 20                  mobile station shall perform the following:
- 21                  – The mobile station shall set PDCH\_GROUP\_IDENTIFIER<sub>S</sub> to '000';
- 22                  ◇ Otherwise, the mobile station shall perform the following:
- 23                  – If PDCH\_GROUP\_IND<sub>R</sub> is set to '1', the mobile station shall set
- 24                  PDCH\_GROUP\_IDENTIFIER<sub>S</sub> to the same value as that of the
- 25                  previous pilot in the list that has a F-PDCH assigned; otherwise,
- 26                  the mobile station shall set PDCH\_GROUP\_IDENTIFIER<sub>S</sub> to the
- 27                  value one greater than that of the previous pilot in the list that
- 28                  has a F-PDCH assigned.
- 29                  o Otherwise, the mobile station shall perform the following:
- 30                  ◇ If this is the first pilot in the list that has a F-PDCH assignment, the
- 31                  mobile station shall perform the following:
- 32                  – The mobile station shall set PDCH\_GROUP\_IDENTIFIER<sub>S</sub> to '000';
- 33                  ◇ Otherwise, the mobile station shall perform the following:
- 34                  – If F-PDCH is assigned for this pilot, the mobile station shall
- 35                  perform the following:

- 1                                   + If PWR\_COMB\_IND<sub>r</sub> is set to '1', and there are no pilots
- 2                                   between this pilot and the previous pilot in the list that has a
- 3                                   F-PDCH assigned, the mobile station shall set
- 4                                   PDCH\_GROUP\_IDENTIFIER<sub>s</sub> to the same value as that of the
- 5                                   previous pilot in the list that has a F-PDCH assigned.
- 6                                   + If PWR\_COMB\_IND<sub>r</sub> is set to '1', and all pilots between this
- 7                                   pilot and the previous pilot in the list that has a F-PDCH
- 8                                   assigned have PWR\_COMB\_IND set to '1', the mobile station
- 9                                   shall set PDCH\_GROUP\_IDENTIFIER<sub>s</sub> to the same value as
- 10                                  that of the previous pilot in the list that has a F-PDCH
- 11                                  assigned.
- 12                                  + Otherwise, the mobile station shall set
- 13                                  PDCH\_GROUP\_IDENTIFIER<sub>s</sub> to the value one greater than
- 14                                  that of the previous pilot in the list.
- 15                                  - Otherwise, the mobile station shall set
- 16                                  PDCH\_GROUP\_IDENTIFIER<sub>s</sub> to NULL.
- 17                   o If EXT\_CH\_IND<sub>r</sub> signals the allocation of a F-FCH, the mobile station
- 18                   shall set CODE\_CHAN\_FCH<sub>s</sub> = CODE\_CHAN\_FCH<sub>r</sub>, and
- 19                   QOF\_MASK\_ID\_FCH<sub>s</sub> = QOF\_MASK\_ID\_FCH<sub>r</sub>.
- 20                   o If EXT\_CH\_IND<sub>r</sub> signals the allocation of a F-DCCH, the mobile station
- 21                   shall set CODE\_CHAN\_DCCH<sub>s</sub> = CODE\_CHAN\_DCCH<sub>r</sub>, and
- 22                   QOF\_MASK\_ID\_DCCH<sub>s</sub> = QOF\_MASK\_ID\_DCCH<sub>r</sub>.
- 23                   o If FOR\_PDCH\_INCL<sub>r</sub> is equal to '1', EXT\_CH\_IND<sub>r</sub> signals the allocation
- 24                   of a R-PDCH, and FOR\_ACKCH\_ASSIGNED<sub>r</sub> is equal to '1', the mobile
- 25                   station shall set FOR\_ACKCH\_WALSH\_INDEX<sub>s</sub> to
- 26                   FOR\_ACKCH\_WALSH\_INDEX<sub>r</sub>, and FOR\_ACKSCH\_INDEX<sub>s</sub> to
- 27                   FOR\_ACKSCH\_INDEX<sub>r</sub>.
- 28                   o If FOR\_RCCH\_INCL<sub>r</sub> is included and set to '1', the mobile station shall
- 29                   do the following:
- 30                    ◇ Set FOR\_RCCH\_WALSH\_INDEX<sub>s</sub> to FOR\_RCCH\_WALSH\_INDEX<sub>r</sub>.
- 31                    ◇ Set FOR\_RCSCH\_INDEX<sub>s</sub> to FOR\_RCSCH\_INDEX<sub>r</sub>.
- 32                   o If FOR\_PDCH\_INCL<sub>r</sub> is equal to '1', and if FOR\_GCH\_ASSIGNED<sub>r</sub> is
- 33                   included and set to '1', the mobile station shall perform the following:
- 34                    ◇ Set NUM\_FOR\_GCH<sub>s</sub> to NUM\_FOR\_GCH<sub>r</sub>, and
- 35                    ◇ For each of the NUM\_FOR\_GCH<sub>s</sub> occurrences of
- 36                    FOR\_GCH\_WALSH\_INDEX<sub>r</sub>, the mobile station shall set
- 37                    FOR\_GCH\_WALSH\_INDEX<sub>s</sub>[j] to FOR\_GCH\_WALSH\_INDEX<sub>r</sub>[j].
- 38                   o Otherwise, the mobile station shall perform the following:
- 39                    ◇ Set NUM\_FOR\_GCH<sub>s</sub> to 0, and

1                   ◇ Set FOR\_GCH\_WALSH\_INDEX<sub>S</sub> to NULL.

2           – The mobile station shall initialize CODE\_CHAN\_LIST as described in 2.6.8, and  
3           shall set SERV\_NEG<sub>S</sub> to enabled.

4           – If DIRECT\_CH\_ASSIGN\_IND<sub>R</sub> is equal to '1', the mobile station shall perform the  
5           following:

6           + The mobile station shall set RTC\_NOM\_PWR<sub>S</sub> to RTC\_NOM\_PWR<sub>R</sub>.

7           + If the mobile station has not received confirmation of delivery of the *Page*  
8           *Response Message* or the *Reconnect Message* sent in this substate, the  
9           mobile station shall perform the following:

10          o Set RTC\_NOM\_PWR\_USE\_IND to '1'.

11          o Set DIRECT\_CH\_ASSIGN\_RECOVER\_IND<sub>S</sub> to  
12          DIRECT\_CH\_ASSIGN\_RECOVER\_IND<sub>R</sub>

13          – If FREQ\_INCL<sub>R</sub> equals '1', the mobile station shall then tune to the new  
14          frequency assignment.

15          – If DIRECT\_CH\_ASSIGN\_IND<sub>R</sub> is equal to '1' and RESPOND\_IND<sub>R</sub> is equal to '1',  
16          the mobile station shall perform the following:

17          + If the mobile station is in *Mobile Station Idle State*, then the mobile station  
18          shall enter the *Update Overhead Information Substate* of the *System Access*  
19          *State* (see 2.6.3.2) with a direct channel assignment respond indication  
20          within T<sub>33m</sub> seconds after the *Extended Channel Assignment Message* is  
21          received; otherwise, the mobile station shall enter the *Page Response*  
22          *Substate* with a direct channel assignment respond indication.

23                 Otherwise, the mobile station shall enter the *Traffic Channel Initialization*  
24                 *Substate* of the *Mobile Station Control on the Traffic Channel State*.

## 25       8. Fast Call Setup Order:

26           • If ORDQ<sub>R</sub> is equal to '00000000', the mobile station shall process the message  
27           and respond with a *Fast Call Setup Order* as specified in 2.6.12.1.

28           • If ORDQ<sub>R</sub> is equal to '00000001', the mobile station shall process the message  
29           as specified in 2.6.12.1.

## 30       9. Feature Notification Message

## 31       10. Local Control Order

32       11. *Lock Until Power-Cycled Order*: The mobile station shall disable its transmitter and  
33       record the reason for the *Lock Until Power-Cycled Order* in the mobile station's  
34       semi-permanent memory (LCKRSN\_P<sub>S-p</sub> equals the least significant four bits of  
35       ORDQ<sub>R</sub>). The mobile station should notify the user of the locked condition. The  
36       mobile station shall enter the *System Determination Substate* of the *Mobile Station*  
37       *Initialization State* with a lock indication (see 2.6.1.1), and shall not enter the  
38       *System Access State* again until after the next mobile station power-up or until it

has received an *Unlock Order*. This requirement shall take precedence over any other mobile station requirement specifying entry to the *System Access State*.

12. *Maintenance Required Order*: The mobile station shall record the reason for the *Maintenance Required Order* in the mobile station's semi-permanent memory (MAINTRSN<sub>S-p</sub> equals the least significant four bits of ORDQ<sub>r</sub>). The mobile station shall remain in the unlocked condition. The mobile station should notify the user of the maintenance required condition.

13. *Registration Accepted Order*: The mobile station shall perform the procedures as specified in 2.6.11.1.

14. *Registration Rejected Order*: This order indicates that normal service is not available on this system. The mobile station shall disable the full-TMSI timer. If the received order specifies to delete the TMSI (ORDQ = '00000100'), the mobile station shall set all the bits of the TMSI\_CODE<sub>S-p</sub> to '1'. The mobile station shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a registration rejected indication (see 2.6.1.1).

15. *Release Order*: If NDSS\_ORIG<sub>S</sub> is equal to enabled, the mobile station shall set NDSS\_ORIG<sub>S</sub> to disabled, and should indicate to the user that the call origination has been canceled. The mobile station shall enter the *Mobile Station Idle State* or the *System Determination Substate* of the *Mobile Station Initialization State* with a release indication (see 2.6.1.1). If the mobile station enters the *Mobile Station Idle State*, and if PACA<sub>S</sub> is equal to enabled, the mobile station shall set PACA<sub>S</sub> to disabled and PACA\_CANCEL to '0', shall disable the PACA state timer, and should indicate to the user that the PACA call has been canceled.

16. *Retry Order*: The mobile station shall process the message as follows:

- If RETRY\_TYPE<sub>r</sub> is equal to '000', the mobile station shall set RETRY\_DELAY<sub>S</sub>[RETRY\_TYPE] to 0, where RETRY\_TYPE is equal to '001', '010', '011', '100', or '101'.
- If RETRY\_TYPE<sub>r</sub> is equal to '001', '100', or '101', the mobile station shall perform the following:
  - If RETRY\_DELAY<sub>r</sub> is equal to '00000000', then the mobile station shall set RETRY\_DELAY<sub>S</sub>[RETRY\_TYPE<sub>r</sub>] to 0.
  - If RETRY\_DELAY<sub>r</sub> is not equal to '00000000', the mobile station shall set RETRY\_DELAY<sub>S</sub>[RETRY\_TYPE<sub>r</sub>] as follows:
    - + If the most significant bit of the RETRY\_DELAY<sub>r</sub> is '0', set RETRY\_DELAY\_UNIT<sub>S</sub> to 1000ms. If the most significant bit of the RETRY\_DELAY<sub>r</sub> is '1', set RETRY\_DELAY\_UNIT<sub>S</sub> to 60000ms.
    - + The mobile station shall set RETRY\_DELAY\_VALUE<sub>S</sub> to the seven least significant bits of RETRY\_DELAY<sub>r</sub>.
    - + The mobile station shall store the next system time 80 ms boundary + RETRY\_DELAY\_VALUE<sub>S</sub> × RETRY\_DELAY\_UNIT<sub>S</sub> ms as RETRY\_DELAY<sub>S</sub>[RETRY\_TYPE<sub>r</sub>].

- 1 17. *Security Mode Command Message*: The mobile station shall perform the  
2 procedures as specified in 2.6.11.4.
- 3 18. *Service Redirection Message*: The mobile station shall process the message as  
4 follows:
- 5 • If the mobile station is directed to an unsupported operation mode or band  
6 class, the mobile station shall respond with a *Mobile Station Reject Order* with  
7 ORDQ equal to '00000110' (message requires a capability that is not supported  
8 by the mobile station).
  - 9 • If DELETE\_TMSI<sub>r</sub> is equal to '1', the mobile station shall set all the bits of  
10 TMSI\_CODE<sub>s-p</sub> to '1'. The mobile station shall disable the full-TMSI timer.
  - 11 • The mobile station shall set RETURN\_IF\_FAIL<sub>s</sub> = RETURN\_IF\_FAIL<sub>r</sub>.
  - 12 • If RECORD\_TYPE<sub>r</sub> is equal to '00000000', the mobile station shall enter the  
13 *System Determination Substate* of the *Mobile Station Initialization State* with an  
14 NDSS off indication (see 2.6.1.1); otherwise, the mobile station shall store the  
15 redirection record received in the message as REDIRECT\_REC<sub>s</sub> and shall enter  
16 the *System Determination Substate* of the *Mobile Station Initialization State* with  
17 a redirection indication (see 2.6.1.1).
- 18 19. *SSD Update Message*: The mobile station shall respond to the message as  
19 specified in 2.3.12.1.5.
- 20 20. *Status Request Message*: The mobile station shall disable the *System Access State*  
21 timer and respond to the message. If P\_REV\_IN\_USE<sub>s</sub> is less than or equal to  
22 three, the mobile station shall respond with a *Status Response Message*. If  
23 P\_REV\_IN\_USE<sub>s</sub> is greater than three, the mobile station shall respond with an  
24 *Extended Status Response Message*. If the message does not specify any  
25 qualification information (QUAL\_INFO\_TYPE<sub>r</sub> is equal to '00000000'), the mobile  
26 station shall include the requested information records in the response. If the  
27 message specifies a band class (QUAL\_INFO\_TYPE<sub>r</sub> is equal to '00000001'), the  
28 mobile station shall only include the requested information records for the  
29 specified band class (BAND\_CLASS<sub>r</sub>) in the response. If the message specifies a  
30 band class and an operating mode (QUAL\_INFO\_TYPE<sub>r</sub> is equal to '00000010'), the  
31 mobile station shall only include the requested information records for the  
32 specified band class (BAND\_CLASS<sub>r</sub>) and operating mode (OP\_MODE<sub>r</sub>) in the  
33 response. If the message specifies a band class or a band class and an operating  
34 mode which is not supported by the mobile station, the mobile station shall send a  
35 *Mobile Station Reject Order* with ORDQ set to '00000110' (message requires a  
36 capability that is not supported by the mobile station). If the response to this  
37 message exceeds the allowable length, the mobile station shall send a *Mobile*  
38 *Station Reject Order* with ORDQ set to '00001000' (response message would exceed  
39 the allowable length). If the message specifies an information record which is not  
40 supported by the mobile station for the specified band class and operating mode,  
41 the mobile station shall send a *Mobile Station Reject Order* with ORDQ set to  
42 '00001001' (information record is not supported for the specified band class and  
43 operating mode).

1       21. *TMSI Assignment Message*: The mobile station shall store the TMSI zone and code  
2       as follows:

- 3       • The mobile station shall store the length of the TMSI zone field by setting  
4       ASSIGNING\_TMSI\_ZONE\_LEN<sub>s-p</sub> to TMSI\_ZONE\_LEN<sub>r</sub>;
- 5       • The mobile station shall store the assigning TMSI zone number by setting the  
6       ASSIGNING\_TMSI\_ZONE\_LEN<sub>s-p</sub> least significant octets of  
7       ASSIGNING\_TMSI\_ZONE<sub>s-p</sub> to TMSI\_ZONE<sub>r</sub>, and
- 8       • The mobile station shall store the TMSI code by setting TMSI\_CODE<sub>s-p</sub> to  
9       TMSI\_CODE<sub>r</sub>.

10       The mobile station shall set the TMSI expiration time by setting TMSI\_EXP\_TIME<sub>s-p</sub>  
11       to TMSI\_EXP\_TIME<sub>r</sub>. The mobile station shall disable the full-TMSI timer. The  
12       mobile station shall then respond with a *TMSI Assignment Completion Message*  
13       within T<sub>56m</sub> seconds.

14       22. *User Zone Reject Message*

15       23. *General Extension Message*: The mobile station shall process this message as  
16       specified in section 2.6.18.

17       24. *Any other message*: If the mobile station receives any other message specified in  
18       Table 3.7.2.3-1, it shall ignore all Layer 3 fields. The mobile station shall ignore all  
19       other messages.

20       If the mobile station performs an access probe handoff or access handoff and  
21       receives any of the following messages, it shall process the message as specified in  
22       2.6.3.1.3:

- 23       • If the mobile station is currently monitoring the Paging Channel:
  - 24           1. *System Parameters Message*
  - 25           2. *Access Parameters Message*
  - 26           3. *Neighbor List Message*
  - 27           4. *Extended System Parameters Message*
  - 28           5. *Extended Neighbor List Message*
  - 29           6. *General Neighbor List Message*
  - 30           7. *Global Service Redirection Message*
  - 31           8. *Extended Global Service Redirection Message*
- 32       • If the mobile station is currently monitoring the Primary Broadcast Control  
33       Channel:
  - 34           1. *ANSI-41 System Parameters Message*
  - 35           2. *Enhanced Access Parameters Message*
  - 36           3. *Universal Neighbor List Message*
  - 37           4. *MC-RR Parameters Message*

## 1                   5. *Extended Global Service Redirection Message*

### 2   2.6.3.4 Mobile Station Order/Message Response Substate

3   In this substate, the mobile station sends a message that is a response to a message  
4   received from the base station. If the base station responds to the mobile station's  
5   message with an authentication request, the mobile station responds in this substate.

6   If a message received from the base station requires a Layer 2 acknowledgment and does  
7   not require a Layer 3 response, Layer 3 shall indicate to Layer 2 that no response is  
8   outstanding (see [4]).

9   If a message received from the base station requires a Layer 2 acknowledgment and also a  
10   Layer 3 response, Layer 3 shall indicate to Layer 2 that a response is outstanding (see [4]).

11   When transmitting a response to a message received from the base station, Layer 3 shall  
12   indicate to Layer 2 that the type of the message is a response (see [4]).

13   When transmitting an autonomous message (i.e., a message that is not sent as a response  
14   to a message received from the base station), Layer 3 shall indicate to Layer 2 that the type  
15   of the message is a request other than a registration request or a message transmission  
16   request (see [4]).

17   Upon entering the *Mobile Station Order/Message Response Substate*, the mobile station  
18   shall send the response message.

19   While in this substate, the mobile station shall monitor the Paging Channel or the Forward  
20   Common Control Channel. If the mobile station declares a loss of the Paging Channel or  
21   the Forward Common Control Channel (see 2.6.3.1.8), the mobile station shall perform the  
22   following:

- 23       • If PACA<sub>S</sub> is equal to enabled, the mobile station shall set PACA<sub>S</sub> to disabled and  
24       PACA\_CANCEL to '0', shall disable the PACA state timer, and should indicate to the  
25       user that the PACA call has been canceled.
- 26       • The mobile station shall declare an access attempt failure and update its  
27       registration variables as specified in 2.6.5.5.3.2.
- 28       • The mobile station shall disable its transmitter.
- 29       • The mobile station shall enter the *Mobile Station Idle State*.

30   If the mobile station receives confirmation of delivery of any message sent by the mobile  
31   station in this substate, it shall send a response in this substate if required, and shall  
32   then enter the *Mobile Station Idle State*.

33   If PACA<sub>S</sub> is equal to enabled, the mobile station shall set PACA\_CANCEL to '1' when the  
34   user directs the mobile station to cancel a PACA call.

35   If the mobile station is to exit the *System Access State* as a result of processing Layer 3  
36   fields of a message requiring an acknowledgment, the mobile station shall exit the *System*  
37   *Access State* after Layer 3 receives an indication from Layer 2 that the acknowledgment to  
38   the message has been sent and acknowledged.

39   If Layer 3 receives a message with an indication from Layer 2 that an access attempt for a

1 message being transmitted was not terminated as a result of processing the Layer 2 fields  
2 of the received message, the mobile station shall ignore the received message.

3 The following directed messages and orders can be received. If any field value of the  
4 message or order is outside its permissible range, the mobile station may send a *Mobile*  
5 *Station Reject Order* with ORDQ equal to '00000100' (message field not in valid range).

6 1. *Authentication Challenge Message*: The mobile station shall respond to the  
7 message as specified in 2.3.12.1.4, regardless of the value of AUTH<sub>S</sub>.

8 2. *Authentication Request Message*: The mobile station shall process the message  
9 and shall respond as specified in 2.3.12.5.2.

10 3. *Base Station Challenge Confirmation Order*: The mobile station shall respond to  
11 the message as specified in 2.3.12.1.5.

12 4. *Base Station Reject Order*: The mobile station shall perform the procedures as  
13 specified in 2.6.11.5.

14 25. *Data Burst Message*

15 26. *Fast Call Setup Order*:

- 16 • If ORDQ<sub>r</sub> is equal to '00000000', the mobile station shall process the message  
17 and respond with a *Fast Call Setup Order* as specified in 2.6.12.1.
- 18 • If ORDQ<sub>r</sub> is equal to '00000001', the mobile station shall process the message  
19 as specified in 2.6.12.1.

20 27. *Feature Notification Message*

21 28. *Local Control Order*

22 29. *Lock Until Power-Cycled Order*: The mobile station shall disable its transmitter and  
23 record the reason for the *Lock Until Power-Cycled Order* in the mobile station's  
24 semi-permanent memory (LCKRSN<sub>P<sub>S-P</sub></sub> equals the least significant four bits of  
25 ORDQ<sub>r</sub>). The mobile station should notify the user of the locked condition. The  
26 mobile station shall enter the *System Determination Substate* of the *Mobile Station*  
27 *Initialization State* with a lock indication (see 2.6.1.1), and shall not enter the  
28 *System Access State* again until after the next mobile station power-up or until it  
29 has received an *Unlock Order*. This requirement shall take precedence over any  
30 other mobile station requirement specifying entry to the *System Access State*.

31 30. *Maintenance Required Order*: The mobile station shall record the reason for the  
32 *Maintenance Required Order* in the mobile station's semi-permanent memory  
33 (MAINTRSN<sub>S-P</sub> equals the least significant four bits of ORDQ<sub>r</sub>). The mobile station  
34 shall remain in the unlocked condition. The mobile station should notify the user  
35 of the maintenance required condition.

36 31. *Registration Accepted Order*: The mobile station shall perform the procedures as  
37 specified in 2.6.11.1.

38 32. *Registration Rejected Order*: This order indicates that normal service is not  
39 available on this system. The mobile station shall disable the full-TMSI timer. If  
40 the received order specifies to delete the TMSI (ORDQ = '00000100'), the mobile

station shall set all the bits of the TMSI\_CODE<sub>S-p</sub> to '1'. The mobile station shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a registration rejected indication (see 2.6.1.1).

33. *Retry Order*: The mobile station shall process the message as follows:

- If RETRY\_TYPE<sub>R</sub> is equal to '000', the mobile station shall set RETRY\_DELAY<sub>S</sub>[RETRY\_TYPE] to 0, where RETRY\_TYPE is equal to '001', '010', '011', '100, or '101'.
- If RETRY\_TYPE<sub>R</sub> is equal to '001', '100', or '101', the mobile station shall perform the following:
  - If RETRY\_DELAY<sub>R</sub> is equal to '00000000', then the mobile station shall set RETRY\_DELAY<sub>S</sub>[RETRY\_TYPE<sub>R</sub>] to 0.
  - If RETRY\_DELAY<sub>R</sub> is not equal to '00000000', the mobile station shall set RETRY\_DELAY<sub>S</sub>[RETRY\_TYPE<sub>R</sub>] as follows:
    - + If the most significant bit of the RETRY\_DELAY<sub>R</sub> is '0', set RETRY\_DELAY\_UNIT<sub>S</sub> to 1000ms. If the most significant bit of the RETRY\_DELAY<sub>R</sub> is '1', set RETRY\_DELAY\_UNIT<sub>S</sub> to 60000ms.
    - + The mobile station shall set RETRY\_DELAY\_VALUE<sub>S</sub> to the seven least significant bits of RETRY\_DELAY<sub>R</sub>.
    - + The mobile station shall store the next system time 80 ms boundary + RETRY\_DELAY\_VALUE<sub>S</sub> × RETRY\_DELAY\_UNIT<sub>S</sub> ms as RETRY\_DELAY<sub>S</sub>[RETRY\_TYPE<sub>R</sub>].

34. *Security Mode Command Message*: The mobile station shall perform the procedures as specified in 2.6.11.4.

35. *Service Redirection Message*: The mobile station shall process the message as follows:

- If the mobile station is directed to an unsupported operation mode or band class, the mobile station shall respond with a *Mobile Station Reject Order* with ORDQ equal to '00000110' (message requires a capability that is not supported by the mobile station).
- If DELETE\_TMSI<sub>R</sub> is equal to '1', the mobile station shall set all the bits of TMSI\_CODE<sub>S-p</sub> to '1'. The mobile station shall disable the full-TMSI timer.
- The mobile station shall set RETURN\_IF\_FAIL<sub>S</sub> = RETURN\_IF\_FAIL<sub>R</sub>.
- If RECORD\_TYPE<sub>R</sub> is equal to '00000000', the mobile station shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with an NDSS off indication (see 2.6.1.1); otherwise, the mobile station shall store the redirection record received in the message as REDIRECT\_REC<sub>S</sub> and shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a redirection indication (see 2.6.1.1).

- 1 36. *SSD Update Message*: The mobile station shall respond to the message as  
2 specified in 2.3.12.1.5.
- 3 37. *Status Request Message*: The mobile station shall disable the *System Access State*  
4 timer and respond to the message. If  $P\_REV\_IN\_USE_s$  is less than or equal to  
5 three, the mobile station shall respond with a *Status Response Message*. If  
6  $P\_REV\_IN\_USE_s$  is greater than three, the mobile station shall respond with an  
7 *Extended Status Response Message*. If the message does not specify any  
8 qualification information ( $QUAL\_INFO\_TYPE_r$  is equal to '00000000'), the mobile  
9 station shall include the requested information records in the response. If the  
10 message specifies a band class ( $QUAL\_INFO\_TYPE_r$  is equal to '00000001'), the  
11 mobile station shall only include the requested information records for the  
12 specified band class ( $BAND\_CLASS_r$ ) in the response. If the message specifies a  
13 band class and an operating mode ( $QUAL\_INFO\_TYPE_r$  is equal to '00000010'), the  
14 mobile station shall only include the requested information records for the  
15 specified band class ( $BAND\_CLASS_r$ ) and operating mode ( $OP\_MODE_r$ ) in the  
16 response. If the message specifies a band class or a band class and an operating  
17 mode which is not supported by the mobile station, the mobile station shall send a  
18 *Mobile Station Reject Order* with  $ORDQ$  set to '00000110' (message requires a  
19 capability that is not supported by the mobile station). If the response to this  
20 message exceeds the allowable length, the mobile station shall send a *Mobile*  
21 *Station Reject Order* with  $ORDQ$  set to '00001000' (response message would exceed  
22 the allowable length). If the message specifies an information record which is not  
23 supported by the mobile station for the specified band class and operating mode,  
24 the mobile station shall send a *Mobile Station Reject Order* with  $ORDQ$  set to  
25 '00001001' (information record is not supported for the specified band class and  
26 operating mode).
- 27 38. *TMSI Assignment Message*: The mobile station shall store the TMSI zone and code  
28 as follows:
- 29 • The mobile station shall store the length of the TMSI zone field by setting  
30  $ASSIGNING\_TMSI\_ZONE\_LEN_{s-p}$  to  $TMSI\_ZONE\_LEN_r$ ,
  - 31 • The mobile station shall store the assigning TMSI zone number by setting the  
32  $ASSIGNING\_TMSI\_ZONE\_LEN_{s-p}$  least significant octets of  
33  $ASSIGNING\_TMSI\_ZONE_{s-p}$  to  $TMSI\_ZONE_r$ , and
  - 34 • The mobile station shall store the TMSI code by setting  $TMSI\_CODE_{s-p}$  to  
35  $TMSI\_CODE_r$ .
- 36 The mobile station shall set the TMSI expiration time by setting  $TMSI\_EXP\_TIME_{s-p}$   
37 to  $TMSI\_EXP\_TIME_r$ . The mobile station shall disable the full-TMSI timer. The  
38 mobile station shall then respond with a *TMSI Assignment Completion Message*  
39 within  $T_{56m}$  seconds.
- 40 39. *User Zone Reject Message*
- 41 40. *Any other message*: If the mobile station receives any other message specified in  
42 Table 3.7.2.3-1, it shall ignore all Layer 3 fields. The mobile station shall ignore all  
43 other messages.

### 1 2.6.3.5 Mobile Station Origination Attempt Substate

2 In this substate, the mobile station sends an *Origination Message*, *Call Recovery Request*  
3 *Message* or a *Reconnect Message*. If the mobile station sends a *Reconnect Message*, it shall  
4 set the ORIG\_IND field of the message to '1'.

5 If directed by the user to transmit a Short Data Burst (see [30]) and the mobile station  
6 sends a *Reconnect Message* in assured mode in this substate, the mobile station may  
7 include a Short Data Burst in the *Reconnect Message* by setting the SDB\_INCL field to '1',  
8 if all of the following conditions are true:

- 9 • SDB\_SUPPORTED<sub>s</sub> and SDB\_IN\_RCNM\_IND<sub>s</sub> are equal to '1', and
- 10 • ACCT is not enabled for the service option number associated with the Short Data  
11 Burst as follows:
  - 12 – The service option number associated with the Short Data Burst is not equal to  
13 any ACCT\_SO entry in ACCT\_SO\_LIST, and
  - 14 – The service option group number of the service option associated with the Short  
15 Data Burst is not equal to any ACCT\_SO\_GRP entry in ACCT\_SO\_GRP\_LIST.

16 The mobile station shall not send the *Reconnect Message* if RECONNECT\_MSG\_IND<sub>s</sub>  
17 equals '0', if this message is not being sent to reconnect a dormant packet data service  
18 instance, or the information that needs to be conveyed to the base station for the dormant  
19 packet data reconnection (PREV\_SID, PREV\_NID, PREV\_PZID. See [42] for details) can not  
20 be carried in a *Reconnect Message*.

21 The mobile station shall not send the *Call Recovery Request Message* if CRRM\_MSG\_IND<sub>s</sub>  
22 equals '0'.

23 If P\_REV\_IN\_USE<sub>s</sub> is greater than or equal to 11 and the *Origination Message* is being sent  
24 to perform packet data dormant handoff, the mobile station shall include all dormant  
25 packet data service instances (see [42]) up to the limit specified by  
26 MAX\_ADD\_SERV\_INSTANCE<sub>s</sub>.

27 If the base station responds to the *Origination Message*, *Call Recovery Request Message* or  
28 the *Reconnect Message* with an authentication request, the mobile station responds in this  
29 substate.

30 If a message received from the base station requires a Layer 2 acknowledgment and does  
31 not require a Layer 3 response, Layer 3 shall indicate to Layer 2 that no response is  
32 outstanding (see [4]).

33 If a message received from the base station requires a Layer 2 acknowledgment and also a  
34 Layer 3 response, Layer 3 shall indicate to Layer 2 that a response is outstanding (see [4]).

35 When transmitting a response to a message received from the base station, Layer 3 shall  
36 indicate to Layer 2 that the type of the message is a response (see [4]).

37 When transmitting an autonomous message (i.e., a message that is not sent as a response  
38 to a message received from the base station), Layer 3 shall indicate to Layer 2 that the type

1 of the message is a request other than a registration request or a message transmission  
2 request (see [4]).

3 Upon entering the *Mobile Station Origination Attempt Substate*, the mobile station shall set  
4 RLGAIN\_ADJ<sub>S</sub> to '0000', and perform the following:

- 5 • If P\_REV\_IN\_USE<sub>S</sub> is less than 11, set PLCM\_TYPE<sub>S</sub> to '0000'; otherwise set  
6 PLCM\_TYPE<sub>S</sub> to '0100'.
- 7 • The mobile station shall exit the *Mobile Station Origination Attempt Substate*, shall  
8 enter either the *Mobile Station Idle State* or the *System Determination Substate* with  
9 an ACCT blocked indication, and should indicate to the user that the call has  
10 terminated if all of the following conditions are true:
  - 11 – P\_REV\_IN\_USE<sub>S</sub> is greater than six,
  - 12 – ACCT\_INCL\_EMG<sub>S</sub> is equal to '1' or the mobile station determines that the call  
13 is not an emergency call,
  - 14 – ACCT is enabled for the requested service option number, due to either of the  
15 following two conditions:
    - 16 + the requested service option number is equal to an ACCT\_SO entry in  
17 ACCT\_SO\_LIST, or
    - 18 + the service option group number of the requested service option is equal to  
19 an ACCT\_SO\_GRP entry in ACCT\_SO\_GRP\_LIST.
- 20 • If the substate was entered with an origination indication, the mobile station shall  
21 send the *Origination Message*, *Call Recovery Request Message* or the *Reconnect*  
22 *Message* as an r-csch request.
- 23 • If the substate was entered with a PACA response indication, the mobile station  
24 shall send the *Origination Message* as an r-csch response using the access  
25 procedures specified in 2.6.3.1. The mobile station shall include the dialed digits (if  
26 any) from the previous origination attempt in the *Origination Message*.
- 27 • If the origination is a result of NDSS\_ORIG<sub>S</sub> being equal to enabled, the mobile  
28 station shall include in the *Origination Message* the dialed digits (if any) recorded  
29 from the previous origination attempt.
- 30 • If the mobile station has a stored service configuration (that is, parameters  
31 conveyed by both the Service Configuration information record and the Non-  
32 negotiable Service Configuration information record) and corresponding SYNC\_ID  
33 with associated SID and NID that are equal to the SID<sub>S</sub> and NID<sub>S</sub> respectively, and  
34 USE\_SYNC\_ID<sub>S</sub> is equal to '1', the mobile station may include the SYNC\_ID field in  
35 the *Origination Message* or the *Reconnect Message* and, if included, shall perform  
36 the following:
  - 37 – The mobile station shall set it to the SYNC\_ID corresponding to the stored  
38 service configuration. The mobile station shall store the value of the SYNC\_ID  
39 field in SYNC\_ID<sub>S</sub>.
  - 40 – The mobile station shall set the SR\_ID field of the *Origination Message* or the

1           *Reconnect Message* as follows:

- 2           + If the mobile station requests the restoration of a single service option
- 3           connection from the stored service configuration, the mobile station shall
- 4           set this field to the corresponding service reference identifier.
- 5           + Otherwise (that is, the mobile station requests the restoration of all the
- 6           service option connections from the stored service configuration), the mobile
- 7           station shall set this field to '111'.

- 8           • The mobile station shall include in the *Origination Message* as many of the dialed
- 9           digits as possible without exceeding the message capsule size. When calculating
- 10          the number of dialed digits to be included in the *Origination Message*, the mobile
- 11          station shall assume the following if P\_REV\_IN\_USE<sub>S</sub> is greater than three:

- 12          – The number of additional reported pilots (NUM\_ADD\_PILOTS) is equal to five
- 13          (see 2.6.3.1.7 and 2.7.1.3.1.3) so that up to five additional pilots may be
- 14          reported in any access probe, and
- 15          – The number of alternative service option numbers (NUM\_ALT\_SO) is less than
- 16          or equal to the maximum alternative service option numbers
- 17          (MAX\_NUM\_ALT\_SO<sub>S</sub>).

- 18          • If PACA<sub>S</sub> is equal to enabled, the mobile station shall set the PACA\_REORIG field of
- 19          the *Origination Message* to '1'; otherwise, the mobile station shall set the field to '0'.

20 While in this substate, the mobile station shall monitor the Paging Channel or the Forward  
 21 Common Control Channel. The mobile station may perform an access probe handoff or an  
 22 access handoff as described in 2.6.3.1.3.2 and 2.6.3.1.3.3. If the mobile station declares a  
 23 loss of the Paging Channel or the Forward Common Control Channel (see 2.6.3.1.8) during  
 24 an access attempt, the mobile station may perform an access probe handoff; otherwise, it  
 25 shall declare an access attempt failure and shall perform the following:

- 26          • If the mobile station is monitoring the Paging Channel, the mobile station shall set
- 27          SYS\_PAR\_MSG\_SEQ<sub>S</sub> and ACC\_MSG\_SEQ<sub>S</sub> to NULL.
- 28          • If the mobile station is monitoring the Forward Common Control Channel, the
- 29          mobile station shall set MC\_RR\_PAR\_MSG\_SEQ<sub>S</sub> and ACC\_MSG\_SEQ<sub>S</sub> to NULL.
- 30          • If PACA<sub>S</sub> is equal to enabled, the mobile station shall set PACA<sub>S</sub> to disabled and
- 31          PACA\_CANCEL to '0', shall disable the PACA state timer, and should indicate to the
- 32          user that the PACA call has been canceled.
- 33          • If NDSS\_ORIG<sub>S</sub> is equal to enabled, the mobile station shall set NDSS\_ORIG<sub>S</sub> to
- 34          disabled, and should indicate to the user that the call origination is canceled.
- 35          • The mobile station shall update its registration variables as specified in 2.6.5.5.3.2.
- 36          • The mobile station shall disable its transmitter and enter the *Mobile Station Idle*
- 37          *State*.

38 If the mobile station receives confirmation of delivery of any message sent by the mobile  
 39 station in this substate, the mobile station shall perform an access handoff if all of the  
 40 following conditions hold:

- 1 • The mobile station declares a loss of the Paging Channel or the Forward Common
- 2 Control Channel,
- 3 • The mobile station is permitted to perform an access handoff (see 2.6.3.1.3.2) and
- 4 there are pilots other than the active pilot in the access handoff list (see
- 5 2.6.3.1.3.2).

6 If the mobile station declares a loss of the Paging Channel or the Forward Common Control  
 7 Channel and does not perform an access handoff, the mobile station shall perform the  
 8 following:

- 9 • If the mobile station is monitoring the Paging Channel, the mobile station shall set
- 10 SYS\_PAR\_MSG\_SEQ<sub>S</sub> and ACC\_MSG\_SEQ<sub>S</sub> to NULL.
- 11 • If the mobile station is monitoring the Forward Common Control Channel, the
- 12 mobile station shall set MC\_RR\_PAR\_MSG\_SEQ<sub>S</sub> and ACC\_MSG\_SEQ<sub>S</sub> to NULL.
- 13 • If PACA<sub>S</sub> is equal to enabled, the mobile station shall set PACA<sub>S</sub> to disabled and
- 14 PACA\_CANCEL to '0', shall disable the PACA state timer, and should indicate to the
- 15 user that the PACA call has been canceled.
- 16 • If NDSS\_ORIG<sub>S</sub> is equal to enabled, the mobile station shall set NDSS\_ORIG<sub>S</sub> to
- 17 disabled and should indicate to the user that the call origination is canceled.
- 18 • The mobile station shall disable its transmitter and enter the *Mobile Station Idle*
- 19 *State*.

20 If the mobile station receives confirmation of delivery of the *Origination Message*, *Call*  
 21 *Recovery Request Message* or the *Reconnect Message*, the mobile station shall update its  
 22 registration variables with respect to the base station to which the first access probe was  
 23 transmitted after entering the *System Access State* as specified in 2.6.5.5.3.1.

24 The mobile station shall set and disable the *System Access State* timer as follows:

- 25 • The mobile station shall disable the timer whenever it begins an access attempt.
- 26 • The mobile station shall set the timer to T<sub>42m</sub> seconds whenever it ends an access
- 27 attempt.
- 28 • The mobile station shall disable the timer whenever it exits the *System Access*
- 29 *State*.

30 If the *System Access State* timer expires while in this substate, the mobile station shall  
 31 perform the following:

- 32 • If PACA<sub>S</sub> is equal to enabled, the mobile station shall set PACA<sub>S</sub> to disabled and
- 33 PACA\_CANCEL to '0', shall disable the PACA state timer, and should indicate to the
- 34 user that the PACA call has been canceled.
- 35 • If NDSS\_ORIG<sub>S</sub> is equal to enabled, the mobile station shall set NDSS\_ORIG<sub>S</sub> to
- 36 disabled, and should indicate to the user that the call origination is canceled.
- 37 • If the mobile station is monitoring the Paging Channel, the mobile station shall set
- 38 SYS\_PAR\_MSG\_SEQ<sub>S</sub> and ACC\_MSG\_SEQ<sub>S</sub> to NULL and enter the *Mobile Station*
- 39 *Idle State*.

- 1       • If the mobile station is monitoring the Forward Common Control Channel, the  
2       mobile station shall set MC\_RR\_PAR\_MSG\_SEQ<sub>S</sub> and ACC\_MSG\_SEQ<sub>S</sub> to NULL and  
3       enter the *Mobile Station Idle State*.

4       If the mobile station is directed by the user to disconnect the call, the mobile station shall  
5       perform the following actions:

- 6       • Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any  
7       access attempt in progress.
- 8       • The mobile station shall send the *Release Order* (normal release) in assured mode  
9       requiring confirmation of delivery.
- 10      • After receiving confirmation of delivery of the *Release Order*, the mobile station  
11      shall enter the *Mobile Station Idle State* (see 2.6.2.2) or the *System Determination*  
12      *Substate* of the *Mobile Station Initialization State* with a release indication (see  
13      2.6.1.1).

14      If the mobile station is directed by the user to power off, the mobile station shall perform  
15      the following actions:

- 16      • Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any  
17      access attempt in progress.
- 18      • The mobile station shall send the *Release Order* (with power-down indication) in  
19      assured mode requiring confirmation of delivery.
- 20      • After receiving confirmation of delivery of the *Release Order*, the mobile station  
21      shall perform power-down registration procedures (see 2.6.5.1.2).
- 22      • The mobile station may power off.

23      If the mobile station receives a *Channel Assignment Message* or the *Extended Channel*  
24      *Assignment Message*, Layer 3 shall send a *dedicated channel assignment* indication to  
25      Layer 2 (see [4]). If the mobile station has not received confirmation of delivery of the  
26      *Origination Message*, *Call Recovery Request Message* or the *Reconnect Message* before  
27      receiving the *Channel Assignment Message* or the *Extended Channel Assignment Message*,  
28      the mobile station shall update its registration variables with respect to the base station to  
29      which the first access probe was transmitted after entering the *System Access State*, as  
30      specified in 2.6.5.5.3.1.

31      If the mobile station is to exit the *System Access State* as a result of processing Layer 3  
32      fields of a message requiring an acknowledgment, the mobile station shall exit the *System*  
33      *Access State* after Layer 3 receives an indication from Layer 2 that the acknowledgment to  
34      the message has been sent and acknowledged.

35      If Layer 3 receives a message other than messages listed below:

- 36      • a *Channel Assignment Message*, or
- 37      • *Extended Channel Assignment Message* with either DIRECT\_CH\_ASSIGN\_IND field  
38      not included, or DIRECT\_CH\_ASSIGN\_IND field included and set to '0'

39      with an indication from Layer 2 that an access attempt for a message being transmitted  
40      was not terminated as a result of processing the Layer 2 fields of the received message,

the mobile station shall ignore the received message.

The following directed messages and orders can be received. If any field value of the message or order is outside its permissible range, the mobile station may send a *Mobile Station Reject Order* with ORDQ equal to '00000100' (message field not in valid range).

1. *Authentication Challenge Message*: The mobile station shall respond to the message as specified in 2.3.12.1.4, regardless of the value of AUTH<sub>S</sub>.
2. *Authentication Request Message*: The mobile station shall process the message and shall respond as specified in 2.3.12.5.2.
3. *Base Station Challenge Confirmation Order*: The mobile station shall respond to the message as specified in 2.3.12.1.5.
4. *Base Station Reject Order*: The mobile station shall perform the procedures as specified in 2.6.11.5.
5. *Channel Assignment Message*: The mobile station shall process the message as follows:
  - If ASSIGN\_MODE<sub>R</sub> equals '000', the mobile station shall perform the following actions:
    - The mobile station shall set CH\_IND<sub>S</sub> to '01'.
    - The mobile station shall store the frame offset (FRAME\_OFFSET<sub>S</sub> = FRAME\_OFFSET<sub>R</sub>), the message encryption mode indicator (ENCRYPT\_MODE<sub>S</sub> = ENCRYPT\_MODE<sub>R</sub>), and, if FREQ\_INCL<sub>R</sub> equals '1', the Frequency Assignment (CDMACH<sub>S</sub> = CDMA\_FREQ<sub>R</sub>).
    - If PACA<sub>S</sub> is equal to enabled, the mobile station shall set PACA<sub>S</sub> to disabled and PACA\_CANCEL to '0', shall disable the PACA state timer, and should indicate to the user that the PACA call is proceeding.
    - If the mobile station is currently monitoring the Paging Channel, the mobile station shall set IDLE\_BCCH\_CHAN to '0'; otherwise, the mobile station shall set IDLE\_BCCH\_CHAN to '1'. The mobile station shall set IDLE\_CDMA\_CHAN to CDMACH<sub>S</sub>, IDLE\_CDMABAND to CDMABAND<sub>S</sub>, IDLE\_SID to SID<sub>S</sub>, IDLE\_NID to NID<sub>S</sub>, and IDLE\_P\_REV to P\_REV<sub>S</sub>.
    - The mobile station shall initialize the CODE\_CHAN\_LIST as described in 2.6.8, shall set SERV\_NEG<sub>S</sub> to disabled, and shall enter the *Traffic Channel Initialization Substate* of the *Mobile Station Control on the Traffic Channel State*.
  - If ASSIGN\_MODE<sub>R</sub> equals '001', the mobile station shall perform the following actions:
    - If the message requires acknowledgment, the mobile station shall wait until Layer 3 receives an indication from Layer 2 that the acknowledgment to the message has been sent and acknowledged.

- 1           – If a CDMA channel (CDMA\_FREQ) is specified in the assignment, the mobile  
2           station shall set CDMACH<sub>S</sub> = CDMA\_FREQ<sub>r</sub>, tune to the new Frequency  
3           Assignment, and measure the strength of each pilot listed in the assignment  
4           using the Neighbor Set search procedures specified in 2.6.6.2.1 and  
5           2.6.6.2.2.
- 6           – The mobile station shall set CONFIG\_MSG\_SEQ<sub>S</sub> and ACC\_MSG\_SEQ<sub>S</sub> to  
7           NULL (see 2.6.2.2) and shall set PILOT\_PN<sub>S</sub> to the pilot PN sequence offset of  
8           the strongest pilot in the list.
- 9           – If the mobile station has not stored configuration parameters for the Primary  
10          Paging Channel of the new base station, or if the stored information is not  
11          current (see 2.6.2.2), the mobile station shall set SYS\_PAR\_MSG\_SEQ<sub>S</sub>,  
12          NGHBR\_LST\_MSG\_SEQ<sub>S</sub>, EXT\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub>,  
13          GEN\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub>, CHAN\_LST\_MSG\_SEQ<sub>S</sub>,  
14          EXT\_CHAN\_LST\_MSG\_SEQ<sub>S</sub>, FD\_CHAN\_LST\_MSG\_SEQ<sub>S</sub>,  
15          EXT\_SYS\_PAR\_MSG\_SEQ<sub>S</sub>, USER\_ZONE\_ID\_MSG\_SEQ<sub>S</sub>,  
16          PRI\_NGHBR\_LST\_MSG\_SEQ<sub>S</sub>, GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>S</sub>, and  
17          EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>S</sub> to NULL.
- 18          – The mobile station shall set PAGE\_CHAN<sub>S</sub> to '1' and PAGECH<sub>S</sub> to the  
19          Primary Paging Channel. The mobile station shall then begin monitoring  
20          the Primary Paging Channel of the selected base station.
- 21          – If RESPOND<sub>r</sub> is equal to '1', the mobile station shall enter the *Update*  
22          *Overhead Information Substate* with an origination indication.
- 23      • If ASSIGN\_MODE<sub>r</sub> equals '100', the mobile station shall perform the following  
24      actions:
  - 25          – The mobile station shall set CH\_IND<sub>S</sub> to '01'.
  - 26          – If GRANTED\_MODE<sub>r</sub> equals '00', and the multiplex option or radio  
27          configuration specified in the DEFAULT\_CONFIG field is not supported by  
28          the mobile station, the mobile station shall send a *Mobile Station Reject*  
29          *Order* with ORDQ field set to '00000110' (capability not supported by the  
30          mobile station) and remain in *Mobile Station Origination Attempt Substate*.
  - 31          – If FREQ\_INCL<sub>r</sub> equals '0', the mobile station shall perform the following  
32          actions:
    - 33              + The mobile station shall store the frame offset (FRAME\_OFFSET<sub>S</sub> =  
34              FRAME\_OFFSET<sub>r</sub>), the message encryption mode indicator  
35              (ENCRYPT\_MODE<sub>S</sub> = ENCRYPT\_MODE<sub>r</sub>), the granted mode  
36              (GRANTED\_MODE<sub>S</sub> = GRANTED\_MODE<sub>r</sub>), and the default configuration  
37              (DEFAULT\_CONFIG<sub>S</sub> = DEFAULT\_CONFIG<sub>r</sub>).
    - 38              + The mobile station shall set SERV\_NEG<sub>S</sub> to enabled.
    - 39              + If PACA<sub>S</sub> is equal to enabled, the mobile station shall set PACA<sub>S</sub> equal to  
40              disabled and PACA\_CANCEL to '0', shall disable the PACA state timer,  
41              and should indicate to the user that the PACA call is proceeding.

- 1           + The mobile station shall initialize CODE\_CHAN\_LIST as described in
- 2           2.6.8.
- 3           + If the mobile station is currently monitoring the Paging Channel, the
- 4           mobile station shall set IDLE\_BCCH\_CHAN to '0'; otherwise, the mobile
- 5           station shall set IDLE\_BCCH\_CHAN to '1'. The mobile station shall set
- 6           IDLE\_CDMA\_CHAN to CDMACH<sub>S</sub>, IDLE\_CDMABAND to CDMABAND<sub>S</sub>,
- 7           IDLE\_SID to SID<sub>S</sub>, IDLE\_NID to NID<sub>S</sub>, and IDLE\_P\_REV to P\_REV<sub>S</sub>.
- 8           + The mobile station shall then enter the *Traffic Channel Initialization*
- 9           *Substate of the Mobile Station Control on the Traffic Channel State.*
- 10          – If FREQ\_INCL<sub>R</sub> equals '1', the mobile station shall perform the following
- 11          actions:
- 12           + If the band class is not supported by the mobile station, the mobile
- 13           station shall send a *Mobile Station Reject Order* with ORDQ field set to
- 14           '00000110' (capability not supported by the mobile station) and remain
- 15           in the *Mobile Station Origination Attempt Substate.*
- 16           + If the band class is supported by the mobile station, the mobile station
- 17           shall perform the following actions:
- 18           o The mobile station shall store the frame offset (FRAME\_OFFSET<sub>S</sub> =
- 19           FRAME\_OFFSET<sub>R</sub>), the message encryption mode indicator
- 20           (ENCRYPT\_MODE<sub>S</sub> = ENCRYPT\_MODE<sub>R</sub>), the granted mode
- 21           (GRANTED\_MODE<sub>S</sub> = GRANTED\_MODE<sub>R</sub>), the default configuration
- 22           (DEFAULT\_CONFIG<sub>S</sub> = DEFAULT\_CONFIG<sub>R</sub>), the idle Frequency
- 23           Assignment (IDLE\_CDMA\_CHAN = CDMACH<sub>S</sub>), the idle band class
- 24           (IDLE\_CDMABAND = CDMABAND<sub>S</sub>), the band class (CDMABAND<sub>S</sub> =
- 25           BAND\_CLASS<sub>R</sub>), and the Frequency Assignment
- 26           (CDMACH<sub>S</sub> = CDMA\_FREQ<sub>R</sub>).
- 27           o The mobile station shall set SERV\_NEG<sub>S</sub> to enabled.
- 28           o If PACA<sub>S</sub> is equal to enabled, the mobile station shall set PACA<sub>S</sub> to
- 29           disabled and PACA\_CANCEL to '0', shall disable the PACA state
- 30           timer, and should indicate to the user that the PACA call is
- 31           proceeding.
- 32           o The mobile station shall initialize the CODE\_CHAN\_LIST as
- 33           described in 2.6.8.
- 34           o If the mobile station is currently monitoring the Paging Channel, the
- 35           mobile station shall set IDLE\_BCCH\_CHAN to '0'; otherwise, the
- 36           mobile station shall set IDLE\_BCCH\_CHAN to '1'. The mobile station
- 37           shall set IDLE\_SID to SID<sub>S</sub>, IDLE\_NID to NID<sub>S</sub>, and IDLE\_P\_REV to
- 38           P\_REV<sub>S</sub>.
- 39           o The mobile station shall then tune to the new Frequency Assignment
- 40           and enter the *Traffic Channel Initialization Substate of the Mobile*
- 41           *Station Control on the Traffic Channel State.*

- 1       • If ASSIGN\_MODE<sub>r</sub> equals '101', the mobile station shall perform the following
- 2       actions:
- 3       – If FREQ\_INCL<sub>r</sub> equals '0', the mobile station shall perform the following
- 4       actions:
- 5       + If the message requires acknowledgment, the mobile station shall wait
- 6       until Layer 3 receives an indication from Layer 2 that the
- 7       acknowledgment to the message has been sent and acknowledged.
- 8       + The mobile station shall set CONFIG\_MSG\_SEQ<sub>s</sub> and ACC\_MSG\_SEQ<sub>s</sub>
- 9       to NULL (see 2.6.2.2) and shall set PILOT\_PN<sub>s</sub> to the pilot PN sequence
- 10      offset of the strongest pilot in the list (PILOT\_PN<sub>r</sub>).
- 11      + If the mobile station has not stored configuration parameters for the
- 12      Primary Paging Channel of the new base station, or if the stored
- 13      information is not current (see 2.6.2.2), the mobile station shall set
- 14      SYS\_PAR\_MSG\_SEQ<sub>s</sub>, NGHBR\_LST\_MSG\_SEQ<sub>s</sub>,
- 15      EXT\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, GEN\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>,
- 16      CHAN\_LST\_MSG\_SEQ<sub>s</sub>, EXT\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>,
- 17      FD\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>, EXT\_SYS\_PAR\_MSG\_SEQ<sub>s</sub>,
- 18      USER\_ZONE\_ID\_MSG\_SEQ<sub>s</sub>, PRI\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>,
- 19      GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub>, and
- 20      EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub> to NULL.
- 21      + The mobile station shall set PAGE\_CHAN<sub>s</sub> to '1' and PAGECH<sub>s</sub> to the
- 22      Primary Paging Channel. The mobile station shall then begin
- 23      monitoring the Primary Paging Channel of the selected base station.
- 24      + If RESPOND<sub>r</sub> is equal to '1', the mobile station shall perform the
- 25      following:
- 26      o If the *Channel Assignment Message* does not require an
- 27      acknowledgment, the mobile station shall enter the *Update Overhead*
- 28      *Information Substate* with an origination indication within T<sub>34m</sub>
- 29      seconds after receiving the *Channel Assignment Message*.
- 30      o If the *Channel Assignment Message* requires an acknowledgment,
- 31      the mobile station shall enter the *Update Overhead Information*
- 32      *Substate* with a page response retransmission indication within
- 33      T<sub>34m</sub> seconds after Layer 3 receives an indication from Layer 2 that
- 34      the acknowledgment to the *Channel Assignment Message* has been
- 35      sent and acknowledged.
- 36      + If RESPOND<sub>r</sub> is equal to '0', the mobile station shall perform the
- 37      following:
- 38      o If the *Channel Assignment Message* does not require an
- 39      acknowledgment, the mobile station shall enter the *Mobile Station*
- 40      *Idle State* within T<sub>34m</sub> seconds after receiving the *Channel*
- 41      *Assignment Message*.

- 1                   o If the *Channel Assignment Message* requires an acknowledgment,  
2                   the mobile station shall enter the *Mobile Station Idle State* within  
3                   T<sub>34m</sub> seconds after Layer 3 receives an indication from Layer 2 that  
4                   the acknowledgment to the *Channel Assignment Message* has been  
5                   sent and acknowledged.
- 6           – If  $FREQ\_INCL_r$  equals '1', the mobile station shall perform the following  
7           actions:
  - 8           + If the band class is not supported by the mobile station, the mobile  
9           station shall send a *Mobile Station Reject Order* with ORDQ field set to  
10           '00000110' (capability not supported by the mobile station) and remain  
11           in the *Mobile Station Origination Attempt Substate*.
  - 12           + If the band class is supported by the mobile station, the mobile station  
13           shall perform the following actions:
    - 14           o If the message requires acknowledgment, the mobile station shall  
15           wait until Layer 3 receives an indication from Layer 2 that the  
16           acknowledgment to the message has been sent and acknowledged.
    - 17           o The mobile station shall set  $CDMACH_s$  to  $CDMA\_FREQ_r$  and  
18            $CDMABAND_s$  to  $BAND\_CLASS_r$ . Then the mobile station shall tune  
19           to the new Frequency Assignment, measure the strength of each  
20           pilot listed in the assignment using the Neighbor Set search  
21           procedures specified in 2.6.6.2.1 and 2.6.6.2.2, set  $PILOT\_PN_s$  to the  
22           pilot PN sequence offset of the strongest pilot in the list ( $PILOT\_PN_r$ ),  
23           and set  $CONFIG\_MSG\_SEQ_s$  and  $ACC\_MSG\_SEQ_s$  to NULL (see  
24           2.6.2.2).
    - 25           o If the mobile station has not stored configuration parameters for the  
26           Primary Paging Channel of the new base station, or if the stored  
27           information is not current (see 2.6.2.2), the mobile station shall set  
28            $SYS\_PAR\_MSG\_SEQ_s$ ,  $NGHBR\_LST\_MSG\_SEQ_s$ ,  
29            $EXT\_NGHBR\_LST\_MSG\_SEQ_s$ ,  $GEN\_NGHBR\_LST\_MSG\_SEQ_s$ ,  
30            $CHAN\_LST\_MSG\_SEQ_s$ ,  $EXT\_CHAN\_LST\_MSG\_SEQ_s$ ,  
31            $FD\_CHAN\_LST\_MSG\_SEQ_s$ ,  $EXT\_SYS\_PAR\_MSG\_SEQ_s$ ,  
32            $USER\_ZONE\_ID\_MSG\_SEQ_s$ ,  $PRI\_NGHBR\_LST\_MSG\_SEQ_s$ ,  
33            $GLOB\_SERV\_REDIR\_MSG\_SEQ_s$ , and  
34            $EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ_s$  to NULL.
    - 35           o The mobile station shall set  $PAGE\_CHAN_s$  to '1' and  $PAGECH_s$  to the  
36           Primary Paging Channel. The mobile station shall then begin  
37           monitoring the Primary Paging Channel of the selected base station.
    - 38           o If  $RESPOND_r$  is equal to '1', the mobile station shall perform the  
39           following:

- 1                   ◇ If the *Channel Assignment Message* does not require an
- 2                   acknowledgment, the mobile station shall enter the *Update*
- 3                   *Overhead Information Substate* with a page response
- 4                   retransmission indication within  $T_{34m}$  seconds after receiving
- 5                   the *Channel Assignment Message*.
- 6                   ◇ If the *Channel Assignment Message* requires an acknowledgment,
- 7                   the mobile station shall enter the *Update Overhead Information*
- 8                   *Substate* with a page response retransmission indication within
- 9                    $T_{34m}$  seconds after Layer 3 receives an indication from Layer 2
- 10                  that the acknowledgment to the *Channel Assignment Message*
- 11                  has been sent and acknowledged.
- 12                  o If  $RESPOND_r$  is equal to '0', the mobile station shall perform the
- 13                  following:
- 14                   ◇ If the *Channel Assignment Message* does not require an
- 15                   acknowledgment, the mobile station shall enter the *Mobile*
- 16                   *Station Idle State* within  $T_{34m}$  seconds after receiving the
- 17                   *Channel Assignment Message*.
- 18                   ◇ If the *Channel Assignment Message* requires an acknowledgment,
- 19                   the mobile station shall enter the *Mobile Station Idle State* within
- 20                    $T_{34m}$  seconds after Layer 3 receives an indication from Layer 2
- 21                   that the acknowledgment to the *Channel Assignment Message*
- 22                   has been sent and acknowledged.

## 23       6. Data Burst Message

- 24       7. *Extended Channel Assignment Message*: If  $P\_REV\_IN\_USE_s$  is greater than or equal
- 25       to 11, and  $DIRECT\_CH\_ASSIGN\_IND_r$  equals '1', the mobile station shall ignore the
- 26       message. Otherwise, the mobile station shall process the message as follows:
- 27       • The mobile station shall set  $RTC\_NOM\_PWR\_USE\_IND$  to '0'.
  - 28       • The mobile station shall set  $DIRECT\_CH\_ASSIGN\_RECOVER\_IND_s$  to '0'.
  - 29       • If  $ASSIGN\_MODE_r$  equals '000', the mobile station shall perform the following
  - 30       actions:
    - 31       – If  $PACA_s$  is equal to enabled, the mobile station shall set  $PACA_s$  to disabled
    - 32       and  $PACA\_CANCEL$  to '0', shall disable the  $PACA$  state timer, and should
    - 33       indicate to the user that the  $PACA$  call has been canceled.
    - 34       – If  $GRANTED\_MODE_r$  equals '00', and the multiplex option and radio
    - 35       configuration specified in the  $DEFAULT\_CONFIG$  field are not supported by
    - 36       the mobile station, the mobile station shall send a *Mobile Station Reject*
    - 37       *Order* with  $ORDQ$  field set to '00000110' (capability not supported by the
    - 38       mobile station) and shall remain in the *Mobile Station Origination Attempt*
    - 39       *Substate*.

- 1           – If GRANTED\_MODE<sub>r</sub> is equal to '00' and DEFAULT\_CONFIG<sub>r</sub> is not equal to
- 2           '100', the mobile station shall send a *Mobile Station Reject Order* with ORDQ
- 3           field set to '00001110' (RC does not match with DEFAULT\_CONFIG<sub>r</sub>) and
- 4           shall remain in the *Mobile Station Origination Attempt Substate* if any of the
- 5           following conditions is true:
  - 6           + FOR\_FCH\_RC<sub>r</sub> is not equal to the RC associated with
  - 7           DEFAULT\_CONFIG<sub>r</sub> (see Table 3.7.2.3.2.21-2).
  - 8           + REV\_FCH\_RC<sub>r</sub> is not equal to the RC associated with
  - 9           DEFAULT\_CONFIG<sub>r</sub> (see Table 3.7.2.3.2.21-2).
- 10          – If the mobile station does not support either of the Fundamental Channel
- 11          Radio Configurations (FOR\_FCH\_RC or REV\_FCH\_RC), the mobile shall
- 12          send a *Mobile Station Reject Order* with the ORDQ field set to '00000110'
- 13          (capability not supported by the mobile station) and remain in the *Mobile*
- 14          *Station Origination Attempt Substate*.
- 15          – If PLCM\_TYPE<sub>r</sub> equals '0010' and IMSI\_O is derived from IMSI\_T, or if
- 16          PLCM\_TYPE<sub>r</sub> equals '0011' and IMSI\_O is derived from IMSI\_M, the mobile
- 17          station shall send a *Mobile Station Reject Order* with the ORDQ field set to
- 18          '00011100' (PLCM\_TYPE mismatch) and remain in the *Mobile Station*
- 19          *Origination Attempt Substate*.
- 20          – The mobile station shall set CH\_IND<sub>s</sub> to '01'.
- 21          – If P\_REV\_IN\_USE<sub>s</sub> is equal to or greater than six, the mobile station shall
- 22          store the Forward Fundamental Channel Radio Configuration
- 23          (FOR\_FCH\_RC<sub>s</sub> = FOR\_FCH\_RC<sub>r</sub>) and the Reverse Fundamental Channel
- 24          Radio Configuration (REV\_FCH\_RC<sub>s</sub> = REV\_FCH\_RC<sub>r</sub>)
- 25          – If FREQ\_INCL<sub>r</sub> equals '0', the mobile station shall perform the following
- 26          actions:
  - 27          + The mobile station shall store the frame offset (FRAME\_OFFSET<sub>s</sub> =
  - 28          FRAME\_OFFSET<sub>r</sub>), the message encryption mode indicator
  - 29          (ENCRYPT\_MODE<sub>s</sub> = ENCRYPT\_MODE<sub>r</sub>), the bypass indicator
  - 30          (BYPASS\_ALERT\_ANSWER<sub>s</sub> = BYPASS\_ALERT\_ANSWER<sub>r</sub>), the granted
  - 31          mode (GRANTED\_MODE<sub>s</sub> = GRANTED\_MODE<sub>r</sub>), the default
  - 32          configuration (DEFAULT\_CONFIG<sub>s</sub> = DEFAULT\_CONFIG<sub>r</sub>), and the
  - 33          occurrences of PILOT\_PN and PWR\_COMB for each included member of
  - 34          the Active Set.
  - 35          + If C\_SIG\_ENCRYPT\_MODE is included, the mobile station shall set
  - 36          C\_SIG\_ENCRYPT\_MODE<sub>s</sub> to C\_SIG\_ENCRYPT\_MODE<sub>r</sub>.
  - 37          + The mobile station shall perform the procedures in 2.6.11.2.
  - 38          + The mobile station shall set SERV\_NEG<sub>s</sub> to enabled.
  - 39          + If PACA<sub>s</sub> is equal to enabled, the mobile station shall set PACA<sub>s</sub> equal to
  - 40          disabled and PACA\_CANCEL to '0', shall disable the PACA state timer,
  - 41          and should indicate to the user that the PACA call is proceeding.

- 1           + The mobile station shall initialize CODE\_CHAN\_LIST as described in
- 2           2.6.8.
- 3           + The mobile station shall set FPC\_FCH\_INIT\_SETPT<sub>S</sub> to
- 4           FPC\_FCH\_INIT\_SETPT<sub>R</sub>, FPC\_FCH\_CURR\_SETPT<sub>S</sub> to
- 5           FPC\_FCH\_INIT\_SETPT<sub>S</sub>, FPC\_FCH\_FER<sub>S</sub> to FPC\_FCH\_FER<sub>R</sub>,
- 6           FPC\_FCH\_MIN\_SETPT<sub>S</sub> to FPC\_FCH\_MIN\_SETPT<sub>R</sub>,
- 7           FPC\_FCH\_MAX\_SETPT<sub>S</sub> to FPC\_FCH\_MAX\_SETPT<sub>R</sub>, and
- 8           FPC\_PRI\_CHAN<sub>S</sub> to '0' if the mobile station supports any Radio
- 9           Configuration greater than 2.
- 10          + The mobile station shall set FPC\_SUBCHAN\_GAIN<sub>S</sub> to
- 11          FPC\_SUBCHAN\_GAIN<sub>R</sub>.
- 12          + The mobile station shall set REV\_FCH\_GATING\_MODE<sub>S</sub> to
- 13          REV\_FCH\_GATING\_MODE<sub>R</sub>.
- 14          + The mobile station shall set REV\_PWR\_CNTL\_DELAY<sub>S</sub> to
- 15          REV\_PWR\_CNTL\_DELAY<sub>R</sub> if REV\_PWR\_CNTL\_DELAY\_INCL<sub>R</sub> is equal to
- 16          '1'.
- 17          + The mobile station shall set RL\_GAIN\_ADJ<sub>S</sub> to RL\_GAIN\_ADJ<sub>R</sub>.
- 18          + The mobile station shall set PLCM\_TYPE<sub>S</sub> to PLCM\_TYPE<sub>R</sub> if
- 19          PLCM\_TYPE\_INCL<sub>R</sub> is equal to '1'; otherwise, the mobile station shall set
- 20          PLCM\_TYPE<sub>S</sub> as follows:
  - 21           o If P\_REV\_IN\_USE<sub>S</sub> is less than 11, set PLCM\_TYPE<sub>S</sub> to '0000';
  - 22           otherwise set PLCM\_TYPE<sub>S</sub> to '0100'.
- 23          + The mobile station shall set PLCM\_39<sub>S</sub> to PLCM\_39<sub>R</sub> if PLCM\_TYPE<sub>R</sub> is
- 24          equal to '0001'.
- 25          + If the mobile station is currently monitoring the Paging Channel, the
- 26          mobile station shall set IDLE\_BCCH\_CHAN to '0'; otherwise, the mobile
- 27          station shall set IDLE\_BCCH\_CHAN to '1'. The mobile station shall set
- 28          IDLE\_CDMA\_CHAN to CDMACH<sub>S</sub>, IDLE\_CDMABAND to CDMABAND<sub>S</sub>,
- 29          IDLE\_SID to SID<sub>S</sub>, IDLE\_NID to NID<sub>S</sub>, and IDLE\_P\_REV to P\_REV<sub>S</sub>.
- 30          + The mobile station shall then enter the *Traffic Channel Initialization*
- 31          *Substate* of the *Mobile Station Control on the Traffic Channel State*.
- 32          – If FREQ\_INCL<sub>R</sub> equals '1', the mobile station shall perform the following
- 33          actions:
  - 34           + If the band class is not supported by the mobile station, the mobile
  - 35           station shall send a *Mobile Station Reject Order* with ORDQ field set to
  - 36           '00000110' (capability not supported by the mobile station) and remain
  - 37           in the *Mobile Station Origination Attempt Substate*.
  - 38           + If the band class is supported by the mobile station, the mobile station
  - 39           shall perform the following actions:

- 1           o The mobile station shall store the frame offset ( $FRAME\_OFFSET_S =$   
2            $FRAME\_OFFSET_R$ ); the message encryption mode indicator  
3           ( $ENCRYPT\_MODE_S = ENCRYPT\_MODE_R$ ); the bypass indicator  
4           ( $BYPASS\_ALERT\_ANSWER_S = BYPASS\_ALERT\_ANSWER_R$ ); the  
5           granted mode ( $GRANTED\_MODE_S = GRANTED\_MODE_R$ ); the default  
6           configuration ( $DEFAULT\_CONFIG_S = DEFAULT\_CONFIG_R$ ); the idle  
7           Frequency Assignment ( $IDLE\_CDMA\_CHAN = CDMACH_S$ ); the idle  
8           band class ( $IDLE\_CDMABAND = CDMABAND_S$ ); the band class  
9           ( $CDMABAND_S = BAND\_CLASS_R$ ); the Frequency Assignment  
10          ( $CDMACH_S = CDMA\_FREQ_R$ ); and the occurrences of  $PILOT\_PN$  and  
11           $PWR\_COMB\_IND$  for each included member of the Active Set.
- 12          o The mobile station shall perform the procedures in 2.6.11.2.
- 13          o The mobile station shall set  $SERV\_NEG_S$  to enabled.
- 14          o The mobile station shall initialize  $CODE\_CHAN\_LIST$  as described in  
15          2.6.8.
- 16          o The mobile station shall set  $FPC\_FCH\_INIT\_SETPT_S$  to  
17           $FPC\_FCH\_INIT\_SETPT_R$ ,  $FPC\_FCH\_CURR\_SETPT_S$  to  
18           $FPC\_FCH\_INIT\_SETPT_S$ ,  $FPC\_FCH\_FER_S$  to  $FPC\_FCH\_FER_R$ ,  
19           $FPC\_FCH\_MIN\_SETPT_S$  to  $FPC\_FCH\_MIN\_SETPT_R$ ,  
20           $FPC\_FCH\_MAX\_SETPT_S$  to  $FPC\_FCH\_MAX\_SETPT_R$ , and  
21           $FPC\_PRI\_CHAN_S$  to '0' if the mobile station supports any Radio  
22          Configuration greater than 2.
- 23          o The mobile station shall set  $FPC\_SUBCHAN\_GAIN_S$  to  
24           $FPC\_SUBCHAN\_GAIN_R$ .
- 25          o The mobile station shall set  $RLGAIN\_ADJ_S$  to  $RLGAIN\_ADJ_R$ .
- 26          o The mobile station shall set  $REV\_FCH\_GATING\_MODE_S$  to  
27           $REV\_FCH\_GATING\_MODE_R$ .
- 28          o The mobile station shall set  $REV\_PWR\_CNTL\_DELAY_S$  to  
29           $REV\_PWR\_CNTL\_DELAY_R$  if  $REV\_PWR\_CNTL\_DELAY\_INCL_R$  is equal  
30          to '1'.
- 31          o The mobile station shall set  $PLCM\_TYPE_S$  to  $PLCM\_TYPE_R$  if  
32           $PLCM\_TYPE\_INCL_R$  is equal to '1'; otherwise, the mobile station shall  
33          set  $PLCM\_TYPE_S$  as follows:
  - 34           ◇ If  $P\_REV\_IN\_USE_S$  is less than 11, set  $PLCM\_TYPE_S$  to '0000';
  - 35           otherwise set  $PLCM\_TYPE_S$  to '0100'.
- 36          o The mobile station shall set  $PLCM\_39_S$  to  $PLCM\_39_R$  if  $PLCM\_TYPE_R$   
37          is equal to '0001'.

- o If the mobile station is currently monitoring the Paging Channel, the mobile station shall set IDLE\_BCCH\_CHAN to '0'; otherwise, the mobile station shall set IDLE\_BCCH\_CHAN to '1'. The mobile station shall set IDLE\_SID to SID<sub>s</sub>, IDLE\_NID to NID<sub>s</sub>, IDLE\_P\_REV to P\_REV<sub>s</sub>.
  - o The mobile station shall then tune to the new Frequency Assignment and enter the *Traffic Channel Initialization Substate* of the *Mobile Station Control on the Traffic Channel State*.
- If ASSIGN\_MODE<sub>r</sub> equals '001', the mobile station shall perform the following actions:
  - If FREQ\_INCL<sub>r</sub> equals '0', the mobile station shall perform the following actions:
    - + If the message requires acknowledgment, the mobile station shall wait until Layer 3 receives an indication from Layer 2 that the acknowledgment to the message has been sent and acknowledged.
    - + The mobile station shall set CONFIG\_MSG\_SEQ<sub>s</sub> and ACC\_MSG\_SEQ<sub>s</sub> to NULL (see 2.6.2.2) and shall set PILOT\_PN<sub>s</sub> to the pilot PN sequence offset of the strongest pilot in the list (PILOT\_PN<sub>r</sub>).
    - + If the mobile station has not stored configuration parameters for the Primary Paging Channel of the new base station, or if the stored information is not current (see 2.6.2.2), the mobile station shall set SYS\_PAR\_MSG\_SEQ<sub>s</sub>, NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, EXT\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, GEN\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, CHAN\_LST\_MSG\_SEQ<sub>s</sub>, EXT\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>, FD\_CHAN\_LST\_MSG\_SEQ<sub>s</sub>, EXT\_SYS\_PAR\_MSG\_SEQ<sub>s</sub>, USER\_ZONE\_ID\_MSG\_SEQ<sub>s</sub>, PRI\_NGHBR\_LST\_MSG\_SEQ<sub>s</sub>, GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub>, and EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ<sub>s</sub> to NULL.
    - + The mobile station shall set PAGE\_CHAN<sub>s</sub> to '1' and PAGECH<sub>s</sub> to the Primary Paging Channel. If the mobile station was monitoring Forward Common Control Channel, the mobile station shall set the PRAT<sub>s</sub> to '00'. The mobile station shall then begin monitoring the Primary Paging Channel of the selected base station.
    - + If RESPOND<sub>r</sub> is equal to '1', the mobile station shall perform the following:
      - o If the *Extended Channel Assignment Message* does not require an acknowledgment, the mobile station shall enter the *Update Overhead Information Substate* with an origination indication within T<sub>34m</sub> seconds after receiving the *Extended Channel Assignment Message*.

- o If the *Extended Channel Assignment Message* requires an acknowledgment, the mobile station shall enter the *Update Overhead Information Substate* with an origination indication within  $T_{34m}$  seconds after Layer 3 receives an indication from Layer 2 that the acknowledgment to the *Extended Channel Assignment Message* has been sent and acknowledged.
- If  $FREQ\_INCL_r$  equals '1', the mobile station shall perform the following actions:
  - + If the band class is not supported by the mobile station, the mobile station shall send a *Mobile Station Reject Order* with ORDQ field set to '00000110' (capability not supported by the mobile station) and remain in the *Mobile Station Origination Attempt Substate*.
  - + If the band class is supported by the mobile station, the mobile station shall perform the following actions:
    - o If the message requires acknowledgment, the mobile station shall wait until Layer 3 receives an indication from Layer 2 that the acknowledgment to the message has been sent and acknowledged.
    - o The mobile station shall set  $CDMACH_s$  to  $CDMA\_FREQ_r$  and  $CDMABAND_s$  to  $BAND\_CLASS_r$ . Then the mobile station shall tune to the new Frequency Assignment, measure the strength of each pilot listed in the assignment using the Neighbor Set search procedures specified in 2.6.6.2.1 and 2.6.6.2.2, set  $PILOT\_PN_s$  to the pilot PN sequence offset of the strongest pilot in the list ( $PILOT\_PN_r$ ), and set  $CONFIG\_MSG\_SEQ_s$  and  $ACC\_MSG\_SEQ_s$  to NULL (see 2.6.2.2).
    - o If the mobile station has not stored configuration parameters for the Primary Paging Channel of the new base station, or if the stored information is not current (see 2.6.2.2), the mobile station shall set  $SYS\_PAR\_MSG\_SEQ_s$ ,  $NGHBR\_LST\_MSG\_SEQ_s$ ,  $EXT\_NGHBR\_LST\_MSG\_SEQ_s$ ,  $GEN\_NGHBR\_LST\_MSG\_SEQ_s$ ,  $CHAN\_LST\_MSG\_SEQ_s$ ,  $EXT\_CHAN\_LST\_MSG\_SEQ_s$ ,  $FD\_CHAN\_LST\_MSG\_SEQ_s$ ,  $EXT\_SYS\_PAR\_MSG\_SEQ_s$ ,  $USER\_ZONE\_ID\_MSG\_SEQ_s$ ,  $PRI\_NGHBR\_LST\_MSG\_SEQ_s$ ,  $GLOB\_SERV\_REDIR\_MSG\_SEQ_s$ , and  $EXT\_GLOB\_SERV\_REDIR\_MSG\_SEQ_s$  to NULL.
    - o The mobile station shall set  $PAGE\_CHAN_s$  to '1' and  $PAGECH_s$  to the Primary Paging Channel. If the mobile station was monitoring Forward Common Control Channel, the mobile station shall set the  $PRAT_s$  to '00'. The mobile station shall then begin monitoring the Primary Paging Channel of the selected base station.
    - o If  $RESPOND_r$  is equal to '1', the mobile station shall perform the following:

- 1                   ◇ If the *Extended Channel Assignment Message* does not require an
- 2                   acknowledgment, the mobile station shall enter the *Update*
- 3                   *Overhead Information Substate* with an origination indication
- 4                   within  $T_{34m}$  seconds after receiving the *Extended Channel*
- 5                   *Assignment Message*.
- 6                   ◇ If the *Extended Channel Assignment Message* requires an
- 7                   acknowledgment, the mobile station shall enter the *Update*
- 8                   *Overhead Information Substate* with an origination indication
- 9                   within  $T_{34m}$  seconds after Layer 3 receives an indication from
- 10                  Layer 2 that the acknowledgment to the *Extended Channel*
- 11                  *Assignment Message* has been sent and acknowledged.
- 12                  • If ASSIGN\_MODE<sub>r</sub> equals '100', the mobile station shall perform the following
- 13                  actions:
- 14                  – If PACA<sub>s</sub> is equal to enabled, the mobile station shall set PACA<sub>s</sub> to disabled
- 15                  and PACA\_CANCEL to '0', shall disable the PACA state timer, and should
- 16                  indicate to the user that the PACA call has been canceled.
- 17                  – If GRANTED\_MODE<sub>r</sub> equals '00' and the multiplex option and radio
- 18                  configuration specified in the DEFAULT\_CONFIG<sub>r</sub> field are not supported by
- 19                  the mobile station, the mobile station shall send a *Mobile Station Reject*
- 20                  *Order* with ORDQ field set to '00000110' (capability not supported by the
- 21                  mobile station) and shall remain in the *Mobile Station Origination Attempt*
- 22                  *Substate*.
- 23                  – If GRANTED\_MODE<sub>r</sub> equals '11', P\_REV\_IN\_USE<sub>s</sub> is less than 11, and the
- 24                  mobile station did not include a SYNC\_ID field in the *Origination Message* or
- 25                  the *Reconnect Message* that was transmitted in this substate, the mobile
- 26                  station shall send a *Mobile Station Reject Order* with ORDQ field set to
- 27                  '00000110' (capability not supported by the mobile station) and shall
- 28                  remain in the *Mobile Station Origination Attempt Substate*.
- 29                  – If SYNC\_ID\_INCL<sub>r</sub> is included and equals '1' and the mobile station does not
- 30                  have stored service configuration corresponding to SYNC\_ID<sub>r</sub> for the current
- 31                  SID<sub>s</sub> and NID<sub>s</sub> pair, the mobile station shall send a *Mobile Station Reject*
- 32                  *Order* with ORDQ field set to '00011011' (Requested stored service
- 33                  configuration is not available) and shall remain in the *Mobile Station*
- 34                  *Origination Attempt Substate*.
- 35                  – If GRANTED\_MODE<sub>r</sub> equals '11', SR\_ID\_RESTORE<sub>r</sub> is not equal to '111',
- 36                  and a service option connection record corresponding to SR\_ID\_RESTORE<sub>r</sub>
- 37                  is not contained in the stored service configuration, the mobile station shall
- 38                  send a *Mobile Station Reject Order* with ORDQ field set to '00000110'
- 39                  (capability not supported by the mobile station) and shall remain in the
- 40                  *Mobile Station Origination Attempt Substate*.

- 1           – If GRANTED\_MODE<sub>r</sub> equals '00' and DEFAULT\_CONFIG<sub>r</sub> is not equal to
- 2           '100', the mobile station shall send a *Mobile Station Reject Order* with ORDQ
- 3           field set to '00001110' (RC does not match with DEFAULT\_CONFIG) and
- 4           shall remain in the *Mobile Station Origination Attempt Substate* if one of the
- 5           following conditions is true:
  - 6           + FOR\_RC<sub>r</sub> is not equal to the Radio Configuration associated with
  - 7           DEFAULT\_CONFIG<sub>r</sub> as specified in Table 3.7.2.3.2.21-2.
  - 8           + REV\_RC<sub>r</sub> is not equal to the Radio Configuration associated with
  - 9           DEFAULT\_CONFIG<sub>r</sub> as specified in Table 3.7.2.3.2.21-2.
- 10          – If the mobile station does not support either of the Radio Configurations
- 11          (FOR\_RC or REV\_RC), the mobile station shall send a *Mobile Station Reject*
- 12          *Order* with the ORDQ field set to '00000110' (capability not supported by
- 13          the mobile station) and remain in the *Mobile Station Origination Attempt*
- 14          *Substate*.
- 15          – If CH\_IND<sub>r</sub> = '01' and the mobile station does not support the Fundamental
- 16          Channel, the mobile station shall send a *Mobile Station Reject Order* with
- 17          the ORDQ field set to '00000110' (capability not supported by the mobile
- 18          station) and remain in the *Mobile Station Origination Attempt Substate*.
- 19          – If CH\_IND<sub>r</sub> = '10' and the mobile station does not support the Dedicated
- 20          Control Channel, the mobile station shall send a *Mobile Station Reject Order*
- 21          with the ORDQ field set to '00000110' (capability not supported by the
- 22          mobile station) and remain in the *Mobile Station Origination Attempt*
- 23          *Substate*.
- 24          – If CH\_IND<sub>r</sub> = '11' and the mobile station does not support the Dedicated
- 25          Control Channel and Fundamental Channel concurrently, the mobile
- 26          station shall send a *Mobile Station Reject Order* with the ORDQ field set to
- 27          '00000110' (capability not supported by the mobile station) and remain in
- 28          the *Mobile Station Origination Attempt Substate*.
- 29          – If FREQ\_INCL<sub>r</sub> equals '1' and if the band class (BAND\_CLASS<sub>r</sub>) is not
- 30          supported by the mobile station, the mobile station shall send a *Mobile*
- 31          *Station Reject Order* with ORDQ field set to '00000110' (capability not
- 32          supported by the mobile station) and remain in the *Mobile Station*
- 33          *Origination Attempt Substate*.
- 34          – If PLCM\_TYPE<sub>r</sub> equals '0010' and IMSI\_O is derived from IMSI\_T, or if
- 35          PLCM\_TYPE<sub>r</sub> equals '0011' and IMSI\_O is derived from IMSI\_M, the mobile
- 36          station shall send a *Mobile Station Reject Order* with the ORDQ field set to
- 37          '00011100' (PLCM\_TYPE mismatch) and remain in the *Mobile Station*
- 38          *Origination Attempt Substate*.

- 1           – If FUNDICATED\_BCMC\_IND<sub>r</sub> is included and set to 1, and the mobile  
2           station does not support the BCMC reception on the Forward Fundicated  
3           Channels assigned in this message, the mobile station shall send a *Mobile*  
4           *Station Reject Order* with the ORDQ field set to '00000110' (capability not  
5           supported by the mobile station) and remain in the *Mobile Station*  
6           *Origination Attempt Substate*.
- 7           – If the mobile station does not send a Mobile Station Reject Order as  
8           specified above, it shall continue to perform the actions specified below.
- 9           – The mobile station shall set
  - 10           + IDLE\_CDMABAND = CDMABAND<sub>s</sub>
  - 11           + IDLE\_CDMACH = CDMACH<sub>s</sub>
- 12          – If FREQ\_INCL<sub>r</sub> equals '1', the mobile station shall set
  - 13           + CDMABAND<sub>s</sub> = BAND\_CLASS<sub>r</sub>
  - 14           + CDMACH<sub>s</sub> = CDMA\_FREQ<sub>r</sub>
- 15          – The mobile station shall store the bypass indicator  
16           (BYPASS\_ALERT\_ANSWER<sub>s</sub> = BYPASS\_ALERT\_ANSWER<sub>r</sub>).
- 17          – The mobile station shall store granted mode (GRANTED\_MODE<sub>s</sub> =  
18           GRANTED\_MODE<sub>r</sub>). If GRANTED\_MODE<sub>r</sub> equals '11', the mobile station  
19           shall perform the following:
  - 20           + The mobile station shall store service reference identifier to be restored  
21           (SR\_ID\_RESTORE<sub>s</sub> = SR\_ID\_RESTORE<sub>r</sub>).
  - 22           + If SR\_ID\_RESTORE<sub>r</sub> equals '000', the mobile station shall store bitmap  
23           of service reference identifiers to be restored (SR\_ID\_RESTORE\_BITMAP<sub>s</sub>  
24           = SR\_ID\_RESTORE\_BITMAP<sub>r</sub>).
- 25          – If SYNC\_ID\_INCL<sub>r</sub> is included and equals '1', the mobile station shall store  
26           the service configuration synchronization identifier (SYNC\_ID<sub>s</sub> = SYNC\_ID<sub>r</sub>).
- 27          – The mobile station shall store the default configuration (DEFAULT\_CONFIG<sub>s</sub>  
28           = DEFAULT\_CONFIG<sub>r</sub>).
- 29          – The mobile station shall store the Forward Traffic Channel Radio  
30           Configuration (FOR\_RC<sub>s</sub> = FOR\_RC<sub>r</sub>) and the Reverse Traffic Channel Radio  
31           Configuration (REV\_RC<sub>s</sub> = REV\_RC<sub>r</sub>).
- 32          – The mobile station shall store the frame offset (FRAME\_OFFSET<sub>s</sub> =  
33           FRAME\_OFFSET<sub>r</sub>).
- 34          – The mobile station shall store the message encryption mode indicator  
35           (ENCRYPT\_MODE<sub>s</sub> = ENCRYPT\_MODE<sub>r</sub>).
- 36          – The mobile station shall perform the procedures in 2.6.11.2.
- 37          – The mobile station shall store the Forward power control subchannel  
38           relative gain (FPC\_SUBCHAN\_GAIN<sub>s</sub> = FPC\_SUBCHAN\_GAIN<sub>r</sub>).

- 1           – The mobile station shall set  $RLGAIN\_ADJ_S$  to  $RLGAIN\_ADJ_R$ .
- 2           – The mobile station shall set  $REV\_FCH\_GATING\_MODE_S$  to
- 3            $REV\_FCH\_GATING\_MODE_R$ .
- 4           – The mobile station shall set  $REV\_PWR\_CNTL\_DELAY_S$  to
- 5            $REV\_PWR\_CNTL\_DELAY_R$  if  $REV\_PWR\_CNTL\_DELAY\_INCL_R$  is equal to '1'.
- 6           – If  $3XFL\_1XRL\_INCL_R$  is equal to '1', the mobile station shall set
- 7            $1XRL\_FREQ\_OFFSET_S$  to  $1XRL\_FREQ\_OFFSET_R$ .
- 8           – The mobile station shall set  $PLCM\_TYPE_S$  to  $PLCM\_TYPE_R$  if
- 9            $PLCM\_TYPE\_INCL_R$  is equal to '1'; otherwise, the mobile station shall set
- 10           $PLCM\_TYPE_S$  as follows:
- 11          + If  $P\_REV\_IN\_USE_S$  is less than 11, set  $PLCM\_TYPE_S$  to '0000'; otherwise
- 12          set  $PLCM\_TYPE_S$  to '0100'.
- 13          – The mobile station shall set  $PLCM\_39_S$  to  $PLCM\_39_R$  if  $PLCM\_TYPE_R$  is equal
- 14          to '0001'.
- 15          – The mobile station shall set  $EARLY\_RL\_TRANSMIT\_IND_S$  to
- 16           $EARLY\_RL\_TRANSMIT\_IND_R$ .
- 17          – If  $FIXED\_PREAMBLE\_TRANSMIT\_IND_R$  is included, the mobile station shall
- 18          set  $FIXED\_PREAMBLE\_TRANSMIT\_IND_S$  to
- 19           $FIXED\_PREAMBLE\_TRANSMIT\_IND_R$ ; otherwise, the mobile station shall set
- 20           $FIXED\_PREAMBLE\_TRANSMIT\_IND_S$  to '0'. If
- 21           $FIXED\_PREAMBLE\_TRANSMIT\_IND_S$  equals '1', the mobile station shall set
- 22           $FIXED\_NUM\_PREAMBLE_S$  to  $FIXED\_NUM\_PREAMBLE_R$ .
- 23          – If  $TX\_PWR\_LIMIT\_INCL_R$  is set to '1', the mobile station shall perform the
- 24          following:
- 25          + If the mobile station is being assigned to operate in the 1915MHz –
- 26          1920MHz block of the PCS band, the mobile station shall store the
- 27          transmit power limit  $TX\_PWR\_LIMIT_S = (TX\_PWR\_LIMIT_R - 30dB)$ ;
- 28          + Otherwise, the mobile station shall set  $TX\_PWR\_LIMIT_S$  to the limit
- 29          defined in [11] for the target base station.
- 30          – The mobile station shall store the channel indicator ( $CH\_IND_S = CH\_IND_R$ )
- 31          and the mobile station shall perform the following actions:
- 32          + If  $CH\_IND_R$  equals '01', the mobile station shall set
- 33           $FPC\_FCH\_INIT\_SETPT_S$  to  $FPC\_FCH\_INIT\_SETPT_R$ ,
- 34           $FPC\_FCH\_CURR\_SETPT_S$  to  $FPC\_FCH\_INIT\_SETPT_S$ ,  $FPC\_FCH\_FER_S$  to
- 35           $FPC\_FCH\_FER_R$ ,  $FPC\_FCH\_MIN\_SETPT_S$  to  $FPC\_FCH\_MIN\_SETPT_R$ ,
- 36           $FPC\_FCH\_MAX\_SETPT_S$  to  $FPC\_FCH\_MAX\_SETPT_R$ , and
- 37           $FPC\_PRI\_CHAN_S$  to '0' if the mobile station supports any Radio
- 38          Configuration greater than 2. Then for each included member of the
- 39          Active Set, the mobile station shall store the following:
- 40          o Set the  $PILOT\_PN$  field to  $PILOT\_PN_R$ .

- 1                   o Set the ADD\_PILOT\_REC\_INCL field to ADD\_PILOT\_REC\_INCL<sub>r</sub>. If
- 2                   ADD\_PILOT\_REC\_INCL<sub>r</sub> equals '1', the mobile station shall store the
- 3                   following:
- 4                   ◇ Set the PILOT\_REC\_TYPE field of PILOT\_REC to
- 5                   PILOT\_REC\_TYPE<sub>r</sub>.
- 6                   ◇ If PILOT\_REC\_TYPE<sub>r</sub> equals '000', the mobile station shall set the
- 7                   TD\_POWER\_LEVEL field of PILOT\_REC to TD\_POWER\_LEVEL<sub>r</sub>
- 8                   and set the TD\_MODE field of PILOT\_REC to TD\_MODE<sub>r</sub>.
- 9                   ◇ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '001', the mobile station shall
- 10                  – Set the AUX\_PILOT\_QOF field of PILOT\_REC to QOF<sub>r</sub>.
- 11                  – Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to
- 12                  AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by
- 13                  WALSH\_LENGTH<sub>r</sub>.
- 14                  ◇ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '010', the mobile station shall:
- 15                  – Set the AUX\_PILOT\_TD\_QOF field of PILOT\_REC to QOF<sub>r</sub>.
- 16                  – Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to
- 17                  AUX\_WALSH<sub>r</sub> with the Walsh Code length specified by
- 18                  WALSH\_LENGTH<sub>r</sub>.
- 19                  – Set the AUX\_TD\_POWER\_LEVEL field of PILOT\_REC to
- 20                  AUX\_TD\_POWER\_LEVEL<sub>r</sub>.
- 21                  – Set the TD\_MODE field of PILOT\_REC to TD\_MODE<sub>r</sub>.
- 22                  ◇ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '011', the mobile station shall:
- 23                  – Set the SR3\_PRIMARY\_PILOT field of PILOT\_REC to
- 24                  SR3\_PRIMARY\_PILOT<sub>r</sub>.
- 25                  – Set the SR3\_PILOT\_POWER1 field of PILOT\_REC to
- 26                  SR3\_PILOT\_POWER1<sub>r</sub>.
- 27                  – Set the SR3\_PILOT\_POWER2 field of PILOT\_REC to
- 28                  SR3\_PILOT\_POWER2<sub>r</sub>.
- 29                  ◇ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '100', the mobile station shall:
- 30                  – Set the SR3\_PRIMARY\_PILOT field of PILOT\_REC to
- 31                  SR3\_PRIMARY\_PILOT<sub>r</sub>.
- 32                  – Set the SR3\_PILOT\_POWER1 field of PILOT\_REC to
- 33                  SR3\_PILOT\_POWER1<sub>r</sub>.
- 34                  – Set the SR3\_PILOT\_POWER2 field of PILOT\_REC to
- 35                  SR3\_PILOT\_POWER2<sub>r</sub>.
- 36                  – Set the AUX\_PILOT\_QOF field of PILOT\_REC to QOF<sub>r</sub>.

- 1                                   – Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to
- 2                                   AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by
- 3                                   WALSH\_LENGTH<sub>r</sub>.
- 4                                   – If ADD\_INFO\_INCL1<sub>r</sub> is equal to '1', set the AUX\_PILOT\_QOF1
- 5                                   field of PILOT\_REC to QOF1<sub>r</sub> and set the
- 6                                   AUX\_PILOT\_WALSH\_CODE1 field of PILOT\_REC to
- 7                                   AUX\_PILOT\_WALSH1<sub>r</sub> with the Walsh Code length specified
- 8                                   by WALSH\_LENGTH1<sub>r</sub>; otherwise, set the AUX\_PILOT\_QOF1
- 9                                   field of PILOT\_REC to QOF<sub>r</sub> and set the
- 10                                  AUX\_PILOT\_WALSH\_CODE1 field of PILOT\_REC to
- 11                                  AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by
- 12                                  WALSH\_LENGTH<sub>r</sub>.
- 13                                  – If ADD\_INFO\_INCL2<sub>r</sub> is equal to '1', set the AUX\_PILOT\_QOF2
- 14                                  field of PILOT\_REC to QOF2<sub>r</sub> and set the
- 15                                  AUX\_PILOT\_WALSH\_CODE2 field of PILOT\_REC to
- 16                                  AUX\_PILOT\_WALSH2<sub>r</sub> with the Walsh Code length specified
- 17                                  by WALSH\_LENGTH2<sub>r</sub>; otherwise, set the AUX\_PILOT\_QOF2
- 18                                  field of PILOT\_REC to QOF<sub>r</sub> and set the
- 19                                  AUX\_PILOT\_WALSH\_CODE2 field of PILOT\_REC to
- 20                                  AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by
- 21                                  WALSH\_LENGTH<sub>r</sub>.
- 22                                  o Set the PWR\_COMB\_IND field to PWR\_COMB\_IND<sub>r</sub>.
- 23                                  o Set the CODE\_CHAN\_FCH field to CODE\_CHAN\_FCH<sub>r</sub>.
- 24                                  o Set the QOF\_MASK\_ID\_FCH field to QOF\_MASK\_ID\_FCH<sub>r</sub>.
- 25                                  + If CH\_IND<sub>r</sub> equals '01' and 3X\_FCH\_INFO\_INCL<sub>r</sub> equals '1', for each
- 26                                  included member of the Active Set, the mobile station store the
- 27                                  following:
- 28                                  o If 3X\_FCH\_LOW\_INCL<sub>r</sub> equals '1', set the QOF\_MASK\_ID\_FCH\_LOW
- 29                                  field to QOF\_MASK\_ID\_FCH\_LOW<sub>r</sub> and the CODE\_CHAN\_FCH\_LOW
- 30                                  field to CODE\_CHAN\_FCH\_LOW<sub>r</sub>. Otherwise, set the
- 31                                  QOF\_MASK\_ID\_FCH\_LOW field to QOF\_MASK\_ID\_FCH<sub>r</sub> and the
- 32                                  CODE\_CHAN\_FCH\_LOW to CODE\_CHAN\_FCH<sub>r</sub>.
- 33                                  o If 3X\_FCH\_HIGH\_INCL<sub>r</sub> equals '1', set the
- 34                                  QOF\_MASK\_ID\_FCH\_HIGH field to QOF\_MASK\_ID\_FCH\_HIGH<sub>r</sub> and
- 35                                  the CODE\_CHAN\_FCH\_HIGH field to CODE\_CHAN\_FCH\_HIGH<sub>r</sub>.
- 36                                  Otherwise, set the QOF\_MASK\_ID\_FCH\_HIGH field to
- 37                                  QOF\_MASK\_ID\_FCH<sub>r</sub> and the CODE\_CHAN\_FCH\_HIGH to
- 38                                  CODE\_CHAN\_FCH<sub>r</sub>.

- 1                   + If CH\_IND<sub>r</sub> equals '10', the mobile station shall set  
2                   FPC\_DCCH\_INIT\_SETPT<sub>s</sub> to FPC\_DCCH\_INIT\_SETPT<sub>r</sub>,  
3                   FPC\_DCCH\_CURR\_SETPT<sub>s</sub> to FPC\_DCCH\_INIT\_SETPT<sub>s</sub>,  
4                   FPC\_DCCH\_FER<sub>s</sub> to FPC\_DCCH\_FER<sub>r</sub>, FPC\_DCCH\_MIN\_SETPT<sub>s</sub> to  
5                   FPC\_DCCH\_MIN\_SETPT<sub>r</sub>, FPC\_DCCH\_MAX\_SETPT<sub>s</sub> to  
6                   FPC\_DCCH\_MAX\_SETPT<sub>r</sub>, FUNDICATED\_BCMC\_IND<sub>s</sub> to  
7                   FUNDICATED\_BCMC\_IND<sub>r</sub>, and FPC\_PRI\_CHAN<sub>s</sub> to '1' if the mobile  
8                   station supports any Radio Configuration greater than 2. Then for each  
9                   included member of the Active Set, the mobile station shall store the  
10                  following:
- 11                 o Set the PILOT\_PN to PILOT\_PN<sub>r</sub>.
- 12                 o Set the ADD\_PILOT\_REC\_INCL field to ADD\_PILOT\_REC\_INCL. If  
13                   ADD\_PILOT\_REC\_INCL is equal to '1', the mobile station shall store  
14                   the following:
- 15                     ◇ Set the PILOT\_REC\_TYPE field of PILOT\_REC to  
16                     PILOT\_REC\_TYPE<sub>r</sub>.
- 17                     ◇ If PILOT\_REC\_TYPE<sub>r</sub> equals '000', the mobile station shall set the  
18                     TD\_POWER\_LEVEL field of PILOT\_REC to TD\_POWER\_LEVEL<sub>r</sub>  
19                     and set the TD\_MODE field of PILOT\_REC to TD\_MODE<sub>r</sub>.
- 20                     ◇ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '001', the mobile station shall
- 21                         – Set the AUX\_PILOT\_QOF field of PILOT\_REC to QOF<sub>r</sub>.
- 22                         – Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to  
23                         AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by  
24                         WALSH\_LENGTH<sub>r</sub>.
- 25                     ◇ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '010', the mobile station shall:
- 26                         – Set the AUX\_PILOT\_TD\_QOF field of PILOT\_REC to QOF<sub>r</sub>.
- 27                         – Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to  
28                         AUX\_WALSH<sub>r</sub> with the Walsh Code length specified by  
29                         WALSH\_LENGTH<sub>r</sub>.
- 30                         – Set the AUX\_TD\_POWER\_LEVEL field of PILOT\_REC to  
31                         AUX\_TD\_POWER\_LEVEL<sub>r</sub>.
- 32                         – Set the TD\_MODE field of PILOT\_REC to TD\_MODE<sub>r</sub>.
- 33                     ◇ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '011', the mobile station shall:
- 34                         – Set the SR3\_PRIMARY\_PILOT field of PILOT\_REC to  
35                         SR3\_PRIMARY\_PILOT<sub>r</sub>.
- 36                         – Set the SR3\_PILOT\_POWER1 field of PILOT\_REC to  
37                         SR3\_PILOT\_POWER1<sub>r</sub>.
- 38                         – Set the SR3\_PILOT\_POWER2 field of PILOT\_REC to  
39                         SR3\_PILOT\_POWER2<sub>r</sub>.

- 1                   ◇ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '100', the mobile station shall:
- 2                   – Set the SR3\_PRIMARY\_PILOT field of PILOT\_REC to
- 3                   SR3\_PRIMARY\_PILOT<sub>r</sub>.
- 4                   – Set the SR3\_PILOT\_POWER1 field of PILOT\_REC to
- 5                   SR3\_PILOT\_POWER1<sub>r</sub>.
- 6                   – Set the SR3\_PILOT\_POWER2 field of PILOT\_REC to
- 7                   SR3\_PILOT\_POWER2<sub>r</sub>.
- 8                   – Set the AUX\_PILOT\_QOF field of PILOT\_REC to QOF<sub>r</sub>.
- 9                   – Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to
- 10                  AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by
- 11                  WALSH\_LENGTH<sub>r</sub>.
- 12                  – If ADD\_INFO\_INCL1<sub>r</sub> is equal to '1', set the AUX\_PILOT\_QOF1
- 13                  field of PILOT\_REC to QOF1<sub>r</sub> and set the
- 14                  AUX\_PILOT\_WALSH\_CODE1 field of PILOT\_REC to
- 15                  AUX\_PILOT\_WALSH1<sub>r</sub> with the Walsh Code length specified
- 16                  by WALSH\_LENGTH1<sub>r</sub>; otherwise, set the AUX\_PILOT\_QOF1
- 17                  field of PILOT\_REC to QOF<sub>r</sub> and set the
- 18                  AUX\_PILOT\_WALSH\_CODE1 field of PILOT\_REC to
- 19                  AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by
- 20                  WALSH\_LENGTH<sub>r</sub>.
- 21                  – If ADD\_INFO\_INCL2<sub>r</sub> is equal to '1', set the AUX\_PILOT\_QOF2
- 22                  field of PILOT\_REC to QOF2<sub>r</sub> and set the
- 23                  AUX\_PILOT\_WALSH\_CODE2 field of PILOT\_REC to
- 24                  AUX\_PILOT\_WALSH2<sub>r</sub> with the Walsh Code length specified
- 25                  by WALSH\_LENGTH2<sub>r</sub>; otherwise, set the AUX\_PILOT\_QOF2
- 26                  field of PILOT\_REC to QOF<sub>r</sub> and set the
- 27                  AUX\_PILOT\_WALSH\_CODE2 field of PILOT\_REC to
- 28                  AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by
- 29                  WALSH\_LENGTH<sub>r</sub>.
- 30                  ○ Set the PWR\_COMB\_IND field to PWR\_COMB\_IND<sub>r</sub>.
- 31                  ○ Set the CODE\_CHAN\_FCH field to CODE\_CHAN\_FCH<sub>r</sub>.
- 32                  ○ Set the QOF\_MASK\_ID\_FCH field to QOF\_MASK\_ID\_FCH<sub>r</sub>.
- 33                  ○ Set the DCCH\_INCL field to DCCH\_INCL<sub>r</sub>. If DCCH\_INCL<sub>r</sub> equals '1',
- 34                  the mobile station shall store the following:
- 35                   ◇ Set the CODE\_CHAN\_DCCH field to CODE\_CHAN\_DCCH<sub>r</sub>.
- 36                   ◇ Set the QOF\_MASK\_ID\_DCCH field to QOF\_MASK\_ID\_DCCH<sub>r</sub>.
- 37                  + If CH\_IND<sub>r</sub> equals '10' and 3X\_DCCH\_INFO\_INCL<sub>r</sub> equals '1', for each
- 38                  included member of the Active Set, the mobile station shall store the
- 39                  following:

- 1                   o If 3X\_DCCH\_LOW\_INCL<sub>r</sub> equals '1', set the
- 2                   QOF\_MASK\_ID\_DCCH\_LOW field to QOF\_MASK\_ID\_DCCH\_LOW<sub>r</sub>
- 3                   and the CODE\_CHAN\_DCCH\_LOW field to
- 4                   CODE\_CHAN\_DCCH\_LOW<sub>r</sub>. Otherwise, set the
- 5                   QOF\_MASK\_ID\_DCCH\_LOW field to QOF\_MASK\_ID\_FCH<sub>r</sub> and the
- 6                   CODE\_CHAN\_DCCH\_LOW to CODE\_CHAN\_FCH<sub>r</sub>.
- 7                   o If 3X\_DCCH\_HIGH\_INCL<sub>r</sub> equals '1', set the
- 8                   QOF\_MASK\_ID\_DCCH\_HIGH field to QOF\_MASK\_ID\_DCCH\_HIGH<sub>r</sub>,
- 9                   and the CODE\_CHAN\_DCCH\_HIGH field to
- 10                  CODE\_CHAN\_DCCH\_HIGH<sub>r</sub>. Otherwise, set the
- 11                  QOF\_MASK\_ID\_DCCH\_HIGH field to QOF\_MASK\_ID\_FCH<sub>r</sub> and the
- 12                  CODE\_CHAN\_DCCH\_HIGH to CODE\_CHAN\_FCH<sub>r</sub>.
- 13           + If CH\_IND<sub>r</sub> equals '10', and FUNDICATED\_BCMC\_IND<sub>r</sub> equals '1', for
- 14           each included member of the Active Set, the mobile station shall store
- 15           the following:
- 16           o Set FOR\_CPCCH\_WALSH<sub>s</sub> to FOR\_CPCCH\_WALSH<sub>r</sub>.
- 17           o Set FOR\_CPCSCH<sub>s</sub> to FOR\_CPCSCH<sub>r</sub>.
- 18           + If CH\_IND<sub>r</sub> equals '11', the mobile station shall set
- 19           FPC\_FCCH\_INIT\_SETPT<sub>s</sub> to FPC\_FCH\_INIT\_SETPT<sub>r</sub>,
- 20           FPC\_FCH\_CURR\_SETPT<sub>s</sub> to FPC\_FCH\_INIT\_SETPT<sub>s</sub>, FPC\_FCH\_FER<sub>s</sub> to
- 21           FPC\_FCH\_FER<sub>r</sub>, FPC\_FCH\_MIN\_SETPT<sub>s</sub> to FPC\_FCH\_MIN\_SETPT<sub>r</sub>,
- 22           FPC\_FCH\_MAX\_SETPT<sub>s</sub> to FPC\_FCH\_MAX\_SETPT<sub>r</sub>,
- 23           FPC\_DCCH\_INIT\_SETPT<sub>s</sub> to FPC\_DCCH\_INIT\_SETPT<sub>r</sub>,
- 24           FPC\_DCCH\_CURR\_SETPT<sub>s</sub> to FPC\_DCCH\_INIT\_SETPT<sub>s</sub>,
- 25           FPC\_DCCH\_FER<sub>s</sub> to FPC\_DCCH\_FER<sub>r</sub>, FPC\_DCCH\_MIN\_SETPT<sub>s</sub> to
- 26           FPC\_DCCH\_MIN\_SETPT<sub>r</sub>, FPC\_DCCH\_MAX\_SETPT<sub>s</sub> to
- 27           FPC\_DCCH\_MAX\_SETPT<sub>r</sub>, FPC\_PRI\_CHAN<sub>s</sub> to FPC\_PRI\_CHAN<sub>r</sub>, and
- 28           FUNDICATED\_BCMC\_IND<sub>s</sub> to FUNDICATED\_BCMC\_IND<sub>r</sub>. Then for
- 29           each included member of the Active Set, the mobile station shall store
- 30           the following:
- 31           o Set the PILOT\_PN to PILOT\_PN<sub>r</sub>.
- 32           o Set the ADD\_PILOT\_REC\_INCL field to ADD\_PILOT\_REC. If
- 33           ADD\_PILOT\_REC\_INCL is equal to '1', the mobile station shall store
- 34           the following:
- 35           ◇ Set the PILOT\_REC\_TYPE field of PILOT\_REC to
- 36           PILOT\_REC\_TYPE<sub>r</sub>.
- 37           ◇ If PILOT\_REC\_TYPE<sub>r</sub> equals '000', the mobile station shall set the
- 38           TD\_POWER\_LEVEL field of PILOT\_REC to TD\_POWER\_LEVEL<sub>r</sub>
- 39           and set the TD\_MODE field of PILOT\_REC to TD\_MODE<sub>r</sub>.
- 40           ◇ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '001', the mobile station shall
- 41           – Set the AUX\_PILOT\_QOF field of PILOT\_REC to QOF<sub>r</sub>.

- 1                   – Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to
- 2                   AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by
- 3                   WALSH\_LENGTH<sub>r</sub>.
- 4           ◇ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '010', the mobile station shall:
- 5                   – Set the AUX\_PILOT\_TD\_QOF field of PILOT\_REC to QOF<sub>r</sub>.
- 6                   – Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to
- 7                   AUX\_WALSH<sub>r</sub> with the Walsh Code length specified by
- 8                   WALSH\_LENGTH<sub>r</sub>.
- 9                   – Set the AUX\_TD\_POWER\_LEVEL field of PILOT\_REC to
- 10                  AUX\_TD\_POWER\_LEVEL<sub>r</sub>.
- 11                  – Set the TD\_MODE field of PILOT\_REC to TD\_MODE<sub>r</sub>.
- 12           ◇ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '011', the mobile station shall:
- 13                   – Set the SR3\_PRIMARY\_PILOT field of PILOT\_REC to
- 14                   SR3\_PRIMARY\_PILOT<sub>r</sub>.
- 15                   – Set the SR3\_PILOT\_POWER1 field of PILOT\_REC to
- 16                   SR3\_PILOT\_POWER1<sub>r</sub>.
- 17                   – Set the SR3\_PILOT\_POWER2 field of PILOT\_REC to
- 18                   SR3\_PILOT\_POWER2<sub>r</sub>.
- 19           ◇ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '100', the mobile station shall:
- 20                   – Set the SR3\_PRIMARY\_PILOT field of PILOT\_REC to
- 21                   SR3\_PRIMARY\_PILOT<sub>r</sub>.
- 22                   – Set the SR3\_PILOT\_POWER1 field of PILOT\_REC to
- 23                   SR3\_PILOT\_POWER1<sub>r</sub>.
- 24                   – Set the SR3\_PILOT\_POWER2 field of PILOT\_REC to
- 25                   SR3\_PILOT\_POWER2<sub>r</sub>.
- 26                   – Set the AUX\_PILOT\_QOF field of PILOT\_REC to QOF<sub>r</sub>.
- 27                   – Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to
- 28                   AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by
- 29                   WALSH\_LENGTH<sub>r</sub>.
- 30                   – If ADD\_INFO\_INCL1<sub>r</sub> is equal to '1', set the AUX\_PILOT\_QOF1
- 31                   field of PILOT\_REC to QOF1<sub>r</sub> and set the
- 32                   AUX\_PILOT\_WALSH\_CODE1 field of PILOT\_REC to
- 33                   AUX\_PILOT\_WALSH1<sub>r</sub> with the Walsh Code length specified
- 34                   by WALSH\_LENGTH1<sub>r</sub>; otherwise, set the AUX\_PILOT\_QOF1
- 35                   field of PILOT\_REC to QOF<sub>r</sub> and set the
- 36                   AUX\_PILOT\_WALSH\_CODE1 field of PILOT\_REC to
- 37                   AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by
- 38                   WALSH\_LENGTH<sub>r</sub>.

- If ADD\_INFO\_INCL<sub>2r</sub> is equal to '1', set the AUX\_PILOT\_QOF2 field of PILOT\_REC to QOF<sub>2r</sub> and set the AUX\_PILOT\_WALSH\_CODE2 field of PILOT\_REC to AUX\_PILOT\_WALSH<sub>2r</sub> with the Walsh Code length specified by WALSH\_LENGTH<sub>2r</sub>; otherwise, set the AUX\_PILOT\_QOF2 field of PILOT\_REC to QOF<sub>r</sub> and set the AUX\_PILOT\_WALSH\_CODE2 field of PILOT\_REC to AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by WALSH\_LENGTH<sub>r</sub>.
  - o Set the PWR\_COMB\_IND field to PWR\_COMB\_IND<sub>r</sub>.
  - o Set the CODE\_CHAN\_FCH field to CODE\_CHAN\_FCH<sub>r</sub>.
  - o Set the QOF\_MASK\_ID\_FCH field to QOF\_MASK\_ID\_FCH<sub>r</sub>.
  - o Set the CODE\_CHAN\_DCCH field to CODE\_CHAN\_DCCH<sub>r</sub>.
  - o Set the QOF\_MASK\_ID\_DCCH field to QOF\_MASK\_ID\_DCCH<sub>r</sub>.
  - + If CH\_IND<sub>r</sub> equals '11' and 3X\_FCH\_INFO\_INCL<sub>r</sub> equals '1', for each included member of the Active Set, the mobile station store the following:
    - o If 3X\_FCH\_LOW\_INCL<sub>r</sub> equals '1', set the QOF\_MASK\_ID\_FCH\_LOW field to QOF\_MASK\_ID\_FCH\_LOW<sub>r</sub> and the CODE\_CHAN\_FCH\_LOW field to CODE\_CHAN\_FCH\_LOW<sub>r</sub>. Otherwise, set the QOF\_MASK\_ID\_FCH\_LOW field to QOF\_MASK\_ID\_FCH<sub>r</sub> and the CODE\_CHAN\_FCH\_LOW to CODE\_CHAN\_FCH<sub>r</sub>.
    - o If 3X\_FCH\_HIGH\_INCL<sub>r</sub> equals '1', set the QOF\_MASK\_ID\_FCH\_HIGH field to QOF\_MASK\_ID\_FCH\_HIGH<sub>r</sub> and the CODE\_CHAN\_FCH\_HIGH field to CODE\_CHAN\_FCH\_HIGH<sub>r</sub>. Otherwise, set the QOF\_MASK\_ID\_FCH\_HIGH field to QOF\_MASK\_ID\_FCH<sub>r</sub> and the CODE\_CHAN\_FCH\_HIGH to CODE\_CHAN\_FCH<sub>r</sub>.
  - + If CH\_IND<sub>r</sub> equals '11' and FUNDICATED\_BCNC\_IND<sub>r</sub> equals '1', the mobile station shall:
    - o Set REV\_FCH\_ASSIGNED<sub>s</sub> to REV\_FCH\_ASSIGNED<sub>r</sub>.
  - + If CH\_IND<sub>r</sub> equals '11' and FUNDICATED\_BCNC\_IND<sub>r</sub> equals '1', the mobile station shall set FCH\_BCNC\_IND to '1'; otherwise, the mobile station shall set FCH\_BCNC\_IND to '0'.
  - + If CH\_IND<sub>r</sub> equals '11', FUNDICATED\_BCNC\_IND<sub>r</sub> equals '1', and FOR\_CPCCH\_INFO\_INCL<sub>r</sub> is included and is set to '1', for each included member of the Active Set, the mobile station shall store the following:
    - o Set FOR\_CPCCH\_WALSH<sub>s</sub> to FOR\_CPCCH\_WALSH<sub>r</sub>.
    - o Set FOR\_CPCSCH<sub>s</sub> to FOR\_CPCSCH<sub>r</sub>.

- 1                   + If CH\_IND<sub>r</sub> equals '11', FUNDICATED\_BCMC\_IND<sub>r</sub> equals '1', and  
2                   ADD\_PLCM\_FOR\_FCH\_INCL<sub>r</sub> is included and is set to '1', the mobile  
3                   station shall store the following:  
4                   o Set ADD\_PLCM\_FOR\_FCH\_TYPE<sub>s</sub> to ADD\_PLCM\_FOR\_FCH\_TYPE<sub>r</sub>.  
5                   o Set ADD\_PLCM\_FOR\_FCH\_39<sub>s</sub> to ADD\_PLCM\_FOR\_FCH\_39<sub>r</sub> if  
6                   ADD\_PLCM\_FOR\_FCH\_TYPE<sub>r</sub> is equal to '1'.  
7                   + If CH\_IND<sub>r</sub> equals '11' and 3X\_DCCH\_INFO\_INCL<sub>r</sub> equals '1', for each  
8                   included member of the Active Set, the mobile station store the  
9                   following:  
10                  o If 3X\_DCCH\_LOW\_INCL<sub>r</sub> equals '1', set the  
11                  QOF\_MASK\_ID\_DCCH\_LOW field to QOF\_MASK\_ID\_DCCH\_LOW<sub>r</sub>  
12                  and the CODE\_CHAN\_DCCH\_LOW field to  
13                  CODE\_CHAN\_DCCH\_LOW<sub>r</sub>. Otherwise, set the  
14                  QOF\_MASK\_ID\_DCCH\_LOW field to QOF\_MASK\_ID\_FCH<sub>r</sub> and the  
15                  CODE\_CHAN\_DCCH\_LOW to CODE\_CHAN\_FCH<sub>r</sub>.  
16                  o If 3X\_DCCH\_HIGH\_INCL<sub>r</sub> equals '1', set the  
17                  QOF\_MASK\_ID\_DCCH\_HIGH field to QOF\_MASK\_ID\_DCCH\_HIGH<sub>r</sub>  
18                  and the CODE\_CHAN\_DCCH\_HIGH field to  
19                  CODE\_CHAN\_DCCH\_HIGH<sub>r</sub>. Otherwise, set the  
20                  QOF\_MASK\_ID\_DCCH\_HIGH field to QOF\_MASK\_ID\_FCH<sub>r</sub> and the  
21                  CODE\_CHAN\_DCCH\_HIGH to CODE\_CHAN\_FCH<sub>r</sub>.  
22                  – The mobile station shall initialize CODE\_CHAN\_LIST as described in 2.6.8,  
23                  and shall set SERV\_NEG<sub>s</sub> to enabled.  
24                  – If the mobile station is currently monitoring the Paging Channel, the mobile  
25                  station shall set IDLE\_BCCH\_CHAN to '0'; otherwise, the mobile station  
26                  shall set IDLE\_BCCH\_CHAN to '1'. The mobile station shall set IDLE\_SID to  
27                  SID<sub>s</sub>, IDLE\_NID to NID<sub>s</sub>, and IDLE\_P\_REV to P\_REV<sub>s</sub>.  
28                  – If FREQ\_INCL<sub>r</sub> equals '1', the mobile station shall then tune to the new  
29                  frequency assignment.  
30                  – The mobile station shall then enter the *Traffic Channel Initialization*  
31                  *Substate of the Mobile Station Control on the Traffic Channel State*.  
32                  • If ASSIGN\_MODE<sub>r</sub> equals '101', the mobile station shall perform the following  
33                  actions:  
34                  – If PACA<sub>s</sub> is equal to enabled, the mobile station shall set PACA<sub>s</sub> to disabled and  
35                  PACA\_CANCEL to '0', shall disable the PACA state timer, and should indicate to  
36                  the user that the PACA call has been canceled.

- 1       – If GRANTED\_MODE<sub>r</sub> equals '11', P\_REV\_IN\_USE<sub>s</sub> is less than 11, and the  
2       mobile station did not include a SYNC\_ID field in the *Origination Message* or the  
3       *Reconnect Message* that was transmitted in this substate, the mobile station  
4       shall send a *Mobile Station Reject Order* with ORDQ field set to '00000110'  
5       (capability not supported by the mobile station) and shall remain in the *Mobile*  
6       *Station Origination Attempt Substate*.
- 7       – If SYNC\_ID\_INCL<sub>r</sub> is included and equals '1' and the mobile station does not  
8       have stored service configuration corresponding to SYNC\_ID<sub>r</sub> for the current  
9       SID<sub>s</sub> and NID<sub>s</sub> pair, the mobile station shall send a *Mobile Station Reject Order*  
10      with ORDQ field set to '00011011' (Requested stored service configuration is  
11      not available) and shall remain in the *Mobile Station Origination Attempt*  
12      *Substate*.
- 13      – If GRANTED\_MODE<sub>r</sub> equals '11', SR\_ID\_RESTORE<sub>r</sub> is not equal to '111', and a  
14      service option connection record corresponding to SR\_ID\_RESTORE<sub>r</sub> is not  
15      contained in the stored service configuration, the mobile station shall send a  
16      *Mobile Station Reject Order* with ORDQ field set to '00000110' (capability not  
17      supported by the mobile station) and shall remain in the *Mobile Station*  
18      *Origination Attempt Substate*.
- 19      – If the mobile station does not support any of the specified Radio Configurations  
20      (FOR\_PDCH\_RC, FOR\_FCH\_DCCH\_RC or REV\_FCH\_DCCH\_RC), the mobile  
21      station shall send a *Mobile Station Reject Order* with the ORDQ field set to  
22      '00000110' (capability not supported by the mobile station) and remain in the  
23      *Mobile Station Origination Attempt Substate*.
- 24      – If EXT\_CH\_IND<sub>r</sub> signals the allocation of a F-FCH or R-FCH and the mobile  
25      station does not support Fundamental Channel, the mobile station shall send a  
26      *Mobile Station Reject Order* with the ORDQ field set to '00000110' (capability not  
27      supported by the mobile station) and remain in the *Mobile Station Origination*  
28      *Attempt Substate*.
- 29      – If EXT\_CH\_IND<sub>r</sub> signals the allocation of a F-DCCH or R-DCCH and the mobile  
30      station does not support the Dedicated Control Channel, the mobile station  
31      shall send a *Mobile Station Reject Order* with the ORDQ field set to '00000110'  
32      (capability not supported by the mobile station) and remain in the *Mobile*  
33      *Station Origination Attempt Substate*.
- 34      – If FREQ\_INCL<sub>r</sub> equals '1' and if the band class (BAND\_CLASS<sub>r</sub>) is not supported  
35      by the mobile station, the mobile station shall send a *Mobile Station Reject*  
36      *Order* with ORDQ field set to '00000110' (capability not supported by the mobile  
37      station) and remain in the *Mobile Station Origination Attempt Substate*.
- 38      – If PLCM\_TYPE<sub>r</sub> equals '0010' and IMSI\_O is derived from IMSI\_T, or if  
39      PLCM\_TYPE<sub>r</sub> equals '0011' and IMSI\_O is derived from IMSI\_M, the mobile  
40      station shall send a *Mobile Station Reject Order* with the ORDQ field set to  
41      '00011100' (PLCM\_TYPE mismatch) and remain in the *Mobile Station Origination*  
42      *Attempt Substate*.

- 1       – If FUNDICATED\_BCNC\_IND<sub>r</sub> is included and set to 1, and the mobile station  
2       does not support BCNC reception on the Forward Fundicated Channels  
3       assigned in this message, the mobile station shall send a *Mobile Station Reject*  
4       *Order* with the ORDQ field set to '00000110' (capability not supported by the  
5       mobile station) and remain in the *Mobile Station Origination Attempt Substate*.
- 6       – If the mobile station does not send a *Mobile Station Reject Order* as specified  
7       above, it shall continue to perform the actions specified below.
- 8       – Layer 3 shall send SIG-HandoffPDCH.Indication (handoff\_type = ASSIGN) to the  
9       MAC layer.
- 10      – If FREQ\_INCL<sub>r</sub> equals '1', the mobile station shall set  
11          + CDMABAND<sub>s</sub> = BAND\_CLASS<sub>r</sub>  
12          + CDMACH<sub>s</sub> = CDMA\_FREQ<sub>r</sub>
- 13      – The mobile station shall store the bypass indicator (BYPASS\_ALERT\_ANSWER<sub>s</sub>  
14      = BYPASS\_ALERT\_ANSWER<sub>r</sub>).
- 15      – The mobile station shall store the granted mode indicator (GRANTED\_MODE<sub>s</sub> =  
16      GRANTED\_MODE<sub>r</sub>). If GRANTED\_MODE<sub>r</sub> equals '11', the mobile station shall  
17      perform the following:  
18          + The mobile station shall store the service reference identifier to be restored  
19          (SR\_ID\_RESTORE<sub>s</sub> = SR\_ID\_RESTORE<sub>r</sub>).
- 20          + If SR\_ID\_RESTORE<sub>r</sub> equals '000', the mobile station shall store bitmap of  
21          service reference identifiers to be restored (SR\_ID\_RESTORE\_BITMAP<sub>s</sub> =  
22          SR\_ID\_RESTORE\_BITMAP<sub>r</sub>).
- 23          + If SYNC\_ID\_INCL<sub>r</sub> is included and equals '1', the mobile station shall store  
24          the service configuration synchronization identifier (SYNC\_ID<sub>s</sub> = SYNC\_ID<sub>r</sub>).
- 25      – The mobile station shall store the frame offset (FRAME\_OFFSET<sub>s</sub> =  
26      FRAME\_OFFSET<sub>r</sub>).
- 27      – The mobile station shall store the message encryption mode indicator  
28      (ENCRYPT\_MODE<sub>s</sub> = ENCRYPT\_MODE<sub>r</sub>).
- 29      – The mobile station shall perform the following procedures in the order listed  
30      below:  
31          + If D\_SIG\_ENCRYPT\_MODE<sub>r</sub> is included, the mobile station shall perform the  
32          following:

- 1           o If D\_SIG\_ENCRYPT\_MODE<sub>r</sub> is equal to '000', the mobile station shall set
- 2           D\_SIG\_ENCRYPT\_MODE<sub>s</sub> to C\_SIG\_ENCRYPT\_MODE<sub>s</sub>; otherwise, the
- 3           mobile station shall set D\_SIG\_ENCRYPT\_MODE<sub>s</sub> to
- 4           D\_SIG\_ENCRYPT\_MODE<sub>r</sub>, ENC\_KEY<sub>s</sub> to the most recently generated
- 5           CMEAKEY in the mobile station associated with AUTHR of the
- 6           *Origination Message*, and EXT\_ENCRYPT\_SEQ[0] and
- 7           EXT\_ENCRYPT\_SEQ[1] to  $256 \times \text{ENC\_SEQ\_H}$  (the ENC\_SEQ\_H field in
- 8           the *Origination Message*).
- 9           + If ENC\_KEY\_SIZE<sub>r</sub> is included, the mobile station shall set ENC\_KEY\_SIZE<sub>s</sub>
- 10          to ENC\_KEY\_SIZE<sub>r</sub>.
- 11          + If C\_SIG\_ENCRYPT\_MODE is included, the mobile station shall set
- 12          C\_SIG\_ENCRYPT\_MODE<sub>s</sub> to C\_SIG\_ENCRYPT\_MODE<sub>r</sub>.
- 13          – The mobile station shall set EXT\_CH\_IND<sub>s</sub> to EXT\_CH\_IND<sub>r</sub>.
- 14          – The mobile station shall set CH\_IND<sub>s</sub> to '00'.
- 15          – If EXT\_CH\_IND<sub>r</sub> signals the allocation of a F-FCH or a F-DCCH, the mobile
- 16          station shall store the Forward power control subchannel relative gain
- 17          [FPC\_SUBCHAN\_GAIN<sub>s</sub> = FPC\_SUBCHAN\_GAIN<sub>r</sub>].
- 18          – The mobile station shall set RLGAIN\_ADJ<sub>s</sub> to RLGAIN\_ADJ<sub>r</sub>.
- 19          – The mobile station shall set PLCM\_TYPE<sub>s</sub> to PLCM\_TYPE<sub>r</sub> if PLCM\_TYPE\_INCL<sub>r</sub>
- 20          is equal to '1'; otherwise, the mobile station shall set PLCM\_TYPE<sub>s</sub> as follows:
- 21           + If P\_REV\_IN\_USE<sub>s</sub> is less than 11, set PLCM\_TYPE<sub>s</sub> to '0000'; otherwise set
- 22           PLCM\_TYPE<sub>s</sub> to '0100'.
- 23          – The mobile station shall set PLCM\_39<sub>s</sub> to PLCM\_39<sub>r</sub> if PLCM\_TYPE<sub>r</sub> is equal to
- 24          '0001'.
- 25          – The mobile station shall set FUNDICATED\_BCNC\_IND<sub>s</sub> to
- 26          FUNDICATED\_BCNC\_IND<sub>r</sub>. If FUNDICATED\_BCNC\_IND<sub>r</sub> equals '1' and the
- 27          EXT\_CH\_IND<sub>r</sub> signals the allocation of a F-FCH, the mobile station shall set
- 28          FCH\_BCNC\_IND to '1'; otherwise, the mobile station shall set FCH\_BCNC\_IND
- 29          to '0'.
- 30          – If FUNDICATED\_BCNC\_IND<sub>r</sub> equals '1' and ADD\_PLCM\_FOR\_FCH\_INCL<sub>r</sub> is
- 31          included and is set to '1', the mobile station shall store the following:
- 32           + Set ADD\_PLCM\_FOR\_FCH\_TYPE<sub>s</sub> to ADD\_PLCM\_FOR\_FCH\_TYPE<sub>r</sub>.
- 33           + Set ADD\_PLCM\_FOR\_FCH\_39<sub>s</sub> to ADD\_PLCM\_FOR\_FCH\_39<sub>r</sub> if
- 34           ADD\_PLCM\_FOR\_FCH\_TYPE<sub>r</sub> is equal to '1'.
- 35          – The mobile station shall set REV\_FCH\_GATING\_MODE<sub>s</sub> to
- 36          REV\_FCH\_GATING\_MODE<sub>r</sub>.
- 37          – The mobile station shall set REV\_PWR\_CNTL\_DELAY<sub>s</sub> to
- 38          REV\_PWR\_CNTL\_DELAY<sub>r</sub> if REV\_PWR\_CNTL\_DELAY\_INCL<sub>r</sub> is equal to '1'.

- 1       – The mobile station shall set FULL\_CI\_FEEDBACK\_IND<sub>S</sub> to
- 2       FULL\_CI\_FEEDBACK\_IND<sub>R</sub>.
- 3       – If EXT\_CH\_IND<sub>R</sub> equals '01000', the mobile station shall set
- 4       FOR\_CPCCH\_RATE<sub>S</sub> to FOR\_CPCCH\_RATE<sub>R</sub>, and FOR\_CPCCH\_UPDATE\_RATE<sub>S</sub>
- 5       to FOR\_CPCCH\_UPDATE\_RATE<sub>R</sub>; otherwise, the mobile station shall set
- 6       FOR\_CPCCH\_RATE<sub>S</sub> to '00', and FOR\_CPCCH\_UPDATE\_RATE<sub>S</sub> to '00'.
- 7       – The mobile station shall set REV\_CQICH\_FRAME\_OFFSET<sub>S</sub> to
- 8       REV\_CQICH\_FRAME\_OFFSET<sub>R</sub>.
- 9       – The mobile station shall set REV\_CQICH\_REPS<sub>S</sub> to REV\_CQICH\_REPS<sub>R</sub>.
- 10      – The mobile station shall set REV\_ACKCH\_REPS<sub>S</sub> to REV\_ACKCH\_REPS<sub>R</sub>.
- 11      – The mobile station shall set FOR\_PDCH\_RC<sub>S</sub> to FOR\_PDCH\_RC<sub>R</sub>.
- 12      – If EXT\_CH\_IND<sub>R</sub> signals the allocation of a R-PDCH, the mobile station shall set
- 13      REV\_PDCH\_RC<sub>S</sub> to REV\_PDCH\_RC<sub>R</sub>.
- 14      – If EXT\_CH\_IND<sub>R</sub> signals the allocation of a F-FCH, the mobile station shall set
- 15      FOR\_FCH\_RC<sub>S</sub> to FOR\_FCH\_DCCH\_RC<sub>R</sub>.
- 16      – If EXT\_CH\_IND<sub>R</sub> signals the allocation of a F-DCCH, the mobile station shall set
- 17      FOR\_DCCH\_RC<sub>S</sub> to FOR\_FCH\_DCCH\_RC<sub>R</sub>.
- 18      – If EXT\_CH\_IND<sub>R</sub> signals the allocation of a R-FCH, the mobile station shall set
- 19      REV\_FCH\_RC<sub>S</sub> to REV\_FCH\_DCCH\_RC<sub>R</sub>.
- 20      – If EXT\_CH\_IND<sub>R</sub> signals the allocation of a R-DCCH, the mobile station shall set
- 21      REV\_DCCH\_RC<sub>S</sub> to REV\_FCH\_DCCH\_RC<sub>R</sub>.
- 22      – If EXT\_CH\_IND<sub>R</sub> signals the allocation of a F-FCH and a F-DCCH, the mobile
- 23      station shall set FPC\_PRI\_CHAN<sub>S</sub> to FPC\_PRI\_CHAN<sub>R</sub>.
- 24      – If EXT\_CH\_IND<sub>R</sub> signals the allocation of a F-FCH, the mobile station shall set
- 25      FPC\_FCH\_INIT\_SETPT<sub>S</sub> to FPC\_FCH\_INIT\_SETPT<sub>R</sub>, FPC\_FCH\_CURR\_SETPT<sub>S</sub> to
- 26      FPC\_FCH\_INIT\_SETPT<sub>S</sub>, FPC\_FCH\_FER<sub>S</sub> to FPC\_FCH\_FER<sub>R</sub>,
- 27      FPC\_FCH\_MIN\_SETPT<sub>S</sub> to FPC\_FCH\_MIN\_SETPT<sub>R</sub>, FPC\_FCH\_MAX\_SETPT<sub>S</sub> to
- 28      FPC\_FCH\_MAX\_SETPT<sub>R</sub>.
- 29      – If EXT\_CH\_IND<sub>R</sub> signals the allocation of a F-DCCH, the mobile station shall set
- 30      FPC\_DCCH\_INIT\_SETPT<sub>S</sub> to FPC\_DCCH\_INIT\_SETPT<sub>R</sub>,
- 31      FPC\_DCCH\_CURR\_SETPT<sub>S</sub> to FPC\_DCCH\_INIT\_SETPT<sub>S</sub>, FPC\_DCCH\_FER<sub>S</sub> to
- 32      FPC\_DCCH\_FER<sub>R</sub>, FPC\_DCCH\_MIN\_SETPT<sub>S</sub> to FPC\_DCCH\_MIN\_SETPT<sub>R</sub>,
- 33      FPC\_DCCH\_MAX\_SETPT<sub>S</sub> to FPC\_DCCH\_MAX\_SETPT<sub>R</sub>.
- 34      – If EARLY\_RL\_TRANSMIT\_IND<sub>R</sub> is included, the mobile station shall set
- 35      EARLY\_RL\_TRANSMIT\_IND<sub>S</sub> to EARLY\_RL\_TRANSMIT\_IND<sub>R</sub>; otherwise, the
- 36      mobile station shall set EARLY\_RL\_TRANSMIT\_IND<sub>S</sub> to '0'.

- 1       – If FIXED\_PREAMBLE\_TRANSMIT\_IND<sub>R</sub> is included, the mobile station shall set  
2       FIXED\_PREAMBLE\_TRANSMIT\_IND<sub>S</sub> to FIXED\_PREAMBLE\_TRANSMIT\_IND<sub>R</sub>;  
3       otherwise, the mobile station shall set FIXED\_PREAMBLE\_TRANSMIT\_IND<sub>S</sub> to  
4       ‘0’. If FIXED\_PREAMBLE\_TRANSMIT\_IND<sub>S</sub> equals ‘1’, the mobile station shall  
5       set FIXED\_NUM\_PREAMBLE<sub>S</sub> to FIXED\_NUM\_PREAMBLE<sub>R</sub>.
- 6       – If TX\_PWR\_LIMIT\_INCL<sub>R</sub> is set to ‘1’, the mobile station shall perform the  
7       following:  
8       + If the mobile station is being assigned to operate in the 1915MHz –  
9       1920MHz block of the PCS band, the mobile station shall store the transmit  
10      power limit TX\_PWR\_LIMIT<sub>S</sub> = (TX\_PWR\_LIMIT<sub>R</sub> - 30dB);  
11      + Otherwise, the mobile station shall set TX\_PWR\_LIMIT<sub>S</sub> to the limit defined  
12      in [11] for the target base station.
- 13      – If FOR\_PDCH\_PARMS\_INCL<sub>R</sub> is equal to ‘1’, the mobile station shall set  
14      FOR\_PDCH\_COMMON\_PARMS<sub>S</sub> = ‘0’; otherwise, if  
15      FOR\_PDCH\_COMMON\_PARMS<sub>S</sub> is equal to ‘0’, the mobile station shall send a  
16      *Mobile Station Reject Order* with ORDQ equal to ‘00000011’ (message structure  
17      not acceptable) and remain in the current state.
- 18      – If FOR\_PDCH\_RLGAIN\_INCL<sub>R</sub> is included and equal to ‘1’, the mobile station  
19      shall set RLGAIN\_ACKCH\_PILOT<sub>S</sub> to RLGAIN\_ACKCH\_PILOT<sub>R</sub>, and  
20      RLGAIN\_CQICH\_PILOT<sub>S</sub> to RLGAIN\_CQICH\_PILOT<sub>R</sub>.
- 21      – If FOR\_PDCH\_PARMS\_INCL<sub>R</sub> is equal to ‘1’, the mobile station shall set  
22      NUM\_SOFT\_SWITCHING\_FRAMES<sub>S</sub> to NUM\_SOFT\_SWITCHING\_FRAMES<sub>R</sub> + 1,  
23      and NUM\_SOFT\_SWITCHING\_FRAMES<sub>S</sub> to  
24      NUM\_SOFT\_SWITCHING\_FRAMES<sub>R</sub> + 1.
- 25      – If CHM\_SWITCHING\_PARMS\_INCL<sub>R</sub> is included and equal to ‘1’, the mobile  
26      station shall set NUM\_SOFT\_SWITCHING\_FRAMES\_CHM<sub>S</sub> to  
27      NUM\_SOFT\_SWITCHING\_FRAMES\_CHM<sub>R</sub> + 1, and  
28      NUM\_SOFT\_SWITCHING\_FRAMES\_CHM<sub>S</sub> to  
29      NUM\_SOFT\_SWITCHING\_FRAMES\_CHM<sub>R</sub> + 1.
- 30      – If CHM\_SWITCHING\_PARMS\_INCL<sub>R</sub> is included and equal to ‘0’, the mobile  
31      station shall set NUM\_SOFT\_SWITCHING\_FRAMES\_CHM<sub>S</sub> to  
32      NUM\_SOFT\_SWITCHING\_FRAMES<sub>R</sub> + 1, and  
33      NUM\_SOFT\_SWITCHING\_FRAMES\_CHM<sub>S</sub> to  
34      NUM\_SOFT\_SWITCHING\_FRAMES<sub>R</sub> + 1.
- 35      – If FOR\_PDCH\_PARMS\_INCL<sub>R</sub> is equal to ‘1’, the mobile station shall set  
36      NUM\_SOFT\_SWITCHING\_SLOTS<sub>S</sub> according to Table 3.7.2.3.2.21-9 based on  
37      the value of NUM\_SOFT\_SWITCHING\_SLOTS<sub>R</sub>.
- 38      – If FOR\_PDCH\_PARMS\_INCL<sub>R</sub> is equal to ‘1’, the mobile station shall set  
39      NUM\_SOFT\_SWITCHING\_SLOTS<sub>S</sub> according to Table 3.7.2.3.2.21-9 based on  
40      the value of NUM\_SOFT\_SWITCHING\_SLOTS<sub>R</sub>.

- 1       – If CHM\_SWITCHING\_PARMs\_INCL<sub>r</sub> is included and equal to '1', the mobile  
2       station shall:
  - 3       + Set NUM\_SOFT\_SWITCHING\_SLOTS\_CHM<sub>s</sub> according to Table 3.7.2.3.2.21-  
4       9 based on the value of NUM\_SOFT\_SWITCHING\_SLOTS\_CHM<sub>r</sub>.
  - 5       + Set NUM\_SOFTER\_SWITCHING\_SLOTS\_CHM<sub>s</sub> according to Table  
6       3.7.2.3.2.21-9 based on the value of  
7       NUM\_SOFTER\_SWITCHING\_SLOTS\_CHM<sub>r</sub>.
- 8       – If CHM\_SWITCHING\_PARMs\_INCL<sub>r</sub> is included and equal to '0', the mobile  
9       station shall:
  - 10      + Set NUM\_SOFT\_SWITCHING\_SLOTS\_CHM<sub>s</sub> according to Table 3.7.2.3.2.21-  
11      9 based on the value of NUM\_SOFT\_SWITCHING\_SLOTS<sub>r</sub>.
  - 12      + Set NUM\_SOFTER\_SWITCHING\_SLOTS\_CHM<sub>s</sub> according to Table  
13      3.7.2.3.2.21-9 based on the value of NUM\_SOFTER\_SWITCHING\_SLOTS<sub>r</sub>.
- 14      – If FOR\_PDCH\_PARMs\_INCL<sub>r</sub> is equal to '1', the mobile station shall set  
15      PDCH\_SOFT\_SWITCHING\_DELAY<sub>s</sub> to PDCH\_SOFT\_SWITCHING\_DELAY<sub>r</sub> + 1,  
16      and PDCH\_SOFTER\_SWITCHING\_DELAY<sub>s</sub> to  
17      PDCH\_SOFTER\_SWITCHING\_DELAY<sub>r</sub> + 1.
- 18      – If TX\_DISABLED\_TIMER\_INCL<sub>r</sub> is equal to '1', the mobile station shall set  
19      TX\_DISABLED\_TIMER<sub>s</sub> to TX\_DISABLED\_TIMER<sub>r</sub>; otherwise, the mobile station  
20      shall set TX\_DISABLED\_TIMER<sub>s</sub> to T<sub>81m</sub>.
- 21      – If EXT\_CH\_IND<sub>r</sub> signals the allocation of a R-PDCH, the mobile station shall:
  - 22      + Set FOR\_GCH\_ASSIGNED<sub>s</sub> to FOR\_GCH\_ASSIGNED<sub>r</sub>.
  - 23      + Set FOR\_RCCH\_ASSIGNED<sub>s</sub> to FOR\_RCCH\_ASSIGNED<sub>r</sub>.
  - 24      + If FOR\_RCCH\_ASSIGNED<sub>s</sub> is equal to '1', the mobile station shall:
    - 25      o Set FOR\_RCCH\_DRC\_MODE<sub>s</sub> to FOR\_RCCH\_DRC\_MODE<sub>r</sub>.
    - 26      o Set FOR\_RCCH\_REPETITION<sub>s</sub> to FOR\_RCCH\_REPETITION<sub>r</sub>.
    - 27      o Set FOR\_RCCH\_UPDATE\_RATE<sub>s</sub> to FOR\_RCCH\_UPDATE\_RATE<sub>r</sub>.
  - 28      + If FOR\_ACKCH\_ASSIGNED<sub>r</sub> is equal to '1', the mobile station shall set  
29      FOR\_ACKCH\_MODE<sub>s</sub> to FOR\_ACKCH\_MODE<sub>r</sub>.
  - 30      + If FOR\_ACKCH\_COMB\_SEL<sub>r</sub> is included, the mobile station shall set  
31      FOR\_ACKCH\_COMB\_SEL<sub>s</sub> to FOR\_ACKCH\_COMB\_SEL<sub>r</sub>; otherwise, the  
32      mobile station shall set FOR\_ACKCH\_COMB\_SEL<sub>s</sub> to '0'.
  - 33      + If REV\_PDCH\_RLGAIN\_INCL<sub>r</sub> is included and equal to '1', the mobile station  
34      shall perform the following:
    - 35      o The mobile station shall set RLGAIN\_SPICH\_PILOT<sub>s</sub> to  
36      RLGAIN\_SPICH\_PILOT<sub>r</sub>.
    - 37      o The mobile station shall set RLGAIN\_REQCH\_PILOT<sub>s</sub> to  
38      RLGAIN\_REQCH\_PILOT<sub>r</sub>.

- 1           o The mobile station shall set  $RLGAIN\_PDCCH\_PILOT_S$  to
- 2            $RLGAIN\_PDCCH\_PILOT_R$ .
- 3       + If  $REV\_PDCH\_PARMS\_1\_INCL_R$  is included and equal to '1', the mobile
- 4       station shall perform the following:
- 5           o The mobile station shall set  $REV\_PDCH\_TABLE\_SEL_S$  to
- 6            $REV\_PDCH\_TABLE\_SEL_R$ .
- 7           o The mobile station shall set  $REV\_PDCH\_MAX\_AUTO\_TPR_S$  to
- 8            $REV\_PDCH\_MAX\_AUTO\_TPR_R$ .
- 9       – Otherwise, the mobile station shall:
- 10       + Set  $FOR\_GCH\_ASSIGNED_S$  to NULL.
- 11       + Set  $FOR\_RCCH\_ASSIGNED_S$  to NULL.
- 12       – For each included member of the Active Set, the mobile station shall store the
- 13       following:
- 14       + Set the  $PILOT\_PN$  field to  $PILOT\_PN_R$ .
- 15       + Set the  $ADD\_PILOT\_REC\_INCL$  field to  $ADD\_PILOT\_REC\_INCL_R$ . If
- 16        $ADD\_PILOT\_REC\_INCL_R$  equals '1', the mobile station shall store the
- 17       following:
- 18       o Set the  $PILOT\_REC\_TYPE$  field of  $PILOT\_REC$  to  $PILOT\_REC\_TYPE_R$ .
- 19       o If  $PILOT\_REC\_TYPE_R$  equals '000', the mobile station shall set the
- 20        $TD\_POWER\_LEVEL$  field of  $PILOT\_REC$  to  $TD\_POWER\_LEVEL_R$  and set
- 21       the  $TD\_MODE$  field of  $PILOT\_REC$  to  $TD\_MODE_R$ .
- 22       o If  $PILOT\_REC\_TYPE_R$  is equal to '001', the mobile station shall.
- 23        ◇ Set the  $AUX\_PILOT\_QOF$  field of  $PILOT\_REC$  to  $QOF_R$ .
- 24        ◇ Set the  $AUX\_PILOT\_WALSH\_CODE$  field of  $PILOT\_REC$  to
- 25         $AUX\_PILOT\_WALSH_R$  with the Walsh Code length specified by
- 26         $WALSH\_LENGTH_R$ .
- 27       o If  $PILOT\_REC\_TYPE_R$  is equal to '010', the mobile station shall:
- 28        ◇ Set the  $AUX\_PILOT\_TD\_QOF$  field of  $PILOT\_REC$  to  $QOF_R$ .
- 29        ◇ Set the  $AUX\_PILOT\_WALSH\_CODE$  field of  $PILOT\_REC$  to
- 30         $AUX\_WALSH_R$  with the Walsh Code length specified by
- 31         $WALSH\_LENGTH_R$ .
- 32        ◇ Set the  $AUX\_TD\_POWER\_LEVEL$  field of  $PILOT\_REC$  to
- 33         $AUX\_TD\_POWER\_LEVEL_R$ .
- 34        ◇ Set the  $TD\_MODE$  field of  $NGHBR\_PILOT\_REC$  to  $TD\_MODE_R$ .
- 35       o Set  $FOR\_PDCH\_INCL_S$  to  $FOR\_PDCH\_INCL_R$ .
- 36       o If  $FOR\_PDCH\_INCL_R$  is equal to '1', the mobile station shall perform the
- 37       following:

- 1                   ◇ If FOR\_PDCH\_PARMS\_INCL<sub>R</sub> is equal to '1', the mobile station shall  
2                   store the following parameters:
- 3                   – The mobile station shall set WALSH\_TABLE\_ID<sub>S</sub> to  
4                   WALSH\_TABLE\_ID<sub>R</sub>.
- 5                   – The mobile station shall set NUM\_PDCCH<sub>S</sub> to NUM\_PDCCH<sub>R</sub>.
- 6                   – The mobile station shall set FOR\_PDCCH\_WALSH<sub>S</sub>[i] to the i<sup>th</sup>  
7                   occurrence of FOR\_PDCCH\_WALSH<sub>R</sub>.
- 8                   ◇ The mobile station shall set MAC\_ID<sub>S</sub> to MAC\_ID<sub>R</sub>.
- 9                   ◇ The mobile station shall set REV\_CQICH\_COVER<sub>S</sub> to  
10                  REV\_CQICH\_COVER<sub>R</sub>.
- 11                  ◇ If EXT\_CH\_IND<sub>R</sub> signals the allocation of a F-CPCCH, the mobile  
12                  station shall set FOR\_CPCCH\_WALSH<sub>S</sub> to FOR\_CPCCH\_WALSH<sub>R</sub>, and  
13                  FOR\_CPCSCH<sub>S</sub> to FOR\_CPCSCH<sub>R</sub>.
- 14                  ◇ The mobile station shall store FOR\_PDCCH\_WALSH<sub>S</sub>[i] to the i<sup>th</sup>  
15                  occurrence of FOR\_PDCCH\_WALSH<sub>R</sub>.
- 16                  o The mobile station shall set PWR\_COMB\_IND<sub>S</sub> to PWR\_COMB\_IND<sub>R</sub>.
- 17                  o If PDCH\_GROUP\_IND\_INCL<sub>R</sub> is equal to '1', the mobile station shall set  
18                  PDCH\_GROUP\_IDENTIFIER<sub>S</sub> as follows:
- 19                   ◇ If this is the first pilot in the list that has a F-PDCH assignment, the  
20                   mobile station shall perform the following:
- 21                   – The mobile station shall set PDCH\_GROUP\_IDENTIFIER<sub>S</sub> to '000';
- 22                   ◇ Otherwise, the mobile station shall perform the following:
- 23                   – If PDCH\_GROUP\_IND<sub>R</sub> is set to '1', the mobile station shall set  
24                   PDCH\_GROUP\_IDENTIFIER<sub>S</sub> to the same value as that of the  
25                   previous pilot in the list that has a F-PDCH assigned; otherwise,  
26                   the mobile station shall set PDCH\_GROUP\_IDENTIFIER<sub>S</sub> to the  
27                   value one greater than that of the previous pilot in the list that  
28                   has a F-PDCH assigned.
- 29                  o Otherwise, the mobile station shall perform the following:
- 30                   ◇ If this is the first pilot in the list that has a F-PDCH assignment, the  
31                   mobile station shall perform the following:
- 32                   – The mobile station shall set PDCH\_GROUP\_IDENTIFIER<sub>S</sub> to '000';
- 33                   ◇ Otherwise, the mobile station shall perform the following:
- 34                   – If F-PDCH is assigned for this pilot, the mobile station shall  
35                   perform the following:

- 1                                   + If PWR\_COMB\_IND<sub>r</sub> is set to '1', and there are no pilots
- 2                                   between this pilot and the previous pilot in the list that has a
- 3                                   F-PDCH assigned, the mobile station shall set
- 4                                   PDCH\_GROUP\_IDENTIFIER<sub>s</sub> to the same value as that of the
- 5                                   previous pilot in the list that has a F-PDCH assigned.
- 6                                   + If PWR\_COMB\_IND<sub>r</sub> is set to '1', and all pilots between this
- 7                                   pilot and the previous pilot in the list that has a F-PDCH
- 8                                   assigned have PWR\_COMB\_IND set to '1', the mobile station
- 9                                   shall set PDCH\_GROUP\_IDENTIFIER<sub>s</sub> to the same value as
- 10                                  that of the previous pilot in the list that has a F-PDCH
- 11                                  assigned.
- 12                                  + Otherwise, the mobile station shall set
- 13                                  PDCH\_GROUP\_IDENTIFIER<sub>s</sub> to the value one greater than
- 14                                  that of the previous pilot in the list.
- 15                                  - Otherwise, the mobile station shall set
- 16                                  PDCH\_GROUP\_IDENTIFIER<sub>s</sub> to NULL.
- 17                                  o If EXT\_CH\_IND<sub>r</sub> signals the allocation of a F-FCH, the mobile station
- 18                                  shall set CODE\_CHAN\_FCH<sub>s</sub> to CODE\_CHAN\_FCH<sub>r</sub>, and
- 19                                  QOF\_MASK\_ID\_FCH<sub>s</sub> to QOF\_MASK\_ID\_FCH<sub>r</sub>.
- 20                                  o If EXT\_CH\_IND<sub>r</sub> signals the allocation of a F-DCCH, the mobile station
- 21                                  shall set CODE\_CHAN\_DCCH<sub>s</sub> to CODE\_CHAN\_DCCH<sub>r</sub>, and
- 22                                  QOF\_MASK\_ID\_DCCH<sub>s</sub> to QOF\_MASK\_ID\_DCCH<sub>r</sub>.
- 23                                  o If FOR\_PDCH\_INCL<sub>r</sub> is equal to '1', EXT\_CH\_IND<sub>r</sub> signals the allocation
- 24                                  of a R-PDCH, and FOR\_ACKCH\_ASSIGNED<sub>r</sub> is equal to '1', the mobile
- 25                                  station shall set FOR\_ACKCH\_WALSH\_INDEX<sub>s</sub> to
- 26                                  FOR\_ACKCH\_WALSH\_INDEX<sub>r</sub>, and FOR\_ACKSCH\_INDEX<sub>s</sub> to
- 27                                  FOR\_ACKSCH\_INDEX<sub>r</sub>.
- 28                                  o If FOR\_RCCH\_INCL<sub>r</sub> is included and set to '1', the mobile station shall
- 29                                  do the following:
- 30                                    ◇ Set FOR\_RCCH\_WALSH\_INDEX<sub>s</sub> to FOR\_RCCH\_WALSH\_INDEX<sub>r</sub>.
- 31                                    ◇ Set FOR\_RCSCH\_INDEX<sub>s</sub> to FOR\_RCSCH\_INDEX<sub>r</sub>.
- 32                                  o If FOR\_PDCH\_INCL<sub>r</sub> is equal to '1', and if FOR\_GCH\_ASSIGNED<sub>r</sub> is
- 33                                  included and set to '1', the mobile station shall perform the following;
- 34                                    ◇ Set NUM\_FOR\_GCH<sub>s</sub> to NUM\_FOR\_GCH<sub>r</sub>, and
- 35                                    ◇ For each of the NUM\_FOR\_GCH<sub>s</sub> occurrences of
- 36                                    FOR\_GCH\_WALSH\_INDEX<sub>r</sub>, the mobile station shall set
- 37                                    FOR\_GCH\_WALSH\_INDEX<sub>s</sub>[j] to FOR\_GCH\_WALSH\_INDEX<sub>r</sub>[j].
- 38                                  o Otherwise, the mobile station shall perform the following:
- 39                                    ◇ Set NUM\_FOR\_GCH<sub>s</sub> to 0, and

- 1                   ◇ Set FOR\_GCH\_WALSH\_INDEX<sub>S</sub> to NULL.
- 2           – The mobile station shall initialize CODE\_CHAN\_LIST as described in 2.6.8, and  
3           shall set SERV\_NEG<sub>S</sub> to enabled.
- 4           – If FREQ\_INCL<sub>R</sub> equals '1', the mobile station shall then tune to the new  
5           frequency assignment.
- 6           – The mobile station shall then enter the *Traffic Channel Initialization Substate* of  
7           the *Mobile Station Control on the Traffic Channel State*.
- 8   8. *Feature Notification Message*: If RELEASE<sub>R</sub> is equal to '1', the mobile station shall  
9   enter the *Mobile Station Idle State* or the *System Determination Substate* of the  
10   *Mobile Station Initialization State* with a release indication (see 2.6.1.1).
- 11   9. *Intercept Order*: The mobile station shall enter the *Mobile Station Idle State*.
- 12   10. *Local Control Order*
- 13   11. *Lock Until Power-Cycled Order*: The mobile station shall disable its transmitter and  
14   record the reason for the *Lock Until Power-Cycled Order* in the mobile station's  
15   semi-permanent memory (LCKRSN\_P<sub>S-p</sub> equals the least significant four bits of  
16   ORDQ<sub>R</sub>). The mobile station should notify the user of the locked condition. The  
17   mobile station shall enter the *System Determination Substate* of the *Mobile Station*  
18   *Initialization State* with a lock indication (see 2.6.1.1), and shall not enter the  
19   *System Access State* again until after the next mobile station power-up or until it  
20   has received an *Unlock Order*. This requirement shall take precedence over any  
21   other mobile station requirement specifying entry to the *System Access State*.
- 22   12. *Maintenance Required Order*: The mobile station shall record the reason for the  
23   *Maintenance Required Order* in the mobile station's semi-permanent memory  
24   (MAINTRSN<sub>S-p</sub> equals the least significant four bits of ORDQ<sub>R</sub>). The mobile station  
25   shall remain in the unlocked condition. The mobile station should notify the user  
26   of the maintenance required condition.
- 27   13. *PACA Message*: If P\_REV\_IN\_USE<sub>S</sub> is less than or equal to four and the mobile  
28   station does not support PACA capability, the mobile station shall send a *Mobile*  
29   *Station Reject Order* with the ORDQ field set to '00000110' (message requires a  
30   capability that is not supported by the mobile station); otherwise, the mobile  
31   station shall process the message as follows:
- 32   • If PACA<sub>S</sub> is equal to disabled, the mobile station shall perform the following  
33   actions:
- 34   – If the purpose of the message is to respond to an *Origination Message*  
35   (PURPOSE<sub>R</sub> is equal to '0000'), the mobile station shall perform the following  
36   actions:
- 37   + The mobile station shall set PACA<sub>S</sub> to enabled and shall set PACA\_SID<sub>S</sub>  
38   to SID<sub>S</sub>.
- 39   + The mobile station shall set the PACA state timer to the duration shown  
40   in Table 3.7.2.3.2.20-2 corresponding to the value of PACA\_TIMEOUT<sub>S</sub>.

- 1           + The mobile station should indicate to the user that the call has been  
2           queued as a PACA call, and should indicate the current queue position  
3           (Q\_POS<sub>r</sub>) of the call.
- 4           + The mobile station shall enter the *Mobile Station Idle State*.
- 5           – If the purpose of the message is to cancel the PACA call (PURPOSE<sub>r</sub> is equal  
6           to '0011'), the mobile station shall perform the following actions:  
7           + The mobile station shall set PACA<sub>s</sub> to disabled and PACA\_CANCEL to '0',  
8           shall disable the PACA state timer, and should indicate to the user that  
9           the PACA call has been canceled.
- 10          + The mobile station shall enter the *Mobile Station Idle State*.
- 11          – If the purpose of the message is anything else (PURPOSE<sub>r</sub> is not equal to  
12          '0000' or '0011'), the mobile station shall ignore the message. The mobile  
13          station shall remain in the *Mobile Station Origination Attempt Substate*.
- 14          • If PACA<sub>s</sub> is equal to enabled, the mobile station shall perform the following  
15          actions:  
16          – If the purpose of the message is to respond to an *Origination Message*  
17          (PURPOSE<sub>r</sub> is equal to '0000'), the mobile station shall perform the following  
18          actions:  
19          + The mobile station should indicate to the user that the PACA call is still  
20          queued, and should indicate to the user the current queue position  
21          (Q\_POS<sub>r</sub>) of the call.  
22          + The mobile station shall set the PACA state timer to the duration shown  
23          in Table 3.7.2.3.2.20-2 corresponding to the value of PACA\_TIMEOUT<sub>s</sub>.  
24          + The mobile station shall enter the *Mobile Station Idle State*.  
25          – If the purpose of the message is to provide the queue position of the PACA  
26          call (PURPOSE<sub>r</sub> is equal to '0001'), the mobile station shall perform the  
27          following actions:  
28          + The mobile station should indicate to the user that the PACA call is still  
29          queued, and should indicate the current queue position (Q\_POS<sub>r</sub>) of the  
30          call.  
31          + The mobile station shall set the PACA state timer to the duration shown  
32          in Table 3.7.2.3.2.20-2 corresponding to the value of PACA\_TIMEOUT<sub>s</sub>.  
33          + The mobile station shall enter the *Mobile Station Idle State*.  
34          – If the purpose of the message is to instruct the mobile station to re-originate  
35          the PACA call (PURPOSE<sub>r</sub> is equal to '0010'), the mobile station shall remain  
36          in the *Mobile Station Origination Attempt Substate*.  
37          – If the purpose of the message is to cancel the PACA call (PURPOSE<sub>r</sub> is equal  
38          to '0011'), the mobile station shall perform the following actions:

- 1           + The mobile station shall set PACA<sub>S</sub> to disabled, shall disable the PACA
- 2           state timer, and should indicate to the user that the PACA call has been
- 3           canceled.
- 4           + The mobile station shall enter the *Mobile Station Idle State*.
- 5   14. *Registration Accepted Order*: The mobile station shall perform the procedures as
- 6       specified in 2.6.11.1.
- 7   15. *Registration Rejected Order*: This order indicates that normal service is not
- 8       available on this system. The mobile station shall disable the full-TMSI timer. If
- 9       the received order specifies to delete the TMSI (ORDQ = '00000100'), the mobile
- 10       station shall set all the bits of the TMSI\_CODE<sub>S-p</sub> to '1'. The mobile station shall
- 11       enter the *System Determination Substate* of the *Mobile Station Initialization State*
- 12       with a registration rejected indication (see 2.6.1.1).
- 13   16. *Release Order* or *Service Status Order*: If NDSS\_ORIG<sub>S</sub> is equal to enabled, the
- 14       mobile station shall set NDSS\_ORIG<sub>S</sub> to disabled, and should indicate to the user
- 15       that the call origination has been canceled. The mobile station shall enter the
- 16       *Mobile Station Idle State* or the *System Determination Substate* of the *Mobile Station*
- 17       *Initialization State* with a release indication (see 2.6.1.1). If the mobile station
- 18       enters the *Mobile Station Idle State*, and if PACA<sub>S</sub> is equal to enabled, the mobile
- 19       station shall set PACA<sub>S</sub> to disabled and PACA\_CANCEL to '0', shall disable the
- 20       PACA state timer, and should indicate to the user that the PACA call has been
- 21       canceled.
- 22   17. *Reorder Order*: If NDSS\_ORIG<sub>S</sub> is equal to enabled, the mobile station shall set
- 23       NDSS\_ORIG<sub>S</sub> to disabled, and should indicate to the user that the call origination
- 24       has been canceled. If PACA<sub>S</sub> is equal to enabled, the mobile station shall set PACA<sub>S</sub>
- 25       to disabled and PACA\_CANCEL to '0', shall disable the PACA state timer, and
- 26       should indicate to the user that the PACA call has been canceled. The mobile
- 27       station shall enter the *Mobile Station Idle State*.
- 28   18. *Retry Order*: The mobile station shall process the order as follows:
- 29       • If RETRY\_TYPE<sub>R</sub> is equal to '000', the mobile station shall set
- 30       RETRY\_DELAY<sub>S</sub>[RETRY\_TYPE] to 0, where RETRY\_TYPE is equal to '001', '010',
- 31       '011', '100', or '101'.
- 32       • If RETRY\_TYPE<sub>R</sub> is equal to '001', '100', or '101', then the mobile station shall
- 33       perform the following:
- 34           – If RETRY\_DELAY<sub>R</sub> is equal to '00000000', then the mobile station shall set
- 35           RETRY\_DELAY<sub>S</sub>[RETRY\_TYPE<sub>R</sub>] to 0.
- 36           – If RETRY\_DELAY<sub>R</sub> is not equal to '00000000', the mobile station shall set
- 37           RETRY\_DELAY<sub>S</sub> as follows:
- 38           + If the most significant bit of the RETRY\_DELAY<sub>R</sub> is '0', set
- 39           RETRY\_DELAY\_UNIT<sub>S</sub> to 1000ms. If the most significant bit of the
- 40           RETRY\_DELAY<sub>R</sub> is '1', set RETRY\_DELAY\_UNIT<sub>S</sub> to 60000ms.

- 1           + The mobile station shall set  $\text{RETRY\_DELAY\_VALUE}_S$  to the seven least
- 2           significant bits of  $\text{RETRY\_DELAY}_R$ .
- 3           + The mobile station shall store the next system time 80 ms boundary +
- 4            $\text{RETRY\_DELAY\_VALUE}_S \times \text{RETRY\_DELAY\_UNIT}_S$  ms as
- 5            $\text{RETRY\_DELAY}_S[\text{RETRY\_TYPE}_R]$ .
- 6           + If  $\text{RETRY\_TYPE}_R$  is equal to '001' or '101', and  $\text{NDSS\_ORIG}_S$  is equal to
- 7           enabled, the mobile station shall set  $\text{NDSS\_ORIG}_S$  to disabled and
- 8           should indicate to the user that the call origination has been canceled.
- 9           If  $\text{PACA}_S$  is equal to enabled, the mobile station shall set  $\text{PACA}_S$  to
- 10          disabled and  $\text{PACA\_CANCEL}$  to '0', shall disable the  $\text{PACA}$  state timer,
- 11          and should indicate to the user that the  $\text{PACA}$  call has been canceled.
- 12          + If  $\text{RETRY\_TYPE}_R$  is equal to '001' or '101', the mobile station shall enter
- 13          the *Mobile Station Idle State*.
- 14   19. *Security Mode Command Message*: The mobile station shall perform the procedures
- 15       as specified in 2.6.11.4.
- 16   20. *Service Redirection Message*: The mobile station shall process the message as
- 17       follows:
- 18       • If the mobile station is directed to an unsupported operation mode or band
- 19       class, the mobile station shall respond with a *Mobile Station Reject Order* with
- 20        $\text{ORDQ}$  equal to '00000110' (message requires a capability that is not supported
- 21       by the mobile station).
- 22       • If  $\text{DELETE\_TMSI}_R$  is equal to '1', the mobile station shall set all the bits of
- 23        $\text{TMSI\_CODE}_{S-p}$  to '1'.
- 24       • The mobile station shall disable the full-TMSI timer.
- 25       • The mobile station shall set  $\text{RETURN\_IF\_FAIL}_S = \text{RETURN\_IF\_FAIL}_R$ .
- 26       • If  $\text{RECORD\_TYPE}_R$  is '00000000', the mobile station shall set  $\text{RETURN\_IF\_FAIL}_S$
- 27       =  $\text{RETURN\_IF\_FAIL}_R$ , and enter the *System Determination Substate* of the *Mobile*
- 28       *Station Initialization State* with an NDSS off indication (see 2.6.1.1); otherwise:
- 29       – if  $\text{REDIRECT\_TYPE}_R$  is '0', the mobile station shall store the redirection
- 30       record received in the message as  $\text{REDIRECT\_REC}_S$  and shall enter the
- 31       System Determination Substate of the *Mobile Station Initialization State* with
- 32       a redirection indication (see 2.6.1.1).
- 33       – if  $\text{REDIRECT\_TYPE}_R$  is '1', the mobile station shall store the redirection
- 34       record received in the message as  $\text{REDIRECT\_REC}_S$  and shall enable
- 35        $\text{NDSS\_ORIG}_S$ , and shall record the dialed digits (if any). The mobile station
- 36       shall enter the System Determination Substate of the *Mobile Station*
- 37       *Initialization State* with a redirection indication (see 2.6.1.1).
- 38   21. *SSD Update Message*: The mobile station shall respond to the message as specified
- 39       in 2.3.12.1.5.

22. *Status Request Message*: The mobile station shall disable the *System Access State* timer and respond to the message. If  $P\_REV\_IN\_USE_s$  is less than or equal to three, the mobile station shall respond with a *Status Response Message*. If  $P\_REV\_IN\_USE_s$  is greater than three, the mobile station shall respond with an *Extended Status Response Message*. If the message does not specify any qualification information ( $QUAL\_INFO\_TYPE_r$  is equal to '00000000'), the mobile station shall include the requested information records in the response. If the message specifies a band class ( $QUAL\_INFO\_TYPE_r$  is equal to '00000001'), the mobile station shall only include the requested information records for the specified band class ( $BAND\_CLASS_r$ ) in the response. If the message specifies a band class and an operating mode ( $QUAL\_INFO\_TYPE_r$  is equal to '00000010'), the mobile station shall only include the requested information records for the specified band class ( $BAND\_CLASS_r$ ) and operating mode ( $OP\_MODE_r$ ) in the response. If the message specifies a band class or a band class and an operating mode which are not supported by the mobile station, the mobile station shall send a *Mobile Station Reject Order* with  $ORDQ$  set to '00000110' (message requires a capability that is not supported by the mobile station). If the response to this message exceeds the allowable length, the mobile station shall send a *Mobile Station Reject Order* with  $ORDQ$  set to '00001000' (response message would exceed the allowable length). If the message specifies an information record which is not supported by the mobile station for the specified band class and operating mode, the mobile station shall send a *Mobile Station Reject Order* with  $ORDQ$  set to '00001001' (information record is not supported for the specified band class and operating mode).

23. *TMSI Assignment Message*: The mobile station shall store the TMSI zone and code as follows:

- The mobile station shall store the length of the TMSI zone field by setting  $ASSIGNING\_TMSI\_ZONE\_LEN_{s-p}$  to  $TMSI\_ZONE\_LEN_r$ ,
- The mobile station shall store the assigning TMSI zone number by setting the  $ASSIGNING\_TMSI\_ZONE\_LEN_{s-p}$  least significant octets of  $ASSIGNING\_TMSI\_ZONE_{s-p}$  to  $TMSI\_ZONE_r$ , and
- The mobile station shall store the TMSI code by setting  $TMSI\_CODE_{s-p}$  to  $TMSI\_CODE_r$ .

The mobile station shall set the TMSI expiration time by setting  $TMSI\_EXP\_TIME_{s-p}$  to  $TMSI\_EXP\_TIME_r$ . The mobile station shall disable the full-TMSI timer. The mobile station shall then respond with a *TMSI Assignment Completion Message* within  $T_{56m}$  seconds.

24. *User Zone Reject Message*

25. *BCMC Order*: The mobile station shall process this message as follows:

- If  $ORDQ_r$  is set to '00000000', the mobile station shall perform the following for each of the BCMC flows that the base station is responding to:
  - If  $CLEAR\_ALL\_RETRY\_DELAY_r$  equals '1', the mobile station shall delete the currently stored BCMC Retry Delay List.

- 1           - If CLEAR\_RETRY\_DELAY<sub>r</sub> equals '1', the mobile station shall delete the entry  
2           in the BCMC\_RETRY\_DELAY\_LIST<sub>s</sub>[i] corresponding to BCMC\_FLOW\_ID (See  
3           section 2.6.13.11) in this message.
- 4           - If ALL\_BCMC\_REASON<sub>r</sub> or BCMC\_REASON<sub>r</sub> equals '0000', Layer 3 shall send  
5           a *BCMC-Monitor.Response(BCMC\_FLOW\_ID, result=FAILURE, cause=*  
6           *FLOW\_NOT\_AVAILABLE, reason\_ind=CURRENT\_SYS)* for each of the  
7           corresponding BCMC\_FLOW\_ID to the BCMC Service Layer.
- 8           - If ALL\_BCMC\_REASON<sub>r</sub> or BCMC\_REASON<sub>r</sub> equals '0001', Layer 3 shall send  
9           a *BCMC-Monitor.Response(BCMC\_FLOW\_ID, result=FAILURE, cause=*  
10           *FLOW\_NOT\_TRANSMITTED, reason\_ind=CURRENT\_SYS)* for each of the  
11           corresponding BCMC\_FLOW\_ID to the BCMC Service Layer.
- 12           - If BCMC\_REASON<sub>r</sub> equals '0010' for any of the flows or ALL\_BCMC\_REASON<sub>r</sub>  
13           equals '0010', the mobile station shall enable the BCMC wait timer with a  
14           value of BSPM\_WAIT\_TIME seconds, shall enter the *Mobile Station Idle State*  
15           and shall wait for an updated *BCMC Service Parameters Message* as specified  
16           in 2.6.13.1.
- 17           - If ALL\_BCMC\_REASON<sub>r</sub> or BCMC\_REASON<sub>r</sub> equals '0011', Layer 3 shall send  
18           a *BCMC-Monitor.Response(BCMC\_FLOW\_ID, result = SUCCESS, cause =*  
19           *REGISTRATION\_ACCEPTED, reason\_ind = CURRENT\_SYS)* for each of the  
20           corresponding BCMC\_FLOW\_ID to the BCMC Service Layer.
- 21           - If ALL\_BCMC\_REASON<sub>r</sub> or BCMC\_REASON<sub>r</sub> equals '0100', Layer 3 shall send  
22           a *BCMC-Monitor.Response(BCMC\_FLOW\_ID, result = FAILURE, cause=*  
23           *AUTHORIZATION\_FAILURE, reason\_ind = CURRENT\_SYS)* for each of the  
24           corresponding BCMC\_FLOW\_ID to the BCMC Service Layer.
- 25           - If ALL\_BCMC\_REASON<sub>r</sub> or BCMC\_REASON<sub>r</sub> equals '0101', the mobile station  
26           shall perform the following:
  - 27           + Layer 3 shall send a *BCMC-Monitor.Response(BCMC\_FLOW\_ID,*  
28           *result=FAILURE, cause= RETRY\_DELAY, reason\_ind=CURRENT\_SYS)* for  
29           each of the corresponding BCMC\_FLOW\_ID to the BCMC Service Layer.
  - 30           + For each of the corresponding BCMC\_FLOW\_ID, if there is a  
31           BCMC\_RETRY\_DELAY\_LIST<sub>s</sub>[i].BCMC\_FLOW\_ID which is same as  
32           BCMC\_FLOW\_ID (See section 2.6.13.11), the mobile station shall set  
33           BCMC\_RETRY\_DELAY\_LIST<sub>s</sub>[i].RETRY\_DELAY to current system time  
34           plus ALL\_BCMC\_RETRY\_DELAY<sub>r</sub>/BCMC\_RETRY\_DELAY<sub>r</sub>; otherwise, the  
35           mobile station shall add new BCMC\_RETRY\_DELAY\_LIST<sub>s</sub>[i] to the BCMC  
36           Retry Delay List and shall set  
37           BCMC\_RETRY\_DELAY\_LIST<sub>s</sub>[i].BCMC\_FLOW\_ID to the BCMC\_FLOW\_ID,  
38           BCMC\_RETRY\_DELAY\_LIST<sub>s</sub>[i].RETRY\_DELAY to current system time  
39           plus ALL\_BCMC\_RETRY\_DELAY<sub>r</sub>/BCMC\_RETRY\_DELAY<sub>r</sub>.
- 40           - If the base station indicates BCMC\_REASON (indicated via  
41           ALL\_BCMC\_REASON<sub>r</sub>/BCMC\_REASON<sub>r</sub>) of '0000', '0001', '0011', '0100', or

1                   ‘0101’ for all of the flows requested, the mobile station shall enter the *Mobile*  
2                   *Station Idle State*.

3       26. General Extension Message: The mobile station shall process this message as  
4       specified in section 2.6.18.

5       27. *Any other message*: If the mobile station receives any other message specified in  
6       Table 3.7.2.3-1, it shall ignore all Layer 3 fields. The mobile station shall ignore all  
7       other messages.

8   If the mobile station performs an access probe handoff or access handoff and receives any  
9   of the following messages, it shall process the message as specified in 2.6.3.1.3:

- 10       • If the mobile station is currently monitoring the Paging Channel:
  - 11           1. *System Parameters Message*
  - 12           2. *Access Parameters Message*
  - 13           3. *Neighbor List Message*
  - 14           4. *Extended System Parameters Message*
  - 15           5. *Extended Neighbor List Message*
  - 16           6. *General Neighbor List Message*
  - 17           7. *Global Service Redirection Message*
  - 18           8. *Extended Global Service Redirection Message*
- 19       • If the mobile station is currently monitoring the Primary Broadcast Control  
20       Channel:
  - 21           1. *ANSI-41 System Parameters Message*
  - 22           2. *Enhanced Access Parameters Message*
  - 23           3. *Universal Neighbor List Message*
  - 24           4. *MC-RR Parameters Message*
  - 25           5. *Extended Global Service Redirection Message*

#### 26   2.6.3.6 Registration Access Substate

27   In this substate, the mobile station sends a *Registration Message*. If the base station  
28   responds with an authentication request, the mobile station responds in this substate.

29   Upon entering the *Registration Access Substate*, the mobile station shall send the  
30   *Registration Message*.

31   If a message received from the base station requires a Layer 2 acknowledgment and does  
32   not require a Layer 3 response, Layer 3 shall indicate to Layer 2 that no response is  
33   outstanding (see [4]).

34   If a message received from the base station requires a Layer 2 acknowledgment and also a  
35   Layer 3 response, Layer 3 shall indicate to Layer 2 that a response is outstanding (see [4]).

1 When transmitting a response to a message received from the base station, Layer 3 shall  
2 indicate to Layer 2 that the type of the message is a response (see [4]).

3 When transmitting an autonomous message (i.e., a message that is not sent as a response  
4 to a message received from the base station) other than the *Registration Message*, Layer 3  
5 shall indicate to Layer 2 that the type of the message is a request other than a registration  
6 request or a message transmission request (see [4]).

7 When transmitting an autonomous *Registration Message* (i.e., it is not sent as a response  
8 to a *Registration Request Order* received from the base station), Layer 3 shall indicate to  
9 Layer 2 that the type of the message is a request that is a registration (see [4]).

10 While in this substate, the mobile station shall monitor the Paging Channel or the Forward  
11 Common Control Channel. If the mobile station declares a loss of the Paging Channel or  
12 the Forward Common Control Channel (see 2.6.3.1.8), the mobile station shall perform the  
13 following:

- 14 • If PACA<sub>S</sub> is equal to enabled, the mobile station shall set PACA<sub>S</sub> to disabled and  
15 PACA\_CANCEL to '0', shall disable the PACA state timer, and should indicate to the  
16 user that the PACA call has been canceled.
- 17 • The mobile station shall declare an access attempt failure and update its  
18 registration variables as specified in 2.6.5.5.3.2.
- 19 • The mobile station shall disable its transmitter and enter the *Mobile Station Idle*  
20 *State*.

21 If the mobile station receives confirmation of delivery of any message sent by the mobile  
22 station in this substate, it shall then enter the *Mobile Station Idle State* unless:

- 23 • If the registration access was initiated due to a user direction to power down, the  
24 mobile station shall update registration variables as specified in 2.6.5.5.3.3 and  
25 may power down.
- 26 • If the mobile station has included the ENC\_SEQ\_H field in the *Registration*  
27 *Message*.
- 28 • If a message received from the base station requires a response, the mobile station  
29 shall send a response to the message in this substate.

30 If the mobile station receives confirmation of delivery of the *Registration Message*, the  
31 mobile station shall update its registration variables as specified in 2.6.5.5.3.1.

32 If the mobile station is directed by the user to originate a call, the mobile station may  
33 process the origination request as follows:

- 34 • Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any  
35 access attempt in progress.
- 36 • If PACA<sub>S</sub> is equal to enabled, the mobile station shall set PACA<sub>S</sub> to disabled and  
37 PACA\_CANCEL to '0', shall disable the PACA state timer, and should indicate to the  
38 user that the PACA call has been canceled.
- 39 • The mobile station shall enter the *Mobile Station Origination Attempt Substate* with  
40 an origination indication.

1 If PACA<sub>S</sub> is equal to enabled, the mobile station shall set PACA\_CANCEL to '1' when the  
2 user directs the mobile station to cancel a PACA call.

3 If the mobile station is to exit the *System Access State* as a result of processing Layer 3  
4 fields of a message requiring an acknowledgment, the mobile station shall exit the *System*  
5 *Access State* after Layer 3 receives an indication from Layer 2 that the acknowledgment to  
6 the message has been sent and acknowledged.

7 If Layer 3 receives a message other than message listed below:

- 8 • *Extended Channel Assignment Message* with DIRECT\_CH\_ASSIGN\_IND field  
9 included and set to '1'

10 with an indication from Layer 2 that an access attempt for a message being transmitted  
11 was not terminated as a result of processing the Layer 2 fields of the received message, the  
12 mobile station shall ignore the received message.

13 The following directed messages and orders can be received. If any field value of the  
14 message or order is outside its permissible range, the mobile station may send a *Mobile*  
15 *Station Reject Order* with ORDQ equal to '00000100' (message field not in valid range).

- 16 1. *Authentication Challenge Message*: If the registration access was initiated due to a  
17 user direction to power down, the mobile station shall ignore the message;  
18 otherwise, the mobile station shall respond to the message as specified in  
19 2.3.12.1.4, regardless of the value of AUTH<sub>S</sub>.
- 20 2. *Authentication Request Message*: The mobile station shall process the message and  
21 shall respond as specified in 2.3.12.5.2.
- 22 3. *Base Station Challenge Confirmation Order*: If the registration access was initiated  
23 due to a user direction to power down, the mobile station shall ignore the message;  
24 otherwise, the mobile station shall respond to the message as specified in  
25 2.3.12.1.5.
- 26 4. *Base Station Reject Order*: The mobile station shall perform the procedures as  
27 specified in 2.6.11.5.
- 28 5. *Data Burst Message*
- 29 6. *Feature Notification Message*
- 30 7. *Local Control Order*
- 31 8. *Lock Until Power-Cycled Order*: The mobile station shall disable its transmitter and  
32 record the reason for the *Lock Until Power-Cycled Order* in the mobile station's  
33 semi-permanent memory (LCKRSN\_P<sub>S-p</sub> equals the least significant four bits of  
34 ORDQ<sub>r</sub>). The mobile station should notify the user of the locked condition. The  
35 mobile station shall enter the *System Determination Substate* of the *Mobile Station*  
36 *Initialization State* with a lock indication (see 2.6.1.1), and shall not enter the  
37 *System Access State* again until after the next mobile station power-up or until it  
38 has received an *Unlock Order*. This requirement shall take precedence over any  
39 other mobile station requirement specifying entry to the *System Access State*.

1       9. *Maintenance Required Order*: The mobile station shall record the reason for the  
 2       *Maintenance Required Order* in the mobile station's semi-permanent memory  
 3       (MAINTRSN<sub>S-p</sub> equals the least significant four bits of ORDQ<sub>r</sub>). The mobile station  
 4       shall remain in the unlocked condition. The mobile station should notify the user  
 5       of the maintenance required condition.

6       10. *PACA Message*: If P\_REV\_IN\_USE<sub>S</sub> is less than or equal to four and the mobile  
 7       station does not support PACA capability, the mobile station shall send a *Mobile*  
 8       *Station Reject Order* with the ORDQ field set to '00000110' (message requires a  
 9       capability that is not supported by the mobile station); otherwise, the mobile  
 10       station shall process the message as follows:

11       If PACA<sub>S</sub> is equal to disabled, the mobile station shall send a *Mobile Station Reject*  
 12       *Order* with the ORDQ field set to '00000010' (message not accepted in this state).

13       If PACA<sub>S</sub> is equal to enabled, the mobile station shall perform the following:

- 14       • If the purpose of the message is to respond to an *Origination Message*  
 15       (PURPOSE<sub>r</sub> is equal to '0000'), the mobile station shall send a *Mobile Station*  
 16       *Reject Order* with the ORDQ field set to '00000010' (message not accepted in  
 17       this state).
- 18       • If the purpose of the message is to provide the queue position of the PACA call  
 19       (PURPOSE<sub>r</sub> is equal to '0001'), the mobile station shall set the PACA state timer  
 20       to the duration shown in Table 3.7.2.3.2.20-2 corresponding to the value of  
 21       PACA\_TIMEOUT<sub>S</sub>, should indicate to the user that the PACA call is still queued,  
 22       and should indicate to the user the current queue position (Q\_POS<sub>r</sub>) of the call.
- 23       • If the purpose of the message is to instruct the mobile station to re-originate the  
 24       PACA call (PURPOSE<sub>r</sub> is equal to '0010'), Layer 3 shall send an L2-  
 25       Supervision.Request primitive to Layer 2 to abort any access attempt in  
 26       progress, shall set the PACA state timer to the duration shown in Table  
 27       3.7.2.3.2.20-2 corresponding to the value of PACA\_TIMEOUT<sub>S</sub>, and shall enter  
 28       the *Mobile Station Origination Attempt Substate* with a PACA response  
 29       indication.
- 30       • If the purpose of the message is to cancel the PACA call (PURPOSE<sub>r</sub> is equal to  
 31       '0011'), the mobile station shall set PACA<sub>S</sub> to disabled and PACA\_CANCEL to '0',  
 32       shall disable the PACA state timer, and should indicate to the user that the  
 33       PACA call has been canceled.

34       11. *Registration Accepted Order*: The mobile station shall perform the procedures  
 35       specified in 2.6.11.1

36       12. *Registration Rejected Order*: This order indicates that normal service is not  
 37       available on this system. The mobile station shall disable the full-TMSI timer. If  
 38       the received order specifies to delete the TMSI (ORDQ = '00000100'), the mobile  
 39       station shall set all the bits of the TMSI\_CODE<sub>S-p</sub> to '1'. The mobile station shall  
 40       enter the *System Determination Substate* of the *Mobile Station Initialization State*  
 41       with a registration rejected indication (see 2.6.1.1).

- 1      13. *Release Order*: If NDSS\_ORIG<sub>S</sub> is equal to enabled, the mobile station shall set  
2      NDSS\_ORIG<sub>S</sub> to disabled, and should indicate to the user that the call origination  
3      has been canceled. The mobile station shall enter the *Mobile Station Idle State* or  
4      the *System Determination Substate* of the *Mobile Station Initialization State* with a  
5      release indication (see 2.6.1.1). If the mobile station enters the *Mobile Station Idle*  
6      *State*, and if PACA<sub>S</sub> is equal to enabled, the mobile station shall set PACA<sub>S</sub> to  
7      disabled and PACA\_CANCEL to '0', shall disable the PACA state timer, and should  
8      indicate to the user that the PACA call has been canceled.
- 9      14. *Retry Order*: The mobile station shall process the message as follows:
- 10      • If RETRY\_TYPE<sub>R</sub> is equal to '000', the mobile station shall set  
11      RETRY\_DELAY<sub>S</sub>[RETRY\_TYPE] to 0, where RETRY\_TYPE is equal to '001', '010',  
12      '011', '100', or '101'.
  - 13      • If RETRY\_TYPE<sub>R</sub> is equal to '001', '100', or '101', the mobile station shall perform  
14      the following:
    - 15      – If RETRY\_DELAY<sub>R</sub> is equal to '00000000', then the mobile station shall set  
16      RETRY\_DELAY<sub>S</sub>[RETRY\_TYPE<sub>R</sub>] to 0.
    - 17      – If RETRY\_DELAY<sub>R</sub> is not equal to '00000000', the mobile station shall set  
18      RETRY\_DELAY<sub>S</sub>[RETRY\_TYPE<sub>R</sub>] as follows:
      - 19      + If the most significant bit of the RETRY\_DELAY<sub>R</sub> is '0', set  
20      RETRY\_DELAY\_UNIT<sub>S</sub> to 1000ms. If the most significant bit of the  
21      RETRY\_DELAY<sub>R</sub> is '1', set RETRY\_DELAY\_UNIT<sub>S</sub> to 60000ms.
      - 22      + The mobile station shall set RETRY\_DELAY\_VALUE<sub>S</sub> to the seven least  
23      significant bits of RETRY\_DELAY<sub>R</sub>.
      - 24      + The mobile station shall store the next system time 80 ms boundary +  
25      RETRY\_DELAY\_VALUE<sub>S</sub> × RETRY\_DELAY\_UNIT<sub>S</sub> ms as  
26      RETRY\_DELAY<sub>S</sub>[RETRY\_TYPE<sub>R</sub>].
- 27      15. *Security Mode Command Message*: The mobile station shall perform the procedures  
28      as specified in 2.6.11.4.
- 29      16. *Service Redirection Message*: The mobile station shall process the message as  
30      follows:
- 31      • If the mobile station is directed to an unsupported operation mode or band  
32      class, the mobile station shall respond with a *Mobile Station Reject Order* with  
33      ORDQ equal to '00000110' (message requires a capability that is not supported  
34      by the mobile station).
  - 35      • If DELETE\_TMSI<sub>R</sub> is equal to '1', the mobile station shall set all the bits of  
36      TMSI\_CODE<sub>S-p</sub> to '1'. The mobile station shall disable the full-TMSI timer.
  - 37      • The mobile station shall set RETURN\_IF\_FAIL<sub>S</sub> = RETURN\_IF\_FAIL<sub>R</sub>.

- 1       • If RECORD\_TYPE<sub>r</sub> is equal to '00000000', the mobile station shall enter the  
2       *System Determination Substate* of the *Mobile Station Initialization State* with an  
3       NDSS off indication (see 2.6.1.1); otherwise, the mobile station shall store the  
4       redirection record received in the message as REDIRECT\_REC<sub>s</sub> and shall enter  
5       the *System Determination Substate* of the *Mobile Station Initialization State* with  
6       a redirection indication (see 2.6.1.1).
- 7       17. *SSD Update Message*: If the registration access was initiated due to a user  
8       direction to power down, the mobile station shall ignore the message. Otherwise,  
9       the mobile station shall respond to the message as specified in 2.3.12.1.5.
- 10      18. *Status Request Message*: The mobile station shall disable the *System Access State*  
11      timer and respond to the message. If P\_REV\_IN\_USE<sub>s</sub> is less than or equal to three,  
12      the mobile station shall respond with a *Status Response Message*. If  
13      P\_REV\_IN\_USE<sub>s</sub> is greater than three, the mobile station shall respond with an  
14      *Extended Status Response Message*. If the message does not specify any  
15      qualification information (QUAL\_INFO\_TYPE<sub>r</sub> is equal to '00000000'), the mobile  
16      station shall include the requested information records in the response. If the  
17      message specifies a band class (QUAL\_INFO\_TYPE<sub>r</sub> is equal to '00000001'), the  
18      mobile station shall only include the requested information records for the specified  
19      band class (BAND\_CLASS<sub>r</sub>) in the response. If the message specifies a band class  
20      and an operating mode (QUAL\_INFO\_TYPE<sub>r</sub> is equal to '00000010'), the mobile  
21      station shall only include the requested information records for the specified band  
22      class (BAND\_CLASS<sub>r</sub>) and operating mode (OP\_MODE<sub>r</sub>) in the response.
- 23      If the message specifies a band class or a band class and an operating mode which  
24      are not supported by the mobile station, the mobile station shall send a *Mobile*  
25      *Station Reject Order* with ORDQ set to '00000110' (message requires a capability  
26      that is not supported by the mobile station). If the response to this message  
27      exceeds the allowable length, the mobile station shall send a *Mobile Station Reject*  
28      *Order* with ORDQ set to '00001000' (response message would exceed the allowable  
29      length). If the message specifies an information record which is not supported by  
30      the mobile station for the specified band class and operating mode, the mobile  
31      station shall send a *Mobile Station Reject Order* with ORDQ set to '00001001'  
32      (information record is not supported for the specified band class and operating  
33      mode).
- 34      19. *TMSI Assignment Message*: The mobile station shall store the TMSI zone and code  
35      as follows:
- 36      • The mobile station shall store the length of the TMSI zone field by setting  
37      ASSIGNING\_TMSI\_ZONE\_LEN<sub>s-p</sub> to TMSI\_ZONE\_LEN<sub>r</sub>;
- 38      • The mobile station shall store the assigning TMSI zone number by setting the  
39      ASSIGNING\_TMSI\_ZONE\_LEN<sub>s-p</sub> least significant octets of  
40      ASSIGNING\_TMSI\_ZONE<sub>s-p</sub> to TMSI\_ZONE<sub>r</sub>, and
- 41      • The mobile station shall store the TMSI code by setting TMSI\_CODE<sub>s-p</sub> to  
42      TMSI\_CODE<sub>r</sub>.

The mobile station shall set the TMSI expiration time by setting TMSI\_EXP\_TIME<sub>s-p</sub> to TMSI\_EXP\_TIME<sub>r</sub>. The mobile station shall disable the full-TMSI timer. The mobile station shall then respond with a *TMSI Assignment Completion Message* within T<sub>56m</sub> seconds.

#### 20. *User Zone Reject Message*

21. *General Page Message* or *Universal Page Message*: If the mobile station receives a mobile-station-addressed page, the mobile station may determine if there is a page match (see 2.6.2.3). If a match is declared, the mobile station shall perform the following:

- Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any access attempt in progress.
- The mobile station shall enter the *Page Response Substate*.

22. *Extended Channel Assignment Message*: If the DIRECT\_CH\_ASSIGN\_IND<sub>r</sub> is included and is set to '1', the mobile station shall perform the following:

- Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any access attempt in progress.
- The mobile station shall process the message as specified in section 2.6.3.3.

Otherwise, the mobile station shall ignore this message.

#### 23. *Fast Call Setup Order*

- If ORDQ<sub>r</sub> is equal to '00000000', the mobile station shall process the message and respond with a *Fast Call Setup Order* as specified in 2.6.12.1.
- If ORDQ<sub>r</sub> is equal to '00000001', the mobile station shall process the message as specified in 2.6.12.1.

24. *General Extension Message*: The mobile station shall process this message as specified in section 2.6.18.

25. *Any other message*: If the mobile station receives any other message specified in Table 3.7.2.3-1, it shall ignore all Layer 3 fields. The mobile station shall ignore all other messages.

#### 2.6.3.7 Mobile Station Message Transmission Substate

In this substate, the mobile station sends a *Data Burst Message*, a *Device Information Message*, a *Radio Environment Message*, or a *Fast Call Setup Order*. If the base station responds with an authentication request, the mobile station responds in this substate.

Support of this substate is optional.

If a message received from the base station requires a Layer 2 acknowledgment and does not require a Layer 3 response, Layer 3 shall indicate to Layer 2 that no response is outstanding (see [4]).

If a message received from the base station requires a Layer 2 acknowledgment and also a Layer 3 response, Layer 3 shall indicate to Layer 2 that a response is outstanding (see [4]).

1 When transmitting a response to a message received from the base station, Layer 3 shall  
2 indicate to Layer 2 that the type of the message is a response (see [4]).

3 When transmitting an autonomous message (i.e., a message that is not sent as a response  
4 to a message received from the base station) other than the *Data Burst Message*, Layer 3  
5 shall indicate to Layer 2 that the message is a request other than a registration request or  
6 a message transmission request (see [4]).

7 When transmitting an autonomous *Data Burst Message*, Layer 3 shall indicate to Layer 2  
8 that the type of the message is a request that is a message transmission (see [4]).

9 The mobile station shall not send any Short Data Burst (see [30], [42]) until the maximum  
10 of the system time stored in RETRY\_DELAY<sub>S</sub>[100] and RETRY\_DELAY<sub>S</sub>[101].

11 Upon entering the *Mobile Station Message Transmission Substate*, the mobile station shall  
12 transmit the message as follows:

- 13 • The mobile station shall exit the *Mobile Station Message Transmission Substate*,  
14 shall enter either the *Mobile Station Idle State* or the *System Determination Substate*  
15 with an ACCT blocked indication, and should indicate to the user that the message  
16 transmission has terminated if all of the following conditions are true:
  - 17 – P\_REV\_IN\_USE<sub>S</sub> is greater than six,
  - 18 – ACCT is enabled for the service option number associated with the *Data Burst*  
19 *Message*, due to either of the following two conditions:
    - 20 + The service option number associated with the *Data Burst Message* is equal  
21 to an ACCT\_SO entry in ACCT\_SO\_LIST, or
    - 22 + The service option group number of the service option associated with the  
23 *Data Burst Message* is equal to an ACCT\_SO\_GRP entry in  
24 ACCT\_SO\_GRP\_LIST.
- 25 • If the mobile station entered this substate with a message transmission indication,  
26 the mobile station shall transmit the *Data Burst Message* to the base station.
- 27 • If the mobile station entered this substate with a hook status indication, the mobile  
28 station shall set the autonomous message timer equal to AUTO\_MSG\_INTERVAL<sub>S</sub>  
29 and shall start the timer. The mobile station shall transmit the Device Information  
30 Message to the base station, with the RECORD\_TYPE field of the message set to  
31 00100000 and the Hook Indicator field set to the current hook status.
- 32 • If the mobile station entered this substate with a radio environment report  
33 indication, the mobile station shall transmit the *Radio Environment Message* to the  
34 base station in assured mode, and increment RER\_COUNT upon receiving  
35 confirmation of delivery. If, after incrementing, RER\_COUNT is equal to  
36 RER\_MAX\_NUM\_MSG<sub>S</sub>, the mobile station shall set RER\_MODE\_ENABLED to NO.  
37 If RER\_MODE\_ENABLED is set to NO and TKZ\_MODE\_PENDING is equal to YES,  
38 the mobile station shall perform the following:
  - 39 – Set TKZ\_MODE\_ENABLED to YES and TKZ\_MODE\_PENDING to NO.

- 1       – If TKZ\_SID<sub>S</sub> is equal to SID<sub>S</sub>, TKZ\_NID<sub>S</sub> is equal to NID<sub>S</sub>, and  
2       TKZ\_MODE\_SUPPORTED<sub>S</sub> is equal to '1', initialize the tracking zone list  
3       (TKZ\_LIST) to contain TKZ\_ID<sub>S</sub>; otherwise, initialize the tracking zone list to  
4       NULL.
- 5       – Enable the tracking zone update timer with an initial value of infinity if  
6       TKZ\_UPDATE\_PRD<sub>S</sub> is equal to '1111'; otherwise, the mobile station shall  
7       enable the tracking zone update timer with an initial value of  $2^{TKZ\_UPDATE\_PRD_S + 6}$   
8       seconds.
- 9       • If the mobile station entered this substate with a tracking zone indication, the  
10       mobile station shall perform the following:
- 11       – The mobile station shall transmit the *Radio Environment Message* to the base  
12       station.
- 13       – If the mobile station receives confirmation of delivery of *Radio Environment*  
14       *Message*, the mobile station shall add TKZ\_ID<sub>S</sub> to TKZ\_LIST. For all entries of  
15       TKZ\_LIST whose TKZ timer is not active, other than TKZ\_ID<sub>S</sub>, enable the TKZ  
16       timer with the duration specified by TKZ\_TIMER<sub>S</sub>. If TKZ\_LIST contains more  
17       than TKZ\_LIST\_LEN<sub>S</sub> + 1 entries, the entry with active TKZ timer with smallest  
18       remaining TKZ timer value shall be removed from the list before adding the new  
19       entry.
- 20       – The mobile station shall increment TKZ\_COUNT upon receiving confirmation of  
21       delivery. If, after incrementing, TKZ\_COUNT is equal to TKZ\_MAX\_NUM\_MSG<sub>S</sub>,  
22       the mobile station shall disable the tracking zone update timer and set  
23       TKZ\_MODE\_ENABLED to NO.
- 24       • If the mobile station entered this substate with a fast call setup indication, the  
25       mobile station shall transmit the *Fast Call Setup Order* (ORDQ = '00000000') to the  
26       base station as follows:
- 27       – If the mobile station requests operation in the reduced slot cycle mode, the  
28       mobile station shall set the RSC\_MODE\_IND field to '1' and perform the  
29       following:
- 30       + Set RSC\_MODE\_ENABLED to YES.
- 31       + Set the RSC\_END\_TIME\_UNIT and RSC\_END\_TIME\_VALUE fields as  
32       specified in 2.7.3.6, and store the system time specified by these fields as  
33       RSC\_END\_TIME.
- 34       + Set the RSCI field as specified in 2.7.3.6 and store it as RSCI<sub>S</sub>; if RSCI<sub>S</sub> is  
35       equal to '0111', set SLOTTED<sub>S</sub> to NO.
- 36       + Set IGNORE\_QPCH<sub>S</sub> to '1'.
- 37       – Otherwise, the mobile station shall set the RSC\_MODE\_IND field to '0'.
- 38       While in this substate, the mobile station shall monitor the Paging Channel or the Forward  
39       Common Control Channel. If the mobile station declares a loss of the Paging Channel or

the Forward Common Control Channel (see 2.6.3.1.8), the mobile station shall perform the following:

- If PACA<sub>S</sub> is equal to enabled, the mobile station shall set PACA<sub>S</sub> to disabled and PACA\_CANCEL to '0', shall disable the PACA state timer, and should indicate to the user that the PACA call has been canceled.
- The mobile station shall declare an access attempt failure and update its registration variables as specified in 2.6.5.5.3.2.
- The mobile station shall disable its transmitter and enter the *Mobile Station Idle State*.

If the mobile station receives confirmation of any message sent by the mobile station in this substate, it shall send a response in this substate if required and shall then enter the *Mobile Station Idle State*.

If PACA<sub>S</sub> is equal to enabled, the mobile station shall set PACA\_CANCEL to '1' when the user directs the mobile station to cancel a PACA call.

If the mobile station is to exit the *System Access State* as a result of processing Layer 3 fields of a message requiring an acknowledgment, the mobile station shall exit the *System Access State* after Layer 3 receives an indication from Layer 2 that the acknowledgment to the message has been sent and acknowledged.

If Layer 3 receives a message other than message listed below:

- *Extended Channel Assignment Message* with DIRECT\_CH\_ASSIGN\_IND field included and set to '1'

with an indication from Layer 2 that an access attempt for a message being transmitted was not terminated as a result of processing the Layer 2 fields of the received message, the mobile station shall ignore the received message.

The following directed messages and orders can be received. If any field value of the message or order is outside its permissible range, the mobile station may send a *Mobile Station Reject Order* with ORDQ equal to '00000100' (message field not in valid range).

1. *Authentication Challenge Message*: The mobile station shall respond to the message as specified in 2.3.12.1.4, regardless of the value of AUTH<sub>S</sub>.
2. *Authentication Request Message*: The mobile station shall process the message and shall respond as specified in 2.3.12.5.2.
3. *Base Station Challenge Confirmation Order*: The mobile station shall respond to the message as specified in 2.3.12.1.5.
4. *Base Station Reject Order*: The mobile station shall perform the procedures as specified in 2.6.11.5.
5. *Data Burst Message*
6. *Local Control Order*
7. *Lock Until Power-Cycled Order*: The mobile station shall disable its transmitter and record the reason for the *Lock Until Power-Cycled Order* in the mobile station's

semi-permanent memory (LCKRSN<sub>P<sub>S</sub>-p</sub> equals the least significant four bits of ORDQ<sub>r</sub>). The mobile station should notify the user of the locked condition. The mobile station shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a lock indication (see 2.6.1.1), and shall not enter the *System Access State* again until after the next mobile station power-up or until it has received an *Unlock Order*. This requirement shall take precedence over any other mobile station requirement specifying entry to the *System Access State*.

8. *Maintenance Required Order*: The mobile station shall record the reason for the *Maintenance Required Order* in the mobile station's semi-permanent memory (MAINTRSN<sub>S-p</sub> equals the least significant four bits of ORDQ<sub>r</sub>). The mobile station shall remain in the unlocked condition. The mobile station should notify the user of the maintenance required condition.

9. *PACA Message*: If P\_REV\_IN\_USE<sub>S</sub> is less than or equal to four and the mobile station does not support PACA capability, the mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00000110' (message requires a capability that is not supported by the mobile station); otherwise, the mobile station shall process the message as follows:

If PACA<sub>S</sub> is equal to disabled, the mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00000010' (message not accepted in this state).

If PACA<sub>S</sub> is equal to enabled, the mobile station shall perform the following:

- If the purpose of the message is to respond to an *Origination Message* (PURPOSE<sub>r</sub> is equal to '0000'), the mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00000010' (message not accepted in this state).
- If the purpose of the message is to provide the queue position of the PACA call (PURPOSE<sub>r</sub> is equal to '0001'), the mobile station shall set the PACA state timer to the duration shown in Table 3.7.2.3.2.20-2 corresponding to the value of PACA\_TIMEOUT<sub>S</sub>, should indicate to the user that the PACA call is still queued, and should indicate to the user the current queue position (Q\_POS<sub>r</sub>) of the call.
- If the purpose of the message is to instruct the mobile station to re-originate the PACA call (PURPOSE<sub>r</sub> is equal to '0010'), Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any access attempt in progress, shall set the PACA state timer to the duration shown in Table 3.7.2.3.2.20-2 corresponding to the value of PACA\_TIMEOUT<sub>S</sub>, and shall enter the *Mobile Station Origination Attempt Substate* with a PACA response indication.
- If the purpose of the message is to cancel the PACA call (PURPOSE<sub>r</sub> is equal to '0011'), the mobile station shall set PACA<sub>S</sub> to disabled and PACA\_CANCEL to '0', shall disable the PACA state timer, and should indicate to the user that the PACA call has been canceled.

10. *Registration Accepted Order*: The mobile station shall perform the procedures as specified in 2.6.11.1.

11. *Registration Rejected Order*: This order indicates that normal service is not available on this system. The mobile station shall disable the full-TMSI timer. If the received order specifies to delete the TMSI (ORDQ = '00000100'), the mobile station shall set all the bits of the TMSI\_CODE<sub>S-p</sub> to '1'. The mobile station shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a registration rejected indication (see 2.6.1.1).
12. *Retry Order*: The mobile station shall process the message as follows:
- If RETRY\_TYPE<sub>R</sub> is equal to '000', the mobile station shall set RETRY\_DELAY<sub>S</sub>[RETRY\_TYPE] to 0, where RETRY\_TYPE is equal to '001', '010', '011', '100', or '101'.
  - If RETRY\_TYPE<sub>R</sub> is equal to '001', '100', or '101', the mobile station shall perform the following:
    - If RETRY\_DELAY<sub>R</sub> is equal to '00000000', then the mobile station shall set RETRY\_DELAY<sub>S</sub>[RETRY\_TYPE<sub>R</sub>] to 0.
    - If RETRY\_DELAY<sub>R</sub> is not equal to '00000000', the mobile station shall set RETRY\_DELAY<sub>S</sub>[RETRY\_TYPE<sub>R</sub>] as follows:
      - + If the most significant bit of the RETRY\_DELAY<sub>R</sub> is '0', set RETRY\_DELAY\_UNIT<sub>S</sub> to 1000ms. If the most significant bit of the RETRY\_DELAY<sub>R</sub> is '1', set RETRY\_DELAY\_UNIT<sub>S</sub> to 60000ms.
      - + The mobile station shall set RETRY\_DELAY\_VALUE<sub>S</sub> to the seven least significant bits of RETRY\_DELAY<sub>R</sub>.
      - + The mobile station shall store the next system time 80 ms boundary + RETRY\_DELAY\_VALUE<sub>S</sub> × RETRY\_DELAY\_UNIT<sub>S</sub> ms as RETRY\_DELAY<sub>S</sub>[RETRY\_TYPE<sub>R</sub>].
13. *Security Mode Command Message*: The mobile station shall perform the procedures as specified in 2.6.11.4.
14. *Service Redirection Message*: The mobile station shall process the message as follows:
- If the mobile station is directed to an unsupported operation mode or band class, the mobile station shall respond with a *Mobile Station Reject Order* with ORDQ equal to '00000110' (message requires a capability that is not supported by the mobile station).
  - If DELETE\_TMSI<sub>R</sub> is equal to '1', the mobile station shall set all the bits of TMSI\_CODE<sub>S-p</sub> to '1'. The mobile station shall disable the full-TMSI timer.
  - The mobile station shall set RETURN\_IF\_FAIL<sub>S</sub> = RETURN\_IF\_FAIL<sub>R</sub>.

- If RECORD\_TYPE<sub>r</sub> is equal to '00000000', the mobile station shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with an NDSS off indication (see 2.6.1.1); otherwise, the mobile station shall store the redirection record received in the message as REDIRECT\_REC<sub>s</sub> and shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a redirection indication (see 2.6.1.1).

15. *SSD Update Message*: The mobile station shall respond to the message as specified in 2.3.12.1.5.

16. *Status Request Message*: The mobile station shall disable the *System Access State* timer and respond to the message. If P\_REV\_IN\_USE<sub>s</sub> is less than or equal to three, the mobile station shall respond with a *Status Response Message*. If P\_REV\_IN\_USE<sub>s</sub> is greater than three, the mobile station shall respond with an *Extended Status Response Message*. If the message does not specify any qualification information (QUAL\_INFO\_TYPE<sub>r</sub> is equal to '00000000'), the mobile station shall include the requested information records in the response. If the message specifies a band class (QUAL\_INFO\_TYPE<sub>r</sub> is equal to '00000001'), the mobile station shall only include the requested information records for the specified band class (BAND\_CLASS<sub>r</sub>) in the response. If the message specifies a band class and an operating mode (QUAL\_INFO\_TYPE<sub>r</sub> is equal to '00000010'), the mobile station shall only include the requested information records for the specified band class (BAND\_CLASS<sub>r</sub>) and operating mode (OP\_MODE<sub>r</sub>) in the response.

If the message specifies a band class or a band class and an operating mode which is not supported by the mobile station, the mobile station shall send a *Mobile Station Reject Order* with ORDQ set to '00000110' (message requires a capability that is not supported by the mobile station). If the response to this message exceeds the allowable length, the mobile station shall send a *Mobile Station Reject Order* with ORDQ set to '00001000' (response message would exceed the allowable length). If the message specifies an information record which is not supported by the mobile station for the specified band class and operating mode, the mobile station shall send a *Mobile Station Reject Order* with ORDQ set to '00001001' (information record is not supported for the specified band class and operating mode).

17. *TMSI Assignment Message*: The mobile station shall store the TMSI zone and code as follows:

- The mobile station shall store the length of the TMSI zone field by setting ASSIGNING\_TMSI\_ZONE\_LEN<sub>s-p</sub> to TMSI\_ZONE\_LEN<sub>r</sub>,
- The mobile station shall store the assigning TMSI zone number by setting the ASSIGNING\_TMSI\_ZONE\_LEN<sub>s-p</sub> least significant octets of ASSIGNING\_TMSI\_ZONE<sub>s-p</sub> to TMSI\_ZONE<sub>r</sub>, and
- The mobile station shall store the TMSI code by setting TMSI\_CODE<sub>s-p</sub> to TMSI\_CODE<sub>r</sub>.

The mobile station shall set the TMSI expiration time by setting TMSI\_EXP\_TIME<sub>s-p</sub> to TMSI\_EXP\_TIME<sub>r</sub>. The mobile station shall disable the

1 full-TMSI timer. The mobile station shall then respond with a *TMSI Assignment*  
2 *Completion Message* within T<sub>56m</sub> seconds.

3 18. *General Page Message* or *Universal Page Message*: If the mobile station receives a  
4 mobile-station-addressed page, the mobile station may determine whether there is  
5 a page match (see 2.6.2.3). If a match is declared, the mobile station shall perform  
6 the following:

- 7 • Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any  
8 access attempt in progress.
- 9 • If the mobile station entered this substate with a message transmission  
10 indication, the mobile station may store the *Data Burst Message* for later  
11 transmission.
- 12 • The mobile station shall enter the *Page Response Substate*.

13 19. *Extended Channel Assignment Message*: If the DIRECT\_CH\_ASSIGN\_IND<sub>r</sub> is  
14 included and is set to '1', the mobile station shall perform the following:

- 15 • If the mobile station entered this substate with a message transmission  
16 indication, the mobile station may store the *Data Burst Message* for later  
17 transmission.
- 18 • Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any  
19 access attempt in progress.
- 20 • The mobile station shall process the message as specified in section 2.6.3.3.

21 Otherwise, the mobile station shall ignore this message.

22 20. *Fast Call Setup Order*:

- 23 • If ORDQ<sub>r</sub> is equal to '00000000', the mobile station shall process the message  
24 and respond with a *Fast Call Setup Order* as specified in 2.6.12.1.
- 25 • If ORDQ<sub>r</sub> is equal to '00000001', the mobile station shall process the message  
26 as specified in 2.6.12.1.

27 21. *General Extension Message*: The mobile station shall process this message as  
28 specified in section 2.6.18.

29 22. *Any other message*: If the mobile station receives any other message specified in  
30 Table 3.7.2.3-1, it shall ignore all Layer 3 fields. The mobile station shall ignore all  
31 other messages.

### 32 2.6.3.8 PACA Cancel Substate

33 In this substate, the mobile station sends a *PACA Cancel Message*. If the base station  
34 responds with an authentication request, the mobile station responds in this substate.

35 Upon entering the *PACA Cancel Substate*, the mobile station shall transmit the *PACA*  
36 *Cancel Message*.

1 If a message received from the base station requires a Layer 2 acknowledgment and does  
 2 not require a Layer 3 response, Layer 3 shall indicate to Layer 2 that no response is  
 3 outstanding (see [4]).

4 If a message received from the base station requires a Layer 2 acknowledgment and also a  
 5 Layer 3 response, Layer 3 shall indicate to Layer 2 that a response is outstanding (see [4]).

6 When transmitting a response to a message received from the base station, Layer 3 shall  
 7 indicate to Layer 2 that the type of the message is a response (see [4]).

8 When transmitting an autonomous message (i.e., a message that is not sent as a response  
 9 to a message received from the base station), Layer 3 shall indicate to Layer 2 that the type  
 10 of the message is a request other than a registration request or a message transmission  
 11 request (see [4]).

12 While in this substate, the mobile station shall monitor the Paging Channel or the Forward  
 13 Common Control Channel. If the mobile station declares a loss of the Paging Channel or  
 14 the Forward Common Control Channel (see 2.6.3.1.8), it shall declare an access attempt  
 15 failure and update its registration variables as specified in 2.6.5.5.3.2, disable its  
 16 transmitter and enter the *Mobile Station Idle State*. If the mobile station receives  
 17 confirmation of any message sent by the mobile station in this substate, it shall send a  
 18 response in this substate if required and shall then enter the *Mobile Station Idle State*.

19 If the mobile station is to exit the *System Access State* as a result of processing Layer 3  
 20 fields of a message requiring an acknowledgment, the mobile station shall exit the *System*  
 21 *Access State* after Layer 3 receives an indication from Layer 2 that the acknowledgment to  
 22 the message has been sent and acknowledged.

23 If Layer 3 receives a message other than message listed below:

- 24 • *Extended Channel Assignment Message* with DIRECT\_CH\_ASSIGN\_IND field  
 25 included and set to '1'

26 with an indication from Layer 2 that an access attempt for a message being transmitted  
 27 was not terminated as a result of processing the Layer 2 fields of the received message, the  
 28 mobile station shall ignore the received message.

29 The following directed messages and orders can be received. If any field value of the  
 30 message or order is outside its permissible range, the mobile station may send a *Mobile*  
 31 *Station Reject Order* with ORDQ equal to '00000100' (message field not in valid range).

- 32 1. *Authentication Challenge Message*: The mobile station shall respond to the  
 33 message as specified in 2.3.12.1.4, regardless of the value of AUTH<sub>S</sub>.
- 34 2. *Authentication Request Message*: The mobile station shall process the message and  
 35 shall respond as specified in 2.3.12.5.2.
- 36 3. *Base Station Challenge Confirmation Order*: The mobile station shall respond to the  
 37 message as specified in 2.3.12.1.5.
- 38 4. *Base Station Reject Order*: The mobile station shall perform the procedures as  
 39 specified in 2.6.11.5.
- 40 5. *Data Burst Message*

1        6. *Local Control Order*

2        7. *Lock Until Power-Cycled Order*: The mobile station shall disable its transmitter and  
 3        record the reason for the *Lock Until Power-Cycled Order* in the mobile station's  
 4        semi-permanent memory (LCKRSN<sub>P</sub>-p equals the least significant four bits of  
 5        ORDQ<sub>R</sub>). The mobile station should notify the user of the locked condition. The  
 6        mobile station shall enter the *System Determination Substate* of the *Mobile Station*  
 7        *Initialization State* with a lock indication (see 2.6.1.1), and shall not enter the  
 8        *System Access State* again until after the next mobile station power-up or until it  
 9        has received an *Unlock Order*. This requirement shall take precedence over any  
 10       other mobile station requirement specifying entry to the *System Access State*.

11       8. *Maintenance Required Order*: The mobile station shall record the reason for the  
 12       *Maintenance Required Order* in the mobile station's semi-permanent memory  
 13       (MAINTRSN<sub>S</sub>-p equals the least significant four bits of ORDQ<sub>R</sub>). The mobile station  
 14       shall remain in the unlocked condition. The mobile station should notify the user  
 15       of the maintenance required condition.

16       9. *PACA Message*: The mobile station shall send a *Mobile Station Reject Order* with  
 17       the ORDQ field set to '00000010' (message not accepted in this state).

18       10. *Registration Accepted Order*: The mobile station shall perform the procedures as  
 19       specified in 2.6.11.1.

20       11. *Registration Rejected Order*: This order indicates that normal service is not available  
 21       on this system. The mobile station shall disable the full-TMSI timer. If the received  
 22       order specifies to delete the TMSI (ORDQ = '00000100'), the mobile station shall set  
 23       all the bits of the TMSI\_CODE<sub>S</sub>-p to '1'. The mobile station shall enter the *System*  
 24       *Determination Substate* of the *Mobile Station Initialization State* with a registration  
 25       rejected indication (see 2.6.1.1).

26       12. *Retry Order*: The mobile station shall process the message as follows:

- 27       • If RETRY\_TYPE<sub>R</sub> is equal to '000', the mobile station shall set  
 28       RETRY\_DELAY<sub>S</sub>[RETRY\_TYPE] to 0, where RETRY\_TYPE is equal to '001', '010',  
 29       '011', '100', or '101'.
- 30       • If RETRY\_TYPE<sub>R</sub> is equal to '001', '100', or '101', the mobile station shall perform  
 31       the following:
  - 32       – If RETRY\_DELAY<sub>R</sub> is equal to '00000000', then the mobile station shall set  
 33       RETRY\_DELAY<sub>S</sub>[RETRY\_TYPE<sub>R</sub>] to 0.
  - 34       – If RETRY\_DELAY<sub>R</sub> is not equal to '00000000', the mobile station shall set  
 35       RETRY\_DELAY<sub>S</sub>[RETRY\_TYPE<sub>R</sub>] as follows:
    - 36       + If the most significant bit of the RETRY\_DELAY<sub>R</sub> is '0', set  
 37       RETRY\_DELAY\_UNIT<sub>S</sub> to 1000ms. If the most significant bit of the  
 38       RETRY\_DELAY<sub>R</sub> is '1', set RETRY\_DELAY\_UNIT<sub>S</sub> to 60000ms.
    - 39       + The mobile station shall set RETRY\_DELAY\_VALUE<sub>S</sub> to the seven least  
 40       significant bits of RETRY\_DELAY<sub>R</sub>.

- 1                   + The mobile station shall store the next system time 80 ms boundary +  
 2                   RETRY\_DELAY\_VALUE<sub>S</sub> × RETRY\_DELAY\_UNIT<sub>S</sub> ms as  
 3                   RETRY\_DELAY<sub>S</sub>[RETRY\_TYPE<sub>R</sub>].
- 4   13. *Security Mode Command Message*: The mobile station shall perform the procedures  
 5       as specified in 2.6.11.4.
- 6   14. *Service Redirection Message*: The mobile station shall process the message as  
 7       follows:
- 8       • If the mobile station is directed to an unsupported operation mode or band  
 9         class, the mobile station shall respond with a *Mobile Station Reject Order* with  
 10        ORDQ equal to '00000110' (message requires a capability that is not supported  
 11        by the mobile station).
  - 12       • If DELETE\_TMSI<sub>R</sub> is equal to '1', the mobile station shall set all the bits of  
 13        TMSI\_CODE<sub>S-p</sub> to '1'. The mobile station shall disable the full-TMSI timer.
  - 14       • The mobile station shall set RETURN\_IF\_FAIL<sub>S</sub> = RETURN\_IF\_FAIL<sub>R</sub>.
  - 15       • If RECORD\_TYPE<sub>R</sub> is equal to '00000000', the mobile station shall enter the  
 16        *System Determination Substate* of the *Mobile Station Initialization State* with an  
 17        NDSS off indication (see 2.6.1.1); otherwise, the mobile station shall store the  
 18        redirection record received in the message as REDIRECT\_REC<sub>S</sub> and shall enter  
 19        the *System Determination Substate* of the *Mobile Station Initialization State* with  
 20        a redirection indication (see 2.6.1.1).
- 21   15. *SSD Update Message*: The mobile station shall respond to the message as specified  
 22       in 2.3.12.1.5.
- 23   16. *Status Request Message*: The mobile station shall disable the *System Access State*  
 24       timer and respond to the message. If P\_REV\_IN\_USE<sub>S</sub> is less than or equal to three,  
 25       the mobile station shall respond with a *Status Response Message*. If  
 26       P\_REV\_IN\_USE<sub>S</sub> is greater than three, the mobile station shall respond with an  
 27       *Extended Status Response Message*. If the message does not specify any  
 28       qualification information (QUAL\_INFO\_TYPE<sub>R</sub> is equal to '00000000'), the mobile  
 29       station shall include the requested information records in the response. If the  
 30       message specifies a band class (QUAL\_INFO\_TYPE<sub>R</sub> is equal to '00000001'), the  
 31       mobile station shall only include the requested information records for the specified  
 32       band class (BAND\_CLASS<sub>R</sub>) in the response. If the message specifies a band class  
 33       and an operating mode (QUAL\_INFO\_TYPE<sub>R</sub> is equal to '00000010'), the mobile  
 34       station shall only include the requested information records for the specified band  
 35       class (BAND\_CLASS<sub>R</sub>) and operating mode (OP\_MODE<sub>R</sub>) in the *Status Response*  
 36       *Message*.
- 37       If the message specifies a band class or a band class and an operating mode which  
 38       is not supported by the mobile station, the mobile station shall send a *Mobile*  
 39       *Station Reject Order* with ORDQ set to '00000110' (message requires a capability  
 40       that is not supported by the mobile station). If the response to this message  
 41       exceeds the allowable length, the mobile station shall send a *Mobile Station Reject*  
 42       *Order* with ORDQ set to '00001000' (response message would exceed the allowable

length). If the message specifies an information record which is not supported by the mobile station for the specified band class and operating mode, the mobile station shall send a *Mobile Station Reject Order* with ORDQ set to '00001001' (information record is not supported for the specified band class and operating mode).

17. *TMSI Assignment Message*: The mobile station shall store the TMSI zone and code as follows:

- The mobile station shall store the length of the TMSI zone field by setting ASSIGNING\_TMSI\_ZONE\_LEN<sub>s-p</sub> to TMSI\_ZONE\_LEN<sub>r</sub>,
- The mobile station shall store the assigning TMSI zone number by setting the ASSIGNING\_TMSI\_ZONE\_LEN<sub>s-p</sub> least significant octets of ASSIGNING\_TMSI\_ZONE<sub>s-p</sub> to TMSI\_ZONE<sub>r</sub>, and
- The mobile station shall store the TMSI code by setting TMSI\_CODE<sub>s-p</sub> to TMSI\_CODE<sub>r</sub>.

The mobile station shall set the TMSI expiration time by setting TMSI\_EXP\_TIME<sub>s-p</sub> to TMSI\_EXP\_TIME<sub>r</sub>. The mobile station shall disable the full-TMSI timer. The mobile station shall then respond with a *TMSI Assignment Completion Message* within T<sub>56m</sub> seconds.

18. *General Page Message* or *Universal Page Message*: If the mobile station receives a mobile-station-addressed page, the mobile station may determine whether there is a page match (see 2.6.2.3). If a match is declared, the mobile station shall perform the following:

- Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any access attempt in progress.
- The mobile station shall enter the *Page Response Substate*.

19. *Extended Channel Assignment Message*: If the DIRECT\_CH\_ASSIGN\_IND<sub>r</sub> is included and is set to '1', the mobile station shall perform the following:

- Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to abort any access attempt in progress.
- The mobile station shall process the message as specified in section 2.6.3.3.

Otherwise, the mobile station shall ignore this message.

20. *Fast Call Setup Order*:

- If ORDQ<sub>r</sub> is equal to '00000000', the mobile station shall process the message and respond with a *Fast Call Setup Order* as specified in 2.6.12.1.
- If ORDQ<sub>r</sub> is equal to '00000001', the mobile station shall process the message as specified in 2.6.12.1.

21. *General Extension Message*: The mobile station shall process this message as specified in section 2.6.18.

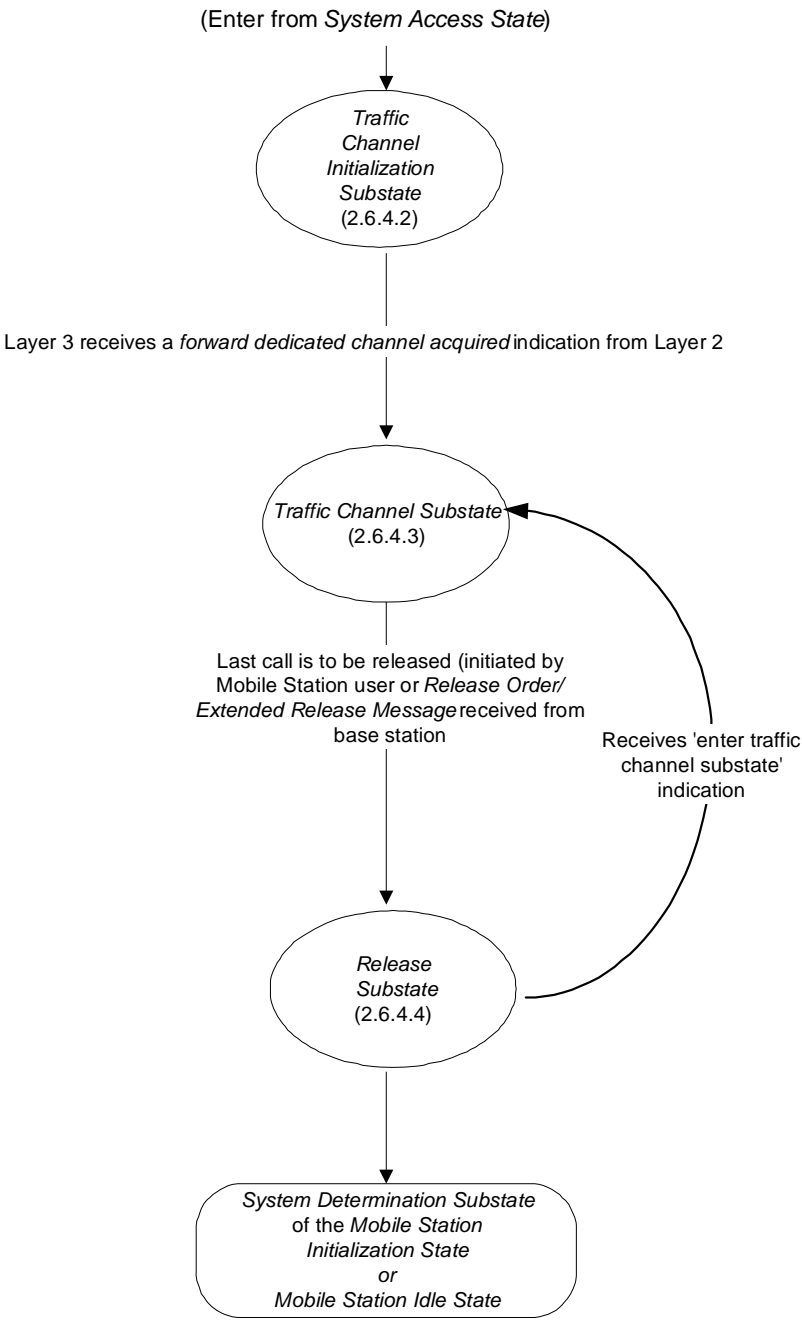

22. *Any other message:* If the mobile station receives any other message specified in Table 3.7.2.3-1, it shall ignore all Layer 3 fields. The mobile station shall ignore all other messages.

#### 2.6.4 Mobile Station Control on the Traffic Channel State

In this state, the mobile station communicates with the base station using the Forward and Reverse Traffic Channels.

As illustrated in Figure 2.6.4-1, the *Mobile Station Control on the Traffic Channel State* consists of the following substates:

- *Traffic Channel Initialization Substate* - In this substate, the mobile station verifies that it can receive the Forward Traffic Channel and begins transmitting on the Reverse Traffic Channel.
- *Traffic Channel Substate* - In this substate, the mobile station exchanges Traffic Channel frames with the base station in accordance with the current service configuration. The mobile station may perform the gating operation of Reverse Pilot Channel. While in this substate, one or more Call Control instances can be activated (see 2.6.10).
- *Release Substate* - In this substate, the mobile station disconnects the calls and the physical channels.

1  
2  
3

**Figure 2.6.4-1. Mobile Station Control on the Traffic Channel State**

#### 1 2.6.4.1 Special Functions and Actions

2 The mobile station performs special functions and actions in one or more of the substates  
3 of the *Mobile Station Control on the Traffic Channel State*.

##### 4 2.6.4.1.1 Forward Traffic Channel Power Control

5 The mobile station uses FPC\_MODE\_NO\_SCH<sub>S</sub> as FPC\_MODE<sub>S</sub> except during the forward  
6 Supplemental Channel assignment interval. During the forward Supplemental Channel  
7 assignment interval, the mobile station uses FPC\_MODE\_SCH<sub>S</sub> as FPC\_MODE<sub>S</sub>.

8 To support Forward Traffic Channel power control, the mobile station reports frame error  
9 rate statistics to the base station. If the base station enables periodic reporting, the mobile  
10 station reports frame error rate statistics at specified intervals. If the base station enables  
11 threshold reporting, the mobile station reports frame error rate statistics when the frame  
12 error rate reaches a specified threshold.<sup>28</sup>

13 The mobile station shall maintain the following frame counters:

- 14 • A counter (TOT\_FRAMES<sub>S</sub>) for the total number of frames received on the Forward  
15 Fundamental Channel.
- 16 • A counter (BAD\_FRAMES<sub>S</sub>) for the number of bad frames detected on the Forward  
17 Fundamental Channel.
- 18 • A counter (DCCH\_TOT\_FRAMES<sub>S</sub>) for the total number of frames received on the  
19 Forward Dedicated Control Channel, when the Dedicated Control Channel is  
20 assigned.
- 21 • A counter (DCCH\_BAD\_FRAMES<sub>S</sub>) for the total number of bad frames received on  
22 the Forward Dedicated Control Channel, when the Dedicated Control Channel is  
23 assigned.

24 The mobile station shall maintain the following counters for each Supplemental Channel  
25 assigned, if FOR\_SCH\_FER\_REP<sub>S</sub> is equal to '1':

- 26 • A counter (SCH\_TOT\_FRAMES<sub>S</sub>) for the number of frames received on the assigned  
27 Supplemental Channel.
- 28 • A counter (SCH\_BAD\_FRAMES<sub>S</sub>) for the number of bad frames received on the  
29 assigned Supplemental Channel.

30 The mobile station shall increment the counter by 1 at every 20 ms interval if a 20ms  
31 frame or at least one 5ms frame is received from the Forward Fundamental Channel or  
32 Dedicated Control Channel:

---

<sup>28</sup> Periodic reporting and threshold reporting may be independently enabled or disabled by the base station.

- 1       • If the received frame is from the Fundamental Channel, the mobile station shall  
2       perform the following:
- 3       – Increment TOT\_FRAMES<sub>S</sub> by 1.
- 4       – If the received 20ms frame is bad or one of the 5ms frames is bad, the mobile  
5       station shall increment BAD\_FRAMES<sub>S</sub> by 1.
- 6       • If the received frame is from the Forward Dedicated Control Channel, the mobile  
7       station shall perform the following:
- 8       – Increment DCCH\_TOT\_FRAMES<sub>S</sub> by 1.
- 9       – If the received 20ms frame is bad or one of the 5ms frames is bad, the mobile  
10      station shall increment DCCH\_BAD\_FRAMES<sub>S</sub> by 1.
- 11      • If either of the following conditions is true:
- 12      – PWR\_THRESH\_ENABLE<sub>S</sub> is equal to '1' and if one of the following conditions is  
13      true:
- 14          + If the mobile station is to perform the primary inner loop estimation on the  
15          received Forward Fundamental Channel [FPC\_PRI\_CHAN<sub>S</sub> = '0'], and  
16          BAD\_FRAMES<sub>S</sub> is equal to PWR\_REP\_THRESH<sub>S</sub> or
- 17          + If the mobile station is to perform the primary inner loop estimation on the  
18          received Forward Dedicated Control Channel [FPC\_PRI\_CHAN<sub>S</sub> = '1'], and  
19          DCCH\_BAD\_FRAMES<sub>S</sub> is equal to PWR\_REP\_THRESH<sub>S</sub>.
- 20      or
- 21      – PWR\_PERIOD\_ENABLE<sub>S</sub> is equal to '1' and if one of the following conditions is  
22      true:
- 23          + If the mobile station is to perform the primary inner loop estimation on the  
24          received Forward Fundamental Channel [FPC\_PRI\_CHAN<sub>S</sub> = '0'], and  
25          TOT\_FRAMES<sub>S</sub> is equal to  $\lfloor (2^{(PWR\_REP\_FRAMES\_S/2)} \times 5) \rfloor$ , or
- 26          + If the mobile station is to perform the primary inner loop estimation on the  
27          received Forward Dedicated Control Channel [FPC\_PRI\_CHAN<sub>S</sub> = '1'], and  
28          DCCH\_TOT\_FRAMES<sub>S</sub> is equal to  $\lfloor (2^{(PWR\_REP\_FRAMES\_S/2)} \times 5) \rfloor$ ,
- 29      then the mobile station shall send a *Power Measurement Report Message* to the  
30      base station. The mobile station should send the *Power Measurement Report*  
31      *Message* in unassured mode. After sending a *Power Measurement Report Message*,  
32      the mobile station shall set TOT\_FRAMES<sub>S</sub>, BAD\_FRAMES<sub>S</sub> to zero, and if the  
33      Dedicated Control Channel is assigned, shall set DCCH\_TOT\_FRAMES<sub>S</sub> and  
34      DCCH\_BAD\_FRAMES<sub>S</sub> to zero. The mobile station shall not increment the  
35      counters for a period of PWR\_REP\_DELAY<sub>S</sub> × 4 frames following the first  
36      transmission of the message.
- 37      • If FPC\_PRI\_CHAN<sub>S</sub> is equal to '0' and TOT\_FRAMES<sub>S</sub> is equal to  
38       $\lfloor (2^{(PWR\_REP\_FRAMES\_S/2)} \times 5) \rfloor$ , the mobile station shall perform the following:
- 39      – Set TOT\_FRAMES<sub>S</sub> and BAD\_FRAMES<sub>S</sub> to zero.

- 1           – Set  $DCCH\_TOT\_FRAMES_S$  and  $DCCH\_BAD\_FRAMES_S$  to zero, if the Dedicated  
2           Control Channel is assigned.
- 3           • If  $FPC\_PRI\_CHAN_S$  is equal to '1' and  $DCCH\_TOT\_FRAMES_S$  is equal to  
4            $\lfloor (2(PWR\_REP\_FRAMES_S/2) \times 5) \rfloor$ , the mobile station shall set  
5            $TOT\_FRAMES_S$ ,  $BAD\_FRAMES_S$ ,  $DCCH\_TOT\_FRAMES_S$ , and  $DCCH\_BAD\_FRAMES_S$   
6           to zero.
- 7   For each received frame from an assigned Supplemental Channel, the mobile station shall  
8   perform the following, if  $FOR\_SCH\_FER\_REP_S$  is equal to '1':
- 9           • Increment  $SCH\_TOT\_FRAMES_S$  by 1.
- 10          • If the received frame is bad, increment  $SCH\_BAD\_FRAMES_S$  by 1.
- 11   At the end of a burst on each assigned Supplemental Channel, if  $FOR\_SCH\_FER\_REP_S$  is  
12   equal to '1', the mobile station shall report the total number of frames received on this  
13   Supplemental Channel ( $SCH\_TOT\_FRAMES_S$ ) and the bad frames detected  
14   ( $SCH\_BAD\_FRAMES_S$ ) with the fields  $SCH\_PWR\_MEAS\_FRAMES$  and  
15    $SCH\_ERRORS\_DETECTED$  in the *Power Measurement Report Message* respectively. After  
16   sending the *Power Measurement Report Message* for the Supplemental Channel, the  
17   mobile station shall set  $SCH\_TOTAL\_FRAMES_S$  and  $SCH\_BAD\_FRAMES_S$  of the reported  
18   SCH to zero.
- 19   If both Forward Fundamental Channel and the Forward Dedicated Control Channel are  
20   assigned to the mobile station, the mobile station shall perform the following:
- 21          • The mobile station shall set  $FPC\_DELTA\_SETPT_S$  to  $(FPC\_FCH\_CURR\_SETPT_S -$   
22           $FPC\_DCCH\_CURR\_SETPT_S)$ .
- 23          • For each received frame, if  $|FPC\_FCH\_CURR\_SETPT_S - FPC\_DCCH\_CURR\_SETPT_S$   
24           $- FPC\_DELTA\_SETPT_S|$  is equal to or greater than its assigned threshold  
25           $FPC\_SETPT\_THRESH_S$ , the mobile station shall send the *Outer Loop Report*  
26          *Message* requiring acknowledgment to the base station, and the mobile station  
27          shall then set  $FPC\_DELTA\_SETPT_S$  to  $(FPC\_FCH\_CURR\_SETPT_S -$   
28           $FPC\_DCCH\_CURR\_SETPT_S)$ .
- 29   For each of the supplemental channels assigned to the mobile station and  $FPC\_MODE_S$  is  
30   set to '000', the mobile station shall perform the following:
- 31          • The mobile station shall set  $FPC\_DELTA\_SCH\_SETPT_S$  to  
32           $(FPC\_FCH\_CURR\_SETPT_S - FPC\_SCH\_CURR\_SETPT_S)$  if  $FPC\_PRI\_CHAN_S$  is equal  
33          to '0'.
- 34          • The mobile station shall set  $FPC\_DELTA\_SCH\_SETPT_S$  to  
35           $(FPC\_DCCH\_CURR\_SETPT_S - FPC\_SCH\_CURR\_SETPT_S)$  if  $FPC\_PRI\_CHAN_S$  is equal  
36          to '1'.

- 1 • For each received frame, if  $FPC\_PRI\_CHAN_S$  is equal to '0' and  
2  $|FPC\_FCH\_CURR\_SETPT_S - FPC\_SCH\_CURR\_SETPT_S -$   
3  $FPC\_DELTA\_SCH\_SETPT_S|$  is equal to or greater than its assigned threshold  
4  $FPC\_SETPT\_THRESH\_SCH_S$ , the mobile station shall send the *Outer Loop Report*  
5 *Message* in assured mode, and the mobile station shall then set  
6  $FPC\_DELTA\_SCH\_SETPT_S$  to  $(FPC\_FCH\_CURR\_SETPT_S -$   
7  $FPC\_SCH\_CURR\_SETPT_S)$ .
- 8 • For each received frame, if  $FPC\_PRI\_CHAN_S$  is equal to '1' and  
9  $|FPC\_DCCH\_CURR\_SETPT_S - FPC\_SCH\_CURR\_SETPT_S -$   
10  $FPC\_DELTA\_SCH\_SETPT_S|$  is equal to or greater than its assigned threshold  
11  $FPC\_SETPT\_THRESH\_SCH_S$ , the mobile station shall send the *Outer Loop Report*  
12 *Message* in assured mode, and the mobile station shall then set  
13  $FPC\_DELTA\_SCH\_SETPT_S$  to  $(FPC\_DCCH\_CURR\_SETPT_S -$   
14  $FPC\_SCH\_CURR\_SETPT_S)$ .

15 If the Supplemental channels are assigned to the mobile station and  $FPC\_MODE_S$  is set to  
16 '001', '010', '101', or '110', for each additional Forward Supplemental Channel other than  
17 the Forward Supplemental Channel specified by  $FPC\_SEC\_CHAN_S$ , the mobile station shall  
18 perform the following:

- 19 • The mobile station shall set  $FPC\_DELTA\_SCH\_SETPT_S$  to  
20  $(FPC\_SCH\_CURR\_SETPT_S[FPC\_SEC\_CHAN_S] - FPC\_SCH\_CURR\_SETPT_S)$  for the  
21 Supplemental Channel.
- 22 • For each received frame, if  $|FPC\_SCH\_CURR\_SETPT_S[FPC\_SEC\_CHAN_S] -$   
23  $FPC\_SCH\_CURR\_SETPT_S - FPC\_DELTA\_SCH\_SETPT_S|$  is equal to or greater than  
24 its assigned threshold  $FPC\_SETPT\_THRESH\_SCH_S$ , the mobile station shall send  
25 the *Outer Loop Report Message* in assured mode, and the mobile station shall then  
26 set  $FPC\_DELTA\_SCH\_SETPT_S$  to  $(FPC\_SCH\_CURR\_SETPT_S[FPC\_SEC\_CHAN_S] -$   
27  $FPC\_SCH\_CURR\_SETPT_S)$ .

#### 28 2.6.4.1.1.1 Forward Traffic Channel Power Control Initialization

29 To initialize Forward Traffic Channel power control, the mobile station shall set  
30  $TOT\_FRAMES_S$ ,  $BAD\_FRAMES_S$ ,  $DCCH\_TOT\_FRAMES_S$ , and  $DCCH\_BAD\_FRAMES_S$  to  
31 zero. The mobile station shall initialize the frame counters  $SCH\_TOT\_FRAMES_S$  and  
32  $SCH\_BAD\_FRAMES_S$  for each assigned Supplemental Channel to zero. The mobile station  
33 shall initialize  $FOR\_SCH\_FER\_REP_S$  to zero.

#### 34 2.6.4.1.1.2 Processing the Power Control Parameters Message

35 The mobile station shall store the following parameters from the *Power Control Parameters*  
36 *Message*:

- 37 • Power control reporting threshold ( $PWR\_REP\_THRESH_S = PWR\_REP\_THRESH_T$ )
- 38 • Power control reporting frame count ( $PWR\_REP\_FRAMES_S = PWR\_REP\_FRAMES_T$ )
- 39 • Threshold report mode indicator  
40 ( $PWR\_THRESH\_ENABLE_S = PWR\_THRESH\_ENABLE_T$ )

- 1 • Periodic report mode indicator  
2 (PWR\_PERIOD\_ENABLE<sub>S</sub> = PWR\_PERIOD\_ENABLE<sub>T</sub>)
- 3 • Power report delay (PWR\_REP\_DELAY<sub>S</sub> = PWR\_REP\_DELAY<sub>T</sub>)

4 The mobile station shall set TOT\_FRAMES<sub>S</sub> and BAD\_FRAMES<sub>S</sub> to zero if FCH is assigned.  
5 The mobile station shall set DCCH\_TOT\_FRAMES<sub>S</sub> and DCCH\_BAD\_FRAMES<sub>S</sub> to zero if  
6 DCCH is assigned.

#### 7 2.6.4.1.1.3 Processing the Power Control Message

8 The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to  
9 '00000110' (message requires a capability that is not supported by the mobile station) if  
10 any of the following conditions are detected:

- 11 • If the mobile station does not support any Radio Configuration greater than 2 and  
12 FPC\_MODE<sub>T</sub> is not supported by the mobile station.
- 13 • If the mobile station does not support Supplemental Channel and FPC\_MODE<sub>T</sub> is  
14 set to the '001', '010', '101', or '110'.
- 15 • If PWR\_CNTL\_STEP<sub>T</sub> corresponds to a power control step size (see [2]) is not  
16 supported by the mobile station.

17 The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to  
18 '00000111' (message cannot be handled by the current mobile station configuration) if any  
19 of the following conditions are detected:

- 20 • FPC\_PRI\_CHAN<sub>T</sub> is set to '1' and only the Fundamental Channel is assigned.
- 21 • FPC\_PRI\_CHAN<sub>T</sub> is set to '0' and only the Dedicated Control Channel is assigned.

22 If none of the above conditions are true, the mobile station shall process the message as  
23 follows at the action time (see 2.6.4.1.5) specified in the message:

- 24 • The mobile station shall store the power control step size (PWR\_CNTL\_STEP<sub>S</sub> =  
25 PWR\_CNTL\_STEP<sub>T</sub>).
- 26 • If FPC\_INCL<sub>T</sub> is equal to '1', the mobile station shall perform the following:
  - 27 – The mobile station shall set FPC\_MODE\_NO\_SCH<sub>S</sub> = FPC\_MODE<sub>T</sub>.
  - 28 – The mobile station shall set FPC\_MODE<sub>S</sub> = FPC\_MODE\_NO\_SCH<sub>S</sub> if there is no  
29 forward Supplemental Channel burst in progress (see 2.6.6.2.5.1.1).
  - 30 – The mobile station shall set FPC\_PRI\_CHAN<sub>S</sub> to FPC\_PRI\_CHAN<sub>T</sub>
  - 31 – If FPC\_OLPC\_FCH\_INCL is equal to '1', the mobile station shall:
    - 32 + Set FPC\_FCH\_FER<sub>S</sub> to FPC\_FCH\_FER<sub>T</sub>.
    - 33 + If FPC\_FCH\_MIN\_SETPT<sub>T</sub> is not equal to '1111111', set  
34 FPC\_FCH\_MIN\_SETPT<sub>S</sub> to FPC\_FCH\_MIN\_SETPT<sub>T</sub>; otherwise, set  
35 FPC\_FCH\_MIN\_SETPT<sub>S</sub> to FPC\_FCH\_CURR\_SETPT<sub>S</sub>.

- 1           + If FPC\_FCH\_MAX\_SETPT<sub>R</sub> is not equal to '11111111', set
- 2           FPC\_FCH\_MAX\_SETPT<sub>S</sub> to FPC\_FCH\_MAX\_SETPT<sub>R</sub>; otherwise, set
- 3           FPC\_FCH\_MAX\_SETPT<sub>S</sub> to FPC\_FCH\_CURR\_SETPT<sub>S</sub>.
- 4       - If FPC\_OLPC\_DCCH\_INCL is equal to '1', the mobile station shall:
- 5           + Set FPC\_DCCH\_FER<sub>S</sub> to FPC\_DCCH\_FER<sub>R</sub>.
- 6           + If FPC\_DCCH\_MIN\_SETPT<sub>R</sub> is not equal to '11111111', set
- 7           FPC\_DCCH\_MIN\_SETPT<sub>S</sub> to FPC\_DCCH\_MIN\_SETPT<sub>R</sub>; otherwise, set
- 8           FPC\_DCCH\_MIN\_SETPT<sub>S</sub> to FPC\_DCCH\_CURR\_SETPT<sub>S</sub>.
- 9           + If FPC\_DCCH\_MAX\_SETPT<sub>R</sub> is not equal to '11111111', set
- 10          FPC\_DCCH\_MAX\_SETPT<sub>S</sub> to FPC\_DCCH\_MAX\_SETPT<sub>R</sub>; otherwise, set
- 11          FPC\_DCCH\_MAX\_SETPT<sub>S</sub> to FPC\_DCCH\_CURR\_SETPT<sub>S</sub>.
- 12       - If FPC\_INCL is equal to '1' and FPC\_MODE is equal to '001', '010', '101', or '110',
- 13          the mobile station shall:
- 14           + Set FPC\_SEC\_CHAN<sub>S</sub> to FPC\_SEC\_CHAN<sub>R</sub>.
- 15           + Set FPC\_BCMC\_CHAN<sub>S</sub> to FPC\_BCMC\_CHAN<sub>R</sub>.
- 16       - If NUM\_SUP<sub>R</sub> is not equal to '00', for each Supplemental Channel included in
- 17          the message, the mobile station shall:
- 18           + Set SCH\_ID<sub>S</sub> to SCH\_ID<sub>R</sub>.
- 19           + Set FPC\_SCH\_FER<sub>S</sub>[SCH\_ID<sub>S</sub>] to FPC\_SCH\_FER<sub>R</sub>.
- 20           + If FPC\_SCH\_MIN\_SETPT<sub>R</sub> is not equal to '11111111', set
- 21           FPC\_SCH\_MIN\_SETPT<sub>S</sub>[SCH\_ID<sub>S</sub>] to FPC\_SCH\_MIN\_SETPT<sub>R</sub>; otherwise, set
- 22           FPC\_SCH\_MIN\_SETPT<sub>S</sub>[SCH\_ID<sub>S</sub>] to FPC\_SCH\_CURR\_SETPT<sub>S</sub>.
- 23           + If FPC\_SCH\_MAX\_SETPT<sub>R</sub> is not equal to '11111111', set
- 24           FPC\_SCH\_MAX\_SETPT<sub>S</sub>[SCH\_ID<sub>S</sub>] to FPC\_SCH\_MAX\_SETPT<sub>R</sub>; otherwise, set
- 25           FPC\_SCH\_MAX\_SETPT<sub>S</sub>[SCH\_ID<sub>S</sub>] to FPC\_SCH\_CURR\_SETPT<sub>S</sub>.
- 26       - If FPC\_THRESH\_INCL is equal to '1', the mobile station shall set
- 27          FPC\_SETPT\_THRESH<sub>S</sub> to FPC\_SETPT\_THRESH<sub>R</sub>.
- 28       - If FPC\_THRESH\_SCH\_INCL is equal to '1', the mobile station shall set
- 29          FPC\_SETPT\_THRESH\_SCH<sub>S</sub> to FPC\_SETPT\_THRESH\_SCH<sub>R</sub>.
- 30       • If RPC\_INCL<sub>R</sub> is equal to '1' and the mobile station supports any Radio
- 31          Configuration greater than 2, the mobile station shall perform the following:
- 32           - If RPC\_ADJ\_REC\_TYPE is equal to '0000', the mobile station shall update the
- 33           Reverse Channel Adjustment Gain Table (see [2]) containing an offset relative to
- 34           the Reverse Pilot Channel power for each reverse link code channel received in
- 35           this message.
- 36           - If RPC\_ADJ\_REC\_TYPE is equal to '0001' or '0010', the mobile station shall
- 37           update the Reverse Link Attribute Adjustment Gain Table (see [2]) containing
- 38           an offset relative to the Reverse Pilot Channel power for each transmission rate,
- 39           frame length, coding type received in this message.

- 1       – If `RPC_ADJ_REC_TYPE` is equal to '0011', at the action time of the message, the  
2       mobile station shall update the Reverse Link Attribute Adjustment Gain Table  
3       (see [2]) containing an offset relative to the Reverse Pilot Channel power for the  
4       R-CQICH.
- 5       – If `RPC_ADJ_REC_TYPE` is equal to '0100', the mobile station shall perform the  
6       following:
  - 7       + At the first R-PDCH frame boundary at or after the action time of the  
8       message, the mobile station shall update the Reverse Link Attribute  
9       Adjustment Gain Table (see [2]) containing an offset relative to the Reverse  
10      Pilot Channel power for any combination of the following channels:
    - 11      o R-REQCH,
    - 12      o R-SPICH,
    - 13      o R-PDCCH possibly for each encoder packet size, or for the boosted and  
14      non boosted modes
    - 15      o R-PDCH possibly for each encoder packet size, or for the boosted and  
16      non boosted modes, or for each encoder packet size and transmission  
17      round.
  - 18      + At the action time of the message, the mobile station shall update the  
19      Reverse Link Attribute Adjustment Gain Table (see [2]) containing an offset  
20      relative to the Reverse Pilot Channel power for the R-ACKCH.
  - 21      + If `REV_SPICH_ADJ_INCLr` is equal to '1', the mobile station shall set  
22      `REV_SPICH_EP_SIZEs` to `REV_SPICH_EP_SIZEr+1`.
  - 23      + If `REV_PDCH_PARMS_INCLr` is equal to '1', the mobile station shall set  
24      `REV_PDCH_NUM_ARQ_ROUNDS_NORMALs` to  
25      `REV_PDCH_NUM_ARQ_ROUNDS_NORMALr+1`, and  
26      `REV_PDCH_NUM_ARQ_ROUNDS_BOOSTs` to  
27      `REV_PDCH_NUM_ARQ_ROUNDS_BOOSTr+1`.

#### 28   2.6.4.1.1.4 Processing the Rate Change Message

29   The mobile station shall process this message as follows at the action time (see 2.6.4.1.5)  
30   specified in the message:

- 31      • The mobile station shall set `FULL_CI_FEEDBACK_INDs` to  
32      `FULL_CI_FEEDBACK_INDr`.
- 33      • If `REV_CQICH_RATE_CHANGE_INCLr` is equal to '1', the mobile station shall set  
34      `REV_CQICH_REPSs` to `REV_CQICH_REPSr`. In addition, if  
35      `RL_CQICH_ATT_ADJ_GAIN_INCLr` is equal to '1', the mobile station shall update  
36      the Reverse Link Attribute Adjustment Gain Table (see [2]) containing the offsets  
37      relative to the Reverse Pilot Channel power for the corresponding transmission  
38      power level (HIGH or LOW).

- 1       • If SWITCHING\_PARMES\_INCL<sub>r</sub> is included and equal to '1', the mobile station shall  
2       set NUM\_SOFT\_SWITCHING\_FRAMES<sub>s</sub> to NUM\_SOFT\_SWITCHING\_FRAMES<sub>r</sub> + 1,  
3       and, NUM\_SOFTER\_SWITCHING\_FRAMES<sub>s</sub> to  
4       NUM\_SOFTER\_SWITCHING\_FRAMES<sub>r</sub> + 1.
- 5       • If CHM\_SWITCHING\_PARMES\_INCL is included and equal to '1', the mobile station  
6       shall set NUM\_SOFT\_SWITCHING\_FRAMES\_CHM<sub>s</sub> to  
7       NUM\_SOFT\_SWITCHING\_FRAMES\_CHM<sub>r</sub> + 1, and  
8       NUM\_SOFTER\_SWITCHING\_FRAMES\_CHM<sub>s</sub> to  
9       NUM\_SOFTER\_SWITCHING\_FRAMES\_CHM<sub>r</sub> + 1.
- 10      • If CHM\_SWITCHING\_PARMES\_INCL is included and equal to '0', the mobile station  
11      shall set NUM\_SOFT\_SWITCHING\_FRAMES\_CHM<sub>s</sub> to  
12      NUM\_SOFT\_SWITCHING\_FRAMES<sub>r</sub> + 1, and  
13      NUM\_SOFTER\_SWITCHING\_FRAMES\_CHM<sub>s</sub> to  
14      NUM\_SOFTER\_SWITCHING\_FRAMES<sub>r</sub> + 1.
- 15      • If REV\_ACKCH\_RATE\_CHANGE\_INCL<sub>r</sub> is equal to '1', the mobile station shall set  
16      REV\_ACKCH\_REPS<sub>s</sub> to REV\_ACKCH\_REPS<sub>r</sub>.
- 17      • If REV\_PDCH\_MAX\_PARMES\_INCL<sub>r</sub> is equal to '1', the base station shall set  
18      REV\_PDCH\_MAX\_AUTO\_TPR<sub>s</sub> to REV\_PDCH\_MAX\_AUTO\_TPR<sub>r</sub>, and  
19      REV\_PDCH\_MAX\_SIZE\_ALLOWED\_ENCODER\_PACKET<sub>s</sub> to  
20      REV\_PDCH\_MAX\_SIZE\_ALLOWED\_ENCODER\_PACKET<sub>r</sub>+1.
- 21      • If REV\_PDCH\_PARMES\_INCL<sub>r</sub> is equal to '1', the mobile station shall set  
22      REV\_PDCH\_NUM\_ARQ\_ROUNDS\_NORMAL<sub>s</sub> to  
23      REV\_PDCH\_NUM\_ARQ\_ROUNDS\_NORMAL<sub>r</sub>+1, and  
24      REV\_PDCH\_NUM\_ARQ\_ROUNDS\_BOOST<sub>s</sub> to  
25      REV\_PDCH\_NUM\_ARQ\_ROUNDS\_BOOST<sub>r</sub>+1.
- 26
- 27

#### 2.6.4.1.2 Service Configuration and Negotiation

During Traffic Channel operation, the mobile station and base station communicate through the exchange of Forward and Reverse Traffic Channel frames. The mobile station and base station use a common set of attributes for building and interpreting Traffic Channel frames. This set of attributes, referred to as a service configuration, consists of both negotiable and non-negotiable parameters.

The set of negotiable service configuration parameters consists of the following:

1. *Forward and Reverse Multiplex Options:* These control the way in which the information bits of the Forward and Reverse Traffic Channel frames, respectively, are divided into various types of traffic, such as signaling traffic, primary traffic and secondary traffic. A multiplex option together with a radio configuration specifies the frame structures and transmission rates (see [3]). The multiplex options which support Supplemental Code Channel transmission and Supplemental Channel transmission on the Forward and Reverse Traffic Channels are included in [3]. Multiplex Options 3 through 16 also indicate the capability for supporting Supplemental Code Channel transmission on the Forward and Reverse Traffic Channels. Invocation of Supplemental Code Channel operation on the Forward or Reverse Traffic Channels occurs by the *Supplemental Channel Request Message*, the *Supplemental Channel Assignment Message*, and the *General Handoff Direction Message*. Invocation of Supplemental Channel operation on the Forward or Reverse Traffic Channels occurs by the *Supplemental Channel Request Mini Message*, the *Extended Supplemental Channel Assignment Message*, the *Forward Supplemental Channel Assignment Mini Message*, *Universal Handoff Direction Message*, and the *Reverse Supplemental Channel Assignment Mini Message*. The multiplex option used for the Forward Traffic Channel can be the same as that used for the Reverse Traffic Channel, or it can be different.
2. *Forward and Reverse Traffic Channel Configurations:* These include the Radio Configurations and other necessary attributes for the Forward and Reverse Traffic Channels. The Traffic Channel Configuration used can be different for the Forward and Reverse Traffic Channels or it can be the same.
3. *Forward and Reverse Traffic Channel Transmission Rates:* These are the transmission rates actually used for the Forward and Reverse Traffic Channels respectively. The transmission rates for the Forward Traffic Channel can include all of the transmission rates supported by the radio configuration associated with the Forward Traffic Channel multiplex option, or a subset of the supported rates. Similarly, the transmission rates used for the Reverse Traffic Channel can include all rates supported by the radio configuration associated with the Reverse Traffic Channel multiplex option, or a subset of the supported rates. The transmission rates used for the Forward Traffic Channel can be the same as those used for the Reverse Traffic Channel, or they can be different.
4. *Service Option Connections:* These are the services in use on the Traffic Channel. There can be multiple service option connections. It is also possible that there is no service option connection, in which case the mobile station uses the Reverse

Traffic Channel as follows:

- Sends null traffic on the Reverse Fundamental Channel, if the Fundamental Channel is present.
- Sends signaling traffic on the Reverse Traffic Channel where r-dsch is mapped to.

Associated with each service option connection are a service option, a Forward Traffic Channel traffic type, a Reverse Traffic Channel traffic type, and a service option connection reference. The associated service option formally defines the way in which traffic bits are processed by the mobile station and base station. The associated Forward and Reverse Traffic Channel traffic types specify the types of traffic used to support the service option. A service option can require the use of a particular type of traffic, such as primary or secondary, or it can accept more than one traffic type. A service option can be one-way, in which case it can be supported on the Forward Traffic Channel only or the Reverse Traffic Channel only. Alternatively, a service option can be two-way, in which case it can be supported on the Forward and Reverse Traffic Channels simultaneously. Connected service options can also invoke operation on Supplemental Code Channels in either one or both of the Forward and Reverse Traffic Channels by negotiating a multiplex option that supports operation on Supplemental Code Channels (see [3] for Multiplex options applicable to Supplemental Code Channels), and by using the appropriate Supplemental Code Channel related messages (i.e., the *Supplemental Channel Request Message*, the *Supplemental Channel Assignment Message*, and the *General Handoff Direction Message*). After Supplemental Code Channels have been assigned by the base station, the connected service option can transmit primary and/or secondary traffic on Supplemental Code Channels. Connected service options can also invoke operation on Supplemental Channels in either one or both of the Forward and Reverse Traffic Channels by negotiating a multiplex option that supports operation on Supplemental Channels (see [3] for Multiplex Options applicable to Supplemental Channel) and by using the appropriate Supplemental Channel related messages (i.e., the *Supplemental Channel Request Mini Message*, the *Extended Supplemental Channel Assignment Message*, the *Forward Supplemental Channel Assignment Mini Message*, the *Reverse Supplemental Channel Assignment Mini Message*, and the *Universal Handoff Direction Message*). After Supplemental Channels have been assigned by the base station, the connected service option can transmit primary and/or secondary traffic on Supplemental Channels. The associated service option connection reference provides a means for uniquely identifying the service option connection. The reference serves to resolve ambiguity when there are multiple service option connections in use.

The non-negotiable service configuration parameters are sent from the base station to the mobile stations only, and consists of the following:

1. *Reverse Pilot Gating Rate*: This controls the way in which the reverse pilot is gated on the Reverse Pilot Channel. The base station specifies the reverse pilot gating rate to be used in the *Service Connect Message*, the *General Handoff Direction*

1            *Message, and the Universal Handoff Direction Message.*

- 2            2. *Forward and Reverse Power Control Parameters:* These consist of forward power  
3            control operation mode, outer loop power control parameters (e.g. target frame error  
4            rate, minimum  $E_b/N_t$  setpoint, and maximum  $E_b/N_t$  setpoint) for the Forward  
5            Fundamental Channel and Forward Dedicated Control Channel, and Power Control  
6            Subchannel indicator which indicates where the mobile station is to perform the  
7            primary inner loop estimation and the base station is to multiplex the Power  
8            Control Subchannel.
- 9            3. *Logical to Physical Mapping:* This is a table of logical to physical mapping entries,  
10           consisting of service reference identifier, logical resource, physical resource,  
11           forward flag, reverse flag, and priority.

12           The mobile station can request a default service configuration associated with a service  
13           option at call origination, and can request new service configurations during Traffic  
14           Channel operation. A requested service configuration can differ greatly from its  
15           predecessor or can be very similar. For example, the mobile station can request a service  
16           configuration in which all of the service option connections are different from those of the  
17           existing configuration; or the mobile station can request a service configuration in which  
18           the existing service option connections are maintained with only minor changes, such as a  
19           different set of transmission rates or a different mapping of service option connections to  
20           Forward and Reverse Traffic Channel traffic types.

21           If the mobile station requests a service configuration that is acceptable to the base station,  
22           they both begin using the new service configuration. If the mobile station requests a  
23           service configuration that is not acceptable to the base station, the base station can reject  
24           the requested service configuration or propose an alternative service configuration. If the  
25           base station proposes an alternative service configuration, the mobile station can accept or  
26           reject the base station's proposed service configuration, or propose yet another service  
27           configuration. This process, called service negotiation, ends when the mobile station and  
28           the base station find a mutually acceptable service configuration, or when either the  
29           mobile station or the base station rejects a service configuration proposed by the other.

30           It is also possible for the base station to request a default service configuration associated  
31           with a service option when paging the mobile station and to request new service  
32           configurations during Traffic Channel operation. The service negotiation proceeds as  
33           described above, but with the roles of the mobile station and base station reversed.

34           For CDMA mode operation in Band Class 0, the mobile station and base station can also  
35           use an alternative method for negotiating a service configuration known as service option  
36           negotiation. Service option negotiation is similar to service negotiation, but offers less  
37           flexibility for specifying the attributes of the service configuration. During service option  
38           negotiation, the base station or the mobile station specifies only which service option is to  
39           be used. There is no facility for explicitly specifying the multiplex options, traffic types or  
40           transmission rates to be used on the Forward and Reverse Traffic Channels in conjunction  
41           with the service option. Instead, implicit service configuration attributes are assumed. In  
42           particular, the Forward and Reverse multiplex options and transmission rates are  
43           assumed to be the default multiplex options and transmission rates associated with the

requested service option, and the traffic type for both the Forward and Reverse Traffic Channels is assumed to be primary traffic; furthermore, a service configuration established using service option negotiation is restricted to having only a single service option connection.

At mobile station origination and termination, the type of negotiation to use, either service negotiation or service option negotiation, is indicated in the *Channel Assignment Message*. Service negotiation is always used after the mobile station receives an *Extended Channel Assignment Message*. If a CDMA-to-CDMA hard handoff occurs during the call, the type of negotiation to use following the handoff is indicated in the *Extended Handoff Direction Message*, the *General Handoff Direction Message*, or the *Universal Handoff Direction Message*.

For CDMA mode operation in band classes other than Band Class 0, only service negotiation is to be used.

The following messages are used to support service negotiation:

1. *Service Request Message*: The mobile station can use this message to propose a service configuration, or to accept or reject a service configuration proposed in a *Service Response Message*. The base station can use this message to propose a service configuration, or to reject a service configuration proposed in a *Service Response Message*.
2. *Service Response Message*: The mobile station can use this message to accept or reject a service configuration proposed in a *Service Request Message*, or to propose an alternative service configuration. The base station can use this message to reject a service configuration proposed in a *Service Request Message*, or to propose an alternative service configuration.
3. *Service Connect Message*: The base station can use this message to accept a service configuration proposed in a *Service Request Message* or *Service Response Message*, and to instruct the mobile station to begin using the service configuration.
4. *Service Connect Completion Message*: The mobile station can use this message to acknowledge the transition to a new service configuration.
5. *Service Option Control Message*: The mobile station and base station can use this message to invoke service-option-specific functions.
6. *Extended Channel Assignment Message*: The base station can use this message to accept or reject the initial service configuration proposed by the mobile station in an *Origination Message* or a *Page Response Message*.

The following messages are used to support service option negotiation:

1. *Service Option Request Order*: The mobile station and base station can use this message either to request a service option or to suggest an alternative service option.
2. *Service Option Response Order*: The mobile station and base station can use this message to accept or to reject a service option request.

1       3. *Service Option Control Order*: The mobile station and base station can use this  
2       message to invoke service option specific functions.

3       The following messages are used to support both service negotiation and service option  
4       negotiation:

5       1. *Origination Message*: The mobile station can use this message to propose an initial  
6       service configuration.

7       2. *Channel Assignment Message*: The base station can use this message to accept or to  
8       reject the initial service configuration proposed by the mobile station in an  
9       *Origination Message* or a *Page Response Message* and to indicate which type of  
10      negotiation, either service negotiation or service option negotiation, is to be used  
11      during the call.

12      3. *Extended Handoff Direction Message*: The base station can use this message to  
13      indicate which type of negotiation, either service negotiation or service option  
14      negotiation, is to be used following a CDMA-to-CDMA hard handoff.

15      4. *General Handoff Direction Message*: The base station can use this message to  
16      indicate which type of negotiation, either service negotiation or service option  
17      negotiation, is to be used following a CDMA-to-CDMA hard handoff. The base  
18      station can use this message to accept a service configuration proposed in a  
19      *Service Request Message* or *Service Response Message*. The base station can also  
20      use this message to instruct the mobile station to begin using the service  
21      configuration.

22      5. *General Page Message* or *Universal Page Message*: The base station can use a  
23      mobile-station-addressed page in a *General Page Message* or in a *Universal Page*  
24      *Message* to propose an initial service configuration.

25      6. *Page Response Message*: The mobile station can use this message to accept or to  
26      reject the initial service configuration proposed by the base station in a mobile-  
27      station-addressed page, or to propose an alternative initial service configuration.

28      7. *Status Request Message*: The base station can use this message to request service  
29      capability information from the mobile station.

30      8. *Status Response Message*: The mobile station can use this message to return the  
31      service capability information requested by the base station in a *Status Request*  
32      *Message*.

33      9. *Extended Status Response Message*: The mobile station can use this message to  
34      return the service capability information requested by the base station in a *Status*  
35      *Request Message*.

36      10. *Universal Handoff Direction Message*: The base station can use this message to  
37      indicate which type of negotiation, either service negotiation or service option  
38      negotiation, is to be used following a CDMA-to-CDMA hard handoff. The base  
39      station can use this message to accept a service configuration proposed in a  
40      *Service Request Message* or *Service Response Message*. The base station can also  
41      use this message to instruct the mobile station to begin using the service

1 configuration.

2 11. General Extension Message: The mobile station shall process this message as  
3 specified in section 2.6.18.

#### 4 2.6.4.1.2.1 Use of Variables

##### 5 2.6.4.1.2.1.1 Maintaining the Service Request Sequence Number

6 The mobile station shall maintain a service request sequence number variable,  
7 SERV\_REQ\_NUM<sub>S</sub> for use with service negotiation. Upon entering the *Mobile Station*  
8 *Control On the Traffic Channel State*, the mobile station shall set SERV\_REQ\_NUM<sub>S</sub> to 0.  
9 Each time the mobile station sends a new *Service Request Message*, it shall set the  
10 SERV\_REQ\_SEQ field of the message to the current value of SERV\_REQ\_NUM<sub>S</sub>, and shall  
11 then set SERV\_REQ\_NUM<sub>S</sub> equal to (SERV\_REQ\_NUM<sub>S</sub> + 1) modulo 8.

##### 12 2.6.4.1.2.1.2 Maintaining the Service Negotiation Indicator Variable

13 The mobile station shall maintain a service negotiation indicator variable, SERV\_NEG<sub>S</sub>, to  
14 indicate which type of negotiation to use, either service negotiation or service option  
15 negotiation. The mobile station shall set SERV\_NEG<sub>S</sub> to enabled whenever service  
16 negotiation is to be used, and shall set SERV\_NEG<sub>S</sub> to disabled whenever service option  
17 negotiation is to be used. The precise rules for setting SERV\_NEG<sub>S</sub> are specified in 2.6.4.2  
18 and 2.6.6.2.5.1.

19 For CDMA operation in band classes other than Band Class 0, the mobile station shall set  
20 SERV\_NEG<sub>S</sub> to enabled.

##### 21 2.6.4.1.2.1.3 Maintaining the Service Option Request Number

22 The mobile station shall maintain a service option request number variable, SO\_REQ<sub>S</sub>, for  
23 use with service option negotiation. The mobile station shall set SO\_REQ<sub>S</sub> to a special  
24 value, NULL, if the mobile station does not have an outstanding service option request. If  
25 the mobile station has an outstanding service option request, the mobile station shall set  
26 SO\_REQ<sub>S</sub> to the number of the service option associated with the outstanding request.

##### 27 2.6.4.1.2.1.4 Stored Service Configuration and Reconnection

28 This section provides an overview of how the mobile station and the base station may store  
29 the service configuration and how the stored service configuration may be restored upon  
30 re-establishing dedicated channels.

31 Upon establishing a call and entering the *Mobile Station Control on the Traffic Channel*  
32 *State*, service negotiation procedures are performed as specified in 2.6.4.1.2.2 to establish  
33 a mutually acceptable service configuration between the mobile station and the base  
34 station. The service configuration consists of parameters specified via the Service  
35 Configuration information record (see 3.7.5.7) and Non-Negotiable Service Configuration  
36 information record (see 3.7.5.20). The mobile station and the base station may store the  
37 established service configuration. This is done so that when the call is re-established, the  
38 stored service configuration may be restored and without performing the service  
39 negotiation procedures. In order to ensure that the service configuration restored at the

mobile station and the base station are identical (that is, the values of the service configuration parameters are identical), a service configuration synchronization identifier (called SYNC\_ID) is associated with each stored service configuration. SYNC\_ID is a variable length identifier assigned by the base station corresponding to a particular Service Configuration information record and Non-negotiable Service Configuration information record. The SYNC\_ID value is used by the base station to determine whether these two information records may be omitted from the *Service Connect Message*.

When P\_REV\_IN\_USE<sub>s</sub> is less than or equal to six, there is no requirement on storing the established service configuration for future use. In this case, when a call is re-established and the mobile station enters the *Mobile Station Control on the Traffic Channel State*, service configuration must be re-established by performing service negotiation procedures again.

When P\_REV\_IN\_USE<sub>s</sub> is greater than six, based on the value of SYNC\_ID included by the mobile station in the *Origination Message*, *Page Response Message*, or *Enhanced Origination Message* the base station may not send the Service Configuration information record and the Non-negotiable Service Configuration information record over the air and instructs the mobile station to start using the stored information records corresponding to the SYNC\_ID reported by the mobile station.

When P\_REV\_IN\_USE<sub>s</sub> is equal to or greater than nine, the mobile station is required to store minimum of four service configurations. Also, the stored service configuration can be restored incrementally as well. That is, if N service option connections are contained in the stored service configuration, then the mobile station can request to restore one of these service option connections upon establishing dedicated channels. This is achieved via the SR\_ID field of the *Origination Message* or *Reconnect Message*. Once operating on the dedicated channels, the mobile station can request to restore additional service option connections via the *Enhanced Origination Message*. The base station in turn can grant the mobile station request via *Extended Channel Assignment Message*, *Service Connect Message*, or *Call Assignment Message*. If the base station uses *Extended Channel Assignment Message* to grant the mobile station request, then the base station is not required to send a *Service Connect Message*. During traffic channel operation, service option connections are to be restored only from the SYNC\_ID that is currently in use (if any).

When P\_REV\_IN\_USE<sub>s</sub> is equal to or greater than 11, the base station can autonomously order the mobile station to restore a stored service configuration via the *Extended Channel Assignment Message* or *Service Connect Message* even when the mobile station has not requested to restore a service configuration, or when the mobile station has requested to restore a different service configuration. Additionally, the base station can signal the SYNC\_ID value corresponding to the currently used service configuration using the *Universal Handoff Direction Message*.

#### 2.6.4.1.2.2 Service Subfunctions

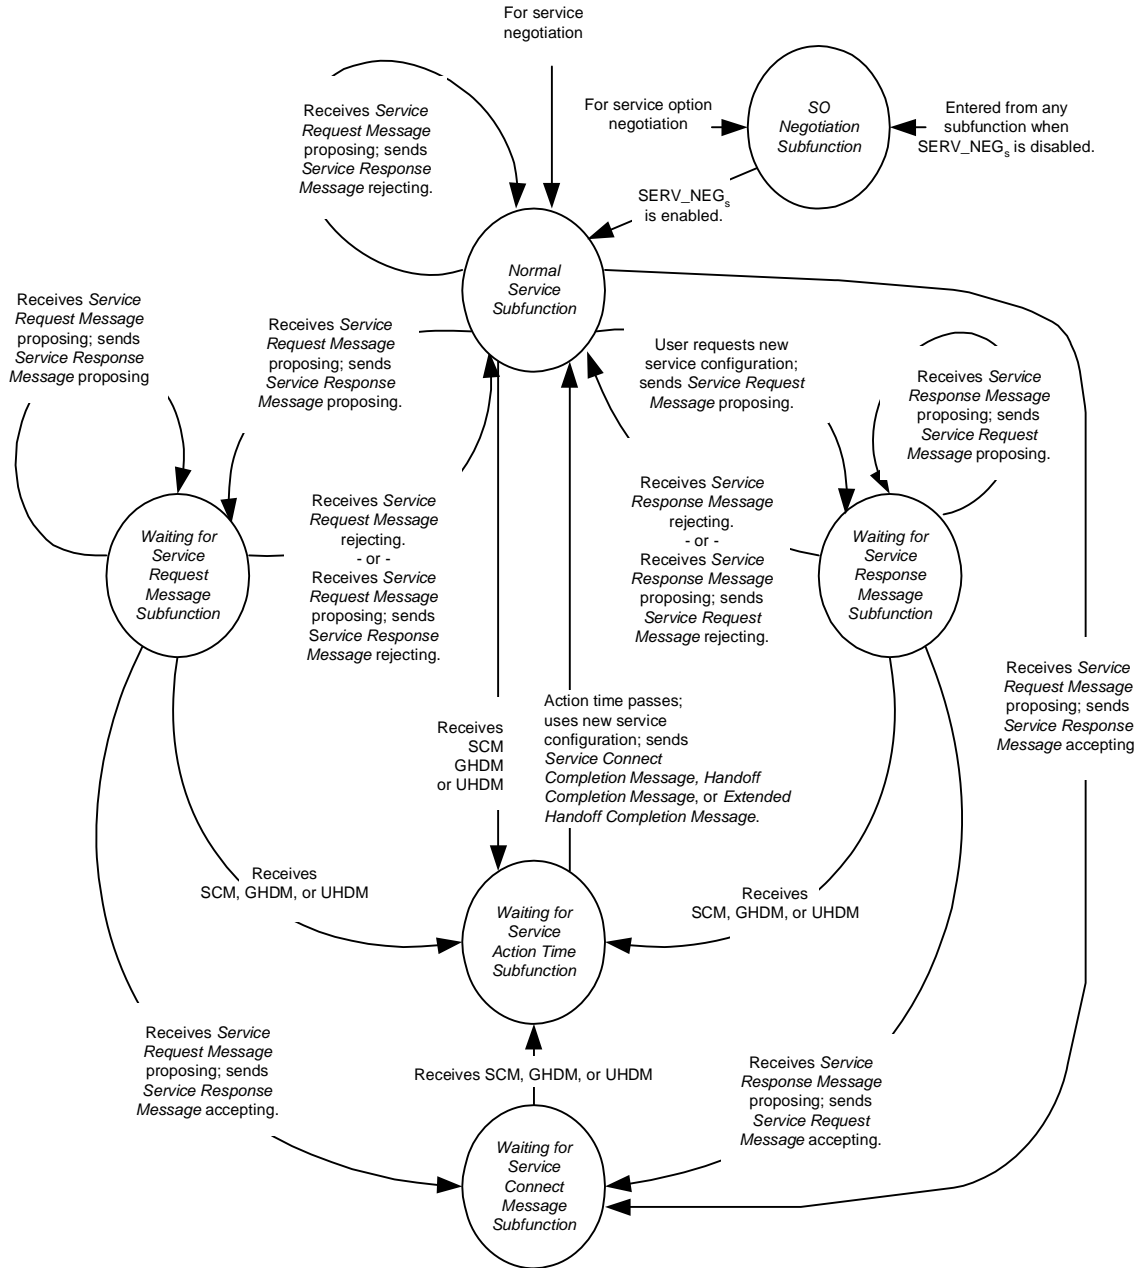

As illustrated in Figure 2.6.4.1.2.2-1, the mobile station supports service configuration and negotiation by performing the following set of service subfunctions:

- 1 • *Normal Service Subfunction* - While this subfunction is active, the mobile station  
2 processes service configuration requests from the user and from the base station.
- 3 • *Waiting for Service Request Message Subfunction* - While this subfunction is active,  
4 the mobile station waits to receive a *Service Request Message*.
- 5 • *Waiting for Service Response Message Subfunction* - While this subfunction is  
6 active, the mobile station waits to receive a *Service Response Message*.
- 7 • *Waiting for Service Connect Message Subfunction* - While this subfunction is active,  
8 the mobile station waits to receive a *Service Connect Message*, a *General Handoff*  
9 *Direction Message*, or a *Universal Handoff Direction Message* containing a service  
10 configuration record.
- 11 • *Waiting for Service Action Time Subfunction* - While this subfunction is active, the  
12 mobile station waits for the action time associated with a new service configuration  
13 and then sends a *Service Connect Completion Message*, a *Handoff Completion*  
14 *Message*, or an *Extended Handoff Completion Message*.
- 15 • *SO Negotiation Subfunction* - While this subfunction is active, the mobile station  
16 supports service option negotiation with the base station. This subfunction is only  
17 used while operating in Band Class 0.

18 The *SO Negotiation Subfunction* supports service option negotiation. All of the other  
19 service subfunctions support service negotiation.

20 At any given time during Traffic Channel operation, only one of the service subfunctions is  
21 active. For example, when the mobile station first enters the *Traffic Channel Initialization*  
22 *Substate* of the *Mobile Station Control on the Traffic Channel State*, the *Normal Service*  
23 *Subfunction*, the *Waiting for Service Connect Message Subfunction* or the *SO Negotiation*  
24 *Subfunction* is active. Each of the other service subfunctions may become active in  
25 response to various events which occur during the Traffic Channel substates. Typically,  
26 the mobile station processes events pertaining to service configuration and negotiation in  
27 accordance with the requirements for the active service subfunction, however, some Traffic  
28 Channel substates do not allow for the processing of certain events pertaining to service  
29 configuration and negotiation, or specify requirements for processing such events which  
30 supersede the requirements of the active service subfunction.

31  
32

## Notes:

- SCM stands for *Service Connect Message*.
- GHDM stands for *General Handoff Direction Message*.
- UHDM stands for *Universal Handoff Direction Message*.
- Processing for special cases, such as timeouts and errors, is not shown in this diagram.

Figure 2.6.4.1.2.2-1. Mobile Station Service Subfunctions

#### 2.6.4.1.2.2.1 Normal Service Subfunction

While this subfunction is active, the mobile station processes service configuration requests from the user and from the base station.

While the *Normal Service Subfunction* is active, the mobile station shall perform the following:

- The mobile station shall process Forward and Reverse Traffic Channel frames in accordance with the current service configuration. The mobile station shall discard any Forward Traffic Channel frame which has a format that is not supported by the mobile station. The mobile station may discard any type of Forward Traffic Channel traffic that is not signaling traffic and is not part of the current service configuration.
- To initiate service negotiation for a new service configuration, the mobile station shall send a *Service Request Message* to propose the new service configuration. The mobile station shall activate the *Waiting for Service Response Message Subfunction*.
- For any service option connection that is part of the current service configuration, the mobile station may send a *Service Option Control Message* to invoke a service option specific function in accordance with the requirements for the associated service option.
- If SERV\_NEG<sub>S</sub> changes from enabled to disabled (see 2.6.6.2.5.1), the mobile station shall activate the *SO Negotiation Subfunction*.
- If the mobile station receives one of the following service negotiation messages, the mobile station shall process the message according to the specified requirements:
  1. *Service Connect Message*: The mobile station shall perform the following:
    - If USE\_OLD\_SERV\_CONFIG<sub>r</sub> equals '01' or '10', and if the mobile station entered the *Mobile Station Control on the Traffic Channel State* due to receiving an *Extended Channel Assignment Message* with GRANTED\_MODE set to '11', the mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00010100' (stored configuration already restored at channel assignment) within T<sub>56m</sub> seconds and shall not perform the rest of the procedures below.
    - If USE\_OLD\_SERV\_CONFIG<sub>r</sub> equals '00', the mobile station shall perform the following: If the mobile station accepts the service configuration specified in the message, the mobile station shall activate the *Waiting for Service Action Time Subfunction*; otherwise, the mobile station shall send a *Mobile Station Reject Order* (ORDQ = '00000111') within T<sub>56m</sub> seconds.

- 1                   • If USE\_OLD\_SERV\_CONFIG<sub>r</sub> equals '01', the mobile station shall perform  
2                   the following: If the mobile station accepts the service configuration  
3                   currently stored at the mobile station, the mobile station shall activate the  
4                   Waiting for Service Action Time Subfunction; otherwise, the mobile station  
5                   shall send a Mobile Station Reject Order (ORDQ = '00000111') within T<sub>56m</sub>  
6                   seconds.
- 7                   • If USE\_OLD\_SERV\_CONFIG<sub>r</sub> equals '10', the mobile station shall perform  
8                   the following: If the mobile station accepts the service configuration  
9                   resulting from updating the stored service configuration with the service  
10                  configuration received in this message, the mobile station shall activate the  
11                  Waiting for Service Action Time Subfunction; otherwise, the mobile station  
12                  shall send a Mobile Station Reject Order (ORDQ = '00000111') within T<sub>56m</sub>  
13                  seconds.
- 14                  • If USE\_OLD\_SERV\_CONFIG<sub>r</sub> equals '11', the mobile station shall perform  
15                  the following: if the mobile station accepts the service configuration  
16                  resulting from restoring the indicated service option connection records  
17                  from the stored service configuration and releasing the indicated service  
18                  option connection records from the current service configuration, the mobile  
19                  station shall activate the Waiting for Service Action Time Subfunction;  
20                  otherwise, the mobile station shall send a *Mobile Station Reject Order*  
21                  (ORDQ = '00000111') within T<sub>56m</sub> seconds.
- 22           2. *Service Option Control Message*: If the service option connection specified by  
23           the message is part of the current service configuration, and the service option  
24           specified by the message is the same as the service option associated with the  
25           service option connection, the mobile station shall interpret the action time of  
26           the message as specified in 2.6.4.1.5, and shall process the message in  
27           accordance with the requirements for the service option; otherwise, the mobile  
28           station shall send a *Mobile Station Reject Order* (ORDQ = '00000111') within  
29           T<sub>56m</sub> seconds.
- 30           3. *Service Request Message*: The mobile station shall process the message as  
31           follows:
- 32           – If the purpose of the message is to reject a proposed service configuration,  
33           the mobile station shall send a *Mobile Station Reject Order* (ORDQ =  
34           '00000010') within T<sub>56m</sub> seconds.
- 35           – If the purpose of the message is to propose a service configuration, the  
36           mobile station shall process the message as follows:
- 37           + If the mobile station accepts the proposed service configuration, the  
38           mobile station shall send a *Service Response Message* to accept the  
39           proposed service configuration within T<sub>59m</sub> seconds. The mobile station  
40           shall activate the *Waiting for Service Connect Message Subfunction*.

- 1                   + If the mobile station does not accept the proposed service configuration  
2                   and does not have an alternative service configuration to propose, the  
3                   mobile station shall send a *Service Response Message* to reject the  
4                   proposed service configuration within T<sub>59m</sub> seconds.
- 5                   + If the mobile station does not accept the proposed service configuration  
6                   and has an alternative service configuration to propose, the mobile  
7                   station shall send a *Service Response Message* to propose the alternative  
8                   service configuration within T<sub>59m</sub> seconds. The mobile station shall  
9                   activate the *Waiting for Service Request Message Subfunction*.
- 10           4. *Service Response Message*: The mobile station shall send a *Mobile Station*  
11           *Reject Order* (ORDQ = '00000010') within T<sub>56m</sub> seconds.
- 12           5. *General Handoff Direction Message*: If the SCR\_INCLUDED field is included in  
13           this message and is set to '1':  
14           If the mobile station has not rejected this message, the mobile station shall  
15           activate the *Waiting for Service Action Time Subfunction*.
- 16           6. *Universal Handoff Direction Message*: If the SCR\_INCLUDED field is included in  
17           this message and is set to '1':  
18           If the mobile station has not rejected this message, the mobile station shall  
19           activate the *Waiting for Service Action Time Subfunction*.
- 20           • If the mobile station receives one of the following service option negotiation  
21           messages, the mobile station shall send a *Mobile Station Reject Order* (ORDQ =  
22           '00000010') within T<sub>56m</sub> seconds:  
23           1. *Service Option Request Order*  
24           2. *Service Option Response Order*  
25           3. *Service Option Control Order*
- 26   2.6.4.1.2.2.2 *Waiting for Service Request Message Subfunction*  
27   While this subfunction is active, the mobile station waits to receive a *Service Request*  
28   *Message*.  
29   Upon activation of the *Waiting for Service Request Message Subfunction*, the mobile station  
30   shall set the subfunction timer for T<sub>68m</sub> seconds.  
31   While the *Waiting for Service Request Message Subfunction* is active, the mobile station  
32   shall perform the following:  
33   • If the subfunction timer expires, the mobile station shall activate the *Normal*  
34   *Service Subfunction*.

- 1 • The mobile station shall process Forward and Reverse Traffic Channel frames in  
2 accordance with the current service configuration. The mobile station shall discard  
3 any Forward Traffic Channel frame which has a format that is not supported by the  
4 mobile station. The mobile station may discard any type of Forward Traffic  
5 Channel traffic that is not signaling traffic and is not part of the current service  
6 configuration.
- 7 • The mobile station shall not initiate service negotiation for a new service  
8 configuration.
- 9 • For any service option connection that is part of the current service configuration,  
10 the mobile station may send a *Service Option Control Message* to invoke a service  
11 option specific function in accordance with the requirements for the associated  
12 service option.
- 13 • If SERV\_NEG<sub>s</sub> changes from enabled to disabled (see 2.6.6.2.5.1), the mobile  
14 station shall activate the *SO Negotiation Subfunction*.
- 15 • If the mobile station receives one of the following service negotiation messages, the  
16 mobile station shall process the message according to the specified requirements:  
17 1. *Service Connect Message*: The mobile station shall perform the following:  
18 • If USE\_OLD\_SERV\_CONFIG<sub>r</sub> equals '01' or '10', and if the mobile station  
19 entered the *Mobile Station Control on the Traffic Channel State* due to  
20 receiving an *Extended Channel Assignment Message* with  
21 GRANTED\_MODE set to '11', the mobile station shall send a *Mobile*  
22 *Station Reject Order* with the ORDQ field set to '00010100' (stored  
23 configuration already restored at channel assignment) within T<sub>56m</sub>  
24 seconds, and shall activate the *Normal Service Subfunction*.
- 25 • If USE\_OLD\_SERV\_CONFIG<sub>r</sub> equals '00', the mobile station shall  
26 perform the following: If the mobile station accepts the service  
27 configuration specified in the message, the mobile station shall activate  
28 the *Waiting for Service Action Time Subfunction*; otherwise, the mobile  
29 station shall send a *Mobile Station Reject Order* (ORDQ = '00000111')  
30 within T<sub>56m</sub> seconds and shall activate the *Normal Service Subfunction*.
- 31 • If USE\_OLD\_SERV\_CONFIG<sub>r</sub> equals '01', the mobile station shall  
32 perform the following: If the mobile station accepts the service  
33 configuration currently stored at the mobile station, the mobile station  
34 shall activate the *Waiting for Service Action Time Subfunction*;  
35 otherwise, the mobile station shall send a *Mobile Station Reject Order*  
36 (ORDQ = '00000111') within T<sub>56m</sub> seconds and shall activate the *Normal*  
37 *Service Subfunction*.
- 38 • If USE\_OLD\_SERV\_CONFIG<sub>r</sub> equals '10', the mobile station shall  
39 perform the following: If the mobile station accepts the service  
40 configuration resulting from updating the stored service configuration  
41 with the service configuration received in this message, the mobile  
42 station shall activate the *Waiting for Service Action Time Subfunction*;

otherwise, the mobile station shall send a Mobile Station Reject Order (ORDQ = '00000111') within T<sub>56m</sub> seconds and shall activate the *Normal Service Subfunction*.

- If USE\_OLD\_SERV\_CONFIG<sub>r</sub> equals '11', the mobile station shall perform the following: if the mobile station accepts the service configuration resulting from restoring the indicated service option connection records from the stored service configuration and releasing the indicated service option connection records from the current service configuration, the mobile station shall activate the Waiting for Service Action Time Subfunction; otherwise, the mobile station shall send a *Mobile Station Reject Order* (ORDQ = '00000111') within T<sub>56m</sub> seconds and shall activate the *Normal Service Subfunction*.

2. *Service Option Control Message*: If the service option connection specified by the message is part of the current service configuration, and the service option specified by the message is the same as the service option associated with the service option connection, the mobile station shall interpret the action time of the message as specified in 2.6.4.1.5, and shall process the message in accordance with the requirements for the service option; otherwise, the mobile station shall send a *Mobile Station Reject Order* (ORDQ = '00000111') within T<sub>56m</sub> seconds.

3. *Service Request Message*: The mobile station shall process the message as follows:

- If the purpose of the message is to reject a proposed service configuration, the mobile station shall activate the *Normal Service Subfunction*.
- If the purpose of the message is to propose a service configuration, the mobile station shall process the message as follows:
  - + If the mobile station accepts the proposed service configuration, the mobile station shall send a *Service Response Message* to accept the proposed service configuration within T<sub>59m</sub> seconds. The mobile station shall activate the *Waiting for Service Connect Message Subfunction*.
  - + If the mobile station does not accept the proposed service configuration and does not have an alternative service configuration to propose, the mobile station shall send a *Service Response Message* to reject the proposed service configuration within T<sub>59m</sub> seconds. The mobile station shall activate the *Normal Service Subfunction*.
  - + If the mobile station does not accept the proposed service configuration and has an alternative service configuration to propose, the mobile station shall send a *Service Response Message* to propose the alternative service configuration within T<sub>59m</sub> seconds. The mobile station shall reset the subfunction timer for T<sub>68m</sub> seconds.

4. *Service Response Message*: The mobile station shall send a *Mobile Station Reject Order* (ORDQ = '00000010') within T<sub>56m</sub> seconds.

5. *General Handoff Direction Message*: If the SCR\_INCLUDED field is included in this message and is set to '1':

If the mobile station has not rejected this message, the mobile station shall activate the *Waiting for Service Action Time Subfunction*; otherwise, the mobile station shall activate the *Normal Service Subfunction*.

6. *Universal Handoff Direction Message*: If the SCR\_INCLUDED field is included in this message and is set to '1':

If the mobile station has not rejected this message, the mobile station shall activate the *Waiting for Service Action Time Subfunction*; otherwise, the mobile station shall activate the *Normal Service Subfunction*.

- If the mobile station receives one of the following service option negotiation messages, the mobile station shall send a *Mobile Station Reject Order* (ORDQ = '00000010') within T<sub>56m</sub> seconds:

1. *Service Option Request Order*
2. *Service Option Response Order*
3. *Service Option Control Order*

#### 2.6.4.1.2.2.3 Waiting for Service Response Message Subfunction

While this subfunction is active, the mobile station waits to receive a *Service Response Message*.

Upon activation of the *Waiting for Service Response Message Subfunction*, the mobile station shall set the subfunction timer for T<sub>68m</sub> seconds.

While the *Waiting for Service Response Message Subfunction* is active, the mobile station shall perform the following:

- If the subfunction timer expires, the mobile station shall activate the *Normal Service Subfunction*.
- The mobile station shall process Forward and Reverse Traffic Channel frames in accordance with the current service configuration. The mobile station shall discard any Forward Traffic Channel frame which has a format that is not supported by the mobile station. The mobile station may discard any type of Forward Traffic Channel traffic that is not signaling traffic and is not part of the current service configuration.
- The mobile station shall not initiate service negotiation for a new service configuration.
- For any service option connection that is part of the current service configuration, the mobile station may send a *Service Option Control Message* to invoke a service option specific function in accordance with the requirements for the associated service option.
- If SERV\_NEG<sub>s</sub> changes from enabled to disabled (see 2.6.6.2.5.1), the mobile station shall activate the *SO Negotiation Subfunction*.

- 1 • If the mobile station receives one of the following service negotiation messages, the  
2 mobile station shall process the message according to the specified requirements:
- 3 1. *Service Connect Message*: The mobile station shall perform the following:
  - 4 • If USE\_OLD\_SERV\_CONFIG<sub>r</sub> equals '01' or '10', and if the mobile station  
5 entered the *Mobile Station Control on the Traffic Channel State* due to  
6 receiving an *Extended Channel Assignment Message* with GRANTED\_MODE  
7 set to '11', the mobile station shall send a *Mobile Station Reject Order* with  
8 the ORDQ field set to '00010100' (stored configuration already restored at  
9 channel assignment) within T<sub>56m</sub> seconds, and shall activate the *Normal*  
10 *Service Subfunction*.
  - 11 • If USE\_OLD\_SERV\_CONFIG<sub>r</sub> equals '00', the mobile station shall perform  
12 the following: If the mobile station accepts the service configuration  
13 specified in the message, the mobile station shall activate the *Waiting for*  
14 *Service Action Time Subfunction*; otherwise, the mobile station shall send a  
15 *Mobile Station Reject Order* (ORDQ = '00000111') within T<sub>56m</sub> seconds and  
16 shall activate the *Normal Service Subfunction*.
  - 17 • If USE\_OLD\_SERV\_CONFIG<sub>r</sub> equals '01', the mobile station shall perform  
18 the following: If the mobile station accepts the service configuration  
19 currently stored at the mobile station, the mobile station shall activate the  
20 *Waiting for Service Action Time Subfunction*; otherwise, the mobile station  
21 shall send a *Mobile Station Reject Order* (ORDQ = '00000111') within T<sub>56m</sub>  
22 seconds and shall activate the *Normal Service Subfunction*.
  - 23 • If USE\_OLD\_SERV\_CONFIG<sub>r</sub> equals '10', the mobile station shall perform  
24 the following: If the mobile station accepts the service configuration  
25 resulting from updating the stored service configuration with the service  
26 configuration received in this message, the mobile station shall activate the  
27 *Waiting for Service Action Time Subfunction*; otherwise, the mobile station  
28 shall send a *Mobile Station Reject Order* (ORDQ = '00000111') within T<sub>56m</sub>  
29 seconds and shall activate the *Normal Service Subfunction*.
  - 30 • If USE\_OLD\_SERV\_CONFIG<sub>r</sub> equals '11', the mobile station shall perform  
31 the following: if the mobile station accepts the service configuration  
32 resulting from restoring the indicated service option connection records  
33 from the stored service configuration and releasing the indicated service  
34 option connection records from the current service configuration, the mobile  
35 station shall activate the *Waiting for Service Action Time Subfunction*;  
36 otherwise, the mobile station shall send a *Mobile Station Reject Order*  
37 (ORDQ = '00000111') within T<sub>56m</sub> seconds and shall activate the *Normal*  
38 *Service Subfunction*.

- 1        2. *Service Option Control Message*: If the service option connection specified by  
2        the message is part of the current service configuration, and the service option  
3        specified by the message is the same as the service option associated with the  
4        service option connection, the mobile station shall interpret the action time of  
5        the message as specified in 2.6.4.1.5, and shall process the message in  
6        accordance with the requirements for the service option; otherwise, the mobile  
7        station shall send a *Mobile Station Reject Order* (ORDQ = '00000111') within  
8        T<sub>56m</sub> seconds.
- 9        3. *Service Request Message*: The mobile station shall process the message as  
10       follows:
- 11       – If the purpose of the message is to reject a proposed service configuration,  
12       the mobile station shall send a *Mobile Station Reject Order* (ORDQ =  
13       '00000010') within T<sub>56m</sub> seconds.
- 14       – If the purpose of the message is to propose a service configuration, the  
15       mobile station shall discontinue processing the service configuration  
16       requested by the user and shall process the message as follows:
- 17       + If the mobile station accepts the proposed service configuration, the  
18       mobile station shall send a *Service Response Message* to accept the  
19       proposed service configuration within T<sub>59m</sub> seconds. The mobile station  
20       shall activate the *Waiting for Service Connect Message Subfunction*.
- 21       + If the mobile station does not accept the proposed service configuration  
22       and does not have an alternative service configuration to propose, the  
23       mobile station shall send a *Service Response Message* to reject the  
24       proposed service configuration within T<sub>59m</sub> seconds. The mobile station  
25       shall activate the *Normal Service Subfunction*.
- 26       + If the mobile station does not accept the proposed service configuration  
27       and has an alternative service configuration to propose, the mobile  
28       station shall send a *Service Response Message* to propose the alternative  
29       service configuration within T<sub>59m</sub> seconds. The mobile station shall  
30       activate the *Waiting for Service Request Message Subfunction*.
- 31       4. *Service Response Message*: The mobile station shall process the message as  
32       follows:
- 33       – If the service request sequence number (SERV\_REQ\_SEQ<sub>r</sub>) from the  
34       message does not match the sequence number of the *Service Request*  
35       *Message* for which the mobile station is expecting a response, the mobile  
36       station shall not process the other Layer 3 fields of the message.
- 37       – If the purpose of the message is to reject the service configuration proposed  
38       in the corresponding *Service Request Message*, the mobile station shall  
39       activate the *Normal Service Subfunction*. The mobile station may indicate to  
40       the user that the requested service configuration has been rejected.
- 41       – If the purpose of the message is to propose a service configuration, the  
42       mobile station shall process the message as follows:

- 1                   + If the mobile station accepts the proposed service configuration, the
- 2                   mobile station shall send a *Service Request Message* to accept the
- 3                   proposed service configuration within T<sub>59m</sub> seconds. The mobile station
- 4                   shall activate the *Waiting for Service Connect Message Subfunction*.
- 5                   + If the mobile station does not accept the proposed service configuration
- 6                   and does not have an alternative service configuration to propose, the
- 7                   mobile station shall send a *Service Request Message* to reject the
- 8                   proposed service configuration within T<sub>59m</sub> seconds. The mobile station
- 9                   shall activate the *Normal Service Subfunction*.
- 10                  + If the mobile station does not accept the proposed service configuration
- 11                  and has an alternative service configuration to propose, the mobile
- 12                  station shall send a *Service Request Message* to propose the alternative
- 13                  service configuration within T<sub>59m</sub> seconds. The mobile station shall
- 14                  reset the subfunction timer for T<sub>68m</sub> seconds.
- 15                  5. *General Handoff Direction Message*: If the SCR\_INCLUDED field is included in
- 16                  this message and is set to '1':
- 17                  If the mobile station has not rejected this message, the mobile station shall
- 18                  activate the *Waiting for Service Action Time Subfunction*; otherwise, the mobile
- 19                  station shall activate the *Normal Service Subfunction*.
- 20                  6. *Universal Handoff Direction Message*: If the SCR\_INCLUDED field is included
- 21                  in this message and is set to '1':
- 22                  If the mobile station has not rejected this message, the mobile station shall
- 23                  activate the *Waiting for Service Action Time Subfunction*; otherwise, the mobile
- 24                  station shall activate the *Normal Service Subfunction*.
- 25                  • If the mobile station receives one of the following service option negotiation
- 26                  messages, the mobile station shall send a *Mobile Station Reject Order* (ORDQ =
- 27                  '00000010') within T<sub>56m</sub> seconds:
- 28                  1. *Service Option Request Order*
- 29                  2. *Service Option Response Order*
- 30                  3. *Service Option Control Order*

#### 31 2.6.4.1.2.2.4 Waiting for Service Connect Message Subfunction

32 While this subfunction is active, the mobile station waits to receive a *Service Connect*  
 33 *Message*, a *General Handoff Direction Message*, or a *Universal Handoff Direction Message*  
 34 containing a service configuration record.

35 Upon activation of the *Waiting for Service Connect Message Subfunction*, the mobile station  
 36 shall set the subfunction timer for T<sub>65m</sub> seconds.

37 While the *Waiting for Service Connect Message Subfunction* is active, the mobile station  
 38 shall perform the following:

- 1 • If the subfunction timer expires, the mobile station shall activate the *Normal*  
2 *Service Subfunction*.
- 3 • The mobile station shall process Forward and Reverse Traffic Channel frames in  
4 accordance with the current service configuration. The mobile station shall discard  
5 any Forward Traffic Channel frame which has a format that is not supported by the  
6 mobile station. The mobile station may discard any type of Forward Traffic  
7 Channel traffic that is not signaling traffic and is not part of the current service  
8 configuration.
- 9 • The mobile station shall not initiate service negotiation for a new service  
10 configuration.
- 11 • For any service option connection that is part of the current service configuration,  
12 the mobile station may send a *Service Option Control Message* to invoke a service  
13 option specific function in accordance with the requirements for the associated  
14 service option.
- 15 • If SERV\_NEG<sub>s</sub> changes from enabled to disabled (see 2.6.6.2.5.1), the mobile  
16 station shall activate the *SO Negotiation Subfunction*.
- 17 • If the mobile station receives one of the following service negotiation messages, the  
18 mobile station shall process the message according to the specified requirements:  
19 1. *Service Connect Message*: The mobile station shall perform the following:  
20 • If USE\_OLD\_SERV\_CONFIG<sub>r</sub> equals '01' or '10', and if the mobile station  
21 entered the *Mobile Station Control on the Traffic Channel State* due to  
22 receiving an *Extended Channel Assignment Message* with GRANTED\_MODE  
23 set to '11', the mobile station shall send a *Mobile Station Reject Order* with  
24 the ORDQ field set to '00010100' (stored configuration already restored at  
25 channel assignment) within T<sub>56m</sub> seconds, and shall activate the *Normal*  
26 *Service Subfunction*.  
27 • If USE\_OLD\_SERV\_CONFIG<sub>r</sub> equals '00', the mobile station shall perform  
28 the following: If the mobile station accepts the service configuration  
29 specified in the message, the mobile station shall activate the *Waiting for*  
30 *Service Action Time Subfunction*; otherwise, the mobile station shall send a  
31 *Mobile Station Reject Order* (ORDQ = '00000111') within T<sub>56m</sub> seconds and  
32 shall activate the *Normal Service Subfunction*.  
33 • If USE\_OLD\_SERV\_CONFIG<sub>r</sub> equals '01', the mobile station shall perform  
34 the following: If the mobile station accepts the service configuration  
35 currently stored at the mobile station, the mobile station shall activate the  
36 *Waiting for Service Action Time Subfunction*; otherwise, the mobile station  
37 shall send a *Mobile Station Reject Order* (ORDQ = '00000111') within T<sub>56m</sub>  
38 seconds, and shall activate the *Normal Service Subfunction*.

- 1                   • If USE\_OLD\_SERV\_CONFIG<sub>r</sub> equals '10', the mobile station shall perform  
2                   the following: If the mobile station accepts the service configuration  
3                   resulting from updating the stored service configuration with the service  
4                   configuration received in this message, the mobile station shall activate the  
5                   Waiting for Service Action Time Subfunction; otherwise, the mobile station  
6                   shall send a Mobile Station Reject Order (ORDQ = '00000111') within T<sub>56m</sub>  
7                   seconds, and shall activate the *Normal Service Subfunction*.
- 8                   • If USE\_OLD\_SERV\_CONFIG<sub>r</sub> equals '11', the mobile station shall perform  
9                   the following: if the mobile station accepts the service configuration  
10                  resulting from restoring the indicated service option connection records  
11                  from the stored service configuration and releasing the indicated service  
12                  option connection records from the current service configuration, the mobile  
13                  station shall activate the Waiting for Service Action Time Subfunction;  
14                  otherwise, the mobile station shall send a *Mobile Station Reject Order*  
15                  (ORDQ = '00000111') within T<sub>56m</sub> seconds, and shall activate the *Normal*  
16                  *Service Subfunction*.
- 17           2. *Service Option Control Message*: If the service option connection specified by  
18           the message is part of the current service configuration, and the service option  
19           specified by the message is the same as the service option associated with the  
20           service option connection, the mobile station shall interpret the action time of  
21           the message as specified in 2.6.4.1.5, and shall process the message in  
22           accordance with the requirements for the service option; otherwise, the mobile  
23           station shall send a *Mobile Station Reject Order* (ORDQ = '00000111') within  
24           T<sub>56m</sub> seconds.
- 25           3. *Service Request Message*: The mobile station shall process the message as  
26           follows:
- 27           – If the purpose of the message is to reject a proposed service configuration,  
28           the mobile station shall send a *Mobile Station Reject Order* (ORDQ =  
29           '00000010') within T<sub>56m</sub> seconds.
- 30           – If the purpose of the message is to propose a service configuration, the  
31           mobile station shall process the message as follows:
- 32           + If the mobile station accepts the proposed service configuration, the  
33           mobile station shall send a *Service Response Message* to accept the  
34           proposed service configuration within T<sub>59m</sub> seconds. The mobile station  
35           shall reset the subfunction timer for T<sub>65m</sub> seconds.
- 36           + If the mobile station does not accept the proposed service configuration  
37           and does not have an alternative service configuration to propose, the  
38           mobile station shall send a *Service Response Message* to reject the  
39           proposed service configuration within T<sub>59m</sub> seconds. The mobile station  
40           shall activate the *Normal Service Subfunction*.

- + If the mobile station does not accept the proposed service configuration and has an alternative service configuration to propose, the mobile station shall send a *Service Response Message* to propose the alternative service configuration within  $T_{59m}$  seconds. The mobile station shall activate the *Waiting for Service Request Message Subfunction*.

4. *Service Response Message*: The mobile station shall send a *Mobile Station Reject Order* (ORDQ = '00000010') within  $T_{56m}$  seconds.

5. *General Handoff Direction Message*: If the SCR\_INCLUDED field is included in this message and is set to '1':

If the mobile station has not rejected this message, the mobile station shall activate the *Waiting for Service Action Time Subfunction*; otherwise, the mobile station shall activate the *Normal Service Subfunction*.

6. *Universal Handoff Direction Message*: If the SCR\_INCLUDED field is included in this message and is set to '1':

If the mobile station has not rejected this message, the mobile station shall activate the *Waiting for Service Action Time Subfunction*; otherwise, the mobile station shall activate the *Normal Service Subfunction*.

- If the mobile station receives one of the following service option negotiation messages, the mobile station shall send a *Mobile Station Reject Order* (ORDQ = '00000010') within  $T_{56m}$  seconds:

1. *Service Option Request Order*
2. *Service Option Response Order*
3. *Service Option Control Order*

#### 2.6.4.1.2.2.5 Waiting for Service Action Time Subfunction

While this subfunction is active, the mobile station waits for the action time associated with a new service configuration. If the action time was specified by a *Service Connect Message*, the mobile station shall send the *Service Connect Completion Message* at the action time.

While the *Waiting for Service Action Time Subfunction* is active, the mobile station shall perform the following:

- Prior to the action time associated with the *Service Connect Message*, *General Handoff Direction Message* (containing a service configuration record), or *Universal Handoff Direction Message* (containing a service configuration record), the mobile station shall process Forward and Reverse Traffic Channel frames in accordance with the current service configuration. The mobile station shall discard any Forward Traffic Channel frame which has a format that is not supported by the mobile station. The mobile station may discard any type of Forward Traffic Channel traffic that is not signaling traffic and is not part of the current service configuration.

- 1       • At the action time associated with the *Service Connect Message*, *General Handoff*  
2       *Direction Message* (containing a service configuration record) or *Universal Handoff*  
3       *Direction Message* (containing a service configuration record), the mobile station  
4       shall perform the following<sup>29</sup>:
  - 5       – If this is a *Service Connect Message* and USE\_TYPE0\_PLCM<sub>r</sub> equals '1', the  
6       mobile station shall perform the following:
    - 7       + If P\_REV\_IN\_USE<sub>s</sub> is less than 11, set PLCM\_TYPE<sub>s</sub> to '0000'; otherwise set  
8       PLCM\_TYPE<sub>s</sub> to '0100'.
    - 9       + The mobile station shall use the Public Long Code Mask derived from  
10       PLCM\_TYPE<sub>s</sub> as specified in 2.3.6.
  - 11      – If this is a *Service Connect Message* with USE\_OLD\_SERV\_CONFIG<sub>r</sub> equals '01',  
12      the mobile station shall perform the following:
    - 13      + If SYNC\_ID\_INCL<sub>r</sub> is included and set to '1', the SYNC\_ID<sub>r</sub> indicates the  
14      stored service configuration to be restored; otherwise, the SYNC\_ID  
15      conveyed by the mobile station indicates the stored service configuration to  
16      be restored.
    - 17      + The Call Control instance identified by NULL shall also be identified by the  
18      connection reference assigned to the first service option connection in the  
19      stored Service Configuration information record.
    - 20      + For each service option connection (with corresponding connection  
21      reference CON\_REF<sub>i</sub>) in the stored service configuration record, if any,  
22      except for the first one, Layer 3 shall instantiate a Call Control instance (as  
23      specified in 2.6.10) with a 'restore indication'. The mobile station shall  
24      identify each of these Call Control instances by the corresponding  
25      CON\_REF<sub>i</sub>.
    - 26      + The mobile station shall begin to use the stored service configuration  
27      corresponding to this SYNC\_ID as the current service configuration as  
28      specified in 2.6.4.1.2.2.5.2 and shall begin to process Forward and Reverse  
29      Traffic Channel frames accordingly. The mobile station shall send a *Service*  
30      *Connect Completion Message* within T<sub>56m</sub> seconds after the action time.
    - 31      + The mobile station shall store the synchronization identifier corresponding  
32      to the stored service configuration as SYNC\_ID<sub>s</sub>.

---

<sup>29</sup> Note that these procedures that take place at the action time may not occur for this message if a GHDM/UHDM with SCR\_INCLUDED equal to '1' is received before the action time of this message. In this case, these procedures take place for the new message. One exception is that the call assignments from this message take effect at the action time of this message regardless of the call assignments from the new message.

- 1           + The mobile station shall exit this subfunction and activate the *Normal*
- 2           *Service Subfunction*.
- 3       - If this is a *Service Connect Message* with USE\_OLD\_SERV\_CONFIG<sub>r</sub> equals '10',
- 4       the mobile station shall perform the following:
- 5           + If SYNC\_ID\_INCL<sub>r</sub> is included and set to '1' and
- 6           SYNC\_ID\_BS\_INITIATED\_IND<sub>r</sub> is set to '1', the SYNC\_ID<sub>r</sub> indicates the
- 7           stored service configuration to be restored; otherwise, the SYNC\_ID
- 8           conveyed by the mobile station indicates the stored service configuration to
- 9           be restored.
- 10          + The mobile station shall update the stored service configuration with the
- 11          received service configuration as follows:
- 12           o The mobile station shall restore the stored service configuration as
- 13           specified in 2.6.4.1.2.2.5.2.
- 14           o The mobile station shall process the received Service Configuration
- 15           Record as specified in 2.6.4.1.12.
- 16           o The mobile station shall process the received Non-negotiable Service
- 17           Configuration Record as specified in 2.6.4.1.13.
- 18          + For each service option connection (with corresponding connection
- 19          reference CON\_REF<sub>i</sub>) in the stored service configuration record, if any,
- 20          except for the first one, Layer 3 shall instantiate a Call Control instance (as
- 21          specified in 2.6.10) with a 'restore indication'. The mobile station shall
- 22          identify each of these Call Control instances by the corresponding
- 23          CON\_REF<sub>i</sub>.
- 24          + The mobile station shall begin to use the updated service configuration as
- 25          the current service configuration and shall begin to process Forward and
- 26          Reverse Traffic Channel frames accordingly. The mobile station shall send a
- 27          *Service Connect Completion Message* within T<sub>56m</sub> seconds after the action
- 28          time.
- 29          + If SYNC\_ID\_INCL<sub>r</sub> is set to '1' and SYNC\_ID\_BS\_INITIATED\_IND<sub>r</sub> is set to '0',
- 30          the mobile station shall perform the following::
- 31           o The mobile station shall store the synchronization identifier received
- 32           from the base station (SYNC\_ID<sub>s</sub> = SYNC\_ID<sub>r</sub>).
- 33           o The mobile station shall store the new service configuration
- 34           corresponding to SYNC\_ID<sub>s</sub> as specified in 2.6.4.1.2.2.5.1.
- 35          Otherwise, the mobile station shall set SYNC\_ID<sub>s</sub> to NULL.
- 36          + The mobile station shall exit this subfunction and activate the *Normal*
- 37          *Service Subfunction*.

- 1       – If this is a *Service Connect Message* with USE\_OLD\_SERV\_CONFIG<sub>r</sub> equals '11',  
2       the mobile station shall perform the following:
  - 3       + If the SYNC\_ID\_INCL field is included in this message and set to '1', the  
4       SYNC\_ID included in this message indicates the stored service configuration  
5       to be restored; otherwise, the SYNC\_ID conveyed by the mobile station  
6       indicates the stored service configuration to be restored.
    - 7       o Prior to this message, if an *Extended Channel Assignment Message* with  
8       GRANTED\_MODE set to '11' was not received and a *Service Connect*  
9       *Message*, *General Handoff Direction Message* (with service  
10       configuration), or *Universal Handoff Direction Message* (with service  
11       configuration) was not successfully received or accepted by the mobile  
12       station since entering the *Traffic Channel Substate*, the mobile station  
13       shall perform the following:
      - 14       ◇ The mobile station shall begin to use the service configuration which  
15       was stored by the mobile station when it left the *Mobile Station*  
16       *Control on the Traffic Channel State* as the current service  
17       configuration as specified in 2.6.4.1.2.2.5.2 where only the service  
18       option connection record corresponding to SR\_ID<sub>r</sub> received in the  
19       *Service Connect Message* shall be restored.
      - 20       ◇ The Call Control instance identified by NULL shall also be identified  
21       by the connection reference assigned to the restored service option  
22       connection.
      - 23       ◇ The mobile station shall begin to process Forward and Reverse  
24       Traffic Channel frames accordingly with the restored service  
25       configuration. The mobile station shall send a *Service Connect*  
26       *Completion Message* within T<sub>56m</sub> seconds after the action time.
      - 27       ◇ The mobile station shall store the synchronization identifier  
28       corresponding to the stored service configuration as SYNC\_ID<sub>s</sub>.
      - 29       ◇ The mobile station shall exit this subfunction and activate the  
30       *Normal Service Subfunction*.
    - 31       o Otherwise, the mobile station shall perform the following at the action  
32       time of this message:
      - 33       ◇ The mobile station shall restore the indicated service option  
34       connection record(s) from the stored service configuration as  
35       specified in 2.6.4.1.2.2.5.2, where the service option connection  
36       records to be restored are determined as follows:
        - 37       ➤ If SR\_ID<sub>r</sub> equals '111', the mobile station shall restore all  
38       remaining service option connection records. Otherwise, if

SR\_ID<sub>r</sub> equals '000', the mobile station shall restore service option connection records corresponding to SR\_ID<sub>s</sub> indicated by SR\_ID\_RESTORE\_BITMAP<sub>r</sub> received in this message; otherwise the mobile station shall restore the service option connection record corresponding to the SR\_ID<sub>r</sub> received in this message.

➤ Layer 3 shall instantiate a Call Control instance (as specified in 2.6.10) for each of the restored service option connections with a 'restore indication' and Layer 3 shall identify each of these Call Control instances by the value of the CON\_REF field corresponding to the restored service option connection.

➤ The mobile station shall perform the following:

– If SR\_ID<sub>r</sub> equals '111', the mobile station shall disable the enhanced origination timers corresponding to each *Enhanced Origination Message* sent with SYNC\_ID\_INCL field set to '1' and shall remove the corresponding TAG value from the list TAG\_OUTSTANDING\_LIST.

– Otherwise, the mobile station shall disable the enhanced origination timer corresponding to the *Enhanced Origination Message* with SR\_ID field set to either '111' or to the SR\_ID<sub>r</sub> value received in this message and shall remove the corresponding TAG value from the list TAG\_OUTSTANDING\_LIST.

◇ If the SR\_ID\_RELEASE\_BITMAP\_INCL field is included and is set to '1', the mobile station shall release the indicated service option connection record(s) from the current service configuration, where the service option connection records to be released are determined as follows:

➤ The mobile station shall release service option connection records corresponding to SR\_IDs indicated by SR\_ID\_RELEASE\_BITMAP<sub>r</sub> received in this message.

➤ Layer 3 shall terminate a Call Control instance for each of the released service option connections.

– Otherwise, the mobile station shall perform the following:

+ Prior to this message, if a *Service Connect Message*, *General Handoff Direction Message* (with service configuration), or *Universal Handoff Direction Message* (with service configuration) was not successfully received or accepted by the mobile station since entering the *Traffic Channel Substate*, the mobile station shall perform the following:

- 1           o The mobile station shall set the service configuration parameters (i.e.  
2           those signaled via the Service Configuration information record and the  
3           Non-Negotiable Service Configuration information record) to their default  
4           values as specified in 2.6.4.2.
- 5           + The mobile station shall process the received Service Configuration Record  
6           as specified in 2.6.4.1.12, shall process the received Non-negotiable Service  
7           Configuration Record as specified in 2.6.4.1.13 (if included), and shall begin  
8           to use the service configuration specified by the *Service Connect Message*,  
9           *General Handoff Direction Message* or *Universal Handoff Direction Message*  
10          containing a service configuration record as the current service  
11          configuration and shall begin to process Forward and Reverse Traffic  
12          Channel frames accordingly. If the action time was specified by a *Service*  
13          *Connect Message*, the mobile station shall send a *Service Connect*  
14          *Completion Message* within  $T_{56m}$  seconds after the action time.
- 15          + If SYNC\_ID\_INCL<sub>r</sub> is set to '1', the mobile station shall perform the following:
  - 16           o The mobile station shall store the synchronization identifier received  
17           from the base station (SYNC\_ID<sub>s</sub> = SYNC\_ID<sub>r</sub>).
  - 18           o The mobile station shall store the new service configuration  
19           corresponding to SYNC\_ID<sub>s</sub> as specified in 2.6.4.1.2.2.5.1.
- 20          Otherwise, the mobile station shall set SYNC\_ID<sub>s</sub> to NULL.
- 21          + If P\_REV\_IN\_USE<sub>s</sub> is greater than six, the Non-Negotiable Service  
22          Configuration information record is not included in this message, and the  
23          value of SR\_ID corresponding to the logical resource of '0000' in the  
24          LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE is NULL, the mobile station  
25          shall set this SR\_ID field to the value specified in the Service Configuration  
26          information record.
- 27          + If CC\_INFO\_INCL<sub>r</sub> equals '1', then for each of the NUM\_CALLS\_ASSIGN<sub>r</sub>  
28          occurrences of the call control parameters included in the message, the  
29          mobile station shall perform the following:
  - 30           o If RESPONSE\_IND<sub>r</sub> equals '1', and TAG<sub>r</sub> matches any of the TAG values  
31           contained in the list TAG\_OUTSTANDING\_LIST, the Layer 3 shall  
32           instantiate a Call Control instance (as specified in 2.6.10). The mobile  
33           station shall identify this Call Control instance by CON\_REF<sub>r</sub>. The  
34           mobile station shall disable the enhanced origination timer associated  
35           with TAG<sub>r</sub> and remove the TAG value specified by TAG<sub>r</sub> from the list  
36           TAG\_OUTSTANDING\_LIST.
  - 37           o If RESPONSE\_IND<sub>r</sub> equals '0', the mobile station shall store the bypass  
38           indicator (BYPASS\_ALERT\_ANSWER<sub>s</sub> = BYPASS\_ALERT\_ANSWER<sub>r</sub>) and  
39           the Layer 3 shall instantiate a Call Control instance (as specified in  
40           2.6.10). The mobile station shall identify this Call Control instance by  
41           CON\_REF<sub>r</sub>.
- 42          + The mobile station shall exit this subfunction and activate the *Normal*

1                    *Service Subfunction.*

- 2            • The mobile station shall not initiate service negotiation for a new service  
3            configuration.
- 4            • For any service option connection that is part of the current or pending service  
5            configuration, the mobile station may send a *Service Option Control Message* to  
6            invoke a service option specific function in accordance with the requirements for  
7            the associated service option.
- 8            • If SERV\_NEG<sub>S</sub> changes from enabled to disabled (see 2.6.6.2.5.1), the mobile  
9            station shall activate the *SO Negotiation Subfunction*.
- 10          • If the mobile station receives one of the following service negotiation messages, the  
11          mobile station shall process the message according to the specified requirements:
  - 12            1. *Service Connect Message*: The mobile station shall send a *Mobile Station Reject*  
13            *Order* (ORDQ = '00000010') within T<sub>56m</sub> seconds.
  - 14            2. *Service Option Control Message*: If the service option connection specified by  
15            the message is part of the current or pending service configuration, and the  
16            service option specified by the message is the same as the service option  
17            associated with the service option connection, the mobile station shall interpret  
18            the action time of the message as specified in 2.6.4.1.5, and shall process the  
19            message in accordance with the requirements for the service option; otherwise,  
20            the mobile station shall send a *Mobile Station Reject Order* (ORDQ = '00000111')  
21            within T<sub>56m</sub> seconds.
  - 22            3. *Service Request Message*: The mobile station shall send a *Mobile Station Reject*  
23            *Order* (ORDQ = '00000010') within T<sub>56m</sub> seconds.
  - 24            4. *Service Response Message*: The mobile station shall send a *Mobile Station*  
25            *Reject Order* (ORDQ = '00000010') within T<sub>56m</sub> seconds.
  - 26            5. *General Handoff Direction Message*: If the SCR\_INCLUDED field is included in  
27            this message and is set to '1':  
28            If the mobile station has not rejected this message, the mobile station shall  
29            remain in this subfunction until the action time specified in the message, and  
30            shall perform the following:
    - 31                o The mobile station shall not perform the above procedures for the previous  
32                message. But the call assignments from the previous message (if any) shall  
33                take effect at the action time of the previous message.
    - 34                o The mobile station shall perform the above procedures for this message  
35                (that is, begin to use the service configuration specified by the *General*  
36                *Handoff Direction Message*) at the action time of this message.
  - 37            6. *Universal Handoff Direction Message*: If the SCR\_INCLUDED field is included in  
38            this message and is set to '1':  
39            If the mobile station has not rejected this message, the mobile station shall

1 remain in this subfunction until the action time specified in the message, and  
2 shall perform the following:

3       o The mobile station shall not perform the above procedures for the previous  
4 message. But the call assignments from the previous message (if any) shall  
5 take effect at the action time of the previous message.

6       o The mobile station shall perform the above procedures for this message  
7 (that is, begin to use the service configuration and call assignments (if any)  
8 specified by the *Universal Handoff Direction Message*) at the action time of  
9 this message.

10       • If the mobile station receives one of the following service option negotiation  
11 messages, the mobile station shall send a *Mobile Station Reject Order* (ORDQ =  
12 '00000010') within T<sub>56m</sub> seconds:

- 13       1. *Service Option Request Order*
- 14       2. *Service Option Response Order*
- 15       3. *Service Option Control Order*

#### 16 2.6.4.1.2.2.5.1 Storing a Service Configuration with SYNC\_ID

17 The mobile station shall set NUM\_SYNC\_ID\_SUPPORTED as follows:

- 18       • If the mobile station has not reported the Capability Information information record  
19 with the ADD\_NUM\_SYNC\_ID field, the mobile station shall set  
20 NUM\_SYNC\_ID\_SUPPORTED to four.
- 21       • If the mobile station has reported the Capability Information information record  
22 with the ADD\_NUM\_SYNC\_ID field, the mobile station shall set  
23 NUM\_SYNC\_ID\_SUPPORTED to five plus the value of the ADD\_NUM\_SYNC\_ID field  
24 included in the Capability Information information record.

25 The mobile station shall be capable of storing a minimum of NUM\_SYNC\_ID\_SUPPORTED  
26 service configurations along with their corresponding SYNC\_ID, SID and NID.

27 Two SYNC\_IDs are considered to be equal if and only if both the length and value of the  
28 SYNC\_IDs is equal.

29 The mobile station shall use the following procedure in the order listed below to store the  
30 current service configuration when it is associated with a SYNC\_ID:

- 31       • If the mobile station has a stored service configuration associated with SID<sub>s</sub>, NID<sub>s</sub>  
32 and SYNC\_ID<sub>s</sub>, then the mobile station shall delete the stored service configuration.

- If the number of stored service configurations is NUM\_SYNC\_ID\_SUPPORTED or more, the mobile station shall not delete the (NUM\_SYNC\_ID\_SUPPORTED - 1) most recently used<sup>30</sup> service configuration(s) and corresponding synchronization identifier(s), SID(s), NID(s).
- The mobile station shall store the current service configuration (that is, parameters conveyed by both the Service Configuration information record and the Non-negotiable Service Configuration information record) and the SYNC\_ID<sub>S</sub> corresponding to the current service configuration along with SID<sub>S</sub> and NID<sub>S</sub>.

#### 2.6.4.1.2.2.5.2 Restoring a stored Service Configuration based on SYNC\_ID

When restoring a stored service configuration based on SYNC\_ID, the mobile station shall restore only those parameters defined in the current P\_REV\_IN\_USE<sub>S</sub>.

#### 2.6.4.1.2.2.6 SO Negotiation Subfunction

The *SO Negotiation Subfunction* is only supported for mobile stations operating in Band Class 0.

Service option negotiation is not supported for P\_REV\_IN\_USE<sub>S</sub> greater than six.

Upon activation of the *SO Negotiation Subfunction*, the mobile station shall delete from the current service configuration any service option connection which does not use primary traffic on both the Forward and Reverse Traffic Channels and the Layer 3 shall terminate the corresponding Call Control instances. The Call Control instance corresponding to the service option connection which uses primary traffic, if any, shall be identified by NULL.

While the *SO Negotiation Subfunction* is active, the mobile station shall perform the following:

- If the current service configuration includes a service option connection, the mobile station shall process the received primary traffic bits in accordance with the requirements for the service option associated with the service option connection; otherwise, the mobile station shall discard the received primary traffic bits.
- If the current service configuration includes a service option connection, the mobile station shall transmit primary traffic bits in accordance with the requirements for the service option associated with the service option connection; otherwise, the mobile station shall transmit null traffic on the Reverse Fundamental Channel, if the Fundamental Channel is present or transmit power control bits on the Reverse Pilot Channel, if only the Dedicated Control Channel is present.

---

<sup>30</sup> The stored service configuration is considered used when it is stored for the first time or when it is used again during a call using the SYNC\_ID feature.

- 1       • If the current service configuration includes a service option connection, the mobile  
2       station may send a *Service Option Control Order* to invoke a service option specific  
3       function in accordance with the requirements for the service option associated with  
4       the service option connection.
- 5       • To initiate service option negotiation, the mobile station shall set SO\_REQ<sub>s</sub> to the  
6       number of the requested service option and shall send a *Service Option Request*  
7       *Order* containing the requested service option number.
- 8       • If SERV\_NEG<sub>s</sub> changes from disabled to enabled (see 2.6.6.2.5.1), the mobile  
9       station shall set SO\_REQ<sub>s</sub> to NULL and shall activate the *Normal Service*  
10      *Subfunction*.
- 11      • If the mobile station receives a *Service Option Request Order*, it shall process the  
12      order as follows:
  - 13      – If the mobile station accepts the requested service option, the mobile station  
14      shall set SO\_REQ<sub>s</sub> to NULL and shall send a *Service Option Response Order*  
15      accepting the requested service option within T<sub>58m</sub> seconds. The mobile  
16      station shall interpret the message action time of the *Service Option Request*  
17      *Order* in accordance with the requirements for the requested service option and  
18      the mobile station shall begin using the service configuration implied by the  
19      requested service option in accordance with those requirements. The implied  
20      service configuration shall include the default Forward and Reverse multiplex  
21      options and radio configurations associated with the requested service option,  
22      and shall include one service option connection for which the service option  
23      connection reference is 1, the service option is the requested service option, and  
24      the Forward and Reverse Traffic Channel types are both primary traffic. If a Call  
25      Control instance currently exists, the Layer 3 shall use this Call Control  
26      instance for a new service option connection; otherwise, the Layer 3 shall  
27      instantiate a Call Control instance (as specified in 2.6.10) and this Call Control  
28      instance shall be identified by both a connection reference with a value of 1 and  
29      a default identifier with a value of NULL.
  - 30      – If the mobile station does not accept the requested service option and has an  
31      alternative service option to request, the mobile station shall set SO\_REQ<sub>s</sub> to  
32      the alternative service option number and shall send a *Service Option Request*  
33      *Order* requesting the alternative service option within T<sub>58m</sub> seconds.
  - 34      – If the mobile station does not accept the requested service option and does not  
35      have an alternative service option to request, the mobile station shall set  
36      SO\_REQ<sub>s</sub> to NULL and shall send a *Service Option Response Order* to reject the  
37      request within T<sub>58m</sub> seconds. The mobile station shall continue to use the  
38      current service configuration.
- 39      • If the mobile station receives a *Service Option Response Order*, it shall process the  
40      order as follows:

- 1       – If the service option number specified in the order is equal to SO\_REQ<sub>s</sub>, the  
2       mobile station shall set SO\_REQ<sub>s</sub> to NULL. The mobile station shall interpret  
3       the message action time of the *Service Option Response Order* in accordance  
4       with the requirements for the specified service option, and the mobile station  
5       shall begin using the service configuration implied by the specified service  
6       option in accordance with those requirements. The implied service  
7       configuration shall include the default Forward and Reverse multiplex options  
8       and radio configurations associated with the specified service option, and shall  
9       include one service option connection for which the service option connection  
10      reference is 1, the service option is the specified service option, and the Forward  
11      and Reverse Traffic Channel types are both primary traffic. If a Call Control  
12      instance currently exists, the Layer 3 shall use this Call Control instance for a  
13      new service option connection; otherwise, the Layer 3 shall instantiate a Call  
14      Control instance (as specified in 2.6.10) and this Call Control instance shall be  
15      identified by both a connection reference with a value of 1 and a default  
16      identifier with a value of NULL.
- 17      – If the order indicates a service option rejection, the mobile station shall set  
18      SO\_REQ<sub>s</sub> to NULL. The mobile station shall continue to use the current service  
19      configuration.
- 20      – If the order does not indicate a service option rejection and the service option  
21      specified in the order is not equal to SO\_REQ<sub>s</sub>, the mobile station shall set  
22      SO\_REQ<sub>s</sub> to NULL and shall send a *Mobile Station Reject Order* (ORDQ =  
23      '00000100') within T<sub>58m</sub> seconds. The mobile station shall continue to use the  
24      current service configuration.
- 25      • If the mobile station receives a *Service Option Control Order*, it shall process the  
26      order as follows:
  - 27       – If the current service configuration includes a service option connection, the  
28       mobile station shall interpret the message action time of the *Service Option*  
29       *Control Order* in accordance with the requirements for the service option  
30       associated with the service option connection and the mobile station shall  
31       process the *Service Option Control Order* in accordance with those  
32       requirements;
  - 33       – otherwise, the mobile station shall send a *Mobile Station Reject Order* (ORDQ =  
34       '00000001') within T<sub>56m</sub> seconds.
- 35      • If the mobile station receives one of the following service negotiation messages, the  
36      mobile station shall send a *Mobile Station Reject Order* (ORDQ = '00000010') within  
37      T<sub>56m</sub> seconds:
  - 38       1. *Service Connect Message*
  - 39       2. *Service Option Control Message*
  - 40       3. *Service Request Message*
  - 41       4. *Service Response Message*

### 1 2.6.4.1.3 Ordering of Messages

2 The Layer 2 protocol does not guarantee delivery of messages in any order. If the mobile  
3 station requires that the base station receive a set of messages in a certain order, the  
4 mobile station shall send each message in assured mode requiring confirmation of delivery  
5 and shall wait for the confirmation of delivery of each message before transmitting the next  
6 message in the set.

### 7 2.6.4.1.4 Processing the In-Traffic System Parameters Message

8 The mobile station shall store the following parameters from the *In-Traffic System*  
9 *Parameters Message*:

- 10 • System identification ( $SID_S = SID_T$ )
- 11 • Network identification ( $NID_S = NID_T$ )
- 12 • Search window size for the Active Set and the Candidate Set  
13 ( $SRCH\_WIN\_A_S = SRCH\_WIN\_A_T$ )
- 14 • Search window size for the Neighbor Set ( $SRCH\_WIN\_N_S = SRCH\_WIN\_N_T$ )
- 15 • Search window size for the Remaining Set ( $SRCH\_WIN\_R_S = SRCH\_WIN\_R_T$ )
- 16 • Pilot detection threshold ( $T\_ADD_S = T\_ADD_T$ )
- 17 • Pilot drop threshold ( $T\_DROP_S = T\_DROP_T$ )
- 18 • Active Set versus Candidate Set comparison threshold ( $T\_COMP_S = T\_COMP_T$ )
- 19 • Drop timer value ( $T\_TDROP_S = T\_TDROP_T$ )
- 20 • Drop timer range value ( $T\_TDROP\_RANGE_S = T\_TDROP\_RANGE_T$ ) if  
21  $T\_TDROP\_RANGE\_INCL_T$  is equal to '1'; otherwise, ( $T\_TDROP\_RANGE_S = '0000'$ )
- 22 • Forward Packet Data Channel supported indicator ( $FOR\_PDCH\_SUPPORTED_S =$   
23  $FOR\_PDCH\_SUPPORTED_T$ )
- 24 • Short Data Burst supported indicator ( $SDB\_SUPPORTED_S = SDB\_SUPPORTED_T$ )
- 25 • If included, permission for the mobile station to request QoS settings in the *Origination*  
26 *Message*, *Origination Continuation Message*, or *Enhanced Origination Message*  
27 ( $MOB\_QOS_S = MOB\_QOS_T$ )
- 28 • Mobile station initiated position location determination supported indicator  
29 ( $MS\_INIT\_POS\_LOC\_SUP\_IND_S = MS\_INIT\_POS\_LOC\_SUP\_IND_T$ ).
- 30 • PDCH Control Hold Mode supported indicator ( $PDCH\_CHM\_SUPPORTED_S =$   
31  $PDCH\_CHM\_SUPPORTED_T$ ) if included; otherwise, set  $PDCH\_CHM\_SUPPORTED_S$  to  
32 '0'.
- 33 • Reverse Packet Data Channel supported indicator ( $REV\_PDCH\_SUPPORTED_S =$   
34  $REV\_PDCH\_SUPPORTED_T$ ) if included; otherwise, set  $REV\_PDCH\_SUPPORTED_S$  to '0'.
- 35 • Channel configuration request allowed indicator ( $USE\_CH\_CFG\_RRM_S =$   
36  $USE\_CH\_CFG\_RRM_T$ ) if included; otherwise, set  $USE\_CH\_CFG\_RRM_S$  to '0'.

- 1 • Maximum age for retention of Neighbor Set members  
2 (NGHBR\_MAX\_AGE<sub>S</sub> = NGHBR\_MAX\_AGE<sub>T</sub>)
- 3 • Protocol revision level (P\_REV<sub>S</sub> = P\_REV<sub>T</sub>), and protocol revision level currently in use  
4 (P\_REV\_IN\_USE<sub>S</sub> = min (P\_REV<sub>S</sub>, MOB\_P\_REV<sub>P</sub> of the current band class) )
- 5 • Slope of the handoff add/drop criterion (SOFT\_SLOPE<sub>S</sub> = SOFT\_SLOPE<sub>T</sub>)
- 6 • Intercept of the handoff add criterion (ADD\_INTERCEPT<sub>S</sub> = ADD\_INTERCEPT<sub>T</sub>)
- 7 • Intercept of the handoff drop criterion (DROP\_INTERCEPT<sub>S</sub> = DROP\_INTERCEPT<sub>T</sub>)
- 8 • If included, neighbor pilot strength measurement threshold offset (T\_MULCHAN<sub>S</sub> =  
9 T\_MULCHAN<sub>T</sub>)
- 10 • If included, Reverse Supplemental Code Channel beginning of transmission preamble  
11 length (BEGIN\_PREAMBLE<sub>S</sub> = BEGIN\_PREAMBLE<sub>T</sub>)
- 12 • If included, Reverse Supplemental Code Channel discontinuous transmission  
13 resumption preamble length (RESUME\_PREAMBLE<sub>S</sub> = RESUME\_PREAMBLE<sub>T</sub>)
- 14 • If included, Slotted Timer (T\_SLOTTED<sub>S</sub> = T\_SLOTTED<sub>T</sub>)
- 15 • If the mobile station supports packet data service options, the mobile station shall  
16 store the packet data services zone identifier (PACKET\_ZONE\_ID<sub>S</sub> =  
17 PACKET\_ZONE\_ID<sub>T</sub>).
- 18 • If the mobile station supports packet data service options and the PZ\_HYST\_ENABLED  
19 field is included, the mobile station shall store the packet zone hysteresis enabled  
20 indicator (PZ\_HYST\_ENABLED<sub>S</sub> = PZ\_HYST\_ENABLED<sub>T</sub>); otherwise, the mobile station  
21 shall set PZ\_HYST\_ENABLED<sub>S</sub> to '1'.
- 22 • If the PZ\_HYST\_LIST\_LEN field is included, the mobile station shall store the packet  
23 zone hysteresis list length (PZ\_HYST\_LIST\_LEN<sub>S</sub> = PZ\_HYST\_LIST\_LEN<sub>T</sub>); otherwise,  
24 the mobile station shall set PZ\_HYST\_LIST\_LEN<sub>S</sub> to 4.
- 25 • If the PZ\_HYST\_ACT\_TIMER field is included, the mobile station shall store the packet  
26 zone hysteresis activation timer (PZ\_HYST\_ACT\_TIMER<sub>S</sub> = PZ\_HYST\_ACT\_TIMER<sub>T</sub>);  
27 otherwise, the mobile station shall set PZ\_HYST\_ACT\_TIMER<sub>S</sub> to 30 seconds.
- 28 • If the PZ\_HYST\_TIMER\_MUL field and the PZ\_HYST\_TIMER\_EXP field are included, the  
29 mobile station shall store the packet zone hysteresis timer (PZ\_HYST\_TIMER<sub>S</sub> =  
30 PZ\_HYST\_TIMER\_MUL<sub>T</sub> × 8 ^ PZ\_HYST\_TIMER\_EXP<sub>T</sub>); otherwise, the mobile station  
31 shall set PZ\_HYST\_TIMER<sub>S</sub> to 60 seconds.
- 32 • If ENC\_SUPPORTED<sub>T</sub> is equal to '1', the mobile station shall store:
  - 33 – Signaling encryption supported indicator (SIG\_ENCRYPT\_SUP<sub>S</sub> =  
34 SIG\_ENCRYPT\_SUP<sub>T</sub>)
  - 35 – User information encryption supported indicator (UI\_ENCRYPT\_SUP<sub>S</sub> =  
36 UI\_ENCRYPT\_SUP<sub>T</sub>)
- 37 • Concurrent services supported indicator (CS\_SUPPORTED<sub>S</sub> = CS\_SUPPORTED<sub>T</sub>).

- 1 • Maximum number of additional service reference identifiers allowed in origination  
2 (MAX\_ADD\_SERV\_INSTANCES<sub>s</sub> = MAX\_ADD\_SERV\_INSTANCES<sub>r</sub>), if included; otherwise,  
3 the mobile station shall set MAX\_ADD\_SERV\_INSTANCES<sub>s</sub> to 0.
  - 4 • Control Hold Mode supported indicator (CHM\_SUPPORTED<sub>s</sub> = CHM\_SUPPORTED<sub>r</sub>) if  
5 included; otherwise, the mobile station shall perform the following:
    - 6 - If P\_REV\_IN\_USE<sub>s</sub> is less than six, set CHM\_SUPPORTED<sub>s</sub> to '0'.
    - 7 - Otherwise, set CHM\_SUPPORTED<sub>s</sub> to '1'.
  - 8 • CDMA off time report supported indicator  
9 (CDMA\_OFF\_TIME\_REP\_SUP\_IND<sub>s</sub> = CDMA\_OFF\_TIME\_REP\_SUP\_IND<sub>r</sub>).
  - 10 • If CDMA\_OFF\_TIME\_REP\_SUP\_IND<sub>r</sub> is equal to '1', the mobile station shall store CDMA  
11 off time report threshold (CDMA\_OFF\_TIME\_REP\_THRESHOLD<sub>s</sub> =  
12 CDMA\_OFF\_TIME\_REP\_THRESHOLD<sub>r</sub> in units specified by  
13 CDMA\_OFF\_TIME\_REP\_UNIT<sub>r</sub>).
  - 14 • The mobile station shall set BCMC\_ON\_TRAFFIC\_SUP<sub>s</sub> to BCMC\_ON\_TRAFFIC\_SUP<sub>r</sub>. If  
15 BCMC\_ON\_TRAFFIC\_SUP<sub>r</sub> is set to '1', the mobile station shall store  
16 AUTO\_REQ\_TRAF\_ALLOWED\_IND<sub>s</sub> = AUTO\_REQ\_TRAF\_ALLOWED\_IND<sub>r</sub>.
- 17 The mobile station shall determine its roaming status (see 2.6.5.3). The mobile station  
18 should indicate to the user whether the mobile station is roaming.

#### 19 2.6.4.1.5 Message Action Times

20 A Forward Traffic Channel message without a USE\_TIME field or with a USE\_TIME field set  
21 to '0' has an implicit action time. A message that has its USE\_TIME field set to '1' has an  
22 explicit action time that is specified in the ACTION\_TIME field of the message.

23 A message with an explicit action time is called a pending message.

24 Unless otherwise specified, a message having an implicit action time shall take effect no  
25 later than the first 80 ms boundary (relative to System Time plus FRAME\_OFFSET<sub>s</sub> × 1.25  
26 ms) occurring at least 80 ms after the end of the frame containing the last bit of the  
27 message. A message with an explicit action time, except for a *Power Up Function Message*,  
28 shall take effect when System Time minus FRAME\_OFFSET<sub>s</sub> × 1.25 ms (in 80 ms units)  
29 modulo 64 becomes equal to the message's ACTION\_TIME field. A *Power Up Function*  
30 *Message* shall take effect ACTION\_TIME\_FRAME frames after the time when System Time  
31 minus FRAME\_OFFSET<sub>s</sub> × 1.25 ms (in 80 ms units) modulo 64 becomes equal to the  
32 message's ACTION\_TIME field. The difference in time between ACTION\_TIME and the end  
33 of the frame containing the last bit of the message shall be at least 80 ms.

34 The mobile station shall support two pending messages at any given time, not including  
35 pending *Service Option Control Orders* or *Service Option Control Messages*. The number of  
36 pending *Service Option Control Orders* or *Service Option Control Messages* that the mobile  
37 station is required to support is specific to the service option (see the relevant service  
38 option description). In addition, the mobile station shall support one pending *Power Up*  
39 *Function Message*.

#### 2.6.4.1.6 Long Code Transition Request Processing

The mobile station performs these procedures upon receiving a *Long Code Transition Request Order*.

If the *Long Code Transition Request Order* requests a transition to the private long code, and the mobile station is able to generate the private long code (see 2.3.12.3), and the mobile station accepts the request, the mobile station shall send a *Long Code Transition Response Order* (ORDQ = '00000011') within  $T_{56m}$  seconds. The mobile station shall use the private long code on both the Forward Traffic Channel and the Reverse Traffic Channel. The mobile station shall store the public long code mask and  $PLCM\_TYPE_S$  currently in use and begin using the private long code at the explicit action time (see 2.6.4.1.5) specified in the message. At the action time of the message, the mobile station should indicate to the user that the voice privacy mode is active. If the *Long Code Transition Request Order* requests a private long code transition, and the mobile station is not able to generate the private long code or the mobile station does not accept the request, the mobile station shall send a *Long Code Transition Response Order* (ORDQ = '00000010') within  $T_{56m}$  seconds.

If the *Long Code Transition Request Order* requests a transition to the public long code and the mobile station accepts the request, the mobile station shall send a *Long Code Transition Response Order* (ORDQ = '00000010') within  $T_{56m}$  seconds. The mobile station shall use the public long code on both the Forward Traffic Channel and the Reverse Traffic Channel. The mobile station shall begin using the public long code that is stored previously, derived from  $PLCM\_TYPE_S$  as specified in 2.3.6, at the explicit action time (see 2.6.4.1.5) specified in the message. At the action time of the message, the mobile station should indicate to the user that the voice privacy mode is inactive. If the *Long Code Transition Request Order* requests a public long code transition, and the mobile station does not accept the request, the mobile station shall send a *Long Code Transition Response Order* (ORDQ = '00000011') within  $T_{56m}$  seconds.

#### 2.6.4.1.7 Power Up Function (PUF)

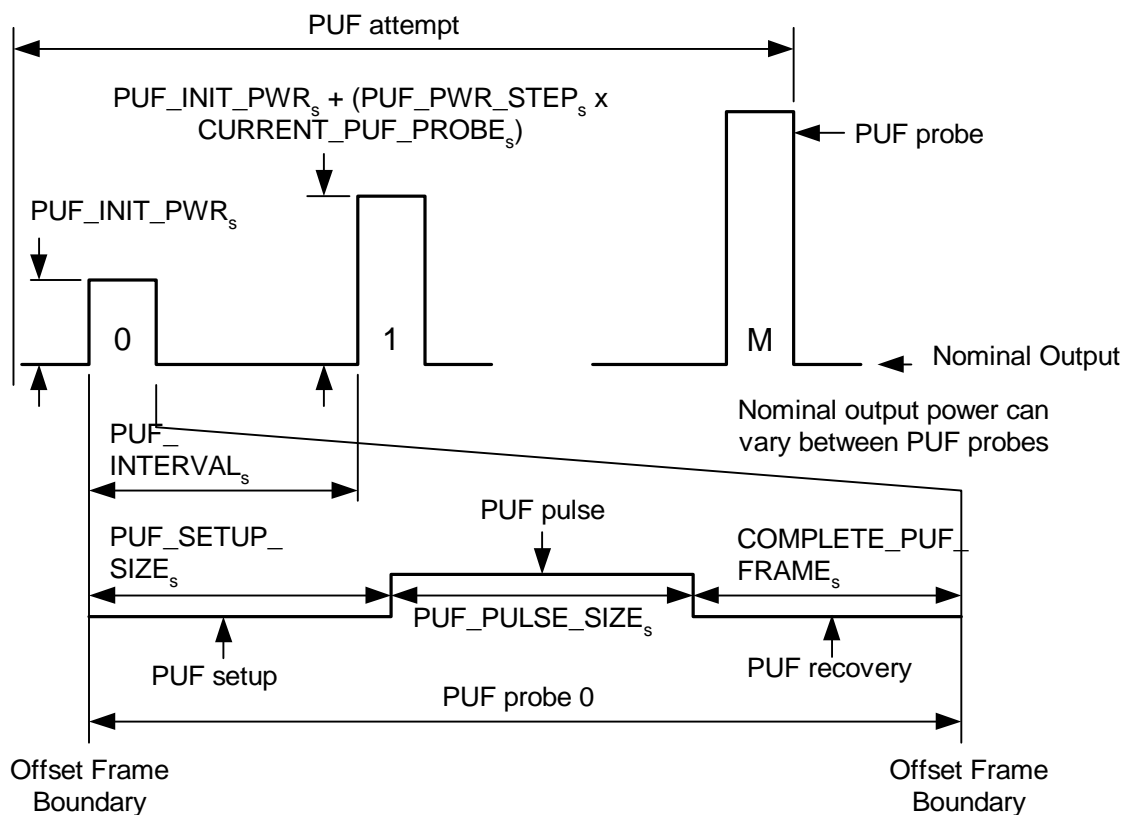

Figure 2.6.4.1.7-1 illustrates the general structure of a PUF attempt. A PUF pulse is the interval during which the mobile station transmits at the specified power level while executing the Power Up Function.

A PUF probe is one or more consecutive Traffic Channel frames. A PUF probe consists of three parts: PUF setup, PUF pulse, and PUF recovery.  $PUF\_SETUP\_SIZE$  is the duration of the PUF setup part, in power control groups.  $PUF\_PULSE\_SIZE$  is the duration of the PUF pulse, in power control groups. The PUF recovery period occupies the remainder of the last frame of the PUF probe.

A PUF attempt is a sequence of PUF probes sent by the mobile station in response to a *Power Up Function Message*. A PUF attempt begins at an offset frame boundary within 80 ms of the  $ACTION\_TIME$  specified in the *Power Up Function Message*. A PUF attempt can be terminated in one of four ways:

- The mobile station receives a *Power Up Function Completion Message*.

- The mobile station has transmitted the maximum number of PUF probes specified in the *Power Up Function Message*.
- The mobile station has transmitted the maximum number of probes allowed at its maximum output power.
- The mobile station receives a new *Power Up Function Message*.

**Figure 2.6.4.1.7-1. Structure of PUF Attempt**

#### 2.6.4.1.7.1 Processing the Power Up Function Message

The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00000110' (message requires a capability that is not supported by the mobile station) if any of the following conditions are detected:

- $PUF\_FREQ\_INCL_r$  is set to '1' and  $PUF\_BAND\_CLASS_r$  is not supported by the mobile station.
- $PUF\_FREQ\_INCL_r$  is set to '1' and the mobile station is unable to re-tune to the PUF Target Frequency during  $(PUF\_SETUP\_SIZE_r + 1)$  power control groups.
- $MOB\_P\_REV_p$  is not equal to five and the mobile station does not support the Power Up Function.

The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00001100' (invalid Frequency Assignment), if the Frequency Assignment specified in the message is the same as the Serving Frequency ( $\text{PUF\_FREQ\_INCL}_r$  is equal to '1',  $\text{PUF\_BAND\_CLASS}_r$  is equal to  $\text{CDMABAND}_s$  and  $\text{PUF\_CDMA\_FREQ}_r$  is equal to  $\text{CDMACH}_s$ ).

If the mobile station is processing a PUF probe, the mobile station shall wait for the PUF probe to complete. It shall then terminate the current PUF attempt. The mobile station shall store the following parameters:

- Maximum number of PUF probes transmitted at full power level ( $\text{MAX\_PWR\_PUF}_s = \text{MAX\_PWR\_PUF}_r + 1$ )
- Total number of PUF probes ( $\text{TOTAL\_PUF\_PROBES}_s = \text{TOTAL\_PUF\_PROBES}_r + 1$ )
- PUF interval ( $\text{PUF\_INTERVAL}_s = \text{PUF\_INTERVAL}_r$ )
- Number of PUF setup power control groups ( $\text{PUF\_SETUP\_SIZE}_s = \text{PUF\_SETUP\_SIZE}_r + 1$ )
- Number of PUF pulse power control groups ( $\text{PUF\_PULSE\_SIZE}_s = \text{PUF\_PULSE\_SIZE}_r + 1$ )
- Power increase of initial PUF pulse ( $\text{PUF\_INIT\_PWR}_s = \text{PUF\_INIT\_PWR}_r$ )
- Power increase for each successive PUF pulse ( $\text{PUF\_PWR\_STEP}_s = \text{PUF\_PWR\_STEP}_r$ )
- Frequency included indicator ( $\text{PUF\_FREQ\_INCL}_s = \text{PUF\_FREQ\_INCL}_r$ )

If  $\text{PUF\_FREQ\_INCL}_s$  equals '1', the mobile station shall store the following:

- PUF probe Target Frequency CDMA Channel number ( $\text{PUF\_TF\_CDMACH}_s = \text{PUF\_CDMA\_FREQ}_r$ )
- PUF probe Target Frequency CDMA band class ( $\text{PUF\_TF\_CDMABAND}_s = \text{PUF\_BAND\_CLASS}_r$ )

The mobile station shall set  $\text{CURRENT\_PUF\_PROBE}_s$  equal to 0.

The mobile station shall then begin the PUF attempt at the time specified in 2.6.4.1.7.2.

#### 2.6.4.1.7.2 Power Up Function Procedures

The mobile station shall process the initial PUF probe beginning at the start of the frame which starts  $\text{ACTION\_TIME\_FRAME}_r \times 20 \text{ ms} + \text{FRAME\_OFFSET}_s \times 1.25 \text{ ms}$  after the System Time specified by  $\text{ACTION\_TIME}_r$ . The mobile station shall process additional PUF probes beginning at intervals of  $\text{PUF\_INTERVAL}_s$  frames from the beginning of the initial PUF probe.

The mobile station shall transmit the PUF probes as described in 2.6.4.1.7.2.1 and 2.6.4.1.7.2.2.

##### 2.6.4.1.7.2.1 PUF Probe On Serving Frequency

The mobile station shall process each PUF probe as follows:

- 1 • The mobile station shall use closed loop power control procedures as specified in
- 2 [2].
- 3 • The mobile station shall use the gated output procedures specified in [2].
- 4 • The mobile station shall control its mean output power as specified in [2].
- 5 • The mobile station shall monitor its output power during the PUF pulse, and
- 6 should monitor its output power at least once during each power control group of
- 7 the PUF pulse. If the mobile station detects that the transmit power level specified
- 8 in [2] is equal to or greater than the maximum power output of the mobile station
- 9 at any time during a PUF pulse, the mobile station shall decrement
- 10  $MAX\_PWR\_PUF_S$  by one for that PUF pulse.
- 11 • The mobile station shall transmit the traffic channel preamble for the duration of
- 12 the PUF probe on the Reverse Fundamental Channel.

13 After the processing of each PUF probe, the mobile station shall increment  
 14  $CURRENT\_PUF\_PROBE_S$  by 1. If  $MAX\_PWR\_PUF_S$  is equal to 0, the mobile station shall  
 15 terminate the PUF attempt. If  $CURRENT\_PUF\_PROBE_S$  equal to  $TOTAL\_PUF\_PROBE_S$ , the  
 16 mobile station shall terminate the PUF attempt.

#### 17 2.6.4.1.7.2.2 PUF Probe On PUF Target Frequency

18 The mobile station shall process each PUF probe as follows:

- 19 • The mobile station shall use closed loop power control procedures as specified in
- 20 [2].
- 21 • The mobile station shall use the gated output procedures specified in [2].
- 22 • The mobile station shall control its mean output power as specified in [2].
- 23 • The mobile station shall store the following Serving Frequency parameters from its
- 24 current configuration:
  - 25 – CDMA Band Class ( $PUF\_SF\_CDMABAND_S = CDMABAND_S$ )
  - 26 – Frequency assignment ( $PUF\_SF\_CDMACH_S = CDMACH_S$ )
- 27 • The mobile station shall monitor its output power during the PUF pulse, and
- 28 should monitor its output power at least once during each power control group of
- 29 PUF pulse. If the mobile station detects that the transmit power level specified in
- 30 [2] is equal to or greater than the maximum power output of the mobile station at
- 31 any time during a PUF pulse, the mobile station shall decrement the
- 32  $MAX\_PWR\_PUF_S$  by one for that PUF pulse.
- 33 • At the beginning of the PUF probe, the mobile station shall disable its transmitter,
- 34 stop processing the Forward Supplemental Code Channel (if any), or the Forward
- 35 Supplemental Channel (if any), disable all corrections to the mobile station time
- 36 reference (see [2]), tune to the CDMA channel specified by  $PUF\_TF\_CDMACH_S$ , and
- 37  $PUF\_TF\_CDMABAND_S$  and re-enable its transmitter.
- 38 • The mobile station shall transmit the traffic channel preamble on the Reverse
- 39 Fundamental Channel during the PUF pulse at  $PUF\_TX\_PWR_S$ .

- 1 • The mobile station should disable its transmitter immediately after the end of the
- 2 PUF pulse, and shall disable its transmitter before the end of the first power control
- 3 group after the PUF pulse. It shall then tune to its assigned CDMA channel as
- 4 given by  $CDMACH_S$  and  $CDMABAND_S$ .
- 5 • If the interval between the time that the mobile station tunes to the PUF Target
- 6 Frequency and the time that it re-tunes to the Serving Frequency is equal to or
- 7 greater than  $(N_{2m} \times 0.02)$  seconds, the mobile station shall wait to receive a period
- 8 of  $(N_{3m} \times 20)$  ms with sufficient signal quality on the physical channel
- 9 corresponding to  $FPC\_PRI\_CHAN_S$ .
- 10 • The mobile station shall then re-enable its transmitter and re-enable any
- 11 adjustments to the mobile station time reference.
- 12 • If the Forward Supplemental Code Channel assignment has not expired while the
- 13 mobile station has tuned to the PUF Target Frequency, then the mobile station
- 14 shall resume processing the Forward Supplemental Code Channels after re-tuning
- 15 to the Serving Frequency.
- 16 • If the Forward Supplemental Channel assignment has not expired while the mobile
- 17 station has tuned to the PUF Target Frequency, then the mobile station shall
- 18 resume processing the Forward Supplemental Channels after re-tuning to the
- 19 Serving Frequency.
- 20 • If the Reverse Supplemental Code Channel assignment has not expired while the
- 21 mobile station has tuned to the PUF Target Frequency, then the mobile station may
- 22 resume transmitting the Reverse Supplemental Code Channels after re-tuning to
- 23 the Serving Frequency.
- 24 • If the Reverse Supplemental Channel assignment has not expired while the mobile
- 25 station has tuned to the PUF Target Frequency, then the mobile station may
- 26 resume transmitting the Reverse Supplemental Code Channels after re-tuning to
- 27 the Serving Frequency.

28 After the processing of each PUF probe, the mobile station shall increment  
 29  $CURRENT\_PUF\_PROBE_S$  by one. If  $MAX\_PWR\_PUF_S$  is equal to 0, the mobile station shall  
 30 terminate the PUF attempt. If  $CURRENT\_PUF\_PROBE_S$  is equal to  $TOTAL\_PUF\_PROBE_S$ ,  
 31 the mobile station shall terminate the PUF attempt.

#### 32 2.6.4.1.7.3 Processing the Power Up Function Completion Message

33 The mobile station shall terminate any PUF attempt no later than the completion of the  
 34 current probe in progress and shall discard any pending *Power Up Function Message*. If  
 35  $LOC\_IND_R$  is equal to '1', the mobile station may store the following parameters:

- 36 • Mobile Station Latitude ( $MS\_LAT_S = MS\_LAT_R$ )
- 37 • Mobile Station Longitude ( $MS\_LONG_S = MS\_LONG_R$ )
- 38 • Time stamp ( $MS\_LOC\_TSTAMP_S = MS\_LOC\_TSTAMP_R$ )

#### 2.6.4.1.8 Forward Traffic Channel Supervision

When in the *Mobile Station Control on the Traffic Channel State*, the mobile station shall continuously monitor the Forward Channel, except:

- During a PUF probe in which it transmits on a PUF target frequency (see 2.6.4.1.7),
- During a search of pilots on a CDMA Candidate Frequency (see 2.6.6.2.8.3),

When a Forward Common Power Control Channel is not assigned, the mobile station shall perform the procedure described in 2.6.4.1.8.1. When a Forward Forward Common Power Control Channel is assigned, the mobile station shall perform the procedure described in 2.6.4.1.8.2.

##### 2.6.4.1.8.1 Forward Traffic Channel Supervision when a Forward Common Power Control Channel is not assigned

The mobile station shall monitor the physical channel corresponding to FPC\_PRI\_CHAN<sub>S</sub> as follows:

- If RESQ\_ENABLED<sub>S</sub> is equal to '1' and FPC\_PRI\_CHAN<sub>S</sub> is equal to '0', the mobile station shall perform the following:
  - While the mobile station's transmitter is enabled:
    - + If the rescue attempt timer is not enabled and the mobile station detects a 'forward link error' trigger as specified in 2.6.4.1.8.1.1, then the mobile station shall perform the following:
      - o disable its transmitter, and
      - o enable the rescue delay timer with an initial value of (RESQ\_DELAY\_TIME<sub>S</sub> × 80) ms.
    - + If the rescue attempt timer is enabled and the mobile station detects a 'good forward link' trigger as specified in 2.6.4.1.8.1.1, then the mobile station shall disable the rescue attempt timer, and shall resume Forward and Reverse Traffic Channel power control as specified in 2.6.4.1.1 and 2.6.6.2.7.2, respectively.
  - While the mobile station's transmitter is disabled:
    - + If the mobile station did not disable its transmitter due to an acknowledgment failure and the mobile station detects a 'good forward link' trigger as specified in 2.6.4.1.8.1.1, then the mobile station should re-enable its transmitter, and shall also perform the following:
      - o disable the rescue delay timer or rescue allowed timer, if either is enabled.
      - o send a *Call Rescue Cancel Order* in assured mode, if the mobile station is not otherwise required to send an *Extended Pilot Strength Measurement Message*.
- Otherwise, the mobile station shall perform the following:

- 1           – If the mobile station detects a ‘forward link error’ trigger as specified in  
2           2.6.4.1.8.1.1, it shall disable its transmitter.
- 3           – Thereafter, if the mobile station detects a ‘good forward link’ trigger as specified  
4           in 2.6.4.1.8.1.1, then the mobile station should re-enable its transmitter.

5 The mobile station shall establish a Forward Traffic Channel fade timer. The timer shall be  
6 enabled when the mobile station first enables its transmitter when in the *Traffic Channel*  
7 *Initialization Substate* of the *Mobile Station Control on the Traffic Channel State*. The fade  
8 timer shall be reset for  $T_{5m}$  seconds whenever the mobile station detects a ‘good forward  
9 link’ trigger as specified in 2.6.4.1.8.1.1. The mobile station shall disable the fade timer  
10 when it tunes to a PUF target frequency, and shall re-enable the fade timer at the end of  
11 the PUF probe. If the timer expires, the mobile station shall disable its transmitter and  
12 declare a loss of the Forward Traffic Channel. If  $CRRM\_MSG\_IND_S$  equals ‘1’ and if no  
13 other access channel message is transmitted after loss of the Forward Traffic Channel, the  
14 mobile station may enter the *Update Overhead Information Substate* of the *System Access*  
15 *State* (see 2.6.3) with an origination indication, within 20 seconds of the loss of the  
16 Forward Traffic Channel, to transmit the *Call Recovery Request Message*.

17 The mobile station also enables, disables, and resets the fade timer as described in  
18 2.6.6.2.8 and 2.6.6.2.10 when it performs a hard handoff or a periodic search.

#### 19 2.6.4.1.8.1.1 Triggers

20 The mobile station shall detect ‘good forward link’ trigger as specified below:

- 21       • If RC11 or RC12 is used on Forward Link and blanking is enabled (i.e.  
22       FOR\_FCH\_BLANKING\_DUTYCYCLE is set to value other than ‘000’), then the  
23       mobile station shall detect ‘good forward link’ trigger when any one of the following  
24       condition is met:
  - 25       – Mobile station receives a period of  $(N_{3m} \times 20)$  ms with sufficient signal quality  
26       on the physical channel corresponding to  $FPC\_PRI\_CHAN_S$ .
  - 27       – Mobile station receives a  $N_{3m}$  consecutive guaranteed transmission frames  
28       with sufficient signal quality on the physical channel corresponding to  
29        $FPC\_PRI\_CHAN_S$ .
- 30       • Otherwise, the mobile station shall detect ‘good forward link’ trigger when it  
31       receives a period of  $(N_{3m} \times 20)$  ms with sufficient signal quality on the physical  
32       channel corresponding to  $FPC\_PRI\_CHAN_S$ .

33 The mobile station shall detect ‘forward link error’ trigger as specified below:

- 34       • If RC11 or RC12 is used on Forward Link and blanking is enabled (i.e.  
35       FOR\_FCH\_BLANKING\_DUTYCYCLE is set to value other than ‘000’), then the  
36       mobile station shall detect ‘forward link error’ trigger when it receives  
37       FOR\_N2M\_IND\_S consecutive guaranteed transmission frames with insufficient  
38       signal quality on the physical channel corresponding to  $FPC\_PRI\_CHAN_S$ .

- 1 • Otherwise, the mobile station shall detect 'forward link error' trigger when it  
2 receives a period of  $(N_{2m} \times 20)$  ms with insufficient signal quality on the physical  
3 channel corresponding to FPC\_PRI\_CHAN<sub>S</sub>.

#### 4 2.6.4.1.8.2 Forward Traffic Channel Supervision when a Forward Common Power Control 5 Channel is assigned

6 The mobile station shall monitor the Forward Common Power Control Channel as follows:

- 7 • If the mobile station receives a period of  $(N_{16m} \times 1.25)$  ms with insufficient signal  
8 quality on the Forward Common Power Control Subchannels assigned to this  
9 mobile, it shall disable its transmitter.
- 10 • Thereafter, if the mobile station receives a period of  $(N_{17m} \times 1.25)$  ms with  
11 sufficient signal quality on the Forward Common Power Control Subchannels  
12 assigned to this mobile, then the mobile station should re-enable its transmitter.

13 The mobile station shall establish a Forward Traffic Channel fade timer. The timer shall be  
14 enabled when the mobile station first enables its transmitter when in the *Traffic Channel*  
15 *Initialization Substate* of the *Mobile Station Control on the Traffic Channel State*. The fade  
16 timer shall be reset for  $T_{5m}$  seconds whenever the mobile station receives a period of  
17  $(N_{17m} \times 1.25)$  ms with sufficient signal quality on the Forward Common Power Control  
18 Subchannels assigned to this mobile. If the timer expires, the mobile station shall disable  
19 its transmitter and declare a loss of the Forward Traffic Channel. If CRRM\_MSG\_IND<sub>S</sub>  
20 equals '1' and if no other access channel message is transmitted after loss of the Forward  
21 Traffic Channel, the mobile station may enter the *Update Overhead Information Substate* of  
22 the *System Access State* (see 2.6.3) with an origination indication, within 20 seconds of the  
23 loss of the Forward Traffic Channel, to transmit the *Call Recovery Request Message*.

24 The mobile station also enables, disables, and resets the fade timer as described in  
25 2.6.6.2.7, 2.6.6.2.8 and 2.6.6.2.10 when it performs a soft handoff, a hard handoff or a  
26 periodic search.

27 Additionally, the mobile station shall perform a ping as follows:

- 28 • The mobile station shall establish a Forward Traffic Channel ping timer as follows:  
29 – When the mobile station first enables its transmitter in the *Traffic Channel*  
30 *Initialization Substate* of the *Mobile Station Control on the Traffic Channel State*,  
31 the mobile station shall enable the Forward Traffic Channel ping timer and set  
32 it to  $T_{78m}$  seconds.
- 33 – When the mobile station receives a message that assigns a F-CPCCH, the  
34 mobile station shall enable the Forward Traffic Channel ping timer and set it to  
35  $T_{78m}$  seconds.
- 36 • When the mobile station receives a Physical Layer SDU destined for this mobile  
37 station on the F-PDCH or on the shared F-DCCH (See [3]), the Forward Traffic  
38 Channel ping timer shall be reset for  $T_{78m}$  seconds.

- When the Forward Traffic Channel ping timer expires, the mobile station shall send a *L2 Acknowledgment Order* in assured mode if there is no other Layer 3 message to be sent in assured mode available for transmission.

#### 2.6.4.1.9 Processing the Extended Release Message and the Extended Release Mini Message

- Upon receiving the *Extended Release Message* or the *Extended Release Mini Message*, the mobile station shall process the message as follows:
  - If USE\_EXT\_CH\_IND<sub>R</sub> is equal to '1', then the mobile station shall set USE\_EXT\_CH\_IND<sub>S</sub> to USE\_EXT\_CH\_IND<sub>R</sub>; otherwise, the mobile station shall set USE\_EXT\_CH\_IND<sub>S</sub> to '0'.
  - If the mobile station determines that the configuration specified by CH\_IND<sub>R</sub> or EXT\_CH\_IND<sub>R</sub> is not valid (see Tables 3.7.3.3.2.34-1, and 3.7.3.3.2.34-3), the mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00000111' (message can not be handled by the current mobile station configuration) and the mobile station shall not perform the remaining procedures in this section.
  - If USE\_EXT\_CH\_IND<sub>S</sub> is equal to '0' and CH\_IND<sub>R</sub> is equal to '111' or the physical channels indicated by the two least significant bits of CH\_IND<sub>R</sub> includes all the physical channels (FCH, DCCH, or both) currently being processed by the mobile station, the Layer 3 shall send a "release indication" to all Call Control instances and shall perform the following:
    - + The mobile station shall set TBR\_RAND\_SUPPR\_ENABLE<sub>S</sub> = TBR\_RAND\_SUPPR\_ENABLE<sub>R</sub>.
    - + The mobile station shall set TBR\_RAND\_WINDOW<sub>S</sub> to TBR\_RAND\_WINDOW<sub>R</sub>.
    - + Enter the *Release Substate* with a base station extended release indication if the message is the *Extended Release Message*.
    - + Enter the *Release Substate* with a base station extended release mini message indication if the message is the *Extended Release Mini Message*.
  - Otherwise, the mobile station shall perform the following:
    - + If the received message is the *Extended Release Message*, the mobile station shall send an *Extended Release Response Message* to the base station. If the received message is the *Extended Release Mini Message*, the mobile station shall send an *Extended Release Response Mini Message* to the base station.
    - + If USE\_EXT\_CH\_IND<sub>S</sub> is equal to '1', then the mobile station shall perform the following:
      - o If SWITCHING\_PARMs\_INCL<sub>R</sub> is included and equal to '1', the mobile station shall set NUM\_SOFT\_SWITCHING\_FRAMES\_CHM<sub>S</sub> to NUM\_SOFT\_SWITCHING\_FRAMES\_CHM<sub>R</sub> + 1, and

1 NUM\_SOFTEN\_SWITCHING\_FRAMES\_CHM<sub>S</sub> to  
 2 NUM\_SOFTEN\_SWITCHING\_FRAMES\_CHM<sub>R</sub> + 1.

- 3       o If EXT\_CH\_IND<sub>R</sub> indicates that F-DCCH is assigned and F-FCH is not  
 4 assigned, the mobile station shall set FPC\_PRI\_CHAN<sub>S</sub> to '1' at the  
 5 action time of the message.
- 6       o If EXT\_CH\_IND<sub>R</sub> indicates that F-FCH is assigned and F-DCCH is not  
 7 assigned, the mobile station shall set FPC\_PRI\_CHAN<sub>S</sub> to '0' at the  
 8 action time of the message.
- 9       o If EXT\_CH\_IND<sub>R</sub> indicates that an R-FCH is to be released, then the  
 10 mobile station shall stop transmitting on R-FCH at the action time  
 11 specified by the message. If EXT\_CH\_IND<sub>R</sub> indicates that an F-FCH is to  
 12 be released, then the mobile station shall stop processing F-FCH at the  
 13 action time specified by the message.
- 14       o If EXT\_CH\_IND<sub>R</sub> indicates that an R-DCCH is to be released, then the  
 15 mobile station shall stop transmitting on R-DCCH at the action time  
 16 specified by the message. If EXT\_CH\_IND<sub>R</sub> indicates that an F-DCCH is  
 17 to be released, then the mobile station shall stop processing F-DCCH at  
 18 the action time specified by the message.
- 19       o If EXT\_CH\_IND<sub>R</sub> indicates that an R-PDCH is to be released, then the  
 20 mobile station shall stop transmitting on R-PDCH at the action time  
 21 specified by the message.
- 22       o If GATING\_RATE\_INCL<sub>R</sub> is equal to '1', the mobile station shall set  
 23 PILOT\_GATING\_RATE<sub>S</sub> = PILOT\_GATING\_RATE<sub>R</sub> at the action time of the  
 24 message.
- 25       o If PDCH\_CONTROL\_HOLD<sub>R</sub> is equal to '1', the mobile station shall  
 26 perform the following:
  - 27           ◇ Set PILOT\_GATING\_USE\_RATE to '1' and start the reverse pilot  
 28 gating and R-CQICH gating at PILOT\_GATING\_RATE<sub>S</sub> at the action  
 29 time of the message.
  - 30           ◇ The mobile station shall cancel the forward and reverse  
 31 supplemental channel assignment, if any, at the action time of the  
 32 message.
- 33       o The mobile station shall set EXT\_CH\_IND<sub>S</sub> to EXT\_CH\_IND<sub>R</sub>.
- 34       + Otherwise (USE\_EXT\_CH\_IND<sub>S</sub> is equal to '0'), the mobile station shall  
 35 perform the following:
  - 36           o The mobile station shall update CH\_IND<sub>S</sub> as follows: If the least

- 1                   significant bit of CH\_IND<sub>r</sub> equals '1', the mobile station shall set  
 2                   CH\_IND<sub>s</sub> = '10'. If the second most significant bit of CH\_IND<sub>r</sub> equals '1',  
 3                   the mobile station shall set CH\_IND<sub>s</sub> = '01'.
- 4                   o If CH\_IND<sub>r</sub> is equal to '001' or '101', the mobile station shall set  
 5                   FPC\_PRI\_CHAN<sub>s</sub> to '1' at the action time of the message.
- 6                   o If CH\_IND<sub>r</sub> is equal to '010', the mobile station shall set FPC\_PRI\_CHAN<sub>s</sub>  
 7                   to '0' at the action time of the message.
- 8                   o If the least significant bit of CH\_IND<sub>r</sub> equals '1', then the mobile station  
 9                   shall stop transmitting on R-FCH and stop processing F-FCH, if  
 10                  assigned, at the action time specified by the message.
- 11                  o If the second most significant bit of CH\_IND<sub>r</sub> equals '1', then the mobile  
 12                  station shall stop transmitting on R-DCCH and stop processing F-  
 13                  DCCH, if assigned, at the action time specified by the message.
- 14                  o If GATING\_RATE\_INCL<sub>r</sub> equals '1', the mobile station shall set  
 15                  PILOT\_GATING\_RATE<sub>s</sub> = PILOT\_GATING\_RATE<sub>r</sub> at the action time of the  
 16                  message.
- 17                  o If the most significant bit of CH\_IND<sub>r</sub> equals '1', the mobile station shall  
 18                  set PILOT\_GATING\_USE\_RATE to '1'. The mobile station shall start the  
 19                  reverse pilot gating at PILOT\_GATING\_RATE<sub>s</sub> at the action time of the  
 20                  message. Furthermore, if the least significant bit of CH\_IND<sub>r</sub> equals '1'  
 21                  (that is, the Fundamental Channel is being released), the mobile station  
 22                  shall store the configuration used for the Fundamental Channel. The  
 23                  mobile station shall cancel the forward and reverse supplemental  
 24                  channel assignment, if any, at the action time of the message.
- 25                  o If a Forward Packet Data Channel is assigned, the mobile station shall  
 26                  perform the following:
- 27                    ◇ Stop processing the Forward Packet Data Channel at the action time  
 28                    specified by the message.
- 29                    ◇ If a Reverse Packet Data Channel is assigned, the mobile station  
 30                    shall stop transmitting on the Reverse Packet Data Channel at the  
 31                    action time specified by the message.
- 32                    ◇ If the two least significant bits of CH\_IND<sub>r</sub> is equal to '00', the mobile  
 33                    station shall perform the following:
- 34                      – If EXT\_CH\_IND<sub>s</sub> signals the allocation of F-FCH and R-FCH, and  
 35                      does not signal allocation of F-DCCH nor R-DCCH, the mobile  
 36                      station shall set CH\_IND<sub>s</sub> = '01' at the action time specified by  
 37                      the message.

- 1                   – If EXT\_CH\_IND<sub>S</sub> signals the allocation of F-DCCH and R-DCCH,  
2                   and does not signal allocation of F-FCH nor R-FCH, the mobile  
3                   station shall set CH\_IND<sub>S</sub> = '10' at the action time specified by  
4                   the message.
- 5                   – If EXT\_CH\_IND<sub>S</sub> signals the allocation of F-FCH, R-FCH, F-DCCH  
6                   and R-DCCH, the mobile station shall set CH\_IND<sub>S</sub> = '11' at the  
7                   action time specified by the message.

#### 8   2.6.4.1.10 Processing the Resource Allocation Message and Resource Allocation Mini 9   Message

10   The mobile station shall process the *Resource Allocation Message* and the *Resource*  
11   *Allocation Mini Message* as follows:

- 12       • The mobile station shall set FPC\_PRI\_CHAN<sub>S</sub> = FPC\_PRI\_CHAN<sub>T</sub> at the action time  
13       of the message.
- 14       • If a F-PDCH is not assigned and the Fundamental Channel was previously  
15       established prior to transitioning to the *Control Hold Mode*, the mobile station shall  
16       start processing F-FCH and start transmitting on R-FCH at the action time of the  
17       message. The mobile station shall establish the Fundamental Channel with the  
18       same configuration as previously used, and shall set CH\_IND<sub>S</sub> to '11'.
- 19       • The mobile station shall set PILOT\_GATING\_USE\_RATE to '0' and shall start the  
20       continuous reverse pilot at the action time of the message and, if a F-PDCH is  
21       assigned, the mobile station shall start the continuous R-CQICH as defined in [3].

#### 22   2.6.4.1.11 Reserved

#### 23   2.6.4.1.12 Processing the Service Configuration Record

24   The mobile station shall update the Service Configuration information record currently in  
25   use as follows:

- 26       • If P\_REV\_IN\_USE<sub>S</sub> is less than eight, the mobile station shall update the multiplex  
27       option information as follows:
  - 28           – The mobile station shall store the forward Fundamental Channel multiplex  
29           option [FOR\_FCH\_MUX\_OPTION<sub>S</sub> = FOR\_MUX\_OPTION<sub>T</sub>].
  - 30           – The mobile station shall store the reverse Fundamental Channel multiplex  
31           option [REV\_FCH\_MUX\_OPTION<sub>S</sub> = REV\_MUX\_OPTION<sub>T</sub>].
  - 32           – The mobile station shall store the forward Dedicated Control Channel multiplex  
33           option [FOR\_DCCH\_MUX\_OPTION<sub>S</sub> = FOR\_MUX\_OPTION<sub>T</sub>].
  - 34           – The mobile station shall store the reverse Dedicated Control Channel multiplex  
35           option [REV\_DCCH\_MUX\_OPTION<sub>S</sub> = REV\_MUX\_OPTION<sub>T</sub>].
- 36       • If P\_REV\_IN\_USE<sub>S</sub> is greater than or equal to eight, the mobile station shall update  
37       the multiplex option information as follows:

- 1       – If FCH\_DCCH\_MUX\_OPTION\_IND is equal to '00':
  - 2           + The mobile station shall store the forward Fundamental Channel multiplex
  - 3           option (FOR\_FCH\_MUX\_OPTION<sub>S</sub> = FOR\_MUX\_OPTION<sub>T</sub>).
  - 4           + The mobile station shall store the forward Dedicated Control Channel
  - 5           multiplex option (FOR\_DCCH\_MUX\_OPTION<sub>S</sub> = FOR\_MUX\_OPTION<sub>T</sub>).
  - 6           + The mobile station shall store the reverse Fundamental Channel multiplex
  - 7           option (REV\_FCH\_MUX\_OPTION<sub>S</sub> = REV\_MUX\_OPTION<sub>T</sub>).
  - 8           + The mobile station shall store the reverse Dedicated Control Channel
  - 9           multiplex option (REV\_DCCH\_MUX\_OPTION<sub>S</sub> = REV\_MUX\_OPTION<sub>T</sub>).
- 10      – If FCH\_DCCH\_MUX\_OPTION\_IND is equal to '01':
  - 11           + The mobile station shall store the forward Fundamental Channel multiplex
  - 12           option (FOR\_FCH\_MUX\_OPTION<sub>S</sub> = FOR\_MUX\_OPTION<sub>T</sub>).
  - 13           + The mobile station shall store the reverse Fundamental Channel multiplex
  - 14           option (REV\_FCH\_MUX\_OPTION<sub>S</sub> = REV\_MUX\_OPTION<sub>T</sub>).
- 15      – If FCH\_DCCH\_MUX\_OPTION\_IND is equal to '10':
  - 16           + The mobile station shall store the forward Dedicated Control Channel
  - 17           multiplex option (FOR\_DCCH\_MUX\_OPTION<sub>S</sub> = FOR\_MUX\_OPTION<sub>T</sub>).
  - 18           + The mobile station shall store the reverse Dedicated Control Channel
  - 19           multiplex option (REV\_DCCH\_MUX\_OPTION<sub>S</sub> = REV\_MUX\_OPTION<sub>T</sub>).
- 20      – If FCH\_DCCH\_MUX\_OPTION\_IND is equal to '11':
  - 21           + The mobile station shall store the forward Fundamental Channel multiplex
  - 22           option (FOR\_FCH\_MUX\_OPTION<sub>S</sub> = FOR\_MUX\_OPTION<sub>T</sub>).
  - 23           + The mobile station shall store the reverse Fundamental Channel multiplex
  - 24           option (REV\_FCH\_MUX\_OPTION<sub>S</sub> = REV\_MUX\_OPTION<sub>T</sub>).
  - 25           + The mobile station shall store the forward Dedicated Control Channel
  - 26           multiplex option (FOR\_DCCH\_MUX\_OPTION<sub>S</sub> =
  - 27           FOR\_DCCH\_MUX\_OPTION<sub>T</sub>).
  - 28           + The mobile station shall store the reverse Dedicated Control Channel
  - 29           multiplex option (REV\_DCCH\_MUX\_OPTION<sub>S</sub> =
  - 30           REV\_DCCH\_MUX\_OPTION<sub>T</sub>).
- 31      • The mobile station shall store the set of number of bits per frame of the forward
- 32      Fundamental Channel and Dedicated Control Channel [FOR\_NUM\_BITS<sub>S</sub> =
- 33      FOR\_NUM\_BITS<sub>T</sub>].
- 34      • The mobile station shall store the set of number of bits per frame of the reverse
- 35      Fundamental Channel and Dedicated Control Channel [REV\_NUM\_BITS<sub>S</sub> =
- 36      REV\_NUM\_BITS<sub>T</sub>].
- 37      • If a service option connection has been omitted from the service option connection
- 38      records, the Layer 3 shall terminate the call control instance (currently existing or

- 1 pending instantiation) identified by the connection reference corresponding to the  
 2 omitted service option connection.
- 3 • If this is the first Service Configuration Record received from the base station in a  
 4 *Service Connect Message*, *General Handoff Direction Message*, or *Universal Handoff*  
 5 *Direction Message* and accepted by the mobile station since entering the *Traffic*  
 6 *Channel substate*, the mobile station shall also identify the Call Control instance  
 7 currently identified by NULL by the connection reference assigned to the first  
 8 service option connection, CON\_REF<sub>r</sub>; otherwise, the mobile station shall identify  
 9 the Call Control instance corresponding to the first service option connection listed  
 10 in this Service Configuration information record by the NULL identifier.
  - 11 • The mobile station shall delete all instances of current service option connection  
 12 records. For each of the NUM\_CON\_REC<sub>r</sub> occurrences of the service option  
 13 connection record (SO\_CON\_REC[i]), the mobile station shall perform the following:
    - 14 – The mobile station shall store the service option connection reference  
 15 (SO\_CON\_REC<sub>s</sub>[i].CON\_REF = CON\_REF<sub>r</sub>).
    - 16 – The mobile station shall store the service option  
 17 (SO\_CON\_REC<sub>s</sub>[i].SERVICE\_OPTION = SERVICE\_OPTION<sub>r</sub>).
    - 18 – The mobile station shall store the forward traffic channel traffic type  
 19 (SO\_CON\_REC<sub>s</sub>[i].FOR\_TRAFFIC = FOR\_TRAFFIC<sub>r</sub>).
    - 20 – The mobile station shall store the reverse traffic channel traffic type  
 21 (SO\_CON\_REC<sub>s</sub>[i].REV\_TRAFFIC = REV\_TRAFFIC<sub>r</sub>).
    - 22 – The mobile station shall store the encryption mode indicator for user  
 23 information privacy (SO\_CON\_REC<sub>s</sub>[i].UI\_ENCRYPT\_MODE =  
 24 UI\_ENCRYPT\_MODE<sub>r</sub>).
    - 25 – The mobile station shall store the service reference identifier  
 26 (SO\_CON\_REC<sub>s</sub>[i].SR\_ID = SR\_ID<sub>r</sub>).
    - 27 – If RLP\_INFO\_INCL<sub>r</sub> equals '1', the mobile station shall store the Radio Link  
 28 Protocol block of bits (SO\_CON\_REC<sub>s</sub>[i].RLP\_BLOB = RLP\_BLOB<sub>r</sub>).
    - 29 – If QOS\_PARMS\_INCL<sub>r</sub> equals '1', the mobile station shall store the QoS  
 30 parameters block (SO\_CON\_REC<sub>s</sub>[i].QOS\_PARMS = QOS\_PARMS<sub>r</sub>).
  - 31 • If FCH\_CC\_INCL<sub>r</sub> equals '1', the mobile station shall perform the following:
    - 32 – The mobile station shall store the indicator for 5ms frames on Fundamental  
 33 Channel as follows: if FCH\_FRAME\_SIZE<sub>r</sub> equals '1', the mobile station shall set  
 34 FCH\_5MS\_FRAMES<sub>s</sub> = '1'; otherwise, it is set to '0'.
    - 35 – The mobile station shall store the Forward Fundamental Channel Radio  
 36 Configuration (FOR\_FCH\_RC<sub>s</sub> = FOR\_FCH\_RC<sub>r</sub>).

- 1        - The mobile station shall store the Reverse Fundamental Channel Radio  
2        Configuration (REV\_FCH\_RC<sub>S</sub> = REV\_FCH\_RC<sub>T</sub>).
- 3        • If DCCH\_CC\_INCL<sub>T</sub> equals '1', the mobile station shall perform the following:
  - 4        - The mobile station shall store the indicator for 5ms frames on Dedicated  
5        Control Channel as follows: If DCCH\_FRAME\_SIZE<sub>T</sub> equals '10' or '11', the  
6        mobile station shall set DCCH\_5MS\_FRAMES<sub>S</sub> = '1'; otherwise, it is set to '0'.
  - 7        - The mobile station shall store the Forward Dedicated Control Channel Radio  
8        Configuration (FOR\_DCCH\_RC<sub>S</sub> = FOR\_DCCH\_RC<sub>T</sub>).
  - 9        - The mobile station shall store the Reverse Dedicated Control Channel Radio  
10       Configuration (REV\_DCCH\_RC<sub>S</sub> = REV\_DCCH\_RC<sub>T</sub>).
- 11       • If FOR\_SCH\_CC\_INCL<sub>T</sub> equals '1', the mobile station shall store the  
12       NUM\_FOR\_SCH<sub>T</sub> occurrences of the Forward Supplemental Channel channel  
13       configuration records as follows:
  - 14       - The mobile station shall store the Forward Supplemental Channel Identification  
15       (FOR\_SCH\_ID[FOR\_SCH\_ID<sub>T</sub>]<sub>S</sub> = FOR\_SCH\_ID<sub>T</sub>).
  - 16       - The mobile station shall store the Forward Supplemental Channel Multiplex  
17       Option (FOR\_SCH\_MUX[FOR\_SCH\_ID<sub>T</sub>]<sub>S</sub> = FOR\_SCH\_MUX<sub>T</sub>).
  - 18       - The mobile station shall store the Forward Supplemental Channel Radio  
19       Configuration (FOR\_SCH\_RC[FOR\_SCH\_ID<sub>T</sub>]<sub>S</sub> = SCH\_RC<sub>T</sub>).
  - 20       - The mobile station shall store the Forward Supplemental Channel Coding Type  
21       (FOR\_SCH\_CODING[FOR\_SCH\_ID<sub>T</sub>]<sub>S</sub> = CODING<sub>T</sub>).
  - 22       - If FRAME\_40\_USED<sub>T</sub> and FRAME\_80\_USED<sub>T</sub> are both equal to '0', the mobile  
23       station shall set FOR\_SCH\_FRAME\_LENGTH<sub>S</sub>[FOR\_SCH\_ID<sub>T</sub>] to '00' (i.e., 20 ms  
24       frame length).
  - 25       - If FRAME\_40\_USED<sub>T</sub> is equal to '1', the mobile station shall set  
26       FOR\_SCH\_FRAME\_LENGTH<sub>S</sub>[FOR\_SCH\_ID<sub>T</sub>] to '01' (i.e., 40 ms frame length).
  - 27       - If FRAME\_80\_USED<sub>T</sub> is equal to '1', the mobile station shall set  
28       FOR\_SCH\_FRAME\_LENGTH<sub>S</sub>[FOR\_SCH\_ID<sub>T</sub>] to '10' (i.e., 80 ms frame length).
  - 29       - F\_MAX\_RATE\_IDX<sub>S</sub>[FOR\_SCH\_ID<sub>T</sub>] = MAX\_RATE<sub>T</sub>.
- 30       • If REV\_SCH\_CC\_INCL<sub>T</sub> equals '1', the mobile station shall store the  
31       NUM\_REV\_SCH<sub>T</sub> occurrences of the Reverse Supplemental Channel channel  
32       configuration records as follows:
  - 33       - The mobile station shall store the Reverse Supplemental Channel Identification  
34       (REV\_SCH\_ID[REV\_SCH\_ID<sub>T</sub>]<sub>S</sub> = REV\_SCH\_ID<sub>T</sub>).
  - 35       - The mobile station shall store the Reverse Supplemental Channel Multiplex  
36       Option (REV\_SCH\_MUX[REV\_SCH\_ID<sub>T</sub>]<sub>S</sub> = REV\_SCH\_MUX<sub>T</sub>).
  - 37       - The mobile station shall store the Reverse Supplemental Channel Radio  
38       Configuration (REV\_SCH\_RC[REV\_SCH\_ID<sub>T</sub>]<sub>S</sub> = SCH\_RC<sub>T</sub>).

- 1       - The mobile station shall store the Reverse Supplemental Channel Coding Type  
2       (REV\_SCH\_CODING[REV\_SCH\_ID<sub>r</sub>]<sub>s</sub> = CODING<sub>r</sub>).
- 3       - If FRAME\_40\_USED<sub>r</sub> and FRAME\_80\_USED<sub>r</sub> are both equal to '0', the mobile  
4       station shall set REV\_SCH\_FRAME\_LENGTH<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] to '00' (i.e., 20 ms  
5       frame length).
- 6       - If FRAME\_40\_USED<sub>r</sub> is equal to '1', the mobile station shall set  
7       REV\_SCH\_FRAME\_LENGTH<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] to '01' (i.e., 40 ms frame length).
- 8       - If FRAME\_80\_USED<sub>r</sub> is equal to '1', the mobile station shall set  
9       REV\_SCH\_FRAME\_LENGTH<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] to '10' (i.e., 80 ms frame length).
- 10      - R\_MAX\_RATE\_IDX<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] = MAX\_RATE<sub>r</sub>.
- 11      • If FOR\_PDCH\_CC\_INCL<sub>r</sub> equals '1', the mobile station shall perform the following:
  - 12      - The mobile station shall store the Forward Packet Data Channel multiplex  
13      option (FOR\_PDCH\_MUX\_OPTION<sub>s</sub> = FOR\_PDCH\_MUX\_OPTION<sub>r</sub>).
  - 14      - The mobile station shall store the Forward Packet Data Channel Radio  
15      Configuration (FOR\_PDCH\_RC<sub>s</sub> = FOR\_PDCH\_RC<sub>r</sub>).
- 16      • If REV\_PDCH\_CC\_INCL<sub>r</sub> equals '1', the mobile station shall store the following:
  - 17      - The Reverse Packet Data Channel multiplex option for the higher data rates  
18      (REV\_PDCH\_MUX\_OPTION\_HIGH\_RATE<sub>s</sub> =  
19      REV\_PDCH\_MUX\_OPTION\_HIGH\_RATE<sub>r</sub>).
  - 20      - The Reverse Packet Data Channel multiplex option for the lower data rates  
21      (REV\_PDCH\_MUX\_OPTION\_LOW\_RATE<sub>s</sub> =  
22      REV\_PDCH\_MUX\_OPTION\_LOW\_RATE<sub>r</sub>).
  - 23      - The Reverse Packet Data Channel Radio Configuration (REV\_PDCH\_RC<sub>s</sub> =  
24      REV\_PDCH\_RC<sub>r</sub>).

#### 25   2.6.4.1.13 Processing the Non-Negotiable Service Configuration Record

26   The mobile station shall update the Non-Negotiable Service Configuration information  
27   record currently in use as follows:

- 28      • If FPC\_INCL<sub>r</sub> equals '1', the mobile station shall perform the following:
  - 29      - The mobile station shall store the Power Control Subchannel indicator  
30      (FPC\_PRI\_CHAN<sub>s</sub> = FPC\_PRI\_CHAN<sub>r</sub>).
  - 31      - The mobile station shall store the forward power control operation mode  
32      (FPC\_MODE\_NO\_SCH<sub>s</sub> = FPC\_MODE<sub>r</sub>).
  - 33      - The mobile station shall set FPC\_MODE<sub>s</sub> = FPC\_MODE\_NO\_SCH<sub>s</sub> if there is no  
34      forward Supplemental Channel assignment in progress (see 2.6.6.2.5.1.1).
  - 35      - If FPC\_OLPC\_FCH\_INCL<sub>r</sub> equals '1', the mobile station shall perform the  
36      following:
    - 37      + The mobile station shall store the Fundamental Channel target Frame Error

- 1                   Rate ( $FPC\_FCH\_FER_S = FPC\_FCH\_FER_T$ ).
- 2           +   The mobile station shall store the minimum Fundamental Channel Outer  
3           Loop  $E_b/N_t$  setpoint ( $FPC\_FCH\_MIN\_SETPT_S = FPC\_FCH\_MIN\_SETPT_T$ ).
- 4           +   The mobile station shall store the maximum Fundamental Channel Outer  
5           Loop  $E_b/N_t$  setpoint ( $FPC\_FCH\_MAX\_SETPT_S = FPC\_FCH\_MAX\_SETPT_T$ ).
- 6           -   If  $FPC\_OLPC\_DCCH\_INCL_R$  equals '1', the mobile station shall perform the  
7           following:
- 8           +   The mobile station shall store the Dedicated Control Channel target Frame  
9           Error Rate ( $FPC\_DCCH\_FER_S = FPC\_DCCH\_FER_T$ ).
- 10          +   The mobile station shall store the minimum Dedicated Control Channel  
11          Outer Loop  $E_b/N_t$  setpoint ( $FPC\_DCCH\_MIN\_SETPT_S =$   
12           $FPC\_DCCH\_MIN\_SETPT_T$ ).
- 13          +   The mobile station shall store the maximum Dedicated Control Channel  
14          Outer Loop  $E_b/N_t$  setpoint ( $FPC\_DCCH\_MAX\_SETPT_S =$   
15           $FPC\_DCCH\_MAX\_SETPT_T$ ).
- 16          •   If  $GATING\_RATE\_INCL_R$  equals '1', the mobile station shall store the Reverse Pilot  
17          Channel gating rate ( $PILOT\_GATING\_RATE_S = PILOT\_GATING\_RATE_T$ ).
- 18          •   If  $FOR\_SCH\_INCL_R$  equals '1', the mobile station shall store the  $NUM\_FOR\_SCH_R$   
19          occurrences of the Forward Supplemental Channel information as follows:
- 20          -   The mobile station shall store the Forward Supplemental Channel Multiframe  
21          Offset ( $FOR\_SCH\_FRAME\_OFFSET[FOR\_SCH\_ID_R]_S =$   
22           $FOR\_SCH\_FRAME\_OFFSET_T$ ).
- 23          •   If  $REV\_SCH\_CC\_INCL_R$  equals '1', the mobile station shall store the  
24           $NUM\_REV\_SCH_R$  occurrences of the Reverse Supplemental Channel information as  
25          follows:
- 26          -   The mobile station shall store the Reverse Supplemental Channel Multiframe  
27          Offset ( $REV\_SCH\_FRAME\_OFFSET[REV\_SCH\_ID_R]_S =$   
28           $REV\_SCH\_FRAME\_OFFSET_T$ ).
- 29          •   The mobile station shall determine the Logical-to-Physical Mapping to be used as  
30          follows:
- 31          -   If  $LPM\_IND_R$  equals '00' and an F-PDCH is assigned, the mobile station shall  
32          reset the Logical-to-Physical Mapping to their default values as specified in  
33          Table 2.6.4.2-2 but with the following modification for requirement 1 stated in  
34          Table 2.6.4.2-2:
- 35          +   The mobile station shall set the  $SR\_ID$  field to the value specified in the  
36          Service Configuration information record.

- 1       - If LPM\_IND<sub>r</sub> equals '00' and P\_REV\_IN\_USE<sub>s</sub> is greater than six and an F-PDCH  
2       is not assigned, the mobile station shall reset the Logical-to-Physical Mapping  
3       to their default values as specified in Table 2.6.4.2-1 but with the following  
4       modification for requirement 1 stated in Table 2.6.4.2-1:
- 5       + The mobile station shall set the SR\_ID field to the value specified in the  
6       Service Configuration information record.
- 7       - If LPM\_IND<sub>r</sub> equals '00' and P\_REV\_IN\_USE<sub>s</sub> is equal to or less than six, the  
8       mobile station shall reset the Logical-to-Physical Mapping to their default  
9       values as follows:
- 10      + Default number of Logical-to-Physical Mapping entries  
11      (NUM\_LPM\_ENTRIES<sub>s</sub> = '0100').
- 12      + Default Table(0) Logical-to-Physical Mapping service reference identifier  
13      (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[0].SR\_ID<sub>s</sub> = '000').
- 14      + Default Table(0) Logical-to-Physical Mapping logical resource identifier  
15      (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[0].LOGICAL\_RESOURCE<sub>s</sub> =  
16      '0001').
- 17      + Default Table(0) Logical-to-Physical Mapping physical resource identifier:
- 18          o If CH\_IND<sub>s</sub> is equal to '01' or '11', the mobile station shall set  
19          LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[0].PHYSICAL\_RESOURCE<sub>s</sub>  
20          to '0000'.
- 21          o If CH\_IND<sub>s</sub> is equal to '10', the mobile station shall set  
22          LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[0].PHYSICAL\_RESOURCE<sub>s</sub>  
23          to '0001'.
- 24      + Default Table(0) Logical-to-Physical Mapping forward mapping indicator  
25      (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[0].FORWARD\_FLAG<sub>s</sub> = '1').
- 26      + Default Table(0) Logical-to-Physical Mapping reverse mapping indicator  
27      (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[0].REVERSE\_FLAG<sub>s</sub> = '1').
- 28      + Default Table(0) Logical-to-Physical Mapping priority  
29      (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[0].PRIORITY<sub>s</sub> = '0000').
- 30      + Default Table(1) Logical-to-Physical Mapping service reference identifier  
31      (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[1].SR\_ID<sub>s</sub> = '001').
- 32      + Default Table(1) Logical-to-Physical Mapping logical resource identifier  
33      (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[1].LOGICAL\_RESOURCE<sub>s</sub> =  
34      '0000').
- 35      + Default Table(1) Logical-to-Physical Mapping physical resource identifier:
- 36          o If CH\_IND<sub>s</sub> is equal to '01' or '11', the mobile station shall set  
37          LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[1].PHYSICAL\_RESOURCE<sub>s</sub>  
38          to '0000'.

- 1                   o If CH\_IND<sub>S</sub> is equal to '10', the mobile station shall set
- 2                   LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[1].PHYSICAL\_RESOURCE
- 3                   E<sub>S</sub> to '0001'.
- 4           + Default Table(1) Logical-to-Physical Mapping forward mapping indicator
- 5            (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[1].FORWARD\_FLAG<sub>S</sub> = '1').
- 6           + Default Table(1) Logical-to-Physical Mapping reverse mapping indicator
- 7            (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[1].REVERSE\_FLAG<sub>S</sub> = '1').
- 8           + Default Table(1) Logical-to-Physical Mapping priority
- 9            (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[1].PRIORITY<sub>S</sub> = '0000').
- 10          + Default Table(2) Logical-to-Physical Mapping service reference identifier
- 11          (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[2].SR\_ID<sub>S</sub> = '001').
- 12          + Default Table(2) Logical-to-Physical Mapping logical resource identifier
- 13          (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[2].LOGICAL\_RESOURCE<sub>S</sub> =
- 14          '0000').
- 15          + Default Table(2) Logical-to-Physical Mapping physical resource identifier
- 16          (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[2].PHYSICAL\_RESOURCE<sub>S</sub> to
- 17          '0010').
- 18          + Default Table(2) Logical-to-Physical Mapping forward mapping indicator
- 19          (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[2].FORWARD\_FLAG<sub>S</sub> = '1').
- 20          + Default Table(2) Logical-to-Physical Mapping reverse mapping indicator
- 21          (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[2].REVERSE\_FLAG<sub>S</sub> = '1').
- 22          + Default Table(2) Logical-to-Physical Mapping priority
- 23          (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[2].PRIORITY<sub>S</sub> = '0000').
- 24          + Default Table(3) Logical-to-Physical Mapping service reference identifier
- 25          (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[3].SR\_ID<sub>S</sub> = '001').
- 26          + Default Table(3) Logical-to-Physical Mapping logical resource identifier
- 27          (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[3].LOGICAL\_RESOURCE<sub>S</sub> =
- 28          '0000').
- 29          + Default Table(3) Logical-to-Physical Mapping physical resource identifier
- 30          (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[3].PHYSICAL\_RESOURCE<sub>S</sub> to
- 31          '0011').
- 32          + Default Table(3) Logical-to-Physical Mapping forward mapping indicator
- 33          (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[3].FORWARD\_FLAG<sub>S</sub> = '1').
- 34          + Default Table(3) Logical-to-Physical Mapping reverse mapping indicator
- 35          (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[3].REVERSE\_FLAG<sub>S</sub> = '1').
- 36          + Default Table(3) Logical-to-Physical Mapping priority
- 37          (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[3].PRIORITY<sub>S</sub> = '0000').

- 1       - If LPM\_IND<sub>r</sub> equals '01', the mobile station shall use the Logical-to-Physical  
2       Mapping included in this Non-Negotiable Service Configuration Record. The  
3       mobile station shall perform the following: The mobile station shall delete the  
4       Logical-to-Physical Mapping currently in use. The mobile station shall store  
5       the number of Logical-to-Physical Mapping entries (NUM\_LPM\_ENTRIES<sub>s</sub> =  
6       NUM\_LPM\_ENTRIES<sub>r</sub>). For each i<sup>th</sup> record of the NUM\_LPM\_ENTRIES<sub>r</sub> Logical-  
7       to-Physical Mapping records included in the received Non-Negotiable Service  
8       Configuration Record:
  - 9       + The mobile station shall store the Logical-to-Physical Mapping service  
10       reference identifier (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[i].SR\_ID<sub>s</sub> =  
11       SR\_ID<sub>r</sub>).
  - 12       + The mobile station shall store the Logical-to-Physical Mapping logical  
13       resource identifier  
14       (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[i].LOGICAL\_RESOURCE<sub>s</sub> =  
15       LOGICAL\_RESOURCE<sub>r</sub>).
  - 16       + The mobile station shall store the Logical-to-Physical Mapping Physical  
17       Channel  
18       (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[i].PHYSICAL\_RESOURCE<sub>s</sub> =  
19       PHYSICAL\_RESOURCE<sub>r</sub>).
  - 20       + The mobile station shall store the Logical-to-Physical Mapping forward  
21       mapping indicator  
22       (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[i].FORWARD\_FLAG<sub>s</sub> =  
23       FORWARD\_FLAG<sub>r</sub>).
  - 24       + The mobile station shall store the Logical-to-Physical Mapping reverse  
25       mapping indicator  
26       (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[i].REVERSE\_FLAG<sub>s</sub> =  
27       REVERSE\_FLAG<sub>r</sub>).
  - 28       + The mobile station shall store the Logical-to-Physical Mapping priority  
29       (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[i].PRIORITY<sub>s</sub> = PRIORITY<sub>r</sub>).
- 30       - If LPM\_IND<sub>r</sub> equals '10', the mobile station shall use the Logical-to-Physical  
31       Mapping currently in use.
- 32       • For each of the NUM\_REC<sub>r</sub> occurrences of the service-specific records included in  
33       the Non-negotiable Service Configuration Record, the mobile station shall perform  
34       the following:
  - 35       - The mobile station shall store the Short Data Burst service option number  
36       omitted indicator (SDB\_SO\_OMIT<sub>s</sub> [SR\_ID<sub>r</sub>] = SDB\_SO\_OMIT<sub>r</sub> ).
- 37       • The mobile station shall store the following:
  - 38       - USE\_FLEX\_NUM\_BITS<sub>s</sub> = USE\_FLEX\_NUM\_BITS<sub>r</sub>
  - 39       - USE\_VAR\_RATE<sub>s</sub> = USE\_VAR\_RATE<sub>r</sub>

- 1        - If  $USE\_VAR\_RATE_R$  is equal to '1', then the mobile station shall store the  
2        following:  
3        +  $R\_INC\_RATE\_ALLOWED_S = R\_INC\_RATE\_ALLOWED_R$   
4        +  $F\_INC\_RATE\_ALLOWED_S = F\_INC\_RATE\_ALLOWED_R$   
5        - If  $USE\_FLEX\_NUM\_BITS_R$  or  $USE\_VAR\_RATE_R$  is equal to '1', then the mobile  
6        station shall store the following:  
7        +  $USE\_ERAM_S = USE\_ERAM_R$   
8        • If  $NUM\_BITS\_TABLES\_INCL_R$  is included and is equal to '1', the mobile station shall  
9        store  $NUM\_BITS\_TABLES\_COUNT+1$  instances of the Flexible Rate Table  
10        ( $NUM\_RECS$  triplets of ( $NUM\_BITS\_IDX$ ,  $NUM\_BITS$ ,  $CRC\_LEN\_IDX$ ) corresponding  
11        to each  $NUM\_BITS\_TABLE\_ID$ ) as follows:  
12        - For each of the  $NUM\_RECS$  occurrences of the three field record consisting of  
13         $NUM\_BITS\_IDX$ ,  $NUM\_BITS$ , and  $CRC\_LEN\_IDX$  the mobile station shall store  
14        the following  
15        +  $NUM\_BITS_S[NUM\_BITS\_TABLE\_ID_R][NUM\_BITS\_IDX_R] = NUM\_BITS_R$ ;  
16        +  $CRC\_LEN\_IDX_S[NUM\_BITS\_TABLE\_ID_R][NUM\_BITS\_IDX_R] = CRC\_LEN\_IDX_R$ ;  
17        • If  $USE\_OLD\_FLEX\_MAPPING_R$  is included and equal to '0', the mobile station shall  
18        store the following:  
19        -  $FFCH\_NBIT\_TABLE\_ID_S = FFCH\_NBIT\_TABLE\_ID_R$ .  
20        -  $RFCH\_NBIT\_TABLE\_ID_S = RFCH\_NBIT\_TABLE\_ID_R$ .  
21        -  $FSCH\_NBIT\_TABLE\_ID_S[1] = FSCH0\_NBIT\_TABLE\_ID_R$ .  
22        -  $FSCH\_NBIT\_TABLE\_ID_S[2] = FSCH1\_NBIT\_TABLE\_ID_R$ .  
23        -  $RSCH\_NBIT\_TABLE\_ID_S[1] = RSCH0\_NBIT\_TABLE\_ID_R$ .  
24        -  $RSCH\_NBIT\_TABLE\_ID_S[2] = RSCH1\_NBIT\_TABLE\_ID_R$ .  
25        -  $FDCCH\_NBIT\_TABLE\_ID_S = FDCCH\_NBIT\_TABLE\_ID_R$ .  
26        - If  $FDCCH\_NBIT\_TABLE\_ID_S$  is not equal to '0000', then the mobile station shall  
27        store  $FDCCH\_NBITS\_IDX_S = FDCCH\_NBITS\_IDX_R$ .  
28        -  $RDCCH\_NBIT\_TABLE\_ID_S = RDCCH\_NBIT\_TABLE\_ID_R$ .  
29        - If  $RDCCH\_NBIT\_TABLE\_ID_S$  is not equal to '0000', then the mobile station shall  
30        store  $RDCCH\_NBITS\_IDX_S = RDCCH\_NBITS\_IDX_R$ .  
31        • Otherwise, the mobile station shall use the previously stored values for the above  
32        variables.  
33        • If  $USE\_FLEX\_NUM\_BITS_R$  is equal to '0', the mobile station shall store the following:  
34        -  $FFCH\_NBIT\_TABLE\_ID_S = '0000'$ .  
35        -  $RFCH\_NBIT\_TABLE\_ID_S = '0000'$ .  
36        -  $FSCH\_NBIT\_TABLE\_ID_S[1] = '0000'$ .

- 1       - FSCH\_NBIT\_TABLE\_IDS[2] = '0000'.
- 2       - RSCH\_NBIT\_TABLE\_IDS[1] = '0000'.
- 3       - RSCH\_NBIT\_TABLE\_IDS[2] = '0000'.
- 4       - FDCCH\_NBIT\_TABLE\_IDS = '0000'.
- 5       - FDCCH\_NBITS\_IDX<sub>S</sub> = '0000'.
- 6       - RDCCH\_NBIT\_TABLE\_IDS = '0000'.
- 7       - FDCCH\_NBITS\_IDX<sub>S</sub> = '0000'.
- 8       • If VAR\_TABLES\_INCL<sub>r</sub> is included and is equal to '1', the mobile station shall store
  - 9       VAR\_RATE\_TABLES\_COUNT+1 instances of the Variable Rate Mask Table
  - 10       (NUM\_RECS pairs of (NUM\_BITS\_IDX, MASK) corresponding to each
  - 11       VAR\_RATE\_TABLE\_ID) as follows:
    - 12       - For each of the NUM\_RECS + 1 occurrences of the two-field record consisting of
    - 13       NUM\_BITS\_IDX and MASK the mobile station shall store the following:
      - 14       + MASK<sub>S</sub>[VAR\_RATE\_TABLE\_ID<sub>r</sub>][NUM\_BITS\_IDX<sub>r</sub>] = MASK<sub>r</sub>;
    - 15       - If FSCH\_VAR\_TABLE\_IDS[1] is not equal to '000', then the mobile station shall
    - 16       store the following:
      - 17       + For row=1, ..., 15
        - 18       o For i=1, ..., row,
          - 19       ◇ If the  $i^{\text{th}}$  bit position in MASK<sub>S</sub>[FSCH\_VAR\_TABLE\_IDS[1]][row] is
          - 20       equal to '1', then the mobile station shall set
          - 21       VAR\_FSCH\_RATE\_OFFSET<sub>S</sub>[1][row][i] to i,
          - 22       ◇ otherwise, the mobile shall set VAR\_FSCH\_RATE\_OFFSET<sub>S</sub>[1][row][i]
          - 23       to '0'.
    - 24       - If FSCH\_VAR\_TABLE\_IDS[2] is not equal to '000', then the mobile station shall
    - 25       store the following:
      - 26       + For row=1, ..., 15
        - 27       o For i=1, ..., row,
          - 28       ◇ If the  $i^{\text{th}}$  bit position in MASK<sub>S</sub>[FSCH\_VAR\_TABLE\_IDS[2]][row] is
          - 29       equal to '1', then the mobile station shall set
          - 30       VAR\_FSCH\_RATE\_OFFSET<sub>S</sub>[2][row][i] to i,
          - 31       ◇ otherwise, the mobile shall set VAR\_FSCH\_RATE\_OFFSET<sub>S</sub>[2][row][i]
          - 32       to '0'.
    - 33       - If RSCH\_VAR\_TABLE\_IDS[1] is not equal to '000', then the mobile station shall
    - 34       store the following:
      - 35       + For row=1, ..., 15
        - 36       o For i=1, ..., row,

- 1                   ◇ If the  $i^{\text{th}}$  bit position in  $\text{MASK}_S[\text{RSCH\_VAR\_TABLE\_ID}_S[1]][\text{row}]$  is  
2                   equal to '1', then the mobile station shall set  
3                    $\text{VAR\_RSCH\_RATE\_OFFSET}_S[1][\text{row}][i]$  to  $i$ ,  
4                   ◇ otherwise, the mobile shall set  $\text{VAR\_RSCH\_RATE\_OFFSET}_S[1][\text{row}][i]$   
5                   to '0'.  
6       - If  $\text{RSCH\_VAR\_TABLE\_ID}_S[2]$  is not equal to '000', then the mobile station shall  
7       store the following:  
8       + For  $\text{row}=1, \dots, 15$   
9       o For  $i=1, \dots, \text{row}$ ,  
10                   ◇ If the  $i^{\text{th}}$  bit position in  $\text{MASK}_S[\text{RSCH\_VAR\_TABLE\_ID}_S[2]][\text{row}]$  is  
11                   equal to '1', then the mobile station shall set  
12                    $\text{VAR\_RSCH\_RATE\_OFFSET}_S[2][\text{row}][i]$  to  $i$ ,  
13                   ◇ otherwise, the mobile shall set  $\text{VAR\_RSCH\_RATE\_OFFSET}_S[2][\text{row}][i]$   
14                   to '0'.  
15       • If  $\text{USE\_OLD\_VAR\_MAPPING}_R$  is included and equal to '0', the mobile station shall  
16       store the following:  
17       -  $\text{FSCH\_VAR\_TABLE\_ID}_S[1] = \text{FSCH0\_VAR\_TABLE\_ID}_R$ .  
18       -  $\text{FSCH\_VAR\_TABLE\_ID}_S[2] = \text{FSCH1\_VAR\_TABLE\_ID}_R$ .  
19       -  $\text{RSCH\_VAR\_TABLE\_ID}_S[1] = \text{RSCH0\_VAR\_TABLE\_ID}_R$ .  
20       -  $\text{RSCH\_VAR\_TABLE\_ID}_S[2] = \text{RSCH1\_VAR\_TABLE\_ID}_R$ .  
21       • Otherwise, use the previously stored values for the above four variables.  
22       • If  $\text{USE\_VAR\_RATE}_R$  is equal to '0', the mobile station shall store the following:  
23       -  $\text{FSCH\_VAR\_TABLE\_ID}_S[1] = \text{'000'}$ .  
24       -  $\text{FSCH\_VAR\_TABLE\_ID}_S[2] = \text{'000'}$ .  
25       -  $\text{RSCH\_VAR\_TABLE\_ID}_S[1] = \text{'000'}$ .  
26       -  $\text{RSCH\_VAR\_TABLE\_ID}_S[2] = \text{'000'}$ .  
27       • If  $\text{LTU\_TABLES\_INCL}_R$  is included and is equal to '1', then the mobile station shall  
28       store  $\text{NUM\_LTU\_TABLES} + 1$  instances of the LTU Table which determines the  
29       number of LTUs per frame for convolutionally encoded supplemental channels for  
30       each number of bits per frame. Each LTU Table is identified by its  $\text{LTU\_TABLE\_ID}$ .  
31       - For each of the  $\text{NUM\_ROWS} + 1$  rows of the LTU Table, the mobile station shall  
32       store the following:  
33       +  $\text{LTU\_TAB}_S[\text{LTU\_TABLE\_ID}_R][\text{NBITS\_IDX}_R] = \text{NUM\_LTUS}_R$   
34       • If  $\text{USE\_OLD\_LTU\_MAPPING}_R$  is included and is equal to '0', then the mobile station  
35       shall store the following:  
36       -  $\text{FSCH\_LTU\_TAB\_ID}_S[1] = \text{FSCH0\_LTU\_TAB\_ID}_R$

- 1       - FSCH\_LTU\_TAB\_IDS[2] = FSCH1\_LTU\_TAB\_ID<sub>r</sub>
- 2       - RSCH\_LTU\_TAB\_IDS[1] = RSCH0\_LTU\_TAB\_ID<sub>r</sub>
- 3       - RSCH\_LTU\_TAB\_IDS[2] = RSCH1\_LTU\_TAB\_ID<sub>r</sub>
- 4       • Else (if USE\_OLD\_LTU\_MAPPING<sub>r</sub> is included and is equal to '1'), the mobile station
- 5       shall use the previously stored values for the above four variables.
- 6       • If LTU\_INFO\_INCL<sub>r</sub> is equal to '0', then the mobile station shall store the following:
- 7       - FSCH\_LTU\_TAB\_IDS[1] = '000'
- 8       - FSCH\_LTU\_TAB\_IDS[2] = '000'
- 9       - RSCH\_LTU\_TAB\_IDS[1] = '000'
- 10       - RSCH\_LTU\_TAB\_IDS[2] = '000'
- 11       • If PARTITION\_TABLES\_INCL<sub>r</sub> is included and is equal to '1', then the mobile station
- 12       shall store NUM\_PARTITION\_TABLES + 1 instances of the Partition Table which
- 13       determines the number of bits allocated to each service per FCH or DCCH frame as
- 14       follows. Each Partition Table is identified by its PARTITION\_TABLE\_ID.
- 15       - For each of the NUM\_ROWS+1 rows of the Partition Table, the mobile station
- 16       shall store the following:
- 17       + PART\_TAB<sub>s</sub>[PARTITION\_TABLE\_ID<sub>r</sub>][CATEGORY<sub>r</sub>].MUX\_HEADER\_LEN =
- 18       MUX\_HEADER\_LEN<sub>r</sub>
- 19       + PART\_TAB<sub>s</sub>[PARTITION\_TABLE\_ID<sub>r</sub>][CATEGORY<sub>r</sub>].MUX\_HEADER =
- 20       MUX\_HEADER<sub>r</sub>
- 21       + PART\_TAB<sub>s</sub>[PARTITION\_TABLE\_ID<sub>r</sub>][CATEGORY<sub>r</sub>]. NUM\_PARTITIONS =
- 22       NUM\_PARTITIONS<sub>r</sub>
- 23       + For i=1, ..., NUM\_PARTITIONS+1; the mobile station shall store the
- 24       following:
- 25       o PART\_TAB<sub>s</sub>[PARTITION\_TABLE\_ID<sub>r</sub>][CATEGORY<sub>r</sub>]. PARTITION\_SR\_ID[i]
- 26       = SR\_ID<sub>r</sub>
- 27       o PART\_TAB<sub>s</sub>[PARTITION\_TABLE\_ID<sub>r</sub>][CATEGORY<sub>r</sub>]. PARTITION\_NBITS[i]
- 28       = SRV\_NUM\_BITS<sub>r</sub>
- 29       • Else (if PARTITION\_TABLES\_INCL<sub>r</sub> is included and is equal to '0'), the mobile
- 30       station shall use the previously stored values for the PART\_TAB<sub>s</sub>.
- 31       • If USE\_OLD\_PART\_MAPPING<sub>r</sub> is included and is equal to '0', then the mobile
- 32       station shall store the following:
- 33       - FFCH\_PART\_TAB\_ID<sub>s</sub> = FFCH\_PART\_TAB\_ID<sub>r</sub>
- 34       - RFCH\_PART\_TAB\_ID<sub>s</sub> = RFCH\_PART\_TAB\_ID<sub>r</sub>
- 35       - FDCCH\_PART\_TAB\_ID<sub>s</sub> = FDCCH\_PART\_TAB\_ID<sub>r</sub>
- 36       - RDCCH\_PART\_TAB\_ID<sub>s</sub> = RDCCH\_PART\_TAB\_ID<sub>r</sub>

- 1       • If USE\_FLEX\_NUM\_BITS<sub>S</sub> is equal to '0', then the mobile station shall store the  
2       following:
  - 3       - FFCH\_PART\_TAB\_ID<sub>S</sub> = '000'
  - 4       - RFCH\_PART\_TAB\_ID<sub>S</sub> = '000'
  - 5       - FDCCH\_PART\_TAB\_ID<sub>S</sub> = '000'
  - 6       - RDCCH\_PART\_TAB\_ID<sub>S</sub> = '000'
- 7       • If SWITCHING\_PARMS\_INCL<sub>R</sub> is included and equal to '1', set  
8       NUM\_SOFT\_SWITCHING\_FRAMES\_CHM<sub>S</sub> to  
9       NUM\_SOFT\_SWITCHING\_FRAMES\_CHM<sub>R</sub> + 1, and  
10       NUM\_SOFT\_SWITCHING\_FRAMES\_CHM<sub>S</sub> to  
11       NUM\_SOFT\_SWITCHING\_FRAMES\_CHM<sub>R</sub> + 1.
- 12       • If RPC\_INCL<sub>R</sub> is equal to '1' and the mobile station supports any Radio  
13       Configuration greater than 2, the mobile station shall perform the following:
  - 14       - If RPC\_ADJ\_REC\_TYPE is equal to '0000', the mobile station shall update the  
15       Reverse Channel Adjustment Gain Table (see [2]) containing an offset relative to  
16       the Reverse Pilot Channel power for each reverse link code channel received in  
17       this message.
  - 18       - If RPC\_ADJ\_REC\_TYPE is equal to '0001' or '0010', the mobile station shall  
19       update the Reverse Link Attribute Adjustment Gain Table (see [2]) containing  
20       an offset relative to the Reverse Pilot Channel power for each transmission rate,  
21       frame length, coding type received in this message.
  - 22       - If RPC\_ADJ\_REC\_TYPE is equal to '0011', at the action time of the message, the  
23       mobile station shall update the Reverse Link Attribute Adjustment Gain Table  
24       (see [2]) containing an offset relative to the Reverse Pilot Channel power for the  
25       R-CQICH.
  - 26       - If RPC\_ADJ\_REC\_TYPE is equal to '0100', the mobile station shall do the  
27       following:
    - 28       + At the first R-PDCH frame boundary at or after the action time of the  
29       message, the mobile station shall update the Reverse Link Attribute  
30       Adjustment Gain Table (see [2]) containing an offset relative to the Reverse  
31       Pilot Channel power for any combination of the following channels:
    - 32       o R-REQCH
    - 33       o R-SPICH
    - 34       o R-PDCCH possibly for each encoder packet size, or for the boosted  
35       and non boosted modes
    - 36       o R-PDCH possibly for each encoder packet size, or for the boosted and  
37       non boosted modes, or for each encoder packet size and  
38       transmission round

- 1           +   At the action time of the message, the mobile station shall update the
- 2           Reverse Link Attribute Adjustment Gain Table (see [2]) containing an
- 3           offset relative to the Reverse Pilot Channel power for the R-ACKCH.
  
- 4           +   If REV\_SPICH\_ADJ\_INCL<sub>r</sub> is equal to '1', the mobile station shall set
- 5           REV\_SPICH\_EP\_SIZE<sub>s</sub> to REV\_SPICH\_EP\_SIZE<sub>r</sub>+1.
  
- 6       •   The mobile station shall determine the BCMC Logical-to-Physical Mapping to be
- 7       used as follows:
- 8       -   If BCMC\_LPM\_INCL<sub>r</sub> equals '0', the mobile station shall delete the BCMC
- 9       Logical-to-Physical Mapping currently in use.
- 10       -   If BCMC\_LPM\_IND<sub>r</sub> is included and equals '01', the mobile station shall use the
- 11       BCMC Logical-to-Physical Mapping included in this Non-Negotiable Service
- 12       Configuration Record. The mobile station shall perform the following:
- 13       +   The mobile station shall delete the BCMC Logical-to-Physical Mapping
- 14       currently in use.
  
- 15       +   The mobile station shall store the BCMC Logical-to-Physical Mapping entry
- 16       for each BCMC\_FLOW\_ID (see 2.6.13.11) included in NNSCR.
  
- 17       For each i<sup>th</sup> record of the BCMC Logical-to-Physical Mapping records included in
- 18       the received Non-Negotiable Service Configuration Record:
  
- 19       +   The mobile station shall store the BCMC Logical-to-Physical Mapping
- 20       BCMC flow identifier
- 21       (BCMC\_LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[i].BCMC\_FLOW\_ID<sub>s</sub> =
- 22       ith occurrence of BCMC\_FLOW\_ID (BCMC flow identifier). See section
- 23       2.6.13.11).
  
- 24       +   The mobile station shall store the BCMC Logical-to-Physical Mapping
- 25       Physical Channel
- 26       (BCMC\_LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[i].PHYSICAL\_RESOURCE
- 27       E<sub>s</sub> = PHYSICAL\_RESOURCE<sub>r</sub>).
  
- 28       +   The mobile station shall store the BCMC Logical-to-Physical Mapping
- 29       forward mapping indicator
- 30       (BCMC\_LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[i].FORWARD\_FLAG<sub>s</sub> =
- 31       FORWARD\_FLAG<sub>r</sub>).
  
- 32       +   The mobile station shall store the BCMC Logical-to-Physical Mapping
- 33       reverse mapping indicator
- 34       (BCMC\_LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[i].REVERSE\_FLAG<sub>s</sub> =
- 35       REVERSE\_FLAG<sub>r</sub>).
  
- 36       +   The mobile station shall store the BCMC Logical-to-Physical Mapping
- 37       BSR\_ID included indicator
- 38       (BCMC\_LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[i].BSR\_ID\_INCL<sub>s</sub> =
- 39       BSR\_ID\_INCL<sub>r</sub>).

- 1           + If the BSR\_ID\_INCL<sub>r</sub> is set to '1', the mobile station shall store the following:
  - 2           o BCMC Logical-to-Physical Mapping BSR\_ID
  - 3           (BCMC\_LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[i].BSR\_ID<sub>s</sub> =
  - 4           BSR\_ID<sub>r</sub>).
- 5           + If the BSR\_ID\_INCL<sub>r</sub> is set to '0', the mobile station shall store the following:
  - 6           o BCMC Logical-to-Physical Mapping Forward Traffic Channel traffic type
  - 7           (BCMC\_LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[i].FOR\_TRAFFIC<sub>s</sub> =
  - 8           FOR\_TRAFFIC<sub>r</sub>).
  - 9           o BCMC Logical-to-Physical Mapping Reverse Traffic Channel traffic type
  - 10          (BCMC\_LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[i].REV\_TRAFFIC<sub>s</sub> =
  - 11          REV\_TRAFFIC<sub>r</sub>).
- 12          - If BCMC\_LPM\_IND<sub>r</sub> is included and equals '10', the mobile station shall use the
- 13          BCMC Logical-to-Physical Mapping currently in use.
- 14          • If a BCMC\_FLOW\_ID (See 2.6.13.11) has been omitted from the BCMC Logical-to-
- 15          Physical Mapping, the mobile station shall perform the following:
  - 16          - Layer 3 shall send a *BCMC-Monitor.Response(BCMC\_FLOW\_ID, result=FAILURE,*
  - 17          *cause= FLOW\_NOT\_AVAILABLE, reason\_ind)* to the BCMC Service Layer, where
  - 18          reason\_ind is set to CALL\_RELEASE.
  - 19          - Layer 3 shall terminate the call control instance identified by the
  - 20          BCMC\_FLOW\_ID corresponding to the omitted BCMC flow
- 21          • If a BCMC\_FLOW\_ID (See 2.6.13.11) has been added to the BCMC Logical-to-
- 22          Physical Mapping, the mobile station shall perform the following:
  - 23          - Layer 3 shall send a *BCMC-Monitor.Response(BCMC\_FLOW\_ID, result=SUCCESS)*
  - 24          to the BCMC Service Layer.
  - 25          - Layer 3 shall instantiate a call control instance and identify it by the
  - 26          BCMC\_FLOW\_ID corresponding to the this BCMC flow
- 27          • If REV\_PDCH\_PARMS\_INCL<sub>r</sub> is equal to '1', then the mobile station shall store the
- 28          following:
  - 29          - If REV\_PDCH\_PARMS\_1\_INCL<sub>r</sub> is equal to '1', the base station shall set:
    - 30          + REV\_PDCH\_MAX\_AUTO\_TPR<sub>s</sub> to REV\_PDCH\_MAX\_AUTO\_TPR<sub>r</sub>, and
    - 31          + REV\_PDCH\_NUM\_ARQ\_ROUNDS\_NORMAL<sub>s</sub> to
    - 32          REV\_PDCH\_NUM\_ARQ\_ROUNDS\_NORMAL<sub>r</sub>+1.
  - 33          - If REV\_PDCH\_OPER\_PARMS\_INCL<sub>r</sub> is equal to '1', the mobile station shall set:
    - 34          + REV\_PDCH\_MAX\_SIZE\_ALLOWED\_ENCODER\_PACKET<sub>s</sub> =
    - 35          REV\_PDCH\_MAX\_SIZE\_ALLOWED\_ENCODER\_PACKET<sub>r</sub>+1,
    - 36          + REV\_PDCH\_DEFAULT\_PERSISTENCE<sub>s</sub> =
    - 37          REV\_PDCH\_DEFAULT\_PERSISTENCE<sub>r</sub>,
    - 38          + REV\_PDCH\_RESET\_PERSISTENCE<sub>s</sub> = REV\_PDCH\_RESET\_PERSISTENCE<sub>r</sub>,

- 1           + REV\_PDCH\_GRANT\_PRECEDENCE<sub>S</sub> = REV\_PDCH\_GRANT\_PRECEDENCE<sub>T</sub>.
- 2           + REV\_PDCH\_ALWAYS\_ACK\_FINAL\_ROUND<sub>S</sub> =
- 3           REV\_PDCH\_ALWAYS\_ACK\_FINAL\_ROUND<sub>T</sub>.
- 4           + REV\_PDCH\_MSIB\_SUPPORTED<sub>S</sub> = REV\_PDCH\_MSIB\_SUPPORTED<sub>T</sub>, and
- 5           + REV\_PDCH\_SOFT\_SWITCHING\_RESET\_IND<sub>S</sub> =
- 6           REV\_PDCH\_SOFT\_SWITCHING\_RESET\_IND<sub>T</sub>.
- 7           - REV\_PDCH\_BOOST\_PARMES\_INCL<sub>S</sub> to REV\_PDCH\_BOOST\_PARMES\_INCL<sub>T</sub>.
- 8           - If REV\_PDCH\_BOOST\_PARMES\_INCL<sub>S</sub> is equal to '1', the base station shall set
- 9           REV\_PDCH\_NUM\_ARQ\_ROUNDS\_BOOST<sub>S</sub> to
- 10          REV\_PDCH\_NUM\_ARQ\_ROUNDS\_BOOST<sub>T</sub>+1, and
- 11          REV\_PDCH\_BOOST\_OVERSHOOT<sub>S</sub> to REV\_PDCH\_BOOST\_OVERSHOOT<sub>T</sub>.
- 12          - REV\_REQCH\_ENABLED<sub>S</sub> to REV\_REQCH\_ENABLED<sub>T</sub>.
- 13          - If REV\_REQCH\_ENABLED<sub>S</sub> is equal to '0', the mobile station shall set
- 14          REV\_PDCH\_REQCH\_TRIGGER<sub>S</sub> to NULL.
- 15          - If REV\_REQCH\_ENABLED<sub>S</sub> is equal to '1', the mobile station shall set
- 16          REV\_REQCH\_PARMES\_INCL<sub>S</sub> to REV\_REQCH\_PARMES\_INCL<sub>T</sub>; otherwise, the
- 17          mobile station shall set REV\_REQCH\_PARMES\_INCL<sub>S</sub> to '0'.
- 18          - If REV\_REQCH\_PARMES\_INCL<sub>S</sub> is equal to '1', the mobile station shall store the
- 19          following:
- 20           + REV\_REQCH\_QUICK\_REPEAT\_ALLOWED<sub>S</sub> to
- 21           REV\_REQCH\_QUICK\_REPEAT\_ALLOWED<sub>T</sub>.
- 22           + REV\_REQCH\_POWER\_REPORTS\_PARMES\_INCL<sub>S</sub> to
- 23           REV\_REQCH\_POWER\_REPORTS\_PARMES\_INCL<sub>T</sub>.
- 24           + If REV\_REQCH\_POWER\_REPORTS\_PARMES\_INCL<sub>S</sub> is equal to '1', the mobile
- 25           station shall store the following:
- 26           o REV\_REQCH\_POWER\_HEADROOM\_INCREASE<sub>S</sub> to
- 27           REV\_REQCH\_POWER\_HEADROOM\_INCREASE<sub>T</sub>.
- 28           o REV\_REQCH\_POWER\_HEADROOM\_DECREASE<sub>S</sub> to
- 29           REV\_REQCH\_POWER\_HEADROOM\_DECREASE<sub>T</sub>.
- 30           o REV\_REQCH\_HEADROOM\_DURATION<sub>S</sub> to
- 31           REV\_REQCH\_HEADROOM\_DURATION<sub>T</sub>.
- 32           o REV\_REQCH\_MAX\_POWER\_UPDATE\_DURATION<sub>S</sub> to
- 33           REV\_REQCH\_MAX\_POWER\_UPDATE\_DURATION<sub>T</sub>.
- 34          - REV\_PDCH\_CRC\_PARMES\_INCL<sub>S</sub> to REV\_PDCH\_CRC\_PARMES\_INCL<sub>T</sub>.
- 35          - If REV\_PDCH\_CRC\_PARMES\_INCL<sub>S</sub> is equal to '1', the mobile station shall store
- 36          the following:
- 37          + REV\_PDCH\_INIT\_TARGET\_TPR<sub>S</sub> to REV\_PDCH\_INIT\_TARGET\_TPR<sub>T</sub>.

- 1           + REV\_PDCH\_MAX\_TARGET\_TPR<sub>S</sub> to REV\_PDCH\_MAX\_TARGET\_TPR<sub>R</sub>.
- 2           + REV\_PDCH\_QUICK\_START\_THRESH<sub>S</sub> to
- 3           REV\_PDCH\_QUICK\_START\_THRESH<sub>R</sub>.
- 4           + The mobile station shall set ( $k = 0$ ).
- 5           + For  $i = 1$  to  $(11 \times (\text{REV\_PDCH\_EP\_MAP\_LEN}_R + 1))$ , if
- 6           REV\_PDCH\_EP\_MAP<sub>R</sub>[ $i$ ]=1, the mobile station shall set:
- 7
  - o ( $k = k+1$ ),
  - 8           o REV\_PDCH\_STEP\_UP<sub>S</sub>[ $i$ ] to (the  $k^{\text{th}}$  occurrence of
  - 9           REV\_PDCH\_STEP\_UP<sub>R</sub>)/32, and
  - 10           o REV\_PDCH\_STEP\_DOWN<sub>S</sub>[ $i$ ] to (the  $k^{\text{th}}$  occurrence of
  - 11           REV\_PDCH\_STEP\_UP<sub>R</sub>)/32.
- 12          - The mobile station shall set ( $k = 0$ ).
- 13          - For  $i = 0$  to 6, the mobile station shall perform the following:
- 14           + If REV\_PDCH\_SR\_ID\_MAP<sub>R</sub>[ $i$ ]=0, the mobile station shall set
- 15
  - o REV\_PDCH\_BOOST\_ALLOWED<sub>S</sub>[ $i$ ] to NULL , and
  - 16           o REV\_PDCH\_AUTO\_ALLOWED<sub>S</sub>[ $i$ ] to NULL
- 17           + Otherwise, the mobile station shall perform the following:
- 18
  - o The mobile station shall set ( $k = k+1$ )
  - 19           o REV\_PDCH\_BOOST\_ALLOWED<sub>S</sub>[ $i$ ] to the  $k^{\text{th}}$  occurrence of
  - 20           REV\_PDCH\_BOOST\_ALLOWED<sub>R</sub>, and
  - 21           o REV\_PDCH\_AUTO\_ALLOWED<sub>S</sub>[ $i$ ] to the  $k^{\text{th}}$  occurrence of
  - 22           REV\_PDCH\_AUTO\_ALLOWED<sub>R</sub>
- 23          - If REV\_REQCH\_PARMS\_INCL<sub>S</sub> is equal to '1', for  $i = 0$  to 6, if
- 24          REV\_PDCH\_SR\_ID\_MAP<sub>R</sub>[ $i$ ]= '0', the mobile station shall set:
- 25           + REV\_REQCH\_USE\_DEFAULT\_TAB<sub>S</sub>[ $i$ ] to NULL,
- 26           + REV\_PDCH\_BUFFER\_SIZE<sub>S</sub>[ $i$ ] to NULL,
- 27           + REV\_REQCH\_BUF\_QUANT\_PARM\_1<sub>S</sub>[ $i$ ] to NULL,
- 28           + REV\_REQCH\_BUF\_QUANT\_PARM\_2<sub>S</sub>[ $i$ ] to NULL,
- 29           + REV\_PDCH\_REQCH\_TRIGGER<sub>S</sub>[ $i$ ].REV\_REQCH\_MIN\_DURATION to NULL,
- 30           + REV\_PDCH\_REQCH\_TRIGGER<sub>S</sub>[ $i$ ]. REV\_REQCH\_USE\_POWER\_REPORTS to
- 31           NULL,
- 32           + REV\_PDCH\_REQCH\_TRIGGER<sub>S</sub>[ $i$ ].REV\_REQCH\_USE\_BUFFER\_REPORTS to
- 33           NULL,

- 1           + REV\_PDCH\_REQCH\_TRIGGER<sub>S</sub>[i].REV\_REQCH\_USE\_WATERMARKS to
- 2           NULL,
- 3       - The mobile station shall set (k = 0).
- 4       - If REV\_REQCH\_PARMS\_INCL<sub>S</sub> is equal to '1', the mobile station shall perform
- 5       the following:
- 6           + For i = 0 to 7, if either of the following conditions is true:
- 7               o i < 7, and REV\_PDCH\_SR\_ID\_MAP[i]='1', or
- 8               o i=7,
- 9           the mobile station shall perform the following:
- 10           o The mobile station shall set (k = k+1).
- 11           o The mobile station shall set
- 12               REV\_PDCH\_REQCH\_TRIGGER<sub>S</sub>[i].REV\_REQCH\_MIN\_DURATION to
- 13               REV\_REQCH\_MIN\_DURATION<sub>r</sub> × 16, using the k<sup>th</sup> occurrence of
- 14               REV\_REQCH\_MIN\_DURATION<sub>r</sub>;
- 15           o The mobile station shall set REV\_PDCH\_REQCH\_TRIGGER<sub>S</sub>[i].
- 16               REV\_REQCH\_USE\_POWER\_REPORTS to the k<sup>th</sup> occurrence of
- 17               REV\_REQCH\_USE\_POWER\_REPORTS<sub>r</sub>;
- 18           o The mobile station shall set
- 19               REV\_PDCH\_REQCH\_TRIGGER<sub>S</sub>[i].REV\_REQCH\_USE\_BUFFER\_REPORT
- 20               S to the k<sup>th</sup> occurrence of REV\_REQCH\_USE\_BUFFER\_REPORTS<sub>r</sub>;
- 21           o The mobile station shall set
- 22               REV\_PDCH\_REQCH\_TRIGGER<sub>S</sub>[i].REV\_REQCH\_USE\_WATERMARKS to
- 23               the k<sup>th</sup> occurrence of REV\_REQCH\_USE\_WATERMARKS<sub>r</sub>;
- 24           o If any of the following conditions are true,
- 25               ◇ REV\_PDCH\_REQCH\_TRIGGER<sub>S</sub>[i].
- 26               REV\_REQCH\_USE\_BUFFER\_REPORTS is equal to '1'.
- 27               ◇ REV\_PDCH\_REQCH\_TRIGGER<sub>S</sub>[i].
- 28               REV\_REQCH\_USE\_POWER\_REPORTS is equal to '1'.
- 29               ◇ REV\_PDCH\_REQCH\_TRIGGER<sub>S</sub>[i].REV\_REQCH\_USE\_WATERMARKS
- 30               is equal to '1'.
- 31               ◇ REV\_PDCH\_REQCH\_TRIGGER<sub>S</sub>[i].REV\_REQCH\_USE\_WATERMARKS
- 32               is equal to '1'.
- 33           The mobile station shall perform the following:

- 1                   ◇ The mobile station shall set REV\_REQCH\_USE\_DEFAULT\_TAB<sub>S</sub>[i] to  
2                   the k<sup>th</sup> occurrence of REV\_REQCH\_USE\_DEFAULT\_TAB<sub>R</sub>.
- 3                   ◇ If REV\_REQCH\_USE\_DEFAULT\_TAB<sub>S</sub>[i] is equal to '000', then, for j =  
4                   1 to 13, the mobile station shall set REV\_PDCH\_BUFFER\_SIZE<sub>S</sub>[i][j]  
5                   to  
6                    $2 \times \text{REV\_REQCH\_BUF\_QUANT\_PARAM\_1}_R \times j^2 +$   
7                    $\text{REV\_REQCH\_BUF\_QUANT\_PARAM\_2}_R \times j$ ,  
8                   using the k<sup>th</sup> occurrences of REV\_REQCH\_BUF\_QUANT\_PARAM\_1<sub>R</sub>,  
9                   and REV\_REQCH\_BUF\_QUANT\_PARAM\_2<sub>R</sub>.
- 10                  ◇ If REV\_REQCH\_USE\_DEFAULT\_TAB<sub>S</sub>[i] is not equal to '000', then,  
11                  for j = 1 to 13, the mobile station shall set  
12                  REV\_PDCH\_BUFFER\_SIZE<sub>S</sub>[i][j] to the buffer size value specified in  
13                  the j<sup>th</sup> row of the buffer size table corresponding to  
14                  REV\_REQCH\_USE\_DEFAULT\_TAB<sub>S</sub>[i].
- 15                  ○ If REV\_PDCH\_REQCH\_TRIGGER<sub>S</sub>[i].REV\_REQCH\_USE\_WATERMARKS  
16                  is equal to '1', the mobile station shall store the following:
- 17                  ◇ REV\_PDCH\_REQCH\_TRIGGER<sub>S</sub>[i].  
18                  REV\_REQCH\_HIGH\_WATERMARK to  
19                  REV\_REQCH\_HIGH\_WATERMARK\_1<sub>R</sub> ×  
20                   $8^{\text{REV\_REQCH\_HIGH\_WATERMARK\_2}_R}$ , using the k<sup>th</sup> occurrences of  
21                  REV\_REQCH\_HIGH\_WATERMARK\_1<sub>R</sub> and  
22                  REV\_REQCH\_HIGH\_WATERMARK\_2<sub>R</sub>.
- 23                  ◇ REV\_PDCH\_REQCH\_TRIGGER<sub>S</sub>[i].REV\_REQCH\_LOW\_WATERMARK  
24                  to REV\_REQCH\_LOW\_WATERMARK\_1<sub>R</sub> ×  
25                   $8^{\text{REV\_REQCH\_LOW\_WATERMARK\_2}_R}$ , using the k<sup>th</sup> occurrences of  
26                  REV\_REQCH\_LOW\_WATERMARK\_1<sub>R</sub> and  
27                  REV\_REQCH\_LOW\_WATERMARK\_2<sub>R</sub>.
- 28                  ◇ REV\_PDCH\_REQCH\_TRIGGER<sub>S</sub>[i].REV\_REQCH\_CEILING to  
29                  REV\_REQCH\_CEILING\_1<sub>R</sub> ×  $8^{\text{REV\_REQCH\_CEILING\_2}_R}$ ,  
30                  using the k<sup>th</sup> occurrences of REV\_REQCH\_CEILING\_1<sub>R</sub> and  
31                  REV\_REQCH\_CEILING\_2<sub>R</sub>.
- 32                  ◇ REV\_PDCH\_REQCH\_TRIGGER<sub>S</sub>[i].REV\_REQCH\_FLOOR<sub>S</sub>[i] to  
33                  REV\_REQCH\_FLOOR\_1<sub>R</sub> ×  $8^{\text{REV\_REQCH\_FLOOR\_2}_R}$ ,  
34                  using the k<sup>th</sup> occurrences of REV\_REQCH\_FLOOR\_1<sub>R</sub>, and  
35                  REV\_REQCH\_FLOOR\_2<sub>R</sub>.

#### 36 2.6.4.1.14 Processing the Security Mode Command Message

37 The mobile station shall process the received *Security Mode Command Message* as follows:

- 38                  • The mobile station shall set D\_SIG\_ENCRYPT\_MODE<sub>S</sub> to D\_SIG\_ENCRYPT\_MODE<sub>R</sub>.
- 39                  • If MSG\_INTEGRITY\_SUP is set to '0', the mobile station shall perform the following:

- 1       – If  $D\_SIG\_ENCRYPT\_MODE_r$  is not equal to '000', the mobile station shall
- 2       perform the following:
- 3       + Set  $ENCRYPT\_MODE_s$  to '11'
- 4       + Form a 128-bit pattern by concatenating the CMEAKEY with a copy of itself
- 5       (the CMEAKEY is associated with the AUTHR of the *Origination Message* or
- 6       *Page Response Message*, or the CMEAKEY associated with the AUTHU
- 7       generated during Unique Challenge-Response procedure as described in
- 8       2.3.12.1.4).
- 9       + Set  $ENC\_KEY[KEY\_ID]$  to the 128-bit pattern.
- 10      + Set  $TX\_EXT\_SSEQ[0][KEY\_ID]$ ,  $TX\_EXT\_SSEQ[1][KEY\_ID]$ ,
- 11       $RX\_EXT\_SSEQ[0][KEY\_ID]$ , and  $RX\_EXT\_SSEQ[1][KEY\_ID]$  to  $1 + 256 \times$
- 12       $NEW\_SSEQ\_H$  if either of the following conditions is true:
  - 13       o The  $NEW\_SSEQ\_H$  field is included in the last *Origination Message* or
  - 14       *Page Response Message* and  $TX\_EXT\_SSEQ[0][KEY\_ID]$  and
  - 15        $TX\_EXT\_SSEQ[1][KEY\_ID]$  have not been initialized by the last *Channel*
  - 16       *Assignment Message*, *Extended Channel Assignment Message*, or an
  - 17       earlier f-dsch *Security Mode Command Message* (see 2.3.12.4.1.3).
  - 18       o This message is a response to a *Security Mode Request Message* (see
  - 19       2.3.12.4.1.3) that includes an  $NEW\_SSEQ\_H$  field.
- 20      • If  $MSG\_INTEGRITY\_SUP$  is set to '1' and  $CHANGE\_KEYS_r$  is set to '1', the mobile
- 21      station shall perform the following:
  - 22       – Set  $KEY\_ID$  to  $SDU\_KEY\_ID$  provided by the LAC Layer (see [4]).
  - 23       – Set  $ENCRYPT\_MODE_s$  to '11'.
  - 24       – If  $KEY\_ID$  is equal to '00' or '01', the mobile station shall perform the following:
    - 25           + Set  $TX\_EXT\_SSEQ[0][KEY\_ID]$ ,  $TX\_EXT\_SSEQ[1][KEY\_ID]$ ,
    - 26            $RX\_EXT\_SSEQ[0][KEY\_ID]$ , and  $RX\_EXT\_SSEQ[1][KEY\_ID]$  to  $1 + 256 \times$
    - 27            $NEW\_SSEQ\_H$  included in the *Origination Message*, *Page Response*
    - 28           *Message*, or *Security Mode Request Message*).
    - 29           + Form a 128-bit pattern by concatenating the CMEAKEY with a copy of itself
    - 30           (the CMEAKEY is associated with the AUTHR of the *Origination Message* or
    - 31           *Page Response Message*, or the CMEAKEY associated with the AUTHU
    - 32           generated during the Unique Challenge-Response procedure as described in
    - 33           2.3.12.1.4).
    - 34           + Set  $ENC\_KEY[KEY\_ID]$  to the 128-bit pattern.
    - 35           + Set  $INT\_KEY[KEY\_ID]$  to the 128-bit pattern.
    - 36           + Set  $LAST\_2G\_KEY\_ID_s$  to  $KEY\_ID$ .
    - 37       – If  $KEY\_ID$  is equal to '10' or '11', the mobile station shall perform the following:

- 1           + Set TX\_EXT\_SSEQ[0][KEY\_ID][0], TX\_EXT\_SSEQ[1][KEY\_ID],  
2           RX\_EXT\_SSEQ[0][KEY\_ID][0], and RX\_EXT\_SSEQ[1][KEY\_ID] to  $1 + 256 \times$   
3           NEW\_SSEQ\_H included in the *Authentication Response Message* or *Security*  
4           *Mode Request Message*.
- 5           + Set ENC\_KEY[KEY\_ID] to the latest CK generated by AKA.
- 6           + Set INT\_KEY[KEY\_ID] to the latest IK generated by AKA.
- 7           + Set LAST\_3G\_KEY\_IDS to KEY\_ID.
- 8           + If the mobile station supports R-UIM, then the mobile shall set USE\_UAK<sub>S</sub>  
9           to USE\_UAK<sub>R</sub>; otherwise, the mobile station shall perform the following:
  - 10           o Set USE\_UAK<sub>S</sub> to '0'.
  - 11           o If USE\_UAK<sub>R</sub> is equal to '1', then the mobile station shall send a *Mobile*  
12           *Station Reject Order* with ORDQ equal to '00010100' (UAK not  
13           supported).
- 14          – Send a *Security Mode Completion Order*.
- 15          • For each of the service option connections specified by the CON\_REF field included  
16          in this message, the mobile station shall set the user information encryption mode  
17          in the corresponding service option connection record (SO\_CON\_REC<sub>S</sub>[i]) to  
18          UI\_ENCRYPT\_MODE<sub>R</sub> (i.e., set SO\_CON\_REC<sub>S</sub>[i].UI\_ENCRYPT\_MODE to  
19          UI\_ENCRYPT\_MODE<sub>R</sub> where SO\_CON\_REC<sub>S</sub>[i].CON\_REF = CON\_REF<sub>R</sub>).
- 20          • For each of the service option connections specified by the CON\_REF field included  
21          in this message, at the action time of the message the mobile station shall start  
22          encrypting user information (e.g., voice and data) using the encryption algorithm  
23          specified by SO\_CON\_REC<sub>S</sub>[i].UI\_ENCRYPT\_MODE where  
24          SO\_CON\_REC<sub>S</sub>[i].CON\_REF = CON\_REF<sub>R</sub> (see Table 3.7.4.5-1).
- 25          • If ENC\_KEY\_SIZE<sub>R</sub> is included, the mobile station shall set ENC\_KEY\_SIZE<sub>S</sub> to  
26          ENC\_KEY\_SIZE<sub>R</sub>.
- 27          • If ENC\_KEY\_SIZE<sub>R</sub> is included and not set to reserved value and if current key  
28          strength is greater than the desired key strength specified by ENC\_KEY\_SIZE<sub>R</sub>  
29          according to table 3.7.4.5-2, mobile station shall perform the key strength  
30          reduction algorithm procedures to reduce the key strength of ENC\_KEY[KEY\_ID]  
31          according to ENC\_KEY\_SIZE<sub>R</sub> as described in 2.3.12.5.4. The current key strength  
32          is 64 bit if KEY\_ID is equal to '00' or '01' and is 128 bit if KEY\_ID is equal to '10' or  
33          '11'.
- 34          • If C\_SIG\_ENCRYPT\_MODE is included, the mobile station shall set  
35          C\_SIG\_ENCRYPT\_MODE<sub>S</sub> to C\_SIG\_ENCRYPT\_MODE<sub>R</sub>.

#### 36 2.6.4.1.15 Processing the Handoff Supplementary Information Solicit Message

37 If the mobile station receives a *Handoff Supplementary Information Solicit Message* from the  
38 base station, it shall transmit a *Handoff Supplementary Information Notification Message* to  
39 the base station. If the supplementary information for a pilot requested in the *Handoff*  
40 *Supplementary Information Solicit Message* is available, then the mobile station should

1 include the supplementary information for this pilot.

## 2 2.6.4.2 Traffic Channel Initialization Substate

3 In this substate, the mobile station verifies that it can receive the Forward Traffic Channel  
4 and begins transmitting on the Reverse Traffic Channel.

5 If this substate is entered from the *Traffic Channel Substate* of the *Mobile Station Control* on  
6 the *Traffic Channel State* with an Initialization Failure indication, the mobile station shall  
7 perform the procedures as specified in 2.6.4.2.1, and shall not perform any of the  
8 remaining procedures in this section.

9 Otherwise, upon entering the *Traffic Channel Initialization Substate*, the mobile station  
10 shall perform the following:

- 11 • The mobile station shall perform registration initialization as specified in  
12 2.6.5.5.4.1.
- 13 • Layer 3 shall send an L2-Supervision.Request primitive to Layer 2 to reset the  
14 acknowledgment procedures as specified in [4].
- 15 • The mobile station shall initialize Forward Traffic Channel power control as  
16 specified in 2.6.4.1.1.1.
- 17 • The mobile station shall initialize the list TAG\_OUTSTANDING\_LIST to be empty.
- 18 • If P\_REV\_IN\_USE<sub>S</sub> is less than seven, the mobile station shall set CS\_SUPPORTED<sub>S</sub>  
19 to '0'.
- 20 • If P\_REV\_IN\_USE<sub>S</sub> is less than nine, the mobile station shall set  
21 FOR\_PDCH\_SUPPORTED<sub>S</sub> to '0'.
- 22 • The mobile station shall set USE\_ERAM<sub>S</sub> to '0'.
- 23 • The mobile station shall set the following variables to their initial default values  
24 given below:
  - 25 – If the mobile station had included the FOR\_PDCH Capability Type-specific fields  
26 in the *Origination Message* or *Page Response Message*, the mobile station shall  
27 store one plus the value included in the ACK\_DELAY field of the message as  
28 ACK\_DELAY and the value included in the NUM\_ARQ\_CHAN field of the  
29 message as NUM\_ARQ\_CHAN.
  - 30 – Default power control step size  
31 (PWR\_CNTL\_STEP<sub>S</sub> = '000')
  - 32 – Default Reverse Supplemental Channel power offset adjustment relative to  
33 Reverse Pilot Channel power
    - 34 + RL\_GAIN\_SCH\_PILOT<sub>S</sub> [0] = '000000'
    - 35 + RL\_GAIN\_SCH\_PILOT<sub>S</sub> [1] = '000000'
  - 36 – Default Reverse Discontinuous Transmission Duration on Reverse  
37 Supplemental Code Channel (REV\_DTX\_DURATION<sub>S</sub> = '0000')

- 1       – Default Reverse Discontinuous Transmission Duration on Reverse  
2       Supplemental Channel (REV\_SCH\_DTX\_DURATION<sub>S</sub> = '0000')
- 3       – Default channel on which the mobile station is to perform the primary inner  
4       loop estimation and the base station is to multiplex the Power Control  
5       Subchannel:
  - 6       + If CH\_IND<sub>S</sub> is equal to '01' or if EXT\_CH\_IND<sub>S</sub> indicates that F-FCH is  
7       assigned and F-DCCH is not assigned, the mobile station shall set  
8       FPC\_PRI\_CHAN<sub>S</sub> to '0'.
  - 9       + If CH\_IND<sub>S</sub> is equal to '10' or if EXT\_CH\_IND<sub>S</sub> indicates that F-DCCH is  
10      assigned and F-FCH is not assigned, the mobile station shall set  
11      FPC\_PRI\_CHAN<sub>S</sub> to '1'.
  - 12     + If EXT\_CH\_IND<sub>S</sub> indicates that neither F-FCH nor F-DCCH is assigned, the  
13     mobile station shall set FPC\_PRI\_CHAN<sub>S</sub> to NULL.
- 14      – Default forward power control operation mode used except during the forward  
15      Supplemental Channel interval  
16      (FPC\_MODE\_NO\_SCH<sub>S</sub> = '000')
- 17      – Default forward power control operation mode used during the forward  
18      Supplemental Channel interval  
19      (FPC\_MODE\_SCH<sub>S</sub> = '000')
- 20      – Default forward power control operation mode  
21      (FPC\_MODE<sub>S</sub> = '000')
- 22      – Slotted timer (T\_SLOTTED<sub>S</sub> = T<sub>74m</sub>)
- 23      – Reduced slot cycle mode enabled indicator (RSC\_MODE\_ENABLED = NO).
- 24      – Radio environment reporting mode enabled indicator (RER\_MODE\_ENABLED =  
25      NO).
- 26      – Tracking zone mode enabled indicator (TKZ\_MODE\_ENABLED = NO).
- 27      – Tracking zone mode pending indicator (TKZ\_MODE\_PENDING = NO).
- 28      – Default Reverse Pilot Channel gating (PILOT\_GATING\_USE\_RATE='0')
- 29      – Default begin preamble for Reverse Supplemental Code Channels  
30      (BEGIN\_PREAMBLE<sub>S</sub> = '000')
- 31      – Default resume preamble for Reverse Supplemental Code Channels  
32      (RESUME\_PREAMBLE<sub>S</sub> = '000')
- 33      – Default start time for Reverse Supplemental Code Channel assignment  
34      (REV\_START\_TIME<sub>S</sub> = NULL)
- 35      – Default retry delays:
  - 36      + RETRY\_DELAY<sub>S</sub>[010] = 0
  - 37      + RETRY\_DELAY<sub>S</sub>[011] = 0

- 1        – Default neighbor pilot strength measurement threshold offset  
2        ( $T\_MULCHAN_S = '000'$ )
- 3        – Default start time for forward Supplemental Code Channel Assignment  
4        ( $FOR\_START\_TIME_S = NULL$ )
- 5        – Default number of Reverse Supplemental Code Channels  
6        ( $NUM\_REV\_CODES_S = '000'$ )
- 7        – Default reverse use  $T\_ADD$  abort indicator  
8        ( $USE\_T\_ADD\_ABORT_S = '0'$ )
- 9        – Default *Supplemental Channel Request Message* sequence number  
10       ( $SCRM\_SEQ\_NUM_S = NULL$ )
- 11       – Default indicator to ignore reverse Supplemental Code Channel assignment  
12       ( $IGNORE\_SCAM_S = '0'$ )
- 13       – Default indicator to ignore reverse Supplemental Channel assignment  
14       ( $IGNORE\_ESCAM_S = '0'$ )
- 15       – Default search period for the candidate search  
16       ( $SEARCH\_PERIOD_S = '1111'$ )
- 17       – Default search window size for the Candidate Frequency Search Set  
18       ( $CF\_SRCH\_WIN\_N_S = SRCH\_WIN\_N_S$ )
- 19       – Default search window size for the Remaining Set on the CDMA Candidate  
20       Frequency ( $CF\_SRCH\_WIN\_R_S = SRCH\_WIN\_R_S$ )
- 21       – Default pilot PN sequence offset increment for the CDMA Candidate Frequency  
22       ( $CF\_PILOT\_INC_S = PILOT\_INC_S$ )
- 23       – Default Candidate Frequency search priorities included indicator  
24       ( $CF\_SEARCH\_PRIORITY\_INCL_S = '0'$ )
- 25       – Default Candidate Frequency search window size included indicator  
26       ( $CF\_SRCH\_WIN\_NGHBR\_INCL_S = '0'$ )
- 27       – Default Candidate Frequency search window offset included indicator  
28       ( $CF\_SRCH\_OFFSET\_INCL_S = '0'$ )
- 29       – Default periodic search indicator  
30       ( $PERIODIC\_SEARCH_S = '0'$ )
- 31       – Default return-if-handoff-fail indicator  
32       ( $RETURN\_IF\_HANDOFF\_FAIL_S = '0'$ )
- 33       – Default total pilot  $E_c/I_0$  threshold  
34       ( $MIN\_TOTAL\_PILOT\_EC\_IO_S = '00000'$ )
- 35       – Default total pilot  $E_c$  threshold  
36       ( $SF\_TOTAL\_EC\_THRESH_S = '11111'$ )
- 37       – Default total pilot  $E_c/I_0$  threshold  
38       ( $SF\_TOTAL\_EC\_IO\_THRESH_S = '11111'$ )

- 1           – Default received power difference threshold
- 2           (DIFF\_RX\_PWR\_THRESH<sub>S</sub> = '00000')
- 3           – Default maximum wait time on the CDMA Target Frequency
- 4           (TF\_WAIT\_TIME<sub>S</sub> = '1111')
- 5           – Default Candidate Frequency Search Set
- 6           (Candidate Frequency Search Set is empty)
- 7           – Default Candidate Frequency CDMA band
- 8           (CF\_CDMABAND<sub>S</sub> = NULL)
- 9           – Default Candidate Frequency CDMA channel
- 10          (CF\_CDMACH<sub>S</sub> = NULL)
- 11          – Default indicator for 5ms frames on Fundamental Channel
- 12          (FCH\_5MS\_FRAMES<sub>S</sub> = '0')
- 13          – Default indicator for 5ms frames on Dedicated Control Channel
- 14          (DCCH\_5MS\_FRAMES<sub>S</sub> = '0')
- 15          – Default start time unit for Supplemental Channel
- 16          (START\_TIME\_UNIT<sub>S</sub> = '000')
- 17          – Default Forward Supplemental Channel FER report indicator
- 18          (FOR\_SCH\_FER\_REP<sub>S</sub> = '0')
- 19          – Default Forward Supplemental Channel Configuration parameters:
- 20           + Set the Forward Supplemental Channel frame length
- 21           FOR\_SCH\_FRAME\_LENGTH<sub>S</sub>[0] to NULL.
- 22           + Set the Forward Supplemental Channel Multiplex Option
- 23           FOR\_SCH\_MUX<sub>S</sub>[0] to NULL.
- 24           + Set the Forward Supplemental Channel Radio Configuration
- 25           FOR\_SCH\_RC<sub>S</sub>[0] to NULL.
- 26           + Set the Forward Supplemental Channel Coding Type FOR\_SCH\_CODING<sub>S</sub>[0]
- 27           to NULL.
- 28           + Set QOF\_IDS[0][SCCL\_INDEX<sub>S</sub>][i] to NULL, for all integer values of i from 0
- 29           to 15.
- 30           + Set FOR\_SCH\_CC\_INDEX<sub>S</sub> [0][SCCL\_INDEX<sub>S</sub>][i] to NULL, for all integer
- 31           values of i from 0 to 15.
- 32           + Set the Forward Supplemental Channel frame length
- 33           FOR\_SCH\_FRAME\_LENGTH<sub>S</sub>[1] to NULL.
- 34           + Set the Forward Supplemental Channel Multiplex Option
- 35           FOR\_SCH\_MUX<sub>S</sub>[1] to NULL.
- 36           + Set the Forward Supplemental Channel Radio Configuration
- 37           FOR\_SCH\_RC<sub>S</sub>[1] to NULL.

- 1           + Set the Forward Supplemental Channel Coding Type FOR\_SCH\_CODING<sub>S</sub>[1]
- 2           to NULL.
- 3           + Set QOF\_IDS[1][SCCL\_INDEX<sub>S</sub>][i] to NULL, for all integer values of i from 0
- 4           to 15.
- 5           + Set FOR\_SCH\_CC\_INDEX<sub>S</sub> [1][SCCL\_INDEX<sub>S</sub>][i] to NULL, for all integer
- 6           values of i from 0 to 15.
- 7        - Call Origination Transaction Identifier
- 8        (TAG<sub>S</sub> = '0000').
- 9        - Default Reverse Supplemental Channel Configuration parameters:
- 10       + REV\_WALSH\_IDS[0][0000] = 1
- 11       + REV\_WALSH\_IDS[0][0001] = 1
- 12       + REV\_WALSH\_IDS[0][0010] = 1
- 13       + REV\_WALSH\_IDS[0][0011] = 1
- 14       + REV\_WALSH\_IDS[0][0100] = 0
- 15       + REV\_WALSH\_IDS[0][0101] = 0
- 16       + REV\_WALSH\_IDS[0][0110] = 0
- 17       + REV\_WALSH\_IDS[1][0000] = 1
- 18       + REV\_WALSH\_IDS[1][0001] = 1
- 19       + REV\_WALSH\_IDS[1][0010] = 1
- 20       + REV\_WALSH\_IDS[1][0011] = 0
- 21       + REV\_WALSH\_IDS[1][0100] = 0
- 22       + REV\_WALSH\_IDS[1][0101] = 0
- 23       + REV\_WALSH\_IDS[1][0110] = 0
- 24       + Set the Reverse Supplemental Channel frame length
- 25       REV\_SCH\_FRAME\_LENGTH<sub>S</sub>[0] to NULL.
- 26       + Set the Reverse Supplemental Channel Multiplex Option REV\_SCH\_MUX<sub>S</sub>[0]
- 27       to NULL.
- 28       + Set the Reverse Supplemental Channel Radio Configuration
- 29       REV\_SCH\_RC<sub>S</sub>[0] to NULL.
- 30       + Set the Reverse Supplemental Channel Coding Type REV\_SCH\_CODING<sub>S</sub>[0]
- 31       to NULL.
- 32       + Set the Reverse Supplemental Channel frame length
- 33       REV\_SCH\_FRAME\_LENGTH<sub>S</sub>[1] to NULL.
- 34       + Set the Reverse Supplemental Channel Multiplex Option REV\_SCH\_MUX<sub>S</sub>[1]
- 35       to NULL.

- 1           + Set the Reverse Supplemental Channel Radio Configuration  
2           REV\_SCH\_RC<sub>S</sub>[1] to NULL.
- 3           + Set the Reverse Supplemental Channel Coding Type REV\_SCH\_CODING<sub>S</sub>[1]  
4           to NULL.
- 5           • If P\_REV\_IN\_USE<sub>S</sub> is greater than six and the ASSIGN\_MODE<sub>R</sub> field of the *Channel*  
6           *Assignment Message* or *Extended Channel Assignment Message* is equal to '000' or  
7           '100', then the mobile station shall initialize the logical to physical mapping table  
8           (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE) according to the requirements in Table  
9           2.6.4.2-1:

**Table 2.6.4.2-1. Default Logical to Physical Mapping Table, ASSIGN\_MODE<sub>R</sub> equal to '000' or '100'**

SR_ID	LOGICAL_ RESOURCE	PHYSICAL_ RESOURCE	FORWARD_ FLAG	REVERSE_ FLAG	PRIORITY
000	0001	(shall be set according to requirement 2)	1	1	0000
(shall be set according to requirement 1)	0000	(shall be set according to requirement 3)	1	1	0000

Where requirement 1 is as follows:

- + The SR\_ID field shall be set to NULL.

Requirement 2 is as follows:

- + If CH\_IND<sub>S</sub> is equal to '01', the PHYSICAL\_RESOURCE field shall be set to '0000'.
- + If CH\_IND<sub>S</sub> is equal to '10', the PHYSICAL\_RESOURCE field shall be set to '0001'.
- + If CH\_IND<sub>S</sub> is equal to '11', there shall be two entries in the default LPM table where the PHYSICAL\_RESOURCE field shall be set to '0000' and '0001' respectively.

Requirement 3 is as follows:

- 1           + If CH\_IND<sub>S</sub> is equal to '01':
- 2           o If the Radio Configuration in use is less than three, the
- 3           PHYSICAL\_RESOURCE field shall be set to '0000'; otherwise, there shall
- 4           be three entries in the default LPM table where the
- 5           PHYSICAL\_RESOURCE field shall be set to '0000', '0010', and '0011'
- 6           respectively.
- 7           + If CH\_IND<sub>S</sub> is equal to '10':
- 8           o There shall be three entries in the default LPM table where the
- 9           PHYSICAL\_RESOURCE field shall be set to '0001', '0010', and '0011'
- 10          respectively.
- 11          + If CH\_IND<sub>S</sub> is equal to '11':
- 12          o There shall be four entries in the default LPM table where the
- 13          PHYSICAL\_RESOURCE field shall be set to '0000', '0001', '0010', and
- 14          '0011' respectively.
- 15          • If the ASSIGN\_MODE<sub>r</sub> field of the *Extended Channel Assignment Message* is equal
- 16          to '101', then the mobile station shall initialize the logical to physical mapping table
- 17          (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE) according to the requirements in Table
- 18          2.6.4.2-2:

19          **Table 2.6.4.2-2. Default Logical to Physical Mapping Table, ASSIGN\_MODE<sub>r</sub> equal to**  
 20          **'101'**

SR_ID	LOGICAL_ RESOURCE	PHYSICAL_ RESOURCE	FORWARD_ FLAG	REVERSE_ FLAG	PRIORIT Y
000	0001	(shall be set according to requirement 2)	(shall be set according to requirement 2)	(shall be set according to requirement 2)	0000
(shall be set according to requirement 1)	0000	(shall be set according to requirement 3)	(shall be set according to requirement 3)	(shall be set according to requirement 3)	0000

21          Where requirement 1 is as follows:

- 22          + The SR\_ID field shall be set to NULL.

23          Requirement 2 is as follows:

- 24          + If EXT\_CH\_IND<sub>S</sub> is equal to '00001', then there shall be two entries in the
- 25          default LPM table where the mobile station shall set:

- 1           o PHYSICAL\_RESOURCE to '0100', FORWARD\_FLAG to '1', and
- 2           REVERSE\_FLAG to '0' for the first entry, and
- 3           o PHYSICAL\_RESOURCE to '0000', FORWARD\_FLAG to '0', and
- 4           REVERSE\_FLAG to '1' for the second entry.
- 5       + If EXT\_CH\_IND<sub>S</sub> is equal to '00010', then there shall be two entries in the
- 6       default LPM table where the mobile station shall set:
- 7           o PHYSICAL\_RESOURCE to '0100', FORWARD\_FLAG to '1', and
- 8           REVERSE\_FLAG to '0' for the first entry, and
- 9           o PHYSICAL\_RESOURCE to '0001', FORWARD\_FLAG to '0', and
- 10          REVERSE\_FLAG to '1' for the second entry.
- 11       + If EXT\_CH\_IND<sub>S</sub> is equal to '00011', then the mobile station shall set
- 12       PHYSICAL\_RESOURCE to '0000', FORWARD\_FLAG to '1', and
- 13       REVERSE\_FLAG to '1'.
- 14       + If EXT\_CH\_IND<sub>S</sub> is equal to '00100', then the mobile station shall set
- 15       PHYSICAL\_RESOURCE to '0001', FORWARD\_FLAG to '1', and
- 16       REVERSE\_FLAG to '1'.
- 17       + If EXT\_CH\_IND<sub>S</sub> is equal to '00101', then there shall be two entries in the
- 18       default LPM table where the mobile station shall set:
- 19           o PHYSICAL\_RESOURCE to '0000', FORWARD\_FLAG to '1', and
- 20           REVERSE\_FLAG to '1' for the first entry, and
- 21           o PHYSICAL\_RESOURCE to '0001', FORWARD\_FLAG to '0', and
- 22           REVERSE\_FLAG to '1' for the second entry.
- 23       + If EXT\_CH\_IND<sub>S</sub> is equal to '00110', then there shall be two entries in the
- 24       default LPM table where the mobile station shall set:
- 25           o PHYSICAL\_RESOURCE to '0000', FORWARD\_FLAG to '1', and
- 26           REVERSE\_FLAG to '1' for the first entry, and
- 27           o PHYSICAL\_RESOURCE to '0001', FORWARD\_FLAG to '1', and
- 28           REVERSE\_FLAG to '1' for the second entry.
- 29       + If EXT\_CH\_IND<sub>S</sub> is equal to '01000', then the mobile station shall set
- 30       PHYSICAL\_RESOURCE to '0100', FORWARD\_FLAG to '1', and
- 31       REVERSE\_FLAG to '1'.
- 32       + If EXT\_CH\_IND<sub>S</sub> is equal to '01001', then there shall be two entries in the
- 33       default LPM table where the mobile station shall set:
- 34           o PHYSICAL\_RESOURCE to '0100', FORWARD\_FLAG to '1', and
- 35           REVERSE\_FLAG to '1' for the first entry, and
- 36           o PHYSICAL\_RESOURCE to '0000', FORWARD\_FLAG to '0', and
- 37           REVERSE\_FLAG to '1' for the second entry.
- 38       + If EXT\_CH\_IND<sub>S</sub> is equal to '01010', then there shall be two entries in the
- 39       default LPM table where the mobile station shall set:

- 1           o PHYSICAL\_RESOURCE to '0100', FORWARD\_FLAG to '1', and
- 2           REVERSE\_FLAG to '1' for the first entry, and
- 3           o PHYSICAL\_RESOURCE to '0001', FORWARD\_FLAG to '0', and
- 4           REVERSE\_FLAG to '1' for the second entry.
- 5       + If EXT\_CH\_IND<sub>S</sub> is equal to '01011', then there shall be two entries in the
- 6       default LPM table where the mobile station shall set:
- 7           o PHYSICAL\_RESOURCE to '0100', FORWARD\_FLAG to '0', and
- 8           REVERSE\_FLAG to '1' for the first entry, and
- 9           o PHYSICAL\_RESOURCE to '0000', FORWARD\_FLAG to '1', and
- 10          REVERSE\_FLAG to '1' for the second entry.
- 11       + If EXT\_CH\_IND<sub>S</sub> is equal to '01100', then there shall be two entries in the
- 12       default LPM table where the mobile station shall set:
- 13           o PHYSICAL\_RESOURCE to '0100', FORWARD\_FLAG to '0', and
- 14           REVERSE\_FLAG to '1' for the first entry, and
- 15           o PHYSICAL\_RESOURCE to '0001', FORWARD\_FLAG to '1', and
- 16           REVERSE\_FLAG to '1' for the second entry.
- 17       + If EXT\_CH\_IND<sub>S</sub> is equal to '01101', then there shall be three entries in the
- 18       default LPM table where the mobile station shall set:
- 19           o PHYSICAL\_RESOURCE to '0100', FORWARD\_FLAG to '0', and
- 20           REVERSE\_FLAG to '1' for the first entry, and
- 21           o PHYSICAL\_RESOURCE to '0000', FORWARD\_FLAG to '1', and
- 22           REVERSE\_FLAG to '1' for the second entry, and
- 23           o PHYSICAL\_RESOURCE to '0001', FORWARD\_FLAG to '0', and
- 24           REVERSE\_FLAG to '1' for the third entry.
- 25       + If EXT\_CH\_IND<sub>S</sub> is equal to '01110', then there shall be three entries in the
- 26       default LPM table where the mobile station shall set:
- 27           o PHYSICAL\_RESOURCE to '0100', FORWARD\_FLAG to '0', and
- 28           REVERSE\_FLAG to '1' for the first entry, and
- 29           o PHYSICAL\_RESOURCE to '0000', FORWARD\_FLAG to '1', and
- 30           REVERSE\_FLAG to '1' for the second entry, and
- 31           o PHYSICAL\_RESOURCE to '0001', FORWARD\_FLAG to '1', and
- 32           REVERSE\_FLAG to '1' for the third entry.

33 Requirement 3 is as follows:

- 34       + If EXT\_CH\_IND<sub>S</sub> is equal to '00001', then there shall be four entries in the
- 35       default LPM table where the mobile station shall set:
- 36           o PHYSICAL\_RESOURCE to '0000', FORWARD\_FLAG to '0', and
- 37           REVERSE\_FLAG to '1' for the first entry,

- 1           o PHYSICAL\_RESOURCE to '0010', FORWARD\_FLAG to '0', and
- 2           REVERSE\_FLAG to '1' for the second entry,
- 3           o PHYSICAL\_RESOURCE to '0011', FORWARD\_FLAG to '0', and
- 4           REVERSE\_FLAG to '1' for the third entry, and
- 5           o PHYSICAL\_RESOURCE to '0100', FORWARD\_FLAG to '1', and
- 6           REVERSE\_FLAG to '0' for the fourth entry.
- 7       + If EXT\_CH\_IND<sub>S</sub> is equal to '00010', then there shall be four entries in the
- 8       default LPM table where the mobile station shall set:
  - 9           o PHYSICAL\_RESOURCE to '0001', FORWARD\_FLAG to '0', and
  - 10          REVERSE\_FLAG to '1' for the first entry,
  - 11          o PHYSICAL\_RESOURCE to '0010', FORWARD\_FLAG to '0', and
  - 12          REVERSE\_FLAG to '1' for the second entry,
  - 13          o PHYSICAL\_RESOURCE to '0011', FORWARD\_FLAG to '0', and
  - 14          REVERSE\_FLAG to '1' for the third entry, and
  - 15          o PHYSICAL\_RESOURCE to '0100', FORWARD\_FLAG to '1', and
  - 16          REVERSE\_FLAG to '0' for the fourth entry.
- 17       + If EXT\_CH\_IND<sub>S</sub> is equal to '00011', then there shall be four entries in the
- 18       default LPM table where the mobile station shall set:
  - 19           o PHYSICAL\_RESOURCE to '0000', FORWARD\_FLAG to '1', and
  - 20           REVERSE\_FLAG to '1' for the first entry,
  - 21           o PHYSICAL\_RESOURCE to '0010', FORWARD\_FLAG to '1', and
  - 22           REVERSE\_FLAG to '1' for the second entry,
  - 23           o PHYSICAL\_RESOURCE to '0011', FORWARD\_FLAG to '1', and
  - 24           REVERSE\_FLAG to '1' for the third entry, and
  - 25           o PHYSICAL\_RESOURCE to '0100', FORWARD\_FLAG to '1', and
  - 26           REVERSE\_FLAG to '0' for the fourth entry.
- 27       + If EXT\_CH\_IND<sub>S</sub> is equal to '00100', then there shall be four entries in the
- 28       default LPM table where the mobile station shall set:
  - 29           o PHYSICAL\_RESOURCE to '0001', FORWARD\_FLAG to '1', and
  - 30           REVERSE\_FLAG to '1' for the first entry,
  - 31           o PHYSICAL\_RESOURCE to '0010', FORWARD\_FLAG to '1', and
  - 32           REVERSE\_FLAG to '1' for the second entry,
  - 33           o PHYSICAL\_RESOURCE to '0011', FORWARD\_FLAG to '1', and
  - 34           REVERSE\_FLAG to '1' for the third entry, and
  - 35           o PHYSICAL\_RESOURCE to '0100', FORWARD\_FLAG to '1', and
  - 36           REVERSE\_FLAG to '0' for the fourth entry.
- 37       + If EXT\_CH\_IND<sub>S</sub> is equal to '00101', then there shall be five entries in the
- 38       default LPM table where the mobile station shall set:

- 1           o PHYSICAL\_RESOURCE to '0000', FORWARD\_FLAG to '1', and
- 2           REVERSE\_FLAG to '1' for the first entry,
- 3           o PHYSICAL\_RESOURCE to '0001', FORWARD\_FLAG to '0', and
- 4           REVERSE\_FLAG to '1' for the second entry,
- 5           o PHYSICAL\_RESOURCE to '0010', FORWARD\_FLAG to '1', and
- 6           REVERSE\_FLAG to '1' for the third entry,
- 7           o PHYSICAL\_RESOURCE to '0011', FORWARD\_FLAG to '1', and
- 8           REVERSE\_FLAG to '1' for the fourth entry, and
- 9           o PHYSICAL\_RESOURCE to '0100', FORWARD\_FLAG to '1', and
- 10          REVERSE\_FLAG to '0' for the fifth entry.
- 11       + If EXT\_CH\_IND<sub>S</sub> is equal to '00110', then there shall be five entries in the
- 12       default LPM table where the mobile station shall set:
- 13          o PHYSICAL\_RESOURCE to '0000', FORWARD\_FLAG to '1', and
- 14          REVERSE\_FLAG to '1' for the first entry,
- 15          o PHYSICAL\_RESOURCE to '0001', FORWARD\_FLAG to '1', and
- 16          REVERSE\_FLAG to '1' for the second entry,
- 17          o PHYSICAL\_RESOURCE to '0010', FORWARD\_FLAG to '1', and
- 18          REVERSE\_FLAG to '1' for the third entry,
- 19          o PHYSICAL\_RESOURCE to '0011', FORWARD\_FLAG to '1', and
- 20          REVERSE\_FLAG to '1' for the fourth entry, and
- 21          o PHYSICAL\_RESOURCE to '0100', FORWARD\_FLAG to '1', and
- 22          REVERSE\_FLAG to '0' for the fifth entry.
- 23       + If EXT\_CH\_IND<sub>S</sub> is equal to '01000', then there shall be one entry in the
- 24       default LPM table where the mobile station shall set:
- 25          o PHYSICAL\_RESOURCE to '0100', FORWARD\_FLAG to '1', and
- 26          REVERSE\_FLAG to '1' for the third entry:
- 27       + If EXT\_CH\_IND<sub>S</sub> is equal to '01001', then there shall be two entries in the
- 28       default LPM table where the mobile station shall set:
- 29          o PHYSICAL\_RESOURCE to '0000', FORWARD\_FLAG to '0', and
- 30          REVERSE\_FLAG to '1' for the first entry,
- 31          o PHYSICAL\_RESOURCE to '0100', FORWARD\_FLAG to '1', and
- 32          REVERSE\_FLAG to '1' for the fourth entry.
- 33       + If EXT\_CH\_IND<sub>S</sub> is equal to '01010', then there shall be four entries in the
- 34       default LPM table where the mobile station shall set:
- 35          o PHYSICAL\_RESOURCE to '0001', FORWARD\_FLAG to '0', and
- 36          REVERSE\_FLAG to '1' for the first entry,
- 37          o PHYSICAL\_RESOURCE to '0100', FORWARD\_FLAG to '1', and
- 38          REVERSE\_FLAG to '1' for the fourth entry.

- 1           + If EXT\_CH\_IND<sub>S</sub> is equal to '01011', then there shall be four entries in the
- 2           default LPM table where the mobile station shall set:
- 3           o PHYSICAL\_RESOURCE to '0000', FORWARD\_FLAG to '1', and
- 4           REVERSE\_FLAG to '1' for the first entry,
- 5           o PHYSICAL\_RESOURCE to '0010', FORWARD\_FLAG to '1', and
- 6           REVERSE\_FLAG to '0' for the second entry,
- 7           o PHYSICAL\_RESOURCE to '0011', FORWARD\_FLAG to '1', and
- 8           REVERSE\_FLAG to '0' for the third entry, and
- 9           o PHYSICAL\_RESOURCE to '0100', FORWARD\_FLAG to '1', and
- 10          REVERSE\_FLAG to '1' for the fourth entry.
- 11          + If EXT\_CH\_IND<sub>S</sub> is equal to '01100', then there shall be four entries in the
- 12          default LPM table where the mobile station shall set:
- 13          o PHYSICAL\_RESOURCE to '0001', FORWARD\_FLAG to '1', and
- 14          REVERSE\_FLAG to '1' for the first entry,
- 15          o PHYSICAL\_RESOURCE to '0010', FORWARD\_FLAG to '1', and
- 16          REVERSE\_FLAG to '0' for the second entry,
- 17          o PHYSICAL\_RESOURCE to '0011', FORWARD\_FLAG to '1', and
- 18          REVERSE\_FLAG to '0' for the third entry, and
- 19          o PHYSICAL\_RESOURCE to '0100', FORWARD\_FLAG to '1', and
- 20          REVERSE\_FLAG to '1' for the fourth entry.
- 21          + If EXT\_CH\_IND<sub>S</sub> is equal to '01101', then there shall be five entries in the
- 22          default LPM table where the mobile station shall set:
- 23          o PHYSICAL\_RESOURCE to '0000', FORWARD\_FLAG to '1', and
- 24          REVERSE\_FLAG to '1' for the first entry,
- 25          o PHYSICAL\_RESOURCE to '0001', FORWARD\_FLAG to '0', and
- 26          REVERSE\_FLAG to '1' for the second entry,
- 27          o PHYSICAL\_RESOURCE to '0010', FORWARD\_FLAG to '1', and
- 28          REVERSE\_FLAG to '0' for the third entry,
- 29          o PHYSICAL\_RESOURCE to '0011', FORWARD\_FLAG to '1', and
- 30          REVERSE\_FLAG to '0' for the fourth entry, and
- 31          o PHYSICAL\_RESOURCE to '0100', FORWARD\_FLAG to '1', and
- 32          REVERSE\_FLAG to '1' for the fifth entry.
- 33          + If EXT\_CH\_IND<sub>S</sub> is equal to '01110', then there shall be five entries in the
- 34          default LPM table where the mobile station shall set:
- 35          o PHYSICAL\_RESOURCE to '0000', FORWARD\_FLAG to '1', and
- 36          REVERSE\_FLAG to '1' for the first entry,
- 37          o PHYSICAL\_RESOURCE to '0001', FORWARD\_FLAG to '1', and
- 38          REVERSE\_FLAG to '1' for the second entry,

- 1           o PHYSICAL\_RESOURCE to '0010', FORWARD\_FLAG to '1', and
- 2           REVERSE\_FLAG to '0' for the third entry,
- 3           o PHYSICAL\_RESOURCE to '0011', FORWARD\_FLAG to '1', and
- 4           REVERSE\_FLAG to '0' for the fourth entry, and
- 5           o PHYSICAL\_RESOURCE to '0100', FORWARD\_FLAG to '1', and
- 6           REVERSE\_FLAG to '1' for the fifth entry.
- 7       • If P\_REV\_IN\_USE<sub>S</sub> is equal to or less than six, the mobile station shall initialize the
- 8       logical to physical mapping table (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE) as
- 9       follows:
- 10       – Default number of Logical-to-Physical Mapping entries
- 11       (NUM\_LPM\_ENTRIES<sub>S</sub> = '0100')
- 12       – Default Table(0) Logical-to-Physical Mapping service reference identifier
- 13       (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[0].SR\_ID<sub>S</sub> = '000')
- 14       – Default Table(0) Logical-to-Physical Mapping logical resource identifier
- 15       (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[0].LOGICAL\_RESOURCE<sub>S</sub> = '0001')
- 16       – Default Table(0) Logical-to-Physical Mapping physical resource identifier:
- 17       + If CH\_IND<sub>S</sub> is equal to '01' or '11', the mobile station shall set
- 18       LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[0].PHYSICAL\_RESOURCE<sub>S</sub> to
- 19       '0000'.
- 20       + If CH\_IND<sub>S</sub> is equal to '10', the mobile station shall set
- 21       LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[0].PHYSICAL\_RESOURCE<sub>S</sub> to
- 22       '0001'.
- 23       – Default Table(0) Logical-to-Physical Mapping forward mapping indicator
- 24       (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[0].FORWARD\_FLAG<sub>S</sub> = '1')
- 25       – Default Table(0) Logical-to-Physical Mapping reverse mapping indicator
- 26       (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[0].REVERSE\_FLAG<sub>S</sub> = '1')
- 27       – Default Table(0) Logical-to-Physical Mapping priority
- 28       (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[0].PRIORITY<sub>S</sub> = '0000')
- 29       – Default Table(1) Logical-to-Physical Mapping service reference identifier
- 30       (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[1].SR\_ID<sub>S</sub> = '001')
- 31       – Default Table(1) Logical-to-Physical Mapping logical resource identifier
- 32       (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[1].LOGICAL\_RESOURCE<sub>S</sub> = '0000')
- 33       – Default Table(1) Logical-to-Physical Mapping physical resource identifier:
- 34       + If CH\_IND<sub>S</sub> is equal to '01' or '11', the mobile station shall set
- 35       LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[1].PHYSICAL\_RESOURCE<sub>S</sub> to
- 36       '0000'.

- 1           + If CH\_IND<sub>S</sub> is equal to '10', the mobile station shall set
- 2           LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[1].PHYSICAL\_RESOURCE<sub>S</sub> to
- 3           '0001'.
- 4           – Default Table(1) Logical-to-Physical Mapping forward mapping indicator
- 5           (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[1].FORWARD\_FLAG<sub>S</sub> = '1')
- 6           – Default Table(1) Logical-to-Physical Mapping reverse mapping indicator
- 7           (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[1].REVERSE\_FLAG<sub>S</sub> = '1')
- 8           – Default Table(1) Logical-to-Physical Mapping priority
- 9           (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[1].PRIORITY<sub>S</sub> = '0000')
- 10          – Default Table(2) Logical-to-Physical Mapping service reference identifier
- 11          (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[2].SR\_ID<sub>S</sub> = '001')
- 12          – Default Table(2) Logical-to-Physical Mapping logical resource identifier
- 13          (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[2].LOGICAL\_RESOURCE<sub>S</sub> = '0000')
- 14          – Default Table(2) Logical-to-Physical Mapping physical resource identifier
- 15          (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[2].PHYSICAL\_RESOURCE<sub>S</sub> to
- 16          '0010').
- 17          – Default Table(2) Logical-to-Physical Mapping forward mapping indicator
- 18          (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[2].FORWARD\_FLAG<sub>S</sub> = '1')
- 19          – Default Table(2) Logical-to-Physical Mapping reverse mapping indicator
- 20          (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[2].REVERSE\_FLAG<sub>S</sub> = '1')
- 21          – Default Table(2) Logical-to-Physical Mapping priority
- 22          (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[2].PRIORITY<sub>S</sub> = '0000')
- 23          – Default Table(3) Logical-to-Physical Mapping service reference identifier
- 24          (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[3].SR\_ID<sub>S</sub> = '001')
- 25          – Default Table(3) Logical-to-Physical Mapping logical resource identifier
- 26          (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[3].LOGICAL\_RESOURCE<sub>S</sub> = '0000')
- 27          – Default Table(3) Logical-to-Physical Mapping physical resource identifier
- 28          (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[2].PHYSICAL\_RESOURCE<sub>S</sub> to
- 29          '0011').
- 30          – Default Table(3) Logical-to-Physical Mapping forward mapping indicator
- 31          (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[3].FORWARD\_FLAG<sub>S</sub> = '1')
- 32          – Default Table(3) Logical-to-Physical Mapping reverse mapping indicator
- 33          (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[3].REVERSE\_FLAG<sub>S</sub> = '1')
- 34          – Default Table(3) Logical-to-Physical Mapping priority
- 35          (LOGICAL\_TO\_PHYSICAL\_MAPPING\_TABLE[3].PRIORITY<sub>S</sub> = '0000')
- 36          • If BCMC\_ON\_TRAFFIC\_SUP<sub>S</sub> is set to '1', the mobile station shall set
- 37          AUTO\_REQ\_TRAF\_ALLOWED\_IND<sub>S</sub> to '1'.
- 38          • The mobile station shall disable the T<sub>MS\_Slotted</sub> timer, and set SLOTTED<sub>S</sub> to YES.

- 1     • The mobile station shall set REV\_SPICH\_EP\_SIZE<sub>S</sub> to 5.
- 2     • If FOR\_PDCH\_PARMS\_INCL<sub>S</sub> is equal to '0', the mobile station shall perform the
- 3       following:
- 4       - The mobile station shall set RLGAIN\_ACKCH\_PILOT<sub>S</sub> to 0.
- 5       - The mobile station shall set RLGAIN\_CQICH\_PILOT<sub>S</sub> to 0.
- 6     • If REV\_PDCH\_PARMS\_INCL<sub>S</sub> is equal to '0', the mobile station shall perform the
- 7       following:
- 8       - The mobile station shall set RLGAIN\_SPICH\_PILOT<sub>S</sub> to 0.
- 9       - The mobile station shall set RLGAIN\_REQCH\_PILOT<sub>S</sub> to 0.
- 10      - The mobile station shall set RLGAIN\_PDCCH\_PILOT<sub>S</sub> to 0.
- 11      - The mobile station shall set REV\_PDCH\_MAX\_AUTO\_TPR<sub>S</sub> to 8 (1dB).
- 12      - The mobile station shall set
- 13       REV\_PDCH\_MAX\_SIZE\_ALLOWED\_ENCODER\_PACKET<sub>S</sub> to 9.
- 14      - The mobile station shall set REV\_PDCH\_DEFAULT\_PERSISTENCE<sub>S</sub> to '0'.
- 15      - The mobile station shall set REV\_PDCH\_RESET\_PERSISTENCE<sub>S</sub> to '0'.
- 16      - The mobile station shall set REV\_PDCH\_NUM\_ARQ\_ROUNDS\_NORMAL<sub>S</sub> to 3.
- 17      - The mobile station shall set REV\_PDCH\_NUM\_ARQ\_ROUNDS\_BOOST<sub>S</sub> to 3.
- 18      - The mobile station shall set REV\_PDCH\_MSIB\_SUPPORTED<sub>S</sub> to '0'.
- 19      - The mobile station shall set REV\_PDCH\_SOFT\_SWITCHING\_RESET\_IND<sub>S</sub> to '0'.
- 20      - The mobile station shall set REV\_PDCH\_TABLE\_SEL<sub>S</sub> to '0'.
- 21     • The mobile station shall set REV\_PDCH\_BUFFER\_SIZE<sub>S</sub> to NULL.
- 22     • For i = 0 to 7, the mobile station shall set<sub>S</sub> to
- 23       REV\_REQCH\_BUF\_QUANT\_PARM\_1<sub>S</sub>[i] to NULL and
- 24       REV\_REQCH\_BUF\_QUANT\_PARM\_2<sub>S</sub>[i] to NULL.
- 25     • The mobile station shall set REV\_REQCH\_POWER\_HEADROOM\_INCREASE<sub>S</sub> to
- 26       NULL.
- 27     • The mobile station shall set REV\_REQCH\_USE\_POWER\_REPORTS<sub>S</sub> to NULL.
- 28     • The mobile station shall set REV\_REQCH\_POWER\_HEADROOM\_DECREASE<sub>S</sub> to
- 29       NULL.
- 30     • The mobile station shall set REV\_REQCH\_HEADROOM\_DURATION<sub>S</sub> to NULL.
- 31     • The mobile station shall set REV\_REQCH\_MAX\_POWER\_UPDATE\_DURATION<sub>S</sub> to
- 32       NULL.
- 33     • The mobile station shall set REV\_PDCH\_INIT\_TARGET\_TPR<sub>S</sub> to 0 (0dB).
- 34     • The mobile station shall set REV\_PDCH\_MAX\_TARGET\_TPR<sub>S</sub> to 0 (0dB).
- 35     • The mobile station shall set REV\_PDCH\_QUICK\_START\_THRESH<sub>S</sub> to 72 (9dB).

- The mobile station shall set REV\_REQCH\_QUICK\_REPEAT\_ALLOWED<sub>S</sub> to NULL.
- The mobile station shall set REV\_PDCH\_GRANT\_PRECEDENCE<sub>S</sub> to '1'.
- The mobile station shall set REV\_PDCH\_ALWAYS\_ACK\_FINAL\_ROUND<sub>S</sub> to '0'.
- For  $i = 1$  to  $(11 \times (\text{REV\_PDCH\_EP\_MAP\_LEN}_T + 1))$ , the mobile station shall perform the following:
  - If  $i \leq 11$ , the mobile station shall perform the following:
    - + The mobile station shall set REV\_PDCH\_STEP\_UP<sub>S</sub>[ $i$ ] and REV\_PDCH\_STEP\_DOWN<sub>S</sub>[ $i$ ] as specified on the  $i^{\text{th}}$  row of Table 2.6.4.2-3.
  - Otherwise, the mobile station shall set REV\_PDCH\_STEP\_UP<sub>S</sub>[ $i$ ] to 0, and it shall set REV\_PDCH\_STEP\_DOWN<sub>S</sub>[ $i$ ] to 0.
- For  $i = 0$  to 6, the mobile station shall perform the following:
  - REV\_PDCH\_BOOST\_ALLOWED<sub>S</sub>[ $i$ ] to '0'.
  - REV\_PDCH\_AUTO\_ALLOWED<sub>S</sub>[ $i$ ] to '1'.
- The mobile station shall set REV\_REQCH\_ENABLED<sub>S</sub> to '0'.
- The mobile station shall set REV\_PDCH\_REQCH\_TRIGGER<sub>S</sub> to NULL.
- The mobile station shall set REV\_PDCH\_BOOST\_OVERSHOOT<sub>S</sub> to 0.

**Table 2.6.4.2-3. Default REV\_PDCH\_STEP\_UP and REV\_PDCH\_STEP\_DOWN tables**

EP_SIZE	REV_PDCH_STEP_UP	REV_PDCH_STEP_DOWN
192	3	0
408	1.75	0.0625
792	0.9375	0.09375
1560	0.5	0.125
3096	0.28125	0.15625
4632	0.15625	0.1875
6168	0.125	0.21875
9240	0.0625	0.28125
12312	0.03125	0.375
15384	0.03125	0.59375
18456	0	0.875

- The mobile station shall set USE\_CH\_CFG\_RRM<sub>S</sub> to '0'.
- If the ASSIGN\_MODE<sub>T</sub> field from the *Channel Assignment Message* equals '000', the mobile station shall set SERV\_NEG<sub>S</sub> to disabled.
- If the ASSIGN\_MODE<sub>T</sub> field from the *Channel Assignment Message* equals '100', the mobile station shall set SERV\_NEG<sub>S</sub> to enabled.

- 1       • The mobile station shall initialize RC parameters as described in section 2.6.16.
- 2       • The mobile station shall determine the service configuration as follows:
  - 3           – If SERV\_NEG<sub>S</sub> equals disabled, the initial service configuration shall include
  - 4           Multiplex Option 1 and Radio Configuration 1 for both the Forward and Reverse
  - 5           Traffic Channels, and shall include no service option connections.
  - 6           – If SERV\_NEG<sub>S</sub> equals enabled, and if GRANTED\_MODE<sub>S</sub> equals '00', the initial
  - 7           service configuration shall include the multiplex option and radio configuration
  - 8           for the Forward and Reverse Traffic Channels as specified by
  - 9           DEFAULT\_CONFIG<sub>S</sub>, and shall include no service option connections.
  - 10          – If SERV\_NEG<sub>S</sub> equals enabled and GRANTED\_MODE<sub>S</sub> equals '01' or '10':
    - 11           + If the mobile station enters the *Traffic Channel Initialization Substate*
    - 12           because of receiving the *Channel Assignment Message*, the initial service
    - 13           configuration shall include the default Forward and Reverse Traffic Channel
    - 14           multiplex options and transmission rates corresponding to the service
    - 15           option requested by the mobile station in the *Origination Message*, in the
    - 16           case of a mobile station originated call, or the *Page Response Message*, in
    - 17           the case of a mobile station terminated, and shall include no service option
    - 18           connections.
    - 19           + If the mobile station enters the *Traffic Channel Initialization Substate*
    - 20           because of receiving the *Extended Channel Assignment Message*, the initial
    - 21           service configuration shall include the default Forward and Reverse Traffic
    - 22           Channel multiplex options that are derived from the radio configurations
    - 23           corresponding to the Table 3.7.2.3.2.21-7, and shall include no service
    - 24           option connections.
    - 25          – If SERV\_NEG<sub>S</sub> equals enabled and GRANTED\_MODE<sub>S</sub> equals '11', the mobile
    - 26          station shall begin to use the stored service configuration corresponding to
    - 27          SYNC\_ID<sub>S</sub> as the current service configuration and shall begin to process
    - 28          Forward and Reverse Traffic Channel frames accordingly. The set of service
    - 29          option connections to be restored are determined as follows:
      - 30           + If SR\_ID\_RESTORE<sub>S</sub> equals '111', the mobile station shall restore all the
      - 31           service option connections from the stored service configuration.
      - 32           + If SR\_ID\_RESTORE<sub>S</sub> equals '000', the mobile station shall restore the service
      - 33           option connections indicated by SR\_ID\_RESTORE\_BITMAP<sub>S</sub> from the stored
      - 34           service configuration.
      - 35           + Otherwise, the mobile station shall restore the service option connection
      - 36           corresponding to SR\_ID\_RESTORE<sub>S</sub> from the stored service configuration.
      - 37          – If SERV\_NEG<sub>S</sub> equals disabled, the mobile station shall perform the following:
        - 38           + If the call is mobile station originated and the *Origination Message* requests
        - 39           a special service option, the mobile station shall set SO\_REQ<sub>S</sub> to the special
        - 40           service option number.

- 1           + If the call is mobile station originated and the *Origination Message* does not  
2           request a special service option, the mobile station shall set SO\_REQ<sub>S</sub> to 1  
3           (the default service option number).
- 4           + If the call is mobile station terminated, the mobile station shall set  
5           SO\_REQ<sub>S</sub> to the service option number requested in the *Page Response*  
6           *Message*.
- 7 While in the *Traffic Channel Initialization Substate*, the mobile station shall perform the  
8 following:
- 9       • The mobile station shall monitor Forward Traffic Channels associated with one or  
10       more pilots in the Active Set.
  - 11       • The mobile station shall perform pilot strength measurements as specified in  
12       2.6.6.2.2, but shall not send *Pilot Strength Measurement Messages* or *Extended*  
13       *Pilot Strength Measurement Messages*.
  - 14       • The mobile station shall perform registration timer maintenance as specified in  
15       2.6.5.5.4.2.
  - 16       • If the bits of TMSI\_CODE<sub>S-p</sub> are not all equal to '1' and if System Time (in 80 ms  
17       units) exceeds TMSI\_EXP\_TIME<sub>S-p</sub> × 2<sup>12</sup>, the mobile station shall set all the bits of  
18       TMSI\_CODE<sub>S-p</sub> to '1' within T<sub>66m</sub> seconds.
  - 19       • If the full-TMSI timer expires or has expired, the mobile station shall set all the bits  
20       of TMSI\_CODE<sub>S-p</sub> to '1'. The mobile station shall update the registration variables  
21       as described in 2.6.5.5.2.5.
  - 22       • If the Forward Packet Data Channel is assigned, whenever the mobile station  
23       transmitter is disabled, the MS shall set FPDCH\_DTX\_INDICATOR<sub>S</sub> to '1'.
  - 24       • If the Forward Packet Data Channel is assigned, whenever the mobile station  
25       transmitter is enabled, the mobile station shall perform the following procedures:  
26       - The MS shall set FPDCH\_DTX\_INDICATOR<sub>S</sub> to '0'.
  - 27       - If the mobile station transmitter has been disabled for at least  
28       TX\_DISABLED\_TIMER<sub>S</sub>, the mobile station shall send SIG-  
29       HandoffPDCH.Indication (handoff\_type = ASSIGN) primitive to the MAC layer.
- 30 If the mobile station does not support the assigned CDMA Channel (see [2]) or all of the  
31 assigned Forward Traffic code channels (see [2]), the mobile station shall enter the *System*  
32 *Determination Substate* of the *Mobile Station Initialization State* with an error indication  
33 (see 2.6.1.1).
- 34 If the mobile station supports the assigned CDMA Channel and the assigned Forward  
35 Traffic code channels, the mobile station shall perform the following:
- 36       • The mobile station shall tune to the assigned CDMA Channel.
  - 37       • The mobile station shall set its code channel for the assigned Forward Traffic code  
38       channel.

1       • The mobile station shall set its Forward and Reverse Traffic Channel frame offsets  
2       to the assigned frame offset as determined by FRAME\_OFFSET<sub>S</sub>.

3       • The mobile station shall set its Forward and Reverse Traffic Channel long code  
4       masks to the public long code mask (see [2]).

5       If all of the following conditions are true:

- 6       • F-CPCCH is assigned, and
- 7       • EARLY\_RL\_TRANSMIT\_IND<sub>S</sub> equals '1',

8       the mobile station shall perform the following:

9       • The mobile station shall adjust its transmit power as specified in [2].

10       • The mobile station shall transmit the Traffic Channel preamble as specified in [2]  
11       and Layer 3 shall send an *acquiring dedicated channel* indication to Layer 2 (see  
12       [4]).

13       • If CH\_IND<sub>S</sub> equals '00', the mobile station shall commence R-CQICH reporting as  
14       specified in [2].

15       • If the mobile station receives a period of ( $N_{18m} \times 1.25$ ) ms with sufficient signal  
16       quality on the Forward Common Power Control Subchannel assigned to this mobile  
17       station within  $T_{79m}$  seconds after entering this substate, the mobile station shall  
18       perform the following additional functions while it remains in the *Traffic Channel*  
19       *Initialization Substate*:

20       - The mobile station shall perform Forward Traffic Channel supervision as  
21       specified in 2.6.4.1.8. If a loss of the Forward Traffic Channel is declared, the  
22       mobile station shall enter the *System Determination Substate* of the *Mobile*  
23       *Station Initialization State* with a system lost indication (see 2.6.1.1).

24       - The mobile station shall process Forward Traffic Channel signaling traffic and  
25       shall discard other types of Forward Traffic Channel traffic.

26       • If the mobile station does not receive a period of ( $N_{18m} \times 1.25$ ) ms with sufficient  
27       signal quality on the Forward Common Power Control Subchannel assigned to this  
28       mobile station within  $T_{79m}$  seconds after entering this substate, the mobile station  
29       shall perform the following:

30       - The mobile station shall disable its transmitter.

31       - The mobile station shall discard any messages queued for transmission, and  
32       those messages received and pending processing.

33       - The mobile station shall remain in this substate and perform the procedures  
34       below.

35       If all of the following conditions are true:

- 1 • F-CPCCH is assigned, and
- 2 • EARLY\_RL\_TRANSMIT\_IND<sub>S</sub> equals '0', or EARLY\_RL\_TRANSMIT\_IND<sub>S</sub> equals '1'
- 3 and the T<sub>79m</sub> timer has expired,.

4 the mobile station shall perform the following:

- 5 • If the mobile station receives a period of (N<sub>18m</sub> × 1.25) ms with sufficient signal
- 6 quality on the Forward Common Power Control Subchannel assigned to this mobile
- 7 station within T<sub>50m</sub> seconds after entering this substate, the mobile station shall
- 8 perform the following additional functions while it remains in the *Traffic Channel*
- 9 *Initialization Substate*:

- 10 - The mobile station shall perform Forward Traffic Channel supervision as
- 11 specified in 2.6.4.1.8. If a loss of the Forward Traffic Channel is declared, the
- 12 mobile station shall enter the *System Determination Substate* of the *Mobile*
- 13 *Station Initialization State* with a system lost indication (see 2.6.1.1).
- 14 - The mobile station shall adjust its transmit power as specified in [2].
- 15 - The mobile station shall transmit the Traffic Channel preamble as specified in
- 16 [2], and Layer 3 shall send an *acquiring dedicated channel* indication to Layer 2
- 17 (see [4]).
- 18 - If CH\_IND<sub>S</sub> equals '00', the mobile station shall commence R-CQICH reporting
- 19 as specified in [2].
- 20 - The mobile station shall process Forward Traffic Channel signaling traffic and
- 21 shall discard other types of Forward Traffic Channel traffic.
- 22 - If Layer 3 receives a L2-Condition.Notification primitive from Layer 2 indicating
- 23 an acknowledgment failure, the mobile station shall perform the following:
- 24 + If the Direct Channel Assignment call setup procedure was used and
- 25 DIRECT\_CH\_ASSIGN\_RECOVER\_IND<sub>S</sub> is set to '1', the mobile station shall
- 26 perform the following:
- 27 o If any of the following conditions is met:
- 28 ◇ The mobile station is able to select the last pilot mobile station was
- 29 monitoring before entering *Mobile Station Control on the Traffic*
- 30 *Channel State* and the pilot has sufficient signal strength, or
- 31 ◇ The mobile station is able to select a pilot with sufficient signal
- 32 strength that is listed in NGHBR\_REC\_LIST, the
- 33 ACCESS\_ENTRY\_HO field of the NGHBR\_REC corresponding to the
- 34 selected pilot is equal to '1' and the mobile station has sufficient
- 35 information to monitor BCCH or PCH from base station
- 36 corresponding to the selected pilot.

- 1                   Then the mobile station shall enter the *Update Overhead Information*  
2                   *Substate* of the *System Access State* with a direct channel assignment  
3                   failure indication on the selected pilot.
- 4                   o Otherwise, the mobile station shall enter the *System Determination*  
5                   *Substate* of the *Mobile Station Initialization State* with a system lost  
6                   indication (see 2.6.1.1).
- 7                   + Otherwise, the mobile station shall disable its transmitter and enter the  
8                   *System Determination Substate* of the *Mobile Station Initialization State* with  
9                   a system lost indication (see 2.6.1.1).
- 10                  • If the mobile station does not receive a period of  $(N_{18m} \times 1.25)$  ms with sufficient  
11                  signal quality on the Forward Common Power Control Subchannel assigned to this  
12                  mobile station within  $T_{50m}$  seconds after entering this substate, the mobile station  
13                  shall perform the following:
- 14                  - If the Direct Channel Assignment call setup procedure was used and  
15                  DIRECT\_CH\_ASSIGN\_RECOVER\_IND<sub>s</sub> is set to '1', the mobile station shall  
16                  perform the following:
- 17                  + If any of the following conditions is met:
- 18                          o The mobile station is able to select the last pilot mobile station was  
19                          monitoring before entering *Mobile Station Control on the Traffic Channel*  
20                          *State* and the pilot has sufficient signal strength, or
- 21                          o The mobile station is able to select a pilot with sufficient signal strength  
22                          that is listed in NGHBR\_REC\_LIST, and the ACCESS\_ENTRY\_HO field of  
23                          the NGHBR\_REC corresponding to the selected pilot is equal to '1' and  
24                          the mobile station has sufficient information to monitor BCCH or PCH  
25                          from base station corresponding to the selected pilot.
- 26                          Then the mobile station shall enter the *Update Overhead Information*  
27                          *Substate* of the *System Access State* with a direct channel assignment  
28                          failure indication on the selected pilot.
- 29                          + Otherwise, the mobile station shall enter the *System Determination Substate*  
30                          of the *Mobile Station Initialization State* with a system lost indication (see  
31                          2.6.1.1).
- 32                  - Otherwise, the mobile station shall enter the *System Determination Substate* of  
33                  the *Mobile Station Initialization State* with a system lost indication (see 2.6.1.1).
- 34                  If all of the following conditions are true:
- 35                          • F-CPCCH is not assigned, and
- 36                          • EARLY\_RL\_TRANSMIT\_IND<sub>s</sub> equals '1',
- 37                  the mobile station shall perform the following:

- 1       • The mobile station shall adjust its transmit power as specified in [2].
- 2       • The mobile station shall transmit the Traffic Channel preamble as specified in [2],  
3       and Layer 3 shall send an acquiring dedicated channel indication to Layer 2 (see  
4       [4]).
- 5       • If CH\_INDs equals '00', the mobile station shall commence R-CQICH reporting as  
6       specified in [2].
- 7       • If the mobile station receives a period of ( $N_{5m} \times 20$ ) ms with sufficient signal quality  
8       on the physical channel corresponding to FPC\_PRI\_CHAN<sub>S</sub> within T<sub>79m</sub> seconds  
9       after entering this substate, the mobile station shall perform the following  
10      additional functions while it remains in the *Traffic Channel Initialization Substate*:
  - 11      - The mobile station shall perform Forward Traffic Channel supervision as  
12      specified in 2.6.4.1.8. If a loss of the Forward Traffic Channel is declared, the  
13      mobile station shall enter the *System Determination Substate* of the *Mobile*  
14      *Station Initialization State* with a system lost indication (see 2.6.1.1).
  - 15      - The mobile station shall process Forward Traffic Channel signaling traffic and  
16      shall discard other types of Forward Traffic Channel traffic.
  - 17      • If the mobile station does not receive a period of ( $N_{5m} \times 20$ ) ms with sufficient  
18      signal quality on the physical channel corresponding to FPC\_PRI\_CHAN<sub>S</sub> within  
19      T<sub>79m</sub> seconds after entering this substate, the mobile station shall perform the  
20      following:
    - 21      - The mobile station shall disable its transmitter.
    - 22      - The mobile station shall discard any messages queued for transmission, and  
23      those messages received and pending processing.
    - 24      - The mobile station shall remain in this substate and perform the procedures  
25      below.
- 26   If all of the following conditions are true:
  - 27      • F-CPCCH is not assigned, and
  - 28      • EARLY\_RL\_TRANSMIT\_IND<sub>S</sub> equals '0', or EARLY\_RL\_TRANSMIT\_IND<sub>S</sub> equals '1'  
29      and the T<sub>79m</sub> timer has expired,
- 30   the mobile station shall perform the following:
  - 31      • If the mobile station receives a period of ( $N_{5m} \times 20$ ) ms with sufficient signal  
32      quality on the physical channel corresponding to FPC\_PRI\_CHAN<sub>S</sub> within T<sub>50m</sub>  
33      seconds after entering this substate, the mobile station shall perform the following  
34      additional functions while it remains in the *Traffic Channel Initialization Substate*:

- 1        - The mobile station shall perform Forward Traffic Channel supervision as  
2        specified in 2.6.4.1.8. If a loss of the Forward Traffic Channel is declared, the  
3        mobile station shall enter the *System Determination Substate* of the *Mobile*  
4        *Station Initialization State* with a system lost indication (see 2.6.1.1).
- 5        - The mobile station shall adjust its transmit power as specified in [2].
- 6        - The mobile station shall transmit the Traffic Channel preamble as specified in  
7        [2], and Layer 3 shall send an *acquiring dedicated channel* indication to Layer 2  
8        (see [4]).
- 9        - If CH\_IND<sub>s</sub> equals '00', the mobile station shall commence R-CQICH reporting  
10       as specified in [2].
- 11       - The mobile station shall process Forward Traffic Channel signaling traffic and  
12       shall discard other types of Forward Traffic Channel traffic.
- 13       - If Layer 3 receives a L2-Condition.Notification primitive from Layer 2 indicating  
14       an acknowledgment failure, the mobile station shall perform the following:
  - 15       + If the Direct Channel Assignment call setup procedure was used and  
16       DIRECT\_CH\_ASSIGN\_RECOVER\_IND<sub>s</sub> is set to '1', the mobile station shall  
17       perform the following:
    - 18       o If any of the following conditions is met:
      - 19       ◇ The mobile station is able to select the last pilot mobile station was  
20       monitoring before entering *Mobile Station Control on the Traffic*  
21       *Channel State* and the pilot has sufficient signal strength, or
      - 22       ◇ The mobile station is able to select a pilot with sufficient signal  
23       strength that is listed in NGHBR\_REC\_LIST, and the  
24       ACCESS\_ENTRY\_HO field of the NGHBR\_REC corresponding to the  
25       selected pilot is equal to '1' and the mobile station has sufficient  
26       information to monitor BCCH or PCH from base station  
27       corresponding to the selected pilot.
    - 28       Then the mobile station shall enter the *Update Overhead Information*  
29       *Substate* of the *System Access State* with a direct channel assignment  
30       failure indication on the selected pilot.
    - 31       o Otherwise, the mobile station shall enter the *System Determination*  
32       *Substate* of the *Mobile Station Initialization State* with a system lost  
33       indication (see 2.6.1.1).
  - 34       + Otherwise, the mobile station shall disable its transmitter and enter the  
35       *System Determination Substate* of the *Mobile Station Initialization State* with  
36       a system lost indication (see 2.6.1.1).
- 37       • If the mobile station does not receive a period of ( $N_{5m} \times 20$ ) ms with sufficient  
38       signal quality on the physical channel corresponding to FPC\_PRI\_CHAN<sub>s</sub> within  
39       T<sub>50m</sub> seconds after entering this substate, the mobile station shall perform the  
40       following:

- 1       - If the Direct Channel Assignment call setup procedure was used and  
2       DIRECT\_CH\_ASSIGN\_RECOVER\_IND<sub>s</sub> is set to '1', the mobile station shall  
3       perform the following:
- 4       + If all of the following conditions are met:
  - 5           ○ The mobile station is able to select the last pilot mobile station was  
6           monitoring before entering *Mobile Station Control on the Traffic Channel*  
7           *State* and the pilot has sufficient signal strength, or
  - 8           ○ The mobile station is able to select a pilot with sufficient signal strength  
9           that is listed in NGHBR\_REC\_LIST, and the ACCESS\_ENTRY\_HO field of  
10          the NGHBR\_REC corresponding to the selected pilot is equal to '1' and  
11          the mobile station has sufficient information to monitor BCCH or PCH  
12          from base station corresponding to the selected pilot.
- 13       Then the mobile station shall enter the *Update Overhead Information*  
14       *Substate* of the *System Access State* with a direct channel assignment  
15       failure indication on the selected pilot.
- 16       + Otherwise, the mobile station shall enter the *System Determination Substate*  
17       of the *Mobile Station Initialization State* with a system lost indication (see  
18       2.6.1.1).
- 19       - Otherwise, the mobile station shall enter the *System Determination Substate* of  
20       the *Mobile Station Initialization State* with a system lost indication (see 2.6.1.1).

21   The mobile station shall then perform the procedures specified in 2.6.4.2.2.

#### 22   2.6.4.2.1 Return to Traffic Channel Initialization Substate with Initialization Failure 23   Indication

24   If F-CPCCH is assigned, the mobile station shall perform the following:

- 25       • The mobile station shall perform the following functions while it remains in the  
26       *Traffic Channel Initialization Substate*:
- 27       - The mobile station shall perform Forward Traffic Channel supervision as  
28       specified in 2.6.4.1.8. If a loss of the Forward Traffic Channel is declared, the  
29       mobile station shall enter the *System Determination Substate* of the *Mobile*  
30       *Station Initialization State* with a system lost indication (see 2.6.1.1).
- 31       - The mobile station shall continue transmitting the Traffic Channel preamble as  
32       specified in [2], the mobile station shall continue R-CQICH reporting as  
33       specified in [2], and Layer 3 shall send an *acquiring dedicated channel*  
34       indication to Layer 2 (see [4]).
- 35       - The mobile station shall process Forward Traffic Channel signaling traffic and  
36       shall discard other types of Forward Traffic Channel traffic.

- 1       - If Layer 3 receives a L2-Condition.Notification primitive from Layer 2 indicating  
2       an acknowledgment failure, the mobile station shall perform the following:
- 3       + If the Direct Channel Assignment call setup procedure was used and  
4       DIRECT\_CH\_ASSIGN\_RECOVER\_IND<sub>s</sub> is set to '1', the mobile station shall  
5       perform the following:
- 6       o If any of the following conditions is met:
- 7           ◇ The mobile station is able to select the last pilot mobile station was  
8           monitoring before entering *Mobile Station Control on the Traffic*  
9           *Channel State* and the pilot has sufficient signal strength, or
- 10          ◇ The mobile station is able to select a pilot with sufficient signal  
11          strength that is listed in NGHBR\_REC\_LIST, and the  
12          ACCESS\_ENTRY\_HO field of the NGHBR\_REC corresponding to the  
13          selected pilot is equal to '1' and the mobile station has sufficient  
14          information to monitor BCCH or PCH from base station  
15          corresponding to the selected pilot.
- 16               Then the mobile station shall enter the *Update Overhead Information*  
17               *Substate* of the *System Access State* with a direct channel assignment  
18               failure indication on the selected pilot.
- 19       o Otherwise, the mobile station shall enter the *System Determination*  
20       *Substate* of the *Mobile Station Initialization State* with a system lost  
21       indication (see 2.6.1.1).
- 22       + Otherwise, the mobile station shall disable its transmitter and enter the  
23       *System Determination Substate* of the *Mobile Station Initialization State* with  
24       a system lost indication (see 2.6.1.1).

25   If F-CPCCH is not assigned, the mobile station shall perform the following:

- 26       • The mobile station shall perform the following functions while it remains in the  
27       *Traffic Channel Initialization Substate*:
- 28       - The mobile station shall perform Forward Traffic Channel supervision as  
29       specified in 2.6.4.1.8. If a loss of the Forward Traffic Channel is declared, the  
30       mobile station shall enter the *System Determination Substate* of the *Mobile*  
31       *Station Initialization State* with a system lost indication (see 2.6.1.1).
- 32       - The mobile station shall continue transmitting the Traffic Channel preamble as  
33       specified in [2], and Layer 3 shall send an *acquiring dedicated channel*  
34       indication to Layer 2 (see [4]). Furthermore, if CH\_IND<sub>s</sub> equals '00', the mobile  
35       station shall continue R-CQICH reporting as specified in [2].
- 36       - The mobile station shall process Forward Traffic Channel signaling traffic and  
37       shall discard other types of Forward Traffic Channel traffic.
- 38       - If Layer 3 receives a L2-Condition.Notification primitive from Layer 2 indicating  
39       an acknowledgment failure, the mobile station shall perform the following:

- + If the Direct Channel Assignment call setup procedure was used and DIRECT\_CH\_ASSIGN\_RECOVER\_IND<sub>s</sub> is set to '1', the mobile station shall perform the following:

- o If any of the following conditions is met:

- ◇ The mobile station is able to select the last pilot mobile station was monitoring before entering *Mobile Station Control on the Traffic Channel State* and the pilot has sufficient signal strength, or
- ◇ The mobile station is able to select a pilot with sufficient signal strength that is listed in NGHBR\_REC\_LIST, and the ACCESS\_ENTRY\_HO field of the NGHBR\_REC corresponding to the selected pilot is equal to '1' and the mobile station has sufficient information to monitor BCCH or PCH from base station corresponding to the selected pilot.

Then the mobile station shall enter the *Update Overhead Information Substate* of the *System Access State* with a direct channel assignment failure indication on the selected pilot.

- o Otherwise, the mobile station shall enter the *System Determination Substate* of the *Mobile Station Initialization State* with a system lost indication (see 2.6.1.1).

- + Otherwise, the mobile station shall disable its transmitter and enter the *System Determination Substate* of the *Mobile Station Initialization State* with a system lost indication (see 2.6.1.1).

The mobile station shall then perform the procedures specified in 2.6.4.2.2.

#### 2.6.4.2.2 Exiting the Traffic Channel Initialization Substate

The mobile station should provide diversity combining of the Forward Fundicated Channels associated with pilots in the Active Set if the mobile station receives multiple pilots in the *Extended Channel Assignment Message*.

If Layer 3 does not receive a *forward dedicated channel acquired* indication from Layer 2 (see [4]) within T<sub>51m</sub> seconds after the transmitter was last enabled, the mobile station shall perform the following:

- If the Direct Channel Assignment call setup procedure was used and DIRECT\_CH\_ASSIGN\_RECOVER\_IND<sub>s</sub> is set to '1', the mobile station shall perform the following:
  - If any of the following conditions is met:
    - + The mobile station is able to select the last pilot mobile station was monitoring before entering *Mobile Station Control on the Traffic Channel State* and the pilot has sufficient signal strength, or

- 1           + The mobile station is able to select a pilot with sufficient signal strength  
2           that is listed in NGHBR\_REC\_LIST, and the ACCESS\_ENTRY\_HO field of the  
3           NGHBR\_REC corresponding to the selected pilot is equal to '1' and the  
4           mobile station has sufficient information to monitor BCCH or PCH from  
5           base station corresponding to the selected pilot.
- 6           Then the mobile station shall enter the *Update Overhead Information Substate*  
7           of the *System Access State* with a direct channel assignment failure indication  
8           on the selected pilot.
- 9           - Otherwise, the mobile station shall enter the *System Determination Substate* of  
10          the *Mobile Station Initialization State* with a system lost indication (see 2.6.1.1).
- 11          • Otherwise, the mobile station shall disable its transmitter and enter the *System*  
12          *Determination Substate* of the *Mobile Station Initialization State* with a system lost  
13          indication (see 2.6.1.1).
- 14          After the first occurrence of receiving a period of  $(N_{5m} \times 20)$  ms with sufficient signal  
15          quality on the physical channel corresponding to FPC\_PRI\_CHAN<sub>S</sub> or a period of  $(N_{18m} \times$   
16          1.25) ms with sufficient signal quality on the Forward Common Power Control Subchannel  
17          assigned to this mobile station, if one of the following conditions is met:
- 18          • Layer 3 has received a *forward dedicated channel acquired* indication from Layer 2  
19          within T<sub>51m</sub> seconds after the transmitter was last enabled, or
- 20          • The mobile station supports transmission of fixed Traffic Channel preamble, and  
21          FIXED\_PREAMBLE\_TRANSMIT\_IND<sub>S</sub> equals '1', and the mobile station has  
22          transmitted the Traffic Channel preamble for the duration corresponding to  
23          FIXED\_NUM\_PREAMBLE<sub>S</sub> as specified by the Table 3.7.2.3.2.21-13
- 24          the mobile station shall perform the following:
- 25          • If CH\_IND<sub>S</sub> is equal to '01', the mobile station shall begin transmitting on the  
26          Reverse Fundamental Channel.
- 27          • If CH\_IND<sub>S</sub> is equal to '11' and FUNDICATED\_BCMC\_IND<sub>S</sub> equals '0', or if CH\_IND<sub>S</sub>  
28          is equal to '11' and FUNDICATED\_BCMC\_IND<sub>S</sub> equals '1' and  
29          REV\_FCH\_ASSIGNED<sub>S</sub> is equal to '1', the mobile station shall begin transmitting on  
30          the Reverse Fundamental Channel.
- 31          • If CH\_IND<sub>S</sub> is equal to '10' or '11', the mobile station shall begin transmitting on the  
32          Reverse Dedicated Control Channel when the mobile station has user data or  
33          signaling traffic to send on the Reverse Dedicated Control Channel.
- 34          • If CH\_IND<sub>S</sub> equals '00', the mobile station shall perform the following:
- 35          - If EXT\_CH\_IND<sub>S</sub> signals the allocation of a R-FCH, the mobile station shall  
36          begin transmitting on the Reverse Fundamental Channel.

- 1        - If EXT\_CH\_IND<sub>S</sub> signals the allocation of a R-DCCH, the mobile station shall
- 2        begin transmitting on the Reverse Dedicated Control Channel when the mobile
- 3        station has user data or signaling traffic to send on the Reverse Dedicated
- 4        Control Channel.
  
- 5        - If EXT\_CH\_IND<sub>S</sub> signals the allocation of a R-PDCH, the mobile station shall
- 6        begin transmitting on the Reverse Packet Data Channel when the mobile
- 7        station has user data or signaling traffic to send on the Reverse Packet Data
- 8        Channel.
  
- 9        • If SERV\_NEG<sub>S</sub> equals disabled, the mobile station shall activate the *SO Negotiation*
- 10       Subfunction.
- 11       • If SERV\_NEG<sub>S</sub> equals enabled and the GRANTED\_MODE<sub>S</sub> is '00', '01', or '11', the
- 12       mobile station shall activate the *Normal Service Subfunction*.
- 13       • If SERV\_NEG<sub>S</sub> equals enabled and the GRANTED\_MODE<sub>S</sub> is '10', the mobile station
- 14       shall activate the *Waiting for Service Connect Message Subfunction*.
- 15       • The mobile station shall perform the following:
- 16           - If SERV\_NEG<sub>S</sub> equals enabled and GRANTED\_MODE<sub>S</sub> is equal to '11', the
- 17           mobile station shall perform the following:
- 18              + The mobile station shall restore the stored service configuration as specified
- 19              in 2.6.4.1.2.2.5.2.
- 20              + For the first service option connection (with corresponding connection
- 21              reference CON\_REF<sub>i</sub>) listed in this stored Service Configuration information
- 22              record, Layer 3 shall instantiate a Call Control instance (as specified in
- 23              2.6.10) with the received BYPASS\_ALERT\_ANSWER<sub>S</sub>. The mobile station
- 24              shall identify this Call Control instances by the corresponding CON\_REF<sub>i</sub>
- 25              and also identify this Call Control instance by the NULL identifier.
- 26              + For each of the remaining service option connection (with corresponding
- 27              connection reference CON\_REF<sub>i</sub>) that will be restored from the stored service
- 28              configuration record, Layer 3 shall instantiate a Call Control instance (as
- 29              specified in 2.6.10) with a 'restore indication'. The mobile station shall
- 30              identify each of these Call Control instances by the corresponding
- 31              CON\_REF<sub>i</sub>.
- 32              + The mobile station shall store the synchronization identifier corresponding
- 33              to the restored service configuration as SYNC\_ID<sub>S</sub>.
- 34           - Otherwise, the mobile station shall perform the following:

- 1           + If the BCMC\_ORIG\_ONLY\_IND field is not included or is included and set to  
2           '0' in the *Origination Message*, *Page Response Message*, or *Reconnect*  
3           *Message*, the Layer 3 shall instantiate a Call Control instance (as specified  
4           in 2.6.10) for each service instance being initiated.
- 5           + The Layer 3 shall assign a default identifier of NULL to the Call Control  
6           instance corresponding to the SR\_ID field of the *Origination Message*, *Page*  
7           *Response Message*, or *Reconnect Message*.
- 8           + If P\_REV\_IN\_USE<sub>S</sub> is greater than or equal to 11, the mobile station shall set  
9           a call control timer to a value of T<sub>42m</sub> seconds.

- 10       • The Layer 3 shall enter the *Traffic Channel Substate*.

#### 11   2.6.4.3 Traffic Channel Substate

12   In this substate, the mobile station may exchange Traffic Channel frames with the base  
13   station in accordance with the current service configuration. The mobile station may  
14   perform the gating operation of Reverse Pilot Channel.

15   The mobile station can be in the *Active Mode* or *Control Hold Mode* while in this substate.

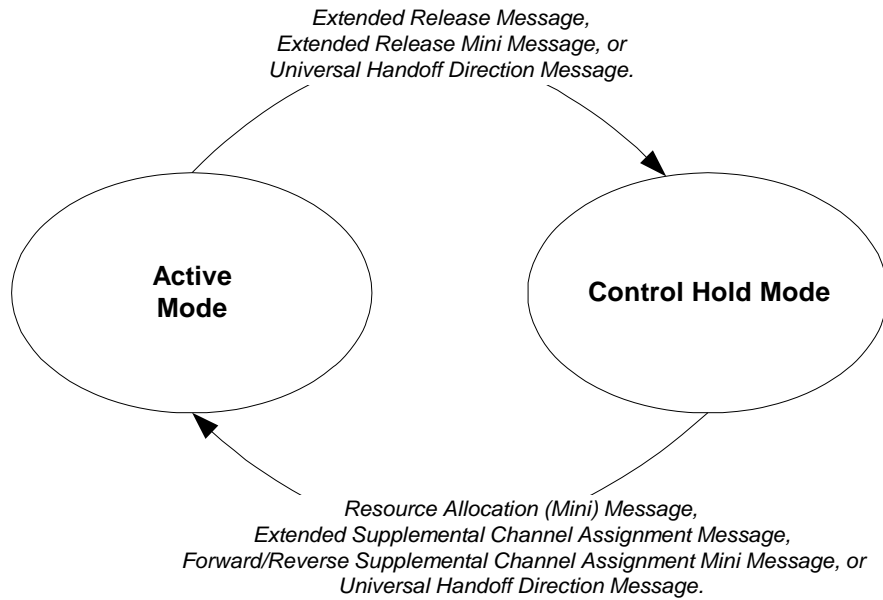

16   The following are the attributes when the mobile station is in the *Active Mode* of *Traffic*  
17   *Channel Substate*:

- 18       • PILOT\_GATING\_USE\_RATE is set to '0' (i.e., the reverse pilot (r-pich) is not gated).
- 19       • Flow of data traffic is permitted by the Multiplex Sublayer.

20   The following are the attributes when the mobile station is in the *Control Hold Mode* of  
21   *Traffic Channel Substate*:

- 22       • PILOT\_GATING\_USE\_RATE is set to '1'.
- 23       • The reverse pilot (r-pich) may be gated (if PILOT\_GATING\_RATE<sub>S</sub> is not equal to  
24       '00').
- 25       • If a Forward Packet Data Channel is not assigned, then the flow of data traffic is  
26       blocked by the Multiplex Sublayer.
- 27       • If a Forward Packet Data Channel is assigned, then the flow of both data traffic and  
28       signaling traffic is blocked by the Multiplex Sublayer.

29   Figure 2.6.4.3-1 shows the valid transitions between the modes of a *Traffic Channel*  
30   *Substate* when a F-PDCH is not assigned in Control Hold Mode and the over-the-air Upper  
31   Layer Signaling Messages that trigger transitions between these modes.

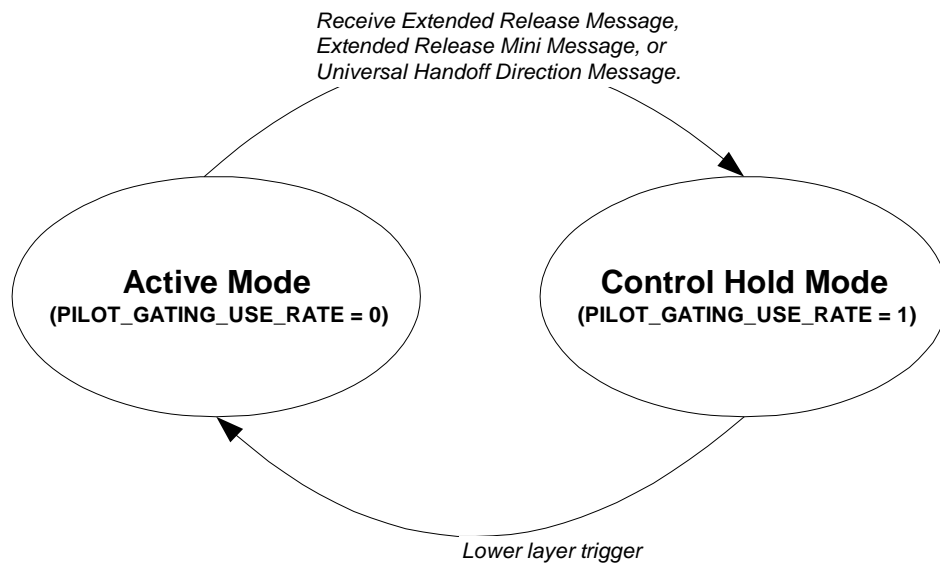

Note: The mode transition occurs when the fields are set appropriately

**Figure 2.6.4.3-1. Mobile Station Modes When a F-PDCH is not Assigned in Control Hold Mode**

Figures 2.6.4.3-2 and 2.6.4.3-3 show the valid transitions between the modes of a *Traffic Channel Substate* when a F-PDCH is assigned in Control Hold Mode and the triggers that cause transitions between these modes.

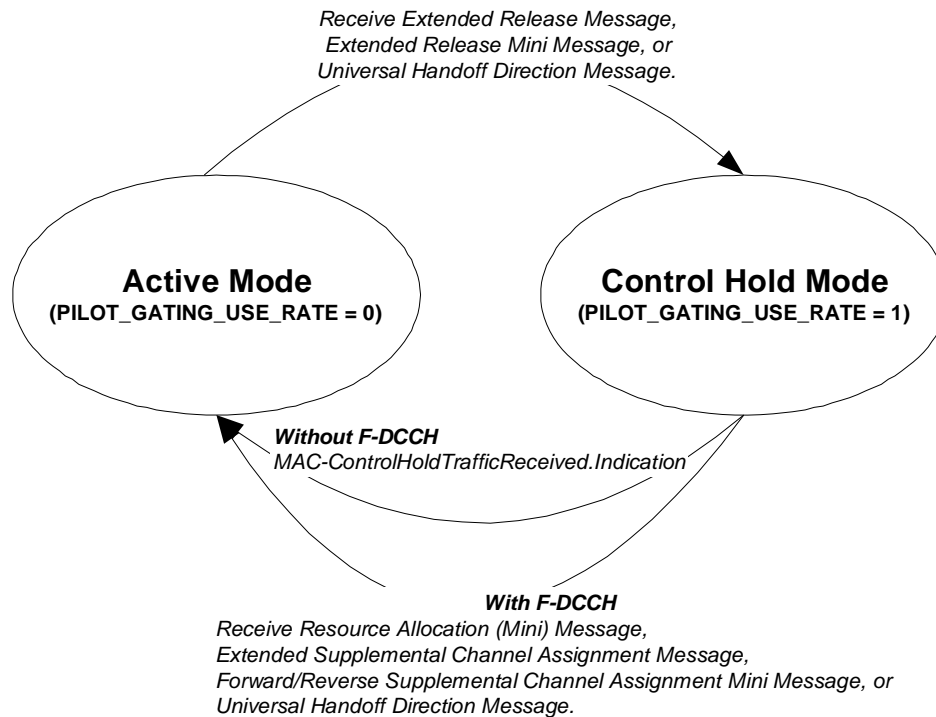

Note: The mode transition occurs  
when the fields are set appropriately

**Figure 2.6.4.3-2. Mobile Station Modes When a F-PDCH is Assigned in Control Hold Mode: Mobile Station Initiated Exit from Control Hold.**

Note: The mode transition occurs  
when the fields are set  
appropriately

**Figure 2.6.4.3-3. Mobile Station Modes when a F-PDCH is Assigned in Control Hold:  
Base Station Initiated Exit from Control Hold.**

Upon entering the *Traffic Channel Substate*, the mobile station shall perform the following:

- If  $SERV\_NEG_S$  equals enabled, the call is mobile station originated, and  $GRANTED\_MODE_S$  is equal to '00' or '01', the mobile station should initiate service negotiation to request a service configuration in accordance with the requirements for the active service subfunction (see 2.6.4.1.2.2).

While in the *Traffic Channel Substate*, the mobile station shall perform the following:

- If  $FIXED\_PREAMBLE\_TRANSMIT\_IND_S$  equals '1' and Layer 3 does not receive a *forward dedicated channel acquired* indication from Layer 2 (see [4]) within  $T_{80m}$  seconds after entering the *Traffic Channel Substate* of the *Mobile Station Control on the Traffic Channel State*, the mobile station shall set  $FIXED\_PREAMBLE\_TRANSMIT\_IND_S$  to '0' and re-enter the *Traffic Channel Initialization Substate* of the *Mobile Station Control on the Traffic Channel State* with an Initialization Failure indication.
- If the call control timer expires, the mobile station shall perform the following for each call control instance without associated  $CON\_REF$ :
  - The mobile station shall terminate the call control instance.
  - The mobile station shall send an indication to the affected service instance indicating that the call control instance has been terminated.

- 1       • The mobile station shall perform Forward Traffic Channel supervision as specified  
2       in 2.6.4.1.8. If a loss of the Forward Traffic Channel is declared, the Layer 3 shall  
3       terminate all Call Control instances, and shall enter the *System Determination*  
4       *Substate* of the *Mobile Station Initialization State* with a system lost indication (see  
5       2.6.1.1).
- 6       • The mobile station may send a *Pilot Strength Measurement Mini Message* to report  
7       pilot strength order change information, periodic pilot strength information, or  
8       threshold based pilot strength information, as specified in the *Mobile Assisted Burst*  
9       *Operation Parameters Message* (see 2.6.6.2.5.2).
- 10      • The mobile station shall adjust its transmit power as specified in [2].
- 11      • The mobile station shall perform Forward Traffic Channel power control as specified  
12      in 2.6.4.1.1.
- 13      • The mobile station shall perform handoff processing as specified in 2.6.6.
- 14      • The mobile station shall process Forward and Reverse Traffic Channel frames in  
15      accordance with requirements for the active service subfunction (see 2.6.4.1.2.2).
- 16      • The mobile station shall perform registration timer maintenance as specified in  
17      2.6.5.5.4.2.
- 18      • If the mobile station is directed to send a *Data Burst Message*, the mobile station  
19      shall send a *Data Burst Message*. If PILOT\_GATING\_USE\_RATE is set to '1', the  
20      mobile station may request to transition to the *Active Mode*  
21      (PILOT\_GATING\_USE\_RATE set to '0') prior to sending the *Data Burst Message*.
- 22      • If a Forward Packet Data Channel is not assigned and the mobile station has user  
23      data to send and PILOT\_GATING\_USE\_RATE is equal to '1', then the mobile station  
24      may send a *Resource Request Message*, *Resource Request Mini Message*,  
25      *Supplemental Channel Request Message*, or *Supplemental Channel Request Mini*  
26      *Message* to request for continuous reverse pilot transmission and user traffic  
27      transmission.
- 28      • When a Forward Packet Data Channel is assigned, PILOT\_GATING\_USE\_RATE is  
29      equal to '1', and the mobile station has data or signaling messages to send, the  
30      mobile station shall set PILOT\_GATING\_USE\_RATE to '0'.
- 31      • When a Forward Packet Data Channel is assigned, PILOT\_GATING\_USE\_RATE is  
32      equal to '1', and the mobile station receives MAC-  
33      ControlHoldTrafficReceived.Indication, the mobile station shall set  
34      PILOT\_GATING\_USE\_RATE to '0' at the *transition\_time* indicated in MAC-  
35      ControlHoldTrafficReceived.Indication.

- 1     • If the mobile station receives SIG-RemoveFPDCHLeg.Request(*index*), then, at the  
2       first 20 ms boundary (relative to System Time plus  $\text{FRAME\_OFFSET}_S \times 1.25 \text{ ms}$ )  
3       occurring at least 20 ms after the reception of this indication, for the specified  
4       member of the F-PDCH reduced active set indicated by *index*, where *index* is the  
5       index of the member in the F-PDCH reduced active set, the mobile station shall  
6       perform the following procedures:
  - 7       – the mobile station shall set  $\text{FOR\_PDCH\_INCL}_S$  to '0', and remove this pilot from  
8         the F-PDCH reduced active set, and
  - 9       – if this is the last pilot in the F-PDCH reduced active set, Layer 3 shall send SIG-  
10        HandoffPDCH.Indication (handoff\_type = ASSIGN) to the MAC layer.
- 11    • If the mobile station is directed by the user to request a new service configuration,  
12      the mobile station shall initiate service negotiation or service option negotiation in  
13      accordance with the requirements for the active service subfunction (see  
14      2.6.4.1.2.2).
- 15    • The mobile station may send a *Service Option Control Message* or *Service Option*  
16      *Control Order* to invoke a service option specific function in accordance with the  
17      requirements for the active service subfunction (see 2.6.4.1.2.2).
- 18    • If the mobile station is directed by the user to request a private long code transition  
19      and has the long code mask (see 2.3.12.3), the mobile station shall send a *Long*  
20      *Code Transition Request Order* (ORDQ = '00000001') in assured mode.
- 21    • If the mobile station is directed by the user to request a public long code transition,  
22      the mobile station shall send a *Long Code Transition Request Order* (ORDQ =  
23      '00000000') in assured mode.
- 24    • If the mobile station supports BCMC operation, it shall perform the procedures as  
25      specified in 2.6.13.
- 26    • If the mobile station is directed by the user to originate a call or if the mobile  
27      station is to monitor BCMC on traffic channel, the mobile station shall perform the  
28      following:
  - 29      – If this is an emergency call origination, the mobile station shall perform the  
30        following:
    - 31           + If it can be indicated to the base station within an existing Call Control  
32            instance, the mobile station shall send an indication to this Call Control  
33            instance that the user has originated an emergency call.
    - 34           + Otherwise, the mobile station shall perform the following:
      - 35               o For each service instance being initiated in the *Enhanced Origination*  
36                *Message*, the mobile station shall perform the following:
        - 37                   ◇ increment the stored value of  $\text{TAG}_S$  to the next unused integer value,
        - 38                   ◇ add  $\text{TAG}_S$  to the list  $\text{TAG\_OUTSTANDING\_LIST}$ ,
        - 39                   ◇ associate the  $\text{TAG}_S$  value to the corresponding service instance. and

- ◇ set an enhanced origination timer associated with TAG<sub>s</sub> to a value of T<sub>42m</sub> seconds.
  - o The mobile station shall send an *Enhanced Origination Message* to the base station, with the TAG or ADD\_TAG field of each call included in the message set to its associated TAG<sub>s</sub>.
  - o Upon sending the *Enhanced Origination Message* and prior to receiving a Layer 3 response from the base station, if the mobile station is directed by the user to cancel this call, the mobile station shall perform the following:
    - ◇ The mobile station shall send a *Call Cancel Message* to the base station, with each TAG or ADD\_TAG field included in the message set to the TAG value in the list TAG\_OUTSTANDING\_LIST corresponding to the call(s) being cancelled.
    - ◇ The mobile station shall remove the TAG field corresponding to each call being cancelled from the list TAG\_OUTSTANDING\_LIST.
  - + If the enhanced origination timer expires, the mobile station shall remove the associated TAG field corresponding to this call from TAG\_OUTSTANDING\_LIST.
  - Otherwise, the mobile station shall perform the following:
    - + If this is a packet data call origination<sup>31</sup>, the mobile station shall first determine the following conditions:
      - o If RETRY\_DELAY<sub>s</sub>[001] is not 0, the mobile station shall not send the *Enhanced Origination Message* until after the system time stored in RETRY\_DELAY<sub>s</sub>[001].
      - o If RETRY\_DELAY<sub>s</sub>[101] is not 0, the mobile station shall not send the *Enhanced Origination Message* until after the system time stored in RETRY\_DELAY<sub>s</sub>[101].
    - + If this contains BCMC origination, the mobile station shall determine the following conditions:
      - o If BCMC\_RETRY\_DELAY\_LISTs[i].RETRY\_DELAY is not zero for the BCMC flow corresponding to BCMC\_RETRY\_DELAY\_LISTs[i].BCMC\_FLOW\_ID, the mobile station shall not include the BCMC flow (See section 2.6.13.11) in the *Enhanced Origination Message* until after the system time stored in BCMC\_RETRY\_DELAY\_LISTs[i].RETRY\_DELAY.

<sup>31</sup> Packet data origination refers to origination with SO 60, SO 61 or any service option in Service Option Group 4 and 5 in [30]

- 1           + If the above conditions do not prohibit the mobile station from sending an
- 2           *Enhanced Origination Message* at this time, the mobile station shall perform
- 3           the following:
- 4           o If P\_REV\_IN\_USE<sub>S</sub> is greater than or equal to 11 and the *Enhanced*
- 5           *Origination Message* is being sent to perform packet data dormant
- 6           handoff, the mobile station shall include all dormant packet data service
- 7           instances (see [42]) up to the limit specified by
- 8           MAX\_ADD\_SERV\_INSTANCE<sub>S</sub>.
- 9           o For each service instance being initiated in the *Enhanced Origination*
- 10          *Message*, the mobile station shall perform the following:
- 11          ◇ increment the stored value of TAG<sub>S</sub> to the next unused integer value,
- 12          ◇ add TAG<sub>S</sub> to the list TAG\_OUTSTANDING\_LIST,
- 13          ◇ associate the TAG<sub>S</sub> value to the corresponding service instance, and
- 14          ◇ set an enhanced origination timer associated with TAG<sub>S</sub> to a value of
- 15          T42m seconds.
- 16          o The mobile station shall send an *Enhanced Origination Message* to the
- 17          base station, with the TAG or ADD\_TAG field of each call included in the
- 18          message set to its associated TAG<sub>S</sub>.
- 19       + Upon sending the *Enhanced Origination Message* and prior to receiving a
- 20       Layer 3 response from the base station, if the mobile station is directed by
- 21       the user to cancel this call, the mobile station shall perform the following:
- 22       o The mobile station shall send a *Call Cancel Message* to the base station,
- 23       with each TAG or ADD\_TAG field included in the message set to the TAG
- 24       value in the list TAG\_OUTSTANDING\_LIST corresponding to the call(s)
- 25       being cancelled.
- 26       o The mobile station shall disable the enhanced origination timer and
- 27       shall remove the TAG field corresponding to each call being cancelled
- 28       from the list TAG\_OUTSTANDING\_LIST.
- 29       + If the enhanced origination timer expires, the mobile station shall remove
- 30       the associated TAG field from TAG\_OUTSTANDING\_LIST.
- 31       • If the Layer 3 receives a “call release request” from a Call Control instance, Layer 3
- 32       shall perform the following:
- 33       - If there are no other active or pending calls, the Layer 3 shall enter the *Release*
- 34       *Substate* with a mobile station release indication (see 2.6.4.4).
- 35       – Otherwise, the mobile station shall perform the following:
- 36       + The mobile station shall send a Service Request Message, Resource Release
- 37       *Request Message*, or a *Resource Release Request Mini Message* to the base
- 38       station requesting to release the service option connection.

- 1           + If the mobile station sends a Resource Release Request Message or a  
2           *Resource Release Request Mini Message*, it shall set the purge service indicator  
3           field to '0'.
- 4       • If the Layer 3 receives a request to release a BCMC call [*BCMC-Stop-*  
5       *Monitor.Request(BCMC\_FLOW\_ID)*] from Upper Layer, Layer 3 shall perform the  
6       following:
  - 7           - If there are no other active or pending calls, the Layer 3 shall enter the *Release*  
8           *Substate* with a mobile station release indication (see 2.6.4.4).
  - 9           - Otherwise, the mobile station shall send a *Resource Release Request Message*  
10           to the base station requesting to release the BCMC flow (See section 2.6.13.11).
- 11       • If the Layer 3 receives a "call inactive indication" from a Call Control instance,  
12       Layer 3 shall perform the following:
  - 13           - If there are no other active or pending calls, the Layer 3 shall enter the *Release*  
14           *Substate* with a service inactive indication (see 2.6.4.4).
  - 15           - Otherwise, the mobile station shall perform the following:
    - 16               + The mobile station shall send a Service Request Message, Resource Release  
17               Request Message, or a Resource Release Request Mini Message to the base  
18               station requesting to release the service option connection and purge the  
19               service.
    - 20               + If the mobile station sends a Resource Release Request Message or a  
21               Resource Release Request Mini Message, it shall set the purge service indicator  
22               field to '1'.
- 23       • If the mobile station is directed by the user to power down, the Layer 3 shall send a  
24       "release indication" to all Call Control instances, and shall enter the *Release*  
25       *Substate* with a power-down indication (see 2.6.4.4).
- 26       • If Layer 3 receives a L2-Condition.Notification primitive from Layer 2 indicating an  
27       acknowledgment failure, then:
  - 28           - If RESQ\_ENABLED<sub>S</sub> is equal to '1' and FPC\_PRI\_CHAN<sub>S</sub> is equal to '0', the  
29           mobile station shall perform the following:
    - 30               + disable its transmitter, and
    - 31               + enable the rescue delay timer with an initial value of (RESQ\_DELAY\_TIME<sub>S</sub>  
32               × 80) ms.
  - 33           - Otherwise, the layer 3 shall terminate all Call Control instances, and the mobile  
34           station shall disable its transmitter and shall enter the *System Determination*  
35           *Substate* of the *Mobile Station Initialization State* with a system lost indication  
36           (see 2.6.1.1).
- 37       • The mobile station shall perform the following:

- 1       – The mobile station may send the *Resource Request Message* or *Resource*  
2       *Request Mini Message* in accordance with requirements for the currently  
3       connected service option whenever  $\text{RETRY\_DELAY}_S[\text{RETRY\_TYPE}]$  is equal to 0,  
4       where,  $\text{RETRY\_TYPE}$  is equal to '010'.
- 5       – The mobile station shall not send the *Resource Request Message* or *Resource*  
6       *Request Mini Message* whenever  $\text{RETRY\_DELAY}_S[\text{RETRY\_TYPE}]$  is set to *infinity*,  
7       where,  $\text{RETRY\_TYPE}$  is equal to '010'.
- 8       – If  $\text{USE\_CH\_CFG\_RRM}_S$  is equal to '0', the mobile station shall set  $\text{CH\_IND\_INCL}$   
9       to '0' in the *Resource Request Message* and *Resource Request Mini Message*;  
10      otherwise, the mobile station may request a channel configuration in the  
11      *Resource Request Message* or *Resource Request Mini Message*.
- 12      – If  $\text{RETRY\_DELAY}_S[\text{RETRY\_TYPE}]$  is not 0 or *infinity*, the mobile station shall not  
13      send the *Resource Request Message* or *Resource Request Mini Message* until  
14      after the system time stored in  $\text{RETRY\_DELAY}_S[\text{RETRY\_TYPE}]$ , where,  
15       $\text{RETRY\_TYPE}$  is equal to '010'.
- 16      – The mobile station may send the *Supplemental Channel Request Message* or  
17      *Supplemental Channel Request Mini Message* whenever  
18       $\text{RETRY\_DELAY}_S[\text{RETRY\_TYPE}]$  is set to '0', where,  $\text{RETRY\_TYPE}$  is equal to  
19      '011'.
- 20      – The mobile station shall not send the *Supplemental Channel Request Message*  
21      or *Supplemental Channel Request Mini Message* whenever  
22       $\text{RETRY\_DELAY}_S[\text{RETRY\_TYPE}]$  is set to *infinity*, where,  $\text{RETRY\_TYPE}$  is equal to  
23      '011'.
- 24      – If  $\text{RETRY\_DELAY}_S[\text{RETRY\_TYPE}]$  is not 0 or *infinity*, the mobile station shall not  
25      send the *Supplemental Channel Request Message* or *Supplemental Channel*  
26      *Request Mini Message* until after the system time stored in  
27       $\text{RETRY\_DELAY}_S[\text{RETRY\_TYPE}]$ , where,  $\text{RETRY\_TYPE}$  is equal to '011'.
- 28      – The mobile station shall not send a Short Data Burst (see [30], [42]) whenever  
29       $\text{RETRY\_DELAY}_S[\text{RETRY\_TYPE}]$  is set to *infinity*, where,  $\text{RETRY\_TYPE}$  is equal to  
30      '100' or '101'.
- 31      – If  $\text{RETRY\_DELAY}_S[\text{RETRY\_TYPE}]$  is not 0 or *infinity*, where,  $\text{RETRY\_TYPE}$  is  
32      equal to '100' or '101', the mobile station shall not send a Short Data Burst (see  
33      [30], [42]) until the maximum of the system time stored in  $\text{RETRY\_DELAY}_S[100]$   
34      and  $\text{RETRY\_DELAY}_S[101]$ .
- 35      – At the system time stored in  $\text{RETRY\_DELAY}_S[\text{RETRY\_TYPE}]$ , the mobile station  
36      shall reset  $\text{RETRY\_DELAY}_S[\text{RETRY\_TYPE}]$  to 0, where  $\text{RETRY\_TYPE}$  is equal to  
37      '001', '010', '011', '100' or '101'.
- 38      • The mobile station may send a *Resource Release Request Message* or a *Resource*  
39      *Release Request Mini Message* to request for reverse pilot gating operation to be  
40      performed or to request a service option connection to be disconnected. The mobile  
41      station may send a *Resource Release Request Message* to request one or more  
42      BCMC flows to be disconnected.

- 1     • The mobile station may send a *Shared Channel Configuration Order* (ORDQ =  
2     '00000000') to request for R-FCH assignment. The mobile station may send a  
3     *Shared Channel Configuration Order* (ORDQ = '00000001') to request release of the  
4     R-FCH.
- 5     • When the Reverse Packet Data Channel is assigned, the mobile station shall not  
6     send a *Supplemental Channel Request Message* or *Supplemental Channel Request*  
7     *Mini Message* containing a request for Reverse Supplemental Channel assignment.
- 8     • The mobile station may enter the *Release Substate* with a service inactive  
9     indication (see 2.6.4.4) if the service corresponding to the packet data service  
10    option instance is inactive at the mobile station.
- 11    • If Layer 3 receives a "substate timer expired indication" from a Call Control  
12    instance, the Layer 3 shall perform the following:
  - 13      - If there are no other active or pending calls, the Layer 3 shall terminate this Call  
14        Control instance; and the mobile station shall disable its transmitter and enter  
15        the *System Determination Substate* of the *Mobile Station Initialization State* with  
16        a system lost indication (see 2.6.1.1).
  - 17      - Otherwise, the mobile station shall send a *Service Request Message*, *Resource*  
18        *Release Request Message*, or a *Resource Release Request Mini Message*.
- 19    • If there are no active or pending calls, the Layer 3 shall enter the *Release Substate*  
20    with a mobile station release indication.
- 21    • If Layer 3 receives a 'message rejected indication' from a Call Control instance,  
22    mobile station shall send a *Mobile Station Reject Order* (ORDQ set to the applicable  
23    reason code as determined from Table 2.7.3-1) within T<sub>56m</sub> seconds as follows:
  - 24      - If P\_REV\_IN\_USE<sub>s</sub> is equal to or greater than seven, the mobile station shall  
25        include the CON\_REF\_INCL field with this message and shall perform the  
26        following: if the corresponding Call Control instance is identified by NULL, the  
27        mobile station shall either set the CON\_REF\_INCL field of the message to '0' or  
28        set the CON\_REF\_INCL field to '1' and set the CON\_REF field to the connection  
29        reference of the service option connection corresponding to this Call Control  
30        instance; otherwise, the mobile station shall set the CON\_REF\_INCL field of the  
31        message to '1' and the CON\_REF field of the message to the connection  
32        reference of the service option connection corresponding to this Call Control  
33        instance.
- 34    • If Layer 3 is requested by the upper layers to query base station identification  
35    number, SID, NID, and LAT/LONG related information for one or more pilots, and  
36    PILOT\_INFO\_REQ\_SUPPORTED<sub>s</sub> equals '1', mobile station shall send a *Base*  
37    *Station Status Request Message* with a "Pilot Information" record type to the base  
38    station.

- 1       • If the mobile station needs to suspend its CDMA Traffic Channel processing for  
2       applications other than a PUF probe, hard handoff, or periodic search, then, prior  
3       to suspending its CDMA Traffic Channel processing, the mobile station shall  
4       perform the following:  
5       - If CDMA\_OFF\_TIME\_REP\_SUP\_IND<sub>s</sub> is equal to '1' and the total time it needs to  
6       suspend processing the CDMA Traffic Channel is longer than  
7       CDMA\_OFF\_TIME\_REP\_THRESHOLD<sub>s</sub>, the mobile station shall send a *CDMA*  
8       *Off Time Report Message*. Otherwise, the mobile shall not send a *CDMA Off Time*  
9       *Report Message*.
- 10       • The mobile station may send a *CDMA Off Time Report Message* with  
11       CDMA\_OFF\_TIME\_ENABLE set to '0' to cancel a previously reported CDMA Traffic  
12       Channel processing suspension.
- 13       • The mobile station shall update RC\_PARAMS\_RECORD<sub>s</sub> as described in section  
14       2.6.17.
- 15       • If the mobile station performs a hard handoff, it shall initialize RC parameters as  
16       described in section 2.6.16.
- 17       • If the mobile station receives R-SCH burst assignment with RC08, then the mobile  
18       station shall perform the following:  
19       - Set REV\_FCH\_BLANKING\_DUTYCYCLE\_IN\_USE to '000' at the start time of the  
20       burst assignment.  
21       - Set REV\_FCH\_BLANKING\_DUTYCYCLE\_IN\_USE to  
22       REV\_FCH\_BLANKING\_DUTYCYCLE<sub>s</sub> at the end of the burst assignment.
- 23       • If the mobile station receives a message which is included in the following list and  
24       every message field value is within its permissible range, the mobile station shall  
25       process the message as described below and in accordance with the message's  
26       action time (see 2.6.4.1.5).  
27       1. *Alert With Information Message*: If P\_REV\_IN\_USE<sub>s</sub> is less than seven, the Layer  
28       3 shall deliver this message to the Call Control instance; otherwise, the Layer 3  
29       shall deliver this message to the Call Control instance identified by NULL.  
30       2. *Reserved*  
31       3. *Audit Order*  
32       4. *Authentication Challenge Message*: The Layer 3 shall send a "reset waiting for  
33       order substate timer indication" to all Call Control instances. The mobile  
34       station shall process the message and shall respond as specified in 2.3.12.1.4  
35       within T<sub>32m</sub> seconds, regardless of the value of AUTH<sub>s</sub>.  
36       5. *Authentication Request Message*: The mobile station shall process the message  
37       and shall respond as specified in 2.3.12.5.2.

- 1       6. *Base Station Challenge Confirmation Order*: The Layer 3 shall send a “reset  
2       waiting for order substate timer indication” to all Call Control instances. The  
3       mobile station shall process the message and shall respond with an *SSD*  
4       *Update Confirmation Order* or *SSD Update Rejection Order* as specified in  
5       2.3.12.1.5 within  $T_{32m}$  seconds.
- 6       7. *Base Station Status Response Message*: The Layer 3 shall deliver the  
7       information contained in this message to the Upper Layer entity that requested  
8       for this information.
- 9       8. *Call Assignment Message*: The mobile station shall process this message as  
10      follows:
- 11      - If  $RESPONSE\_IND_r$  equals ‘1’, then for each of the  $TAG_r$  or  $ADD\_TAG_r$  fields  
12      that matches any of the TAG values contained in the list  
13       $TAG\_OUTSTANDING\_LIST$ , the mobile station shall perform the following:
- 14      + If  $ACCEPT\_IND_r$  or  $ADD\_ACCEPT\_IND_r$  associated with the  $TAG_r$  or  
15       $ADD\_TAG_r$  equals ‘0’, the mobile station shall disable the enhanced  
16      origination timer associated with  $TAG_r$  and shall remove the TAG value  
17      specified by  $TAG_r$  from the list  $TAG\_OUTSTANDING\_LIST$ .
- 18      + If  $ACCEPT\_IND_r$  or  $ADD\_ACCEPT\_IND_r$  associated with the  $TAG_r$  or  
19       $ADD\_TAG_r$  equals ‘1’ and  $USE\_OLD\_SERV\_CONFIG_r$  field associated  
20      with this TAG is not set to ‘1’, the mobile station shall perform the  
21      following:
- 22      o If there already exists or currently pending instantiation a Call  
23      Control instance identified by  $CON\_REF_r$  or  $ADD\_CON\_REF_r$   
24      associated with the  $TAG_r$  or  $ADD\_TAG_r$ , the mobile station shall  
25      send a *Mobile Station Reject Order* with  $ORDQ$  field set to ‘00010010’  
26      (a call control instance is already present with the specified  
27      identifier), with the  $CON\_REF$  field of the order set to the  $CON\_REF_r$   
28      or  $ADD\_CON\_REF_r$ .
- 29      o Otherwise, Layer 3 shall instantiate a Call Control instance (as  
30      specified in 2.6.10) at the action time of the message. The mobile  
31      station shall identify this Call Control instance by  $CON\_REF_r$  or  
32       $ADD\_CON\_REF_r$  associated with the  $TAG_r$  or  $ADD\_TAG_r$ . If a service  
33      option connection corresponding to this call has not been  
34      established, the mobile station should wait for the base station to  
35      initiate service negotiation to establish the service option connection.
- 36      o The mobile station shall disable the enhanced origination timer  
37      corresponding to this TAG and shall remove the TAG value from the  
38      list  $TAG\_OUTSTANDING\_LIST$ .
- 39      + If  $ACCEPT\_IND_r$  equals ‘1’ and  $USE\_OLD\_SERV\_CONFIG_r$  field is  
40      included and is set to ‘1’, the mobile station shall perform the following:

- 1                   ○ At the action time of this message, the mobile station shall restore  
2                   the indicated service option connection record(s) from the stored  
3                   service configuration, where the service option connection records to  
4                   be restored are determined as follows:
- 5                   ○ If SR\_ID<sub>r</sub> equals '111', the mobile station shall restore all remaining  
6                   service option connection records from the stored service  
7                   configuration; otherwise, the mobile station shall restore the service  
8                   option connection record corresponding to the SR\_ID<sub>r</sub> received in  
9                   this message.
- 10                  ○ Layer 3 shall instantiate a Call Control instance (as specified in  
11                  2.6.10) for each of the restored service option connections with a  
12                  'restore indication' and Layer 3 shall identify each of these Call  
13                  Control instances by the value of the CON\_REF field corresponding  
14                  to the restored service option connection.
- 15                  ○ The mobile station shall disable the enhanced origination timer  
16                  corresponding to TAG<sub>r</sub> and shall remove the TAG value specified by  
17                  TAG<sub>r</sub> from the list TAG\_OUTSTANDING\_LIST.
- 18                  – If RESPONSE\_IND<sub>r</sub> equals '1', then for each of the TAG<sub>r</sub> or ADD\_TAG<sub>r</sub>  
19                  fields that does not match with any of the TAG values contained in the list  
20                  TAG\_OUTSTANDING\_LIST, the mobile station shall send a *Mobile Station*  
21                  *Reject Order* with ORDQ field set to '00010011' (TAG received does not  
22                  match TAG stored), with the TAG field of the order set to the TAG<sub>r</sub> or  
23                  ADD\_TAG<sub>r</sub>, and the CON\_REF field of the order set to CON\_REF<sub>r</sub> or  
24                  ADD\_CON\_REF<sub>r</sub>.
- 25                  – If RESPONSE\_IND<sub>r</sub> equals '0' and USE\_OLD\_SERV\_CONFIG<sub>r</sub> field is not  
26                  included or is included and is set to '0', the mobile station shall perform the  
27                  following for each of the CON\_REF<sub>r</sub> or ADD\_CON\_REF<sub>r</sub>:
  - 28                  + If there already exists or currently pending instantiation a Call Control  
29                  instance identified by CON\_REF<sub>r</sub> or ADD\_CON\_REF<sub>r</sub>, the mobile station  
30                  shall send a *Mobile Station Reject Order* with ORDQ field set to  
31                  '00010010' (a call control instance is already present with the specified  
32                  identifier), with the CON\_REF field of the order set to the CON\_REF<sub>r</sub> or  
33                  ADD\_CON\_REF<sub>r</sub>.
  - 34                  + Otherwise, if the mobile station does not accept this call assignment, the  
35                  mobile station shall send a *Mobile Station Reject Order* with ORDQ field  
36                  set to '00010000' (call assignment not accepted), with the CON\_REF  
37                  field of the order set to the CON\_REF<sub>r</sub> or ADD\_CON\_REF<sub>r</sub>.
  - 38                  + Otherwise, at the action time of the message, the mobile station shall  
39                  store the bypass indicator (BYPASS\_ALERT\_ANSWER<sub>s</sub> =  
40                  BYPASS\_ALERT\_ANSWER<sub>r</sub>) and the Layer 3 shall instantiate a Call

- 1 Control instance (as specified in 2.6.10). The mobile station shall  
 2 identify this Call Control instance by the CON\_REF<sub>r</sub> or ADD\_CON\_REF<sub>r</sub>.  
 3 If a service option connection corresponding to this call has not been  
 4 established, the mobile station should wait for the base station to  
 5 initiate service negotiation to establish the service option connection.
- 6 - If RESPONSE\_IND<sub>r</sub> equals '0' and USE\_OLD\_SERV\_CONFIG<sub>r</sub> field is  
 7 included and is set to '1', the mobile station shall perform the following:
    - 8 + At the action time of this message, the mobile station shall restore the  
 9 indicated service option connection record(s) from the stored service  
 10 configuration, where the service option connection records to be  
 11 restored are determined as follows:
      - 12 o If SR\_ID<sub>r</sub> equals '111', the mobile station shall restore all remaining  
 13 service option connection records from the stored service  
 14 configuration; otherwise, the mobile station shall restore the service  
 15 option connection record corresponding to the SR\_ID<sub>r</sub> received in  
 16 this message.
      - 17 + If SR\_ID<sub>r</sub> equals '111', the mobile station shall perform the following:
        - 18 o For the first remaining service option connection (with  
 19 corresponding connection reference CON\_REF<sub>i</sub>) listed in this stored  
 20 Service Configuration information record, Layer 3 shall instantiate a  
 21 Call Control instance (as specified in 2.6.10) with the received  
 22 BYPASS\_ALERT\_ANSWER<sub>s</sub>. The mobile station shall identify this  
 23 Call Control instances by the corresponding CON\_REF<sub>i</sub>.
        - 24 o For each of the remaining service option connections, Layer 3 shall  
 25 instantiate a Call Control instance (as specified in 2.6.10) for each of  
 26 the restored service option connections with a 'restore indication'  
 27 and Layer 3 shall identify each of these Call Control instances by the  
 28 value of the CON\_REF field corresponding to the restored service  
 29 option connection.
      - 30 + If SR\_ID<sub>r</sub> is not equal to '111', Layer 3 shall instantiate a Call Control  
 31 instance (as specified in 2.6.10) with the received  
 32 BYPASS\_ALERT\_ANSWER<sub>s</sub> for the service option connection record  
 33 corresponding to the SR\_ID<sub>r</sub> received in this message.
  - 34 9. *Candidate Frequency Search Control Message:* The mobile station shall  
 35 process the message as specified in 2.6.6.2.5.1.
  - 36 10. *Candidate Frequency Search Request Message:* The mobile station shall  
 37 process the message as specified in 2.6.6.2.5.1.
  - 38 11. *Continuous DTMF Tone Order:* Support of this order by the mobile station is

optional. If  $P\_REV\_IN\_USE_s$  is less than seven, the Layer 3 shall deliver this message to the Call Control instance; otherwise, the Layer 3 shall perform the following: if  $CON\_REF\_INCL_r$  equals '0', the Layer 3 shall deliver this message to the Call Control instance identified by NULL; otherwise, the Layer 3 shall deliver this message to the Call Control instance identified by  $CON\_REF_r$ .

## 12. *Data Burst Message*

13. *Extended Alert With Information Message*: The mobile station shall perform the following: If  $CON\_REF\_INCL_r$  equals '0', the Layer 3 shall deliver this message to the Call Control instance identified by NULL; otherwise, the Layer 3 shall deliver this message to the Call Control instance identified by  $CON\_REF_r$ .

14. *Extended Flash With Information Message*: The mobile station shall perform the following: If  $CON\_REF\_INCL_r$  equals '0', the Layer 3 shall deliver this message to the Call Control instance identified by NULL; otherwise, the Layer 3 shall deliver this message to the Call Control instance identified by  $CON\_REF_r$ .

15. *Extended Handoff Direction Message*: The Layer 3 shall send a "reset waiting for order substate timer indication" to all Call Control instances. The mobile station shall process the message as specified in 2.6.6.2.5.1.

16. *Extended Neighbor List Update Message*: The mobile station shall process the message as specified in 2.6.6.2.5.1.

17. *Extended Release Message*: The mobile station shall process the message as specified in 2.6.4.1.9.

18. *Extended Release Mini Message*: The mobile station shall process the message as specified in 2.6.4.1.9.

19. *Forward Supplemental Channel Assignment Mini Message*: The mobile station shall process the message as specified in 2.6.6.2.5.1.

20. *Flash With Information Message*: If  $P\_REV\_IN\_USE_s$  is less than seven, the Layer 3 shall deliver this message to the Call Control instance; otherwise, the Layer 3 shall deliver this message to the Call Control instance identified by NULL.

21. *Extended Supplemental Channel Assignment Message*: The mobile station shall process the message as specified in 2.6.6.2.5.1.

22. *General Handoff Direction Message*: The Layer 3 shall send a "reset waiting for order substate timer indication" to all Call Control instances. The mobile station shall process the message as specified in 2.6.6.2.5.1.

23. *In-Traffic System Parameters Message*: The mobile station shall process the message as specified in 2.6.4.1.4.

## 24. *Local Control Order*

25. *Lock Until Power-Cycled Order*: The mobile station shall disable its transmitter and record the reason for the *Lock Until Power-Cycled Order* in the mobile station's semi-permanent memory ( $LCKRSN\_P_{s-p}$  equals the least-significant

- 1 four bits of  $ORDQ_r$ ). The mobile station should notify the user of the locked  
 2 condition. The Layer 3 shall terminate all Call Control instances, and shall  
 3 enter the *System Determination Substate* of the *Mobile Station Initialization*  
 4 *State* with a lock indication (see 2.6.1.1), and shall not enter the *System Access*  
 5 *State* again until after the next mobile station power-up or until it has received  
 6 an *Unlock Order*. This requirement shall take precedence over any other  
 7 mobile station requirement specifying entry to the *System Access State*.
- 8 26. *Long Code Transition Request Order*: The mobile station shall process the  
 9 message as specified in 2.6.4.1.6.
- 10 27. *Maintenance Order*: If  $P\_REV\_IN\_USE_s$  is less than seven, the Layer 3 shall  
 11 deliver this message to the Call Control instance; otherwise, the Layer 3 shall  
 12 perform the following: if  $CON\_REF\_INCL_r$  equals '0', the Layer 3 shall deliver  
 13 this message to the Call Control instance identified by NULL; otherwise, the  
 14 Layer 3 shall deliver this message to the Call Control instance identified by  
 15  $CON\_REF_r$ .
- 16 28. *Maintenance Required Order*: The mobile station shall record the reason for the  
 17 *Maintenance Required Order* in the mobile station's semi-permanent memory  
 18 ( $MAINTRSN_{s-p}$  equals the least-significant four bits of  $ORDQ_r$ ). The mobile  
 19 station shall remain in the unlocked condition. The mobile station should  
 20 notify the user of the maintenance required condition.
- 21 29. *Message Encryption Mode Order*: The mobile station shall process the message  
 22 as specified in 2.3.12.2.
- 23 30. *Mobile Station Registered Message*: The mobile station shall process the  
 24 message as specified in 2.6.5.5.4.3.
- 25 31. *Mobile Assisted Burst Operation Parameters Message*: The mobile station shall  
 26 process the message as specified in 2.6.6.2.5.1.
- 27 32. *Neighbor List Update Message*: The mobile station shall process the message  
 28 as specified in 2.6.6.2.5.1.
- 29 33. *Outer Loop Report Request Order*: The mobile station shall send the *Outer Loop*  
 30 *Report Message* in assured mode to the base station.
- 31 34. *Parameter Update Order*: The Layer 3 shall send a "reset waiting for order  
 32 substate timer indication" to all Call Control instances. The mobile station  
 33 shall increment  $COUNT_{s-p}$  (see 2.3.12.1.3). The mobile station shall send a  
 34 *Parameter Update Confirmation Order* within  $T_{56m}$  seconds. The mobile station  
 35 shall set the  $ORDQ$  field of the *Parameter Update Confirmation Order* to the  
 36 same value as the  $ORDQ$  field of the *Parameter Update Order*.
- 37 35. *Periodic Pilot Measurement Request Order*: The mobile station shall process the  
 38 order as specified in 2.6.6.2.5.1.
- 39 36. *Pilot Measurement Request Order*: The mobile station shall process the order  
 40 as specified in 2.6.6.2.5.1.
- 41 37. *Power Control Message*: The mobile station shall process the message as

specified in 2.6.4.1.1.3.

38. *Power Control Parameters Message*: The mobile station shall process the message as specified in 2.6.4.1.1.2.
39. *Power Up Function Message*: The mobile station shall process the message as specified in 2.6.4.1.7.1.
40. *Power Up Function Completion Message*: The mobile station shall process the message as specified in 2.6.4.1.7.3.
41. *Rate Change Message*: The mobile station shall process the message as specified in 2.6.4.1.1.4.
42. *Release Order*: The Layer 3 shall send a “release indication” to all Call Control instances, and shall enter the *Release Substate* with a base station release indication (see 2.6.4.4).
43. *Resource Allocation Message*: The mobile station shall process the message as specified in 2.6.4.1.10.
44. *Resource Allocation Mini Message*: The mobile station shall process the message as specified in 2.6.4.1.10.
45. *Retrieve Parameters Message*: The mobile station shall send, within T<sub>56m</sub> seconds, a *Parameters Response Message*.
46. *Retry Order*: The mobile station shall process the order as follows:
  - If RETRY\_TYPE<sub>R</sub> is equal to ‘000’, the mobile station shall set RETRY\_DELAY<sub>S</sub>[RETRY\_TYPE] to 0, where RETRY\_TYPE is equal to ‘001’, ‘010’, ‘011’, ‘100’, or ‘101’.
  - If RETRY\_TYPE<sub>R</sub> is equal to ‘001’, ‘100’, or ‘101’, then the mobile station shall perform the following:
    - If RETRY\_DELAY<sub>R</sub> is equal to ‘00000000’, then the mobile station shall set RETRY\_DELAY<sub>S</sub> [RETRY\_TYPE<sub>R</sub>] to 0.
    - If RETRY\_DELAY<sub>R</sub> is not equal to ‘00000000’, the mobile station shall set RETRY\_DELAY<sub>S</sub>[RETRY\_TYPE<sub>R</sub>] as follows:
      - + If the most significant bit of the RETRY\_DELAY<sub>R</sub> is 0, set RETRY\_DELAY\_UNIT<sub>S</sub> to 1000ms. If the most significant bit of the RETRY\_DELAY<sub>R</sub> is ‘1’, set RETRY\_DELAY\_UNIT<sub>S</sub> to 60000ms.
      - + The mobile station shall set RETRY\_DELAY\_VALUE<sub>S</sub> to the seven least significant bits of RETRY\_DELAY<sub>R</sub>.
      - + The mobile station shall store the next system time 80 ms boundary + RETRY\_DELAY\_VALUE<sub>S</sub> × RETRY\_DELAY\_UNIT<sub>S</sub> ms as RETRY\_DELAY<sub>S</sub>[RETRY\_TYPE<sub>R</sub>].
  - If RETRY\_TYPE<sub>R</sub> is equal to ‘010’ or ‘011’, the mobile station shall perform the following:

- 1                   - If  $\text{RETRY\_DELAY}_r[\text{RETRY\_TYPE}_r]$  is '00000000', then the mobile station
- 2                   shall set  $\text{RETRY\_DELAY}_s[\text{RETRY\_TYPE}_r]$  to 0.
- 3                   - If  $\text{RETRY\_DELAY}_r[\text{RETRY\_TYPE}_r]$  is '11111111', then the mobile station
- 4                   shall set  $\text{RETRY\_DELAY}_s[\text{RETRY\_TYPE}_r]$  to *infinity*.
- 5                   - If  $\text{RETRY\_DELAY}_r[\text{RETRY\_TYPE}_r]$  is not equal to '00000000' or
- 6                   '11111111', the mobile station shall store the next system time 80 ms
- 7                   boundary +  $\text{RETRY\_DELAY}_r[\text{RETRY\_TYPE}_r] \times 320$  ms as
- 8                    $\text{RETRY\_DELAY}_s[\text{RETRY\_TYPE}_r]$ .
- 9                   47. *Reverse Supplemental Channel Assignment Mini Message*: The mobile station
- 10                  shall process the message as specified in 2.6.6.2.5.1.
- 11                  48. *Security Mode Command Message*: The mobile station shall process the
- 12                  message as specified in 2.6.4.1.14.
- 13                  49. *Send Burst DTMF Message*: Support of this message by the mobile station is
- 14                  optional. If  $\text{P\_REV\_IN\_USE}_s$  is less than seven, the Layer 3 shall deliver this
- 15                  message to the Call Control instance; otherwise, the Layer 3 shall perform the
- 16                  following: if  $\text{CON\_REF\_INCL}_r$  equals '0', the Layer 3 shall deliver this message
- 17                  to the Call Control instance identified by NULL; otherwise, the Layer 3 shall
- 18                  deliver this message to the Call Control instance identified by  $\text{CON\_REF}_r$ .
- 19                  50. *Service Connect Message*: The mobile station shall process the message in
- 20                  accordance with the requirements for the active service subfunction (see
- 21                  2.6.4.1.2.2) if the message is not rejected due to the following conditions:
- 22                  - If the  $\text{CC\_INFO\_INCL}$  field is included in this message and is set to '1', the
- 23                  mobile station shall perform the following for each of the
- 24                   $\text{NUM\_CALLS\_ASSIGN}$  call assignments included in this message:
- 25                  + If there already exists or currently pending instantiation a Call Control
- 26                  instance identified by  $\text{CON\_REF}_r$ , the mobile station shall send a *Mobile*
- 27                  *Station Reject Order* with  $\text{ORDQ}$  field set to '00010010' (a call control
- 28                  instance is already present with the specified identifier), with the
- 29                   $\text{CON\_REF}$  field of the order set to  $\text{CON\_REF}_r$ .
- 30                  + If  $\text{RESPONSE\_IND}_r$  equals '1' and  $\text{TAG}_r$  does not match any of the TAG
- 31                  values contained in the list  $\text{TAG\_OUTSTANDING\_LIST}$ , the mobile
- 32                  station shall send a *Mobile Station Reject Order* with  $\text{ORDQ}$  field set to
- 33                  '00010011' (TAG received does not match TAG stored), with the TAG
- 34                  field of the order set to  $\text{TAG}_r$ , and the  $\text{CON\_REF}$  field of the order set to
- 35                   $\text{CON\_REF}_r$ .
- 36                  + If the mobile station does not accept this call assignment, the mobile
- 37                  station shall send a *Mobile Station Reject Order* with  $\text{ORDQ}$  field set to
- 38                  '00010000' (call assignment not accepted), with the  $\text{CON\_REF}$  field of
- 39                  the order set to  $\text{CON\_REF}_r$ .
- 40                  51. *Service Option Control Message*: The mobile station shall process the message

- 1 in accordance with the requirements for the active service subfunction (see  
2 2.6.4.1.2.2).
- 3 52. *Service Option Control Order*: The mobile station shall process the message in  
4 accordance with the requirements for the active service subfunction (see  
5 2.6.4.1.2.2).
- 6 53. *Service Option Request Order*: The mobile station shall process the message in  
7 accordance with the requirements for the active service subfunction (see  
8 2.6.4.1.2.2).
- 9 54. *Service Option Response Order*: The mobile station shall process the message  
10 in accordance with the requirements for the active service subfunction (see  
11 2.6.4.1.2.2).
- 12 55. *Service Redirection Message*: The mobile station shall process the message as  
13 follows:
- 14 If RECORD\_TYPE<sub>r</sub> is equal to '00000000', the mobile station shall perform the  
15 following:
- 16 – The mobile station shall set RETURN\_IF\_FAIL<sub>s</sub> = RETURN\_IF\_FAIL<sub>r</sub>.
  - 17 – If DELETE\_TMSI<sub>r</sub> is equal to '1', the mobile station shall set all the bits  
18 of TMSI\_CODE<sub>s-p</sub> to '1'.
  - 19 – The mobile station shall disable the full-TMSI timer.
  - 20 – The Layer 3 shall send a "release indication" to all Call Control  
21 instances, and shall enter the Release Substate with an NDSS off  
22 indication (see 2.6.4.4).
- 23 If RECORD\_TYPE<sub>r</sub> is not equal to '00000000', REDIRECT\_TYPE<sub>r</sub> is '1', and the  
24 mobile station supports the band class and operating mode specified in the  
25 message, the mobile station shall perform the following:
- 26 – The mobile station shall store the redirection record received in the  
27 message as REDIRECT\_REC<sub>s</sub>.
  - 28 – The mobile station shall enable NDSS\_ORIG<sub>s</sub> and shall record the dialed  
29 digits (if any) corresponding to the last MS originated call.
  - 30 – The mobile station shall set RETURN\_IF\_FAIL<sub>s</sub> = RETURN\_IF\_FAIL<sub>r</sub>.
  - 31 – If DELETE\_TMSI<sub>r</sub> is equal to '1', the mobile station shall set all the bits  
32 of TMSI\_CODE<sub>s-p</sub> to '1'.
  - 33 – The mobile station shall disable the full-TMSI timer.
  - 34 – The Layer 3 shall send a "release indication" to all Call Control instances,  
35 and shall enter the *Release Substate* with a redirection indication (see  
36 2.6.4.4). Otherwise, the mobile station shall discard the message and send a  
37 *Mobile Station Reject Order* (ORDQ set to the applicable reason code as  
38 determined from Table 2.7.3-1) within T<sub>56m</sub> seconds.
- 39 56. *Service Request Message*: The mobile station shall process the message in

- 1 accordance with the requirements for the active service subfunction (see  
2 2.6.4.1.2.2).
- 3 57. *Service Response Message*: The mobile station shall process the message in  
4 accordance with the requirements for the active service subfunction (see  
5 2.6.4.1.2.2).
- 6 58. *Set Parameters Message*: If the mobile station can set all of the parameters  
7 specified by the `PARAMETER_ID` fields in the message, the mobile station shall  
8 set them; otherwise, the mobile station shall send, within  $T_{56m}$  seconds, a  
9 *Mobile Station Reject Order*.
- 10 59. *SSD Update Message*: The Layer 3 shall send a “reset waiting for order substate  
11 timer indication” to all Call Control instances. The mobile station shall process  
12 the message and respond with a *Base Station Challenge Order* as specified in  
13 2.3.12.1.5 within  $T_{32m}$  seconds.
- 14 60. *Status Request Message*: The mobile station shall send, within  $T_{56m}$  seconds,  
15 a *Status Response Message*. If the message does not specify any qualification  
16 information (`QUAL_INFO_TYPEr` is equal to ‘00000000’), the mobile station  
17 shall include the requested information records in the *Status Response*  
18 *Message*. If the message specifies a band class (`QUAL_INFO_TYPEr` is equal to  
19 ‘00000001’), the mobile station shall only include the requested information  
20 records for the specified band class (`BAND_CLASSr`) in the *Status Response*  
21 *Message*. If the message specifies a band class and an operating mode  
22 (`QUAL_INFO_TYPEr` is equal to ‘00000010’), the mobile station shall only  
23 include the requested information records for the specified band class  
24 (`BAND_CLASSr`) and operating mode (`OP_MODEr`) in the *Status Response*  
25 *Message*.
- 26 If the message specifies a band class or a band class and an operating mode  
27 which is not supported by the mobile station, the mobile station shall send a  
28 *Mobile Station Reject Order* with `ORDQ` set to ‘00000110’ (message requires a  
29 capability that is not supported by the mobile station).
- 30 If the response to this message exceeds the allowable length, the mobile  
31 station shall send a *Mobile Station Reject Order* with `ORDQ` set to ‘00001000’  
32 (response message would exceed the allowable length).
- 33 If the message specifies an information record which is not supported by the  
34 mobile station for the specified band class and operating mode, the mobile  
35 station shall send a *Mobile Station Reject Order* with `ORDQ` set to ‘00001001’  
36 (information record is not supported for the specified band class and operating  
37 mode).
- 38 61. *Status Request Order*: If `CDMABANDs` is equal to ‘00000’, the mobile station  
39 shall send a *Status Message* within  $T_{56m}$  seconds. The mobile station shall  
40 respond with information corresponding to the current band class and  
41 operating mode.
- 42 62. *Supplemental Channel Assignment Message*: The mobile station shall process

the message as specified in 2.6.6.2.5.1.

63. *TMSI Assignment Message*: The mobile station shall store the TMSI zone and code as follows:

- The mobile station shall store the length of the TMSI zone field by setting ASSIGNING\_TMSI\_ZONE\_LEN<sub>s-p</sub> to TMSI\_ZONE\_LEN<sub>r</sub>.
- The mobile station shall store the assigning TMSI zone number by setting the ASSIGNING\_TMSI\_ZONE\_LEN<sub>s-p</sub> least significant octets of ASSIGNING\_TMSI\_ZONE<sub>s-p</sub> to TMSI\_ZONE<sub>r</sub>, and
- The mobile station shall store the TMSI code by setting TMSI\_CODE<sub>s-p</sub> to TMSI\_CODE<sub>r</sub>.

The mobile station shall set the TMSI expiration time by setting TMSI\_EXP\_TIME<sub>s-p</sub> to TMSI\_EXP\_TIME<sub>r</sub>. The mobile station shall disable the full-TMSI timer. The mobile station shall then respond with a *TMSI Assignment Completion Message* within T<sub>56m</sub> seconds.

64. *Universal Handoff Direction Message*: The Layer 3 shall send a “reset waiting for order substate timer indication” to all Call Control instances. The mobile station shall process the message as specified in 2.6.6.2.5.1.

65. *User Zone Reject Message*: The mobile station shall process this message as specified in 2.6.9.2.2.

66. *User Zone Update Message*: The mobile station shall process this message as specified in 2.6.9.2.2.

67. *BCMC Order*: The mobile station shall process this message as follows:

- If ORDQ<sub>r</sub> is set to ‘00000000’, the mobile station shall perform the following for each of the BCMC flows that the base station is responding to:
  - If CLEAR\_ALL\_RETRY\_DELAY<sub>r</sub> equals ‘1’, the mobile station shall delete the currently stored BCMC Retry Delay List.
  - If CLEAR\_RETRY\_DELAY<sub>r</sub> equals ‘1’, the mobile station shall delete the entry in the BCMC\_RETRY\_DELAY\_LIST<sub>s[i]</sub> corresponding to BCMC\_FLOW\_ID (See section 2.6.13.11) in this message.
  - If ALL\_BCMC\_REASON<sub>r</sub> or BCMC\_REASON<sub>r</sub> equals ‘0000’, Layer 3 shall send a *BCMC-Monitor.Response(BCMC\_FLOW\_ID, result=FAILURE, cause= FLOW\_NOT\_AVAILABLE, reason\_ind=CURRENT\_SYS)* for each of the corresponding BCMC\_FLOW\_ID to the BCMC Service Layer.
  - If ALL\_BCMC\_REASON<sub>r</sub> or BCMC\_REASON<sub>r</sub> equals ‘0001’, Layer 3 shall send a *BCMC-Monitor.Response(BCMC\_FLOW\_ID, result=FAILURE, cause= FLOW\_NOT\_TRANSMITTED, reason\_ind=CURRENT\_SYS)* for each of the corresponding BCMC\_FLOW\_ID to the BCMC Service Layer.
  - If ALL\_BCMC\_REASON<sub>r</sub> or BCMC\_REASON<sub>r</sub> equals ‘0010’, Layer 3 shall send a *BCMC-Monitor.Response(BCMC\_FLOW\_ID, result=FAILURE,*

1                    *cause*= *FLOW\_TRANSMITTED\_IN\_IDLE*, *reason\_ind*=*CURRENT\_SYS*) for  
 2 each of the corresponding *BCMC\_FLOW\_ID* to the BCMC Service Layer.

- 3                    – If *ALL\_BCMC\_REASON<sub>r</sub>* or *BCMC\_REASON<sub>r</sub>* equals '0011', Layer 3 shall  
 4 send a *BCMC-Monitor.Response(BCMC\_FLOW\_ID, result = SUCCESS,*  
 5 *cause = REGISTRATION\_ACCEPTED, reason\_ind = CURRENT\_SYS)* for  
 6 each of the corresponding *BCMC\_FLOW\_ID* to the BCMC Service Layer.
- 7                    – If *ALL\_BCMC\_REASON<sub>r</sub>* or *BCMC\_REASON<sub>r</sub>* equals '0100', Layer 3 shall  
 8 send a *BCMC-Monitor.Response(BCMC\_FLOW\_ID, result=FAILURE,*  
 9 *cause= AUTHORIZATION\_FAILURE, reason\_ind=CURRENT\_SYS)* for each  
 10 of the corresponding *BCMC\_FLOW\_ID* to the BCMC Service Layer.
- 11                    – If *ALL\_BCMC\_REASON<sub>r</sub>* or *BCMC\_REASON<sub>r</sub>* equals '0101', the mobile  
 12 station shall perform the following:
  - 13                    + Layer 3 shall send a *BCMC-Monitor.Response(BCMC\_FLOW\_ID,*  
 14 *result=FAILURE, cause= RETRY\_LATER, reason\_ind=CURRENT\_SYS)*  
 15 for each of the corresponding *BCMC\_FLOW\_ID* to the BCMC Service  
 16 Layer.
  - 17                    + For each of the corresponding *BCMC\_FLOW\_ID*, if there is a  
 18 *BCMC\_RETRY\_DELAY\_LIST<sub>s</sub>[i].BCMC\_FLOW\_ID* which is same as  
 19 *BCMC\_FLOW\_ID* (See section 2.6.13.11), the mobile station shall set  
 20 *BCMC\_RETRY\_DELAY\_LIST<sub>s</sub>[i].RETRY\_DELAY* to current system  
 21 time plus *ALL\_BCMC\_RETRY\_DELAY<sub>r</sub>/BCMC\_RETRY\_DELAY*;  
 22 otherwise, the mobile station shall add new  
 23 *BCMC\_RETRY\_DELAY\_LIST<sub>s</sub>[i]* to the BCMC Retry Delay List and  
 24 shall set *BCMC\_RETRY\_DELAY\_LIST<sub>s</sub>[i].BCMC\_FLOW\_ID* to the  
 25 *BCMC\_FLOW\_ID*, *BCMC\_RETRY\_DELAY\_LIST<sub>s</sub>[i].RETRY\_DELAY* to  
 26 current system time plus  
 27 *ALL\_BCMC\_RETRY\_DELAY<sub>r</sub>/BCMC\_RETRY\_DELAY<sub>r</sub>*.

28                    68. *In-Traffic BCMC Service Parameters Message*: The mobile station shall process  
 29 this message as follows:

30                    The mobile station shall store the following parameters:

- 31                    • Autonomous BCMC request on traffic channel allowed indicator  
 32 (*AUTO\_REQ\_TRAF\_ALLOWED\_IND<sub>s</sub> = AUTO\_REQ\_TRAF\_ALLOWED\_IND*  
 33 *r*).
- 34                    • BCMC in idle state supported indicator  
 35 (*BCMC\_ON\_IDLE\_SUP\_IND<sub>s</sub> = BCMC\_ON\_IDLE\_SUP\_IND<sub>r</sub>*).
- 36                    • Only traffic state BCMC flows included indicator  
 37 (*BCMC\_FLOWS\_ON\_TRAFFIC\_ONLY\_IND<sub>s</sub> = BCMC\_FLOWS\_ON\_TRAFFI*  
 38 *C\_ONLY\_IND<sub>r</sub>*) if *BCMC\_FLOWS\_ON\_TRAFFIC\_ONLY\_IND<sub>r</sub>* is included;  
 39 otherwise, *BCMC\_FLOWS\_ON\_TRAFFIC\_ONLY\_IND<sub>s</sub> = '1'*.

- 1           • Length of time stamp for use on r-csch  
2 (ACH\_TIME\_STAMP\_SHORT\_LENGTH<sub>S</sub> = ACH\_TIME\_STAMP\_SHORT\_LENGTH<sub>R</sub>) if NON\_DEFAULT\_VALUE\_INCLUDED<sub>R</sub> equals '1'; otherwise,  
3 ACH\_TIME\_STAMP\_SHORT\_LENGTH<sub>S</sub> shall be set to 10.  
4
  
- 5           • Length of time stamp  
6 (TIME\_STAMP\_LONG\_LENGTH<sub>S</sub> = TIME\_STAMP\_LONG\_LENGTH<sub>R</sub>) if  
7 NON\_DEFAULT\_VALUE\_INCLUDED<sub>R</sub> equals '1'; otherwise,  
8 TIME\_STAMP\_LONG\_LENGTH<sub>S</sub> shall be set to 52.
  
- 9           • Unit for time stamp length (TIME\_STAMP\_UNIT<sub>S</sub> = TIME\_STAMP\_UNIT<sub>R</sub>)  
10 if NON\_DEFAULT\_VALUE\_INCLUDED<sub>R</sub> equals '1'; otherwise,  
11 TIME\_STAMP\_UNIT<sub>S</sub> shall be set to 6.
  
- 12          • For i=1 to the number of flows included in this message, store the  
13 following:
  - 14          - BCMC\_FLOW\_LIST<sub>S</sub>[i].BCMC\_FLOW\_ID = ith occurrence of  
15 BCMC\_FLOW\_ID (BCMC flow identifier) . See section 2.6.13.11.
  
  - 16          - If AUTH\_SIGNATURE\_REQUIRED<sub>R</sub> equals '1',  
17 BCMC\_FLOW\_LIST<sub>S</sub>[i].AUTH\_SIGNATURE\_REQ\_IND = ith  
18 occurrence of AUTH\_SIGNATURE\_REQ\_IND<sub>R</sub>(Authorization signature  
19 required indication).
  
  - 20          - BCMC\_FLOW\_LIST<sub>S</sub>[i].BCMC\_FLOW\_ON\_TRAFFIC\_IDLE\_IND = ith  
21 occurrence of BCMC\_FLOW\_ON\_TRAFFIC\_IDLE\_IND<sub>R</sub> (BCMC flow on  
22 traffic state or idle state supported identifier) if  
23 BCMC\_FLOW\_ON\_TRAFFIC\_IDLE\_IND<sub>R</sub> is included; otherwise,  
24 BCMC\_FLOW\_LIST<sub>S</sub>[i].BCMC\_FLOW\_ON\_TRAFFIC\_IDLE\_IND = '01'.
  
- 25          69. *Shared Channel Configuration Order:* The mobile station shall process this  
26 message as follows:
  - 27          • If ORDQ<sub>R</sub> is set to '00000000', the mobile station shall perform the  
28 following:
    - 29          - The mobile station shall set REV\_FCH\_ASSIGNED<sub>S</sub> to '1'.
    - 30          - If CH\_IND<sub>S</sub> is equal to '11' , the mobile station shall begin transmitting  
31 on the Reverse Fundamental Channel.
    - 32          - If CH\_IND<sub>S</sub> is equal to '00' and EXT\_CH\_IND<sub>S</sub> is equal to '01111',  
33 '10001', '10011', or '10101', the mobile station shall begin transmitting  
34 on the Reverse Fundamental Channel and do the following:
      - 35          + If EXT\_CH\_IND<sub>S</sub> is equal to '01111', store EXT\_CH\_IND<sub>S</sub> = '00110'
      - 36          + If EXT\_CH\_IND<sub>S</sub> is equal to '10001', store EXT\_CH\_IND<sub>S</sub> = '10010'
      - 37          + If EXT\_CH\_IND<sub>S</sub> is equal to '10011', store EXT\_CH\_IND<sub>S</sub> = '01110'

- 1                   +    If EXT\_CH\_IND<sub>S</sub> is equal to '10101', store EXT\_CH\_IND<sub>S</sub> = '10110'
- 2           •    If ORDQ<sub>r</sub> is set to '00000001', the mobile station shall do the following:
- 3               –    The mobile station shall set REV\_FCH\_ASSIGNED<sub>S</sub> to '0'.
- 4               –    If CH\_IND<sub>S</sub> is equal to '11' , the mobile station shall stop transmitting
- 5                   on the Reverse Fundamental Channel.
- 6               –    If CH\_IND<sub>S</sub> is equal to '00' and EXT\_CH\_IND<sub>S</sub> is equal to '00110',
- 7                   '10010', '01110', or '10110', the mobile station shall stop transmitting
- 8                   on the Reverse Fundamental Channel and do the following:
- 9                   +    If EXT\_CH\_IND<sub>S</sub> is equal to '00110', store EXT\_CH\_IND<sub>S</sub> = '01111'
- 10                  +    If EXT\_CH\_IND<sub>S</sub> is equal to '10010', store EXT\_CH\_IND<sub>S</sub> = '10001'
- 11                  +    If EXT\_CH\_IND<sub>S</sub> is equal to '01110', store EXT\_CH\_IND<sub>S</sub> = '10011'
- 12                  +    If EXT\_CH\_IND<sub>S</sub> is equal to '10110', store EXT\_CH\_IND<sub>S</sub> = '10101'

13       70. *Service Status Order:* For each of the SERVICE\_STATUS field included in this  
 14       message, the mobile station shall indicate the status to corresponding service  
 15       instance. For each of the SERVICE\_STATUS field set to '001' (service request  
 16       rejected), the mobile station shall perform the following:

- 17       •    The mobile station shall terminate the call control instance corresponding
- 18           to the SR\_ID associated with this SERVICE\_STATUS field.
- 19       •    The mobile station shall send an indication to the affected service instance
- 20           indicating that the call control instance has been terminated.
- 21       •    If a TAG is associated with the SR\_ID corresponding to this
- 22           SERVICE\_STATUS field, the mobile station shall remove the TAG value
- 23           from the TAG\_OUTSTANDING\_LIST and disable the corresponding
- 24           enhanced origination timer

25       71. *Radio Configuration Parameters Message:* If any of the field of the message is  
 26       set to an invalid value, then the mobile station shall send a *Mobile Station*  
 27       *Reject Order* with the ORDQ field set to '00000100' (message field not in valid  
 28       range). Otherwise, the mobile station shall perform the following:

- 29       •    If FOR\_FCH\_ACK\_MASK\_RL\_BLANKING<sub>r</sub> is included, the mobile station
- 30           shall perform the following:
- 31           –    Set FOR\_FCH\_ACK\_MASK\_RL\_BLANKING<sub>S</sub> to
- 32                FOR\_FCH\_ACK\_MASK\_RL\_BLANKING<sub>r</sub>.
- 33       •    If FOR\_FCH\_ACK\_MASK\_NO\_RL\_BLANKING<sub>r</sub> is included, the mobile
- 34           station shall perform the following:
- 35           –    Set FOR\_FCH\_ACK\_MASK\_NO\_RL\_BLANKING<sub>S</sub> to
- 36                FOR\_FCH\_ACK\_MASK\_NO\_RL\_BLANKING<sub>r</sub>.
- 37       •    If REV\_FCH\_ACK\_MASK<sub>r</sub> is included, the mobile station shall set
- 38           REV\_FCH\_ACK\_MASK<sub>S</sub> to REV\_FCH\_ACK\_MASK<sub>r</sub>.

- 1           • If FOR\_SCH\_ACK\_MASK\_RL\_BLANKING<sub>r</sub> is included, the mobile station  
2           shall perform the following:  
3           – Set FOR\_SCH\_ACK\_MASK\_RL\_BLANKING<sub>s</sub> to  
4           FOR\_SCH\_ACK\_MASK\_RL\_BLANKING<sub>r</sub>.
- 5           • If FOR\_SCH\_ACK\_MASK\_NO\_RL\_BLANKING<sub>r</sub> is included, the mobile  
6           station shall perform the following:  
7           – Set FOR\_SCH\_ACK\_MASK\_NO\_RL\_BLANKING<sub>s</sub> to  
8           FOR\_SCH\_ACK\_MASK\_NO\_RL\_BLANKING<sub>r</sub>.
- 9           • If REV\_SCH\_ACK\_MASK<sub>r</sub> is included, the mobile station shall set  
10          REV\_SCH\_ACK\_MASK<sub>s</sub> to REV\_SCH\_ACK\_MASK<sub>r</sub>.
- 11          • If FOR\_N2M\_IND<sub>r</sub> is included, the mobile station shall set FOR\_N2M\_IND<sub>s</sub>  
12          to FOR\_N2M\_IND<sub>r</sub>.
- 13          • If RPC\_MODE<sub>r</sub> is included, the mobile station shall set RPC\_MODE<sub>s</sub> to  
14          RPC\_MODE<sub>r</sub>.
- 15          • If PWR\_CNTL\_STEP\_ZERO\_RATE<sub>r</sub> is included, the mobile station shall set  
16          PWR\_CNTL\_STEP\_ZERO\_RATE<sub>s</sub> to PWR\_CNTL\_STEP\_ZERO\_RATE<sub>r</sub>.
- 17          • If FOR\_FCH\_BLANKING\_DUTYCYCLE is included, the mobile station shall  
18          set FOR\_FCH\_BLANKING\_DUTYCYCLE<sub>s</sub> to  
19          FOR\_FCH\_BLANKING\_DUTYCYCLE<sub>r</sub>.
- 20          • If REV\_FCH\_BLANKING\_DUTYCYCLE is included, the mobile station shall  
21          perform the following:  
22          – Set REV\_FCH\_BLANKING\_DUTYCYCLE<sub>s</sub> to  
23          REV\_FCH\_BLANKING\_DUTYCYCLE<sub>r</sub>.
- 24          – If the mobile station does not have R-SCH burst assigned with RC08,  
25          then set REV\_FCH\_BLANKING\_DUTYCYCLE\_IN\_USE to  
26          REV\_FCH\_BLANKING\_DUTYCYCLE<sub>r</sub>.
- 27          • If REV\_ACKCH\_GAIN\_ADJ\_ACS1<sub>r</sub> is included, the mobile station shall  
28          perform the following:  
29          – Set REV\_ACKCH\_GAIN\_ADJ\_ACS1<sub>s</sub> to REV\_ACKCH\_GAIN\_ADJ\_ACS1<sub>r</sub>.
- 30          • If REV\_ACKCH\_GAIN\_ADJ\_ACS2PLUS<sub>r</sub> is included, the mobile station  
31          shall perform the following:  
32          – Set REV\_ACKCH\_GAIN\_ADJ\_ACS2PLUS<sub>s</sub> to  
33          REV\_ACKCH\_GAIN\_ADJ\_ACS2PLUS<sub>r</sub>.
- 34          • If NUM\_RC\_PARAMS\_RECORDS is set to non-zero value, the mobile station  
35          shall update RC\_PARAMS\_RECORD<sub>s</sub>[i] as follows:

- 1                   – If entry for PILOT\_PN<sub>r</sub> exists then RC\_PARAMS\_RECORD<sub>s</sub>[i] is the  
2                   existing entry, otherwise RC\_PARAMS\_RECORD<sub>s</sub>[i] is a new entry with  
3                   REV\_SCH\_ACK\_CH\_WALSH[00], REV\_SCH\_ACK\_BIT[00],  
4                   REV\_SCH\_ACK\_CH\_WALSH[01], and REV\_SCH\_ACK\_BIT[01] fields set  
5                   to NULL.
- 6                   – Set RC\_PARAMS\_RECORD<sub>s</sub>[i].PILOT\_PN to PILOT\_PN<sub>r</sub>.
- 7                   – Set RC\_PARAMS\_RECORD<sub>s</sub>[i].QOF\_SET\_IN\_USE to QOF\_SET\_IN\_USE<sub>r</sub>.
- 8                   – If REV\_SCH0\_ACK\_CH\_WALSH is included, the mobile station shall set  
9                   RC\_PARAMS\_RECORD<sub>s</sub>[i].REV\_SCH\_ACK\_CH\_WALSH[00] to  
10                  REV\_SCH0\_ACK\_CH\_WALSH<sub>r</sub>.
- 11                  – If REV\_SCH0\_ACK\_BIT is included, the mobile station shall set  
12                  RC\_PARAMS\_RECORD<sub>s</sub>[i].REV\_SCH\_ACK\_BIT[00] to  
13                  REV\_SCH0\_ACK\_BIT<sub>r</sub>.
- 14                  – If REV\_SCH1\_ACK\_CH\_WALSH is included, the mobile station shall set  
15                  RC\_PARAMS\_RECORD<sub>s</sub>[i].REV\_SCH\_ACK\_CH\_WALSH[01] to  
16                  REV\_SCH1\_ACK\_CH\_WALSH<sub>r</sub>.
- 17                  – If REV\_SCH1\_ACK\_BIT is included, the mobile station shall set  
18                  RC\_PARAMS\_RECORD<sub>s</sub>[i].REV\_SCH\_ACK\_BIT[01] to  
19                  REV\_SCH1\_ACK\_BIT<sub>r</sub>.
- 20                  – Set RC\_PARAMS\_RECORD<sub>s</sub>[i].FOR\_FCH\_CCSH\_INTERLEAVER\_TYPE to  
21                  FOR\_FCH\_CCSH\_INTERLEAVER\_TYPE<sub>r</sub>.
- 22                  • If the mobile station receives a message that is not included in the above list,  
23                  cannot be processed, or requires a capability which is not supported, the mobile  
24                  station shall discard the message and send a *Mobile Station Reject Order* (ORDQ set  
25                  to the applicable reason code as determined from Table 2.7.3-1) within T<sub>56m</sub>  
26                  seconds. If the mobile station receives a Call Control message (see 2.6.10) which is  
27                  directed to a Call Control instance that does not exist, the mobile station shall  
28                  send a *Mobile Station Reject Order* with ORDQ field set to '00010001' (no call  
29                  control instance present with the specified identifier) to the base station within  
30                  T<sub>56m</sub> seconds.
- 31                  • If the bits of TMSI\_CODE<sub>s-p</sub> are not all equal to '1', and if System Time (in 80 ms  
32                  units) exceeds TMSI\_EXP\_TIME<sub>s-p</sub> × 2<sup>12</sup>, the mobile station shall set all the bits of  
33                  TMSI\_CODE<sub>s-p</sub> to '1' within T<sub>66m</sub> seconds.
- 34                  • If the full-TMSI timer expires or has expired, the mobile station shall set all the bits  
35                  of TMSI\_CODE<sub>s-p</sub> to '1'. The mobile station shall update the registration variables  
36                  as described in 2.6.5.5.2.5.
- 37                  • If the Forward Packet Data Channel is assigned, whenever the mobile station  
38                  transmitter is disabled, the MS shall set FPDCH\_DTX\_INDICATOR<sub>s</sub> to '1'.

- If the Forward Packet Data Channel is assigned, whenever the mobile station transmitter is enabled, the mobile station shall perform the following procedures:
  - The MS shall set FPDCH\_DTX\_INDICATOR<sub>S</sub> to '0'..
  - If the mobile station transmitter has been disabled for at least TX\_DISABLED\_TIMER<sub>S</sub>, the mobile station shall send SIG-HandoffPDCH.Indication (handoff\_type = ASSIGN) primitive to the MAC layer.

#### 2.6.4.4 Release Substate

In this substate, the mobile station confirms the disconnect of all calls and physical channels.

Upon entering the *Release Substate*, the mobile station shall perform the following:

- The mobile station shall set the substate timer for T<sub>55m</sub> seconds.
- If the mobile station enters the *Release Substate* with a power-down indication, the mobile station shall send a *Release Order* (ORDQ = '00000001'), and shall perform power-down registration procedures (see 2.6.5.5.4.4). The Layer 3 shall terminate all Call Control instances.
- If the mobile station enters the *Release Substate* with a mobile station release indication, the mobile station shall send a *Release Order* as follows:
  - If the mobile station supports operation in the reduced slot cycle mode following release from the traffic channel, the mobile station shall set ORDQ to '00000011', RETURN\_CAUSE<sub>S</sub> to '0000', and perform the following:
    - + If T\_SLOTTED<sub>S</sub> is equal to 0, the mobile station shall perform the following:
      - o Set the RSC\_MODE\_IND field as specified in 2.7.3.5. If RSC\_MODE\_IND is set to '1', then:
        - ◇ Set RSC\_MODE\_ENABLED to YES.
        - ◇ Set the RSC\_END\_TIME\_UNIT and RSC\_END\_TIME\_VALUE fields as specified in 2.7.3.5, and store the system time specified by these fields as RSC\_END\_TIME.
        - ◇ Set the RSCI field as specified in 2.7.3.5 and store it as RSCI<sub>S</sub>; if RSCI<sub>S</sub> is equal to '0111', set SLOTTED<sub>S</sub> to NO.
        - ◇ Set IGNORE\_QPCH<sub>S</sub> to '1'.
      - + Otherwise, the mobile station shall set the RSC\_MODE\_IND field to '0'.
    - Otherwise, the mobile station shall set ORDQ to '00000000', and set RETURN\_CAUSE<sub>S</sub> to '0000'.
  - If the mobile station enters the *Release Substate* with a service inactive indication, the mobile station shall send a *Release Order* (ORDQ = '00000010'), and set RETURN\_CAUSE<sub>S</sub> to '0000'.

- 1     • If the mobile station enters the *Release Substate* with a base station release  
2     indication, the mobile station shall send a *Release Order* (ORDQ = '00000000').  
3     The Layer 3 shall terminate all Call Control instances. The mobile station shall  
4     disable its transmitter, set RETURN\_CAUSE<sub>S</sub> to '0000', and shall perform the  
5     procedures as specified in 2.6.4.4.1.
- 6     • If the mobile station entered the *Release Substate* with a base station extended  
7     release indication, the mobile station shall perform the following:
  - 8       – The mobile station shall send an *Extended Release Response Message* to the  
9       base station as follows:
    - 10          + If the RSC\_MODE\_SUPPORTED field in the received *Extended Release*  
11          *Message* was set to '1' and the mobile station requests operation in the  
12          reduced slot cycle mode, the mobile station shall set the RSC\_MODE\_IND  
13          field to '1' and perform the following:
      - 14           o Set RSC\_MODE\_ENABLED to YES.
      - 15           o Set the RSC\_END\_TIME\_UNIT and RSC\_END\_TIME\_VALUE fields as  
16           specified in 2.7.2.3.2.25, and store the system time specified by these  
17           fields as RSC\_END\_TIME. The value of RSC\_END\_TIME shall be no later  
18           than the system time specified by MAX\_RSC\_END\_TIME\_UNIT<sub>r</sub> and  
19           MAX\_RSC\_END\_TIME\_VALUE<sub>r</sub> received in the *Extended Release*  
20           *Message*.
      - 21           o Set the RSCI field as specified in 2.7.2.3.2.25 and store it as RSCI<sub>S</sub>; if  
22           RSCI<sub>S</sub> is equal to '0111', set SLOTTED<sub>S</sub> to NO.
      - 23           o Set IGNORE\_QPCH<sub>S</sub> to IGNORE\_QPCH<sub>r</sub> received in the *Extended*  
24           *Release Message*.
    - 25          + Otherwise, the mobile station shall set the RSC\_MODE\_IND field to '0'.
  - 26       – The Layer 3 shall terminate all Call Control instances.
  - 27       – The mobile station shall disable its transmitter, set RETURN\_CAUSE<sub>S</sub> to '0000',  
28       and shall perform the procedures as specified in 2.6.4.4.1.
- 29     • If the mobile station entered the *Release Substate* with a base station extended  
30     release with mini message indication, then the mobile station shall perform the  
31     following:
  - 32       – The mobile station shall send an *Extended Release Response Mini Message* to  
33       the base station.
  - 34       – The Layer 3 shall terminate all Call Control instances.
  - 35       – The mobile station shall disable its transmitter, set RETURN\_CAUSE<sub>S</sub> to '0000',  
36       and shall perform the procedures as specified in 2.6.4.4.1.

- 1 • If the mobile station enters the *Release Substate* with a redirection indication, the  
2 mobile station shall send a *Release Order* (ORDQ = '00000000') and shall enter the  
3 *System Determination Substate* of the *Mobile Station Initialization State* with a  
4 redirection indication (see 2.6.1.1). The Layer 3 shall terminate all Call Control  
5 instances.
- 6 • If the mobile station enters the *Release Substate* with an NDSS off indication, the  
7 mobile station shall send a *Release Order* (ORDQ = '00000000'), and shall enter the  
8 *System Determination Substate* of the *Mobile Station Initialization State* with an  
9 NDSS off indication (see 2.6.1.1). The Layer 3 shall terminate all Call Control  
10 instances.

11 While in the *Release Substate*, the mobile station shall perform the following:

- 12 • If the substate timer expires, the Layer 3 shall terminate all Call Control instances,  
13 and the mobile station shall disable its transmitter and shall enter the *System*  
14 *Determination Substate* of the *Mobile Station Initialization State* with a release  
15 indication (see 2.6.1.1).
- 16 • The mobile station shall perform Forward Traffic Channel supervision as specified  
17 in 2.6.4.1.8. If a loss of the Forward Traffic Channel is declared, the Layer 3 shall  
18 terminate all Call Control instances, and shall enter the *System Determination*  
19 *Substate* of the *Mobile Station Initialization State* with a release indication (see  
20 2.6.1.1).
- 21 • The mobile station shall adjust its transmit power as specified in [2].
- 22 • The mobile station shall perform Forward Traffic Channel power control as specified  
23 in 2.6.4.1.1.
- 24 • The mobile station shall perform handoff processing as specified in 2.6.6.
- 25 • If the Fundamental Channel is present, the mobile station shall transmit null  
26 traffic, except when transmitting signaling traffic, on the Reverse Fundamental  
27 Channel.
- 28 • The mobile station shall process Forward Traffic Channel signaling traffic and shall  
29 discard other types of Forward Traffic Channel traffic.
- 30 • The mobile station shall perform registration timer maintenance as specified in  
31 2.6.5.5.4.2.
- 32 • If Layer 3 receives a L2-Condition.Notification primitive from Layer 2 indicating an  
33 acknowledgment failure, the Layer 3 shall terminate all Call Control instances, and  
34 the mobile station shall disable its transmitter and enter the *System Determination*  
35 *Substate* of the *Mobile Station Initialization State* with a release indication (see  
36 2.6.1.1).
- 37 • If the Layer 3 receives an "enter traffic channel substate indication" from a Call  
38 Control instance, the Layer 3 shall enter the *Traffic Channel substate*.

- 1 • If Layer 3 receives a 'message rejected indication' from a Call Control instance,  
2 mobile station shall send a *Mobile Station Reject Order* (ORDQ set to the applicable  
3 reason code as determined from Table 2.7.3-1) within T<sub>56m</sub> seconds as follows:
  - 4 - If P\_REV\_IN\_USE<sub>s</sub> is equal to or greater than seven, the mobile station shall  
5 include the CON\_REF\_INCL field with this message and shall perform the  
6 following: if the corresponding Call Control instance is identified by NULL, the  
7 mobile station shall either set the CON\_REF\_INCL field of the message to '0' or  
8 set the CON\_REF\_INCL field to '1' and set the CON\_REF field to the connection  
9 reference of the service option connection corresponding to this Call Control  
10 instance; otherwise, the mobile station shall set the CON\_REF\_INCL field of the  
11 message to '1' and the CON\_REF field of the message to the connection  
12 reference of the service option connection corresponding to this Call Control  
13 instance.
- 14 • If the mobile station receives a message which is included in the following list, and  
15 if every message field value is within its permissible range, the mobile station shall  
16 process the message as described below and in accordance with the message's  
17 action time (see 2.6.4.1.5):
  - 18 1. *Alert With Information Message*: If P\_REV\_IN\_USE<sub>s</sub> is less than seven, the Layer  
19 3 shall deliver this message to the Call Control instance; otherwise, the Layer 3  
20 shall deliver this message to the Call Control instance identified by NULL.
  - 21 2. *Authentication Request Message*: The mobile station shall process the message  
22 and shall respond as specified in 2.3.12.5.2.
  - 23 3. *Candidate Frequency Search Control Message*: The mobile station shall  
24 process the message as specified in 2.6.6.2.5.1.
  - 25 4. *Candidate Frequency Search Request Message*: The mobile station shall  
26 process the message as specified in 2.6.6.2.5.1.
  - 27 5. *Data Burst Message*
  - 28 6. *Extended Alert With Information Message*: The mobile station shall perform the  
29 following: If CON\_REF\_INCL<sub>r</sub> equals '0', the Layer 3 shall deliver this message  
30 to the Call Control instance identified by NULL; otherwise, the Layer 3 shall  
31 deliver this message to the Call Control instance identified by CON\_REF<sub>r</sub>.
  - 32 7. *Extended Handoff Direction Message*: The mobile station shall process the  
33 message as specified in 2.6.6.2.5.1.
  - 34 8. *Extended Neighbor List Update Message*: The mobile station shall process the  
35 message as specified in 2.6.6.2.5.1.
  - 36 9. *Extended Supplemental Channel Assignment Message*: The mobile station  
37 shall process the message as specified in 2.6.6.2.5.1.
  - 38 10. *General Handoff Direction Message*: The mobile station shall process the  
39 message as specified in 2.6.6.2.5.1.
  - 40 11. *In-Traffic System Parameters Message*: The mobile station shall process the

- 1 message as specified in 2.6.4.1.4.
- 2 12. *Local Control Order*
- 3 13. *Mobile Assisted Burst Operation Parameters Message*: The mobile station shall  
4 process the message as specified in 2.6.6.2.5.1.
- 5 14. *Lock Until Power-Cycled Order*: The mobile station shall disable its transmitter  
6 and record the reason for the *Lock Until Power-Cycled Order* in the mobile  
7 station's semi-permanent memory (LCKRSN\_P<sub>s-p</sub> equals the least-significant  
8 four bits of ORDQ<sub>r</sub>). The mobile station should notify the user of the locked  
9 condition. The Layer 3 shall terminate all Call Control instances. The Layer 3  
10 shall enter the *System Determination Substate* of the *Mobile Station*  
11 *Initialization State* with a lock indication (see 2.6.1.1), and shall not enter the  
12 *System Access State* again until after the next mobile station power-up or until  
13 it has received an *Unlock Order*. This requirement shall take precedence over  
14 any other mobile station requirement specifying entry to the *System Access*  
15 *State*.
- 16 15. *Maintenance Required Order*: The mobile station shall record the reason for  
17 the *Maintenance Required Order* in the mobile station's semi-permanent  
18 memory (MAINTRSN<sub>s-p</sub> equals the least-significant four bits of ORDQ<sub>r</sub>). The  
19 mobile station shall remain in the unlocked condition. The mobile station  
20 should notify the user of the maintenance required condition.
- 21 16. *Mobile Station Registered Message*: The mobile station shall process the  
22 message as specified in 2.6.5.5.4.3.
- 23 17. *Neighbor List Update Message*: The mobile station shall process the message  
24 as specified in 2.6.6.2.5.1.
- 25 18. *Outer Loop Report Request Order*: The mobile station shall send the *Outer Loop*  
26 *Report Message* in assured mode to the base station.
- 27 19. *Power Control Message*: The mobile station shall process the message as  
28 specified in 2.6.4.1.1.3.
- 29 20. *Power Control Parameters Message*: The mobile station shall process the  
30 message as specified in 2.6.4.1.1.2.
- 31 21. *Power Up Function Message*: The mobile station shall process the message as  
32 specified in 2.6.4.1.7.1.
- 33 22. *Power Up Function Completion Message*: The mobile station shall process the  
34 message as specified in 2.6.4.1.7.3.
- 35 23. *Rate Change Message*: The mobile station shall process the message as  
36 specified in 2.6.4.1.1.4.
- 37 24. *Release Order*: The mobile station shall disable its transmitter. The Layer 3  
38 shall terminate all Call Control instances. The mobile station shall set  
39 RSC\_MODE\_ENABLED to NO. If the mobile station enters the *Release*  
40 *Substate* with a power-down indication, the mobile station may power down;

otherwise, the mobile station shall perform the procedures as specified in 2.6.4.4.1.

25. *Retrieve Parameters Message*: The mobile station shall send, within  $T_{56m}$  seconds, a *Parameters Response Message*.

26. *Retry Order*: The mobile station shall process the order as follows:

- If  $RETRY\_TYPE_R$  is equal to '000', the mobile station shall set  $RETRY\_DELAY_S[RETRY\_TYPE]$  to 0, where  $RETRY\_TYPE$  is equal to '001', '010', '011', '100', or '101'.
- If  $RETRY\_TYPE_R$  is equal to '001', '100', or '101', then the mobile station shall perform the following:
  - If  $RETRY\_DELAY_R$  is equal to '00000000', then the mobile station shall set  $RETRY\_DELAY_S[RETRY\_TYPE_R]$  to 0.
  - If  $RETRY\_DELAY_R$  is not equal to '00000000', the mobile station shall set  $RETRY\_DELAY_S[RETRY\_TYPE_R]$  as follows:
    - + If the most significant bit of the  $RETRY\_DELAY_R$  is 0, set  $RETRY\_DELAY\_UNIT_S$  to 1000ms. If the most significant bit of the  $RETRY\_DELAY_R$  is '1', set  $RETRY\_DELAY\_UNIT_S$  to 60000ms.
    - + The mobile station shall set  $RETRY\_DELAY\_VALUE_S$  to the seven least significant bits of  $RETRY\_DELAY_R$ .
    - + The mobile station shall store the next system time 80 ms boundary +  $RETRY\_DELAY\_VALUE_S \times RETRY\_DELAY\_UNIT_S$  ms as  $RETRY\_DELAY_S[RETRY\_TYPE_R]$ .

27. *Service Option Control Message*: The mobile station shall process the message in accordance with the requirements for the active service subfunction (see 2.6.4.1.2.2).

28. *Service Option Control Order*: The mobile station shall process the message in accordance with the requirements for the active service subfunction (see 2.6.4.1.2.2).

29. *Service Redirection Message*: The mobile station shall disable its transmitter. If the mobile station enters the *Release Substate* with a power-down indication, the mobile station may power down (if powering down, the Layer 3 shall terminate all Call Control instances); otherwise, the mobile station shall process the message as follows:

- If  $RECORD\_TYPE_R$  is '00000000', the mobile station shall perform the following:
  - The mobile station shall set  $RETURN\_IF\_FAIL_S = RETURN\_IF\_FAIL_R$ .
  - If  $DELETE\_TMSI_R$  is equal to '1', the mobile station shall set all the bits of  $TMSI\_CODE_{S-p}$  to '1'.
  - The mobile station shall disable the full-TMSI timer.

- 1           – The Layer 3 shall terminate all Call Control instances, and shall enter  
2           the *System Determination Substate of the Mobile Station Initialization*  
3           State with an NDSS off indication (see 2.6.1.1).
  - 4           • If RECORD\_TYPE is not equal to '00000000', REDIRECT\_TYPE<sub>r</sub> is '1', and  
5           the mobile station supports the band class and operating mode specified in  
6           the message, the mobile station shall perform the following:
    - 7           – The mobile station shall store the redirection record received in the  
8           message as REDIRECT\_REC<sub>s</sub>.
    - 9           – The mobile station shall set RETURN\_IF\_FAIL<sub>s</sub> = RETURN\_IF\_FAIL<sub>r</sub>.
    - 10          – If DELETE\_TMSI<sub>r</sub> is equal to '1', the mobile station shall set all the bits  
11          of TMSI\_CODE<sub>s-p</sub> to '1'.
    - 12          – The mobile station shall disable the full-TMSI timer.
    - 13          – The Layer 3 shall terminate all Call Control instances, and shall enter  
14          the *System Determination Substate of the Mobile Station Initialization*  
15          State with a redirection indication (see 2.6.1.1).
  - 16          • Otherwise, the mobile station shall discard the message and send a *Mobile*  
17          *Station Reject Order* (ORDQ set to the applicable reason code as determined  
18          from Table 2.7.3-1) within T<sub>56m</sub> seconds.
- 19   30. *Status Request Message*: The mobile station shall send, within T<sub>56m</sub> seconds,  
20   a Status Response Message. If the message does not specify any qualification  
21   information (QUAL\_INFO\_TYPE<sub>r</sub> is equal to '00000000'), the mobile station  
22   shall include the requested information records in the *Status Response*  
23   *Message*. If the message specifies a band class (QUAL\_INFO\_TYPE<sub>r</sub> is equal to  
24   '00000001'), the mobile station shall only include the requested information  
25   records for the specified band class (BAND\_CLASS<sub>r</sub>) in the *Status Response*  
26   *Message*. If the message specifies a band class and an operating mode  
27   (QUAL\_INFO\_TYPE<sub>r</sub> is equal to '00000010'), the mobile station shall only  
28   include the requested information records for the specified band class  
29   (BAND\_CLASS<sub>r</sub>) and operating mode (OP\_MODE<sub>r</sub>) in the *Status Response*  
30   *Message*. If the message specifies a band class or a band class and an  
31   operating mode which are not supported by the mobile station, the mobile  
32   station shall send a *Mobile Station Reject Order* with ORDQ set to '00000110'  
33   (message requires a capability that is not supported by the mobile station). If  
34   the response to this message exceeds the allowable length, the mobile station  
35   shall send a *Mobile Station Reject Order* with ORDQ set to '00001000'  
36   (response message would exceed the allowable length). If the message  
37   specifies an information record which is not supported by the mobile station  
38   for the specified band class and operating mode, the mobile station shall send  
39   a *Mobile Station Reject Order* with ORDQ set to '00001001' (information record  
40   is not supported for the specified band class and operating mode).
- 41   31. *Status Request Order*: If CDMABAND<sub>s</sub> is equal to '00000', the mobile station  
42   shall send, a *Status Message* within T<sub>56m</sub> seconds. The mobile station shall

1 respond with information corresponding to the current band class and  
2 operating mode.

3 32. *Supplemental Channel Assignment Message*: The mobile station shall process  
4 the message as specified in 2.6.6.2.5.1.

5 33. *TMSI Assignment Message*: The mobile station shall store the TMSI zone and  
6 code as follows:

- 7 • The mobile station shall store the length of the TMSI zone field by setting  
8 ASSIGNING\_TMSI\_ZONE\_LEN<sub>s-p</sub> to TMSI\_ZONE\_LEN<sub>r</sub>;
- 9 • The mobile station shall store the assigning TMSI zone number by setting  
10 the ASSIGNING\_TMSI\_ZONE\_LEN<sub>s-p</sub> least significant octets of  
11 ASSIGNING\_TMSI\_ZONE<sub>s-p</sub> to TMSI\_ZONE<sub>r</sub>, and
- 12 • The mobile station shall store the TMSI code by setting TMSI\_CODE<sub>s-p</sub> to  
13 TMSI\_CODE<sub>r</sub>.

14 The mobile station shall set the TMSI expiration time by setting  
15 TMSI\_EXP\_TIME<sub>s-p</sub> to TMSI\_EXP\_TIME<sub>r</sub>. The mobile station shall disable the  
16 full-TMSI timer. The mobile station shall then respond with a *TMSI Assignment*  
17 *Completion Message* within T<sub>56m</sub> seconds.

18 34. *Universal Handoff Direction Message*: The mobile station shall process the  
19 message as specified in 2.6.6.2.5.1.

20 35. *User Zone Reject Message*: The mobile station shall process this message as  
21 specified in 2.6.9.2.2.

22 36. *User Zone Update Message*: The mobile station shall process this message as  
23 specified in 2.6.9.2.2.

24 37. *Extended Release Message*:

- 25 • If USE\_EXT\_CH\_IND is equal to '0' and CH\_IND is equal to '111' or the  
26 physical channels indicated by the two least significant bits of CH\_IND  
27 includes all the physical channels (FCH, DCCH, or both) currently being  
28 processed by the mobile station, then the mobile station shall perform the  
29 following:

- 30 – If the mobile station supports operation in the reduced slot cycle mode  
31 following release of the traffic channel, the mobile station shall perform  
32 the following:

- 33 + If RSC\_MODE\_ENABLED is equal to YES, the mobile station shall  
34 perform the following:

- 35 o If RSC\_MODE\_SUPPORTED<sub>r</sub> is equal to '1', the mobile station  
36 shall perform the following:

- 37 ◇ Set RSC\_END\_TIME to the earlier of the current value of

- 1 RSC\_END\_TIME, and the system time specified by  
 2 MAX\_RSC\_END\_TIME\_UNIT<sub>r</sub> and  
 3 MAX\_RSC\_END\_TIME\_VALUE<sub>r</sub>.
- 4 ◇ Set IGNORE\_QPCH<sub>s</sub> to IGNORE\_QPCH<sub>r</sub>.
- 5 o If RSC\_MODE\_SUPPORTED<sub>r</sub> is equal to '0', the mobile station  
 6 shall set RSC\_MODE\_ENABLED to NO.
- 7 + If RSC\_MODE\_ENABLED is equal to NO, the mobile station shall  
 8 perform the following:
- 9 o If REQ\_RSCI\_INCL<sub>r</sub> is included and set to '1', and the mobile  
 10 station sent a *Release Order* with ORDQ equal to '00000011', the  
 11 mobile station shall send an *Extended Release Response Message*  
 12 with the RSC\_MODE\_IND field set to '1', and perform the  
 13 following:
- 14 ◇ Set RSC\_MODE\_ENABLED to YES.
- 15 ◇ Set the RSC\_END\_TIME\_UNIT and RSC\_END\_TIME\_VALUE  
 16 fields as specified in 2.7.2.3.2.25, and store the system time  
 17 specified by these fields as RSC\_END\_TIME. The value of  
 18 RSC\_END\_TIME shall be no later than the system time  
 19 specified by MAX\_RSC\_END\_TIME\_UNIT<sub>r</sub> and  
 20 MAX\_RSC\_END\_TIME\_VALUE<sub>r</sub> received in the *Extended*  
 21 *Release Message*.
- 22 ◇ Set the RSCI field as specified in 2.7.2.3.2.25 and store it as  
 23 RSCI<sub>s</sub>; if RSCI<sub>s</sub> is equal to '0111', set SLOTTED<sub>s</sub> to NO.
- 24 ◇ Set IGNORE\_QPCH<sub>s</sub> to IGNORE\_QPCH<sub>r</sub>.
- 25 – The mobile station shall disable its transmitter.
- 26 – The Layer 3 shall terminate all Call Control instances.
- 27 – If the mobile station enters the *Release Substate* with a power-down  
 28 indication, the mobile station may power down; otherwise, the mobile  
 29 station shall perform the procedures as specified in 2.6.4.4.1.
- 30 • Otherwise, the mobile station shall discard the *Extended Release Message*  
 31 and send a *Mobile Station Reject Order* with ORDQ field set to '00000010'  
 32 (message not accepted in this state) within T<sub>56m</sub> seconds.

- 1 • If the mobile station receives a message that is not included in the above list or  
2 cannot be processed, the mobile station shall discard the message and send a  
3 *Mobile Station Reject Order* (ORDQ set to the applicable reason code as determined  
4 from Table 2.7.3-1) within  $T_{56m}$  seconds. If the mobile station receives a Call  
5 Control message (see 2.6.10) which is directed to a Call Control instance that does  
6 not exist, the mobile station shall send a *Mobile Station Reject Order* with ORDQ  
7 field set to '00010001' (no call control instance present with the specified identifier)  
8 to the base station within  $T_{56m}$  seconds.
- 9 • If the bits of  $TMSI\_CODE_{S-p}$  are not all equal to '1', and if System Time (in 80 ms  
10 units) exceeds  $TMSI\_EXP\_TIME_{S-p} \times 2^{12}$ , the mobile station shall set all the bits of  
11  $TMSI\_CODE_{S-p}$  to '1' within  $T_{66m}$  seconds.
- 12 • If the full-TMSI timer expires or has expired, the mobile station shall set all the bits  
13 of  $TMSI\_CODE_{S-p}$  to '1'. The mobile station shall update the registration variables  
14 as described in 2.6.5.5.2.5.

#### 15 2.6.4.4.1 Procedures for Exiting the Release Substate

16 The mobile station shall perform the following procedures in the order listed below.

17 If the mobile station received an *Extended Release Message* with the  
18  $RER\_MODE\_ENABLED$  field set to '1', then the mobile station shall set  
19  $RER\_MODE\_ENABLED$  to YES,  $RER\_COUNT$  to 0, and shall perform the following:

- 20 • The mobile station shall store the following:
  - 21 – Maximum number of *Radio Environment Messages* that the mobile station is  
22 permitted to transmit while in radio environment reporting mode  
23 ( $RER\_MAX\_NUM\_MSG_S = infinity$ , if  $RER\_MAX\_NUM\_MSG\_IDX_r$  is equal to  
24 '111'; otherwise,  $RER\_MAX\_NUM\_MSG_S = 2^{RER\_MAX\_NUM\_MSG\_IDX_r}$ ).
  - 25 – Maximum number of pilots to maintain in  $RER\_PILOT\_LIST$   
26 ( $MAX\_RER\_PILOT\_LIST\_SIZE_S = MAX\_RER\_PILOT\_LIST\_SIZE_r$ ).
  - 27 – System identification for radio environment reporting mode ( $RER\_SID_S = SID_S$ ).
  - 28 – Network identification for radio environment reporting mode ( $RER\_NID_S = NID_S$ ).
- 29 • The mobile station shall initialize the radio environment report pilot list  
30 ( $RER\_PILOT\_LIST$ ) to contain the set of pilots that made up the Active Set on the  
31 Traffic Channel.
- 32 • The mobile station shall enable the radio environment report timer with an initial  
33 value of *infinity* if  $RER\_TIME_r$  is equal to '111'; otherwise, the mobile station shall  
34 enable the radio environment report timer with an initial value of  $2^{RER\_TIME_r}$   
35 seconds if  $RER\_TIME\_UNIT_r$  is equal to '00', or  $2^{RER\_TIME_r}$  minutes if  
36  $RER\_TIME\_UNIT_r$  is equal to '01', or  $2^{RER\_TIME_r}$  hours if  $RER\_TIME\_UNIT_r$  is equal  
37 to '10'.

38 If the mobile station received an *Extended Release Message* with the  
39  $TKZ\_MODE\_ENABLED$  field set to '1', then the mobile station shall set  $TKZ\_COUNT$  to 0,  
40 and shall perform the following:

- 1     • The mobile station shall store the following:
  - 2       – Tracking zone identifier ( $TKZ\_ID_S = TKZ\_ID_R$ ).
  - 3       – Tracking zone list length ( $TKZ\_LIST\_LEN_S = TKZ\_LIST\_LEN_R$ ).
  - 4       – TKZ timer ( $TKZ\_TIMER_S = TKZ\_TIMER_R$ ).
  - 5       – Maximum number of *Radio Environment Messages* that the mobile station is
  - 6       permitted to transmit while in tracking zone mode ( $TKZ\_MAX\_NUM\_MSG_S =$
  - 7       *infinity*, if  $TKZ\_MAX\_NUM\_MSG\_IDX_R$  is equal to '111'; otherwise,
  - 8        $TKZ\_MAX\_NUM\_MSG_S = 2^{TKZ\_MAX\_NUM\_MSG\_IDX_R}$ ).
  - 9       – System identification for tracking zone mode ( $TKZ\_SID_S = SID_S$ ).
  - 10      – Network identification for tracking zone mode ( $TKZ\_NID_S = NID_S$ ).
  - 11      – Tracking zone update period ( $TKZ\_UPDATE\_PRD_S = TKZ\_UPDATE\_PRD_R$ ).
- 12    • If  $RER\_MODE\_ENABLED$  is equal to NO, the mobile station shall set
- 13     $TKZ\_MODE\_ENABLED$  to YES; otherwise, the mobile station shall set
- 14     $TKZ\_MODE\_PENDING$  to YES.
- 15    • If  $TKZ\_MODE\_ENABLED$  is equal to YES, the mobile station shall perform the
- 16    following:
  - 17      – Initialize the tracking zone list ( $TKZ\_LIST$ ) to contain  $TKZ\_ID_S$ .
  - 18      – Enable the tracking zone update timer with an initial value of infinity if
  - 19       $TKZ\_UPDATE\_PRD_S$  is equal to '1111'; otherwise, the mobile station shall
  - 20      enable the tracking zone update timer with an initial value of  $2^{TKZ\_UPDATE\_PRD_S} +$
  - 21       $6$  seconds.

22 The mobile station shall perform the following procedures to determine whether to enter  
 23 the *Mobile Station Idle State* or *System Determination Substate* of the *Mobile Station*  
 24 *Initialization State*.

25 If the mobile station received an *Extended Release Message* with  
 26  $DIRECT\_TO\_IDLE\_INFO\_INCL$  field equal to '1' and  $RELEASE\_TYPE_R$  equal to '011', the  
 27 mobile station shall enter the *System Determination Substate* of the *Mobile Station*  
 28 *Initialization Substate* with a release indication (see 2.6.1.1).

29 If the mobile station received an *Extended Release Message* with  
 30  $DIRECT\_TO\_IDLE\_INFO\_INCL$  field equal to '1',  $RELEASE\_TYPE_R$  equal to a value other  
 31 than '011', and all the following conditions are met:

- 32    • The system indicated by this message is a preferred system according to system
- 33    selection process of the mobile station, and
- 34    • If the  $BAND\_CLASS$  field is included in this message, the mobile station supports the
- 35    band class capability specified by this field, and
- 36    • If the  $SR1\_TD\_MODE$  field is included in this message, the mobile station supports
- 37    the transmit diversity capability specified by this field, and

- 1 • The mobile station is able to select one of the pilots in the DIRECT TO IDLE record of  
2 the *Extended Release Message* with sufficient signal strength to enter *Mobile Station*  
3 *Idle State*.

4 then, the mobile station shall perform the following:

- 5 • If RELEASE\_TYPE<sub>r</sub> equals '000', the mobile station shall perform the following:
  - 6 – If FREQ\_INCL<sub>r</sub> equals '1', the mobile station shall set CDMABAND<sub>s</sub> to  
7 BAND\_CLASS<sub>r</sub> and CDMACH<sub>s</sub> to CDMA\_FREQ<sub>r</sub>.
  - 8 – The mobile station shall store the following:
    - 9 + PAGECH<sub>s</sub> = PAGE\_CH<sub>r</sub>
    - 10 + PRAT<sub>s</sub> = PRAT<sub>r</sub>
  - 11 – The mobile station shall then perform the following:
    - 12 + Set its code channel to PAGECH<sub>s</sub>,
    - 13 + Set the Paging Channel data rate as determined by PRAT<sub>s</sub>,
    - 14 + The mobile station shall enter the *Mobile Station Idle State* on the CDMA  
15 Channel specified by CDMABAND<sub>s</sub> and CDMACH<sub>s</sub> and acquire the specified  
16 Paging Channel. If BCMC\_INFO\_INCL<sub>r</sub> is included and is equal to '1', the  
17 mobile station may start monitoring the BCMC flows corresponding to the  
18 BCMC\_FLOW\_IDs (See section 2.6.13.11) included in this message after  
19 entering the *Mobile Station Idle State* as specified in section 2.6.13, using  
20 the BCMC flow information included in this message.
- 21 • If RELEASE\_TYPE<sub>r</sub> equals '001', the mobile station shall perform the following:
  - 22 – If FREQ\_INCL<sub>r</sub> equals '1', the mobile station shall set CDMABAND<sub>s</sub> to  
23 BAND\_CLASS<sub>r</sub> and CDMACH<sub>s</sub> to CDMA\_FREQ<sub>r</sub>.
  - 24 – The mobile station shall store the following:
    - 25 + BCCH<sub>s</sub> = SR1\_BCCH\_CODE\_CHAN\_NON\_TD<sub>r</sub>
    - 26 + BCCH\_CODE\_RATE<sub>s</sub> = SR1\_CRAT\_NON\_TD<sub>r</sub>
    - 27 + BRAT<sub>s</sub> = SR1\_BRAT\_NON\_TD<sub>r</sub>
  - 28 – The mobile station shall then perform the following:
    - 29 + Set its Primary Broadcast Control Channel code channel to BCCH<sub>s</sub>,
    - 30 + Set the Primary Broadcast Control Channel data rate as determined by  
31 BRAT<sub>s</sub>,
    - 32 + Set the Primary Broadcast Control Channel code rate as determined by  
33 BCCH\_CODE\_RATE<sub>s</sub>,
    - 34 + The mobile station shall enter the *Mobile Station Idle State* on the CDMA  
35 Channel specified by CDMABAND<sub>s</sub> and CDMACH<sub>s</sub> and acquire the specified  
36 Primary Broadcast Control Channel. If BCMC\_INFO\_INCL<sub>r</sub> is included and  
37 is equal to '1', the mobile station may start monitoring the BCMC flows

- 1 corresponding to the BCMC\_FLOW\_IDs (See section 2.6.13.11) included in  
 2 this message after entering the *Mobile Station Idle State* as specified in  
 3 section 2.6.13, using the BCMC flow information included in this message.
- 4 • If RELEASE\_TYPE<sub>r</sub> equals '010', the mobile station shall perform the following:
    - 5 – If FREQ\_INCL<sub>r</sub> equals '1', the mobile station shall set CDMABAND<sub>s</sub> to  
 6 BAND\_CLASS<sub>r</sub> and CDMACH<sub>s</sub> to CDMA\_FREQ<sub>r</sub>.
    - 7 – The mobile station shall store the following:
      - 8 + BCCH<sub>s</sub> = SR1\_BCCH\_CODE\_CHAN\_TD<sub>r</sub>
      - 9 + BCCH\_CODE\_RATE<sub>s</sub> = SR1\_CRAT\_TD<sub>r</sub>
      - 10 + BRAT<sub>s</sub> = SR1\_BRAT\_TD<sub>r</sub>
    - 11 – The mobile station shall then perform the following:
      - 12 + Set its Primary Broadcast Control Channel code channel to BCCH<sub>s</sub>,
      - 13 + Set the Primary Broadcast Control Channel data rate as determined by  
 14 BRAT<sub>s</sub>,
      - 15 + Set the Primary Broadcast Control Channel code rate as determined by  
 16 BCCH\_CODE\_RATE<sub>s</sub>,
      - 17 + The mobile station shall enter the *Mobile Station Idle State* on the CDMA  
 18 Channel specified by CDMABAND<sub>s</sub> and CDMACH<sub>s</sub> and acquire the specified  
 19 Primary Broadcast Control Channel that supports Transmit Diversity. If  
 20 BCMC\_INFO\_INCL<sub>r</sub> is included and is equal to '1', the mobile station may  
 21 start monitoring the BCMC flows corresponding to the BCMC\_FLOW\_IDs  
 22 (See section 2.6.13.11) included in this message after entering the *Mobile*  
 23 *Station Idle State* as specified in section 2.6.13, using the BCMC flow  
 24 information included in this message.
  - 25 Otherwise, the mobile station shall perform the following:
    - 26 • If RELEASE\_TO\_IDLE\_IND<sub>s</sub> is equal to '0', the mobile station shall enter the System  
 27 Determination Substate of the Mobile Station Initialization State with a release  
 28 indication (see 2.6.1.1).
    - 29 • If RELEASE\_TO\_IDLE\_IND<sub>s</sub> is equal to '1', the mobile station shall perform the  
 30 following:
      - 31 – If the mobile station has stored BCCH information (BCCH Walsh Code, BCCH  
 32 data rate, and BCCH code rate) for a base station which has sufficient pilot  
 33 strength, the mobile station shall restore the BCCH information to BCCH<sub>s</sub>,  
 34 BRAT<sub>s</sub> and BCCH\_CODE\_RATE<sub>s</sub>, and then perform the following:
        - 35 + Set its Primary Broadcast Control Channel code channel to BCCH<sub>s</sub>,
        - 36 + Set the Primary Broadcast Control Channel data rate as determined by  
 37 BRAT<sub>s</sub>,
        - 38 + Set the Primary Broadcast Control Channel code rate as determined by

- 1 BCCH\_CODE\_RATE<sub>S</sub>,
- 2 + The mobile station shall enter the *Mobile Station Idle State*.
- 3 – Otherwise, the mobile station shall perform the following:
- 4 + If the mobile station has stored PCH information (PCH number and PCH
- 5 data rate) for a base station which has sufficient pilot strength, the mobile
- 6 station shall restore the PCH information to PAGECH<sub>S</sub> and PRAT<sub>S</sub>, and then
- 7 perform the following:
- 8 o Set its code channel to PAGECH<sub>S</sub>,
- 9 o Set the Paging Channel data rate as determined by PRAT<sub>S</sub>,
- 10 o The mobile station shall enter the *Mobile Station Idle State*,
- 11 + Otherwise, the mobile station shall perform the following:
- 12 o If IDLE\_SID is equal to SID<sub>S</sub>, IDLE\_CDMABAND is equal to
- 13 CDMABAND<sub>S</sub>, IDLE\_NID is equal to NID<sub>S</sub>, and IDLE\_P\_REV is equal to
- 14 P\_REV<sub>S</sub>, and the mobile station decides to enter the *Mobile Station Idle*
- 15 *State*, the mobile station shall perform the following:
- 16 ◇ The mobile station shall set CDMACH<sub>S</sub> to IDLE\_CDMA\_CHAN.
- 17 ◇ If IDLE\_BCCH\_CHAN is equal to '1', the mobile station shall perform
- 18 the following:
- 19 – Set its Primary Broadcast Control Channel code channel to
- 20 BCCH<sub>S</sub>,
- 21 – Set the Primary Broadcast Control Channel data rate as
- 22 determined by BRAT<sub>S</sub>,
- 23 – Set the Primary Broadcast Control Channel code rate as
- 24 determined by BCCH\_CODE\_RATE<sub>S</sub>,
- 25 – The mobile station shall enter the *Mobile Station Idle State*.
- 26 ◇ If IDLE\_BCCH\_CHAN is equal to '0', the mobile station shall perform
- 27 the following:
- 28 – Set its code channel to PAGECH<sub>S</sub>,
- 29 – Set the Paging Channel data rate as determined by PRAT<sub>S</sub>,
- 30 – The mobile station shall enter the *Mobile Station Idle State*.
- 31 o Otherwise, the mobile station shall enter the *System Determination*
- 32 *Substate* of the *Mobile Station Initialization State* with a release
- 33 indication (see 2.6.1.1).

## 1 2.6.5 Registration

### 2 2.6.5.1 Forms of Registration

3 Registration is the process by which the mobile station notifies the base station of its  
4 location, status, identification, slot cycle, and other characteristics. The mobile station  
5 informs the base station of its location and status so that the base station can efficiently  
6 page the mobile station when establishing a mobile station terminated call. For operation  
7 in the slotted mode, the mobile station supplies the SLOT\_CYCLE\_INDEX parameter so  
8 that the base station can determine which slots the mobile station is monitoring. The  
9 mobile station supplies the station class mark and the protocol revision number so that  
10 the base station knows the capabilities of the mobile station.

11 The CDMA system supports 12 different forms of registration:

- 12 1. Power-up registration. The mobile station registers when it powers on, switches  
13 from using a different frequency block designator, switches from using a different  
14 band class, switches from using an alternative operating mode, or upon the  
15 insertion of an R-UIM into a powered-on ME.
- 16 2. Power-down registration. The mobile station registers when it powers off if  
17 previously registered in the current serving system.
- 18 3. Timer-based registration. The mobile station registers when a timer expires.
- 19 4. Distance-based registration. The mobile station registers when the distance  
20 between the current base station and the base station in which it last registered  
21 exceeds a threshold.
- 22 5. Zone-based registration. The mobile station registers when it enters a new zone.
- 23 6. Parameter-change registration. The mobile station registers when certain of its  
24 stored parameters change or when it enters a new system.
- 25 7. Ordered registration. The mobile station registers when the base station requests  
26 it.
- 27 8. Implicit registration. When a mobile station successfully sends an *Origination*  
28 *Message*, *Reconnect Message*, *Call Recovery Request Message*, or *Page Response*  
29 *Message*, the base station can infer the mobile station's location. This is  
30 considered an implicit registration.
- 31 9. Traffic Channel registration. Whenever the base station has registration  
32 information for a mobile station that has been assigned to a Traffic Channel, the  
33 base station can notify the mobile station that it is registered.
- 34 10. User Zone Registration. The mobile station registers when it selects an active User  
35 Zone (see 2.6.9.1.2).
- 36 11. Encryption/Message Integrity re-sync required registration. The mobile station  
37 registers when extended encryption is turned on and the mobile station determines  
38 that it can not decrypt any messages from the base station (see 2.3.12.4.1.3) or the  
39 mobile station registers when message integrity is supported and the mobile station  
40 determines that it can not validate the MACI of any messages from the base station.

12. BCMC registration. BCMC registration is performed by a mobile station currently monitoring or desiring to monitor a BCMC flow.

The first five forms of registration, User Zone Registration, and Encryption/Message Integrity re-sync required registration, as a group, are called autonomous registration and are enabled by roaming status (see 2.6.5.3). Parameter-change registration is independent of roaming status. Ordered registration is initiated by the base station through an *Order Message*. Implicit registration does not involve the exchange of any registration messages between the base station and the mobile station. The base station can obtain registration information by sending the *Status Request Message* to the mobile station on either the f-csch or the f-dsch. The base station can obtain limited registration information by sending the *Status Request Order* to the mobile station on the f-dsch. The mobile station can be notified that it is registered through the *Mobile Station Registered Message*.

Any of the various forms of autonomous registration and parameter-change registration can be enabled or disabled. The forms of registration that are enabled and the corresponding registration parameters are communicated in the *System Parameters Message* on the Paging Channel, or the *ANSI-41 System Parameters Message* on the Primary Broadcast Control Channel.

In addition, the mobile station may enable or disable autonomous registration for each type of roaming described in 2.6.5.3.

#### 2.6.5.1.1 Power-Up Registration

Power-up registration is performed when the mobile station is turned on. To prevent multiple registrations when power is quickly turned on and off, or when the R-UIM is quickly inserted and removed, the mobile station delays  $T_{57m}$  seconds before registering, after entering the *Mobile Station Idle State*.

The mobile station shall maintain a power-up/initialization timer. While the power-up/initialization timer is active, the mobile station shall not make registration access attempts.

Power-up registration is performed when the mobile station changes to a different operating mode (see 2.6.5.5.1.1), or as indicated by [40]. A power-up registration is also performed when the mobile station changes band classes, serving system, or frequency block designator if the conditions stated in 2.6.5.5.1.1 are met.

#### 2.6.5.1.2 Power-Down Registration

Power-down registration is performed when the user directs the mobile station to power off. If power-down registration is performed, the mobile station does not power off until after completing the registration attempt.

The mobile station does not perform power-down registration if it has not previously registered in the system that corresponds to the current  $SID_S$  and  $NID_S$  (see 2.6.5.5.2.4).

#### 2.6.5.1.3 Timer-Based Registration

Timer-based registration causes the mobile station to register at regular intervals. Its use also allows the system to automatically deregister mobile stations that did not perform a

successful power-down registration. Timer-based registration uses a Paging Channel or a Forward Common Control Channel slot counter (equivalent to a timer with time increments of 80 ms). Timer-based registration is performed when the counter reaches a maximum value ( $\text{REG\_COUNT\_MAX}_S$ ) that is controlled by the base station via the  $\text{REG\_PRD}$  field of the *System Parameters Message* or *ANSI-41 System Parameters Message*. The base station disables timer-based registration by setting  $\text{REG\_PRD}$  to zero.

The mobile station shall maintain a timer-based registration counter ( $\text{REG\_COUNT}_S$ ). The mobile station shall compute and store the timer expiration count ( $\text{REG\_COUNT\_MAX}_S$ ) as

$$\text{REG\_COUNT\_MAX}_S = \lfloor 2^{\text{REG\_PRD}/4} \rfloor.$$

The mobile station shall maintain an indicator of timer-based registration timer enable status ( $\text{COUNTER\_ENABLED}_S$ ).

The counter is reset after each successful registration.

Whenever the mobile station changes  $\text{COUNTER\_ENABLED}_S$  from NO to YES, it shall set  $\text{REG\_COUNT}_S$  as follows:

If the mobile station supports the procedure described in section 2.6.5.1.3.1 and the conditions for suppression of randomization of timer-based registration are met, the mobile station shall set  $\text{REG\_COUNT}_S$  to 0; otherwise, the mobile station shall set  $\text{REG\_COUNT}_S$  based upon the value of  $\text{TBR\_RAND\_WINDOW}_S$  as shown in Table 2.6.5.1.3-1. When setting  $\text{REG\_COUNT}_S$  to a pseudorandom value, the mobile station shall use the pseudorandom number generator specified in 2.6.7.2.

**Table 2.6.5.1.3-1. Percentage of Randomization for Timer-based registration**

Value of <b>TBR_RAND_WINDOW</b> (binary)	Meaning	<b>REG_COUNT<sub>S</sub></b>
00	0% randomization	0
01	25% randomization	Pseudorandom value between 0 and $\lfloor \text{REG\_COUNT\_MAX}_S/4 \rfloor - 1$
10	50% randomization	Pseudorandom value between 0 and $\lfloor \text{REG\_COUNT\_MAX}_S/2 \rfloor - 1$
11	100% randomization	Pseudorandom value between 0 and $(\text{REG\_COUNT\_MAX}_S - 1)$

If the mobile station is operating in the non-slotted mode, it shall increment the timer-based registration counter once per 80 ms whenever  $\text{COUNTER\_ENABLED}_S$  equals YES. If the mobile station is operating in slotted mode, it may increment the timer-based registration counter when it begins to monitor the Paging Channel (see 2.6.2.1.1.3) or the Forward Common Control Channel. A mobile station operating in the slotted mode shall

increment the counter by the same amount that the counter would have been incremented if the mobile station had been operating in the non-slotted mode.<sup>32</sup>

#### 2.6.5.1.3.1 Timer-Based Registration based on Frequency of Implicit Registrations

A mobile station may support a procedure to prevent unnecessary timer-based registrations when implicit registrations are sent frequently.

If the mobile station supports this procedure, the mobile station shall set REG\_COUNT<sub>s</sub> to 0 when it changes COUNTER\_ENABLED<sub>s</sub> from NO to YES if all of the following conditions for suppression of randomization of timer-based registrations are met:

- the mobile station has been powered on for the past  $\lfloor 2^{\text{REG\_PRD}/4} \rfloor \times 0.32$  seconds,
- in every period of  $\lfloor 2^{\text{REG\_PRD}/4} \rfloor \times 0.08$  consecutive seconds in the past  $\lfloor 2^{\text{REG\_PRD}/4} \rfloor \times 0.32$  seconds the mobile station sent at least one *Origination Message*, *Page Response Message*, or *Reconnect Message*, or the mobile station was in the *Mobile Station Control on the Traffic Channel State* for at least part of the period,
- TBR\_RAND\_SUPPR\_ENABLE<sub>s</sub> is equal to '1'.
- If either of the following two conditions are true:
  - the mobile station was not in the *Mobile Station Control on the Traffic Channel State* at any time during the past  $\lfloor 2^{\text{REG\_PRD}/4} \rfloor \times 0.32$  seconds, or
  - the mobile station was in the *Mobile Station Control on the Traffic Channel State* during the past  $\lfloor 2^{\text{REG\_PRD}/4} \rfloor \times 0.32$  seconds, but it was not continuously in the *Mobile Station Control on the Traffic Channel State* for the entire duration of the past  $\lfloor 2^{\text{REG\_PRD}/4} \rfloor \times 0.32$  seconds.

#### 2.6.5.1.4 Distance-Based Registration

Distance-based registration causes a mobile station to register when the distance between the current base station and the base station in which it last registered exceeds a threshold. The mobile station determines that it has moved a certain distance by computing a distance measure based on the difference in latitude and longitude between the current base station and the base station where the mobile station last registered. If this distance measure exceeds the threshold value, the mobile station registers.

The mobile station stores the base station latitude (BASE\_LAT\_REG<sub>s-p</sub>), the base station longitude (BASE\_LONG\_REG<sub>s-p</sub>) and the registration distance (REG\_DIST\_REG<sub>s-p</sub>), of the base station to which the first access probe (for a *Registration Message*, *Origination Message*, *Reconnect Message*, *Call Recovery Request Message*, or *Page Response Message* sent on the r-csch) was transmitted after entering the *System Access State*. The mobile

---

<sup>32</sup> For example, if the mobile station uses a 2.56 second slot cycle, then it may increment the counter by 32 every time it becomes active.

station shall compute the current base station's distance from the last registration point (DISTANCE) as:

$$\text{DISTANCE} = \left\lfloor \frac{\sqrt{(\Delta\text{lat})^2 + (\Delta\text{long})^2}}{16} \right\rfloor,$$

where

$$\Delta\text{lat} = \text{BASE\_LAT}_S - \text{BASE\_LAT\_REG}_{S-p}$$

and

$$\Delta\text{long} = (\text{BASE\_LONG}_S - \text{BASE\_LONG\_REG}_{S-p}) \times \cos(\pi/180 \times \text{BASE\_LAT\_REG}_{S-p}/14400).$$

The mobile station shall compute DISTANCE with an error of no more than  $\pm 5\%$  of its true value when  $|\text{BASE\_LAT\_REG}_{S-p}/14400|$  is less than 60 and with an error of no more than  $\pm 7\%$  of its true value when  $|\text{BASE\_LAT\_REG}_{S-p}/14400|$  is between 60 and 70.<sup>33</sup>

#### 2.6.5.1.5 Zone-Based Registration

Registration zones are groups of base stations within a given system and network. A base station's zone assignment is identified by the REG\_ZONE field of the *System Parameters Message*, *ANSI-41 System Parameters Message* or *Mobile Station Registered Message*.

Zone-based registration causes a mobile station to register whenever it determines it is in a new zone (see 2.6.5.5.2.1), not on its internally stored list of visited registration zones. A zone is added to the list whenever a registration (including implicit registration) occurs, and is deleted upon expiration of a timer. After a system access, timers are enabled for every zone except one that was successfully registered by the access.

A mobile station can be registered in more than one zone. Zones are uniquely identified by a zone number (REG\_ZONE) plus the SID and NID of the zone.

The mobile station shall store a list of the zones in which the mobile station has registered (ZONE\_LIST<sub>S</sub>). Each entry in ZONE\_LIST<sub>S</sub> shall include the zone number (REG\_ZONE) and the (SID, NID) pair for the zone. The mobile station shall be capable of storing at least N<sub>9m</sub> entries in ZONE\_LIST<sub>S</sub>. A base station shall be considered to be in ZONE\_LIST<sub>S</sub> only if the base station's REG\_ZONE, SID and NID are found in an entry in ZONE\_LIST<sub>S</sub>. The mobile station provides storage for one entry of ZONE\_LIST<sub>S</sub> in semi-permanent memory, ZONE\_LIST<sub>S-p</sub> (see 2.3.4).

The mobile station shall maintain a zone list entry timer for each entry in ZONE\_LIST<sub>S</sub>. When an entry in ZONE\_LIST<sub>S</sub> is removed from the list, the corresponding zone list entry timer shall be disabled. The timer duration shall be as determined from the stored value of ZONE\_TIMER<sub>S</sub> using Table 3.7.2.3.2.1-1. The mobile station shall provide a means to examine each timer's value while the timer is active, so that the age of list entries can be compared.

---

<sup>33</sup> BASE\_LAT and BASE\_LONG are given in units of 1/4 seconds. BASE\_LAT/14400 and BASE\_LONG/14400 are in units of degrees.

1 If the mobile station supports one of more band classes that contain multiple frequency  
 2 block designators, the mobile station shall maintain an identifier of the frequency block  
 3 designator for each entry in ZONE\_LIST<sub>s</sub> (see [45]). When the mobile station adds a zone  
 4 to ZONE\_LIST<sub>s</sub>, the mobile station shall include the identifier for the frequency block  
 5 designator.<sup>34</sup>

6 If the mobile station supports multiple band classes, the mobile station shall maintain an  
 7 identifier of the band class for each entry in ZONE\_LIST<sub>s</sub> (see [45]). When the mobile  
 8 station adds a zone to ZONE\_LIST<sub>s</sub>, the mobile station shall include the identifier for the  
 9 band class.

10 The base station controls the maximum number of zones in which a mobile station may be  
 11 considered registered, by means of the TOTAL\_ZONES field of the *System Parameters*  
 12 *Message*, *ANSI-41 System Parameters Message* or *Mobile Station Registered Message*.  
 13 When an entry is added to the zone list, or if TOTAL\_ZONES is decreased, the mobile  
 14 station removes entries from the zone list if there are more entries than allowed by the  
 15 setting of TOTAL\_ZONES.

16 Whenever ZONE\_LIST<sub>s</sub> contains more than TOTAL\_ZONES<sub>s</sub> entries, the mobile station  
 17 shall delete the excess entries according to the following rules:

- 18 • If TOTAL\_ZONES<sub>s</sub> is equal to zero, the mobile station shall delete all entries.
- 19 • If TOTAL\_ZONES<sub>s</sub> is not equal to zero, the mobile station shall delete those entries  
 20 having active zone list entry timers, starting with the oldest entry, as determined by  
 21 the timer values, and continuing in order of decreasing age until no more than  
 22 TOTAL\_ZONES<sub>s</sub> entries remain.

23 The mobile station shall store a list of the systems/networks in which the mobile station  
 24 has registered (SID\_NID\_LIST<sub>s</sub>). Each entry in SID\_NID\_LIST<sub>s</sub> shall include the (SID, NID)  
 25 pair for the system/network. The mobile station shall be capable of storing N<sub>10m</sub> entries  
 26 in SID\_NID\_LIST<sub>s</sub>. A base station shall be considered to be in the SID\_NID\_LIST<sub>s</sub> only if  
 27 the base station's SID and NID are found in an entry in SID\_NID\_LIST<sub>s</sub>. The mobile  
 28 station shall provide storage for one entry of SID\_NID\_LIST<sub>s</sub> in semi-permanent memory  
 29 (SID\_NID\_LIST<sub>s-p</sub>).

30 If the mobile station supports one or more band classes that contain multiple frequency  
 31 block designators, the mobile station shall maintain an identifier of the frequency block  
 32 designator for each entry in SID\_NID\_LIST<sub>s</sub> (see [45]). When the mobile station adds an  
 33 entry to SID\_NID\_LIST<sub>s</sub>, the mobile station shall include the identifier for the frequency  
 34 block designator.

35 If the mobile station supports multiple band classes, the mobile station shall maintain an  
 36 identifier of the band class for each entry in SID\_NID\_LIST<sub>s</sub> (see [45]). When the mobile

---

<sup>34</sup> The mobile station need not maintain a separate identifier for Band Class 0, as the least significant bit of the SID identifies the serving system.

station adds an entry to  $SID\_NID\_LIST_S$ , the mobile station shall include the identifier for the band class.

The mobile station shall maintain a SID/NID list entry timer for each entry in  $SID\_NID\_LIST_S$ . When an entry in  $SID\_NID\_LIST_S$  is removed from the list, the corresponding SID/NID list entry timer shall be disabled. The timer duration shall be as determined from the stored value of  $ZONE\_TIMER_S$  using Table 3.7.2.3.2.1-1. The mobile station shall provide a means to examine each timer's value while the timer is active, so that the age of list entries can be compared.

Whenever  $SID\_NID\_LIST_S$  contains more than  $N_{10m}$  entries, the mobile station shall delete the excess entries according to the following rule:

- The mobile station shall delete those entries having active SID/NID list entry timers, starting with the oldest entry, as determined by the timer values, and continuing in order of decreasing age.

Whenever  $MULT\_SIDS_S$  is equal to '0' and  $SID\_NID\_LIST$  contains entries with different SIDs, the mobile station shall delete the excess entries according to the following rules:

- If the SID/NID entry timer for any entry is disabled, the mobile station shall delete all entries not having the same SID as the entry whose timer is disabled;
- Otherwise, the mobile station shall delete all entries not having the same SID as the newest entry in  $SID\_NID\_LIST$ , as determined by the timer values.

Whenever  $MULT\_NIDS_S$  is equal to '0', and  $SID\_NID\_LIST$  contains more than one entry for any SID, the mobile station shall delete the excess entries for each SID according to the following rules:

- If the SID/NID entry timer for any entry is disabled, the mobile station shall delete all entries for that SID except the entry whose timer is disabled;
- For all other SIDs, the mobile station shall delete all entries for each SID except the newest entry, as determined by the timer values.

#### 2.6.5.1.6 Parameter-Change Registration

Parameter-change registration is performed when a mobile station modifies any of the following stored parameters:

- The preferred slot cycle index ( $SLOT\_CYCLE\_INDEX_p$ )
- The station class mark ( $SCM_p$ )
- The call termination enabled indicators ( $MOB\_TERM\_HOME_p$ ,  $MOB\_TERM\_FOR\_SID_p$ , and  $MOB\_TERM\_FOR\_NID_p$ )

Parameter-change registration is also performed when any of the following capabilities supported by the mobile station changes:

- The band classes
- The band subclasses
- The power classes

- 1       • The radio configurations
- 2       • The operating modes
- 3       • Transmit diversity (OTD or STS)
- 4       • Quick Paging Channel
- 5       • Spreading Rate 3 common channels support
- 6       • Encryption capability

7       Parameter-change registration is performed whenever there is no entry in the mobile  
8       station's `SID_NID_LISTs` that matches the base station's `SID` and `NID`.

9       Parameter-change registration is independent of the roaming status of the mobile  
10      station.<sup>35</sup>

11      Whenever a parameter changes, the mobile station shall delete all entries from  
12      `SID_NID_LISTs`.

#### 13      2.6.5.1.7 Ordered Registration

14      The base station can command the mobile station to register by sending a *Registration*  
15      *Request Order*. Ordered registration is performed in the *Mobile Station Order and Message*  
16      *Processing Operation* (2.6.2.4). Requirements are specified in 2.6.5.5.2.3.

#### 17      2.6.5.1.8 Implicit Registration

18      Whenever an *Origination Message*, *Reconnect Message*, *Call Recovery Request Message*, or  
19      *Page Response Message* is sent, the base station can infer the location of the mobile  
20      station. This is considered an implicit registration. Requirements are specified in  
21      2.6.5.5.3.

#### 22      2.6.5.1.9 Traffic Channel Registration

23      While a mobile station is assigned a Traffic Channel, the mobile station is notified that it is  
24      registered through the *Mobile Station Registered Message*. Requirements are specified in  
25      2.6.5.5.4.3.

#### 26      2.6.5.1.10 User Zone Registration

27      User Zone registration is performed when the mobile station selects an active User Zone  
28      (see 2.6.9.2.1).

#### 29      2.6.5.1.11 Encryption/Message Integrity Re-sync Required Registration

30      Encryption/Message Integrity re-sync required registration is performed when the mobile  
31      station determines that it can not decrypt any message or validate the MACI of any  
32      message from the base station (see 2.3.12.4.1.3). This type of registration is needed for the

---

<sup>35</sup> The indicator `REG_ENABLED` does not govern parameter-change registration.

mobile station to recover from any encryption/message integrity out-of-sync scenario.

#### 2.6.5.1.12 BCMC Registration

BCMC registration is performed when the mobile station is to monitor a BCMC flow that is being transmitted from a band class or frequency different than where the mobile station currently resides. The BCMC registration is also used when the mobile station desires to monitor a BCMC flow configured for transmission which is currently not being transmitted. Requirements are specified in 2.6.13.3.

BCMC registration is performed by a mobile station currently monitoring or desiring to monitor a BCMC flow; it is performed for the following reasons:

1) When the mobile station is to monitor a BCMC flow given by BCMC\_FLOW\_ID, if the band class or frequency where this BCMC flow is being transmitted is different from the band class or frequency where the mobile station currently resides, the mobile station performs a BCMC registration to inform the base station so that the base station can determine in which frequency to page the mobile station.

2) The BCMC registration is also used when the mobile station desires to monitor a BCMC flow configured for transmission which is currently not being transmitted, the mobile station performs a BCMC registration to request transmission of that flow.

3) When the mobile station is currently monitoring a BCMC flow and the base station turns on the registration required flag in the *BCMC Service Parameters Message*, the mobile station performs a BCMC registration. Requirements are specified in 2.6.13.3.

#### 2.6.5.2 Systems and Networks

A base station is a member of a cellular or PCS system and a network. A network is a subset of a system.

Systems are labeled with an identification called the system identification or SID; networks within a system are given a network identification or NID. A network is uniquely identified by the pair (SID, NID). The SID number 0 is a reserved value. The NID number 0 is a reserved value indicating all base stations that are not included in a specific network. The NID number 65535 ( $2^{16}-1$ ) is a reserved value the mobile station may use for roaming status determination (see 2.6.5.3) to indicate that the mobile station considers the entire SID (regardless of NID) as home (non-roaming).

Figure 2.6.5.2-1 shows an example of systems and networks. SID *i* contains three networks labeled *t*, *u*, and *v*. A base station in system *i* that is not in one of these three networks is in NID 0.

**Figure 2.6.5.2-1. Systems and Networks Example**

### 2.6.5.3 Roaming

The mobile station has a list of one or more home (non-roaming) (SID, NID) pairs. A mobile station is roaming if the stored (SID<sub>s</sub>, NID<sub>s</sub>) pair (received in the *System Parameters Message* on the Paging Channel, or the *ANSI-41 System Parameters Message* on the Primary Broadcast Control Channel) does not match one of the mobile station's non-roaming (SID, NID) pairs. Two types of roaming are defined: A mobile station is a foreign NID roamer if the mobile station is roaming and there is some (SID, NID) pair in the mobile station's (SID, NID) list for which SID is equal to SID<sub>s</sub>. A mobile station is a foreign SID roamer if there is no (SID, NID) pair in the mobile station's (SID, NID) list for which SID is

1 equal to  $SID_s$ <sup>36</sup>. The mobile station may use the special NID value 65535 to indicate that  
 2 the mobile station considers all NIDs within a SID to be non-roaming (i.e., that the mobile  
 3 station is not roaming when operating with any base station in that system).

4 The mobile station shall store three 1-bit parameters in its permanent memory (see 2.3.8).  
 5 These parameters are  $MOB\_TERM\_HOME_p$ ,  $MOB\_TERM\_FOR\_SID_p$ , and  $MOB\_TERM\_FOR\_NID_p$ . The mobile station shall set  $MOB\_TERM\_HOME_p$  to '1' if the mobile station is  
 6 configured to receive mobile station terminated calls when using a home (SID, NID) pair;  
 7 otherwise, the mobile station shall set  $MOB\_TERM\_HOME_p$  to '0'. The mobile station shall  
 8 set  $MOB\_TERM\_FOR\_SID_p$  to '1' if the mobile station is configured to receive mobile  
 9 station terminated calls when it is a foreign SID roamer; otherwise  $MOB\_TERM\_FOR\_SID_p$   
 10 shall be set to '0'. The mobile station shall set  $MOB\_TERM\_FOR\_NID_p$  to '1' if the mobile  
 11 station is configured to receive mobile station terminated calls when it is a foreign NID  
 12 roamer; otherwise the mobile station shall set  $MOB\_TERM\_FOR\_NID_p$  to '0'.  
 13

14 The mobile station determines the registration status using these parameters and the  
 15  $HOME\_REG$ ,  $FOR\_NID\_REG$ , and  $FOR\_SID\_REG$  fields of the *System Parameters Message*  
 16 or *ANSI-41 System Parameters Message*.

17 The mobile station shall store a mobile station call termination enabled indicator,  
 18  $MOB\_TERM_s$ . The mobile station shall set  $MOB\_TERM_s$  to YES if any of the following  
 19 conditions is met:

- 20 • The mobile station is not roaming, and  $MOB\_TERM\_HOME_p$  is equal to '1'; or
- 21 • The mobile station is a foreign NID roamer and  $MOB\_TERM\_FOR\_NID_p$  is equal to  
 22 '1'; or
- 23 • The mobile station is a foreign SID roamer and  $MOB\_TERM\_FOR\_SID_p$  is equal to  
 24 '1'; otherwise the mobile station shall set  $MOB\_TERM_s$  to NO.

25 The mobile station shall store a registration status indicator,  $REG\_ENABLED_s$ . The mobile  
 26 station shall set the indicator  $REG\_ENABLED_s$  to YES if any of the following conditions is  
 27 met for the mobile station:

- 28 • The mobile station is not roaming, and both  $HOME\_REG_s$  and  $MOB\_TERM\_HOME_p$   
 29 are equal to '1'; or
- 30 • The mobile station is a foreign NID roamer and both  $FOR\_NID\_REG_s$  and  
 31  $MOB\_TERM\_FOR\_NID_p$  are equal to '1'; or

---

<sup>36</sup> For example, suppose a mobile station has the following SID, NID list: (2, 3), (2, 0), (3, 1). If the base station (SID, NID) pair is (2, 3), then the mobile station is not roaming because the (SID, NID) pair is in the list. If the base station (SID, NID) pair is (2, 7), then the mobile station is a foreign NID roamer, because the SID 2 is in the list, but the (SID, NID) pair (2, 7) is not in the list. If the base station (SID, NID) pair is (4, 0), then the mobile station is a foreign SID roamer, because SID 4 is not in the list.

- 1       • The mobile station is a foreign SID roamer and both FOR\_SID\_REG<sub>S</sub> and
- 2       MOB\_TERM\_FOR\_SID<sub>P</sub> are equal to '1'; otherwise the mobile station shall set
- 3       REG\_ENABLED<sub>S</sub> to NO.

4       The mobile station performs autonomous registrations if REG\_ENABLED<sub>S</sub> is YES.

#### 5       2.6.5.4 Registration Timers and Indicators

6       The mobile station shall provide the following registration timers:

- 7       • Power-up/initialization timer (see 2.6.5.1.1).
- 8       • Timer-based registration timer (see 2.6.5.1.3).
- 9       • Zone list entry timers (see 2.6.5.1.5).
- 10      • SID/NID list entry timers (see 2.6.5.1.5).
- 11      • BCMC frequency registration timer (see 2.6.13).
- 12      • BCMC registration required timer (see 2.6.13).

13      The mobile station shall provide a means of enabling and disabling each timer. When a  
14      timer is disabled, it shall not be considered expired. A timer that has been enabled is  
15      referred to as active.

#### 16      2.6.5.5 Registration Procedures

##### 17      2.6.5.5.1 Actions in the Mobile Station Initialization State

##### 18      2.6.5.5.1.1 Power-Up or Change to a Different Operating Mode, Band Class, Serving 19      System, Frequency Block Designator, or R-UIM Insertion.

20      Upon power-up, the mobile station shall perform the following actions:

- 21      • Delete all entries of ZONE\_LIST<sub>S</sub>.
- 22      • If ZONE\_LIST<sub>S-P</sub> contains an entry, copy the entry to ZONE\_LIST<sub>S</sub> and disable the
- 23      corresponding entry timer.
- 24      • Delete all entries of SID\_NID\_LIST<sub>S</sub>.
- 25      • If SID\_NID\_LIST<sub>S-P</sub> contains an entry, copy the entry to SID\_NID\_LIST<sub>S</sub> and disable
- 26      the corresponding entry timer.
- 27      • Set the registered flag (REGISTERED<sub>S</sub>) to NO.
- 28      • Set timer-based registration enable status (COUNTER\_ENABLED<sub>S</sub>) to NO.
- 29      • Set autonomous registration enable status (REG\_ENABLED<sub>S</sub>) to NO.
- 30      • Set RETURN\_CAUSE<sub>S</sub> to '0000'.
- 31      • Set KEY\_ID, LAST\_2G\_KEY\_ID<sub>S</sub>, and LAST\_3G\_KEY\_ID<sub>S</sub> to '00'.
- 32      • Set ENC\_KEY[i] and INT\_KEY[i] to NULL, where i ranges from '00' to '11'.
- 33      • Set D\_SIG\_ENCRYPT\_MODE<sub>S</sub> and C\_SIG\_ENCRYPT\_MODE<sub>S</sub> to '000'.

- 1       • Set RESTORE\_KEYS to '0'.
- 2       • If the UIM contains IK and CK, the mobile station shall set KEY\_ID to '10',  
3       RESTORE\_KEYS to '1', INT\_KEY[KEY\_ID] to IK, ENC\_KEY[KEY\_ID] to CK,  
4       TX\_EXT\_SSEQ[.][KEY\_ID] and TX\_EXT\_SSEQ[.][KEY\_ID] to any 24-bit value  
5       multiplied by 256.
- 6   If any of the following conditions is true:
  - 7       • BYPASS\_REG\_IND<sub>S</sub> is equal to '00' and the mobile station has switched from using  
8       CDMA
    - 9           – in a different band class, or
    - 10          – in a different serving system in a band class that supports multiple serving  
11          systems (e.g., Band Class 0), or
    - 12          – in a different frequency block designator in a band class that supports  
13          frequency block designator allocations (e.g. Band Class 1)
  - 14       • BYPASS\_REG\_IND<sub>S</sub> is equal to '01' and, for a reason other than processing the  
15       *Extended CDMA Channel List Message*, the mobile station has switched from using  
16       CDMA)
    - 17           – in a different band class, or
    - 18           – in a different serving system in a band class that supports multiple serving  
19           systems (e.g., Band Class 0), or
    - 20           – in a different frequency block designator in a band class that supports  
21           frequency block designator allocations (e.g. Band Class 1)
  - 22       • BYPASS\_REG\_IND<sub>S</sub> is equal to '10', SID<sub>S</sub> is different than REG\_SID<sub>S</sub> and the mobile  
23       station has switched from using CDMA
    - 24           – in a different band class, or
    - 25           – in a different serving system in a band class that supports multiple serving  
26           systems (e.g., Band Class 0), or
    - 27           – in a different frequency block designator in a band class that supports  
28           frequency block designator allocations (e.g. Band Class 1)
- 29   the mobile station shall perform the following actions:
  - 30       • Set timer-based registration enable status (COUNTER\_ENABLED<sub>S</sub>) to NO.
  - 31       • Set autonomous registration enable status (REG\_ENABLED<sub>S</sub>) to NO.
  - 32       • Set RETURN\_CAUSE<sub>S</sub> to '0000'.
  - 33       • Set the registered flag (REGISTERED<sub>S</sub>) to NO.
  - 34       • Set KEY\_ID, LAST\_2G\_KEY\_ID<sub>S</sub>, and LAST\_3G\_KEY\_ID<sub>S</sub> to '00'.
  - 35       • Set ENC\_KEY[i] and INT\_KEY[i] to NULL, where i ranges from '00' to '11'.
  - 36       • Set RESTORE\_KEYS to '0'.

- 1       • If the UIM contains IK and CK, the mobile station shall set KEY\_ID to '10',  
2       RESTORE\_KEYS to '1', INT\_KEY[KEY\_ID] to IK, ENC\_KEY[KEY\_ID] to CK,  
3       TX\_EXT\_SSEQ[.][KEY\_ID] and TX\_EXT\_SSEQ[.][KEY\_ID] to any 24-bit value  
4       multiplied by 256.

#### 5       2.6.5.5.1.2 Timer Maintenance

6       While in the *Mobile Station Initialization State*, the mobile station shall update all active  
7       registration timers (see 2.6.5.4). If any timer expires while in this state, the mobile station  
8       shall preserve the expiration status so that further action can be taken in the *Mobile*  
9       *Station Idle State*.

#### 10      2.6.5.5.1.3 Entering the Mobile Station Idle State

11      Before entering the *Mobile Station Idle State* from the *Mobile Station Initialization State*, the  
12      mobile station shall perform the following action:

- 13       • If REGISTERED<sub>S</sub> is equal to NO, enable the power-up/initialization timer with an  
14       expiration time of T<sub>57m</sub> seconds (see 2.6.5.1.1) only when the mobile station is  
15       entering this state with a power-up indication.

#### 16      2.6.5.5.2 Actions in the Mobile Station Idle State

17      Requirements in this section and its subsections apply only when the mobile station is in  
18      the *Mobile Station Idle State*.

#### 19      2.6.5.5.2.1 Idle Registration Procedures

20      These procedures are performed whenever the mobile station is in the *Mobile Station Idle*  
21      *State* (see 2.6.2.1.3).

22      While in the *Mobile Station Idle State*, the mobile station shall update all active registration  
23      timers (see 2.6.5.4).

24      If the power-up/initialization timer has expired or is disabled, the mobile station shall  
25      perform the following actions in the order given. If any action necessitates a registration,  
26      the mobile station shall enter the *Update Overhead Information Substate* of the *System*  
27      *Access State* (see 2.6.3) with a registration indication.

- 28       1. The timer-based registration timer shall be enabled (COUNTER\_ENABLED<sub>S</sub> = YES)  
29       and the timer count (REG\_COUNT<sub>S</sub>) shall be set to a pseudorandom number as  
30       specified in 2.6.5.1.3, if the following conditions are met:  
31       a. COUNTER\_ENABLED<sub>S</sub> is equal to NO; and  
32       b. The stored configuration parameters are current (see 2.6.2.2); and  
33       c. REG\_ENABLED<sub>S</sub> is equal to YES; and  
34       d. REG\_PRD<sub>S</sub> is not equal to zero.
- 35       2. If any zone list entry timer (see 2.6.5.1.5) has expired, the mobile station shall  
36       delete the corresponding entry from ZONE\_LIST<sub>S</sub>.

- 1        3. If any SID/NID list entry timer (see 2.6.5.1.5) has expired, the mobile station shall  
2        delete the corresponding entry from SID\_NID\_LIST<sub>S</sub>.
- 3        4. The mobile station shall perform power-up registration, as specified in 2.6.5.1.1, if  
4        all the following conditions are met:
  - 5        a. POWER\_UP\_REG<sub>S</sub> is equal to '1'; and
  - 6        b. The stored configuration parameters are current (see 2.6.2.2); and
  - 7        c. REGISTERED<sub>S</sub> is equal to NO, and
  - 8        d. REG\_ENABLED<sub>S</sub> is equal to YES.
- 9        5. The mobile station shall perform parameter-change registration (see 2.6.5.1.6) if all  
10       the following conditions are met:
  - 11       a. PARAMETER\_REG<sub>S</sub> is equal to '1'; and
  - 12       b. The stored configuration parameters are current (see 2.6.2.2); and
  - 13       c. There is no entry of SID\_NID\_LIST<sub>S</sub> whose SID and NID fields match the stored  
14       SID<sub>S</sub> and NID<sub>S</sub>.
- 15       6. The mobile station shall perform timer-based registration (see 2.6.5.1.3) if all the  
16       following conditions are met:
  - 17       a. COUNTER\_ENABLED<sub>S</sub> is equal to YES; and
  - 18       b. The stored configuration parameters are current (see 2.6.2.2); and
  - 19       c. REG\_ENABLED<sub>S</sub> is equal to YES; and
  - 20       d. REG\_COUNT<sub>S</sub> is greater than or equal to REG\_COUNT\_MAX<sub>S</sub>.
- 21       7. The mobile station shall perform distance-based registration (see 2.6.5.1.4) if all the  
22       following conditions are met:
  - 23       a. REG\_DIST<sub>S</sub> is not equal to zero; and
  - 24       b. The stored configuration parameters are current (see 2.6.2.2); and
  - 25       c. REG\_ENABLED<sub>S</sub> is equal to YES; and
  - 26       d. The current base station's distance from the base station in which the mobile  
27       station last registered (see 2.6.5.1.4) is greater than or equal to  
28       REG\_DIST\_REG<sub>S-p</sub>.
- 29       8. The mobile station shall perform zone-based registration (see 2.6.5.1.5) if all the  
30       following conditions are met:
  - 31       a. TOTAL\_ZONES<sub>S</sub> is not equal to zero; and
  - 32       b. The stored configuration parameters are current (see 2.6.2.2); and
  - 33       c. REG\_ENABLED<sub>S</sub> is equal to YES; and
  - 34       d. There is no entry of ZONE\_LIST<sub>S</sub> whose SID, NID and REG\_ZONE fields match  
35       the stored SID<sub>S</sub>, NID<sub>S</sub> and REG\_ZONE<sub>S</sub>.

- 1       9. The mobile station shall perform User Zone registration (see 2.6.2.5.1.10) if it
- 2       selects an active User Zone (see 2.6.9.1.2).
- 3       10. The mobile station shall perform encryption/message integrity re-sync required
- 4       registration (see 2.6.5.1.11) if all the following conditions are met:
- 5       a. REG\_SECURITY\_RESYNC is equal to YES or REGISTER\_IN\_IDLE<sub>S</sub> is equal to
- 6       '1'; and
- 7       b. None of the above registrations have been performed since the last entering of
- 8       the *Mobile Station Idle State*.

#### 9       2.6.5.5.2.2 Processing the Registration Fields of the System Parameters Message and

#### 10      ANSI-41 System Parameters Message

11      When the mobile station processes the *System Parameters Message* or *ANSI-41 System*

12      *Parameters Message*, it shall perform the following actions:

- 13      1. If REG\_PRD<sub>S</sub> is equal to zero, the mobile station shall set COUNTER\_ENABLED<sub>S</sub> to
- 14      NO.
- 15      2. If REG\_PRD<sub>S</sub> is not equal to zero, the mobile station shall set REG\_COUNT\_MAX<sub>S</sub>
- 16      as specified in 2.6.5.1.3.
- 17      3. The mobile station shall update its roaming status and set REG\_ENABLED<sub>S</sub> as
- 18      specified in 2.6.5.3.
- 19      4. If ZONE\_LIST<sub>S</sub> contains more than TOTAL\_ZONES<sub>S</sub> entries, the mobile station shall
- 20      delete the excess entries according to the rules specified in 2.6.5.1.5.
- 21      5. If MULT\_SIDS<sub>S</sub> is equal to '0' and SID\_NID\_LIST contains entries with different
- 22      SIDs, delete the excess entries according to the rules specified in 2.6.5.1.5.
- 23      6. If MULT\_NIDS<sub>S</sub> is equal to '0' and SID\_NID\_LIST contains more than one entry for
- 24      any SID, delete the excess entries according to the rules specified in 2.6.5.1.5.

#### 25      2.6.5.5.2.3 Ordered Registration

26      Ordered registration is performed after receiving a *Registration Request Order* while in the

27      *Mobile Station Order and Message Processing Operation* (see 2.6.2.4).

28      The mobile station shall enter the *Update Overhead Information Substate* of the *System*

29      *Access State* with a registration indication within T<sub>33m</sub> seconds after the *Registration*

30      *Request Order* is received.

#### 31      2.6.5.5.2.4 Power Off

32      These procedures are performed when the mobile station is directed by the user to power

33      off.

34      The mobile station shall perform the following actions:

- 35      • If an entry of ZONE\_LIST<sub>S</sub> does not have an active timer, copy that entry to
- 36      ZONE\_LIST<sub>S-p</sub>; otherwise, delete any entry in ZONE\_LIST<sub>S-p</sub>.

- If an entry of  $SID\_NID\_LIST_S$  does not have an active timer, copy that entry to  $SID\_NID\_LIST_{S-p}$ ; otherwise, delete any entry in  $SID\_NID\_LIST_{S-p}$ .

The mobile station shall perform power-down registration (see 2.6.5.1.2) by entering the *System Access State* with a registration indication within  $T_{33m}$  seconds after the user directs the mobile station to power off, if all the following conditions are true:

- $REG\_ENABLED_S$  equals YES; and
- $POWER\_DOWN\_REG_S$  equals '1'; and
- There is an entry of  $SID\_NID\_LIST_S$  for which the SID and NID fields are equal to  $SID_S$  and  $NID_S$ ; and
- The power-up/initialization timer (see 2.6.5.1.1) is disabled or has expired.

#### 2.6.5.5.2.5 Full-TMSI Timer Expiration

When the mobile station sets all the bits of  $TMSI\_CODE_{S-p}$  to '1' upon expiration of the full-TMSI timer (see 2.6.2), the mobile station shall delete all entries from  $SID\_NID\_LIST_S$  and  $ZONE\_LIST_S$ .

#### 2.6.5.5.3 Actions in the System Access State

Requirements in this section and its subsections apply only when the mobile station is in the *System Access State*.

##### 2.6.5.5.3.1 Successful Access, Registration, or Implicit Registration

These procedures shall be performed after the mobile station receives confirmation of delivery of a *Registration Message*, *Origination Message*, *Reconnect Message*, *Call Recovery Request Message*, or *Page Response Message* sent on the r-csch (see 2.6.3.1.2).

- Disable the power-up/initialization timer (see 2.6.5.1.1).
- Set  $DIGITAL\_REG_{S-p}$  to '00000001'.
- Set  $REG\_COUNT_S$  to zero.
- Set  $REGISTERED_S$  to YES.
- If an explicit or implicit registration was sent, set  $SLOT\_CYCLE\_INDEX\_REG$  to the slot cycle index the mobile station included in the message.
- If  $BYPASS\_REG\_IND_S$  is equal to '00', the mobile station shall perform the following:
  - Delete all entries from  $ZONE\_LIST_S$  belonging to a different band class (see [45]) than  $CDMABAND_S$ .
  - If  $CDMABAND_S$  contains multiple serving systems, delete all entries from  $ZONE\_LIST_S$  that have a SID from a different serving system than  $SERVSYS_S$ .
  - If  $CDMABAND_S$  contains multiple frequency block designators, delete all entries from  $ZONE\_LIST_S$  belonging to a different frequency block designator (see [45]) than the frequency block designator associated with  $REG\_SID_S$ .

- 1 • Add REG\_ZONE<sub>S</sub>, REG\_SID<sub>S</sub>, and REG\_NID<sub>S</sub> to ZONE\_LIST<sub>S</sub> if not already in
- 2 the list. If required, include the band class identifier and block identifier for the
- 3 current band and frequency block designator as specified in 2.6.5.1.5.
- 4 • Disable the zone list entry timer for the entry of ZONE\_LIST<sub>S</sub> containing
- 5 REG\_ZONE<sub>S</sub>, REG\_SID<sub>S</sub>, and REG\_NID<sub>S</sub>. For any other entry of ZONE\_LIST<sub>S</sub>
- 6 whose entry timer is not active, enable the entry timer with the duration specified
- 7 by REG\_ZONE\_TIMER<sub>S</sub> (see 2.6.5.1.5).
- 8 • If ZONE\_LIST<sub>S</sub> contains more than TOTAL\_ZONES<sub>S</sub> entries, delete the excess
- 9 entries according to the rules specified in 2.6.5.1.5.
- 10 • If BYPASS\_REG\_IND<sub>S</sub> is equal to '00', the mobile station shall perform the
- 11 following:
  - 12 – Delete all entries from SID\_NID\_LIST<sub>S</sub> belonging to a different band class (see
  - 13 [45]) than CDMABAND<sub>S</sub>.
  - 14 – If CDMABAND<sub>S</sub> contains multiple serving systems, delete all entries from
  - 15 SID\_NID\_LIST<sub>S</sub> that have a SID from a different serving system than SERVSYS<sub>S</sub>.
  - 16 – If CDMABAND<sub>S</sub> contains multiple frequency block designators, delete all entries
  - 17 from SID\_NID\_LIST<sub>S</sub> belonging to a different frequency block designator (see
  - 18 [45]) than the frequency block designator associated with REG\_SID<sub>S</sub>.
- 19 • Add REG\_SID<sub>S</sub> and REG\_NID<sub>S</sub> to SID\_NID\_LIST<sub>S</sub> if not already in the list. If
- 20 required, include the band class identifier and block identifier for the current band
- 21 and frequency block designator as specified in 2.6.5.1.5.
- 22 • Disable the SID/NID list entry timer for the entry of SID\_NID\_LIST<sub>S</sub> containing
- 23 REG\_SID<sub>S</sub>, and REG\_NID<sub>S</sub>. For any other entry of SID\_NID\_LIST<sub>S</sub> whose entry
- 24 timer is not active, enable the entry timer with the duration specified in 2.6.5.1.5.
- 25 • If SID\_NID\_LIST<sub>S</sub> contains more than N<sub>10m</sub> entries, delete the excess entries
- 26 according to the rules specified in 2.6.5.1.5.
- 27 • If MULT\_SIDS<sub>S</sub> is equal to '0' and SID\_NID\_LIST contains entries with different
- 28 REG\_SID<sub>S</sub>, delete the excess entries according to the rules specified in 2.6.5.1.5.
- 29 • If MULT\_NIDS<sub>S</sub> is equal to '0' and SID\_NID\_LIST contains more than one entry for
- 30 any SID, delete the excess entries according to the rules specified in 2.6.5.1.5.
- 31 • Set the stored location of last registration (BASE\_LAT\_REG<sub>S-p</sub> and BASE\_LONG-
- 32 \_REG<sub>S-p</sub>) to the current base station's location (BASE\_LAT<sub>S</sub> and BASE\_LONG<sub>S</sub>).
- 33 Set the stored registration distance (REG\_DIST\_REG<sub>S-p</sub>) to the current base
- 34 station's registration distance (REG\_DIST<sub>S</sub>).
- 35 • Set REG\_SECURITY\_RESYNC to NO.
- 36 • Set REGISTER\_IN\_IDLE<sub>S</sub> to '0'.

37 These procedures shall be performed after the mobile station receives confirmation of  
 38 delivery of any other message:

- 39 • Set DIGITAL\_REG<sub>S-p</sub> to '00000001'.

- 1       • If BYPASS\_REG\_IND<sub>S</sub> is equal to '00', the mobile station shall perform the
- 2       following:
- 3       – Delete all entries from ZONE\_LIST<sub>S</sub> belonging to a different band class (see [45])
- 4       than CDMABAND<sub>S</sub>.
- 5       – If CDMABAND<sub>S</sub> contains multiple serving systems, delete from ZONE\_LIST<sub>S</sub> all
- 6       entries from ZONE\_LIST<sub>S</sub> that have a SID from a different serving system than
- 7       SERVSYS<sub>S</sub>.
- 8       – If CDMABAND<sub>S</sub> contains multiple frequency block designators, delete all entries
- 9       from ZONE\_LIST<sub>S</sub> belonging to a different frequency block designator (see [45])
- 10      than the frequency block designator associated with SID<sub>S</sub>.
- 11      • For any entry of ZONE\_LIST<sub>S</sub> not matching REG\_ZONE<sub>S</sub>, SID<sub>S</sub>, and NID<sub>S</sub> and not
- 12      having an active entry timer, enable the entry timer with the duration specified by
- 13      ZONE\_TIMER<sub>S</sub> (see 2.6.5.1.5).
- 14      • If BYPASS\_REG\_IND<sub>S</sub> is equal to '00', the mobile station shall perform the
- 15      following:
- 16      – Delete all entries from SID\_NID\_LIST<sub>S</sub> belonging to a different band class (see
- 17      [45]) than CDMABAND<sub>S</sub>.
- 18      – If CDMABAND<sub>S</sub> contains multiple serving systems, delete from SID\_NID\_LIST<sub>S</sub>
- 19      all entries from SID\_NID\_LIST<sub>S</sub> that have a SID from a different serving system
- 20      than SERVSYS<sub>S</sub>.
- 21      – If CDMABAND<sub>S</sub> contains multiple frequency block designators, delete all entries
- 22      from SID\_NID\_LIST<sub>S</sub> belonging to a different frequency block designator (see
- 23      [45]) than the frequency block designator associated with SID<sub>S</sub>.
- 24      • For any entry of SID\_NID\_LIST<sub>S</sub> not matching SID<sub>S</sub> and NID<sub>S</sub> and not having an
- 25      active entry timer, enable the entry timer with the duration specified by
- 26      ZONE\_TIMER<sub>S</sub> (see 2.6.5.1.5).

#### 27   2.6.5.5.3.2 Unsuccessful Access

28   These procedures are performed when the mobile station declares an access attempt  
29   failure when in the *System Access State* (see 2.6.3).

30   The mobile station shall perform the following actions:

- 31      • Set DIGITAL\_REG<sub>S-p</sub> to '00000001'.
- 32      • If an explicit or implicit registration was sent, set SLOT\_CYCLE\_INDEX\_REG to
- 33      min(SLOT\_CYCLE\_INDEX\_REG, slot cycle index the mobile station included in the
- 34      message).
- 35      • If BYPASS\_REG\_IND<sub>S</sub> is equal to '00', the mobile station shall perform the
- 36      following:
- 37      – Delete all entries from ZONE\_LIST<sub>S</sub> belonging to a different band class (see [45])
- 38      than CDMABAND<sub>S</sub>.

- 1       – If CDMABAND<sub>S</sub> contains multiple serving systems, delete from ZONE\_LIST<sub>S</sub> all
- 2       entries from ZONE\_LIST<sub>S</sub> that have a SID from a different serving system than
- 3       SERVSYS<sub>S</sub>.
- 4       – If CDMABAND<sub>S</sub> contains multiple frequency block designators, delete all entries
- 5       from ZONE\_LIST<sub>S</sub> belonging to a different frequency block designator (see [45])
- 6       than the frequency block designator associated with SID<sub>S</sub>.
- 7       • For any entry of ZONE\_LIST<sub>S</sub> not matching REG\_ZONE<sub>S</sub>, SID<sub>S</sub>, and NID<sub>S</sub> and not
- 8       having an active entry timer, enable the entry timer with the duration specified by
- 9       ZONE\_TIMER<sub>S</sub> (see 2.6.5.1.5).
- 10      • If BYPASS\_REG\_IND<sub>S</sub> is equal to '00', the mobile station shall perform the
- 11      following:
- 12      – Delete all entries from SID\_NID\_LIST<sub>S</sub> belonging to a different band class (see
- 13      [45]) than CDMABAND<sub>S</sub>.
- 14      – If CDMABAND<sub>S</sub> contains multiple serving systems, delete from SID\_NID\_LIST<sub>S</sub>
- 15      all entries from SID\_NID\_LIST<sub>S</sub> that have a SID from a different serving system
- 16      than SERVSYS<sub>S</sub>.
- 17      – If CDMABAND<sub>S</sub> contains multiple frequency block designators, delete all entries
- 18      from SID\_NID\_LIST<sub>S</sub> belonging to a different frequency block designator (see
- 19      [45]) than the frequency block designator associated with SID<sub>S</sub>.
- 20      • For any entry of SID\_NID\_LIST<sub>S</sub> not matching SID<sub>S</sub> and NID<sub>S</sub> and not having an
- 21      active entry timer, enable the entry timer with the duration specified by
- 22      ZONE\_TIMER<sub>S</sub> (see 2.6.5.1.5).

#### 23   2.6.5.5.3.3 Power Off

24   These procedures are performed when the mobile station is directed by the user to power

25   off.

26   The mobile station shall perform the following actions:

- 27      • If an entry of ZONE\_LIST<sub>S</sub> does not have an active timer, copy that entry to
- 28      ZONE\_LIST<sub>S-p</sub>; otherwise, delete any entry in ZONE\_LIST<sub>S-p</sub>.
- 29      • If an entry of SID\_NID\_LIST<sub>S</sub> does not have an active timer, copy that entry to
- 30      SID\_NID\_LIST<sub>S-p</sub>; otherwise, delete any entry in SID\_NID\_LIST<sub>S-p</sub>.

#### 31   2.6.5.5.4 Actions in the Mobile Station Control on the Traffic Channel State

32   Requirements in this section and its subsections apply only when the mobile station is in

33   the *Mobile Station Control on the Traffic Channel State*.

##### 34   2.6.5.5.4.1 Traffic Channel Initialization

35   Upon entering the *Traffic Channel Initialization Substate* of the *Mobile Station Control on the*

36   *Traffic Channel State*, the mobile station shall set COUNTER\_ENABLED<sub>S</sub> to NO, shall set

37   TBR\_RAND\_SUPPR\_ENABLE<sub>S</sub> to '0', and shall set TBR\_RAND\_WINDOW<sub>S</sub> to '11'.

#### 2.6.5.5.4.2 Timer Maintenance

While in the *Mobile Station Control on the Traffic Channel State*, the mobile station shall update all active registration timers.

If a zone list entry timer expires, the mobile station shall delete the corresponding entry from ZONE\_LIST<sub>S</sub>. If a SID/NID list entry timer expires, the mobile station shall delete the corresponding entry from SID\_NID\_LIST<sub>S</sub>.

#### 2.6.5.5.4.3 Processing the Mobile Station Registered Message

The mobile station receives the *Mobile Station Registered Message* on the Forward Traffic Channel when the mobile station is considered registered for the base station whose location and other parameters are included in the message.

The mobile station shall store the following parameters:

- System identification (SID<sub>S</sub> = SID<sub>T</sub>)
- Network identification (NID<sub>S</sub> = NID<sub>T</sub>)
- Registration zone (REG\_ZONE<sub>S</sub> = REG\_ZONE<sub>T</sub>)
- Number of registration zones to be retained (TOTAL\_ZONES<sub>S</sub> = TOTAL\_ZONES<sub>T</sub>)
- Zone timer length (ZONE\_TIMER<sub>S</sub> = ZONE\_TIMER<sub>T</sub>)
- Multiple SID storage indicator (MULT\_SIDS<sub>S</sub> = MULT\_SIDS<sub>T</sub>)
- Multiple NID storage indicator (MULT\_NIDS<sub>S</sub> = MULT\_NIDS<sub>T</sub>)
- Base station latitude (BASE\_LAT<sub>S</sub> = BASE\_LAT<sub>T</sub>)
- Base station longitude (BASE\_LONG<sub>S</sub> = BASE\_LONG<sub>T</sub>)
- Registration distance (REG\_DIST<sub>S</sub> = REG\_DIST<sub>T</sub>)

The mobile station shall perform the following actions:

- Set DIGITAL\_REG<sub>S-p</sub> to '00000001'.
- Add REG\_ZONE<sub>S</sub>, SID<sub>S</sub>, and NID<sub>S</sub> to ZONE\_LIST<sub>S</sub> if not already in the list. If required, include the band class identifier and block identifier for the current band and frequency block designator as specified in 2.6.5.1.5.
- If BYPASS\_REG\_IND<sub>S</sub> is equal to '00', delete all entries from ZONE\_LIST<sub>S</sub> belonging to a different band class (see [45]) than CDMABAND<sub>S</sub>.
- Disable the zone list entry timer for the entry of ZONE\_LIST<sub>S</sub> containing REG\_ZONE<sub>S</sub>, SID<sub>S</sub>, and NID<sub>S</sub>. For any other entry of ZONE\_LIST<sub>S</sub> whose entry timer is not active, enable the entry timer with the duration specified by ZONE\_TIMER<sub>S</sub> (see 2.6.5.1.5).
- If ZONE\_LIST<sub>S</sub> contains more than TOTAL\_ZONES<sub>S</sub> entries, delete the excess entries according to the rules specified in 2.6.5.1.5.
- If BYPASS\_REG\_IND<sub>S</sub> is equal to '00', delete all entries from SID\_NID\_LIST<sub>S</sub> belonging to a different band class (see [45]) than CDMABAND<sub>S</sub>.

- 1 • Add  $SID_S$  and  $NID_S$  to  $SID\_NID\_LIST_S$  if not already in the list. If required, include
- 2 the band class identifier and block identifier for the current band and frequency
- 3 block designator as specified in 2.6.5.1.5.
- 4 • Disable the  $SID/NID$  list entry timer for the entry of  $SID\_NID\_LIST_S$  containing
- 5  $SID_S$ , and  $NID_S$ . For any other entry of  $SID\_NID\_LIST_S$  whose entry timer is not
- 6 active, enable the entry timer with the duration specified in 2.6.5.1.5.
- 7 • If  $SID\_NID\_LIST_S$  contains more than  $N_{10m}$  entries, delete the excess entries
- 8 according to the rules specified in 2.6.5.1.5.
- 9 • If  $MULT\_SIDS_S$  is equal to '0' and  $SID\_NID\_LIST$  contains entries with different
- 10  $SIDs$ , delete the excess entries according to the rules specified in 2.6.5.1.5.
- 11 • If  $MULT\_NIDS_S$  is equal to '0' and  $SID\_NID\_LIST$  contains more than one entry for
- 12 any  $SID$ , delete the excess entries according to the rules specified in 2.6.5.1.5.
- 13 • Set the stored location of last registration ( $BASE\_LAT\_REG_{S-p}$  and  $BASE\_LONG\_REG_{S-p}$ ) to the base station's location ( $BASE\_LAT_S$  and  $BASE\_LONG_S$ ). Set the
- 14 stored registration distance ( $REG\_DIST\_REG_{S-p}$ ) to the base station's registration
- 15 distance ( $REG\_DIST_S$ ).
- 16
- 17 • Update its roaming status and set  $MOB\_TERM_S$  as specified in 2.6.5.3. The mobile
- 18 station should indicate to the user whether the mobile station is roaming.

#### 19 2.6.5.5.4.4 Power Off

20 These procedures are performed when the mobile station is directed by the user to power  
21 off.

22 The mobile station shall perform the following actions:

- 23 • If an entry of  $ZONE\_LIST_S$  does not have an active timer, copy that entry to
- 24  $ZONE\_LIST_{S-p}$ ; otherwise, delete the entry in  $ZONE\_LIST_{S-p}$  if  $ZONE\_LIST_{S-p}$
- 25 contains an entry.
- 26 • If an entry of  $SID\_NID\_LIST_S$  does not have an active timer, copy that entry to
- 27  $SID\_NID\_LIST_{S-p}$ ; otherwise, delete the entry in  $SID\_NID\_LIST_{S-p}$  if  $SID\_NID\_LIST_{S-p}$
- 28 contains an entry.

#### 29 2.6.6 Handoff Procedures

30 This section presents an overview and mobile station requirements for handoffs occurring  
31 while the mobile station is in the *Mobile Station Control on the Traffic Channel State* (see  
32 2.6.4). Mobile station requirements for handoffs occurring while the mobile station is in  
33 the *Mobile Station Idle State* are specified in 2.6.2.1.4.

#### 34 2.6.6.1 Overview

##### 35 2.6.6.1.1 Types of Handoff

36 The mobile station supports the following three handoff procedures while in the *Mobile*  
37 *Station Control on the Traffic Channel State*:

- 1 • *Soft Handoff*: A handoff in which the mobile station commences communications  
2 with a new base station without interrupting communications with the old base  
3 station. Soft handoff can only be used between CDMA Channels having identical  
4 Frequency Assignments. Soft handoff provides diversity of Forward Traffic  
5 Channels and Reverse Traffic Channel paths on the boundaries between base  
6 stations.
- 7 • *CDMA-to-CDMA Hard Handoff*: A handoff in which the mobile station is  
8 transitioned between disjoint sets of base stations, different band classes, different  
9 Frequency Assignments, or different frame offsets.

10 The mobile station shall support soft handoffs on the same Frequency Assignment (see  
11 2.6.6.2.7). The mobile station shall support CDMA-to-CDMA hard handoffs between band  
12 classes on which it supports CDMA operation (see 2.6.6.2.8).

### 13 2.6.6.1.2 Pilot Sets

14 Within section 2.6.6 the term pilot refers to a Pilot Channel identified by a pilot sequence  
15 offset (see [2]), a Walsh function or a quasi-orthogonal function (see [2]), and a Frequency  
16 Assignment (see [2]). A pilot is associated with the Forward Traffic Channels in the same  
17 Forward CDMA Channel. All pilots in a pilot set have the same CDMA Frequency  
18 Assignment.

19 The mobile station searches for pilots on the current CDMA Frequency Assignment to  
20 detect the presence of CDMA Channels and to measure their strengths. When the mobile  
21 station detects a pilot of sufficient strength that is not associated with any of the Forward  
22 Traffic Channels assigned to it, it sends a *Pilot Strength Measurement Message* or an  
23 *Extended Pilot Strength Measurement Message* to the base station<sup>37</sup>. The base station can  
24 then assign a Forward Traffic Channel associated with that pilot to the mobile station and  
25 direct the mobile station to perform a handoff.

26 The pilot search parameters and the rules for *Pilot Strength Measurement Message* or  
27 *Extended Pilot Strength Measurement Message* transmission are expressed in terms of the  
28 following sets of pilots:

- 29 • *Active Set*: The pilots associated with the Forward Traffic Channels assigned to the  
30 mobile station.
- 31 • *Candidate Set*: The pilots that are not currently in the Active Set but have been  
32 received by the mobile station with sufficient strength to indicate that the  
33 associated Forward Traffic Channels could be successfully demodulated.

---

<sup>37</sup> The mobile station may send a Handoff Supplementary Information Notification message to the base station if a message that mobile station is sending includes a Pilot for which the base station may require supplementary information. For example, the mobile station may send this message along with PSMM or EPSMM message.

- 1 • *Neighbor Set*: The pilots that are not currently in the Active Set or the Candidate
- 2 Set and are likely candidates for handoff.
- 3 • *Remaining Set*: The set of all possible pilots in the current system on the current
- 4 CDMA Frequency Assignment, excluding the pilots in the Neighbor Set, the
- 5 Candidate Set, and the Active Set. This set of possible pilots consists of pilots
- 6 whose pilot PN sequence offset indices are integer multiples of  $\text{PILOT\_INC}_S$ .

7 The base station may direct the mobile station to search for pilots on a different CDMA  
 8 frequency to detect the presence of CDMA Channels and to measure their strengths. The  
 9 mobile station reports the results of the search to the base station using the *Candidate*  
 10 *Frequency Search Report Message*. Depending upon the pilot strength measurements  
 11 reported in the *Candidate Frequency Search Report Message*, the base station can direct  
 12 the mobile station to perform an inter-frequency hard handoff.

13 The pilot search parameters are expressed in terms of the following sets of pilots on the  
 14 CDMA Candidate Frequency:

- 15 • *Candidate Frequency Neighbor Set*: A list of pilots on the CDMA Candidate
- 16 Frequency.
- 17 • *Candidate Frequency Search Set*: A subset of the Candidate Frequency Neighbor
- 18 Set that the base station may direct the mobile station to search.

## 19 2.6.6.2 Requirements

### 20 2.6.6.2.1 Pilot Search

21 For the pilot sets defined in 2.6.6.1.2, the base station sets the search window (range of PN  
 22 offsets) in which the mobile station is to search for usable multipath components (i.e.,  
 23 multipath components that the mobile station can use for demodulation of the associated  
 24 Forward Traffic Channel) of the pilots in the set.

25 Search performance criteria are defined in [11].

26 This search shall be governed by the following:

- 27 • *Active Set and Candidate Set*: The search procedures for pilots in the Active Set
- 28 and Candidate Set shall be identical. The search window size<sup>38</sup> for each pilot in the
- 29 Active Set and Candidate Set shall be the number of PN chips specified in Table
- 30 2.6.6.2.1-1 corresponding to  $\text{SRCH\_WIN\_A}_S$ . The mobile station should center the
- 31 search window for each pilot of the Active Set and Candidate Set around the
- 32 earliest arriving usable multipath component of the pilot. If the mobile station
- 33 receives a value greater than or equal to 13 for  $\text{SRCH\_WIN\_A}_T$ , it may store and use
- 34 the value 13 in  $\text{SRCH\_WIN\_A}_S$ .

---

<sup>38</sup> The table defines the entire search range. For example,  $\text{SRCH\_WIN\_A}_S = 6$  corresponds to a 28 PN chip search window or  $\pm 14$  PN chips around the search window center.

4

- 1 • *Neighbor Set:* If SRCH\_WIN\_NGHR\_INCL<sub>s</sub> is equal to '1', the search window size

2 for each pilot in the Neighbor Set shall be the number of PN chips specified in Table

3 2.6.6.2.1-1, corresponding to SRCH\_WIN\_NGHR<sub>s</sub> associated with the pilot being

4 searched. If SRCH\_WIN\_NGHR\_INCL<sub>s</sub> is equal to '0', the search window size for

5 each pilot in the Neighbor Set shall be the number of PN chips specified in Table

6 2.6.6.2.1-1 corresponding to SRCH\_WIN\_N<sub>s</sub>. If SRCH\_OFFSET\_INCL<sub>s</sub> is equal to

7 '1', the search window offset for each pilot in the Neighbor Set shall be the number

8 of PN chips specified in Table 2.6.6.2.1-2, corresponding to

9 SRCH\_OFFSET\_NGHR<sub>s</sub> associated with the pilot being searched. If

10 SRCH\_OFFSET\_INCL<sub>s</sub> is equal to '0', the search window offset for each pilot in the

11 Neighbor Set shall be zero PN chip. The mobile station should center the search

12 window for each pilot in the Neighbor Set around the pilot's PN sequence offset

13 plus the corresponding search window offset, using timing defined by the mobile

14 station's time reference (see [2]). If SEARCH\_PRIORITY\_INCL<sub>s</sub> is equal to '1', the

15 mobile station should use SEARCH\_PRIORITY<sub>s</sub> for the corresponding pilot to

16 schedule its neighbor search. If the mobile station supports hopping pilot beacons

17 and the TIMING\_INCL field of the NGHR\_REC for the corresponding pilot is equal

18 to '1', then the mobile station shall use the information included in the

19 NGHR\_TX\_OFFSET, NGHR\_TX\_DURATION, and NGHR\_TX\_PERIOD fields of

20 the NGHR\_REC for the corresponding pilot to schedule the time for searching the

21 neighbor. If ADD\_PILOT\_REC\_INCL field of the NGHR\_REC for the corresponding

22 pilot is equal to '1', the mobile station shall use the information included in the

23 NGHR\_PILOT\_REC field for searching the neighbor.
- 24 • *Remaining Set:* The search window size for each pilot in the Remaining Set shall be

25 the number of PN chips specified in Table 2.6.6.2.1-1 corresponding to

26 SRCH\_WIN\_R<sub>s</sub>. The mobile station should center the search window for each pilot

27 in the Remaining Set around the pilot's PN sequence offset, using timing defined by

28 the mobile station's time reference (see [2]). The mobile station should only search

29 for Remaining Set pilots whose pilot PN sequence offset indices are equal to integer

30 multiples of PILOT\_INC<sub>s</sub>.

- Candidate Frequency Search Set:** If CF\_SRCH\_WIN\_NGHBR\_INCL<sub>S</sub> is equal to '1', the search window size for each pilot in the Candidate Frequency Search Set shall be the number of PN chips specified in Table 2.6.6.2.1-1, corresponding to SRCH\_WIN\_NGHBR<sub>S</sub> associated with the pilot being searched. If CF\_SRCH\_WIN\_NGHBR\_INCL<sub>S</sub> is equal to '0', the search window size for each pilot in the Candidate Frequency Search Set shall be the number of PN chips specified in Table 2.6.6.2.1-1 corresponding to CF\_SRCH\_WIN\_N<sub>S</sub>. If CF\_SRCH\_OFFSET\_INCL<sub>S</sub> is equal to '1', the search window offset for each pilot in the Candidate Frequency Search Set shall be the number of PN chips specified in Table 2.6.6.2.1-2, corresponding to SRCH\_OFFSET\_NGHBR<sub>S</sub> associated with the pilot being searched. If CF\_SRCH\_OFFSET\_INCL<sub>S</sub> is equal to '0', the search window offset for each pilot in the Candidate Frequency Search Set shall be zero PN chips. The mobile station should center the search window for each pilot in the Candidate Frequency Search Set around the pilot's PN sequence offset plus the corresponding search window offset using timing defined by the mobile station's time reference (see [2]). If CF\_SEARCH\_PRIORITY\_INCL<sub>S</sub> is equal to '1', the mobile station should use SEARCH\_PRIORITY<sub>S</sub> associated with each pilot to schedule a search of its Candidate Frequency Search Set.

#### 2.6.6.2.2 Pilot Strength Measurements

The mobile station assists the base station in the handoff process and in the Reverse Supplemental Code Channel operation and in the Reverse Supplemental Channel operation by measuring and reporting the strengths of received pilots.

For an SR1 pilot, the mobile station should use the searcher element (see [2]) to compute the strength of a pilot (PS) by adding the ratios of received pilot energy per chip,  $E_c$ , to total received spectral density (noise and signals),  $I_o$ , of at most  $k$  usable multipath components, where  $k$  is the number of demodulating elements (see [2]) supported by the mobile station.

For an SR3 pilot, the pilot strength is given by

$$\frac{1}{3} \times \left( \left( \frac{E_c}{I_o} \right)_{\text{Primary}} + \frac{\left( \frac{E_c}{I_o} \right)_1}{\Delta_1} + \frac{\left( \frac{E_c}{I_o} \right)_2}{\Delta_2} \right) \text{ where:}$$

-  $\left( \frac{E_c}{I_o} \right)_{\text{Primary}}$  is the pilot  $E_c/I_o$  measured on the Primary carrier (computed as specified above for SR1 pilots),

-  $\left( \frac{E_c}{I_o} \right)_1$  is the pilot  $E_c/I_o$  measured on the pilot on the lower frequency of the two remaining SR3 frequencies (computed as specified above for SR1 pilots), and  $\Delta_1$  is

1 the pilot power level on the lower frequency of the two remaining SR3 frequencies  
 2 relative to that of the primary SR3 pilot, i.e.  $\Delta_1 = 10^{(-SR3\_PILOT\_POWER1/10)}$ .

3 -  $\left(\frac{E_c}{I_o}\right)_2$  is the pilot  $E_c/I_o$  measured on the pilot on the higher frequency of the two  
 4 remaining SR3 frequencies (computed as specified above for SR1 pilots), and  $\Delta_2$  is  
 5 the pilot power level on the higher frequency of the two remaining SR3 frequencies  
 6 relative to that of the primary SR3 pilot, i.e.  $\Delta_2 = 10^{(-SR3\_PILOT\_POWER2/10)}$ .

#### 7 2.6.6.2.3 Handoff Drop Timer

8 The mobile station shall maintain a handoff drop timer for each pilot in the Active Set and  
 9 Candidate Set.

10 If  $P\_REV\_IN\_USE_s$  is less than or equal to three or  $SOFT\_SLOPE_s$  is equal to '000000', the  
 11 mobile station shall perform the following:

- 12 • For the Candidate Set, the mobile station shall start the timer whenever the  
 13 strength of the corresponding pilot becomes less than  $T\_DROP_s$ . The mobile  
 14 station shall reset and disable the timer if the strength of the corresponding pilot  
 15 exceeds  $T\_DROP_s$ .
- 16 • For the Active Set, the mobile station shall start the timer whenever the strength of  
 17 the corresponding pilot becomes less than  $T\_DROP_s$ . The mobile station shall reset  
 18 and disable the timer if the strength of the corresponding pilot exceeds  $T\_DROP_s$ .

19 If  $P\_REV\_IN\_USE_s$  is greater than three and  $SOFT\_SLOPE_s$  is not equal to '000000', the  
 20 mobile station shall perform the following:

- 21 • For the Candidate Set, the mobile station shall start the timer whenever the  
 22 strength of the corresponding pilot becomes less than  $T\_DROP_s$ . The mobile  
 23 station shall reset and disable the timer if the strength of the corresponding pilot  
 24 exceeds  $T\_DROP_s$ .
- 25 • For the Active Set, the mobile station shall sort the  $N_A$  pilots in the Active Set in  
 26 order of increasing strengths, i.e.,  $PS_1 < PS_2 < PS_3 < \dots < PS_{N_A}$  where the strength  
 27  $PS$  is as defined in 2.6.6.2.2. The mobile station shall start the timer whenever the  
 28 strength  $PS_i$  satisfies the following inequality:

$$29 \quad 10 \times \log_{10} PS_i < \max\left(\frac{SOFT\_SLOPE_s}{8} \times 10 \times \log_{10} \sum_{j>i} PS_j + \frac{DROP\_INTERCEPT_s}{2}, -\frac{T\_DROP_s}{2}\right)$$

$$i = 1, 2, \dots, PS_{N_A-1}$$

30

31 For the Active Set, the mobile station shall start the timer even if the timer has previously  
 32 expired. The mobile station shall reset and disable the timer whenever the above  
 33 inequality is not satisfied for the corresponding pilot.

If T\_TDROP\_RANGE<sub>s</sub> is equal to '0000' or if P\_REV\_IN\_USE<sub>s</sub> is less than 9, then the mobile station shall perform the following:

- If T\_TDROP<sub>s</sub> equals zero, the mobile station shall consider the timer expired within 100 ms of enabling it.
- Otherwise, the mobile station shall consider the timer expired within 10% of the timer expiration value shown in Table 2.6.6.2.3-1 corresponding to T\_TDROP<sub>s</sub>. If T\_TDROP<sub>s</sub> changes, the mobile station shall begin using the new value for all handoff drop timers within 100 ms.

**Table 2.6.6.2.3-1. Handoff Drop Timer Expiration Values**

<b>T_TDROP</b>	<b>Timer Expiration (seconds)</b>	<b>T_TDROP</b>	<b>Timer Expiration (seconds)</b>
0	0.1	8	27
1	1	9	39
2	2	10	55
3	4	11	79
4	6	12	112
5	9	13	159
6	13	14	225
7	19	15	319

Otherwise, the mobile shall perform the following:

- The mobile station shall select the timer expiration value as follows:
  - The mobile station shall select the timer expiration value greater than or equal to the minimum drop timer value computed as:
 
$$\max ( 0.1 \text{ seconds, range-based minimum timer expiration value } ),$$
 where the range-based minimum timer expiration value equals:
 
$$( \text{nominal timer expiration value} ) - ( \text{timer expiration range value} ),$$
 where:
    - the nominal timer expiration value is the timer expiration value in Table 2.6.6.2.3-1 corresponding to T\_TDROP<sub>s</sub> and,
    - the timer expiration range value is the timer expiration range value in Table 2.6.6.2.3-2 corresponding to T\_TDROP\_RANGE<sub>s</sub>.
  - The mobile station shall select the timer expiration value less than or equal to the maximum drop timer value which equals:

( nominal timer expiration value ) + ( timer expiration range value ),

where:

- the nominal timer expiration value is the timer expiration value in Table 2.6.6.2.3-1 corresponding to  $T\_TDROP_S$  and,
  - the timer expiration range value is the timer expiration range value in Table 2.6.6.2.3-2 corresponding to  $T\_TDROP\_RANGE_S$ .
- If the mobile station selected a timer expiration value of 0.1s then the mobile station shall consider the timer expired within 100 ms of enabling it.

**Table 2.6.6.2.3-2. Handoff Drop Timer Expiration Range Values**

<b>T_TDROP_RANGE [binary]</b>	<b>Timer Expiration Range (seconds)</b>	<b>T_TDROP_RANGE [binary]</b>	<b>Timer Expiration Range (seconds)</b>
0000	0	1000	27
0001	1	1001	39
0010	2	1010	55
0011	4	1011	79
0100	6	1100	112
0101	9	1101	159
0110	13	1110	225
0111	19	1111	319

The mobile station shall indicate the status of the handoff drop timer for all pilots in the Active Set and Candidate Set when transmitting a *Pilot Strength Measurement Message* or an *Extended Pilot Strength Measurement Message*.

#### 2.6.6.2.4 Pilot PN Phase

The mobile station shall measure the arrival time,  $PILOT\_ARRIVAL$ , for each pilot reported to the base station. The pilot arrival time shall be the time of occurrence, as measured at the mobile station antenna connector, of the earliest arriving usable multipath component of the pilot (for SR3 pilots, it is based on the earliest arriving usable multipath component from all three carriers). The arrival time shall be measured relative to the mobile station's time reference (see [2]) in units of PN chips. The mobile station shall compute the reported pilot PN phase,  $PILOT\_PN\_PHASE$ , as

$$PILOT\_PN\_PHASE = (PILOT\_ARRIVAL + (64 \times PILOT\_PN)) \bmod 2^{15},$$

where  $PILOT\_PN$  is the PN sequence offset index of the pilot (see [2]).

## 2.6.6.2.5 Handoff Messages

## 2.6.6.2.5.1 Processing of Forward Traffic Channel Handoff Messages

If the mobile station receives any of the following messages, then the mobile station shall process the message as described.

1. *Pilot Measurement Request Order*: The mobile station shall send, within  $T_{56m}$  seconds, a *Pilot Strength Measurement Message* if  $P\_REV\_IN\_USE_S$  is less than seven or a *Extended Pilot Strength Measurement Message* if  $P\_REV\_IN\_USE_S$  is equal to or greater than seven.
2. Reserved
3. *Neighbor List Update Message*: If  $P\_REV\_IN\_USE_S$  is greater than or equal to eight, the mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00000010' (message not accepted in this state); otherwise, the mobile station shall process the message as specified in 2.6.6.2.6.3 and set  $SEARCH\_PRIORITY\_INCL_S$ ,  $SRCH\_WIN\_NGHBR\_INCL_S$ , and  $SRCH\_OFFSET\_INCL_S$  to '0', and set  $TIMING\_INCL$  for each of the neighboring base stations in the *Neighbor List Update Message* to '0'.
4. *Extended Handoff Direction Message*: The mobile station shall process the message as follows:
 

The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00000110' (capability not supported), if the mobile station does not support the band class specified in the *Extended Handoff Direction Message*.

If the mobile station does not send a *Mobile Station Reject Order* in response to the *Extended Handoff Direction Message*, the mobile station shall perform the following at the action time of the message:

  - The mobile station shall send a *Handoff Completion Message* or an *Extended Handoff Completion Message* as specified in 2.6.6.2.5.2.
  - Update the Active Set, Candidate Set, and Neighbor Set in accordance with the *Extended Handoff Direction Message* processing (see 2.6.6.2.6.1, 2.6.6.2.6.2, and 2.6.6.2.6.3).
  - The mobile station shall delete all pilots that are not listed in the Active Set from the Active Set of the Supplemental Channel for the Forward Supplemental Channel Assignment (if any). If these deleted pilots include all pilots in the Active Set of the Supplemental Channel, the mobile station shall cancel the Forward Supplemental Channel Assignment.
  - Discontinue use of all Forward Traffic Channels associated with pilots not listed in the *Extended Handoff Direction Message*.
  - The mobile station shall update the Code Channel List,  $CODE\_CHAN\_LIST_S$ , as specified in 2.6.8.

- 1       • If the mobile station is currently processing Forward Supplemental Code Channels,  
2       then it shall continue processing the Forward Supplemental Code Channels using  
3       the updated Code Channel List, CODE\_CHAN\_LIST<sub>S</sub>.
- 4       • The mobile station shall set IGNORE\_SCAM<sub>S</sub> and IGNORE\_ESCAM<sub>S</sub> to '0'.
- 5       • If HARD\_INCLUDED is equal to '1', perform the following actions:  
6       – If FRAME\_OFFSET<sub>R</sub> is not equal to FRAME\_OFFSET<sub>S</sub>, change the frame  
7       offset on all of the code channels of the Forward Traffic Channel and of the  
8       Reverse Traffic Channel.  
9       – If RESET\_L2<sub>R</sub> is equal to '1', Layer 3 shall send a L2-Supervision.Request  
10      primitive to Layer 2 to reset the acknowledgment procedures as specified in  
11      [4]. The acknowledgment procedures shall be reset immediately after the  
12      action time of the *Extended Handoff Direction Message*.  
13      – If RESET\_FPC<sub>R</sub> is equal to '1', initialize the Forward Traffic Channel power  
14      control counters as specified in 2.6.4.1.1.1.  
15      – If SERV\_NEG\_TYPE<sub>R</sub> is equal to '1', set SERV\_NEG<sub>S</sub> to enabled; otherwise  
16      set SERV\_NEG<sub>S</sub> to disabled.  
17      – Use the long code mask as follows:  
18       + If PRIVATE\_LCM<sub>R</sub> equals '1', the mobile station shall use the Private  
19       Long Code Mask as specified in 2.3.6.  
20       + If PRIVATE\_LCM<sub>R</sub> equals '0', the mobile station shall use the Public Long  
21       Code Mask derived from PLCM\_TYPE<sub>S</sub> as specified in 2.3.6.  
22       + The mobile station shall indicate to the user the voice privacy mode  
23       status.  
24      – Process the ENCRYPT\_MODE field as specified in 2.3.12.2.
- 25      • Store the following parameters from the current configuration:  
26      – Serving Frequency Assignment (SF\_CDMACH<sub>S</sub> = CDMACH<sub>S</sub>)  
27      – Serving Frequency band class (SF\_BAND\_CLASS<sub>S</sub> = BAND\_CLASS<sub>S</sub>)  
28      – Serving Frequency frame offset (SF\_FRAME\_OFFSET<sub>S</sub> = FRAME\_OFFSET<sub>S</sub>)  
29      • If HARD\_INCLUDED is not equal to '1', set NUM\_PREAMBLE<sub>S</sub> = '000'.
- 30      • Store the following parameters from the *Extended Handoff Direction Message*:  
31      – *Extended Handoff Direction Message* sequence number (HDM\_SEQ<sub>S</sub> =  
32      HDM\_SEQ<sub>R</sub>)  
33      – If SEARCH\_INCLUDED is equal to '1', then store the following:  
34       + Search window size for the Active Set and Candidate Set  
35       (SRCH\_WIN\_A<sub>S</sub> = SRCH\_WIN\_A<sub>R</sub>)  
36       + Pilot detection threshold (T\_ADD<sub>S</sub> = T\_ADD<sub>R</sub>)  
37       + Pilot drop threshold (T\_DROP<sub>S</sub> = T\_DROP<sub>R</sub>)

- 1           + Active Set versus Candidate Set comparison threshold  
2           (T\_COMP<sub>S</sub> = T\_COMP<sub>R</sub>)
- 3           + Drop timer value (T\_TDROP<sub>S</sub> = T\_TDROP<sub>R</sub>)
- 4           – If HARD\_INCLUDED is equal to '1', then store the following:
- 5           + Frame offset (FRAME\_OFFSET<sub>S</sub> = FRAME\_OFFSET<sub>R</sub>)
- 6           + Nominal power setting of the target cell (NOM\_PWR<sub>S</sub> = NOM\_PWR<sub>R</sub>)
- 7           + Hard handoff traffic channel preamble count required before transmitting  
8           *Handoff Completion Message* or *Extended Handoff Completion Message*  
9           (NUM\_PREAMBLE<sub>S</sub> = NUM\_PREAMBLE<sub>R</sub>)
- 10          + CDMA band class (CDMABAND<sub>S</sub> = BAND\_CLASS<sub>R</sub>)
- 11          + Frequency assignment (CDMACH<sub>S</sub> = CDMA\_FREQ<sub>R</sub>)
- 12          + Nominal power setting of the target cell (If CDMABAND<sub>S</sub> = '00000' or  
13          CDMABAND<sub>S</sub> = '00011', then NOM\_PWR\_EXT<sub>S</sub> = '0'; otherwise,  
14          NOM\_PWR\_EXT<sub>S</sub> = NOM\_PWR\_EXT<sub>R</sub>)
- 15          – One occurrence of PILOT\_PN and PWR\_COMB\_IND for each included  
16          member of the Active Set.
- 17          – If ADD\_LENGTH is not equal to '000', then store the following:
- 18          + Protocol revision level (P\_REV<sub>S</sub> = P\_REV<sub>R</sub>)
- 19          + Protocol revision level currently in use (P\_REV\_IN\_USE<sub>S</sub> = the minimum  
20          value of P\_REV<sub>S</sub> and MOB\_P\_REV<sub>P</sub> of the current band class)
- 21          – Disable return on failure (RETURN\_IF\_HANDOFF\_FAIL<sub>S</sub> = '0')
- 22          • Perform a soft or hard handoff depending on the following conditions:
- 23          – If any of the following conditions is true, the mobile station shall perform a  
24          hard handoff:
- 25                  + HARD\_INCLUDED is set to '1' and either BAND\_CLASS<sub>R</sub> is not equal to  
26                  SF\_CDMABAND<sub>S</sub>, CDMA\_FREQ<sub>R</sub> is not equal to SF\_CDMACH<sub>S</sub>, or  
27                  FRAME\_OFFSET<sub>R</sub> is not equal to SF\_FRAME\_OFFSET<sub>S</sub>, or
- 28                  + The set of pilots specified by the message is disjoint from the Active Set  
29                  prior to the action time of the message.
- 30          – If the mobile station performs a hard handoff, it shall perform the following:
- 31                  + If a Periodic Serving Frequency Pilot Report Procedure is in progress, abort  
32                  the procedure (see 2.6.6.2.12).
- 33                  + If a Candidate Frequency periodic search is in progress, abort the periodic  
34                  search (see 2.6.6.2.8.3.4 and 2.6.6.2.10.4) and set PERIODIC\_SEARCH<sub>S</sub> to  
35                  '0'.
- 36                  + The mobile station shall cancel the Forward Supplemental Channel  
37                  assignment or the Reverse Supplemental Channel assignment (if any).

- + Perform the actions specified in 2.6.6.2.8.1. If the message specifies more than one pilot, the mobile station shall also perform the actions specified in 2.6.6.2.7.1 and 2.6.6.2.7.2.
  - Otherwise, the mobile station shall perform a soft handoff as specified in 2.6.6.2.7.

5. *Candidate Frequency Search Request Message*: The mobile station shall process the message as follows:

The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00000110' (capability not supported), if the following condition is true:

- SEARCH\_MODE<sub>r</sub> is not equal to '0000', and the mobile station does not support the capability specified by SEARCH\_MODE<sub>r</sub>.

If none of the above conditions is true, the mobile station shall perform the actions described in the remainder of this section to process the *Candidate Frequency Search Request Message*.

If SEARCH\_MODE<sub>r</sub> is equal to '0000', the mobile station shall process the *Candidate Frequency Search Request Message* as follows:

- The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00001100' (invalid Frequency Assignment), if the Frequency Assignment specified in the message is the same as the Serving Frequency (BAND\_CLASS<sub>r</sub> is equal to CDMABAND<sub>s</sub> and CDMA\_FREQ<sub>r</sub> is equal to CDMACH<sub>s</sub>).
- The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00001010' (search set not specified), if SEARCH\_TYPE<sub>r</sub> is equal to '01' or '11', and one of the following conditions is true:
  - PILOT\_UPDATE<sub>r</sub> is equal to '0' and the Candidate Frequency Search Set before the action time of the *Candidate Frequency Search Request Message* is empty, or
  - PILOT\_UPDATE<sub>r</sub> is equal to '1' and the message specifies an empty search set.
- The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00001101' (search period too short), if SEARCH\_TYPE<sub>r</sub> is equal to '11' and *search\_period* is less than (max (*fwd\_time*, *rev\_time*) + T<sub>71m</sub>) seconds, where *search\_period*, *fwd\_time* and *rev\_time* are defined below.

(In the following, if PILOT\_UPDATE<sub>r</sub> is equal to '1', *rec\_search\_set* is the set of pilots specified in the *Candidate Frequency Search Request Message* with the corresponding SEARCH\_SET field set to '1'; otherwise, *rec\_search\_set* is the Candidate Frequency Search Set before the action time of the *Candidate Frequency Search Request Message*.)

*search\_period* = time period corresponding to SEARCH\_PERIOD<sub>r</sub> shown in Table 2.6.6.2.8.3.2-1

*fwd\_time* = the mobile station's estimate of the total length of time, in seconds, for which the mobile station will need to suspend its current Forward Traffic Channel processing in order to tune to the Candidate Frequency, to search *rec\_search\_set*, and to re-tune to the Serving Frequency; if the mobile station searches *rec\_search\_set* in multiple visits, *fwd\_time* is the total time for all visits to the Candidate Frequency in a search period (see 2.6.6.2.8.3.2)

*rev\_time* = the mobile station's estimate of the total length of time, in seconds, for which the mobile station will need to suspend its current Reverse Traffic Channel processing in order to tune to the Candidate Frequency, to search *rec\_search\_set*, and to re-tune to the Serving Frequency; if the mobile station searches *rec\_search\_set* in multiple visits, *rev\_time* is the total time for all visits to the Candidate Frequency in a search period

- If the mobile station does not send a *Mobile Station Reject Order* in response to the *Candidate Frequency Search Request Message*, it shall perform the following:
  - The mobile station shall send a *Candidate Frequency Search Response Message* in assured mode, within T<sub>56m</sub> seconds of receiving the *Candidate Frequency Search Request Message*. The mobile station shall set the fields of the *Candidate Frequency Search Response Message* as follows:
    - + The mobile station shall set TOTAL\_OFF\_TIME\_FWD and TOTAL\_OFF\_TIME\_REV to its estimate of the total number of frames or power control groups for which it will need to suspend its current Forward Traffic Channel processing and Reverse Traffic Channel processing, respectively, in order to tune to the Candidate Frequency, to search *rec\_search\_set*, and to re-tune to the Serving Frequency (see 2.6.6.2.8.3.2). If the mobile station searches *rec\_search\_set* in multiple visits to the Candidate Frequency, the mobile station shall report the total number of frames or power control groups in all visits in a search period for which it will need to suspend its current Forward Traffic Channel and the Reverse Traffic Channel processing.
    - + The mobile station shall set MAX\_OFF\_TIME\_FWD and MAX\_OFF\_TIME\_REV to its estimate of the maximum number of frames or power control groups for which it will need to suspend its current Forward Traffic Channel processing and Reverse Traffic Channel processing, respectively, during any single visit to tune to the Candidate Frequency, to search a subset of *rec\_search\_set*, and to re-tune to the Serving Frequency.<sup>39</sup>

---

<sup>39</sup> If the mobile station searches the entire Candidate Frequency Search Set in a single visit to the  
(footnote continued on next page)

- 1           + The mobile station shall set PCG\_OFF\_TIMES to '1' if
- 2           TOTAL\_OFF\_TIME\_FWD, MAX\_OFF\_TIME\_FWD,
- 3           TOTAL\_OFF\_TIME\_REV and MAX\_OFF\_TIME\_REV are expressed in
- 4           units of power control groups. If these time estimates are expressed in
- 5           units of frames, the mobile station shall set PCG\_OFF\_TIMES to '0'. The
- 6           mobile station shall not use power control groups as the unit of duration
- 7           if P\_REV\_IN\_USE<sub>S</sub> is less than six.
  
- 8           + If ALIGN\_TIMING<sub>r</sub> is equal to '1', the mobile station shall set
- 9           ALIGN\_TIMING\_USED to '1' to indicate if it will align its search as
- 10          requested by the base station; otherwise, the mobile station shall set
- 11          ALIGN\_TIMING\_USED to '0'. If ALIGN\_TIMING\_USED is set to '1', the
- 12          mobile station shall set MAX\_NUM\_VISITS to the maximum number of
- 13          visits per search period minus one. If MAX\_NUM\_VISITS is not equal to
- 14          0, the mobile station shall set INTER\_VISIT\_TIME, in units of frames or
- 15          power control groups, to its estimate of the time between the beginning
- 16          of consecutive visits to the Candidate Frequency within the same search
- 17          period.
  
- 18          – When the message takes effect, the mobile station shall perform the
- 19          following actions:
  
- 20               + If any periodic search is in progress, the mobile station shall abort it (see
- 21               2.6.6.2.8.3.4 and 2.6.6.2.10.4).
  
- 22               + Store the following parameters from the *Candidate Frequency Search*
- 23               *Request Message*:
  
- 24                   o *Candidate Frequency Search Request Message* sequence number
- 25                   (CFSRM\_SEQ<sub>S</sub> = CFSRM\_SEQ<sub>r</sub>)
  
- 26                   o Periodic search flag: If SEARCH\_TYPE<sub>r</sub> is equal to '11', the mobile
- 27                   station shall set PERIODIC\_SEARCH<sub>S</sub> to '1'; otherwise, the mobile
- 28                   station shall set PERIODIC\_SEARCH<sub>S</sub> to '0'.
  
- 29                   o Search period on the Candidate Frequency
- 30                   (SEARCH\_PERIOD<sub>S</sub> = SEARCH\_PERIOD<sub>r</sub>)
  
- 31                   o Candidate Frequency search mode
- 32                   (SEARCH\_MODE<sub>S</sub> = SEARCH\_MODE<sub>r</sub>)
  
- 33                   o Band class for the Candidate Frequency
- 34                   (CF\_CDMABAND<sub>S</sub> = BAND\_CLASS<sub>r</sub>)
  
- 35                   o CDMA Channel number for the CDMA Candidate Frequency
- 36                   (CF\_CDMACH<sub>S</sub> = CDMA\_FREQ<sub>r</sub>)

---

Candidate Frequency, TOTAL\_OFF\_TIME\_FWD will be equal to MAX\_OFF\_TIME\_FWD, and TOTAL\_OFF\_TIME\_REV will be equal to MAX\_OFF\_TIME\_REV.

- 1           o Serving Frequency total pilot  $E_c$  threshold  
2           (SF\_TOTAL\_EC\_THRESH<sub>S</sub> = SF\_TOTAL\_EC\_THRESH<sub>T</sub>)
- 3           o Serving Frequency total pilot  $E_c/I_0$  threshold  
4           (SF\_TOTAL\_EC\_I0\_THRESH<sub>S</sub> = SF\_TOTAL\_EC\_I0\_THRESH<sub>T</sub>)
- 5           o Received power difference threshold  
6           (DIFF\_RX\_PWR\_THRESH<sub>S</sub> = DIFF\_RX\_PWR\_THRESH<sub>T</sub>)
- 7           o Candidate Frequency Total pilot  $E_c/I_0$  threshold  
8           (MIN\_TOTAL\_PILOT\_EC\_I0<sub>S</sub> = MIN\_TOTAL\_PILOT\_EC\_I0<sub>T</sub>)
- 9           o Pilot detection threshold on the CDMA Candidate Frequency  
10          (CF\_T\_ADD<sub>S</sub> = CF\_T\_ADD<sub>T</sub>)
- 11          o Maximum time on the CDMA Target Frequency that the mobile  
12          station may wait to receive a period of ( $N_{11m} \times 20$ ) ms with sufficient  
13          signal quality on the physical channel corresponding to  
14          FPC\_PRI\_CHAN<sub>S</sub>  
15          (TF\_WAIT\_TIME<sub>S</sub> = TF\_WAIT\_TIME<sub>T</sub>)
- 16          o Pilot PN sequence offset increment on the CDMA Candidate  
17          Frequency (CF\_PILOT\_INC<sub>S</sub> = CF\_PILOT\_INC<sub>T</sub>)
- 18          o Search window for pilots in the Neighbor Set on the CDMA  
19          Candidate Frequency (CF\_SRCH\_WIN\_N<sub>S</sub> = CF\_SRCH\_WIN\_N<sub>T</sub>)
- 20          o Search window for pilots in the Remaining Set on the CDMA  
21          Candidate Frequency (CF\_SRCH\_WIN\_R<sub>S</sub> = CF\_SRCH\_WIN\_R<sub>T</sub>)
- 22          o If PILOT\_UPDATE is equal to '1', the mobile station shall perform the  
23          following:
  - 24           ◇ Set CF\_SEARCH\_PRIORITY\_INCL<sub>S</sub> and  
25           CF\_SRCH\_WIN\_NGHR\_INCL<sub>S</sub> to the values corresponding to  
26           CF\_NGHR\_SRCH\_MODE shown in Table 2.6.6.2.5.1-1,  
27           ◇ Set CF\_SRCH\_OFFSET\_INCL<sub>S</sub> to CF\_SRCH\_OFFSET\_INCL<sub>T</sub>.
- 28          o If PILOT\_UPDATE is equal to '1', the mobile station shall replace the  
29          Candidate Frequency Neighbor Set with all neighbor pilots specified  
30          in the *Candidate Frequency Search Request Message*. Specifically,  
31          the mobile station shall store the following:
  - 32           ◇ Set the NGHR\_PN field of the Candidate Frequency Neighbor  
33           Set Pilot Record to NGHR\_PN<sub>T</sub>.
  - 34           ◇ Set the ADD\_PILOT\_REC\_INCL field of the Candidate Frequency  
35           Neighbor Set Pilot Record to ADD\_PILOT\_REC\_INCL<sub>T</sub>. If  
36           ADD\_PILOT\_REC\_INCL<sub>T</sub> is equal to '1', the mobile station shall  
37           store the following:

- 1                   - Set the NGHBR\_PILOT\_REC\_TYPE field of the Candidate
- 2                   Frequency Neighbor Set Pilot Record to
- 3                   NGHBR\_PILOT\_REC\_TYPE<sub>r</sub>.
- 4                   - If NGHBR\_PILOT\_REC\_TYPE<sub>r</sub> equals '000', the mobile station
- 5                   shall set the TD\_POWER\_LEVEL and TD\_MODE fields of the
- 6                   Candidate Frequency Neighbor Set Pilot Record to
- 7                   TD\_POWER\_LEVEL<sub>r</sub> and TD\_MODE<sub>r</sub>, respectively.
- 8                   - If NGHBR\_PILOT\_REC\_TYPE<sub>r</sub> is equal to '001', the mobile
- 9                   station shall
- 10                  + Set the AUX\_PILOT\_QOF field of the Candidate Frequency
- 11                  Neighbor Set Pilot Record to QOF<sub>r</sub>.
- 12                  + Set the AUX\_PILOT\_WALSH\_CODE field of the Candidate
- 13                  Frequency Neighbor Set Pilot Record to
- 14                  AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length
- 15                  specified by WALSH\_LENGTH<sub>r</sub>.
- 16                  - If NGHBR\_PILOT\_REC\_TYPE<sub>r</sub> is equal to '010', the mobile
- 17                  station shall:
- 18                  + Set the AUX\_PILOT\_TD\_QOF field of the Candidate
- 19                  Frequency Neighbor Set Pilot Record to QOF<sub>r</sub>.
- 20                  + Set the AUX\_PILOT\_WALSH\_CODE field of the Candidate
- 21                  Frequency Neighbor Set Pilot Record to AUX\_WALSH<sub>r</sub>
- 22                  with the Walsh Code length specified by
- 23                  WALSH\_LENGTH<sub>r</sub>.
- 24                  + Set the AUX\_TD\_POWER\_LEVEL field of the Candidate
- 25                  Frequency Neighbor Set Pilot Record to
- 26                  AUX\_TD\_POWER\_LEVEL<sub>r</sub>.
- 27                  + Set the TD\_MODE field of the Candidate Frequency
- 28                  Neighbor Set Pilot Record to TD\_MODE<sub>r</sub>.
- 29                  - If NGHBR\_PILOT\_REC\_TYPE<sub>r</sub> is equal to '011', the mobile
- 30                  station shall:
- 31                  + Set the SR3\_PRIMARY\_PILOT field of Candidate
- 32                  Frequency Neighbor Set Pilot Record to
- 33                  SR3\_PRIMARY\_PILOT<sub>r</sub>.
- 34                  + Set the SR3\_PILOT\_POWER1 field of Candidate Frequency
- 35                  Neighbor Set Pilot Record to SR3\_PILOT\_POWER1<sub>r</sub>.
- 36                  + Set the SR3\_PILOT\_POWER2 field of Candidate Frequency
- 37                  Neighbor Set Pilot Record to SR3\_PILOT\_POWER2<sub>r</sub>.
- 38                  - If NGHBR\_PILOT\_REC\_TYPE<sub>r</sub> is equal to '100', the mobile
- 39                  station shall:

- 1                   + Set the SR3\_PRIMARY\_PILOT field of Candidate
- 2                   Frequency Neighbor Set Pilot Record to
- 3                   SR3\_PRIMARY\_PILOT<sub>r</sub>.
- 4                   + Set the SR3\_PILOT\_POWER1 field of Candidate Frequency
- 5                   Neighbor Set Pilot Record to SR3\_PILOT\_POWER1<sub>r</sub>.
- 6                   + Set the SR3\_PILOT\_POWER2 field of Candidate Frequency
- 7                   Neighbor Set Pilot Record to SR3\_PILOT\_POWER2<sub>r</sub>.
- 8                   + Set the AUX\_PILOT\_QOF field of Candidate Frequency
- 9                   Neighbor Set Pilot Record to QOF<sub>r</sub>.
- 10                  + Set the AUX\_PILOT\_WALSH\_CODE field of Candidate
- 11                  Frequency Neighbor Set Pilot Record to
- 12                  AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length
- 13                  specified by WALSH\_LENGTH<sub>r</sub>.
- 14                  + If ADD\_INFO\_INCL1<sub>r</sub> is equal to '1', set the
- 15                  AUX\_PILOT\_QOF1 field of Candidate Frequency Neighbor
- 16                  Set Pilot Record to QOF1<sub>r</sub> and set the
- 17                  AUX\_PILOT\_WALSH\_CODE1 field of Candidate Frequency
- 18                  Neighbor Set Pilot Record to AUX\_PILOT\_WALSH1<sub>r</sub> with
- 19                  the Walsh Code length specified by WALSH\_LENGTH1<sub>r</sub>;
- 20                  otherwise, set the AUX\_PILOT\_QOF1 field of Candidate
- 21                  Frequency Neighbor Set Pilot Record to QOF<sub>r</sub> and set the
- 22                  AUX\_PILOT\_WALSH\_CODE1 field of Candidate Frequency
- 23                  Neighbor Set Pilot Record to AUX\_PILOT\_WALSH<sub>r</sub> with
- 24                  the Walsh Code length specified by WALSH\_LENGTH<sub>r</sub>.
- 25                  + If ADD\_INFO\_INCL2<sub>r</sub> is equal to '1', set the
- 26                  AUX\_PILOT\_QOF2 field of Candidate Frequency Neighbor
- 27                  Set Pilot Record to QOF2<sub>r</sub> and set the
- 28                  AUX\_PILOT\_WALSH\_CODE2 field of Candidate Frequency
- 29                  Neighbor Set Pilot Record to AUX\_PILOT\_WALSH2<sub>r</sub> with
- 30                  the Walsh Code length specified by WALSH\_LENGTH2<sub>r</sub>;
- 31                  otherwise, set the AUX\_PILOT\_QOF2 field of Candidate
- 32                  Frequency Neighbor Set Pilot Record to QOF<sub>r</sub> and set the
- 33                  AUX\_PILOT\_WALSH\_CODE2 field of Candidate Frequency
- 34                  Neighbor Set Pilot Record to AUX\_PILOT\_WALSH<sub>r</sub> with
- 35                  the Walsh Code length specified by WALSH\_LENGTH<sub>r</sub>.
- 36                  o If PILOT\_UPDATE is equal to '1' and CF\_SEARCH\_PRIORITY\_INCL<sub>s</sub> is
- 37                  equal to '1', the mobile station shall store the search priority
- 38                  (SEARCH\_PRIORITY<sub>s</sub> = SEARCH\_PRIORITY<sub>r</sub>) associated with each of
- 39                  the neighboring base stations contained in the Candidate Frequency
- 40                  Neighbor Set.
- 41                  o If PILOT\_UPDATE is equal to '1' and CF\_SRCH\_WIN\_NGHR\_INCL<sub>s</sub>
- 42                  is equal to '1', the mobile station shall perform the following:

- ◇ Store the neighbor pilot channel search window size ( $SRCH\_WIN\_NGHBR_S = SRCH\_WIN\_NGHBR_T$ ) associated with each of the neighboring base stations contained in the Candidate Frequency Neighbor Set,
- ◇ If  $CF\_SRCH\_OFFSET\_INCL_T$  equals '1', store the neighbor pilot channel search window offset ( $SRCH\_OFFSET\_NGHBR_S = SRCH\_OFFSET\_NGHBR_T$ ) associated with each of the neighboring base stations contained in the Candidate Frequency Neighbor Set.
- If  $PILOT\_UPDATE$  is equal to '1', the mobile station shall replace the Candidate Frequency Search Set with all flagged pilots (those with the corresponding  $SEARCH\_SET$  field set to '1') specified in the *Candidate Frequency Search Request Message*.
- + If  $ALIGN\_TIMING_T$  is equal to '1' and the mobile station will align its search as requested by the base station, the mobile station shall set  $ALIGN\_TIMING\_USED_S$  to '1' and  $SEARCH\_OFFSET_S$  to  $SEARCH\_OFFSET_T$ ; otherwise, the mobile station shall set  $ALIGN\_TIMING\_USED_S$  to '0' and  $SEARCH\_OFFSET_S$  to '000000'.
- + If the mobile station sets the  $PCG\_OFF\_TIMES$  field of the *Candidate Frequency Search Response Message* to '1', it shall set  $SEARCH\_TIME\_RESOLUTION_S$  to 0.00125; otherwise, it shall set  $SEARCH\_TIME\_RESOLUTION_S$  to 0.02.
- + If  $SEARCH\_TYPE_T$  is equal to '01', the mobile station shall perform a single search of the Candidate Frequency Search Set, as described in 2.6.6.2.8.3.1. If  $SEARCH\_TYPE_T$  is equal to '11', the mobile station shall perform the periodic search procedures, as described in 2.6.6.2.8.3.2.

**Table 2.6.6.2.5.1-1. Search Parameter Settings**

<b>NGHBR_SRCH_-MODE</b> <b>CF_NGHBR_-SRCH_MODE</b>	<b>SEARCH_-PRIORITY_INCL</b> <b>CF_SEARCH_-PRIORITY_INCL</b>	<b>SRCH_WIN_-NGHBR_INCL</b> <b>CF_SRCH_-WIN_NGHBR_INCL</b>

01	1	0
10	0	1
11	1	1

6. *Candidate Frequency Search Control Message*: The mobile station shall process the message as follows:

If  $SEARCH\_MODE_S$  is equal to '0000':

- 1       • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field  
2       set to '00001010' (search set not specified), if SEARCH\_TYPE<sub>r</sub> is not equal to  
3       '00' and the Candidate Frequency Search Set is empty.
- 4       • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field  
5       set to '00001011' (invalid search request), if SEARCH\_TYPE<sub>r</sub> is not equal to '00'  
6       and the Candidate Frequency is the same as the Serving Frequency  
7       (CF\_CDMABAND<sub>s</sub> is equal to CDMABAND<sub>s</sub> and CF\_CDMACH<sub>s</sub> is equal to  
8       CDMACH<sub>s</sub>).
- 9       • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field  
10      set to '00001101' (search period too short), if SEARCH\_TYPE<sub>r</sub> is equal to '11'  
11      and *search\_period* is less than (max (*fwd\_time*, *rev\_time*) + T<sub>71m</sub>) seconds,  
12      where  
13      *search\_period* = time period corresponding to SEARCH\_PERIOD<sub>r</sub> shown in  
14      Table 2.6.6.2.8.3.2-1,  
15      *fwd\_time* = the mobile station's estimate of the total length of time, in  
16      seconds, for which the mobile station will need to suspend its  
17      current Forward Traffic Channel processing in order to tune to  
18      the Candidate Frequency, to search the Candidate Frequency  
19      Search Set and to re-tune to the Serving Frequency; if the  
20      mobile station searches the Candidate Frequency Search Set in  
21      multiple visits, *fwd\_time* is the total time for all visits to the  
22      Candidate Frequency in a search period (see 2.6.6.2.8.3.2),  
23      and  
24      *rev\_time* = the mobile station's estimate of the total length of time, in  
25      seconds, for which the mobile station will need to suspend its  
26      current Reverse Traffic Channel processing in order to tune to  
27      the Candidate Frequency, to search the Candidate Frequency  
28      Search Set and to re-tune to the Serving Frequency; if the  
29      mobile station searches the Candidate Frequency Search Set in  
30      multiple visits, *rev\_time* is the total time for all visits to the  
31      Candidate Frequency in a search period.
- 32      • If the mobile station does not reject the *Candidate Frequency Search Control*  
33      *Message*, it shall perform the following actions when the message takes effect:  
34      – If any periodic search is in progress, the mobile station shall abort it (see  
35      2.6.6.2.8.3.4 and 2.6.6.2.10.4).  
36      – If ALIGN\_TIMING<sub>r</sub> is equal to '1' and the mobile station will align its search  
37      as requested by the base station, the mobile station shall set  
38      ALIGN\_TIMING\_USED<sub>s</sub> to '1'; otherwise, the mobile station shall set  
39      ALIGN\_TIMING\_USED<sub>s</sub> to '0' and SEARCH\_OFFSET<sub>s</sub> to '000000'.  
40      – If SEARCH\_TYPE<sub>r</sub> is equal to '00', the mobile station shall set  
41      PERIODIC\_SEARCH<sub>s</sub> to '0'.

- 1           – If SEARCH\_TYPE<sub>R</sub> is equal to '01':
- 2           + The mobile station shall set PERIODIC\_SEARCH<sub>S</sub> to '0'.
- 3           + The mobile station shall perform a single search of the Candidate
- 4           Frequency Search Set, as described in 2.6.6.2.8.3.1.
- 5           – If SEARCH\_TYPE<sub>R</sub> is equal to '11':
- 6           + The mobile station shall set PERIODIC\_SEARCH<sub>S</sub> to '1'.
- 7           + The mobile station shall perform the periodic search procedures for the
- 8           Candidate Frequency Search Set, as described in 2.6.6.2.8.3.2.

9       7. *Extended Neighbor List Update Message*: The mobile station shall update its  
10 neighbor set as specified in 2.6.6.2.6.3 and perform the following:

- 11       • If NGHBR\_SRCH\_MODE<sub>R</sub> is equal to '01' or '11', the mobile station shall store
- 12       the search priority (SEARCH\_PRIORITY<sub>S</sub> = SEARCH\_PRIORITY<sub>P</sub>) associated with
- 13       each of the neighboring base stations contained in the *Extended Neighbor List*
- 14       *Update Message* which are in the mobile's neighbor set.
- 15       • If NGHBR\_SRCH\_MODE<sub>R</sub> is equal to '01' or '00', the mobile station shall set the
- 16       SRCH\_OFFSET\_INCL<sub>S</sub> field '0'.
- 17       • If NGHBR\_SRCH\_MODE<sub>R</sub> is equal to '10' or '11', the mobile station shall perform
- 18       the following:
  - 19       – Store the neighbor pilot channel search window size
  - 20       (SRCH\_WIN\_NGHBR<sub>S</sub> = SRCH\_WIN\_NGHBR<sub>P</sub>) associated with each of the
  - 21       neighboring base stations contained in the *Extended Neighbor List Updated*
  - 22       *Message* which are in the mobile's neighbor set,
  - 23       – If SRCH\_OFFSET\_INCL<sub>R</sub> equals '1', set the SRCH\_OFFSET\_NGHBR field of
  - 24       NGHBR\_REC[i] to the i<sup>th</sup> occurrence of SRCH\_OFFSET\_NGHBR<sub>R</sub>,
  - 25       – Set SRCH\_OFFSET\_INCL<sub>S</sub> to SRCH\_OFFSET\_INCL<sub>R</sub>.
- 26       • The mobile station shall update the default search window size for its Neighbor
- 27       Set (SRCH\_WIN\_N<sub>S</sub> = SRCH\_WIN\_N<sub>P</sub>).
- 28       • The mobile station shall set SEARCH\_PRIORITY\_INCL<sub>S</sub> and
- 29       SRCH\_WIN\_NGHBR\_INCL<sub>S</sub> to the value specified in Table 2.6.6.2.5.1-1
- 30       corresponding to NGHBR\_SRCH\_MODE<sub>R</sub>.
- 31       • If USE\_TIMING is equal to '1', the mobile station shall store the timing included
- 32       flag (TIMING\_INCL) associated with each of the neighboring base stations
- 33       contained in the *Extended Neighbor List Update Message* which are in the
- 34       mobile station neighbor set; otherwise the mobile station shall set the timing
- 35       included flag (TIMING\_INCL) associated with each of the neighboring base
- 36       stations to '0'.

- 1       • If USE\_TIMING is equal to '1' and TIMING\_INCL<sub>r</sub> is equal to '1', the mobile  
2       station shall store the neighbor transmit time offset (NGHBR\_TX\_OFFSET =  
3       NGHBR\_TX\_OFFSET<sub>r</sub>) associated with each of the neighboring base stations  
4       contained in the *Extended Neighbor List Update Message* which are in the  
5       mobile station neighbor set.
- 6       • If USE\_TIMING is equal to '1' and the TIMING\_INCL is equal to '1', then the  
7       mobile station shall perform the following:
  - 8       – If the GLOBAL\_TIMING\_INCL field is equal to '1', then the mobile station  
9       shall store the neighbor transmit time duration (NGHBR\_TX\_DURATION =  
10       GLOBAL\_TX\_DURATION<sub>r</sub>) and the neighbor transmit time duration  
11       (NGHBR\_TX\_PERIOD = GLOBAL\_TX\_PERIOD<sub>r</sub>) contained in the *Extended*  
12       *Neighbor List Update Message*.
  - 13       – If the GLOBAL\_TIMING\_INCL field is equal to '0', then the mobile station  
14       shall store the neighbor transmit time duration (NGHBR\_TX\_DURATION =  
15       NGHBR\_TX\_DURATION<sub>r</sub>) and the neighbor transmit time duration  
16       (NGHBR\_TX\_PERIOD = NGHBR\_TX\_PERIOD<sub>r</sub>) associated with each of the  
17       neighboring base stations contained in the *Extended Neighbor List Update*  
18       *Message* which are in the mobile station neighbor set.
- 19       • The mobile station shall set RESQ\_ENABLED<sub>s</sub> = RESQ\_ENABLED<sub>r</sub>. If  
20       RESQ\_ENABLED<sub>s</sub> is equal to '1', then the mobile station shall store:
  - 21       – Call rescue delay timer value (RESQ\_DELAY\_TIME<sub>s</sub> = RESQ\_DELAY\_TIME<sub>r</sub>)
  - 22       – Call rescue allowed timer value (RESQ\_ALLOWED\_TIME<sub>s</sub> =  
23       RESQ\_ALLOWED\_TIME<sub>r</sub>)
  - 24       – Call rescue attempt timer value (RESQ\_ATTEMPT\_TIME<sub>s</sub> =  
25       RESQ\_ATTEMPT\_TIME<sub>r</sub>)
  - 26       – Code channel index for call rescue (RESQ\_CODE\_CHAN<sub>s</sub> =  
27       RESQ\_CODE\_CHAN<sub>r</sub>)
  - 28       – Quasi-Orthogonal Function mask identifier for call rescue (RESQ\_QOF<sub>s</sub> =  
29       RESQ\_QOF<sub>r</sub>)
  - 30       – Minimum time between consecutive rescues (RESQ\_MIN\_PERIOD<sub>s</sub> =  
31       RESQ\_MIN\_PERIOD<sub>r</sub> + 1) if RESQ\_MIN\_PERIOD\_INCL<sub>r</sub> is equal to '1';  
32       otherwise, RESQ\_MIN\_PERIOD<sub>s</sub> = '00000'.
  - 33       – The required number of transmissions of a regular PDU before declaring L2  
34       Acknowledgment Failure when Call Rescue is enabled  
35       (RESQ\_NUM\_TOT\_TRANS\_20MS<sub>s</sub> = RESQ\_NUM\_TOT\_TRANS\_20MS<sub>r</sub>) if  
36       included.
  - 37       – The required number of transmissions of a mini PDU before declaring L2  
38       Acknowledgment Failure when Call Rescue is enabled  
39       (RESQ\_NUM\_TOT\_TRANS\_5MS<sub>s</sub> = RESQ\_NUM\_TOT\_TRANS\_5MS<sub>r</sub>) if  
40       included.

- 1           – The mobile station shall set the Traffic Channel preamble length for Call  
2           Rescue Soft Handoff as follows:
  - 3           + If the mobile station is operating in Radio Configuration 1 or 2, set  
4           RESQ\_NUM\_PREAMBLE\_RC1\_RC2<sub>S</sub> = RESQ\_NUM\_PREAMBLE<sub>R</sub>;
  - 5           + If the mobile station is operating in Radio Configuration greater 2, set  
6           RESQ\_NUM\_PREAMBLE<sub>S</sub> = RESQ\_NUM\_PREAMBLE<sub>R</sub>.
- 7           – The power level adjustment to be applied to the last closed-loop power level  
8           when re-enabling the transmitter for call rescue soft handoff  
9           (RESQ\_POWER\_DELTA<sub>S</sub> = RESQ\_POWER\_DELTA<sub>R</sub>).
- 10          – Set the NGHBR\_RESQ\_CONFIGURED field of NGHBR\_REC[i] to the i<sup>th</sup>  
11          occurrence of NGHBR\_RESQ\_CONFIGURED<sub>R</sub>.
- 12          • For each of the neighboring base stations contained in the *General Neighbor*  
13          *List Message*, the mobile station shall set ADD\_PILOT\_REC\_INCL field of  
14          NGHBR\_REC[i] to the i<sup>th</sup> occurrence of ADD\_PILOT\_REC\_INCL<sub>R</sub>. If  
15          ADD\_PILOT\_REC\_INCL<sub>R</sub> equals '1', for each pilot, the mobile station shall also  
16          perform the following:
  - 17          – Set the NGHBR\_PILOT\_REC\_TYPE field of NGHBR\_PILOT\_REC to  
18          NGHBR\_PILOT\_REC\_TYPE<sub>R</sub>.
  - 19          – If NGHBR\_PILOT\_REC\_TYPE<sub>R</sub> is equal to '000'. The mobile station shall set  
20          the TD\_POWER\_LEVEL field of NGHBR\_PILOT\_REC to TD\_POWER\_LEVEL<sub>R</sub>  
21          and set the TD\_MODE field of NGHBR\_PILOT\_REC to TD\_MODE<sub>R</sub>.
  - 22          – If NGHBR\_PILOT\_REC\_TYPE<sub>R</sub> is equal to '001', the mobile station shall:
    - 23          + Set the AUX\_PILOT\_QOF field of NGHBR\_PILOT\_REC to QOF<sub>R</sub>
    - 24          + Set the AUX\_PILOT\_WALSH\_CODE field of NGHBR\_PILOT\_REC to  
25          AUX\_PILOT\_WALSH<sub>R</sub> with the Walsh Code length specified by  
26          WALSH\_LENGTH<sub>R</sub>
  - 27          – If NGHBR\_PILOT\_REC\_TYPE<sub>R</sub> is equal to '010', the mobile station shall:
    - 28          + Set the AUX\_PILOT\_TD\_QOF field of NGHBR\_PILOT\_REC to QOF<sub>R</sub>.
    - 29          + Set the AUX\_PILOT\_WALSH\_CODE field of NGHBR\_PILOT\_REC to  
30          AUX\_WALSH<sub>R</sub> with the Walsh Code length specified by  
31          WALSH\_LENGTH<sub>R</sub>.
    - 32          + Set the AUX\_TD\_POWER\_LEVEL field of NGHBR\_PILOT\_REC to  
33          AUX\_TD\_POWER\_LEVEL<sub>R</sub>.
    - 34          + Set the TD\_MODE field of NGHBR\_PILOT\_REC to TD\_MODE<sub>R</sub>.
  - 35          – If NGHBR\_PILOT\_REC\_TYPE<sub>R</sub> is equal to '011', the mobile station shall:
    - 36          + Set the SR3\_PRIMARY\_PILOT field of NGHBR\_PILOT\_REC to  
37          SR3\_PRIMARY\_PILOT<sub>R</sub>.

- 1           + Set the SR3\_PILOT\_POWER1 field of NGHBR\_PILOT\_REC to
- 2           SR3\_PILOT\_POWER1<sub>r</sub>.
- 3           + Set the SR3\_PILOT\_POWER2 field of NGHBR\_PILOT\_REC to
- 4           SR3\_PILOT\_POWER2<sub>r</sub>.
- 5           – If NGHBR\_PILOT\_REC\_TYPE<sub>r</sub> is equal to '100', the mobile station shall:
- 6           + Set the SR3\_PRIMARY\_PILOT field of NGHBR\_PILOT\_REC to
- 7           SR3\_PRIMARY\_PILOT<sub>r</sub>.
- 8           + Set the SR3\_PILOT\_POWER1 field of NGHBR\_PILOT\_REC to
- 9           SR3\_PILOT\_POWER1<sub>r</sub>.
- 10          + Set the SR3\_PILOT\_POWER2 field of NGHBR\_PILOT\_REC to
- 11          SR3\_PILOT\_POWER2<sub>r</sub>.
- 12          + Set the AUX\_PILOT\_QOF field of NGHBR\_PILOT\_REC to QOF<sub>r</sub>.
- 13          + Set the AUX\_PILOT\_WALSH\_CODE field of NGHBR\_PILOT\_REC to
- 14          AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by
- 15          WALSH\_LENGTH<sub>r</sub>.
- 16          + If ADD\_INFO\_INCL1<sub>r</sub> is equal to '1', set the AUX\_PILOT\_QOF1 field of
- 17          NGHBR\_PILOT\_REC to QOF1<sub>r</sub> and set the AUX\_PILOT\_WALSH\_CODE1
- 18          field of NGHBR\_PILOT\_REC to AUX\_PILOT\_WALSH1<sub>r</sub> with the Walsh
- 19          Code length specified by WALSH\_LENGTH1<sub>r</sub>; otherwise, set the
- 20          AUX\_PILOT\_QOF1 field of NGHBR\_PILOT\_REC to QOF<sub>r</sub> and set the
- 21          AUX\_PILOT\_WALSH\_CODE1 field of NGHBR\_PILOT\_REC to
- 22          AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by
- 23          WALSH\_LENGTH<sub>r</sub>.
- 24          + If ADD\_INFO\_INCL2<sub>r</sub> is equal to '1', set the AUX\_PILOT\_QOF2 field of
- 25          NGHBR\_PILOT\_REC to QOF2<sub>r</sub> and set the AUX\_PILOT\_WALSH\_CODE2
- 26          field of NGHBR\_PILOT\_REC to AUX\_PILOT\_WALSH2<sub>r</sub> with the Walsh
- 27          Code length specified by WALSH\_LENGTH2<sub>r</sub>; otherwise, set the
- 28          AUX\_PILOT\_QOF2 field of NGHBR\_PILOT\_REC to QOF<sub>r</sub> and set the
- 29          AUX\_PILOT\_WALSH\_CODE2 field of NGHBR\_PILOT\_REC to
- 30          AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by
- 31          WALSH\_LENGTH<sub>r</sub>.
- 32       8. *Supplemental Channel Assignment Message*: The mobile station shall process this
- 33       message as follows:
- 34       The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set
- 35       to the specified value if any of the following conditions is true, and shall not
- 36       perform any other action described in this section for processing the *Supplemental*
- 37       *Channel Assignment Message*:

- 1       • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field  
2       set to '00000110' (capability not supported), if the number of forward or reverse  
3       Supplemental Code Channels specified in the *Supplemental Channel*  
4       *Assignment Message* is greater than the maximum number of Supplemental  
5       Code Channels supported by the mobile station.
- 6       • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field  
7       set to '00000011' (message structure not acceptable), if both  
8       USE\_REV\_HDM\_SEQ and EXPL\_REV\_START\_TIME or both  
9       USE\_FOR\_HDM\_SEQ and EXPL\_FOR\_START\_TIME specified in the  
10      *Supplemental Channel Assignment Message* are set to '1'.
- 11      • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field  
12      set to '00000100' (message field not in valid range), if PILOT\_PN specified in the  
13      *Supplemental Channel Assignment Message* is not in the Active Set and this  
14      message is not linked with a *General Handoff Direction Message*.

15      If none of the above conditions is true, the mobile station shall perform the  
16      following.

- 17      • The mobile station shall store the following parameters from the *Supplemental*  
18      *Channel Assignment Message*:
  - 19       – Use *General Handoff Direction Message* forward sequence number indicator  
20       (USE\_FOR\_HDM\_SEQ<sub>S</sub> = USE\_FOR\_HDM\_SEQ<sub>R</sub>)
  - 21       – If USE\_FOR\_HDM\_SEQ<sub>R</sub> is equal to '1', then the mobile station shall store  
22       the following:
    - 23          + The sequence number of the *General Handoff Direction Message* to  
24          which this messaged is linked for the Forward Supplemental Code  
25          Channel assignment (FOR\_LINKED\_HDM\_SEQ<sub>S</sub> =  
26          FOR\_LINKED\_HDM\_SEQ<sub>R</sub>)
    - 27          + The forward Supplemental Code Channel assignment order  
28          (SCAM\_FOR\_ORDER<sub>S</sub> = least significant bit of FOR\_SUP\_CONFIG<sub>R</sub>)
    - 29          + The forward duration assignment indicator  
30          (SCAM\_FOR\_DURATION\_MODE<sub>S</sub> = USE\_FOR\_DURATION<sub>R</sub>).
  - 31       – Use *General Handoff Direction Message* reverse sequence number indicator  
32       (USE\_REV\_HDM\_SEQ<sub>S</sub> = USE\_REV\_HDM\_SEQ<sub>R</sub>)
  - 33       – If USE\_REV\_HDM\_SEQ<sub>R</sub> is equal to '1', then the mobile station shall store  
34       the following:
    - 35          + The sequence number of the *General Handoff Direction Message* to  
36          which this messaged is linked for the Reverse Supplemental Code  
37          Channel assignment (REV\_LINKED\_HDM\_SEQ<sub>S</sub> =  
38          REV\_LINKED\_HDM\_SEQ<sub>R</sub>)
    - 39          + The reverse duration assignment indicator  
40          (SCAM\_REV\_DURATION\_MODE<sub>S</sub> = USE\_REV\_DURATION<sub>R</sub>).

- 1       • If  $USE\_RETRY\_DELAY_R$  is '0', then the mobile station shall store 0 as  
2        $RETRY\_DELAY_S$ . The mobile station may send subsequent *Supplemental*  
3       *Channel Request Messages* whenever  $RETRY\_DELAY_S$  is set to 0.
- 4       • If  $USE\_RETRY\_DELAY_R$  is set to '1', the mobile station shall interpret the  
5       *Supplemental Channel Assignment Message* as an indication that the base  
6       station has specified a *Supplemental Channel Request Message* retry delay in  
7        $RETRY\_DELAY_R$  as follows:
  - 8       – The mobile station shall store the next system time 80 ms boundary +  
9        $RETRY\_DELAY_R \times 320$  ms as  $RETRY\_DELAY_S$ . The mobile station shall not  
10       send any subsequent *Supplemental Channel Request Message* until after the  
11       system time stored in  $RETRY\_DELAY_S$ . At the system time stored in  
12        $RETRY\_DELAY_S$ , the mobile station shall reset  $RETRY\_DELAY_S$  to 0.
  - 13       – If  $RETRY\_DELAY_R$  is '00000000', then the mobile station shall store 0 as  
14        $RETRY\_DELAY_S$ . The mobile station may send subsequent *Supplemental*  
15       *Channel Request Messages* whenever  $RETRY\_DELAY_S$  is set to 0.
  - 16       – If  $RETRY\_DELAY_R$  is '11111111', then the mobile station shall store *infinity*  
17       as  $RETRY\_DELAY_S$ , and the mobile station shall not send any further  
18       *Supplemental Channel Request Messages* until the mobile station receives a  
19       new *Supplemental Channel Assignment Message* with no retry delay or a  
20       non-infinite retry delay specified, or until the mobile station receives a  
21       *General Handoff Direction Message* with a  $CLEAR\_RETRY\_DELAY$  indication  
22       set.
- 23       • If  $REV\_INCLUDED_R$  is equal to '1', then the mobile station shall process Reverse  
24       Supplemental Code Channel assignment information for the *Supplemental*  
25       *Channel Assignment Message*. This information shall be processed as follows:
  - 26       – The mobile station shall store  $USE\_T\_ADD\_ABORT_R$ , the Reverse  
27       Supplemental Code Channel assignment T\_ADD abort indicator, as  
28        $USE\_T\_ADD\_ABORT_S$ .
  - 29       – The mobile station shall store  $REV\_DTX\_DURATION_R$ , Reverse Supplemental  
30       Channel Discontinuous Transmission Duration, as  $REV\_DTX\_DURATION_S$ .
  - 31       – If  $REV\_PARMS\_INCLUDED_R$  is equal to '1', the mobile station shall store the  
32       following:
    - 33       +  $T\_MULCHAN_S = T\_MULCHAN_R$
    - 34       +  $BEGIN\_PREAMBLE_S = BEGIN\_PREAMBLE_R$
    - 35       +  $RESUME\_PREAMBLE_S = RESUME\_PREAMBLE_R$
  - 36       – If  $IGNORE\_SCAM_S$  is equal to '1' and  $SCRM\_SEQ\_NUM_R$  is not present or is  
37       present and is not equal to  $SCRM\_SEQ\_NUM_S$ , then the mobile station shall  
38       not process the remaining Reverse Supplemental Code Channel assignment  
39       information in this message.

- 1           – If IGNORE\_SCAM<sub>S</sub> is equal to '1' and SCRM\_SEQ\_NUM<sub>R</sub> is present and is  
2           equal to SCRM\_SEQ\_NUM<sub>S</sub>, then the mobile station shall set  
3           IGNORE\_SCAM<sub>S</sub> to '0'.
- 4           – The mobile station shall set REV\_START\_TIME<sub>S</sub> as follows:
  - 5           + If EXPL\_REV\_START\_TIME<sub>R</sub> is equal to '1', the mobile station shall set  
6           the REV\_START\_TIME<sub>S</sub> to REV\_START\_TIME<sub>R</sub>.
  - 7           + If USE\_REV\_HDM\_SEQ<sub>R</sub> is equal to '1' and REV\_LINKED\_HDM\_SEQ<sub>R</sub> is  
8           not equal to HDM\_SEQ<sub>S</sub>, the mobile station shall set the  
9           REV\_START\_TIME<sub>S</sub> to NULL.
  - 10          + If USE\_REV\_HDM\_SEQ<sub>R</sub> is equal to '1' and REV\_LINKED\_HDM\_SEQ<sub>R</sub> is  
11          equal to HDM\_SEQ<sub>S</sub>, then the mobile station shall set the  
12          REV\_START\_TIME<sub>S</sub> to the action time of the *General Handoff Direction*  
13          *Message* that is linked to the *Supplemental Channel Assignment*  
14          *Message*.
  - 15          + If EXPL\_REV\_START\_TIME<sub>R</sub> is equal to '0' and USE\_REV\_HDM\_SEQ<sub>R</sub> is  
16          equal to '0', the mobile station shall set the REV\_START\_TIME<sub>S</sub> to the  
17          next 80 ms boundary following the action time of the *Supplemental*  
18          *Channel Assignment Message*.
- 19          – The mobile station shall set NUM\_REV\_CODES<sub>S</sub> to NUM\_REV\_CODES<sub>R</sub>. If  
20          REV\_START\_TIME<sub>S</sub> is not equal to NULL, the mobile station shall perform the  
21          following actions:
  - 22          + If NUM\_REV\_CODES<sub>R</sub> is equal to '000', the mobile station shall stop  
23          transmitting the Reverse Supplemental Code Channels at the start time  
24          specified by REV\_START\_TIME<sub>S</sub>.
  - 25          + If NUM\_REV\_CODES<sub>R</sub> is not equal to '000', the mobile station shall set  
26          PILOT\_GATING\_USE\_RATE to '0' at the action time of the message and  
27          the mobile station may start transmitting on NUM\_REV\_CODES<sub>S</sub>  
28          Reverse Supplemental Code Channels at the start time specified by  
29          REV\_START\_TIME<sub>S</sub> for a duration of time specified by the following  
30          rules:
    - 31          o If USE\_REV\_DURATION<sub>R</sub> is equal to '1', the mobile station shall set  
32          REV\_DURATION<sub>S</sub> to REV\_DURATION<sub>R</sub>. The mobile station may  
33          continue transmitting on the Reverse Supplemental Code Channels  
34          for a period of (REV\_DURATION<sub>S</sub> × 80) ms, or until it receives the  
35          action time of a subsequent *General Handoff Direction Message* or a  
36          *Supplemental Channel Assignment Message* that specifies a different  
37          Reverse Supplemental assignment duration or start time.

- o If  $USE\_REV\_DURATION_R$  is equal to '0', the mobile station may continue to transmit indefinitely on the Reverse Supplemental Code Channels, or until it receives the action time of a subsequent *General Handoff Direction Message* or a *Supplemental Channel Assignment Message* that specifies a different Reverse Supplemental assignment duration or start time.
- If  $FOR\_INCLUDED$  is equal to '1', then the mobile station shall process Forward Supplemental Code Channel assignment information as follows:
  - The mobile station shall assign a value to  $FOR\_START\_TIME_S$  according to the following rules:
    - + If  $EXPL\_FOR\_START\_TIME$  is equal to '1', the mobile station shall set the  $FOR\_START\_TIME_S$  to  $FOR\_START\_TIME_R$ .
    - + If  $USE\_FOR\_HDM\_SEQ_R$  is equal to '1' and  $FOR\_LINKED\_HDM\_SEQ_R$  is not equal to  $HDM\_SEQ_S$ , the mobile station shall set the  $FOR\_START\_TIME_S$  to NULL.
    - + If  $USE\_FOR\_HDM\_SEQ_R$  is equal to '1' and  $FOR\_LINKED\_HDM\_SEQ_R$  is equal to  $HDM\_SEQ_S$ , then the mobile station shall set the  $FOR\_START\_TIME_S$  to the action time of the *General Handoff Direction Message* that is linked to the *Supplemental Channel Assignment Message*.
    - + If  $EXPL\_FOR\_START\_TIME_R$  is equal to '0' and  $USE\_FOR\_HDM\_SEQ_R$  equals '0', the mobile station shall set the  $FOR\_START\_TIME_S$  to the action time of the *Supplemental Channel Assignment Message*.
  - If  $FOR\_SUP\_CONFIG_R$  is equal to '00' and  $FOR\_START\_TIME_S$  is not equal to NULL, the mobile station should stop processing the Forward Supplemental Code Channels at the time specified by  $FOR\_START\_TIME_S$ .
  - If  $FOR\_SUP\_CONFIG_R$  is equal to '01' and  $FOR\_START\_TIME_S$  is not equal to NULL, the mobile station shall set  $PILOT\_GATING\_USE\_RATE$  to '0' at the action time of the message and start processing the Forward Supplemental Code Channels in the  $CODE\_CHAN\_LIST_S$  at  $FOR\_START\_TIME_S$  for a period of time specified by the following rules:
    - + If  $USE\_FOR\_DURATION$  is equal to '1', the mobile station shall set  $FOR\_DURATION_S$  to  $FOR\_DURATION_R$ . The mobile station shall continue processing the Forward Supplemental Code Channels for a period of  $(FOR\_DURATION_S \times 80)$  ms, or until it receives the action time of a subsequent *Supplemental Channel Assignment Message* or a *General Handoff Direction Message* that specifies a different Forward Supplemental assignment duration or start time.

- 1           + If  $USE\_FOR\_DURATION_R$  is equal to '0', the mobile station shall
- 2           continue processing the Forward Supplemental Code Channels until it
- 3           receives the action time of a subsequent *Supplemental Channel*
- 4           *Assignment Message* or a *General Handoff Direction Message* that
- 5           specifies a different Forward Supplemental assignment duration or start
- 6           time.
- 7        – If  $FOR\_SUP\_CONFIG_R$  is equal to '10', the mobile station shall perform the
- 8        following:
- 9           + The mobile station shall update the  $CODE\_CHAN\_LIST_S$  as specified in
- 10          2.6.8.
- 11          + If  $FOR\_START\_TIME_S$  is not equal to NULL the mobile station should
- 12          stop processing Forward Supplemental Code Channels at the time
- 13          specified by  $FOR\_START\_TIME_S$ .
- 14        – If  $FOR\_SUP\_CONFIG_R$  is equal to '11', the mobile station shall perform the
- 15        following:
- 16           + The mobile station shall update the  $CODE\_CHAN\_LIST_S$  as specified in
- 17          2.6.8.
- 18           + If  $FOR\_START\_TIME_S$  is not equal to NULL, then the mobile station shall
- 19          set  $PILOT\_GATING\_USE\_RATE$  to '0' at the action time of the message
- 20          and start processing the Forward Supplemental Code Channels in the
- 21           $CODE\_CHAN\_LIST_S$  at the time specified by  $FOR\_START\_TIME_S$  for a
- 22          period of time specified by the following rules:
- 23           o If  $USE\_FOR\_DURATION_R$  is equal to '1', the mobile station shall set
- 24            $FOR\_DURATION_S$  to  $FOR\_DURATION_R$ . The mobile station shall
- 25           continue processing the Forward Supplemental Code Channels for
- 26            $(FOR\_DURATION_S \times 80)$  ms, until it receives a subsequent
- 27           *Supplemental Channel Assignment Message* or a *General Handoff*
- 28           *Direction Message* that specifies a different Forward Supplemental
- 29           assignment duration or start time.
- 30           o If  $USE\_FOR\_DURATION_R$  is equal to '0', the mobile station shall
- 31           continue processing the Forward Supplemental Code Channels until
- 32           it receives a subsequent *Supplemental Channel Assignment Message*
- 33           or a *General Handoff Direction Message* that specifies a different
- 34           Forward Supplemental assignment duration or start time.

35   9. *General Handoff Direction Message*: The mobile station shall process the message  
36   as follows:

37   In addition to the requirements in this section, if the  $SCR\_INCLUDED$  field is  
38   included in this message and is set to '1' the mobile station shall also process this  
39   message in accordance with the requirements for the active service subfunction  
40   (see 2.6.4.1.2.2).

The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to the specified value if any of the following conditions is true, and shall not perform any other action described in this section for processing the *General Handoff Direction Message*:

- The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00000110' (capability not supported), if the mobile station does not support the band class specified in the *General Handoff Direction Message*.
- The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00000110' (capability not supported), if the number of forward or reverse Supplemental Code Channels specified in the *General Handoff Direction Message* is greater than the maximum number of Supplemental Code Channels supported by the mobile station.
- If the SCR\_INCLUDED field is included in this message and is set to '1', the mobile station shall perform the following:
  - The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00000111' (message cannot be handled by the current mobile station configuration), if the mobile station does not support the service configuration specified in the *General Handoff Direction Message*.
  - The mobile station shall send a *Mobile Station Reject Order* (ORDQ = '00000111') within T<sub>56m</sub> seconds, if the mobile station supports the service configuration specified but does not accept the service configuration specified in the *General Handoff Direction Message*.
- The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00000111' (message cannot be handled by the current mobile station configuration), if the NNSCR\_INCLUDED field is included and set to '1' and the SCR\_INCLUDED field is either not included or included but set to '0', and the mobile station does not support the configuration specified in the non-negotiable service configuration information record in the *General Handoff Direction Message*.
- The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00001010' (search set not specified), if the PERIODIC\_SEARCH field is included in the *General Handoff Direction Message* and is set to '1', and the Candidate Frequency Search Set is empty.
- The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00001101' (search period too short), if the PERIODIC\_SEARCH field is included in the *General Handoff Direction Message* and is set to '1', and *search\_period* is less than  $(\max(\text{fwd\_time}, \text{rev\_time}) + T_{71m} \text{ seconds})$ , where *search\_period* = time period corresponding to SEARCH\_PERIOD<sub>s</sub> shown in Table 2.6.6.2.8.3.2-1,

*fwd\_time* = the mobile station's estimate of the total length of time, in seconds, for which the mobile station will need to suspend its current Forward Traffic Channel processing in order to tune to the CDMA Candidate Frequency, to search the Candidate Frequency Search Set, and to re-tune to the Serving Frequency; if the mobile station searches the Candidate Frequency Search Set in multiple visits, *fwd\_time* is the total time for all visits to the CDMA Candidate Frequency in a search period (see 2.6.6.2.8.3.2),

and

*rev\_time* = the mobile station's estimate of the total length of time, in seconds, for which the mobile station will need to suspend its current Reverse Traffic Channel processing in order to tune to the CDMA Candidate Frequency, to search the Candidate Frequency Search Set, and to re-tune to the Serving Frequency; if the mobile station searches the Candidate Frequency Search Set in multiple visits, *rev\_time* is the total time for all visits to the CDMA Candidate Frequency in a search period.

If none of the above conditions is true, the mobile station shall perform the actions described in the remainder of this section to process the *General Handoff Direction Message* at the action time of the message.

If EXTRA\_PARMS is equal to '1', the mobile station shall store the return on failure indicator from the *General Handoff Direction Message* (RETURN\_IF\_HANDOFF\_FAIL<sub>S</sub> = RETURN\_IF\_HANDOFF\_FAIL<sub>R</sub>); otherwise the mobile station shall set RETURN\_IF\_HANDOFF\_FAIL<sub>S</sub> to '0'.

The mobile station shall set RETURN\_IF\_HANDOFF\_FAIL<sub>S</sub> to '0' (disable return on failure) if any of the following conditions is true:

- If P\_REV\_IN\_USE<sub>S</sub> is less than or equal to four and the mobile station does not support hard handoff with return on failure, or
- At least one of the pilots specified by the message is also included in the Active Set prior to the action time of the message, and one of the following conditions is true:
  - EXTRA\_PARMS is equal to '0', or
  - EXTRA\_PARMS is equal to '1', the message specifies the same Frequency Assignment as the Serving Frequency (BAND\_CLASS<sub>R</sub> is equal to CDMABAND<sub>S</sub> and CDMA\_FREQ<sub>R</sub> is equal to CDMACH<sub>S</sub>), and FRAME\_OFFSET<sub>R</sub> is equal to FRAME\_OFFSET<sub>S</sub>.

The mobile station shall store the following parameters from its current configuration:

- CDMA band class (SF\_CDMABAND<sub>S</sub> = CDMABAND<sub>S</sub>)
- Frequency assignment (SF\_CDMACH<sub>S</sub> = CDMACH<sub>S</sub>)

- 1       • Frame Offset ( $SF\_FRAME\_OFFSET_S = FRAME\_OFFSET_S$ )
- 2       If  $RETURN\_IF\_HANDOFF\_FAIL_S$  is equal to '1', the mobile station shall also store
- 3       the following parameters from its current configuration:
- 4       • Protocol revision level
- 5        ( $SF\_P\_REV_S = P\_REV_S$ )
- 6       • Protocol revision level in use on the Serving Frequency
- 7        ( $SF\_P\_REV\_IN\_USE_S = P\_REV\_IN\_USE_S$ )
- 8       • Search window size for the Active Set and Candidate Set
- 9        ( $SF\_SRCH\_WIN\_A_S = SRCH\_WIN\_A_S$ )
- 10       • Search window size for the Neighbor Set
- 11        ( $SF\_SRCH\_WIN\_N_S = SRCH\_WIN\_N_S$ )
- 12       • Search window size for the Remainder Set
- 13        ( $SF\_SRCH\_WIN\_R_S = SRCH\_WIN\_R_S$ )
- 14       • Pilot detection threshold
- 15        ( $SF\_T\_ADD_S = T\_ADD_S$ )
- 16       • Pilot drop threshold
- 17        ( $SF\_T\_DROP_S = T\_DROP_S$ )
- 18       • Active Set versus Candidate Set comparison threshold
- 19        ( $SF\_T\_COMP_S = T\_COMP_S$ )
- 20       • Drop timer value
- 21        ( $SF\_T\_TDROP_S = T\_TDROP_S$ )
- 22       • Drop timer range value ( $SF\_T\_TDROP\_RANGE_S = T\_TDROP\_RANGE_S$ )
- 23       • Soft slope for the dynamic add and drop thresholds
- 24        ( $SF\_SOFT\_SLOPE_S = SOFT\_SLOPE_S$ )
- 25       • Intercept for the dynamic add threshold
- 26        ( $SF\_ADD\_INTERCEPT_S = ADD\_INTERCEPT_S$ )
- 27       • Intercept for the dynamic drop threshold
- 28        ( $SF\_DROP\_INTERCEPT_S = DROP\_INTERCEPT_S$ )
- 29       • Private long code mask indicator: If the mobile station is using the private long
- 30        code mask on the Serving Frequency, it shall set  $SF\_PRIVATE\_LCM_S$  to '1';
- 31        otherwise, it shall set  $SF\_PRIVATE\_LCM_S$  to '0'.
- 32       • Private long code mask: If the mobile station is using the private long code
- 33        mask on the Serving Frequency, it shall set  $SF\_PVTLCM\_42_S$  to the
- 34        PVTLCM\_42.
- 35       • Public long code mask type: The mobile station shall set  $SF\_PLCM\_TYPE_S$  to
- 36         $PLCM\_TYPE_S$ . If  $PLCM\_TYPE_S$  equals '0001', the mobile station shall set
- 37         $SF\_PLCM\_39_S$  to  $PLCM\_39_S$ .

- 1       • Service negotiation type  
2       (SF\_SERV\_NEG<sub>S</sub> = SERV\_NEG<sub>S</sub>)
- 3       • Service configuration:  
4       Store the current service configuration (service configuration record and non-  
5       negotiable service configuration record) in SF\_SERVICE\_CONFIG<sub>S</sub>
- 6       • Call Information:  
7       Store the list of current calls (Call Control instances, etc.) in SF\_CALLS<sub>S</sub>
- 8       • Message encryption mode: If message encryption is on, the mobile station shall  
9       set SF\_ENCRYPT\_MODE<sub>S</sub> to '1'; otherwise, the mobile station shall set  
10      SF\_ENCRYPT\_MODE<sub>S</sub> to '0'.
- 11      • Extended nominal power setting of the current cell  
12      (SF\_NOM\_PWR\_EXT<sub>S</sub> = NOM\_PWR\_EXT<sub>S</sub>)
- 13      • Nominal power setting of the current cell  
14      (SF\_NOM\_PWR<sub>S</sub> = NOM\_PWR<sub>S</sub>)
- 15      • Power control step  
16      (SF\_PWR\_CNTL\_STEP<sub>S</sub> = PWR\_CNTL\_STEP<sub>S</sub>)
- 17      • Serving Frequency Active Set (SF Active Set = •For each pilot in the current  
18      Active Set: (PILOT\_PN, PWR\_COMB\_IND) • )
- 19      • Serving Frequency Code Channel List  
20      (SF\_CODE\_CHAN\_LIST<sub>S</sub> = CODE\_CHAN\_LIST<sub>S</sub>)
- 21      When the message takes effect, the mobile station shall perform the following  
22      actions:
- 23      • The mobile station shall send a *Handoff Completion Message* or an *Extended*  
24      *Handoff Completion Message* as specified in 2.6.6.2.5.2.
- 25      • Update the Active Set, Candidate Set, and Neighbor Set in accordance with the  
26      *General Handoff Direction Message* processing (see 2.6.6.2.6.1, 2.6.6.2.6.2, and  
27      2.6.6.2.6.3).
- 28      • The mobile station shall delete all pilots that are not listed in the Active Set  
29      from the Active Set of the Supplemental Channel for the Forward Supplemental  
30      Channel Assignment (if any). If these deleted pilots include all pilots in the  
31      Active Set of the Supplemental Channel, the mobile station shall cancel the  
32      Forward Supplemental Channel Assignment.
- 33      • Discontinue use of all Forward Traffic Channels associated with pilots not listed  
34      in the *General Handoff Direction Message*.
- 35      • If EXTRA\_PARMS is equal to '1', perform the following actions:  
36      – If FRAME\_OFFSET<sub>r</sub> is not equal to FRAME\_OFFSET<sub>S</sub>, change the frame  
37      offset on all of the code channels of the Forward Traffic Channel and of the  
38      Reverse Traffic Channel.

- 1           – If RESET\_L2<sub>r</sub> is equal to '1', and RETURN\_IF\_HANDOFF\_FAIL<sub>s</sub> is equal to
- 2           '0', Layer 3 shall send a L2-Supervision.Request primitive to Layer 2 to reset
- 3           the acknowledgment procedures, as specified in [4]. The mobile station
- 4           shall reset the acknowledgment procedures immediately after the action
- 5           time of the *General Handoff Direction Message*.
- 6           – If RESET\_FPC<sub>r</sub> is equal to '1' and RETURN\_IF\_HANDOFF\_FAIL<sub>s</sub> is equal to
- 7           '0', initialize the Forward Traffic Channel power control counters, as
- 8           specified in 2.6.4.1.1.1.
- 9           – If SERV\_NEG\_TYPE<sub>r</sub> is equal to '1', set SERV\_NEG<sub>s</sub> to enabled; otherwise
- 10          set SERV\_NEG<sub>s</sub> to disabled.
- 11          – Use the long code mask as follows:
- 12           + If PRIVATE\_LCM<sub>r</sub> equals '1', the mobile station shall use the Private
- 13           Long Code Mask as specified in 2.3.6.
- 14           + If PRIVATE\_LCM<sub>r</sub> equals '0', the mobile station shall use the Public Long
- 15           Code Mask derived from PLCM\_TYPE<sub>s</sub> as specified in 2.3.6
- 16           + The mobile station shall indicate to the user the voice privacy mode
- 17           status.
- 18          – Process the ENCRYPT\_MODE field, as specified in 2.3.12.2.
- 19          – Perform the procedures as specified in 2.6.11.3.
- 20          • If EXTRA\_PARMS is equal to '0', set the following variables to the values
- 21          indicated:
- 22           – Hard handoff traffic channel preamble count required before transmitting a
- 23           *Handoff Completion Message* or an *Extended Handoff Completion Message*
- 24           (NUM\_PREAMBLE<sub>s</sub> = '000')
- 25           – Complete search flag (COMPLETE\_SEARCH<sub>s</sub> = '1')
- 26           – CDMA band class for the Target Frequency
- 27           (TF\_CDMABAND<sub>s</sub> = SF\_CDMABAND<sub>s</sub>)
- 28           – Frequency assignment for the Target Frequency
- 29           (TF\_CDMACH<sub>s</sub> = SF\_CDMACH<sub>s</sub>)
- 30          • Store the following parameters from the *General Handoff Direction Message*:
- 31           – *General Handoff Direction Message* sequence number
- 32           (HDM\_SEQ<sub>s</sub> = HDM\_SEQ<sub>r</sub>)
- 33           – Forward power control subchannel relative gain (FPC\_SUBCHAN\_GAIN<sub>s</sub> =
- 34           FPC\_SUBCHAN\_GAIN<sub>r</sub>).
- 35           – If the mobile station uses FPC\_SUBCHAN\_GAIN<sub>s</sub>, the mobile station shall
- 36           perform the following:

- 1           + If PC\_ACTION\_TIME<sub>r</sub> is received, the mobile station shall apply its usage
- 2           of the FPC\_SUBCHAN\_GAIN<sub>s</sub> at the time specified by
- 3           PC\_ACTION\_TIME<sub>r</sub>.
- 4           + If PC\_ACTION\_TIME is not received and the explicit action time is
- 5           received, the mobile station shall apply its usage of the
- 6           FPC\_SUBCHAN\_GAIN<sub>s</sub> at the action time.
- 7           + If neither PC\_ACTION\_TIME<sub>r</sub> nor explicit action time is received, the
- 8           mobile station shall apply its usage of the FPC\_SUBCHAN\_GAIN<sub>s</sub> at the
- 9           first 80ms boundary occurring at least 80ms after the end of the frame
- 10          containing the last bit of the *General Handoff Direction Message* sent to
- 11          the mobile station.
- 12         – Reverse Eighth Gating Mode (REV\_FCH\_GATING\_MODE<sub>s</sub> =
- 13         REV\_FCH\_GATING\_MODE<sub>r</sub>).
- 14         – Reverse Power Control Delay if REV\_PWR\_CNTL\_DELAY\_INCL<sub>r</sub> is equal to '1'
- 15         (REV\_PWR\_CNTL\_DELAY<sub>s</sub> = REV\_PWR\_CNTL\_DELAY<sub>r</sub>).
- 16         – Concurrent services supported indicator (CS\_SUPPORTED<sub>s</sub> =
- 17         CS\_SUPPORTED<sub>r</sub>).
- 18         – Forward Packet Data Channel supported indicator
- 19         (FOR\_PDCH\_SUPPORTED<sub>s</sub> = FOR\_PDCH\_SUPPORTED<sub>r</sub>).
- 20         – Pilot information request supported indicator
- 21         (PILOT\_INFO\_REQ\_SUPPORTED<sub>s</sub> = PILOT\_INFO\_REQ\_SUPPORTED<sub>r</sub>).
- 22         – If SEARCH\_INCLUDED is equal to '1', store the following:
- 23           + Search window size for the Active Set and Candidate Set
- 24           (SRCH\_WIN\_A<sub>s</sub> = SRCH\_WIN\_A<sub>r</sub>)
- 25           + Pilot detection threshold
- 26           (T\_ADD<sub>s</sub> = T\_ADD<sub>r</sub>)
- 27           + Pilot drop threshold
- 28           (T\_DROP<sub>s</sub> = T\_DROP<sub>r</sub>)
- 29           + Active Set versus Candidate Set comparison threshold
- 30           (T\_COMP<sub>s</sub> = T\_COMP<sub>r</sub>)
- 31           + Drop timer value
- 32           (T\_TDROPS = T\_TDROPR)
- 33           + Drop timer range value (T\_TDROPS\_RANGE<sub>s</sub> = T\_TDROPS\_RANGE<sub>r</sub>) if
- 34           T\_TDROPS\_RANGE\_INCL<sub>r</sub> is equal to '1'; otherwise, (T\_TDROPS\_RANGE<sub>s</sub> =
- 35           '0000')
- 36           + Soft slope for the dynamic add and drop thresholds
- 37           (SOFT\_SLOPE<sub>s</sub> = SOFT\_SLOPE<sub>r</sub>)
- 38           + Intercept for the dynamic add threshold
- 39           (ADD\_INTERCEPT<sub>s</sub> = ADD\_INTERCEPT<sub>r</sub>)

- 1           + Intercept for the dynamic drop threshold
- 2           (DROP\_INTERCEPT<sub>S</sub> = DROP\_INTERCEPT<sub>T</sub>)
- 3       – If EXTRA\_PARMS is equal to '1', store the following:
- 4           + Protocol revision level (P\_REV<sub>S</sub> = P\_REV<sub>T</sub>), and protocol revision level
- 5           currently in use (P\_REV\_IN\_USE<sub>S</sub> = min (P\_REV<sub>S</sub>, MOB\_P\_REV<sub>P</sub> of the
- 6           current band class) )
- 7           + If the mobile station supports packet data service options, the packet
- 8           data services zone identifier (PACKET\_ZONE\_ID<sub>S</sub> = PACKET\_ZONE\_ID<sub>T</sub>)
- 9           + Frame offset (FRAME\_OFFSET<sub>S</sub> = FRAME\_OFFSET<sub>T</sub>)
- 10          + Acknowledgment procedures reset indicator
- 11          (If RETURN\_IF\_HANDOFF\_FAIL<sub>S</sub> is equal to '1', set TF\_RESET\_L2<sub>S</sub> to
- 12          RESET\_L2<sub>T</sub>)
- 13          + Indicator to initialize the Forward Traffic Channel power control
- 14          counters (If RETURN\_IF\_HANDOFF\_FAIL<sub>S</sub> is equal to '1', set
- 15          TF\_RESET\_FPC<sub>S</sub> to RESET\_FPC<sub>T</sub>)
- 16          + Nominal power setting of the target cell (NOM\_PWR<sub>S</sub> = NOM\_PWR<sub>T</sub>)
- 17          + Extended nominal power setting of the target cell (If CDMABAND<sub>S</sub> =
- 18          '00000' or CDMABAND<sub>S</sub> = '00011', then NOM\_PWR\_EXT<sub>S</sub> = '0';
- 19          otherwise, NOM\_PWR\_EXT<sub>S</sub> = NOM\_PWR\_EXT<sub>T</sub>)
- 20          + Hard handoff traffic channel preamble count required before
- 21          transmitting a *Handoff Completion Message* or an *Extended Handoff*
- 22          *Completion Message* (NUM\_PREAMBLE<sub>S</sub> = NUM\_PREAMBLE<sub>T</sub> )
- 23          + CDMA band class for the Target Frequency
- 24          (TF\_CDMABAND<sub>S</sub> = BAND\_CLASS<sub>T</sub> and CDMABAND<sub>S</sub> = BAND\_CLASS<sub>T</sub>)
- 25          + Frequency assignment for the Target Frequency
- 26          (TF\_CDMACH<sub>S</sub> = CDMA\_FREQ<sub>T</sub> and CDMACH<sub>S</sub> = CDMA\_FREQ<sub>T</sub>)
- 27          + Complete search flag (COMPLETE\_SEARCH<sub>S</sub> = COMPLETE\_SEARCH<sub>T</sub>)
- 28          + Periodic search flag (PERIODIC\_SEARCH<sub>S</sub> = PERIODIC\_SEARCH<sub>T</sub>)
- 29          + Nominal code channel output power offset relative to the Reverse Pilot
- 30          Channel power (RLGAIN\_TRAFFIC\_PILOT<sub>S</sub> = RLGAIN\_TRAFFIC\_PILOT<sub>T</sub>)
- 31       – If EXTRA\_PARMS is equal to '1' and DEFAULT\_RLAG is equal to '1', the
- 32       mobile station shall set each entry of the Reverse Link Attribute Adjustment
- 33       Gain Table and Reverse Channel Adjustment Gain Table (see [2]) to 0.
- 34       – If REV\_PARMS\_INCLUDED is included and is equal to '1', the mobile station
- 35       shall store the following:
- 36           + Neighbor pilot strength measurement threshold offset (T\_MULCHAN<sub>S</sub> =
- 37           T\_MULCHAN<sub>T</sub>)

- 1           + Reverse Supplemental Code Channel beginning of transmission
- 2           preamble length ( $BEGIN\_PREAMBLE_S = BEGIN\_PREAMBLE_R$ )
- 3           + Reverse Supplemental Code Channel resumption of transmission
- 4           preamble length ( $RESUME\_PREAMBLE_S = RESUME\_PREAMBLE_R$ )
- 5       – For each pilot included in the message, the mobile station shall store the
- 6       following:
  - 7           +  $PILOT\_PN$ , the pilot PN sequence offset index
  - 8           +  $PWR\_COMB\_IND$ , the power control symbol combining indicator
- 9       – If  $USE\_PWR\_CNTL\_STEP$  is equal to '1' and  $PWR\_CNTL\_STEP_R$  corresponds
- 10       to a power control step size supported by the mobile station (see [2]), then
- 11       the mobile station shall set  $PWR\_CNTL\_STEP_S$  to  $PWR\_CNTL\_STEP_R$ .
- 12       • Set the pilot detection threshold for the Target Frequency and the Candidate
- 13       Frequency:
  - 14           – Set  $TF\_T\_ADD_S$  to  $T\_ADD_S$ .
  - 15           – If the Target Frequency is the same as the Candidate Frequency
  - 16           ( $TF\_CDMABAND_S$  is equal to  $CF\_CDMABAND_S$  and  $TF\_CDMACH_S$  is equal
  - 17           to  $CF\_CDMACH_S$ ), set  $CF\_T\_ADD_S$  to  $T\_ADD_S$ .
- 18       • If  $FOR\_INCLUDED$  is included and is equal to '0', the mobile station shall
- 19       perform the following:
  - 20           – The mobile station shall update the Code Channel List,  $CODE\_CHAN\_LIST_S$ ,
  - 21           as specified in 2.6.8.
  - 22           – If  $USE\_FOR\_HDM\_SEQ_S$  is equal to '1' and  $FOR\_LINKED\_HDM\_SEQ_S$  is
  - 23           equal to  $HDM\_SEQ_R$  (this indicates that there is pending Forward
  - 24           Supplemental Code Channel assignment information, received in a
  - 25           *Supplemental Channel Assignment Message*, linked to this *General Handoff*
  - 26           *Direction Message*), then the mobile station shall perform the following
  - 27           actions:
    - 28               + The mobile station shall set  $USE\_FOR\_HDM\_SEQ_S$  to '0'.
    - 29               + If  $SCAM\_FOR\_ORDER_S$  is equal to '0', the mobile station shall stop
    - 30               processing all Forward Supplemental Code Channels at the action time
    - 31               of the *General Handoff Direction Message*.
    - 32               + If  $SCAM\_FOR\_ORDER_S$  is equal to '1', the mobile station shall start
    - 33               processing the Forward Supplemental Code Channels specified in
    - 34                $CODE\_CHAN\_LIST_S$  at the action time of the *General Handoff Direction*
    - 35               *Message*, for a period of time determined by the following rules:

- o If SCAM\_FOR\_DURATION\_MODE<sub>S</sub> is equal to '1', the mobile station shall continue processing the Forward Supplemental Code Channels for a period of (FOR\_DURATION<sub>S</sub> × 80) ms, until it receives a subsequent *General Handoff Direction Message* or a *Supplemental Channel Assignment Message* that specifies a different Forward Supplemental Code Channel assignment.
  - o If SCAM\_FOR\_DURATION\_MODE<sub>S</sub> is equal to '0', the mobile station shall continue processing the Forward Supplemental Code Channels until it receives a subsequent *Supplemental Channel Assignment Message* or a *General Handoff Direction Message* that specifies a different Forward Supplemental Code Channel assignment.
- If USE\_FOR\_HDM\_SEQ<sub>S</sub> is equal to '0' or FOR\_LINKED\_HDM\_SEQ<sub>S</sub> is not equal to HDM\_SEQ<sub>R</sub>, and if the mobile station is currently processing Forward Supplemental Code Channels, it shall continue processing the Forward Supplemental Code Channels using the updated Code Channel List, CODE\_CHAN\_LIST<sub>S</sub>.
- If NNSCR\_INCLUDED field is included and set to '1' and SCR\_INCLUDED field is either not included or included but set to '0', the mobile station shall process the received Non-negotiable Service Configuration Record as specified in 2.6.4.1.13 at the action time of this message. If SYNC\_ID\_INCL<sub>R</sub> is set to '1', the mobile station shall perform the following:
  - The mobile station shall store the synchronization identifier received from the base station (SYNC\_ID<sub>S</sub> = SYNC\_ID<sub>R</sub>).
  - The mobile station shall store the current service configuration as specified in 2.6.4.1.2.2.5.1 at the action time of this message.
 Otherwise, the mobile station shall set SYNC\_ID<sub>S</sub> to NULL.
- If FOR\_INCLUDED is included and is equal to '1', then the mobile station shall process the Forward Supplemental Code Channel assignment information as follows:
  - The mobile station shall set USE\_FOR\_HDM\_SEQ<sub>S</sub> to '0'.
  - If FOR\_START\_TIME<sub>S</sub> specifies a time which is after the action time of the *General Handoff Direction Message*, the mobile station shall cancel any pending Forward Supplemental Code Channel assignment and shall set FOR\_START\_TIME<sub>S</sub> to NULL.
  - The mobile station shall update the Code Channel List, CODE\_CHAN\_LIST<sub>S</sub>, in accordance with the value of FOR\_SUP\_CONFIG, as specified in 2.6.8.
  - If FOR\_SUP\_CONFIG is equal to '00' or '10', the mobile station should stop processing Forward Supplemental Code Channels, if any, when the message takes effect.

- 1           – If FOR\_SUP\_CONFIG is equal to '01' or '11', the mobile station shall set  
2           PILOT\_GATING\_USE\_RATE to '0' at the action time of the message and start  
3           processing the Forward Supplemental Code Channels in the updated Code  
4           Channel List, CODE\_CHAN\_LIST<sub>S</sub>, at the action time of the message, for a  
5           period of time determined by the following rules:
  - 6           + If USE\_FOR\_DURATION is equal to '1', the mobile station shall set  
7           FOR\_DURATION<sub>S</sub> to FOR\_DURATION<sub>R</sub>. The mobile station shall  
8           continue processing the Forward Supplemental Code Channels for a  
9           period of (FOR\_DURATION<sub>S</sub> × 80) ms, until it receives a subsequent  
10          *Supplemental Channel Assignment Message* or a *General Handoff*  
11          *Direction Message* that specifies a different Forward Supplemental Code  
12          Channel assignment.
  - 13          + If USE\_FOR\_DURATION is equal to '0', the mobile station shall continue  
14          processing the Forward Supplemental Code Channels until it receives a  
15          subsequent *Supplemental Channel Assignment Message* or a *General*  
16          *Handoff Direction Message* that specifies a different Forward  
17          Supplemental Code Channel assignment.
- 18          • If REV\_INCLUDED is included and is equal to '0', the mobile station shall  
19          perform the following:
  - 20          – If USE\_REV\_HDM\_SEQ<sub>S</sub> is equal to '1' and REV\_LINKED\_HDM\_SEQ<sub>S</sub> is  
21          equal to HDM\_SEQ<sub>R</sub> (this indicates that there is pending Reverse  
22          Supplemental Code Channel assignment information, received in a  
23          *Supplemental Channel Assignment Message*, linked to this *General Handoff*  
24          *Direction Message*), the mobile station shall perform the following actions:
    - 25          + If NUM\_REV\_CODES<sub>S</sub> is equal to '000', the mobile station shall stop  
26          transmitting on all Reverse Supplemental Code Channels at the action  
27          time of the message.
    - 28          + If NUM\_REV\_CODES<sub>S</sub> is not equal to '000', the mobile station may start  
29          transmitting on NUM\_REV\_CODES<sub>S</sub> Reverse Supplemental Code  
30          Channels at the action time of the message, for a duration of time  
31          determined by the following rules:
      - 32          o If SCAM\_REV\_DURATION\_MODE<sub>S</sub> is equal to '1', the mobile station  
33          may continue transmitting on the Reverse Supplemental Code  
34          Channels for a period of (REV\_DURATION<sub>S</sub> × 80) ms, until it receives  
35          a subsequent *General Handoff Direction Message* or a *Supplemental*  
36          *Channel Assignment Message* that specifies a different Reverse  
37          Supplemental Code Channel assignment.

- 1                   o If SCAM\_REV\_DURATION\_MODE<sub>S</sub> is equal to '0', the mobile station  
2                   may continue transmitting on the Reverse Supplemental Code  
3                   Channels until it receives a subsequent *General Handoff Direction*  
4                   *Message* or a *Supplemental Channel Assignment Message* that  
5                   specifies a different Reverse Supplemental Code Channel  
6                   assignment.
- 7                   + The mobile station shall set USE\_REV\_HDM\_SEQ<sub>S</sub> to '0'.
- 8                   – If USE\_REV\_HDM\_SEQ<sub>S</sub> is equal to '0' or REV\_LINKED\_HDM\_SEQ<sub>S</sub> is not  
9                   equal to HDM\_SEQ<sub>R</sub>, and if the previous Reverse Supplemental Code  
10                  Channel assignment is still valid, the mobile station may continue to  
11                  transmit on the Reverse Supplemental Code Channels according to the  
12                  previously specified Reverse Supplemental Code Channel assignment.
- 13                  • If REV\_INCLUDED is included and is equal to '1', then the mobile station shall  
14                  process the Reverse Supplemental Code Channel assignment information as  
15                  follows:
  - 16                  – The mobile station shall set REV\_DTX\_DURATION<sub>S</sub> to  
17                  REV\_DTX\_DURATION<sub>R</sub>.
  - 18                  – The mobile station shall set USE\_REV\_HDM\_SEQ<sub>S</sub> to '0'.
  - 19                  – If REV\_START\_TIME<sub>S</sub> specifies a time which is after the action time of the  
20                  *General Handoff Direction Message*, the mobile station shall cancel any  
21                  pending Reverse Supplemental Code Channel assignment and shall set  
22                  REV\_START\_TIME<sub>S</sub> to NULL.
  - 23                  – If CLEAR\_RETRY\_DELAY is equal to '1', the mobile station shall cancel any  
24                  previously indicated retry delay and shall set RETRY\_DELAY<sub>S</sub><sup>40</sup> to 0;  
25                  otherwise, the mobile station shall continue to honor any previously active  
26                  retry delay stored in RETRY\_DELAY<sub>S</sub>.
  - 27                  – The mobile station shall set NUM\_REV\_CODES<sub>S</sub> to NUM\_REV\_CODES<sub>R</sub>, and  
28                  shall perform the following actions:
    - 29                  + If NUM\_REV\_CODES<sub>S</sub> is equal to '000', the mobile station shall stop  
30                  transmitting on all Reverse Supplemental Code Channels at the action  
31                  time of the message.
    - 32                  + If NUM\_REV\_CODES<sub>S</sub> is not equal to '000', the mobile station shall set  
33                  PILOT\_GATING\_USE\_RATE to '0' at the action time of the message and  
34                  may start transmitting on NUM\_REV\_CODES<sub>S</sub> Reverse Supplemental  
35                  Code Channels at the action time of the message, for a duration of time  
36                  determined by the following rules:

---

<sup>40</sup> The CLEAR\_RETRY\_DELAY field received in *General Handoff Direction Message* does not affect the RETRY\_DELAY<sub>S</sub>[RETRY\_TYPE] values.

- 1                   o If  $USE\_REV\_DURATION_R$  is equal to '1', the mobile station shall set  
2                    $REV\_DURATION_S$  to  $REV\_DURATION_R$ . The mobile station may  
3                   continue transmitting on the Reverse Supplemental Code Channels  
4                   for a period of  $(REV\_DURATION_S \times 80)$  ms, until it receives a  
5                   subsequent *General Handoff Direction Message* or a *Supplemental*  
6                   *Channel Assignment Message* that specifies a different Reverse  
7                   Supplemental Code Channel assignment.
- 8                   o If  $USE\_REV\_DURATION$  is equal to '0', the mobile station may  
9                   continue to transmit on the Reverse Supplemental Code Channels  
10                  until it receives a subsequent *General Handoff Direction Message* or  
11                  a *Supplemental Channel Assignment Message* that specifies a  
12                  different Reverse Supplemental Code Channel assignment.
- 13                – The mobile station shall store  $USE\_T\_ADD\_ABORT_R$ , the Reverse  
14                Supplemental Code Channel assignment T\_ADD abort indicator, as  
15                 $USE\_T\_ADD\_ABORT_S$ .
- 16                • The mobile station shall set  $IGNORE\_SCAM_S$  and  $IGNORE\_ESCAM_S$  to '0'.
- 17                • If  $PERIODIC\_SEARCH_S$  is equal to '0' and a periodic search is in progress, the  
18                mobile station shall abort the periodic search (see 2.6.6.2.8.3.4 and  
19                2.6.6.2.10.4).
- 20                • Perform a soft or hard handoff depending on the following conditions:
  - 21                – If any of the following conditions is true, the mobile station shall perform a  
22                hard handoff:
    - 23                +  $EXTRA\_PARMS$  is set to '1' and either  $BAND\_CLASS_R$  is not equal to  
24                 $SF\_CDMABAND_S$ ,  $CDMA\_FREQ_R$  is not equal to  $SF\_CDMACH_S$ , or  
25                 $FRAME\_OFFSET_R$  is not equal to  $SF\_FRAME\_OFFSET_S$ , or
    - 26                + The set of pilots specified by the message is disjoint from the Active  
27                Set prior to the action time of the message.
  - 28                – If the mobile station performs a hard handoff, it shall perform the following:
    - 29                + If a Periodic Serving Frequency Pilot Report Procedure is in progress, the  
30                mobile station shall abort the procedure (see 2.6.6.2.12).
    - 31                + If a Candidate Frequency periodic search is in progress, the mobile station  
32                shall abort the periodic search (see 2.6.6.2.8.3.4 and 2.6.6.2.10.4).
    - 33                + The mobile station shall cancel the Forward Supplemental Channel  
34                assignment or the Reverse Supplemental Channel assignment (if any).
    - 35                + If  $RETURN\_IF\_HANDOFF\_FAIL_S$  is equal to '0', the mobile station shall  
36                perform actions specified in 2.6.6.2.8.1. If the message specifies more than  
37                one pilot, the mobile station shall also perform actions specified in  
38                2.6.6.2.7.1 and 2.6.6.2.7.2.

- 1                   + If RETURN\_IF\_HANDOFF\_FAIL<sub>S</sub> is equal to '1', the mobile station shall  
2                   perform actions specified in 2.6.6.2.8.2. If the message specifies more than  
3                   one pilot, the mobile station shall also perform actions specified in  
4                   2.6.6.2.7.1 and 2.6.6.2.7.2.
- 5                   – Otherwise, the mobile station shall perform a soft handoff as specified in  
6                   2.6.6.2.7.
- 7    10. *Periodic Pilot Measurement Request Order*: The mobile station shall perform the  
8       following:
- 9       • If the PPSMM timer is enabled, disable it.
- 10      • If ORDQ is equal to '11111111', the mobile station shall send a *Periodic Pilot*  
11       *Strength Measurement Message* to the base station within T<sub>56m</sub> seconds.
- 12      • If ORDQ is not equal to '11111111', the mobile station shall perform the  
13       following:
- 14       – Set the MIN\_PILOT\_PWR\_THRESH<sub>S</sub> to MIN\_PILOT\_PWR\_THRESH<sub>R</sub> received  
15       from the *Periodic Pilot Strength Measurement Request Order*.
- 16       – Set the MIN\_PILOT\_EC\_IO\_THRESH<sub>S</sub> to MIN\_PILOT\_EC\_IO\_THRESH<sub>R</sub>  
17       received from the *Periodic Pilot Strength Measurement Request Order*.
- 18       – Set PPSMM\_PERIOD<sub>S</sub> equal to the larger value of ORDQ and the total length  
19       of time, in units of 80 ms, required by the mobile station to update the pilot  
20       strength measurement of each pilot in the Active Set and the Candidate Set.
- 21       – Perform the Periodic Serving Frequency Pilot Report Procedure as specified  
22       in 2.6.6.2.12.
- 23      • If the mobile station sends the *Periodic Pilot Strength Measurement Message* and  
24       if INCL\_SETPT<sub>R</sub> is equal to '1', the mobile station shall include outer loop E<sub>b</sub>/N<sub>t</sub>  
25       setpoint information corresponding to the physical channel specified by  
26       FPC\_PRI\_CHAN<sub>S</sub>, and Supplemental Channel outer loop E<sub>b</sub>/N<sub>t</sub> setpoint  
27       information if one or more Supplemental Channels are assigned, in the *Periodic*  
28       *Pilot Strength Measurement Message*.
- 29    11. *Universal Handoff Direction Message*: The mobile station shall process the message  
30       as follows:
- 31       In addition to the requirements in this section, if the SCR\_INCLUDED field is  
32       included in this message and is set to '1', the mobile station shall also process this  
33       message in accordance with the requirements for the active service subfunction  
34       (see 2.6.4.1.2.2).
- 35       The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set  
36       to the specified value if any of the following conditions is true, and shall not  
37       perform any other action described in this section for processing the *Universal*  
38       *Handoff Direction Message*:
- 39       • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field

- 1 set to '00000110' (capability not supported), if the mobile station does not  
 2 support the band class specified in the *Universal Handoff Direction Message*.
- 3 • If the SCR\_INCLUDED field is included in this message and is set to '1', the  
 4 mobile station shall perform the following:
- 5 - The mobile station shall send a *Mobile Station Reject Order* with the ORDQ  
 6 field set to '00000111' (message cannot be handled by the current mobile  
 7 station configuration), if the mobile station does not support the service  
 8 configuration specified in the *Universal Handoff Direction Message*.
- 9 - The mobile station shall send a *Mobile Station Reject Order* (ORDQ =  
 10 '00000111') within  $T_{56m}$  seconds, if the mobile station supports the service  
 11 configuration specified but does not accept the service configuration  
 12 specified in the *Universal Handoff Direction Message*.
- 13 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field  
 14 set to '00000111' (message cannot be handled by the current mobile station  
 15 configuration), if the NNSCR\_INCLUDED field is included and set to '1' and the  
 16 SCR\_INCLUDED field is either not included or included but set to '0', and the  
 17 mobile station does not support the configuration specified in the non-  
 18 negotiable service configuration information record in the *Universal Handoff*  
 19 *Direction Message*.
- 20 • If the CC\_INFO\_INCL field is included in this message and is set to '1', the  
 21 mobile station shall perform the following for each of the NUM\_CALLS\_ASSIGN  
 22 call assignments included in this message:
- 23 - If there already exists or currently pending instantiation a Call Control  
 24 instance identified by CON\_REF<sub>r</sub>, the mobile station shall send a *Mobile*  
 25 *Station Reject Order* with ORDQ field set to '00010010' (a call control  
 26 instance is already present with the specified identifier), with the CON\_REF  
 27 field of the order set to CON\_REF<sub>r</sub>.
- 28 - If RESPONSE\_IND<sub>r</sub> equals '1' and TAG<sub>r</sub> does not match any of the TAG  
 29 values contained in the list TAG\_OUTSTANDING\_LIST, the mobile station  
 30 shall send a *Mobile Station Reject Order* with ORDQ field set to '00010011'  
 31 (TAG received does not match TAG stored), with the TAG field of the order  
 32 set to TAG<sub>r</sub>, and the CON\_REF field of the order set to CON\_REF<sub>r</sub>.
- 33 - If the mobile station does not accept this call assignment, the mobile station  
 34 shall send a *Mobile Station Reject Order* with ORDQ field set to '00010000'  
 35 (call assignment not accepted), with the CON\_REF field of the order set to  
 36 CON\_REF<sub>r</sub>.
- 37 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field  
 38 set to '00001010' (search set not specified), if the PERIODIC\_SEARCH field is  
 39 included in the *Universal Handoff Direction Message* and is set to '1' and the

- 1 Candidate Frequency Search Set is empty.
- 2 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field  
3 set to '00000011' (message structure not acceptable), if the message specifies  
4 the Forward/Reverse Supplemental Channel assignment, the most significant  
5 bit of CH\_IND<sub>r</sub> is equal to '0', and CH\_IND<sub>r</sub> is not equal to '000'.
- 6 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field  
7 set to '00000111' (message can not be handled by the current mobile station  
8 configuration), if the message includes a reverse Supplemental Channel  
9 assignment, and any of the following conditions are true:
- 10 – any of the mobile station's reverse supplemental channel configuration  
11 parameter for the corresponding Supplemental Channel is NULL, or
- 12 – the message includes a Reverse Packet Data Channel assignment.
- 13 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field  
14 set to '00000111' (message can not be handled by the current mobile station  
15 configuration), if the message includes a forward Supplemental Channel  
16 assignment and any of the mobile station's forward supplemental channel  
17 configuration parameters for the corresponding Supplemental Channel is NULL.
- 18 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set  
19 to '00001101' (search period too short), if the PERIODIC\_SEARCH field is included  
20 in the *Universal Handoff Direction Message* and is set to '1', and *search\_period* is  
21 less than (max (*fwd\_time*, *rev\_time*) + T<sub>71m</sub> seconds), where
- 22 *search\_period* = time period corresponding to SEARCH\_PERIOD<sub>s</sub> shown in  
23 Table 2.6.6.2.8.3.2-1,
- 24 *fwd\_time* = the mobile station's estimate of the total length of time, in seconds,  
25 for which the mobile station will need to suspend its current  
26 Forward Traffic Channel processing in order to tune to the CDMA  
27 Candidate Frequency, to search the Candidate Frequency Search  
28 Set, and to re-tune to the Serving Frequency; if the mobile station  
29 searches the Candidate Frequency Search Set in multiple visits,  
30 *fwd\_time* is the total time for all visits to the CDMA Candidate  
31 Frequency in a search period (see 2.6.6.2.8.3.2),
- 32 and
- 33 *rev\_time* = the mobile station's estimate of the total length of time, in seconds,  
34 for which the mobile station will need to suspend its current Reverse  
35 Traffic Channel processing in order to tune to the CDMA Candidate  
36 Frequency, to search the Candidate Frequency Search Set, and to re-  
37 tune to the Serving Frequency; if the mobile station searches the  
38 Candidate Frequency Search Set in multiple visits, *rev\_time* is the  
39 total time for all visits to the CDMA Candidate Frequency in a search  
40 period.

- 1 • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field  
2 set to '00000111' (message can not be handled by the current mobile station  
3 configuration), if CH\_IND<sub>r</sub> is equal to '000', and EXT\_CH\_IND<sub>r</sub> is not defined in  
4 Table 3.7.2.3.2.4-11.
- 5 • The mobile shall send a *Mobile Station Reject Order* with the ORDQ field set to  
6 '00011100' (PLCM\_TYPE mismatch) if PLCLM\_TYPE<sub>r</sub> equals '0010' and IMSI\_O is  
7 derived from IMSI\_T or if PLCLM\_TYPE<sub>r</sub> equals '0011' and IMSI\_O is derived from  
8 IMSI\_M.

9 If none of the above conditions is true, the mobile station shall perform the actions  
10 described in the remainder of this section to process the *Universal Handoff*  
11 *Direction* Message at the action time of the message.

12 If EXTRA\_PARMS is equal to '1', the mobile station shall store the return on failure  
13 indicator from the *Universal Handoff Direction Message*  
14 (RETURN\_IF\_HANDOFF\_FAIL<sub>s</sub> = RETURN\_IF\_HANDOFF\_FAIL<sub>r</sub>); otherwise the  
15 mobile station shall set RETURN\_IF\_HANDOFF\_FAIL<sub>s</sub> to '0'.

16 The mobile station shall set RETURN\_IF\_HANDOFF\_FAIL<sub>s</sub> to '0' (disable return on  
17 failure) if any of the following conditions is true:

- 18 • If P\_REV\_IN\_USE<sub>s</sub> is less than or equal to four and the mobile station does not  
19 support hard handoff with return on failure, or
- 20 • At least one of the pilots specified by the message is also included in the Active  
21 Set prior to the action time of the message, and one of the following conditions  
22 is true:
  - 23 – EXTRA\_PARMS is equal to '0', or
  - 24 – EXTRA\_PARMS is equal to '1', the message specifies the same Frequency  
25 Assignment as the Serving Frequency (BAND\_CLASS<sub>r</sub> is equal to  
26 CDMA\_BAND<sub>s</sub> and CDMA\_FREQ<sub>r</sub> is equal to CDMA\_FREQ<sub>s</sub>), and  
27 FRAME\_OFFSET<sub>r</sub> is equal to FRAME\_OFFSET<sub>s</sub>.

28 The mobile station shall store the following parameters from its current  
29 configuration:

- 30 • CDMA band class (SF\_CDMA\_BAND<sub>s</sub> = CDMA\_BAND<sub>s</sub>)
- 31 • Frequency assignment (SF\_CDMA\_FREQ<sub>s</sub> = CDMA\_FREQ<sub>s</sub>)
- 32 • Frame Offset (SF\_FRAME\_OFFSET<sub>s</sub> = FRAME\_OFFSET<sub>s</sub>)

33 If RETURN\_IF\_HANDOFF\_FAIL<sub>s</sub> is equal to '1', the mobile station shall also store  
34 the following parameters from its current configuration:

- 35 • Protocol revision level (SF\_P\_REV<sub>s</sub> = P\_REV<sub>s</sub>)
- 36 • Protocol revision level in use on the Serving Frequency (SF\_P\_REV\_IN\_USE<sub>s</sub> =  
37 P\_REV\_IN\_USE<sub>s</sub>)
- 38 • Search window size for the Active Set and Candidate Set (SF\_SRCH\_WIN\_A<sub>s</sub> =  
39 SRCH\_WIN\_A<sub>s</sub>)

- 1       • Search window size for the Neighbor Set  
2       (SF\_SRCH\_WIN\_N<sub>S</sub> = SRCH\_WIN\_N<sub>S</sub>),
- 3       • Search window size for the Remainder Set  
4       (SF\_SRCH\_WIN\_R<sub>S</sub> = SRCH\_WIN\_R<sub>S</sub>)
- 5       • Pilot detection threshold (SF\_T\_ADD<sub>S</sub> = T\_ADD<sub>S</sub>)
- 6       • Pilot drop threshold (SF\_T\_DROP<sub>S</sub> = T\_DROP<sub>S</sub>)
- 7       • Active Set versus Candidate Set comparison threshold  
8       (SF\_T\_COMP<sub>S</sub> = T\_COMP<sub>S</sub>)
- 9       • Drop timer value (SF\_T\_TDROPS<sub>S</sub> = T\_TDROPS<sub>S</sub>)
- 10       • Drop timer range value (SF\_T\_TDROPS\_RANGE<sub>S</sub> = T\_TDROPS\_RANGE<sub>S</sub>)
- 11       • Soft slope for the dynamic add and drop thresholds  
12       (SF\_SOFT\_SLOPE<sub>S</sub> = SOFT\_SLOPE<sub>S</sub>)
- 13       • Intercept for the dynamic add threshold  
14       (SF\_ADD\_INTERCEPT<sub>S</sub> = ADD\_INTERCEPT<sub>S</sub>)
- 15       • Intercept for the dynamic drop threshold  
16       (SF\_DROP\_INTERCEPT<sub>S</sub> = DROP\_INTERCEPT<sub>S</sub>)
- 17       • Private long code mask indicator: If the mobile station is using the private long  
18       code mask on the Serving Frequency, it shall set SF\_PRIVATE\_LCM<sub>S</sub> to '1';  
19       otherwise, it shall set SF\_PRIVATE\_LCM<sub>S</sub> to '0'.
- 20       • Private long code mask: If the mobile station is using the private long code  
21       mask on the Serving Frequency, it shall set SF\_PVTLCM\_42<sub>S</sub> to the  
22       PVTLCM\_42.
- 23       • Public long code mask type: The mobile station shall set SF\_PLCM\_TYPE<sub>S</sub> to  
24       PLCM\_TYPE<sub>S</sub>. If PLCM\_TYPE<sub>S</sub> equals '0001', the mobile station shall set  
25       SF\_PLCM\_39<sub>S</sub> to PLCM\_39<sub>S</sub>.
- 26       • Service negotiation type (SF\_SERV\_NEG<sub>S</sub> = SERV\_NEG<sub>S</sub>)
- 27       • Service configuration: Store the current service configuration (service  
28       configuration record and non-negotiable service configuration record) in  
29       SF\_SERVICE\_CONFIG<sub>S</sub>
- 30       • Call Information:  
31       Store the list of current calls (Call Control instances, etc.) in SF\_CALLS<sub>S</sub>
- 32       • Message encryption mode: If message encryption is on, the mobile station shall  
33       set SF\_ENCRYPT\_MODE<sub>S</sub> to '1'; otherwise, the mobile station shall set  
34       SF\_ENCRYPT\_MODE<sub>S</sub> to '0'.
- 35       • Extended nominal power setting of the current cell  
36       (SF\_NOM\_PWR\_EXT<sub>S</sub> = NOM\_PWR\_EXT<sub>S</sub>)
- 37       • Nominal power setting of the current cell (SF\_NOM\_PWR<sub>S</sub> = NOM\_PWR<sub>S</sub>)
- 38       • Power control step (SF\_PWR\_CNTL\_STEP<sub>S</sub> = PWR\_CNTL\_STEP<sub>S</sub>)

- Serving Frequency Active Set (SF Active Set = (For each pilot in the current Active Set: (PILOT\_PN, PWR\_COMB\_IND) ) )

- Serving Frequency Code Channel List  
(SF\_CODE\_CHAN\_LIST<sub>S</sub> = CODE\_CHAN\_LIST<sub>S</sub>)

If NNSCR\_INCLUDED field is included and set to '1' and SCR\_INCLUDED field is either not included or included but set to '0', the mobile station shall process the received Non-negotiable Service Configuration Record as specified in 2.6.4.1.13 at the action time of this message. If SYNC\_ID\_INCL<sub>R</sub> is set to '1', the mobile station shall perform the following:

- The mobile station shall store (if included) the synchronization identifier received from the base station corresponding to this service configuration (SYNC\_ID<sub>S</sub> = SYNC\_ID<sub>R</sub>).
- The mobile station shall store the current service configuration as specified in 2.6.4.1.2.2.5.1 at the action time of this message.

Otherwise, the mobile station shall set SYNC\_ID<sub>S</sub> to NULL.

If SYNC\_ID\_INCL<sub>R</sub> is set to '1', NNSCR\_INCLUDED field is not included or is included and set to '0', and SCR\_INCLUDED is not included or is included and set to '0', the mobile station shall perform the following:

- The mobile station shall store the synchronization identifier received from the base station (SYNC\_ID<sub>S</sub> = SYNC\_ID<sub>R</sub>).
- If the currently used service configuration has a corresponding SYNC\_ID, the mobile station shall perform one of the following:
  - + If the current SID (if SID<sub>R</sub> is included in the message then the current SID is SID<sub>R</sub>; otherwise, the current SID is SID<sub>S</sub>) or current NID (if NID<sub>R</sub> is included in the message then the current NID is NID<sub>R</sub>; otherwise, the current NID is NID<sub>S</sub>) is not equal to the stored SID or NID corresponding to the currently used service configuration, the mobile station shall store the current service configuration as specified in 2.6.4.1.2.2.5.1 at the action time of this message.
  - + Otherwise, the mobile station shall update the stored SYNC\_ID value corresponding to the currently used service configuration with SYNC\_ID<sub>R</sub>.
- If the currently used service configuration does not have a corresponding SYNC\_ID, the mobile station shall store the current service configuration as specified in 2.6.4.1.2.2.5.1 at the action time of this message.

When the message takes effect, the mobile station shall perform the following actions:

- The mobile station shall send a *Handoff Completion Message* or an *Extended Handoff Completion Message* as specified in 2.6.6.2.5.2.

- 1 • Update the Active Set, Candidate Set, and Neighbor Set in accordance with the  
2 *Universal Handoff Direction Message* processing (see 2.6.6.2.6.1, 2.6.6.2.6.2,  
3 and 2.6.6.2.6.3).
- 4 • Discontinue use of all Forward Traffic Channels associated with pilots not in the  
5 updated Active Set.
- 6 • The mobile station shall perform the following to determine the long code mask  
7 to use after the handoff:
  - 8 – If the PRIVATE\_LCM field is not included and PLCM\_TYPE\_INCL<sub>R</sub> equals '0',  
9 the mobile station shall continue to use the long code mask currently in  
10 use.
  - 11 – If the PRIVATE\_LCM field is not included and PLCM\_TYPE\_INCL<sub>R</sub> equals '1',  
12 the mobile station shall perform the following:
    - 13 + The mobile station shall set PLCM\_TYPE<sub>S</sub> to PLCM\_TYPE<sub>R</sub>; if  
14 PLCM\_TYPE<sub>R</sub> equals '0001', the mobile station shall set PLCM\_39<sub>S</sub> to  
15 PLCM\_39<sub>R</sub>.
    - 16 + The mobile station shall use the public long code mask derived from  
17 PLCM\_TYPE<sub>S</sub> as specified in 2.3.6.
  - 18 – If PRIVATE\_LCM<sub>R</sub> equals '1' and PLCM\_TYPE\_INCL<sub>R</sub> equals '0', the mobile  
19 station shall perform the following:
    - 20 + The mobile station shall use the private long code mask.
  - 21 – If PRIVATE\_LCM<sub>R</sub> equals '1' and PLCM\_TYPE\_INCL<sub>R</sub> equals '1', the mobile  
22 station shall perform the following:
    - 23 + The mobile station shall use the private long code mask.
    - 24 + The mobile station shall set PLCM\_TYPE<sub>S</sub> to PLCM\_TYPE<sub>R</sub>; if  
25 PLCM\_TYPE<sub>R</sub> equals '0001', the mobile station shall set PLCM\_39<sub>S</sub> to  
26 PLCM\_39<sub>R</sub>.
  - 27 – If PRIVATE\_LCM<sub>R</sub> equals '0' and PLCM\_TYPE\_INCL<sub>R</sub> equals '0', the mobile  
28 station shall perform the following:
    - 29 + The mobile station shall use the public long code mask derived from  
30 PLCM\_TYPE<sub>S</sub> as specified in 2.3.6.
  - 31 – If PRIVATE\_LCM<sub>R</sub> equals '0' and PLCM\_TYPE\_INCL<sub>R</sub> equals '1', the mobile  
32 station shall perform the following:
    - 33 + The mobile station shall set PLCM\_TYPE<sub>S</sub> to PLCM\_TYPE<sub>R</sub>; if  
34 PLCM\_TYPE<sub>R</sub> equals '0001', the mobile station shall set PLCM\_39<sub>S</sub> to  
35 PLCM\_39<sub>R</sub>.
    - 36 + The mobile station shall use the public long code mask derived from  
37 PLCM\_TYPE<sub>S</sub> as specified in 2.3.6.
  - 38 – The mobile station shall indicate to the user the voice privacy mode status.

- 1       • If PARMS\_INCL is equal to '1', perform the following actions:
  - 2           – Set protocol revision level ( $P\_REV_S = P\_REV_R$ ), and protocol revision level
  - 3           currently in use ( $P\_REV\_IN\_USE_S = \min(P\_REV_S, MOB\_P\_REV_P$  of the
  - 4           current band class)).
  - 5           – If SERV\_NEG\_TYPE<sub>R</sub> is equal to '1', set SERV\_NEG<sub>S</sub> to enabled; otherwise
  - 6           set SERV\_NEG<sub>S</sub> to disabled.
- 7       • If EXTRA\_PARMS is equal to '1', perform the following actions:
  - 8           – If FRAME\_OFFSET<sub>R</sub> is not equal to FRAME\_OFFSET<sub>S</sub>, change the frame
  - 9           offset on all of the code channels of the Forward Traffic Channel and of the
  - 10          Reverse Traffic Channel.
  - 11          – If RESET\_L2<sub>R</sub> is equal to '1', and RETURN\_IF\_HANDOFF\_FAIL<sub>S</sub> is equal to
  - 12          '0', Layer 3 shall send a L2-Supervision.Request primitive to Layer 2 to reset
  - 13          the acknowledgment procedures, as specified in [4]. The mobile station
  - 14          shall reset the acknowledgment procedures immediately after the action
  - 15          time of the *Universal Handoff Direction Message*.
  - 16          – If RESET\_FPC<sub>R</sub> is equal to '1' and RETURN\_IF\_HANDOFF\_FAIL<sub>S</sub> is equal to
  - 17          '0', initialize the Forward Traffic Channel power control counters, as
  - 18          specified in 2.6.4.1.1.1.
  - 19          – Process the ENCRYPT\_MODE field, as specified in 2.3.12.2.
  - 20          – Perform the procedures as specified in 2.6.11.3.
- 21       • If EXTRA\_PARMS is equal to '0', set the following variables to the values
- 22       indicated:
  - 23           – Hard handoff traffic channel preamble count required before
  - 24           transmitting a *Handoff Completion Message* or an *Extended Handoff*
  - 25           *Completion Message* (NUM\_PREAMBLE<sub>S</sub> = '000')
  - 26           – Complete search flag (COMPLETE\_SEARCH<sub>S</sub> = '1')
  - 27           – CDMA band class for the Target Frequency
  - 28           (TF\_CDMABAND<sub>S</sub> = SF\_CDMABAND<sub>S</sub>)
  - 29           – Frequency assignment for the Target Frequency
  - 30           (TF\_CDMACH<sub>S</sub> = SF\_CDMACH<sub>S</sub>)
- 31       • Store the following parameters from the *Universal Handoff Direction*
- 32       *Message*:
  - 33           – *Universal Handoff Direction Message* sequence number
  - 34           (HDM\_SEQ<sub>S</sub> = HDM\_SEQ<sub>R</sub>)
  - 35           – Forward power control subchannel relative gain (FPC\_SUBCHAN\_GAIN<sub>S</sub>
  - 36           = FPC\_SUBCHAN\_GAIN<sub>R</sub>).
  - 37           – If the mobile station uses FPC\_SUBCHAN\_GAIN<sub>S</sub>, the mobile station
  - 38           shall perform the following:

- 1           + If PC\_ACTION\_TIME<sub>r</sub> is received, the mobile station shall apply its
- 2           usage of the FPC\_SUBCHAN\_GAIN<sub>s</sub> at the time specified by
- 3           PC\_ACTION\_TIME<sub>r</sub>.
- 4           + If PC\_ACTION\_TIME is not received and the explicit action time is
- 5           received, the mobile station shall apply its usage of the
- 6           FPC\_SUBCHAN\_GAIN<sub>s</sub> at the action time.
- 7           + If neither PC\_ACTION\_TIME<sub>r</sub> nor explicit action time is received, the
- 8           mobile station shall apply its usage of the FPC\_SUBCHAN\_GAIN<sub>s</sub> at
- 9           the first 80ms boundary occurring at least 80ms after the end of the
- 10          frame containing the last bit of the *Universal Handoff Direction*
- 11          Message sent to the mobile station.
- 12          – Reverse Eighth Gating Mode (REV\_FCH\_GATING\_MODE<sub>s</sub> =
- 13          REV\_FCH\_GATING\_MODE<sub>r</sub>).
- 14          – Reverse Power Control Delay if REV\_PWR\_CNTL\_DELAY\_INCL<sub>r</sub> is equal
- 15          to '1' (REV\_PWR\_CNTL\_DELAY<sub>s</sub> = REV\_PWR\_CNTL\_DELAY<sub>r</sub>).
- 16          – Concurrent services supported indicator (CS\_SUPPORTED<sub>s</sub> =
- 17          CS\_SUPPORTED<sub>r</sub>).
- 18          – Maximum number of additional service reference identifiers allowed in
- 19          origination (MAX\_ADD\_SERV\_INSTANCE<sub>s</sub> =
- 20          MAX\_ADD\_SERV\_INSTANCE<sub>r</sub>), if included; otherwise, the mobile station
- 21          shall set MAX\_ADD\_SERV\_INSTANCE<sub>s</sub> to 0.
- 22          – Control Hold Mode supported indicator (CHM\_SUPPORTED<sub>s</sub> =
- 23          CHM\_SUPPORTED<sub>r</sub>) if included; otherwise, the mobile station shall
- 24          perform the following:
- 25           + If P\_REV\_IN\_USE<sub>s</sub> is less than 6, set CHM\_SUPPORTED<sub>s</sub> to '0'.
- 26           + Otherwise, set CHM\_SUPPORTED<sub>s</sub> to '1'
- 27          – CDMA off time report supported indicator
- 28          (CDMA\_OFF\_TIME\_REP\_SUP\_IND<sub>s</sub> = CDMA\_OFF\_TIME\_REP\_SUP\_IND<sub>r</sub>)
- 29          .
- 30          – If CDMA\_OFF\_TIME\_REP\_SUP\_IND<sub>r</sub> is equal to '1', the mobile station
- 31          shall store CDMA off time report threshold
- 32          (CDMA\_OFF\_TIME\_REP\_THRESHOLD<sub>s</sub> =
- 33          CDMA\_OFF\_TIME\_REP\_THRESHOLD<sub>r</sub> in units specified by
- 34          CDMA\_OFF\_TIME\_REP\_UNIT<sub>r</sub>).
- 35          – Forward Packet Data Channel supported indicator
- 36          (FOR\_PDCH\_SUPPORTED<sub>s</sub> = FOR\_PDCH\_SUPPORTED<sub>r</sub>).
- 37          – PDCH Control Hold Mode supported indicator
- 38          (PDCH\_CHM\_SUPPORTED<sub>s</sub> = PDCH\_CHM\_SUPPORTED<sub>r</sub>) if included;
- 39          otherwise, set PDCH\_CHM\_SUPPORTED<sub>s</sub> to '0'.

- 1                   - Reverse Packet Data Channel supported indicator  
2                    (REV\_PDCH\_SUPPORTED<sub>S</sub> = REV\_PDCH\_SUPPORTED<sub>T</sub>) if included;  
3                    otherwise, set REV\_PDCH\_SUPPORTED<sub>S</sub> to '0'.
- 4                   - Short Data Burst supported indicator (SDB\_SUPPORTED<sub>S</sub> =  
5                    SDB\_SUPPORTED<sub>T</sub>).
- 6                   - Pilot information request supported indicator  
7                    (PILOT\_INFO\_REQ\_SUPPORTED<sub>S</sub> = PILOT\_INFO\_REQ\_SUPPORTED<sub>T</sub>).
- 8                   - Release to Idle State allowed indicator (RELEASE\_TO\_IDLE\_IND<sub>S</sub> =  
9                    RELEASE\_TO\_IDLE\_IND<sub>T</sub>).
- 10                  - If SEARCH\_INCLUDED is equal to '1', store the following:
  - 11                   + Search window size for the Active Set and Candidate Set  
12                    (SRCH\_WIN\_A<sub>S</sub> = SRCH\_WIN\_A<sub>T</sub>)
  - 13                   + Pilot detection threshold (T\_ADD<sub>S</sub> = T\_ADD<sub>T</sub>)
  - 14                   + Pilot drop threshold (T\_DROP<sub>S</sub> = T\_DROP<sub>T</sub>)
  - 15                   + Active Set versus Candidate Set comparison threshold  
16                    (T\_COMP<sub>S</sub> = T\_COMP<sub>T</sub>)
  - 17                   + Drop timer value (T\_TDROPS<sub>S</sub> = T\_TDROPT<sub>T</sub>)
  - 18                   + Drop timer range value (T\_TDROPS\_RANGE<sub>S</sub> = T\_TDROPS\_RANGE<sub>T</sub>) if  
19                    T\_TDROPS\_RANGE\_INCL<sub>T</sub> is equal to '1'; otherwise,  
20                    (T\_TDROPS\_RANGE<sub>S</sub> = '0000')
  - 21                   + Soft slope for the dynamic add and drop thresholds  
22                    (SOFT\_SLOPE<sub>S</sub> = SOFT\_SLOPE<sub>T</sub>)
  - 23                   + Intercept for the dynamic add threshold  
24                    (ADD\_INTERCEPT<sub>S</sub> = ADD\_INTERCEPT<sub>T</sub>)
  - 25                   + Intercept for the dynamic drop threshold  
26                    (DROP\_INTERCEPT<sub>S</sub> = DROP\_INTERCEPT<sub>T</sub>)
- 27                  - If EXTRA\_PARMS is equal to '1', store the following:
  - 28                   + If the mobile station supports packet data service options, the packet  
29                    data services zone identifier (PACKET\_ZONE\_ID<sub>S</sub> =  
30                    PACKET\_ZONE\_ID<sub>T</sub>).
  - 31                   + If the mobile station supports packet data service options and the  
32                    PZ\_HYST\_ENABLED field is included, the mobile station shall store  
33                    the packet zone hysteresis enabled indicator (PZ\_HYST\_ENABLED<sub>S</sub> =  
34                    PZ\_HYST\_ENABLED<sub>T</sub>); otherwise, the mobile station shall set  
35                    PZ\_HYST\_ENABLED<sub>S</sub> to '1'.
  - 36                   + If the PZ\_HYST\_LIST\_LEN field is included, the mobile station shall  
37                    store the packet zone hysteresis list length (PZ\_HYST\_LIST\_LEN<sub>S</sub> =  
38                    PZ\_HYST\_LIST\_LEN<sub>T</sub>); otherwise, the mobile station shall set  
39                    PZ\_HYST\_LIST\_LEN<sub>S</sub> to 4.

- 1                   + If the PZ\_HYST\_ACT\_TIMER field is included, the mobile station
- 2                   shall store the packet zone hysteresis activation timer
- 3                   (PZ\_HYST\_ACT\_TIMER<sub>S</sub> = PZ\_HYST\_ACT\_TIMER<sub>R</sub>); otherwise, the
- 4                   mobile station shall set PZ\_HYST\_ACT\_TIMER<sub>S</sub> to 30 seconds.
  
- 5                   + If the PZ\_HYST\_TIMER\_MUL field and the PZ\_HYST\_TIMER\_EXP field
- 6                   are included, the mobile station shall store the packet zone
- 7                   hysteresis timer (PZ\_HYST\_TIMER<sub>S</sub> = PZ\_HYST\_TIMER\_MUL<sub>R</sub> × 8 ^
- 8                   PZ\_HYST\_TIMER\_EXP<sub>R</sub>); otherwise, the mobile station shall set
- 9                   PZ\_HYST\_TIMER<sub>S</sub> to 60 seconds.
  
- 10                  + Frame offset (FRAME\_OFFSET<sub>S</sub> = FRAME\_OFFSET<sub>R</sub>)
  
- 11                  + Acknowledgment procedures reset indicator
- 12                  (If RETURN\_IF\_HANDOFF\_FAIL<sub>S</sub> is equal to '1', set TF\_RESET\_L2<sub>S</sub> to
- 13                  RESET\_L2<sub>R</sub>)
  
- 14                  + Indicator to initialize the Forward Traffic Channel power control
- 15                  counters (If RETURN\_IF\_HANDOFF\_FAIL<sub>S</sub> is equal to '1', set
- 16                  TF\_RESET\_FPC<sub>S</sub> to RESET\_FPC<sub>R</sub>)
  
- 17                  + Nominal power setting of the target cell (NOM\_PWR<sub>S</sub> = NOM\_PWR<sub>R</sub>)
  
- 18                  + Extended nominal power setting of the target cell (If CDMABAND<sub>S</sub> =
- 19                  '00000' or CDMABAND<sub>S</sub> = '00011', then NOM\_PWR\_EXT<sub>S</sub> = '0';
- 20                  otherwise, NOM\_PWR\_EXT<sub>S</sub> = NOM\_PWR\_EXT<sub>R</sub>)
  
- 21                  + Hard handoff traffic channel preamble count required before
- 22                  transmitting a *Handoff Completion Message* or an *Extended Handoff*
- 23                  *Completion Message* (NUM\_PREAMBLE<sub>S</sub> = NUM\_PREAMBLE<sub>R</sub>)
  
- 24                  + CDMA band class for the Target Frequency
- 25                  (TF\_CDMABAND<sub>S</sub> = BAND\_CLASS<sub>R</sub> and CDMABAND<sub>S</sub> =
- 26                  BAND\_CLASS<sub>R</sub>)
  
- 27                  + Frequency assignment for the Target Frequency
- 28                  (TF\_CDMACH<sub>S</sub> = CDMA\_FREQ<sub>R</sub> and CDMACH<sub>S</sub> = CDMA\_FREQ<sub>R</sub>)
  
- 29                  + Complete search flag (COMPLETE\_SEARCH<sub>S</sub> =
- 30                  COMPLETE\_SEARCH<sub>R</sub>)
  
- 31                  + Periodic search flag (PERIODIC\_SEARCH<sub>S</sub> = PERIODIC\_SEARCH<sub>R</sub>)
  
- 32                  + Nominal code channel output power offset relative to the Reverse
- 33                  Pilot Channel power (RLGAIN\_TRAFFIC\_PILOT<sub>S</sub> =
- 34                  RLGAIN\_TRAFFIC\_PILOT<sub>R</sub>)
  
- 35                  - If EXTRA\_PARMS is equal to '1' and DEFAULT\_RLAG is equal to '1', the
- 36                  mobile station shall set each entry of the Reverse Link Attribute
- 37                  Adjustment Gain Table and Reverse Channel Adjustment Gain Table
- 38                  (see [2]) to 0.

- 1                   – If USE\_PWR\_CNTL\_STEP is equal to '1' and PWR\_CNTL\_STEP<sub>r</sub>
- 2                   corresponds to a power control step size supported by the mobile station
- 3                   (see [2]), then the mobile station shall set PWR\_CNTL\_STEP<sub>s</sub> to
- 4                   PWR\_CNTL\_STEP<sub>r</sub>.
- 5                   – If CLEAR\_RETRY\_DELAY<sub>r</sub> is equal to '1', the mobile station shall cancel
- 6                   any previously indicated retry delay and shall set
- 7                   RETRY\_DELAY<sub>s</sub>[RETRY\_TYPE] to 0, where RETRY\_TYPE is equal to '001',
- 8                   '010', '011', '100', or '101'; otherwise, the mobile station shall continue to
- 9                   honor any previously active retry delay stored in RETRY\_DELAY<sub>s</sub>.
- 10                  – If 3XFL\_1XRL\_INCL<sub>r</sub> is equal to '1', the mobile station shall set
- 11                  1XRL\_FREQ\_OFFSET<sub>s</sub> to 1XRL\_FREQ\_OFFSET<sub>r</sub>.
- 12                  – If SCH\_INCL<sub>r</sub> is equal to '1' and NUM\_FOR\_ASSIGN<sub>r</sub> is not equal to '00',
- 13                  the mobile station shall store the following information for each
- 14                  occurrence of the record and process the Forward Supplemental Burst
- 15                  as specified in 2.6.6.2.5.1.1:
- 16                  + FOR\_SCH\_START\_TIME\_INCL<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] =
- 17                  FOR\_SCH\_START\_TIME\_INCL<sub>r</sub>
- 18                  + If FOR\_SCH\_START\_TIME\_INCL<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is equal to '1', set
- 19                  FOR\_SCH\_START\_TIME<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] = FOR\_SCH\_START\_TIME<sub>r</sub>
- 20                  + FOR\_SCH\_DURATION<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] = FOR\_SCH\_DURATION<sub>r</sub>
- 21                  + SCCL\_INDEX<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] = SCCL\_INDEX<sub>r</sub>
- 22                  + If SCH\_BCMC\_IND field is included the mobile station shall perform
- 23                  the following:
- 24                  o If SCH\_BCMC\_IND<sub>r</sub> equals '1' and USE\_ADD\_PLCM\_FOR\_SCH<sub>r</sub>
- 25                  equals '1', set corresponding SCH\_BCMC\_IND[FOR\_SCH\_ID<sub>r</sub>] to
- 26                  '1'; otherwise, set SCH\_BCMC\_IND[FOR\_SCH\_ID<sub>r</sub>] = '0'
- 27                  + If SCH\_BCMC\_IND<sub>r</sub> is included and equals '1' and
- 28                  ADD\_PLCM\_FOR\_SCH\_INCL<sub>r</sub> is included and is set to '1', the mobile
- 29                  station shall store following fields:
- 30                  o Set ADD\_PLCM\_FOR\_SCH\_TYPE<sub>s</sub> to
- 31                  ADD\_PLCM\_FOR\_SCH\_TYPE<sub>r</sub>.
- 32                  o Set ADD\_PLCM\_FOR\_SCH\_35<sub>s</sub> to ADD\_PLCM\_FOR\_SCH\_35<sub>r</sub> if
- 33                  ADD\_PLCM\_FOR\_SCH\_TYPE<sub>r</sub> is equal to '1'.
- 34                  + If SCH\_BCMC\_IND<sub>r</sub> is included and equals '1', the mobile station
- 35                  shall store following fields:
- 36                  o USE\_ADD\_PLCM\_FOR\_SCH<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] =
- 37                  USE\_ADD\_PLCM\_FOR\_SCH<sub>r</sub>
- 38                  o FSCH\_OUTERCODE\_INCL<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] =
- 39                  FSCH\_OUTERCODE\_INCL<sub>r</sub>

- 1                   o If FSCH\_OUTERCODE\_INCL<sub>r</sub> equals '1', the mobile station shall
- 2                   store following fields:
- 3                    ◊ FSCH\_OUTERCODE\_RATE<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] =
- 4                    FSCH\_OUTERCODE\_RATE<sub>r</sub>
- 5                    ◊ FSCH\_OUTERCODE\_OFFSET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] =
- 6                    FSCH\_OUTERCODE\_OFFSET<sub>r</sub>
- 7                - If SCH\_INCL<sub>r</sub> is equal to '1' and NUM\_REV\_ASSIGN<sub>r</sub> is not equal to '00',
- 8                the mobile station shall store the following information for each
- 9                occurrence of the record and process the Reverse Supplemental Burst as
- 10               specified in 2.6.6.2.5.1.2:
- 11                + REV\_SCH\_START\_TIME\_INCL<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] =
- 12                REV\_SCH\_START\_TIME\_INCL<sub>r</sub>
- 13                + If REV\_SCH\_START\_TIME\_INCL<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] is equal to '1', set
- 14                REV\_SCH\_START\_TIME<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] = REV\_SCH\_START\_TIME<sub>r</sub>
- 15                + REV\_SCH\_DURATION<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] = REV\_SCH\_DURATION<sub>r</sub>
- 16                + REV\_SCH\_NUM\_BITS\_IDX<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] =
- 17                REV\_SCH\_NUM\_BITS\_IDX<sub>r</sub>
- 18                - The mobile station shall set BCMC\_ON\_TRAFFIC\_SUP<sub>s</sub> to
- 19                BCMC\_ON\_TRAFFIC\_SUP<sub>r</sub>. If BCMC\_ON\_TRAFFIC\_SUP<sub>r</sub> is set to '1', the
- 20                mobile station shall store AUTO\_REQ\_TRAF\_ALLOWED\_IND<sub>s</sub> =
- 21                AUTO\_REQ\_TRAF\_ALLOWED\_IND<sub>r</sub>
- 22                - If SID\_INCL<sub>r</sub> is equal to '1', the mobile station shall store the following:
- 23                + System identification (SID<sub>s</sub> = SID<sub>r</sub>)
- 24                - If NID\_INCL<sub>r</sub> is equal to '1', the mobile station shall store the following:
- 25                + Network identification (NID<sub>s</sub> = NID<sub>r</sub>)
- 26                - If ENC\_SUPPORTED<sub>r</sub> is equal to '1', the mobile station shall store:
- 27                + Signaling encryption supported indicator (SIG\_ENCRYPT\_SUP<sub>s</sub> =
- 28                SIG\_ENCRYPT\_SUP<sub>r</sub>)
- 29                + User information encryption supported indicator (UI\_ENCRYPT\_SUP<sub>s</sub>
- 30                = UI\_ENCRYPT\_SUP<sub>r</sub>)
- 31                - Sync ID supported indicator (USE\_SYNC\_ID<sub>s</sub> = USE\_SYNC\_ID<sub>r</sub>) if
- 32                included.
- 33                - Channel configuration request allowed indicator (USE\_CH\_CFG\_RRM<sub>s</sub> =
- 34                USE\_CH\_CFG\_RRM<sub>r</sub>) if included; otherwise, set USE\_CH\_CFG\_RRM<sub>s</sub> to
- 35                '0'.
- 36                - If TX\_PWR\_LIMIT\_DEFAULT<sub>r</sub> is included and set to '0', the mobile
- 37                station shall perform the following:

- 1                   + If the mobile station is being assigned to operate in the 1915MHz –
- 2                   1920MHz block of the PCS band, the mobile station shall store the
- 3                   transmit power limit  $TX\_PWR\_LIMIT_S = (TX\_PWR\_LIMIT_R - 30dB)$ ;
- 4                   + Otherwise, the mobile station shall set  $TX\_PWR\_LIMIT_S$  to the limit
- 5                   defined in [11] for the target base station.
- 6                   – If  $TX\_PWR\_LIMIT\_DEFAULT_R$  is included and set to '1', the mobile
- 7                   station shall store  $TX\_PWR\_LIMIT_S$  to the limit defined in [11] for the
- 8                   target base station.
- 9                   – Permission for the mobile station to request QoS settings in the
- 10                  *Origination Message, Origination Continuation Message, or Enhanced*
- 11                  *Origination Message* ( $MOB\_QOS_S = MOB\_QOS_R$ ) if included.
- 12                  – The mobile station initiated position location determination supported
- 13                  indicator ( $MS\_INIT\_POS\_LOC\_SUP\_IND_S =$
- 14                   $MS\_INIT\_POS\_LOC\_SUP\_IND_R$ ).
- 15                  – If  $CH\_IND_R$  is equal to '101', the mobile station shall perform the
- 16                  following:
- 17                  + The mobile station shall set  $CH\_IND_S = '01'$ .
- 18                  + If  $SCH\_INCL_R$  is equal to '1' and  $NUM\_FOR\_SCH$  is not equal to
- 19                  '00000', for all the  $NUM\_FOR\_SCH$  occurrences, the mobile station
- 20                  shall perform the following:
- 21                  o The mobile station shall determine,
- 22                   $N\_FSCH\_BITS\_SET_S[FOR\_SCH\_ID_R][SCCL\_INDEX_R]$ , the number
- 23                  of information bits per Forward Supplemental Channel frame
- 24                  identified by  $FOR\_SCH\_ID$  and corresponding to the index
- 25                   $SCCL\_INDEX$  according to the following rules:
- 26                  ◇ If  $FSCH\_VAR\_TABLE\_ID_S[FOR\_SCH\_ID_R]$  is equal to '000',
- 27                  then:
- 28                  – If  $USE\_FLEX\_NUM\_BITS_S$  is equal to '0' or if
- 29                   $USE\_FLEX\_NUM\_BITS_S$  is equal to '1' and
- 30                   $FSCH\_NBIT\_TABLE\_ID_S[FOR\_SCH\_ID_R]$  is equal to '0000',
- 31                  then the mobile station shall set the number of
- 32                  information bits per frame,
- 33                   $N\_FSCH\_BITS\_SET_S[FOR\_SCH\_ID_R][SCCL\_INDEX_R]$  and
- 34                  number of CRC bits per frame,
- 35                   $FSCH\_CRC\_LEN\_SET_S[FOR\_SCH\_ID_R][SCCL\_INDEX_R]$ ,
- 36                  according to Table 3.7.3.3.2.37-2 using
- 37                   $FOR\_SCH\_NUM\_BITS\_IDX_R$  as the index to the table.

- 1                   - If  $USE\_FLEX\_NUM\_BITS_S$  is equal to '1' and
- 2                     $FSCH\_NBIT\_TABLE\_IDS[FOR\_SCH\_ID_R]$  is not equal to
- 3                    '0000', then the mobile station shall set the number of
- 4                    CRC bits per frame,
- 5                     $FSCH\_CRC\_LEN\_SET_S[FOR\_SCH\_ID_R][SCCL\_INDEX_R]$ ,
- 6                    using Table 3.7.5.20-1 and
- 7                     $CRC\_LEN\_IDX_S[FSCH\_NBIT\_TABLE\_IDS[FOR\_SCH\_ID_R]][FOR\_SCH\_NUM\_BITS\_IDX_R]$  as the index to the table.
- 8                    The mobile station shall also set the number of
- 9                    information bits per frame corresponding to
- 10                    $SCCL\_INDEX_R$ ,
- 11                     $N\_FSCH\_BITS\_SET_S[FOR\_SCH\_ID_R][SCCL\_INDEX_R]$ , to
- 12                     $NUM\_BITS_S[FSCH\_NBIT\_TABLE\_IDS[FOR\_SCH\_ID_R]][FOR\_SCH\_NUM\_BITS\_IDX_R]$ .
- 13
- 14
- 15               ◇ If  $FSCH\_VAR\_TABLE\_IDS[FOR\_SCH\_ID_R]$  is not equal to '000',
- 16               then:
- 17               - The mobile station shall set
- 18                 $N\_FSCH\_BITS\_IDX\_SET_S[FOR\_SCH\_ID_R]$ , the set of
- 19                indices to the number of information bits per frame as
- 20                follows:
- 21                + If  $FOR\_SCH\_NUM\_BITS\_IDX_R$  is equal to '0000', then
- 22                 $N\_FSCH\_BITS\_IDX\_SET_S[FOR\_SCH\_ID_R] = \{$
- 23                 $FOR\_SCH\_NUM\_BITS\_IDX_R \}$ ,
- 24                + otherwise the mobile station shall set (initialize)
- 25                 $N\_FSCH\_BITS\_IDX\_SET_S[FOR\_SCH\_ID_R] =$
- 26                 $\{FOR\_SCH\_NUM\_BITS\_IDX_R\}$  and for  $i=1, \dots,$
- 27                 $FOR\_SCH\_NUM\_BITS\_IDX_R$  the mobile station shall
- 28                add  $FOR\_SCH\_NUM\_BITS\_IDX_R -$
- 29                 $VAR\_FSCH\_RATE\_OFFSET_S[FOR\_SCH\_ID_R][FOR\_SCH\_NUM\_BITS\_IDX_R][i]$  to the set specified by
- 30                 $N\_FSCH\_BITS\_IDX\_SET_S[FOR\_SCH\_ID_R]$
- 31
- 32
- 33               - If  $USE\_FLEX\_NUM\_BITS_S$  is equal to '0' or if
- 34                 $USE\_FLEX\_NUM\_BITS_S$  is equal to '1' and
- 35                 $FSCH\_NBIT\_TABLE\_IDS[FOR\_SCH\_ID_R]$  is equal to '0000',
- 36                then the mobile station shall set
- 37                 $N\_FSCH\_BITS\_SET_S[FOR\_SCH\_ID_R][SCCL\_INDEX_R]$ , the
- 38                set of number of information bits per frame as follows.
- 39                The  $i^{th}$  member of the set
- 40                 $N\_FSCH\_BITS\_SET_S[FOR\_SCH\_ID_R][SCCL\_INDEX_R]$  is
- 41                obtained using Table 3.7.3.3.2.37-2 and the  $i^{th}$  member of
- 42                the set  $N\_FSCH\_BITS\_IDX\_SET_S[FOR\_SCH\_ID_R]$  as the
- 43                index to the table.

- If USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '1' and FSCH\_NBIT\_TABLE\_IDS[FOR\_SCH\_ID<sub>r</sub>] is not equal to '0000', then
        - + the mobile station shall set N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], the set of number of information bits per frame as follows.  
The  $i^{th}$  member of the set N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>] is equal to NUM\_BITS<sub>s</sub>[FSCH\_NBIT\_TABLE\_IDS[FOR\_SCH\_ID<sub>r</sub>]][N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][i]], where N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][i] denotes the  $i^{th}$  member of the set N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] and,
        - + the mobile station shall set FSCH\_CRC\_LEN\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], the set of number CRC bits per frame as follows.  
The  $i^{th}$  member of the set FSCH\_CRC\_LEN\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>] using Table 3.7.5.20-1 and CRC\_LEN\_IDX<sub>s</sub>[FSCH\_NBIT\_TABLE\_IDS[FOR\_SCH\_ID<sub>r</sub>]][N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][i]] as the index to the table, where N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][i] denotes the  $i^{th}$  member of the set N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>].
    - + If SCH\_INCL<sub>r</sub> is equal to '1' and NUM\_REV\_SCH is not equal to '00000', for all the NUM\_REV\_SCH occurrences, the mobile station shall perform the following:
      - o Set REV\_SCH\_NUM\_BITS\_IDX<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] to REV\_SCH\_NUM\_BITS\_IDX<sub>r</sub>.
      - o Set REV\_WALSH\_IDS[REV\_SCH\_ID<sub>r</sub>][REV\_SCH\_NUM\_BITS\_IDX<sub>s</sub>] to REV\_WALSH\_ID<sub>r</sub>.
    - + For each member of the Active Set included in the message, the mobile station shall perform the following:
      - o Set PILOT\_PN to PILOT\_PN<sub>r</sub>.
      - o If SRCH\_OFFSET\_INCL<sub>r</sub> equals '1', set the SRCH\_OFFSET field of PILOT\_REC to SRCH\_OFFSET<sub>r</sub>; otherwise, set the SRCH\_OFFSET field of PILOT\_REC to '000'.
      - o Set ADD\_PILOT\_REC\_INCL to ADD\_PILOT\_REC\_INCL<sub>r</sub>.

- 1                   o If ADD\_PILOT\_REC\_INCL<sub>r</sub> equals '1', the mobile station shall also
- 2                   perform the following:
- 3                   ◇ Set the PILOT\_REC\_TYPE field of PILOT\_REC to
- 4                   PILOT\_REC\_TYPE<sub>r</sub>.
- 5                   ◇ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '000', the mobile station shall
- 6                   set the TD\_POWER\_LEVEL field of PILOT\_REC to
- 7                   TD\_POWER\_LEVEL<sub>r</sub> and set the TD\_MODE field of
- 8                   NGHBR\_PILOT\_REC to TD\_MODE<sub>r</sub>.
- 9                   ◇ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '001', the mobile station
- 10                  shall:
- 11                  – Set the AUX\_PILOT\_QOF field of PILOT\_REC to QOF<sub>r</sub>.
- 12                  – Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to
- 13                  AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length
- 14                  specified by WALSH\_LENGTH<sub>r</sub>.
- 15                  ◇ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '010', the mobile station
- 16                  shall:
- 17                  – Set the AUX\_PILOT\_TD\_QOF field of PILOT\_REC to QOF<sub>r</sub>.
- 18                  – Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to
- 19                  AUX\_WALSH<sub>r</sub> with the Walsh Code length specified by
- 20                  WALSH\_LENGTH<sub>r</sub>.
- 21                  – Set the AUX\_TD\_POWER\_LEVEL field of PILOT\_REC to
- 22                  AUX\_TD\_POWER\_LEVEL<sub>r</sub>.
- 23                  – Set the TD\_MODE field of PILOT\_REC to TD\_MODE<sub>r</sub>.
- 24                  ◇ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '011', the mobile station
- 25                  shall:
- 26                  – Set the SR3\_PRIMARY\_PILOT field of PILOT\_REC to
- 27                  SR3\_PRIMARY\_PILOT<sub>r</sub>.
- 28                  – Set the SR3\_PILOT\_POWER1 field of PILOT\_REC to
- 29                  SR3\_PILOT\_POWER1<sub>r</sub>.
- 30                  – Set the SR3\_PILOT\_POWER2 field of PILOT\_REC to
- 31                  SR3\_PILOT\_POWER2<sub>r</sub>.
- 32                  ◇ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '100', the mobile station
- 33                  shall:
- 34                  – Set the SR3\_PRIMARY\_PILOT field of PILOT\_REC to
- 35                  SR3\_PRIMARY\_PILOT<sub>r</sub>.
- 36                  – Set the SR3\_PILOT\_POWER1 field of PILOT\_REC to
- 37                  SR3\_PILOT\_POWER1<sub>r</sub>.

- 1                                   – Set the SR3\_PILOT\_POWER2 field of PILOT\_REC to
- 2                                   SR3\_PILOT\_POWER2<sub>r</sub>.
- 3                                   – Set the AUX\_PILOT\_QOF field of PILOT\_REC to QOF<sub>r</sub>.
- 4                                   – Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to
- 5                                   AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length
- 6                                   specified by WALSH\_LENGTH<sub>r</sub>.
- 7                                   – If ADD\_INFO\_INCL1<sub>r</sub> is equal to '1', set the
- 8                                   AUX\_PILOT\_QOF1 field of PILOT\_REC to QOF1<sub>r</sub> and set
- 9                                   the AUX\_PILOT\_WALSH\_CODE1 field of PILOT\_REC to
- 10                                  AUX\_PILOT\_WALSH1<sub>r</sub> with the Walsh Code length
- 11                                  specified by WALSH\_LENGTH1<sub>r</sub>; otherwise, set the
- 12                                  AUX\_PILOT\_QOF1 field of PILOT\_REC to QOF<sub>r</sub> and set
- 13                                  the AUX\_PILOT\_WALSH\_CODE1 field of PILOT\_REC to
- 14                                  AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length
- 15                                  specified by WALSH\_LENGTH<sub>r</sub>.
- 16                                  – If ADD\_INFO\_INCL2<sub>r</sub> is equal to '1', set the
- 17                                  AUX\_PILOT\_QOF2 field of PILOT\_REC to QOF2<sub>r</sub> and set
- 18                                  the AUX\_PILOT\_WALSH\_CODE2 field of PILOT\_REC to
- 19                                  AUX\_PILOT\_WALSH2<sub>r</sub> with the Walsh Code length
- 20                                  specified by WALSH\_LENGTH2<sub>r</sub>; otherwise, set the
- 21                                  AUX\_PILOT\_QOF2 field of PILOT\_REC to QOF<sub>r</sub> and set
- 22                                  the AUX\_PILOT\_WALSH\_CODE2 field of PILOT\_REC to
- 23                                  AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length
- 24                                  specified by WALSH\_LENGTH<sub>r</sub>.
- 25                                  o Store PWR\_COMB\_IND, CODE\_CHAN\_FCH and
- 26                                  QOF\_MASK\_ID\_FCH.
- 27                                  o If SCH\_INCL<sub>r</sub> is equal to '1' and NUM\_SCH is equal to '00000',
- 28                                  the mobile station shall delete the corresponding pilot from the
- 29                                  all entries of the corresponding Supplemental Channel.
- 30                                  o If SCH\_INCL<sub>r</sub> is equal to '1' and NUM\_SCH is not equal to
- 31                                  '00000', for each Supplemental Channel included in this record,
- 32                                  the mobile station shall:
- 33                                   ◇ If PILOT\_INCL is equal to '0', then the mobile station shall
- 34                                   delete the corresponding pilot from the Active Set of
- 35                                   Supplemental Channel for the corresponding SCCL\_INDEX<sub>r</sub>.
- 36                                   ◇ If PILOT\_INCL is equal to '1', then for each Supplemental
- 37                                   Channel included in this record, the mobile station shall set
- 38                                   PILOT\_PN<sub>s</sub> [FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i] to PILOT\_PN<sub>r</sub>,
- 39                                   QOF\_ID<sub>s</sub> [FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i] to
- 40                                   QOF\_MASK\_ID\_SCH<sub>r</sub>, and
- 41                                   FOR\_SCH\_CC\_INDEX<sub>s</sub> [FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i] to
- 42                                   CODE\_CHAN\_SCH<sub>r</sub>.

- 1                   ◇ If PILOT\_INCL is equal to '1' and CCSH\_INCLUDED is set to
- 2                   '1', then for each Supplemental Channel included in this
- 3                   record, the mobile station shall set
- 4                   CCSH\_ENCODER\_TYPE<sub>S</sub>[FOR\_SCH\_ID<sub>R</sub>][SCCL\_INDEX<sub>R</sub>][i] to
- 5                   CCSH\_ENCODER\_TYPE<sub>R</sub>.
- 6                   ◇ If PILOT\_INCL is equal to '1' and CCSH\_INCLUDED is set to
- 7                   '0', then for each Supplemental Channel included in this
- 8                   record, the mobile station shall set
- 9                   CCSH\_ENCODER\_TYPE<sub>S</sub>[FOR\_SCH\_ID<sub>R</sub>][SCCL\_INDEX<sub>R</sub>][i] to
- 10                  '0' (default Turbo Encoder type).
- 11                  ◇ The mobile station shall delete all pilots that are not included
- 12                  in the list specified by the NUM\_PILOTS field from the Active
- 13                  Set of Supplemental Channel for the corresponding
- 14                  SCCL\_INDEX<sub>R</sub>.
- 15                  + If CCSH\_INCLUDED is equal to '1', the mobile station shall perform
- 16                  the following:
- 17                   o If CCSH\_ENCODER\_ACTION\_TIME<sub>R</sub> is received, then the mobile
- 18                   station shall set CCSH\_ENCODER\_ACTION\_TIME<sub>S</sub> to
- 19                   CCSH\_ENCODER\_ACTION\_TIME<sub>R</sub>, and the mobile station shall
- 20                   apply each CCSH\_ENCODER\_TYPE<sub>S</sub> at the time specified by
- 21                   CCSH\_ENCODER\_ACTION\_TIME<sub>R</sub>.
- 22                   o If CCSH\_ENCODER\_ACTION\_TIME<sub>R</sub> is not received, the mobile
- 23                   station shall apply each CCSH\_ENCODER\_TYPE<sub>S</sub> at the action
- 24                   time of the message.
- 25                  + If 3X\_FCH\_INFO\_INCL<sub>R</sub> equals '1', for each included member of the
- 26                  Active Set, the mobile station store the following:
- 27                   o If 3X\_FCH\_LOW\_INCL<sub>R</sub> equals '1', set the
- 28                   QOF\_MASK\_ID\_FCH\_LOW field to QOF\_MASK\_ID\_FCH\_LOW<sub>R</sub>
- 29                   and the CODE\_CHAN\_FCH\_LOW field to
- 30                   CODE\_CHAN\_FCH\_LOW<sub>R</sub>. Otherwise, set the
- 31                   QOF\_MASK\_ID\_FCH\_LOW field to QOF\_MASK\_ID\_FCH<sub>R</sub> and the
- 32                   CODE\_CHAN\_FCH\_LOW to CODE\_CHAN\_FCH<sub>R</sub>.
- 33                   o If 3X\_FCH\_HIGH\_INCL<sub>R</sub> equals '1', set the
- 34                   QOF\_MASK\_ID\_FCH\_HIGH field to QOF\_MASK\_ID\_FCH\_HIGH<sub>R</sub>
- 35                   and the CODE\_CHAN\_FCH\_HIGH field to
- 36                   CODE\_CHAN\_FCH\_HIGH<sub>R</sub>. Otherwise, set the
- 37                   QOF\_MASK\_ID\_FCH\_HIGH field to QOF\_MASK\_ID\_FCH<sub>R</sub> and the
- 38                   CODE\_CHAN\_FCH\_HIGH to CODE\_CHAN\_FCH<sub>R</sub>.
- 39                   o If 3X\_SCH\_INFO\_INCL<sub>R</sub> equals '1', for each Supplemental
- 40                   Channel included, the mobile station store the following:

- 1                   ◇ If 3X\_SCH\_LOW\_INCL<sub>r</sub> equals '1', set the QOF\_ID\_SCH\_LOW<sub>s</sub>  
2                   [FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i] to  
3                   QOF\_MASK\_ID\_SCH\_LOW<sub>r</sub> and the  
4                   FOR\_SCH\_CC\_INDEX\_LOW[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i]  
5                   field to CODE\_CHAN\_SCH\_LOW<sub>r</sub>. Otherwise, set  
6                   QOF\_ID\_SCH\_LOW<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i] to  
7                   QOF\_MASK\_ID\_SCH<sub>r</sub>, and  
8                   FOR\_SCH\_CC\_INDEX\_LOW<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i]  
9                   to CODE\_CHAN\_SCH<sub>r</sub>.
- 10                  ◇ If 3X\_SCH\_HIGH\_INCL<sub>r</sub> equals '1', set the  
11                  QOF\_ID\_SCH\_HIGH<sub>s</sub> [FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i] to  
12                  QOF\_MASK\_ID\_SCH\_HIGH<sub>r</sub> and the  
13                  FOR\_SCH\_CC\_INDEX\_HIGH[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i]  
14                  field to CODE\_CHAN\_SCH\_HIGH<sub>r</sub>. Otherwise, set  
15                  QOF\_ID\_SCH\_HIGH<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i] to  
16                  QOF\_MASK\_ID\_SCH<sub>r</sub>, and  
17                  FOR\_SCH\_CC\_INDEX\_HIGH<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i]  
18                  ] to CODE\_CHAN\_SCH<sub>r</sub>.
- 19                  + The mobile station shall delete all pilots that are not listed in the  
20                  NUM\_PILOTS field from the Active Set.
- 21                  + The mobile station shall delete all pilots that are not listed in the  
22                  Active Set from the Active Set of the Supplemental Channel for the  
23                  Forward Supplemental Channel Assignment (if any). If these deleted  
24                  pilots include all pilots in the Active Set of the Supplemental  
25                  Channel, the mobile station shall cancel the Forward Supplemental  
26                  Channel Assignment.
- 27                  – If CH\_IND<sub>r</sub> is equal to '010' or '110', the mobile station shall perform the  
28                  following:  
29                  + The mobile station shall set CH\_IND<sub>s</sub> = '10'.
- 30                  + If SCH\_INCL<sub>r</sub> is equal to '1' and NUM\_FOR\_SCH is not equal to  
31                  '00000', for all the NUM\_FOR\_SCH occurrences, the mobile station  
32                  shall perform the following:
- 33                   o The mobile station shall determine,  
34                   N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], the number  
35                   of information bits per Forward Supplemental Channel frame  
36                   identified by FOR\_SCH\_ID and corresponding to the index  
37                   SCCL\_INDEX according to the following rules:
- 38                   ◇ If FSCH\_VAR\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is equal to '000',  
39                   then:

- If  $USE\_FLEX\_NUM\_BITS_S$  is equal to '0' or if  $USE\_FLEX\_NUM\_BITS_S$  is equal to '1' and  $FSCH\_NBIT\_TABLE\_ID_S[FOR\_SCH\_ID_R]$  is equal to '0000', then the mobile station shall set the number of information bits per frame,  $N\_FSCH\_BITS\_SET_S[FOR\_SCH\_ID_R][SCCL\_INDEX_R]$  and number of CRC bits per frame,  $FSCH\_CRC\_LEN\_SET_S[FOR\_SCH\_ID_R][SCCL\_INDEX_R]$ , according to Table 3.7.3.3.2.37-2 using  $FOR\_SCH\_NUM\_BITS\_IDX_R$  as the index to the table.
  - If  $USE\_FLEX\_NUM\_BITS_S$  is equal to '1' and  $FSCH\_NBIT\_TABLE\_ID_S[FOR\_SCH\_ID_R]$  is not equal to '0000', then the mobile station shall set the number of CRC bits per frame,  $FSCH\_CRC\_LEN\_SET_S[FOR\_SCH\_ID_R][SCCL\_INDEX_R]$ , using Table 3.7.5.20-1 and  $CRC\_LEN\_IDX_S[FSCH\_NBIT\_TABLE\_ID_S[FOR\_SCH\_ID_R]][FOR\_SCH\_NUM\_BITS\_IDX_R]$  as the index to the table. The mobile station shall also set the number of information bits per frame corresponding to  $SCCL\_INDEX_R$ ,  $N\_FSCH\_BITS\_SET_S[FOR\_SCH\_ID_R][SCCL\_INDEX_R]$ , to  $NUM\_BITS_S[FSCH\_NBIT\_TABLE\_ID_S[FOR\_SCH\_ID_R]][FOR\_SCH\_NUM\_BITS\_IDX_R]$ .
- ◇ If  $FSCH\_VAR\_TABLE\_ID_S[FOR\_SCH\_ID_R]$  is not equal to '000', then:
- The mobile station shall set  $N\_FSCH\_BITS\_IDX\_SET_S[FOR\_SCH\_ID_R]$ , the set of indices to the number of information bits per frame as follows:
    - + If  $FOR\_SCH\_NUM\_BITS\_IDX_R$  is equal to '0000', then  $N\_FSCH\_BITS\_IDX\_SET_S[FOR\_SCH\_ID_R] = \{FOR\_SCH\_NUM\_BITS\_IDX_R\}$ ,
    - + otherwise the mobile station shall set (initialize)  $N\_FSCH\_BITS\_IDX\_SET_S[FOR\_SCH\_ID_R] = \{FOR\_SCH\_NUM\_BITS\_IDX_R\}$  and for  $i=1, \dots, FOR\_SCH\_NUM\_BITS\_IDX_R$  the mobile station shall add  $FOR\_SCH\_NUM\_BITS\_IDX_R - VAR\_FSCH\_RATE\_OFFSET_S[FOR\_SCH\_ID_R][FOR\_SCH\_NUM\_BITS\_IDX_R][i]$  to the set specified by  $N\_FSCH\_BITS\_IDX\_SET_S[FOR\_SCH\_ID_R]$

- If  $USE\_FLEX\_NUM\_BITS_S$  is equal to '0' or if  $USE\_FLEX\_NUM\_BITS_S$  is equal to '1' and  $FSCH\_NBIT\_TABLE\_IDS[FOR\_SCH\_ID_R]$  is equal to '0000', then the mobile station shall set  $N\_FSCH\_BITS\_SET_S[FOR\_SCH\_ID_R][SCCL\_INDEX_R]$ , the set of number of information bits per frame as follows. The  $i^{th}$  member of the set  $N\_FSCH\_BITS\_SET_S[FOR\_SCH\_ID_R][SCCL\_INDEX_R]$  is obtained using Table 3.7.3.3.2.37-2 and the  $i^{th}$  member of the set  $N\_FSCH\_BITS\_IDX\_SET_S[FOR\_SCH\_ID_R]$  as the index to the table.
- If  $USE\_FLEX\_NUM\_BITS_S$  is equal to '1' and  $FSCH\_NBIT\_TABLE\_IDS[FOR\_SCH\_ID_R]$  is not equal to '0000', then
  - + the mobile station shall set  $N\_FSCH\_BITS\_SET_S[FOR\_SCH\_ID_R][SCCL\_INDEX_R]$ , the set of number of information bits per frame as follows. The  $i^{th}$  member of the set  $N\_FSCH\_BITS\_SET_S[FOR\_SCH\_ID_R][SCCL\_INDEX_R]$  is equal to  $NUM\_BITS_S[FSCH\_NBIT\_TABLE\_IDS[FOR\_SCH\_ID_R]][N\_FSCH\_BITS\_IDX\_SET_S[FOR\_SCH\_ID_R][i]]$ , where  $N\_FSCH\_BITS\_IDX\_SET_S[FOR\_SCH\_ID_R][i]$  denotes the  $i^{th}$  member of the set  $N\_FSCH\_BITS\_IDX\_SET_S[FOR\_SCH\_ID_R]$  and,
  - + the mobile station shall set  $FSCH\_CRC\_LEN\_SET_S[FOR\_SCH\_ID_R][SCCL\_INDEX_R]$ , the set of number CRC bits per frame as follows. The  $i^{th}$  member of the set  $FSCH\_CRC\_LEN\_SET_S[FOR\_SCH\_ID_R][SCCL\_INDEX_R]$  using Table 3.7.5.20-1 and  $CRC\_LEN\_IDX_S[FSCH\_NBIT\_TABLE\_IDS[FOR\_SCH\_ID_R]][N\_FSCH\_BITS\_IDX\_SET_S[FOR\_SCH\_ID_R][i]]$  as the index to the table, where  $N\_FSCH\_BITS\_IDX\_SET_S[FOR\_SCH\_ID_R][i]$  denotes the  $i^{th}$  member of the set  $N\_FSCH\_BITS\_IDX\_SET_S[FOR\_SCH\_ID_R]$ .
- + If  $SCH\_INCL_R$  is equal to '1' and  $NUM\_REV\_SCH$  is not equal to '00000', for all the  $NUM\_REV\_SCH$  occurrences, the mobile station shall perform the following:
  - o Set  $REV\_SCH\_NUM\_BITS\_IDX_S[REV\_SCH\_ID_R]$  to  $REV\_SCH\_NUM\_BITS\_IDX_R$ .

- 1                   o Set REV\_WALSH\_ID<sub>S</sub>
- 2                   [REV\_SCH\_ID<sub>r</sub>][REV\_SCH\_NUM\_BITS\_IDX<sub>S</sub>] to REV\_WALSH\_ID<sub>r</sub>.
- 3           + For each member of the Active Set included in the message, the
- 4           mobile station shall perform the followings:
- 5                   o Set PILOT\_PN to PILOT\_PN<sub>r</sub>.
- 6                   o If SRCH\_OFFSET\_INCL<sub>r</sub> equals '1', set the SRCH\_OFFSET field of
- 7                   PILOT\_REC to SRCH\_OFFSET<sub>r</sub>; otherwise, set the
- 8                   SRCH\_OFFSET field of PILOT\_REC to '000'.
- 9                   o Set ADD\_PILOT\_REC\_INCL to ADD\_PILOT\_REC\_INCL<sub>r</sub>.
- 10                  o If ADD\_PILOT\_REC\_INCL<sub>r</sub> equals '1', the mobile station shall also
- 11                  perform the following:
- 12                   ◇ Set the PILOT\_REC\_TYPE field of PILOT\_REC to
- 13                   PILOT\_REC\_TYPE<sub>r</sub>.
- 14                   ◇ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '000', the mobile station shall
- 15                   set the TD\_POWER\_LEVEL field of PILOT\_REC to
- 16                   TD\_POWER\_LEVEL<sub>r</sub> and set the TD\_MODE field of
- 17                   PILOT\_REC to TD\_MODE<sub>r</sub>.
- 18                   ◇ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '001', the mobile station
- 19                   shall:
- 20                   – Set the AUX\_PILOT\_QOF field of PILOT\_REC to QOF<sub>r</sub>.
- 21                   – Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to
- 22                   AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length
- 23                   specified by WALSH\_LENGTH<sub>r</sub>.
- 24                   ◇ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '010', the mobile station
- 25                   shall:
- 26                   – Set the AUX\_PILOT\_TD\_QOF field of PILOT\_REC to QOF<sub>r</sub>.
- 27                   – Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to
- 28                   AUX\_WALSH<sub>r</sub> with the Walsh Code length specified by
- 29                   WALSH\_LENGTH<sub>r</sub>.
- 30                   – Set the AUX\_TD\_POWER\_LEVEL field of PILOT\_REC to
- 31                   AUX\_TD\_POWER\_LEVEL<sub>r</sub>.
- 32                   – Set the TD\_MODE field of PILOT\_REC to TD\_MODE<sub>r</sub>.
- 33                   ◇ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '011', the mobile station
- 34                   shall:
- 35                   – Set the SR3\_PRIMARY\_PILOT field of PILOT\_REC to
- 36                   SR3\_PRIMARY\_PILOT<sub>r</sub>.
- 37                   – Set the SR3\_PILOT\_POWER1 field of PILOT\_REC to
- 38                   SR3\_PILOT\_POWER1<sub>r</sub>.

- 1                                   – Set the SR3\_PILOT\_POWER2 field of PILOT\_REC to
- 2                                   SR3\_PILOT\_POWER2<sub>r</sub>.
- 3                   ◇ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '100', the mobile station
- 4                   shall:
- 5                                   – Set the SR3\_PRIMARY\_PILOT field of PILOT\_REC to
- 6                                   SR3\_PRIMARY\_PILOT<sub>r</sub>.
- 7                                   – Set the SR3\_PILOT\_POWER1 field of PILOT\_REC to
- 8                                   SR3\_PILOT\_POWER1<sub>r</sub>.
- 9                                   – Set the SR3\_PILOT\_POWER2 field of PILOT\_REC to
- 10                                  SR3\_PILOT\_POWER2<sub>r</sub>.
- 11                                  – Set the AUX\_PILOT\_QOF field of PILOT\_REC to QOF<sub>r</sub>.
- 12                                  – Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to
- 13                                  AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length
- 14                                  specified by WALSH\_LENGTH<sub>r</sub>.
- 15                                  – If ADD\_INFO\_INCL1<sub>r</sub> is equal to '1', set the
- 16                                  AUX\_PILOT\_QOF1 field of PILOT\_REC to QOF1<sub>r</sub> and set
- 17                                  the AUX\_PILOT\_WALSH\_CODE1 field of PILOT\_REC to
- 18                                  AUX\_PILOT\_WALSH1<sub>r</sub> with the Walsh Code length
- 19                                  specified by WALSH\_LENGTH1<sub>r</sub>; otherwise, set the
- 20                                  AUX\_PILOT\_QOF1 field of PILOT\_REC to QOF<sub>r</sub> and set
- 21                                  the AUX\_PILOT\_WALSH\_CODE1 field of PILOT\_REC to
- 22                                  AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length
- 23                                  specified by WALSH\_LENGTH<sub>r</sub>.
- 24                                  – If ADD\_INFO\_INCL2<sub>r</sub> is equal to '1', set the
- 25                                  AUX\_PILOT\_QOF2 field of PILOT\_REC to QOF2<sub>r</sub> and set
- 26                                  the AUX\_PILOT\_WALSH\_CODE2 field of PILOT\_REC to
- 27                                  AUX\_PILOT\_WALSH2<sub>r</sub> with the Walsh Code length
- 28                                  specified by WALSH\_LENGTH2<sub>r</sub>; otherwise, set the
- 29                                  AUX\_PILOT\_QOF2 field of PILOT\_REC to QOF<sub>r</sub> and set
- 30                                  the AUX\_PILOT\_WALSH\_CODE2 field of PILOT\_REC to
- 31                                  AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length
- 32                                  specified by WALSH\_LENGTH<sub>r</sub>.
- 33                   o Store PWR\_COMB\_IND, CODE\_CHAN\_DCCH and
- 34                   QOF\_MASK\_ID\_DCCH.
- 35                   o If SCH\_INCL<sub>r</sub> is equal to '1' and NUM\_SCH is equal to '00000',
- 36                   the mobile station shall delete the corresponding pilot from all
- 37                   entries of the corresponding Supplemental Channel.
- 38                   o If SCH\_INCL<sub>r</sub> is equal to '1' and NUM\_SCH is not equal to
- 39                   '00000', the mobile station shall:

- 1                   ◇ If PILOT\_INCL is equal to '0', then the mobile station shall  
2 delete the corresponding pilot from the Active Set of  
3 Supplemental Channel for the corresponding SCCL\_INDEX<sub>R</sub>.
- 4                   ◇ If PILOT\_INCL is equal to '1', then for each Supplemental  
5 Channel included in this record, the mobile station shall set  
6 PILOT\_PN<sub>S</sub> [FOR\_SCH\_ID<sub>R</sub>][SCCL\_INDEX<sub>S</sub>][i] to PILOT\_PN<sub>R</sub>,  
7 QOF\_ID<sub>S</sub>[FOR\_SCH\_ID<sub>R</sub>][SCCL\_INDEX<sub>S</sub>][i] to  
8 QOF\_MASK\_ID\_SCH<sub>R</sub>, and FOR\_SCH\_CC\_INDEX<sub>S</sub>  
9 [FOR\_SCH\_ID<sub>S</sub>][SCCL\_INDEX<sub>S</sub>][i] to CODE\_CHAN\_SCH<sub>R</sub>.
- 10                  ◇ If PILOT\_INCL is equal to '1' and CCSH\_INCLUDED is set to  
11 '1', then for each Supplemental Channel included in this  
12 record, the mobile station shall set  
13 CCSH\_ENCODER\_TYPE<sub>S</sub>[FOR\_SCH\_ID<sub>R</sub>][SCCL\_INDEX<sub>R</sub>][i] to  
14 CCSH\_ENCODER\_TYPE<sub>R</sub>.
- 15                  ◇ If PILOT\_INCL is equal to '1' and CCSH\_INCLUDED is set to  
16 '0', then for each Supplemental Channel included in this  
17 record, the mobile station shall set  
18 CCSH\_ENCODER\_TYPE<sub>S</sub>[FOR\_SCH\_ID<sub>R</sub>][SCCL\_INDEX<sub>R</sub>][i] to  
19 '0' (default Turbo Encoder type).
- 20                  ◇ The mobile station shall delete all pilots that are not included  
21 in the list specified by the NUM\_PILOTS field from the Active  
22 Set of Supplemental Channel for the corresponding  
23 SCCL\_INDEX<sub>R</sub>.
- 24                  + If CCSH\_INCLUDED is equal to '1', the mobile station shall perform  
25 the following:
- 26                   o If CCSH\_ENCODER\_ACTION\_TIME<sub>R</sub> is received, then the mobile  
27 station shall set CCSH\_ENCODER\_ACTION\_TIME<sub>S</sub> to  
28 CCSH\_ENCODER\_ACTION\_TIME<sub>R</sub>, and the mobile station shall  
29 apply each CCSH\_ENCODER\_TYPE<sub>S</sub> at the time specified by  
30 CCSH\_ENCODER\_ACTION\_TIME<sub>R</sub>.
- 31                   o If CCSH\_ENCODER\_ACTION\_TIME<sub>R</sub> is not received, the mobile  
32 station shall apply each CCSH\_ENCODER\_TYPE<sub>S</sub> at the action  
33 time of the message.
- 34                  + If 3X\_DCCH\_INFO\_INCL<sub>R</sub> equals '1', for each included member of the  
35 Active Set, the mobile station store the following:
- 36                   o If 3X\_DCCH\_LOW\_INCL<sub>R</sub> equals '1', set the  
37 QOF\_MASK\_ID\_DCCH\_LOW field to QOF\_MASK\_ID\_DCCH\_LOW<sub>R</sub>  
38 and the CODE\_CHAN\_DCCH\_LOW field to  
39 CODE\_CHAN\_DCCH\_LOW<sub>R</sub>. Otherwise, set the  
40 QOF\_MASK\_ID\_DCCH\_LOW field to QOF\_MASK\_ID\_FCH<sub>R</sub> and  
41 the CODE\_CHAN\_DCCH\_LOW to CODE\_CHAN\_FCH<sub>R</sub>.

- 1                   o If  $3X\_DCCH\_HIGH\_INCL_R$  equals '1', set the
- 2                   QOF\_MASK\_ID\_DCCH\_HIGH field to
- 3                   QOF\_MASK\_ID\_DCCH\_HIGH<sub>R</sub> and the
- 4                   CODE\_CHAN\_DCCH\_HIGH field to CODE\_CHAN\_DCCH\_HIGH<sub>R</sub>.
- 5                   Otherwise, set the QOF\_MASK\_ID\_DCCH\_HIGH field to
- 6                   QOF\_MASK\_ID\_FCH<sub>R</sub> and the CODE\_CHAN\_DCCH\_HIGH to
- 7                   CODE\_CHAN\_FCH<sub>R</sub>.
- 8                   o If  $3X\_SCH\_INFO\_INCL_R$  equals '1', for each Supplemental
- 9                   Channel included, the mobile station store the following:
- 10                  ◇ If  $3X\_SCH\_LOW\_INCL_R$  equals '1', set
- 11                  QOF\_ID\_SCH\_LOW[FOR\_SCH\_ID<sub>R</sub>][SCCL\_INDEX<sub>R</sub>][i] to
- 12                  QOF\_MASK\_ID\_SCH\_LOW<sub>R</sub> and
- 13                  FOR\_SCH\_CC\_INDEX\_LOW[FOR\_SCH\_ID<sub>R</sub>][SCCL\_INDEX<sub>R</sub>][i]
- 14                  field to CODE\_CHAN\_SCH\_LOW<sub>R</sub>. Otherwise, set
- 15                  QOF\_ID\_SCH\_LOW[FOR\_SCH\_ID<sub>R</sub>][SCCL\_INDEX<sub>R</sub>][i] to
- 16                  QOF\_MASK\_ID\_SCH<sub>R</sub>, and
- 17                  FOR\_SCH\_CC\_INDEX\_LOW[FOR\_SCH\_ID<sub>R</sub>][SCCL\_INDEX<sub>R</sub>][i]
- 18                  to CODE\_CHAN\_SCH<sub>R</sub>.
- 19                  ◇ If  $3X\_SCH\_HIGH\_INCL_R$  equals '1', set
- 20                  QOF\_ID\_SCH\_HIGH[FOR\_SCH\_ID<sub>R</sub>][SCCL\_INDEX<sub>R</sub>][i] to
- 21                  QOF\_MASK\_ID\_SCH\_HIGH<sub>R</sub> and the
- 22                  FOR\_SCH\_CC\_INDEX\_HIGH[FOR\_SCH\_ID<sub>R</sub>][SCCL\_INDEX<sub>R</sub>][i]
- 23                  field to CODE\_CHAN\_SCH\_HIGH<sub>R</sub>. Otherwise, set
- 24                  QOF\_ID\_SCH\_HIGH[FOR\_SCH\_ID<sub>R</sub>][SCCL\_INDEX<sub>R</sub>][i] to
- 25                  QOF\_MASK\_ID\_SCH<sub>R</sub>, and
- 26                  FOR\_SCH\_CC\_INDEX\_HIGH[FOR\_SCH\_ID<sub>R</sub>][SCCL\_INDEX<sub>R</sub>][i]
- 27                  to CODE\_CHAN\_SCH<sub>R</sub>.
- 28                  + The mobile station shall set FUNDICATED\_BCMC\_IND<sub>S</sub> to
- 29                  FUNDICATED\_BCMC\_IND<sub>R</sub>.
- 30                  + If FUNDICATED\_BCMC\_IND<sub>R</sub> equals '1', for each included member of
- 31                  the Active Set, the mobile station shall store the following:
- 32                  o Set FOR\_CPCCH\_WALSH<sub>S</sub> to FOR\_CPCCH\_WALSH<sub>R</sub>.
- 33                  o Set FOR\_CPCSCH<sub>S</sub> to FOR\_CPCSCH<sub>R</sub>.
- 34                  + The mobile station shall delete all pilots that are not listed in the
- 35                  NUM\_PILOTS field from the Active Set.
- 36                  + The mobile station shall delete all pilots that are not listed in the
- 37                  Active Set from the Active Set of the Supplemental Channel for the
- 38                  Forward Supplemental Channel Assignment (if any). If these deleted
- 39                  pilots include all pilots in the Active Set of the Supplemental
- 40                  Channel, the mobile station shall cancel the Forward Supplemental
- 41                  Channel Assignment.

- 1           - If CH\_IND<sub>r</sub> is equal to '111', the mobile station shall perform the
- 2           following:
- 3           + The mobile station shall set CH\_IND<sub>s</sub> = '11'.
- 4           + If SCH\_INCL<sub>r</sub> is equal to '1' and NUM\_FOR\_SCH is not equal to
- 5           '00000', for all the NUM\_FOR\_SCH occurrences, the mobile station
- 6           shall perform the following:
- 7           o The mobile station shall determine,
- 8           N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], the number
- 9           of information bits per Forward Supplemental Channel frame
- 10          identified by FOR\_SCH\_ID and corresponding to the index
- 11          SCCL\_INDEX according to the following rules:
- 12          ◇ If FSCH\_VAR\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is equal to '000',
- 13          then:
- 14           - If USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '0' or if
- 15           USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '1' and
- 16           FSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is equal to '0000',
- 17           then the mobile station shall set the number of
- 18           information bits per frame,
- 19           N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>] and
- 20           number of CRC bits per frame,
- 21           FSCH\_CRC\_LEN\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>],
- 22           according to Table 3.7.3.3.2.37-2 using
- 23           FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub> as the index to the table.
- 24           - If USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '1' and
- 25           FSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is not equal to
- 26           '0000', then the mobile station shall set the number of
- 27           CRC bits per frame,
- 28           FSCH\_CRC\_LEN\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>],
- 29           using Table 3.7.5.20-1 and
- 30           CRC\_LEN\_IDX<sub>s</sub>[FSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>]][F
- 31           OR\_SCH\_NUM\_BITS\_IDX<sub>r</sub>] as the index to the table.
- 32           The mobile station shall also set the number of
- 33           information bits per frame corresponding to
- 34           SCCL\_INDEX<sub>r</sub>,
- 35           N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], to
- 36           NUM\_BITS<sub>s</sub>[FSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>]][F
- 37           OR\_SCH\_NUM\_BITS\_IDX<sub>r</sub>].
- 38          ◇ If FSCH\_VAR\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is not equal to
- 39          '000', then:

- 1                   - The mobile station shall set
- 2                     $N\_FSCH\_BITS\_IDX\_SET_S[FOR\_SCH\_ID_R]$ , the set of
- 3                    indices to the number of information bits per frame as
- 4                    follows:
- 5                    + If  $FOR\_SCH\_NUM\_BITS\_IDX_R$  is equal to '0000', then
- 6                     $N\_FSCH\_BITS\_IDX\_SET_S[FOR\_SCH\_ID_R] = \{$
- 7                     $FOR\_SCH\_NUM\_BITS\_IDX_R \}$ ,
- 8                    + otherwise the mobile station shall set (initialize)
- 9                     $N\_FSCH\_BITS\_IDX\_SET_S[FOR\_SCH\_ID_R] =$
- 10                     $\{FOR\_SCH\_NUM\_BITS\_IDX_R\}$  and for  $i=1, \dots,$
- 11                     $FOR\_SCH\_NUM\_BITS\_IDX_R$  the mobile station shall
- 12                    add  $FOR\_SCH\_NUM\_BITS\_IDX_R -$
- 13                     $VAR\_FSCH\_RATE\_OFFSET_S[FOR\_SCH\_ID_R][FOR\_SCH$
- 14                     $\_NUM\_BITS\_IDX_R][i]$  to the set specified by
- 15                     $N\_FSCH\_BITS\_IDX\_SET_S[FOR\_SCH\_ID_R]$
- 16                   - If  $USE\_FLEX\_NUM\_BITS_S$  is equal to '0' or if
- 17                     $USE\_FLEX\_NUM\_BITS_S$  is equal to '1' and
- 18                     $FSCH\_NBIT\_TABLE\_ID_S[FOR\_SCH\_ID_R]$  is equal to '0000',
- 19                    then the mobile station shall set
- 20                     $N\_FSCH\_BITS\_SET_S[FOR\_SCH\_ID_R][SCCL\_INDEX_R]$ , the
- 21                    set of number of information bits per frame as follows.
- 22                    The  $i^{th}$  member of the set
- 23                     $N\_FSCH\_BITS\_SET_S[FOR\_SCH\_ID_R][SCCL\_INDEX_R]$  is
- 24                    obtained using Table 3.7.3.3.2.37-2 and the  $i^{th}$  member of
- 25                    the set  $N\_FSCH\_BITS\_IDX\_SET_S[FOR\_SCH\_ID_R]$  as the
- 26                    index to the table.
- 27                   - If  $USE\_FLEX\_NUM\_BITS_S$  is equal to '1' and
- 28                     $FSCH\_NBIT\_TABLE\_ID_S[FOR\_SCH\_ID_R]$  is not equal to
- 29                    '0000', then
- 30                    + the mobile station shall set
- 31                     $N\_FSCH\_BITS\_SET_S[FOR\_SCH\_ID_R][SCCL\_INDEX_R]$ ,
- 32                    the set of number of information bits per frame as
- 33                    follows.
- 34                    The  $i^{th}$  member of the set
- 35                     $N\_FSCH\_BITS\_SET_S[FOR\_SCH\_ID_R][SCCL\_INDEX_R]$  is
- 36                    equal to
- 37                     $NUM\_BITS_S[FSCH\_NBIT\_TABLE\_ID_S[FOR\_SCH\_ID_R]]$
- 38                     $[N\_FSCH\_BITS\_IDX\_SET_S[FOR\_SCH\_ID_R][i]]$ , where
- 39                     $N\_FSCH\_BITS\_IDX\_SET_S[FOR\_SCH\_ID_R][i]$  denotes the
- 40                     $i^{th}$  member of the set
- 41                     $N\_FSCH\_BITS\_IDX\_SET_S[FOR\_SCH\_ID_R]$  and,

- 1 + the mobile station shall set  
2 FSCH\_CRC\_LEN\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>],  
3 the set of number CRC bits per frame as follows.  
4 The  $i^{\text{th}}$  member of the set  
5 FSCH\_CRC\_LEN\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>]  
6 using Table 3.7.5.20-1 and  
7 CRC\_LEN\_IDX<sub>s</sub>[FSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID  
8 <sub>r</sub>]][N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][i]] as the  
9 index to the table, where  
10 N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][i] denotes the  
11  $i^{\text{th}}$  member of the set  
12 N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>].
  - 13 + If SCH\_INCL<sub>r</sub> is equal to '1' and NUM\_REV\_SCH is not equal to  
14 '00000', for all the NUM\_REV\_SCH occurrences, the mobile station  
15 shall perform the following:  
16 o Set REV\_SCH\_NUM\_BITS\_IDX<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] to  
17 REV\_SCH\_NUM\_BITS\_IDX<sub>r</sub>.  
18 o Set REV\_WALSH\_ID<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>][REV\_SCH\_NUM\_BITS\_IDX<sub>s</sub>]  
19 to REV\_WALSH\_ID<sub>r</sub>.
  - 20 + For each member in the Active Set included in the message, the  
21 mobile station shall perform the followings:  
22 o Set PILOT\_PN to PILOT\_PN<sub>r</sub>.  
23 o If SRCH\_OFFSET\_INCL<sub>r</sub> equals '1', set the SRCH\_OFFSET field of  
24 PILOT\_REC to SRCH\_OFFSET<sub>r</sub>; otherwise, set the  
25 SRCH\_OFFSET field of PILOT\_REC to '000'.  
26 o Set ADD\_PILOT\_REC\_INCL to ADD\_PILOT\_REC\_INCL<sub>r</sub>.  
27 o If ADD\_PILOT\_REC\_INCL<sub>r</sub> equals '1', the mobile station shall also  
28 perform the following:  
29 o Set the PILOT\_REC\_TYPE field of PILOT\_REC to  
30 PILOT\_REC\_TYPE<sub>r</sub>.  
31 o If PILOT\_REC\_TYPE<sub>r</sub> is equal to '000', the mobile station shall  
32 set the TD\_POWER\_LEVEL field of PILOT\_REC to  
33 TD\_POWER\_LEVEL<sub>r</sub> and set the TD\_MODE field of  
34 PILOT\_REC to TD\_MODE<sub>r</sub>.  
35 o If PILOT\_REC\_TYPE<sub>r</sub> is equal to '001', the mobile station  
36 shall:  
37 o Set the AUX\_PILOT\_QOF field of PILOT\_REC to QOF<sub>r</sub>.  
38 o Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to  
39 AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length  
40 specified by WALSH\_LENGTH<sub>r</sub>.

- 1                   ◇ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '010', the mobile station  
2 shall:
- 3                   – Set the AUX\_PILOT\_TD\_QOF field of PILOT\_REC to QOF<sub>r</sub>.
- 4                   – Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to  
5 AUX\_WALSH<sub>r</sub> with the Walsh Code length specified by  
6 WALSH\_LENGTH<sub>r</sub>.
- 7                   – Set the AUX\_TD\_POWER\_LEVEL field of PILOT\_REC to  
8 AUX\_TD\_POWER\_LEVEL<sub>r</sub>.
- 9                   – Set the TD\_MODE field of PILOT\_REC to TD\_MODE<sub>r</sub>.
- 10                  ◇ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '011', the mobile station  
11 shall:
- 12                  – Set the SR3\_PRIMARY\_PILOT field of PILOT\_REC to  
13 SR3\_PRIMARY\_PILOT<sub>r</sub>.
- 14                  – Set the SR3\_PILOT\_POWER1 field of PILOT\_REC to  
15 SR3\_PILOT\_POWER1<sub>r</sub>.
- 16                  – Set the SR3\_PILOT\_POWER2 field of PILOT\_REC to  
17 SR3\_PILOT\_POWER2<sub>r</sub>.
- 18                  ◇ If PILOT\_REC\_TYPE<sub>r</sub> is equal to '100', the mobile station  
19 shall:
- 20                  – Set the SR3\_PRIMARY\_PILOT field of PILOT\_REC to  
21 SR3\_PRIMARY\_PILOT<sub>r</sub>.
- 22                  – Set the SR3\_PILOT\_POWER1 field of PILOT\_REC to  
23 SR3\_PILOT\_POWER1<sub>r</sub>.
- 24                  – Set the SR3\_PILOT\_POWER2 field of PILOT\_REC to  
25 SR3\_PILOT\_POWER2<sub>r</sub>.
- 26                  – Set the AUX\_PILOT\_QOF field of PILOT\_REC to QOF<sub>r</sub>.
- 27                  – Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to  
28 AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length  
29 specified by WALSH\_LENGTH<sub>r</sub>.
- 30                  – If ADD\_INFO\_INCL1<sub>r</sub> is equal to '1', set the  
31 AUX\_PILOT\_QOF1 field of PILOT\_REC to QOF1<sub>r</sub> and set  
32 the AUX\_PILOT\_WALSH\_CODE1 field of PILOT\_REC to  
33 AUX\_PILOT\_WALSH1<sub>r</sub> with the Walsh Code length  
34 specified by WALSH\_LENGTH1<sub>r</sub>; otherwise, set the  
35 AUX\_PILOT\_QOF1 field of PILOT\_REC to QOF<sub>r</sub> and set  
36 the AUX\_PILOT\_WALSH\_CODE1 field of PILOT\_REC to  
37 AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length  
38 specified by WALSH\_LENGTH<sub>r</sub>.

- If ADD\_INFO\_INCL2<sub>r</sub> is equal to '1', set the AUX\_PILOT\_QOF2 field of PILOT\_REC to QOF2<sub>r</sub> and set the AUX\_PILOT\_WALSH\_CODE2 field of PILOT\_REC to AUX\_PILOT\_WALSH2<sub>r</sub> with the Walsh Code length specified by WALSH\_LENGTH2<sub>r</sub>; otherwise, set the AUX\_PILOT\_QOF2 field of PILOT\_REC to QOF<sub>r</sub> and set the AUX\_PILOT\_WALSH\_CODE2 field of PILOT\_REC to AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by WALSH\_LENGTH<sub>r</sub>.
  - o Store PWR\_COMB\_IND, CODE\_CHAN\_FCH, QOF\_MASK\_ID\_FCH, CODE\_CHAN\_DCCH and QOF\_MASK\_ID\_DCCH.
  - o If SCH\_INCL<sub>r</sub> is equal to '1' and NUM\_SCH is equal to '00000', the mobile station shall delete the corresponding pilot from all entries of the corresponding Supplemental Channel.
  - o If SCH\_INCL<sub>r</sub> is equal to '1' and NUM\_SCH is not equal to '00000', the mobile station shall:
    - ◊ If PILOT\_INCL is equal to '0', then the mobile station shall delete the corresponding pilot from the Active Set of Supplemental Channel for the corresponding SCCL\_INDEX<sub>r</sub>.
    - ◊ If PILOT\_INCL is equal to '1', then for each Supplemental Channel included in this record, the mobile station shall set PILOT\_PN<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i] to PILOT\_PN<sub>r</sub>, QOF\_IDS[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i] to QOF\_MASK\_ID\_SCH<sub>r</sub>, and FOR\_SCH\_CC\_INDEX<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i] to CODE\_CHAN\_SCH<sub>r</sub>.
    - ◊ If PILOT\_INCL is equal to '1' and CASH\_INCLUDED is set to '1', then for each Supplemental Channel included in this record, the mobile station shall set CASH\_ENCODER\_TYPE<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i] to CASH\_ENCODER\_TYPE<sub>r</sub>.
    - ◊ If PILOT\_INCL is equal to '1' and CASH\_INCLUDED is set to '0', then for each Supplemental Channel included in this record, the mobile station shall set CASH\_ENCODER\_TYPE<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i] to '0' (default Turbo Encoder type).
    - ◊ The mobile station shall delete all pilots that are not included in the list specified by the NUM\_PILOTS field from the Active Set of Supplemental Channel for the corresponding SCCL\_INDEX<sub>r</sub>.
  - + If CASH\_INCLUDED is equal to '1', the mobile station shall perform the following:

- 1                   o If `CCSH_ENCODER_ACTION_TIMEr` is received, then the mobile  
2                   station shall set `CCSH_ENCODER_ACTION_TIMEs` to  
3                   `CCSH_ENCODER_ACTION_TIMEr`, and the mobile station shall  
4                   apply each `CCSH_ENCODER_TYPEs` at the time specified by  
5                   `CCSH_ENCODER_ACTION_TIMEr`.
- 6                   o If `CCSH_ENCODER_ACTION_TIMEr` is not received, the mobile  
7                   station shall apply each `CCSH_ENCODER_TYPEs` at the action  
8                   time of the message.
- 9                   + If `3X_FCH_INFO_INCLr` equals '1', for each included member of the  
10                  Active Set, the mobile station store the following:
  - 11               o If `3X_FCH_LOW_INCLr` equals '1', set the  
12               `QOF_MASK_ID_FCH_LOW` field to `QOF_MASK_ID_FCH_LOWr`  
13               and the `CODE_CHAN_FCH_LOW` field to  
14               `CODE_CHAN_FCH_LOWr`. Otherwise, set the  
15               `QOF_MASK_ID_FCH_LOW` field to `QOF_MASK_ID_FCHr` and the  
16               `CODE_CHAN_FCH_LOW` to `CODE_CHAN_FCHr`.
  - 17               o If `3X_FCH_HIGH_INCLr` equals '1', set the  
18               `QOF_MASK_ID_FCH_HIGH` field to `QOF_MASK_ID_FCH_HIGHr`  
19               and the `CODE_CHAN_FCH_HIGH` field to  
20               `CODE_CHAN_FCH_HIGHr`. Otherwise, set the  
21               `QOF_MASK_ID_FCH_HIGH` field to `QOF_MASK_ID_FCHr` and the  
22               `CODE_CHAN_FCH_HIGH` to `CODE_CHAN_FCHr`.
- 23                  + If `3X_DCCH_INFO_INCLr` equals '1', for each included member of the  
24                  Active Set, the mobile station store the following:
  - 25               o If `3X_DCCH_LOW_INCLr` equals '1', set the  
26               `QOF_MASK_ID_DCCH_LOW` field to `QOF_MASK_ID_DCCH_LOWr`  
27               and the `CODE_CHAN_DCCH_LOW` field to  
28               `CODE_CHAN_DCCH_LOWr`. Otherwise, set the  
29               `QOF_MASK_ID_DCCH_LOW` field to `QOF_MASK_ID_FCHr` and  
30               the `CODE_CHAN_DCCH_LOW` to `CODE_CHAN_FCHr`.
  - 31               o If `3X_DCCH_HIGH_INCLr` equals '1', set the  
32               `QOF_MASK_ID_DCCH_HIGH` field to  
33               `QOF_MASK_ID_DCCH_HIGHr` and the  
34               `CODE_CHAN_DCCH_HIGH` field to `CODE_CHAN_DCCH_HIGHr`.  
35               Otherwise, set the `QOF_MASK_ID_DCCH_HIGH` field to  
36               `QOF_MASK_ID_FCHr` and the `CODE_CHAN_DCCH_HIGH` to  
37               `CODE_CHAN_FCHr`.
- 38                  + If `3X_FCH_INFO_INCLr` or `3X_DCCH_INFO_INCLr` equals '1', for each  
39                  included member of the Active Set, the mobile station store the  
40                  following:
  - 41               o If `3X_SCH_INFO_INCLr` equals '1', for each Supplemental  
42               Channel included, the mobile station store the following:

- 1                   ◇ If 3X\_SCH\_LOW\_INCL<sub>r</sub> equals '1', set  
2                   QOF\_ID\_SCH\_LOW[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i] to  
3                   QOF\_MASK\_ID\_SCH\_LOW<sub>r</sub> and the  
4                   FOR\_SCH\_CC\_INDEX\_LOW[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i]  
5                   field to CODE\_CHAN\_SCH\_LOW<sub>r</sub>. Otherwise, set  
6                   QOF\_ID\_SCH\_LOW[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i] to  
7                   QOF\_MASK\_ID\_SCH<sub>r</sub>, and  
8                   FOR\_SCH\_CC\_INDEX\_LOW[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i]  
9                   to CODE\_CHAN\_SCH<sub>r</sub>.
- 10                  ◇ If 3X\_SCH\_HIGH\_INCL<sub>r</sub> equals '1', set  
11                  QOF\_ID\_SCH\_HIGH[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i] to  
12                  QOF\_MASK\_ID\_SCH\_HIGH<sub>r</sub> and the  
13                  FOR\_SCH\_CC\_INDEX\_HIGH[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i]  
14                  field to CODE\_CHAN\_SCH\_HIGH<sub>r</sub>. Otherwise, set  
15                  QOF\_ID\_SCH\_HIGH[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i] to  
16                  QOF\_MASK\_ID\_SCH<sub>r</sub>, and  
17                  FOR\_SCH\_CC\_INDEX\_HIGH[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i]  
18                  to CODE\_CHAN\_SCH<sub>r</sub>.
- 19                  + The mobile station shall set FUNDICATED\_BCNC\_IND<sub>s</sub> to  
20                  FUNDICATED\_BCNC\_IND<sub>r</sub>.
- 21                  + If FUNDICATED\_BCNC\_IND<sub>r</sub> equals '1', the mobile station shall  
22                  store the following:
- 23                   o Set REV\_FCH\_ASSIGNED<sub>s</sub> to REV\_FCH\_ASSIGNED<sub>r</sub>.
- 24                  + If FUNDICATED\_BCNC\_IND<sub>r</sub> equals '1', the mobile station shall set  
25                  FCH\_BCNC\_IND to '1'; otherwise, the mobile station shall set  
26                  FCH\_BCNC\_IND to '0'.
- 27                  + If FUNDICATED\_BCNC\_IND<sub>r</sub> equals '1' and FOR\_CPCCH\_INFO\_INCL<sub>r</sub>  
28                  is included and is set to '1', for each included member of the Active  
29                  Set, the mobile station shall store the following:
- 30                   o Set FOR\_CPCCH\_WALSH<sub>s</sub> to FOR\_CPCCH\_WALSH<sub>r</sub>.
- 31                   o Set FOR\_CPCSCH<sub>s</sub> to FOR\_CPCSCH<sub>r</sub>.
- 32                  + If FUNDICATED\_BCNC\_IND<sub>r</sub> equals '1' and  
33                  ADD\_PLCM\_FOR\_FCH\_INCL<sub>r</sub> is included and is set to '1', the mobile  
34                  station shall store the following:
- 35                   o Set ADD\_PLCM\_FOR\_FCH\_TYPE<sub>s</sub> to  
36                   ADD\_PLCM\_FOR\_FCH\_TYPE<sub>r</sub>.
- 37                   o Set ADD\_PLCM\_FOR\_FCH\_39<sub>s</sub> to ADD\_PLCM\_FOR\_FCH\_39<sub>r</sub> if  
38                   ADD\_PLCM\_FOR\_FCH\_TYPE<sub>r</sub> is equal to '1'.
- 39                  + The mobile station shall delete all pilots that are not listed in the  
40                  NUM\_PILOTS field from the Active Set.

- 1                   + The mobile station shall delete all pilots that are not listed in the
- 2                   Active Set from the Active Set of the Supplemental Channel for the
- 3                   Forward Supplemental Channel Assignment (if any). If these deleted
- 4                   pilots include all pilots in the Active Set of the Supplemental
- 5                   Channel, the mobile station shall cancel the Forward Supplemental
- 6                   Channel Assignment.
- 7                   - If CH\_IND<sub>r</sub> is equal to '000', the mobile station shall perform the
- 8                   following:
- 9                   + If this message assigns a Forward Packet Data Channel or Reverse
- 10                  Packet Data Channel which was not assigned prior to the action time
- 11                  of this message, Layer 3 shall send SIG-HandoffPDCH.Indication
- 12                  (handoff\_type = HANDOFF) to the MAC layer; otherwise, Layer 3
- 13                  shall send SIG-HandoffPDCH.Indication (handoff\_type = ASSIGN) to
- 14                  the MAC layer.
- 15                  + If the message includes a Reverse Packet Data Channel assignment,
- 16                  the mobile station shall cancel the Reverse Supplemental Channel
- 17                  assignment, if any, at the action time of the message.
- 18                  + The mobile station shall set CH\_IND<sub>s</sub> to '000'.
- 19                  + The mobile station shall set EXT\_CH\_IND<sub>s</sub> to EXT\_CH\_IND<sub>r</sub>.
- 20                  + If PDCH\_CONTROL\_HOLD<sub>r</sub> is equal to '0' and
- 21                  PILOT\_GATING\_USE\_RATE is equal to '1', the mobile station shall
- 22                  set PILOT\_GATING\_USE\_RATE to '0' and shall start the continuous
- 23                  reverse pilot at the specified action time of the message and, if a F-
- 24                  PDCH is assigned, the mobile station shall start the continuous R-
- 25                  CQICH as defined in [3].
- 26                  + If PDCH\_CONTROL\_HOLD<sub>r</sub> is equal to '1', the mobile station may
- 27                  perform the following:
- 28                   o Set PILOT\_GATING\_USE\_RATE equal to '1' and start the reverse
- 29                   pilot gating and Reverse CQI Channel gating at
- 30                   PILOT\_GATING\_RATE<sub>s</sub> at the action time of the message.
- 31                   o The mobile station shall cancel the forward and reverse
- 32                   supplemental channel assignment, if any.
- 33                  + The mobile station shall set FULL\_CI\_FEEDBACK\_IND<sub>s</sub> to
- 34                  FULL\_CI\_FEEDBACK\_IND<sub>r</sub>.

- 1                   + If EXT\_CH\_IND<sub>r</sub> equals '01000', the mobile station shall set  
2                   FOR\_CPCCH\_RATE<sub>s</sub> to FOR\_CPCCH\_RATE<sub>r</sub>, and  
3                   FOR\_CPCCH\_UPDATE\_RATE<sub>s</sub> to FOR\_CPCCH\_UPDATE\_RATE<sub>r</sub>;  
4                   otherwise, the mobile station shall set FOR\_CPCCH\_RATE<sub>s</sub> to '00',  
5                   and FOR\_CPCCH\_UPDATE\_RATE<sub>s</sub> to '00'.
- 6                   + The mobile station shall set REV\_CQICH\_FRAME\_OFFSET<sub>s</sub> to  
7                   REV\_CQICH\_FRAME\_OFFSET<sub>r</sub>.
- 8                   + The mobile station shall set REV\_CQICH\_REPS<sub>s</sub> to  
9                   REV\_CQICH\_REPS<sub>r</sub>.
- 10                  + The mobile station shall set REV\_ACKCH\_REPS<sub>s</sub> to  
11                  REV\_ACKCH\_REPS<sub>r</sub>.
- 12                  + If SCH\_INCL<sub>r</sub> is equal to '1', and EXT\_CH\_IND<sub>r</sub> signals the allocation  
13                  of a F-FCH or a F-DCCH, and NUM\_FOR\_SCH is not equal to  
14                  '00000', for all the NUM\_FOR\_SCH occurrences, the mobile station  
15                  shall perform the following:
- 16                  o The mobile station shall determine,  
17                  N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], the number  
18                  of information bits per Forward Supplemental Channel frame  
19                  identified by FOR\_SCH\_ID and corresponding to the index  
20                  SCCL\_INDEX according to the following rules:
- 21                  ◇ If FSCH\_VAR\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is equal to '000',  
22                  then:
- 23                  - If USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '0' or if  
24                  USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '1' and  
25                  FSCH\_NBIT\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is equal to '0000',  
26                  then the mobile station shall set the number of  
27                  information bits per frame,  
28                  N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>] and  
29                  number of CRC bits per frame,  
30                  FSCH\_CRC\_LEN\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>],  
31                  according to Table 3.7.3.3.2.37-2 using  
32                  FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub> as the index to the table.

- If USE\_FLEX\_NUM\_BITS<sub>S</sub> is equal to '1' and FSCH\_NBIT\_TABLE\_IDS[FOR\_SCH\_ID<sub>r</sub>] is not equal to '0000', then the mobile station shall set the number of CRC bits per frame, FSCH\_CRC\_LEN\_SET<sub>S</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], using Table 3.7.5.20-1 and CRC\_LEN\_IDX<sub>S</sub>[FSCH\_NBIT\_TABLE\_IDS[FOR\_SCH\_ID<sub>r</sub>]][FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub>] as the index to the table. The mobile station shall also set the number of information bits per frame corresponding to SCCL\_INDEX<sub>r</sub>, N\_FSCH\_BITS\_SET<sub>S</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], to NUM\_BITS<sub>S</sub>[FSCH\_NBIT\_TABLE\_IDS[FOR\_SCH\_ID<sub>r</sub>]][FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub>].
- ◇ If FSCH\_VAR\_TABLE\_IDS[FOR\_SCH\_ID<sub>r</sub>] is not equal to '000', then:
  - The mobile station shall set N\_FSCH\_BITS\_IDX\_SET<sub>S</sub>[FOR\_SCH\_ID<sub>r</sub>], the set of indices to the number of information bits per frame as follows:
    - + If FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub> is equal to '0000', then N\_FSCH\_BITS\_IDX\_SET<sub>S</sub>[FOR\_SCH\_ID<sub>r</sub>] = { FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub> },
    - + otherwise, the mobile station shall set (initialize) N\_FSCH\_BITS\_IDX\_SET<sub>S</sub>[FOR\_SCH\_ID<sub>r</sub>] = {FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub>} and for i=1, ..., FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub> the mobile station shall add FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub> - VAR\_FSCH\_RATE\_OFFSET<sub>S</sub>[FOR\_SCH\_ID<sub>r</sub>][FOR\_SCH\_NUM\_BITS\_IDX<sub>r</sub>][i] to the set specified by N\_FSCH\_BITS\_IDX\_SET<sub>S</sub>[FOR\_SCH\_ID<sub>r</sub>]
  - If USE\_FLEX\_NUM\_BITS<sub>S</sub> is equal to '0' or if USE\_FLEX\_NUM\_BITS<sub>S</sub> is equal to '1' and FSCH\_NBIT\_TABLE\_IDS[FOR\_SCH\_ID<sub>r</sub>] is equal to '0000', then the mobile station shall set N\_FSCH\_BITS\_SET<sub>S</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], the set of number of information bits per frame as follows. The *i*<sup>th</sup> member of the set N\_FSCH\_BITS\_SET<sub>S</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>] is obtained using Table 3.7.3.3.2.37-2 and the *i*<sup>th</sup> member of the set N\_FSCH\_BITS\_IDX\_SET<sub>S</sub>[FOR\_SCH\_ID<sub>r</sub>] as the index to the table.

- If USE\_FLEX\_NUM\_BITS<sub>s</sub> is equal to '1' and FSCH\_NBIT\_TABLE\_IDS[FOR\_SCH\_ID<sub>r</sub>] is not equal to '0000', then
        - + the mobile station shall set N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], the set of number of information bits per frame as follows.  
The  $i^{\text{th}}$  member of the set N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>] is equal to NUM\_BITS<sub>s</sub>[FSCH\_NBIT\_TABLE\_IDS[FOR\_SCH\_ID<sub>r</sub>]][N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][i]], where N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][i] denotes the  $i^{\text{th}}$  member of the set N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] and,
        - + the mobile station shall set FSCH\_CRC\_LEN\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], the set of number CRC bits per frame as follows.  
The  $i^{\text{th}}$  member of the set FSCH\_CRC\_LEN\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>] using Table 3.7.5.20-1 and CRC\_LEN\_IDX<sub>s</sub>[FSCH\_NBIT\_TABLE\_IDS[FOR\_SCH\_ID<sub>r</sub>]][N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][i]] as the index to the table, where N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][i] denotes the  $i^{\text{th}}$  member of the set N\_FSCH\_BITS\_IDX\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>].
    - + If SCH\_INCL<sub>r</sub> is equal to '1' and NUM\_REV\_SCH is not equal to '00000', for all the NUM\_REV\_SCH occurrences, the mobile station shall perform the following:
      - o Set REV\_SCH\_NUM\_BITS\_IDX<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] to REV\_SCH\_NUM\_BITS\_IDX<sub>r</sub>.
      - o Set REV\_WALSH\_IDS[REV\_SCH\_ID<sub>r</sub>][REV\_SCH\_NUM\_BITS\_IDX<sub>s</sub>] to REV\_WALSH\_ID<sub>r</sub>.
    - + If FOR\_PDCH\_RLGAIN\_INCL<sub>r</sub> is included and equal to '1', the mobile station shall set RLGAIN\_ACKCH\_PILOT<sub>s</sub> to RLGAIN\_ACKCH\_PILOT<sub>r</sub>, and RLGAIN\_CQICH\_PILOT<sub>s</sub> to RLGAIN\_CQICH\_PILOT<sub>r</sub>.
    - + If FOR\_PDCH\_PARMES\_INCL<sub>r</sub> is equal to '1', the mobile station shall set NUM\_SOFT\_SWITCHING\_FRAMES<sub>s</sub> to NUM\_SOFT\_SWITCHING\_FRAMES<sub>r</sub> + 1, and NUM\_SOFTER\_SWITCHING\_FRAMES<sub>s</sub> to NUM\_SOFTER\_SWITCHING\_FRAMES<sub>r</sub> + 1.

- 1                   + If CHM\_SWITCHING\_PARMs\_INCL<sub>r</sub> is included and equal to '1', the
- 2                   mobile station shall set NUM\_SOFT\_SWITCHING\_FRAMES\_CHM<sub>s</sub> to
- 3                   NUM\_SOFT\_SWITCHING\_FRAMES\_CHM<sub>r</sub> + 1, and
- 4                   NUM\_SOFT\_SWITCHING\_FRAMES\_CHM<sub>s</sub> to
- 5                   NUM\_SOFT\_SWITCHING\_FRAMES\_CHM<sub>r</sub> + 1.
- 6                   + If CHM\_SWITCHING\_PARMs\_INCL<sub>r</sub> is included and equal to '0', the
- 7                   mobile station shall set NUM\_SOFT\_SWITCHING\_FRAMES\_CHM<sub>s</sub> to
- 8                   NUM\_SOFT\_SWITCHING\_FRAMES<sub>r</sub> + 1, and
- 9                   NUM\_SOFT\_SWITCHING\_FRAMES\_CHM<sub>s</sub> to
- 10                  NUM\_SOFT\_SWITCHING\_FRAMES<sub>r</sub> + 1.
- 11                 + If FOR\_PDCH\_PARMs\_INCL<sub>r</sub> is equal to '1', the mobile station shall
- 12                 set NUM\_SOFT\_SWITCHING\_SLOTS<sub>s</sub> according to Table
- 13                 3.7.2.3.2.21-9 based on the value of
- 14                 NUM\_SOFT\_SWITCHING\_SLOTS<sub>r</sub>.
- 15                 + If FOR\_PDCH\_PARMs\_INCL<sub>r</sub> is equal to '1', the mobile station shall
- 16                 set NUM\_SOFT\_SWITCHING\_SLOTS<sub>s</sub> according to Table
- 17                 3.7.2.3.2.21-9 based on the value of
- 18                 NUM\_SOFT\_SWITCHING\_SLOTS<sub>r</sub>.
- 19                 + If CHM\_SWITCHING\_PARMs\_INCL<sub>r</sub> is included and equal to '1', the
- 20                 mobile station shall:
- 21                   o Set NUM\_SOFT\_SWITCHING\_SLOTS\_CHM<sub>s</sub> according to Table
- 22                   3.7.2.3.2.21-9 based on the value of
- 23                   NUM\_SOFT\_SWITCHING\_SLOTS\_CHM<sub>r</sub>.
- 24                   o Set NUM\_SOFT\_SWITCHING\_SLOTS\_CHM<sub>s</sub> according to Table
- 25                   3.7.2.3.2.21-9 based on the value of
- 26                   NUM\_SOFT\_SWITCHING\_SLOTS\_CHM<sub>r</sub>.
- 27                 + If CHM\_SWITCHING\_PARMs\_INCL<sub>r</sub> is included and equal to '0', the
- 28                 mobile station shall:
- 29                   o Set NUM\_SOFT\_SWITCHING\_SLOTS\_CHM<sub>s</sub> according to Table
- 30                   3.7.2.3.2.21-9 based on the value of
- 31                   NUM\_SOFT\_SWITCHING\_SLOTS<sub>r</sub>.
- 32                   o Set NUM\_SOFT\_SWITCHING\_SLOTS\_CHM<sub>s</sub> according to Table
- 33                   3.7.2.3.2.21-9 based on the value of
- 34                   NUM\_SOFT\_SWITCHING\_SLOTS<sub>r</sub>.
- 35                 + If FOR\_PDCH\_PARMs\_INCL<sub>r</sub> is equal to '1', the mobile station shall
- 36                 set PDCH\_SOFT\_SWITCHING\_DELAY<sub>s</sub> to
- 37                 PDCH\_SOFT\_SWITCHING\_DELAY<sub>r</sub> + 1, and
- 38                 PDCH\_SOFT\_SWITCHING\_DELAY<sub>s</sub> to
- 39                 PDCH\_SOFT\_SWITCHING\_DELAY<sub>r</sub> + 1.

- 1                   + If FOR\_PDCH\_PARMS\_INCL<sub>r</sub> is equal to '1', and
- 2                   FOR\_PDCH\_COMMON\_PARMS<sub>r</sub> is equal to '1', the mobile station
- 3                   shall store the following parameters that are common to all pilots in
- 4                   the Active Set:
- 5                   o The mobile station shall set FOR\_PDCH\_COMMON\_PARMS<sub>s</sub> to
- 6                   '1'.
- 7                   o The mobile station shall set WALSH\_TABLE\_ID<sub>s</sub> to
- 8                   WALSH\_TABLE\_ID<sub>r</sub>.
- 9                   o The mobile station shall set NUM\_PDCCH<sub>s</sub> to NUM\_PDCCH<sub>r</sub>.
- 10                  o The mobile station shall set FOR\_PDCCH\_WALSH<sub>s</sub>[i] to the i<sup>th</sup>
- 11                  occurrence of FOR\_PDCCH\_WALSH<sub>r</sub>.
- 12                  o The mobile station shall set TX\_DISABLED\_TIMER<sub>s</sub> to
- 13                  TX\_DISABLED\_TIMER<sub>r</sub>.
- 14                  + If FOR\_PDCH\_PARMS\_INCL<sub>r</sub> is equal to '0', and
- 15                  FOR\_PDCH\_COMMON\_PARMS<sub>s</sub> is equal to '0', the mobile station
- 16                  shall send a *Mobile Station Reject Order* with ORDQ equal to
- 17                  '00000011' (message structure not acceptable) and remain in the
- 18                  current state.
- 19                  + If EXT\_CH\_IND<sub>r</sub> signals the allocation of a R-PDCH, the mobile
- 20                  station shall:
- 21                  o Set FOR\_GCH\_ASSIGNED<sub>s</sub> to FOR\_GCH\_ASSIGNED<sub>r</sub>.
- 22                  o Set FOR\_RCCH\_ASSIGNED<sub>s</sub> to FOR\_RCCH\_ASSIGNED<sub>r</sub>.
- 23                  o If FOR\_RCCH\_ASSIGNED<sub>s</sub> is equal to '1', the mobile station
- 24                  shall:
- 25                   ◇ Set FOR\_RCCH\_DRC\_MODE<sub>s</sub> to FOR\_RCCH\_DRC\_MODE<sub>r</sub>.
- 26                   ◇ Set FOR\_RCCH\_REPETITION<sub>s</sub> to FOR\_RCCH\_REPETITION<sub>r</sub>.
- 27                   ◇ Set FOR\_RCCH\_UPDATE\_RATE<sub>s</sub> to
- 28                   FOR\_RCCH\_UPDATE\_RATE<sub>r</sub>.
- 29                  o If FOR\_ACKCH\_ASSIGNED<sub>r</sub> is equal to '1', the mobile station
- 30                  shall set FOR\_ACKCH\_MODE<sub>s</sub> to FOR\_ACKCH\_MODE<sub>r</sub>.
- 31                  o If FOR\_ACKCH\_COMB\_SEL<sub>r</sub> is included, the mobile station shall
- 32                  set FOR\_ACKCH\_COMB\_SEL<sub>s</sub> to FOR\_ACKCH\_COMB\_SEL<sub>r</sub>;
- 33                  otherwise, the mobile station shall set FOR\_ACKCH\_COMB\_SEL<sub>s</sub>
- 34                  to '0'.
- 35                  o If REV\_PDCH\_RLGAIN\_INCL<sub>r</sub> is included and equal to '1', the
- 36                  mobile station shall perform the following:
- 37                   ◇ The mobile station shall set RLGAIN\_SPICH\_PILOT<sub>s</sub> to
- 38                   RLGAIN\_SPICH\_PILOT<sub>r</sub>.

- 1                   ◇ The mobile station shall set `RLGAIN_REQCH_PILOTS` to
- 2                   `RLGAIN_REQCH_PILOTR`.
- 3                   ◇ The mobile station shall set `RLGAIN_PDCCH_PILOTS` to
- 4                   `RLGAIN_PDCCH_PILOTR`.
- 5                   o If `REV_PDCH_PARMS_1_INCLR` is included and equal to '1', the
- 6                   mobile station shall perform the following:
- 7                   ◇ The mobile station shall set `REV_PDCH_TABLE_SELS` to
- 8                   `REV_PDCH_TABLE_SELR`.
- 9                   ◇ The mobile station shall set `REV_PDCH_MAX_AUTO_TPRS` to
- 10                  `REV_PDCH_MAX_AUTO_TPRR`.
- 11                  + Otherwise, the mobile station shall:
- 12                   o Set `FOR_GCH_ASSIGNEDS` to NULL.
- 13                   o Set `FOR_RCCH_ASSIGNEDS` to NULL.
- 14                  + For each member of the Active Set included in the message, the
- 15                  mobile station shall perform the following:
- 16                   o Set `PILOT_PN` to `PILOT_PNR`.
- 17                   o If `SRCH_OFFSET_INCLR` equals '1', set the `SRCH_OFFSET` field of
- 18                   `PILOT_REC` to `SRCH_OFFSETR`; otherwise, set the
- 19                   `SRCH_OFFSET` field of `PILOT_REC` to '000'.
- 20                   o Set `ADD_PILOT_REC_INCL` to `ADD_PILOT_REC_INCLR`.
- 21                   o If `ADD_PILOT_REC_INCLR` equals '1', the mobile station shall also
- 22                   perform the following:
- 23                   ◇ Set the `PILOT_REC_TYPE` field of `PILOT_REC` to
- 24                   `PILOT_REC_TYPER`.
- 25                   ◇ If `PILOT_REC_TYPER` is equal to '000', the mobile station shall
- 26                   set the `TD_POWER_LEVEL` field of `PILOT_REC` to
- 27                   `TD_POWER_LEVELR` and set the `TD_MODE` field of
- 28                   `NGHBR_PILOT_REC` to `TD_MODER`.
- 29                   ◇ If `PILOT_REC_TYPER` is equal to '001', the mobile station
- 30                   shall:
- 31                   – Set the `AUX_PILOT_QOF` field of `PILOT_REC` to `QOFR`.
- 32                   – Set the `AUX_PILOT_WALSH_CODE` field of `PILOT_REC` to
- 33                   `AUX_PILOT_WALSHR` with the Walsh Code length
- 34                   specified by `WALSH_LENGTHR`.
- 35                   ◇ If `PILOT_REC_TYPER` is equal to '010', the mobile station
- 36                   shall:
- 37                   – Set the `AUX_PILOT_TD_QOF` field of `PILOT_REC` to `QOFR`.

- 1                                   – Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to
- 2                                   AUX\_WALSH<sub>r</sub> with the Walsh Code length specified by
- 3                                   WALSH\_LENGTH<sub>r</sub>.
- 4                                   – Set the AUX\_TD\_POWER\_LEVEL field of PILOT\_REC to
- 5                                   AUX\_TD\_POWER\_LEVEL<sub>r</sub>.
- 6                                   – Set the TD\_MODE field of PILOT\_REC to TD\_MODE<sub>r</sub>.
- 7                   o Set FOR\_PDCH\_INCL<sub>s</sub> to FOR\_PDCH\_INCL<sub>r</sub>.
- 8                   o If FOR\_PDCH\_INCL<sub>r</sub> is equal to '1', the mobile station shall
- 9                   perform the following:
- 10                    ◇ If FOR\_PDCH\_PARMS\_INCL<sub>r</sub> is equal to '1', and
- 11                    FOR\_PDCH\_COMMON\_PARMS<sub>r</sub> is equal to '0', the mobile
- 12                    station shall store the following parameters:
- 13                    – The mobile station shall set
- 14                    FOR\_PDCH\_COMMON\_PARMS<sub>s</sub> to '0'.– The mobile
- 15                    station shall set WALSH\_TABLE\_ID<sub>s</sub> to
- 16                    WALSH\_TABLE\_ID<sub>r</sub>.
- 17                    – The mobile station shall set NUM\_PDCCH<sub>s</sub> to
- 18                    NUM\_PDCCH<sub>r</sub>.
- 19                    – The mobile station shall set FOR\_PDCCH\_WALSH<sub>s</sub>[i] to
- 20                    the i<sup>th</sup> occurrence of FOR\_PDCCH\_WALSH<sub>r</sub>.
- 21                    ◇ The mobile station shall set MAC\_ID<sub>s</sub> to MAC\_ID<sub>r</sub>.
- 22                    ◇ The mobile station shall set REV\_CQICH\_COVER<sub>s</sub> to
- 23                    REV\_CQICH\_COVER<sub>r</sub>.
- 24                    ◇ If EXT\_CH\_IND<sub>r</sub> signals the allocation of a F-CPCCH, the
- 25                    mobile station shall set FOR\_CPCCH\_WALSH<sub>s</sub> to
- 26                    FOR\_CPCCH\_WALSH<sub>r</sub>, and FOR\_CPCSCH<sub>s</sub> to
- 27                    FOR\_CPCSCH<sub>r</sub>.
- 28                    ◇ The mobile station shall store FOR\_PDCCH\_WALSH<sub>s</sub>[i] to the
- 29                    i<sup>th</sup> occurrence of FOR\_PDCCH\_WALSH<sub>r</sub>.
- 30                   o The mobile station shall set PWR\_COMB\_IND<sub>s</sub> to
- 31                   PWR\_COMB\_IND<sub>r</sub>.
- 32                   o If PDCH\_GROUP\_IND\_INCL<sub>r</sub> is equal to '1', the mobile station
- 33                   shall set PDCH\_GROUP\_IDENTIFIER<sub>s</sub> as follows:
- 34                    ◇ If this is the first pilot in the list that has a F-PDCH
- 35                    assignment, the mobile station shall perform the following:
- 36                    – The mobile station shall set PDCH\_GROUP\_IDENTIFIER<sub>s</sub>
- 37                    to '000';
- 38                    ◇ Otherwise, the mobile station shall perform the following:

- 1  
2  
3  
4  
5  
6  
7  
8  
9  
10  
11

34  
35  
36  
37  
38  
39
- If PDCH\_GROUP\_IND<sub>r</sub> is set to '1', the mobile station shall set PDCH\_GROUP\_IDENTIFIER<sub>s</sub> to the same value as that of the previous pilot in the list that has a F-PDCH assigned; otherwise, the mobile station shall set PDCH\_GROUP\_IDENTIFIER<sub>s</sub> to the value one greater than that of the previous pilot in the list that has a F-PDCH assigned.
  - o Otherwise, the mobile station shall perform the following:
    - ◇ If this is the first pilot in the list that has a F-PDCH assignment, the mobile station shall perform the following:
      - The mobile station shall set PDCH\_GROUP\_IDENTIFIER<sub>s</sub> to '000';
    - ◇ Otherwise, the mobile station shall perform the following:
      - If F-PDCH is assigned for this pilot, the mobile station shall perform the following:
        - + If PWR\_COMB\_IND<sub>r</sub> is set to '1', and there are no pilots between this pilot and the previous pilot in the list that has a F-PDCH assigned, the mobile station shall set PDCH\_GROUP\_IDENTIFIER<sub>s</sub> to the same value as that of the previous pilot in the list that has a F-PDCH assigned.
        - + If PWR\_COMB\_IND<sub>r</sub> is set to '1', and all pilots between this pilot and the previous pilot in the list that has a F-PDCH assigned have PWR\_COMB\_IND set to '1', the mobile station shall set PDCH\_GROUP\_IDENTIFIER<sub>s</sub> to the same value as that of the previous pilot in the list that has a F-PDCH assigned.
        - + Otherwise, the mobile station shall set PDCH\_GROUP\_IDENTIFIER<sub>s</sub> to the value one greater than that of the previous pilot in the list.
      - Otherwise, the mobile station shall set PDCH\_GROUP\_IDENTIFIER<sub>s</sub> to NULL.
  - o If EXT\_CH\_IND<sub>r</sub> signals the allocation of a F-FCH, the mobile station shall set CODE\_CHAN\_FCH<sub>s</sub> to CODE\_CHAN\_FCH<sub>r</sub>, and QOF\_MASK\_ID\_FCH<sub>s</sub> to QOF\_MASK\_ID\_FCH<sub>r</sub>.
  - o If EXT\_CH\_IND<sub>r</sub> signals the allocation of a F-DCCH, the mobile station shall set CODE\_CHAN\_DCCH<sub>s</sub> to CODE\_CHAN\_DCCH<sub>r</sub>, and QOF\_MASK\_ID\_DCCH<sub>s</sub> to QOF\_MASK\_ID\_DCCH<sub>r</sub>.

- 1                   o If EXT\_CH\_IND<sub>r</sub> signals the allocation of a F-DCCH, the mobile  
2                   station shall set CODE\_CHAN\_DCCH<sub>s</sub> to CODE\_CHAN\_DCCH<sub>r</sub>,  
3                   and QOF\_MASK\_ID\_DCCH<sub>s</sub> to QOF\_MASK\_ID\_DCCH<sub>r</sub>.
- 4                   o If FOR\_PDCH\_INCL<sub>r</sub> is equal to '1', EXT\_CH\_IND<sub>r</sub> signals the  
5                   allocation of a R-PDCH, and if FOR\_ACKCH\_ASSIGNED<sub>r</sub> is equal  
6                   to '1', the mobile station shall set FOR\_ACKCH\_WALSH\_INDEX<sub>s</sub>  
7                   to FOR\_ACKCH\_WALSH\_INDEX<sub>r</sub>, and FOR\_ACKSCH\_INDEX<sub>s</sub> to  
8                   FOR\_ACKSCH\_INDEX<sub>r</sub>.
- 9                   o If FOR\_RCCH\_INCL<sub>r</sub> is included and set to '1', the mobile station  
10                  shall do the following:
  - 11                  ◇ set FOR\_RCCH\_WALSH\_INDEX<sub>s</sub> to  
12                  FOR\_RCCH\_WALSH\_INDEX<sub>s</sub>.
  - 13                  ◇ set FOR\_RCSCH\_INDEX<sub>s</sub> to FOR\_RCSCH\_INDEX<sub>r</sub>.
- 14                  o If FOR\_PDCH\_INCL<sub>r</sub> is equal to '1', and if FOR\_GCH\_ASSIGNED<sub>r</sub>  
15                  is included and set to '1', the mobile station shall perform the  
16                  following:
  - 17                  ◇ set NUM\_FOR\_GCH<sub>s</sub> to NUM\_FOR\_GCH<sub>r</sub>, and
  - 18                  ◇ for each of the NUM\_FOR\_GCH<sub>s</sub> occurrences of  
19                  FOR\_GCH\_WALSH\_INDEX<sub>r</sub>, the mobile station shall set  
20                  FOR\_GCH\_WALSH\_INDEX<sub>s</sub>[j] to  
21                  FOR\_GCH\_WALSH\_INDEX<sub>r</sub>[j].
- 22                  o Otherwise, the mobile station shall perform the following:
  - 23                  ◇ set NUM\_FOR\_GCH<sub>s</sub> to 0, and
  - 24                  ◇ set FOR\_GCH\_WALSH\_INDEX<sub>s</sub> to NULL.
- 25                  o If SCH\_INCL<sub>r</sub> is equal to '1' and NUM\_SCH is equal to '00000',  
26                  the mobile station shall delete the corresponding pilot from the  
27                  all entries of the corresponding Supplemental Channel.
- 28                  o If SCH\_INCL<sub>r</sub> is equal to '1' and NUM\_SCH is not equal to  
29                  '00000', for each Supplemental Channel included in this record,  
30                  the mobile station shall:
  - 31                  ◇ If PILOT\_INCL is equal to '0', then the mobile station shall  
32                  delete the corresponding pilot from the Active Set of  
33                  Supplemental Channel for the corresponding SCCL\_INDEX<sub>r</sub>.
  - 34                  ◇ If PILOT\_INCL is equal to '1', then for each Supplemental  
35                  Channel included in this record, the mobile station shall set  
36                  PILOT\_PN<sub>s</sub> [FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i] to PILOT\_PN<sub>r</sub>,  
37                  QOF\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i] to  
38                  QOF\_MASK\_ID\_SCH<sub>r</sub>, and  
39                  FOR\_SCH\_CC\_INDEX<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i] to  
40                  CODE\_CHAN\_SCH<sub>r</sub>.

- 1                   ◇ If PILOT\_INCL is equal to '1' and CCSH\_INCLUDED is set to
- 2                   '1', then for each Supplemental Channel included in this
- 3                   record, the mobile station shall set
- 4                   CCSH\_ENCODER\_TYPE<sub>S</sub>[FOR\_SCH\_ID<sub>R</sub>][SCCL\_INDEX<sub>R</sub>][i] to
- 5                   CCSH\_ENCODER\_TYPE<sub>R</sub>.
- 6                   ◇ If PILOT\_INCL is equal to '1' and CCSH\_INCLUDED is set to
- 7                   '0', then for each Supplemental Channel included in this
- 8                   record, the mobile station shall set
- 9                   CCSH\_ENCODER\_TYPE<sub>S</sub>[FOR\_SCH\_ID<sub>R</sub>][SCCL\_INDEX<sub>R</sub>][i] to
- 10                  '0' (default Turbo Encoder type).
- 11                  ◇ The mobile station shall delete all pilots that are not included
- 12                  in the list specified by the NUM\_PILOTS field from the Active
- 13                  Set of Supplemental Channel for the corresponding
- 14                  SCCL\_INDEX<sub>R</sub>.
- 15                  + If CCSH\_INCLUDED is equal to '1', the mobile station shall perform
- 16                  the following:
- 17                   o If CCSH\_ENCODER\_ACTION\_TIME<sub>R</sub> is received, then the mobile
- 18                   station shall set CCSH\_ENCODER\_ACTION\_TIME<sub>S</sub> to
- 19                   CCSH\_ENCODER\_ACTION\_TIME<sub>R</sub>, and the mobile station shall
- 20                   apply each CCSH\_ENCODER\_TYPE<sub>S</sub> at the time specified by
- 21                   CCSH\_ENCODER\_ACTION\_TIME<sub>R</sub>.
- 22                   o If CCSH\_ENCODER\_ACTION\_TIME<sub>R</sub> is not received, the mobile
- 23                   station shall apply each CCSH\_ENCODER\_TYPE<sub>S</sub> at the action
- 24                   time of the message.
- 25                  + The mobile station shall set FUNDICATED\_BCMC\_IND<sub>S</sub> to
- 26                  FUNDICATED\_BCMC\_IND<sub>R</sub>. If FUNDICATED\_BCMC\_IND<sub>R</sub> equals '1'
- 27                  and the EXT\_CH\_IND<sub>R</sub> signals the allocation of a F-FCH, the mobile
- 28                  station shall set FCH\_BCMC\_IND to '1'; otherwise, the mobile station
- 29                  shall set FCH\_BCMC\_IND to '0'.
- 30                  + If FUNDICATED\_BCMC\_IND<sub>R</sub> equals '1' and
- 31                  ADD\_PLCM\_FOR\_FCH\_INCL<sub>R</sub> is included and is set to '1', the mobile
- 32                  station shall store the following:
- 33                   o Set ADD\_PLCM\_FOR\_FCH\_TYPE<sub>S</sub> to
- 34                   ADD\_PLCM\_FOR\_FCH\_TYPE<sub>R</sub>.
- 35                   o Set ADD\_PLCM\_FOR\_FCH\_39<sub>S</sub> to ADD\_PLCM\_FOR\_FCH\_39<sub>R</sub> if
- 36                   ADD\_PLCM\_FOR\_FCH\_TYPE<sub>R</sub> is equal to '1'.
- 37                  + The mobile station shall delete all pilots that are not listed in the
- 38                  NUM\_PILOTS field from the Active Set.

- 1                   +   The mobile station shall delete all pilots that are not listed in the
- 2                   Active Set from the Active Set of the Supplemental Channel for the
- 3                   Forward Supplemental Channel Assignment (if any). If these deleted
- 4                   pilots include all pilots in the Active Set of the Supplemental
- 5                   Channel, the mobile station shall cancel the Forward Supplemental
- 6                   Channel Assignment.
- 7                   •   If the CH\_IND<sub>r</sub> is set to '111' and FUNDICATED\_BCMC\_IND<sub>r</sub> equals '1', the
- 8                   mobile station shall change the R-FCH assignment as specified in
- 9                   REV\_FCH\_ASSIGNED<sub>r</sub>, at the specified action time.
- 10                  •   If the most significant bit of CH\_IND<sub>r</sub> is set to '1' and
- 11                  PILOT\_GATING\_USE\_RATE is equal to '1', the mobile station shall set
- 12                  PILOT\_GATING\_USE\_RATE to '0' and shall start the continuous reverse
- 13                  pilot at the specified action time. If the most significant bit of CH\_IND<sub>r</sub> is
- 14                  set to '0', CH\_IND<sub>r</sub> is not equal to '000', and PILOT\_GATING\_USE\_RATE is
- 15                  equal to '0', the mobile station shall perform the following:
- 16                  –   The mobile station shall set PILOT\_GATING\_USE\_RATE to '1' and shall
- 17                  start the reverse pilot gating at the specified action time.
- 18                  –   If the Fundamental Channel is also being released, the mobile station
- 19                  shall store the configuration used for the Fundamental Channel.
- 20                  –   The mobile station shall cancel the forward and reverse supplemental
- 21                  channel assignment, if any.
- 22                  •   The mobile station shall set IGNORE\_ESCAM<sub>s</sub> and IGNORE\_SCAM<sub>s</sub> to '0'.
- 23                  •   Set the pilot detection threshold for the Target Frequency and the Candidate
- 24                  Frequency:
- 25                  –   Set TF\_T\_ADD<sub>s</sub> to T\_ADD<sub>s</sub>.
- 26                  –   If the Target Frequency is the same as the Candidate Frequency
- 27                  (TF\_CDMABAND<sub>s</sub> is equal to CF\_CDMABAND<sub>s</sub> and TF\_CDMACH<sub>s</sub> is
- 28                  equal to CF\_CDMACH<sub>s</sub>), set CF\_T\_ADD<sub>s</sub> to T\_ADD<sub>s</sub>.
- 29                  •   If PERIODIC\_SEARCH<sub>s</sub> is equal to '0' and a periodic search is in progress,
- 30                  the mobile station shall abort the periodic search (see 2.6.6.2.8.3.4 and
- 31                  2.6.6.2.10.4).
- 32                  •   The mobile station shall determine its roaming status (see 2.6.5.3). The
- 33                  mobile station should indicate to the user whether the mobile station is
- 34                  roaming.
- 35                  •   Perform a soft or hard handoff depending on the following conditions:
- 36                  –   If any of the following conditions is true, the mobile station shall perform a
- 37                  hard handoff:
- 38                  +   EXTRA\_PARMS is set to '1' and either BAND\_CLASS<sub>r</sub> is not equal to
- 39                  SF\_CDMABAND<sub>s</sub>, CDMA\_FREQ<sub>r</sub> is not equal to SF\_CDMACH<sub>s</sub>, or
- 40                  FRAME\_OFFSET<sub>r</sub> is not equal to SF\_FRAME\_OFFSET<sub>s</sub>, or

- 1                   + The set of pilots specified by the message is disjoint from the Active Set
- 2                   prior to the action time of the message.
- 3                   – If the mobile station performs a hard handoff, it shall perform the following:
- 4                   + If a Periodic Serving Frequency Pilot Report Procedure is in progress, the
- 5                   mobile station shall abort the procedure (see 2.6.6.2.12).
- 6                   + If a Candidate Frequency periodic search is in progress, the mobile
- 7                   station shall abort the periodic search (see 2.6.6.2.8.3.4 and
- 8                   2.6.6.2.10.4).
- 9                   + If a Forward Supplemental Channel assignment or a Reverse
- 10                  Supplemental Channel assignment is in progress, the mobile station
- 11                  shall abort it.
- 12                  + The mobile station shall cancel any outstanding Forward
- 13                  Supplemental Channel assignment or Reverse Supplemental
- 14                  Channel assignment that is not specified by this message.
- 15                  + The mobile station shall cancel the current Forward Supplemental
- 16                  Channel assignment or the Reverse Supplemental Channel assignment,
- 17                  if it is in progress. If the message does not specify another Forward
- 18                  Supplemental Channel assignment or Reverse Supplemental Channel
- 19                  assignment, the mobile station shall cancel the outstanding Forward
- 20                  Supplemental Channel assignment or Reverse Supplemental Channel
- 21                  assignment, if any.
- 22                  + If RETURN\_IF\_HANDOFF\_FAIL<sub>S</sub> is equal to '0', the mobile station shall
- 23                  perform actions specified in 2.6.6.2.8.1. If the message specifies more
- 24                  than one pilot, the mobile station shall also perform actions specified in
- 25                  2.6.6.2.7.1 and 2.6.6.2.7.2.
- 26                  + If RETURN\_IF\_HANDOFF\_FAIL<sub>S</sub> is equal to '1', the mobile station shall
- 27                  perform actions specified in 2.6.6.2.8.2. If the message specifies more
- 28                  than one pilot, the mobile station shall also perform actions specified in
- 29                  2.6.6.2.7.1 and 2.6.6.2.7.2.
- 30                  – Otherwise, the mobile station shall perform a soft handoff as specified in
- 31                  2.6.6.2.7.
- 32                  12. *Mobile Assisted Burst Operation Parameters Message:* The mobile station shall
- 33                  process this message as follows:
- 34                  • The mobile station shall set ORDER\_FLAG<sub>S</sub> to ORDER\_FLAG<sub>r</sub>.
- 35                  • If ORDER\_FLAG<sub>r</sub> is equal to '1', the mobile station shall perform the
- 36                  following:
- 37                  – The mobile station shall set PS\_MIN\_DELTA<sub>S</sub> to PS\_MIN\_DELTA<sub>r</sub> + 1.
- 38                  – The mobile station shall set ORDER\_INTERVAL<sub>S</sub> to ORDER\_INTERVAL<sub>r</sub>.

- 1           • If ORDER\_FLAG<sub>r</sub> is equal to '0', the mobile station shall perform the
- 2           following:
- 3           – The mobile station shall set PS\_MIN\_DELTA<sub>s</sub> to 0.
- 4           – The mobile station shall set ORDER\_INTERVAL<sub>s</sub> to 0.
- 5           • The mobile station shall set PERIODIC\_FLAG<sub>s</sub> to PERIODIC\_FLAG<sub>r</sub>.
- 6           • If PERIODIC\_FLAG<sub>r</sub> is equal to '1', the mobile station shall perform the
- 7           following:
- 8           – The mobile station shall set NUM\_PILOTS<sub>s</sub> to NUM\_PILOTS<sub>r</sub>.
- 9           – The mobile station shall set PERIODIC\_INTERVAL<sub>s</sub> to
- 10          PERIODIC\_INTERVAL<sub>r</sub>.
- 11          • If PERIODIC\_FLAG<sub>r</sub> is equal to '0', the mobile station shall perform the
- 12          following:
- 13          – The mobile station shall set NUM\_PILOTS<sub>s</sub> to 0.
- 14          – The mobile station shall set PERIODIC\_INTERVAL<sub>s</sub> to 0.
- 15          • The mobile station shall set THRESHOLD\_FLAG<sub>s</sub> to THRESHOLD\_FLAG<sub>r</sub>.
- 16          • If THRESHOLD\_FLAG<sub>r</sub> is equal to '1', the mobile station shall perform the
- 17          following:
- 18          – The mobile station shall set PS\_FLOOR\_LOW<sub>s</sub> to PS\_FLOOR\_LOW<sub>r</sub>.
- 19          – The mobile station shall set PS\_FLOOR\_HIGH<sub>s</sub> to PS\_FLOOR\_HIGH<sub>r</sub>.
- 20          – The mobile station shall set PS\_CEILING\_LOW<sub>s</sub> to PS\_CEILING\_LOW<sub>r</sub>.
- 21          – The mobile station shall set PS\_CEILING\_HIGH<sub>s</sub> to PS\_CEILING\_HIGH<sub>r</sub>.
- 22          • If THRESHOLD\_FLAG<sub>r</sub> is equal to '0', the mobile station shall perform the
- 23          following:
- 24          – The mobile station shall set PS\_FLOOR\_LOW<sub>s</sub> to '0'.
- 25          – The mobile station shall set PS\_FLOOR\_HIGH<sub>s</sub> to '0'.
- 26          – The mobile station shall set PS\_CEILING\_LOW<sub>s</sub> to '0'.
- 27          – The mobile station shall set PS\_CEILING\_HIGH<sub>s</sub> to '0'.
- 28          13. *Extended Supplemental Channel Assignment Message*: The mobile station shall
- 29          process this message as follows:
- 30          The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
- 31          set to the specified value if any of the following conditions is true, and shall not
- 32          perform any other action described in this section for processing the *Extended*
- 33          *Supplemental Channel Assignment Message*:

- 1       • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ  
2       field set to '00000110' (capability not supported), if the number of forward or  
3       reverse Supplemental Channels specified in the *Extended Supplemental*  
4       *Channel Assignment Message* is greater than the maximum number of  
5       Supplemental Channels supported by the mobile station.
- 6       • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ  
7       field set to '00000100' (message field not in valid range), if PILOT\_PN  
8       specified in the *Extended Supplemental Channel Assignment Message* is not  
9       in the Active Set.
- 10      • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ  
11      field set to '00000111' (message can not be handled by the current mobile  
12      station configuration), if the message includes a reverse Supplemental  
13      Channel assignment, and any of the following conditions is true:
  - 14          – any of the mobile station's reverse supplemental channel configuration  
15          parameter for the corresponding Supplemental Channel is NULL, or,
  - 16          – the Reverse Packet Data Channel is assigned.
- 17      • The mobile station shall send a *Mobile Station Reject Order* with the ORDQ  
18      field set to '00000111' (message can not be handled by the current mobile  
19      station configuration), if the message includes a forward Supplemental  
20      Channel assignment and any of the mobile station's forward supplemental  
21      channel configuration parameter for the corresponding Supplemental  
22      Channel is NULL.

23      If none of the above conditions is true, the mobile station shall perform the  
24      following:

- 25      • The mobile station shall store REV\_SCH\_DTX\_DURATION<sub>r</sub>, Reverse  
26      Supplemental Channel Discontinuous Transmission Duration, as  
27      REV\_SCH\_DTX\_DURATION<sub>s</sub> at the action time of the message.
- 28      • The mobile station shall store the unit for START\_TIME\_UNIT<sub>s</sub> =  
29      START\_TIME\_UNIT<sub>r</sub>.
- 30      • The mobile station shall store USE\_T\_ADD\_ABORT<sub>r</sub>, Reverse Supplemental  
31      Channel assignment T\_ADD abort indicator, as USE\_T\_ADD\_ABORT<sub>s</sub>.
- 32      • If IGNORE\_ESCAM<sub>s</sub> is equal to '1' and SCRM\_SEQ\_NUM<sub>r</sub> is not present or  
33      is present and is not equal to SCRM\_SEQ\_NUM<sub>s</sub>, then the mobile station  
34      shall not process the remaining Reverse Supplemental Channel assignment  
35      information in this message.
- 36      • If IGNORE\_ESCAM<sub>s</sub> is equal to '1' and SCRM\_SEQ\_NUM<sub>r</sub> is present and is  
37      equal to SCRM\_SEQ\_NUM<sub>s</sub>, then the mobile station shall set  
38      IGNORE\_ESCAM<sub>s</sub> to '0'.

- 1       • If ADD\_INFO\_INCL<sub>r</sub> is equal to '1', the message includes a Supplemental  
2       Channel assignment (that is, NUM\_FOR\_SCH<sub>r</sub> is not equal to '00' and/or  
3       NUM\_REV\_SCH<sub>r</sub> is not equal to '00'), and PILOT\_GATING\_USE\_RATE is  
4       equal to '1', the mobile station shall process the following information of the  
5       *Extended Supplemental Channel Assignment Message* as follows:  
6       – The mobile station shall set FPC\_PRI\_CHAN<sub>s</sub> = FPC\_PRI\_CHAN<sub>r</sub> at the  
7       action time of the message.
- 8       • If REV\_CFG\_INCLUDED is equal to '1', for all the (NUM\_REV\_CFG\_RECS +  
9       1) occurrences of the reverse configuration record, the mobile station shall  
10      store the REV\_WALSH\_ID matrix as follows:  
11      – REV\_WALSH\_ID<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>][REV\_SCH\_NUM\_BITS\_IDX<sub>r</sub>] =  
12      REV\_WALSH\_ID<sub>r</sub>
- 13      • If NUM\_REV\_SCH<sub>r</sub> is not equal to '00', then the mobile station shall store  
14      the following information for each occurrence of the record and process the  
15      Reverse Supplemental Burst as specified in 2.6.6.2.5.1.2:  
16      – REV\_SCH\_START\_TIME\_INCL<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] =  
17      REV\_SCH\_START\_TIME\_INCL<sub>r</sub>  
18      – If REV\_SCH\_START\_TIME\_INCL<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] is set to '1', set  
19      REV\_SCH\_START\_TIME<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] = REV\_SCH\_START\_TIME<sub>r</sub>  
20      – REV\_SCH\_DURATION<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] = REV\_SCH\_DURATION<sub>r</sub>  
21      – REV\_SCH\_NUM\_BITS\_IDX<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] = REV\_SCH\_NUM\_BITS\_IDX<sub>r</sub>
- 22      • If NUM\_FOR\_SCH<sub>r</sub> is not equal to '00', then the mobile station shall store  
23      the following information for each occurrence of the record and process the  
24      Forward Supplemental Burst as specified in 2.6.6.2.5.1.1:  
25      – FOR\_SCH\_START\_TIME\_INCL<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] =  
26      FOR\_SCH\_START\_TIME\_INCL<sub>r</sub>  
27      – If FOR\_SCH\_START\_TIME\_INCL<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is set to '1', set  
28      FOR\_SCH\_START\_TIME<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] = FOR\_SCH\_START\_TIME<sub>r</sub>  
29      – FOR\_SCH\_DURATION<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] = FOR\_SCH\_DURATION<sub>r</sub>  
30      – FOR\_SCH\_FER\_REP<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] = FOR\_SCH\_FER\_REP<sub>r</sub>  
31      – SCCL\_INDEX<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] = SCCL\_INDEX<sub>r</sub>  
32      – If SCH\_BCMC\_IND field is included the mobile station shall perform the  
33      following:  
34      + If SCH\_BCMC\_IND<sub>r</sub> equals '1' and USE\_ADD\_PLCM\_FOR\_SCH<sub>r</sub>  
35      equals '1', set corresponding SCH\_BCMC\_IND[FOR\_SCH\_ID<sub>r</sub>] to '1';  
36      otherwise, set SCH\_BCMC\_IND[FOR\_SCH\_ID<sub>r</sub>] = '0'.  
37      – If SCH\_BCMC\_IND<sub>r</sub> is included and equals '1' and  
38      ADD\_PLCM\_FOR\_SCH\_INCL<sub>r</sub> is included and is set to '1', the mobile  
39      station shall store following fields:

- 1                   + Set ADD\_PLCM\_FOR\_SCH\_TYPE<sub>S</sub> to ADD\_PLCM\_FOR\_SCH\_TYPE<sub>R</sub>.
- 2                   + Set ADD\_PLCM\_FOR\_SCH\_35<sub>S</sub> to ADD\_PLCM\_FOR\_SCH\_35<sub>R</sub> if
- 3                   ADD\_PLCM\_FOR\_SCH\_TYPE<sub>R</sub> is equal to '1'.
- 4                   - If SCH\_BCMC\_IND<sub>R</sub> is included and equals '1', the mobile station shall
- 5                   store following fields:
- 6                   + USE\_ADD\_PLCM\_FOR\_SCH<sub>S</sub>[FOR\_SCH\_ID<sub>R</sub>] =
- 7                   USE\_ADD\_PLCM\_FOR\_SCH<sub>R</sub>
- 8                   + FSCH\_OUTERCODE\_INCL<sub>S</sub>[FOR\_SCH\_ID<sub>R</sub>] =
- 9                   FSCH\_OUTERCODE\_INCL<sub>R</sub>
- 10                  + If FSCH\_OUTERCODE\_INCL<sub>R</sub> equals '1', the mobile station shall
- 11                  store following fields:
- 12                   o FSCH\_OUTERCODE\_RATE<sub>S</sub>[FOR\_SCH\_ID<sub>R</sub>] =
- 13                   FSCH\_OUTERCODE\_RATE<sub>R</sub>
- 14                   o FSCH\_OUTERCODE\_OFFSET<sub>S</sub>[FOR\_SCH\_ID<sub>R</sub>] =
- 15                   FSCH\_OUTERCODE\_OFFSET<sub>R</sub>
- 16                  • If FOR\_CFG\_INCLUDED is equal to '1', the mobile station shall perform the
- 17                  following:
- 18                   - Set FOR\_SCH\_FER\_REP<sub>S</sub> to FOR\_SCH\_FER\_REP<sub>R</sub>.
- 19                   - If FOR\_SCH\_FER\_REP<sub>R</sub> is equal to '0', set SCH\_TOT\_FRAMES<sub>S</sub> and
- 20                   SCH\_BAD\_FRAMES<sub>S</sub> to 0.
- 21                   - Store NUM\_FOR\_CFG\_RECS occurrences of Forward Supplemental
- 22                   Channel Configuration associated with the identification of Forward
- 23                   Supplemental Channel.
- 24                  • For each record of the Forward Supplemental Channel Code list the mobile
- 25                  station shall store the Forward Supplemental Channel Code list associated
- 26                  with the FOR\_SCH\_ID<sub>R</sub> as follows:
- 27                   - NUM\_SUP\_SHO<sub>S</sub>[FOR\_SCH\_ID<sub>R</sub>][SCCL\_INDEX<sub>R</sub>] = NUM\_SUP\_SHO<sub>R</sub>.
- 28                   - The mobile station shall determine,
- 29                   N\_FSCH\_BITS\_SET<sub>S</sub>[FOR\_SCH\_ID<sub>R</sub>][SCCL\_INDEX<sub>R</sub>], the number of
- 30                   information bits per Forward Supplemental Channel frame identified by
- 31                   FOR\_SCH\_ID and corresponding to the index SCCL\_INDEX according to
- 32                   the following rules:
- 33                   + If FSCH\_VAR\_TABLE\_IDS<sub>S</sub>[FOR\_SCH\_ID<sub>R</sub>] is equal to '000', then:

- 1                   o If USE\_FLEX\_NUM\_BITS<sub>S</sub> is equal to '0' or if  
2                   USE\_FLEX\_NUM\_BITS<sub>S</sub> is equal to '1' and  
3                   FSCH\_NBIT\_TABLE\_IDS[FOR\_SCH\_ID<sub>R</sub>] is equal to '0000', then  
4                   the mobile station shall set the number of information bits per  
5                   frame, N\_FSCH\_BITS\_SET<sub>S</sub>[FOR\_SCH\_ID<sub>R</sub>][SCCL\_INDEX<sub>R</sub>] and  
6                   number of CRC bits per frame,  
7                   FSCH\_CRC\_LEN\_SET<sub>S</sub>[FOR\_SCH\_ID<sub>R</sub>][SCCL\_INDEX<sub>R</sub>], according  
8                   to Table 3.7.3.3.2.37-2 using FOR\_SCH\_NUM\_BITS\_IDX<sub>R</sub> as the  
9                   index to the table.
- 10                  o If USE\_FLEX\_NUM\_BITS<sub>S</sub> is equal to '1' and  
11                  FSCH\_NBIT\_TABLE\_IDS[FOR\_SCH\_ID<sub>R</sub>] is not equal to '0000',  
12                  then the mobile station shall set the number of CRC bits per  
13                  frame, FSCH\_CRC\_LEN\_SET<sub>S</sub>[FOR\_SCH\_ID<sub>R</sub>][SCCL\_INDEX<sub>R</sub>],  
14                  using Table 3.7.5.20-1 and  
15                  CRC\_LEN\_IDX<sub>S</sub>[FSCH\_NBIT\_TABLE\_IDS[FOR\_SCH\_ID<sub>R</sub>]][FOR\_SC  
16                  H\_NUM\_BITS\_IDX<sub>R</sub>] as the index to the table.  
17                  The mobile station shall also set the number of information bits  
18                  per frame corresponding to SCCL\_INDEX<sub>R</sub>,  
19                  N\_FSCH\_BITS\_SET<sub>S</sub>[FOR\_SCH\_ID<sub>R</sub>][SCCL\_INDEX<sub>R</sub>], to  
20                  NUM\_BITS<sub>S</sub>[FSCH\_NBIT\_TABLE\_IDS[FOR\_SCH\_ID<sub>R</sub>]][FOR\_SCH\_N  
21                  UM\_BITS\_IDX<sub>R</sub>].
- 22                  + If FSCH\_VAR\_TABLE\_IDS[FOR\_SCH\_ID<sub>R</sub>] is not equal to '000', then:
- 23                  o The mobile station shall set  
24                  N\_FSCH\_BITS\_IDX\_SET<sub>S</sub>[FOR\_SCH\_ID<sub>R</sub>], the set of indices to the  
25                  number of information bits per frame as follows:
- 26                  ◇ If FOR\_SCH\_NUM\_BITS\_IDX<sub>R</sub> is equal to '0000', then  
27                  N\_FSCH\_BITS\_IDX\_SET<sub>S</sub>[FOR\_SCH\_ID<sub>R</sub>] = {  
28                  FOR\_SCH\_NUM\_BITS\_IDX<sub>R</sub> },
- 29                  ◇ otherwise the mobile station shall set (initialize)  
30                  N\_FSCH\_BITS\_IDX\_SET<sub>S</sub>[FOR\_SCH\_ID<sub>R</sub>] =  
31                  {FOR\_SCH\_NUM\_BITS\_IDX<sub>R</sub>} and for i=1, ...,  
32                  FOR\_SCH\_NUM\_BITS\_IDX<sub>R</sub> the mobile station shall add  
33                  FOR\_SCH\_NUM\_BITS\_IDX<sub>R</sub> -  
34                  VAR\_FSCH\_RATE\_OFFSET<sub>S</sub>[FOR\_SCH\_ID<sub>R</sub>][FOR\_SCH\_NUM\_  
35                  BITS\_IDX<sub>R</sub>][i] to the set specified by  
36                  N\_FSCH\_BITS\_IDX\_SET<sub>S</sub>[FOR\_SCH\_ID<sub>R</sub>]

- 1                   o If  $USE\_FLEX\_NUM\_BITS_S$  is equal to '0' or if  
2                   USE\_FLEX\_NUM\_BITS\_S is equal to '1' and  
3                   FSCH\_NBIT\_TABLE\_IDS[FOR\_SCH\_ID\_R] is equal to '0000', then  
4                   the mobile station shall set  
5                   N\_FSCH\_BITS\_SET\_S[FOR\_SCH\_ID\_R][SCCL\_INDEX\_R], the set of  
6                   number of information bits per frame as follows.  
7                   The  $i^{th}$  member of the set  
8                   N\_FSCH\_BITS\_SET\_S[FOR\_SCH\_ID\_R][SCCL\_INDEX\_R] is obtained  
9                   using Table 3.7.3.3.2.37-2 and the  $i^{th}$  member of the set  
10                  N\_FSCH\_BITS\_IDX\_SET\_S[FOR\_SCH\_ID\_R] as the index to the  
11                  table.
- 12               o If  $USE\_FLEX\_NUM\_BITS_S$  is equal to '1' and  
13                  FSCH\_NBIT\_TABLE\_IDS[FOR\_SCH\_ID\_R] is not equal to '0000',  
14                  then
- 15               ◇ the mobile station shall set  
16                  N\_FSCH\_BITS\_SET\_S[FOR\_SCH\_ID\_R][SCCL\_INDEX\_R], the set of  
17                  number of information bits per frame as follows.  
18                  The  $i^{th}$  member of the set  
19                  N\_FSCH\_BITS\_SET\_S[FOR\_SCH\_ID\_R][SCCL\_INDEX\_R] is equal  
20                  to  $NUM\_BITS_S[FSCH\_NBIT\_TABLE\_IDS[FOR\_SCH\_ID\_R]]$   
21                   $[N\_FSCH\_BITS\_IDX\_SET_S[FOR\_SCH\_ID\_R][i]]$ , where  
22                  N\_FSCH\_BITS\_IDX\_SET\_S[FOR\_SCH\_ID\_R][i] denotes the  $i^{th}$   
23                  member of the set N\_FSCH\_BITS\_IDX\_SET\_S[FOR\_SCH\_ID\_R]  
24                  and,
- 25               ◇ the mobile station shall set  
26                  FSCH\_CRC\_LEN\_SET\_S[FOR\_SCH\_ID\_R][SCCL\_INDEX\_R], the set  
27                  of number CRC bits per frame as follows.  
28                  The  $i^{th}$  member of the set  
29                  FSCH\_CRC\_LEN\_SET\_S[FOR\_SCH\_ID\_R][SCCL\_INDEX\_R] using  
30                  Table 3.7.5.20-1 and  
31                  CRC\_LEN\_IDX\_S[FSCH\_NBIT\_TABLE\_IDS[FOR\_SCH\_ID\_R]][N\_FS  
32                  CH\_BITS\_IDX\_SET\_S[FOR\_SCH\_ID\_R][i]] as the index to the  
33                  table, where N\_FSCH\_BITS\_IDX\_SET\_S[FOR\_SCH\_ID\_R][i]  
34                  denotes the  $i^{th}$  member of the set  
35                  N\_FSCH\_BITS\_IDX\_SET\_S[FOR\_SCH\_ID\_R].
- 36               – For the  $i^{th}$  record of the Forward Supplemental Channel Active Set (for all  
37                  values of i between 1 and NUM\_SUP\_SHO+1) specified in this message,  
38                  the mobile station shall store the following entries corresponding to the  
39                  SCCL\_INDEX\_R as follows:
- 40               + PILOT\_PN\_S[FOR\_SCH\_ID\_R][SCCL\_INDEX\_R][i] = PILOT\_PN\_R,
- 41               + Set the ADD\_PILOT\_REC\_INCL field to ADD\_PILOT\_REC\_INCL\_R. If  
42                  ADD\_PILOT\_REC\_INCL\_R equals '1', the mobile station shall store the  
43                  following:

- 1                   o Set the PILOT\_REC\_TYPE field of PILOT\_REC to
- 2                   PILOT\_REC\_TYPE<sub>r</sub>.
- 3                   o If PILOT\_REC\_TYPE<sub>r</sub> equals '000', the mobile station shall set the
- 4                   TD\_POWER\_LEVEL field of PILOT\_REC to TD\_POWER\_LEVEL<sub>r</sub>
- 5                   and set the TD\_MODE field of PILOT\_REC to TD\_MODE<sub>r</sub>.
- 6                   o If PILOT\_REC\_TYPE<sub>r</sub> is equal to '001', the mobile station shall.
- 7                   – Set the AUX\_PILOT\_QOF field of PILOT\_REC to QOF<sub>r</sub>.
- 8                   – Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to
- 9                   AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by
- 10                  WALSH\_LENGTH<sub>r</sub>.
- 11                  o If NGHBR\_PILOT\_REC\_TYPE<sub>r</sub> is equal to '010', the mobile station
- 12                  shall:
- 13                  – Set the AUX\_PILOT\_TD\_QOF field of PILOT\_REC to QOF<sub>r</sub>.
- 14                  – Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to
- 15                  AUX\_WALSH<sub>r</sub> with the Walsh Code length specified by
- 16                  WALSH\_LENGTH<sub>r</sub>.
- 17                  – Set the AUX\_TD\_POWER\_LEVEL field of PILOT\_REC to
- 18                  AUX\_TD\_POWER\_LEVEL<sub>r</sub>.
- 19                  – Set the TD\_MODE field of NGHBR\_PILOT\_REC to TD\_MODE<sub>r</sub>.
- 20                  o If PILOT\_REC\_TYPE<sub>r</sub> is equal to '011', the mobile station shall:
- 21                  – Set the SR3\_PRIMARY\_PILOT field of PILOT\_REC to
- 22                  SR3\_PRIMARY\_PILOT<sub>r</sub>.
- 23                  – Set the SR3\_PILOT\_POWER1 field of PILOT\_REC to
- 24                  SR3\_PILOT\_POWER1<sub>r</sub>.
- 25                  – Set the SR3\_PILOT\_POWER2 field of PILOT\_REC to
- 26                  SR3\_PILOT\_POWER2<sub>r</sub>.
- 27                  o If PILOT\_REC\_TYPE<sub>r</sub> is equal to '100', the mobile station shall:
- 28                  – Set the SR3\_PRIMARY\_PILOT field of PILOT\_REC to
- 29                  SR3\_PRIMARY\_PILOT<sub>r</sub>.
- 30                  – Set the SR3\_PILOT\_POWER1 field of PILOT\_REC to
- 31                  SR3\_PILOT\_POWER1<sub>r</sub>.
- 32                  – Set the SR3\_PILOT\_POWER2 field of PILOT\_REC to
- 33                  SR3\_PILOT\_POWER2<sub>r</sub>.
- 34                  – Set the AUX\_PILOT\_QOF field of PILOT\_REC to QOF<sub>r</sub>.
- 35                  – Set the AUX\_PILOT\_WALSH\_CODE field of PILOT\_REC to
- 36                  AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code length specified by
- 37                  WALSH\_LENGTH<sub>r</sub>.

- 1                                   - If ADD\_INFO\_INCL1<sub>r</sub> is equal to '1', set the AUX\_PILOT\_QOF1  
2                                   field of PILOT\_REC to QOF1<sub>r</sub> and set the  
3                                   AUX\_PILOT\_WALSH\_CODE1 field of PILOT\_REC to  
4                                   AUX\_PILOT\_WALSH1<sub>r</sub> with the Walsh Code length specified  
5                                   by WALSH\_LENGTH1<sub>r</sub>.
- 6                                   - Otherwise, set the AUX\_PILOT\_QOF1 field of PILOT\_REC to  
7                                   QOF<sub>r</sub> and set the AUX\_PILOT\_WALSH\_CODE1 field of  
8                                   PILOT\_REC to AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code  
9                                   length specified by WALSH\_LENGTH<sub>r</sub>.
- 10                                  - If ADD\_INFO\_INCL2<sub>r</sub> is equal to '1', set the AUX\_PILOT\_QOF2  
11                                  field of PILOT\_REC to QOF2<sub>r</sub> and set the  
12                                  AUX\_PILOT\_WALSH\_CODE2 field of PILOT\_REC to  
13                                  AUX\_PILOT\_WALSH2<sub>r</sub> with the Walsh Code length specified  
14                                  by WALSH\_LENGTH2<sub>r</sub>.
- 15                                  - Otherwise, set the AUX\_PILOT\_QOF2 field of PILOT\_REC to  
16                                  QOF<sub>r</sub> and set the AUX\_PILOT\_WALSH\_CODE2 field of  
17                                  PILOT\_REC to AUX\_PILOT\_WALSH<sub>r</sub> with the Walsh Code  
18                                  length specified by WALSH\_LENGTH<sub>r</sub>.
- 19                                  + QOF\_MASK\_ID\_SCH<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i] =  
20                                  QOF\_MASK\_ID\_SCH<sub>r</sub>.
- 21                                  + FOR\_SCH\_CC\_INDEX<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i]=  
22                                  CODE\_CHAN\_SCH<sub>r</sub>.
- 23                                  + If the mobile station supports Code Combining Soft Handoff, and  
24                                  CCSH\_INCLUDED is set to '1', set  
25                                  CCSH\_ENCODER\_TYPE<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i]=  
26                                  CCSH\_ENCODER\_TYPE<sub>r</sub>.
- 27                                  + If the mobile station supports Code Combining Soft Handoff, and  
28                                  CCSH\_INCLUDED is set to '0', set  
29                                  CCSH\_ENCODER\_TYPE<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>][i]= 0 (default  
30                                  Turbo Encoder type)
- 31                                  • The mobile station may soft-combine the Forward Supplemental Channel  
32                                  frames received on the Forward Supplemental Channels in the same  
33                                  Forward Supplemental Channel Active Set.
- 34                                  • If the mobile station supports any Radio Configuration greater than 2, the  
35                                  mobile station shall perform the following:
  - 36                                   - If FPC\_INCL<sub>r</sub> is equal to '1', the mobile station shall:
    - 37                                   + Set FPC\_MODE\_SCH<sub>s</sub> to FPC\_MODE\_SCH<sub>r</sub>.
  - 38                                   - If FPC\_INCL is equal to '1' and FPC\_MODE\_SCH is equal to '001', '010',  
39                                   '101', or '110', the mobile station shall:
    - 40                                   + Set FPC\_SEC\_CHAN<sub>s</sub> to FPC\_SEC\_CHAN<sub>r</sub>.

- 1           + Set FPC\_BCMC\_CHAN<sub>S</sub> to FPC\_BCMC\_CHAN<sub>R</sub>.
- 2           - If NUM\_SUP<sub>R</sub> is included and not equal to '00', for each Supplemental
- 3           Channel included in the message, the mobile station shall:
- 4           + Set SCH\_ID<sub>S</sub> to SCH\_ID<sub>R</sub>.
- 5           + Set FPC\_SCH\_FER<sub>S</sub> to FPC\_SCH\_FER<sub>R</sub>.
- 6           + Set FPC\_SCH\_INIT\_SETPT<sub>S</sub> as follows:
  - 7           o If FPC\_SCH\_INIT\_SETPT\_OP<sub>R</sub> is set to '0', set
  - 8           FPC\_SCH\_INIT\_SETPT<sub>S</sub> to FPC\_SCH\_INIT\_SETPT<sub>R</sub>.
  - 9           o If FPC\_SCH\_INIT\_SETPT\_OP<sub>R</sub> is set to '1':
    - 10           ◇ If FPC\_PRI\_CHAN<sub>R</sub> is equal to '0', set FPC\_SCH\_INIT\_SETPT<sub>S</sub>
    - 11           to (FPC\_FCH\_CURR\_SETPT<sub>S</sub> + FPC\_SCH\_INIT\_SETPT<sub>R</sub>).
    - 12           ◇ Otherwise, set FPC\_SCH\_INIT\_SETPT<sub>S</sub> to
    - 13           (FPC\_DCCH\_CURR\_SETPT<sub>S</sub> + FPC\_SCH\_INIT\_SETPT<sub>R</sub>).
- 14           + Set FPC\_SCH\_MIN\_SETPT<sub>S</sub> to FPC\_SCH\_MIN\_SETPT<sub>R</sub>.
- 15           + Set FPC\_SCH\_MAX\_SETPT<sub>S</sub> to FPC\_SCH\_MAX\_SETPT<sub>R</sub>.
- 16           - If FPC\_THRESH\_SCH\_INCL is included and equal to '1', the mobile
- 17           station shall set FPC\_SETPT\_THRESH\_SCH<sub>S</sub> to SETPT\_THRESH\_SCH<sub>R</sub>.
- 18           • If RPC\_INCL is equal to '1', the mobile station shall set RLGAIN\_SCH\_PILOT<sub>S</sub>
- 19           to RLGAIN\_SCH\_PILOT<sub>R</sub>.
- 20           • If NUM\_3X\_CFG<sub>R</sub> is not equal to '00', the mobile station shall store the
- 21           Forward 3X Supplemental Channel Configuration associated with the
- 22           identification of Forward Supplemental Channel (NUM\_3X\_CFG<sub>S</sub> =
- 23           NUM\_3X\_CFG<sub>R</sub>).
- 24           • For each 3X SCH record included in this message, the mobile station shall
- 25           update the Forward Supplemental Channel Code list associated with the
- 26           FOR\_SCH\_ID<sub>R</sub> as follows:
  - 27           - For the i<sup>th</sup> record of the Forward Supplemental Channel Active Set (for all
  - 28           values of i between 1 and NUM\_SUP\_SHO+1) specified in this message,
  - 29           the mobile station shall store the following three entries corresponding
  - 30           to the SCCL\_INDEX<sub>R</sub> as follows:
    - 31           + If 3X\_SCH\_LOW\_INCL<sub>R</sub> equals '1', set
    - 32           QOF\_MASK\_ID\_SCH\_LOW[FOR\_SCH\_ID<sub>R</sub>][SCCL\_INDEX<sub>R</sub>][i] to
    - 33           QOF\_MASK\_ID\_SCH\_LOW<sub>R</sub> and
    - 34           FOR\_SCH\_CC\_INDEX\_LOW[FOR\_SCH\_ID<sub>R</sub>][SCCL\_INDEX<sub>R</sub>][i] to
    - 35           CODE\_CHAN\_SCH\_LOW<sub>R</sub>. Otherwise, set
    - 36           QOF\_MASK\_ID\_SCH\_LOW[FOR\_SCH\_ID<sub>R</sub>][SCCL\_INDEX<sub>R</sub>][i] to
    - 37           QOF\_MASK\_ID\_SCH[FOR\_SCH\_ID<sub>R</sub>][SCCL\_INDEX<sub>R</sub>][i] and
    - 38           FOR\_SCH\_CC\_INDEX\_LOW[FOR\_SCH\_ID<sub>R</sub>][SCCL\_INDEX<sub>R</sub>][i] to
    - 39           CODE\_CHAN\_SCH[FOR\_SCH\_ID<sub>R</sub>][SCCL\_INDEX<sub>R</sub>][i].

- 1                   + If  $3X\_SCH\_HIGH\_INCL_r$  equals '1', set  
 2                    $QOF\_MASK\_ID\_SCH\_HIGH[FOR\_SCH\_ID_r][SCCL\_INDEX_r][i]$  to  
 3                    $QOF\_MASK\_ID\_SCH\_HIGH_r$  and  
 4                    $FOR\_SCH\_CC\_INDEX\_HIGH[FOR\_SCH\_ID_r][SCCL\_INDEX_r][i]$  to  
 5                    $CODE\_CHAN\_SCH\_HIGH_r$ . Otherwise, set  
 6                    $QOF\_MASK\_ID\_SCH\_HIGH[FOR\_SCH\_ID_r][SCCL\_INDEX_r][i]$  to  
 7                    $QOF\_MASK\_ID\_SCH[FOR\_SCH\_ID_r][SCCL\_INDEX_r][i]$  and  
 8                    $FOR\_SCH\_CC\_INDEX\_HIGH[FOR\_SCH\_ID_r][SCCL\_INDEX_r][i]$  to  
 9                    $CODE\_CHAN\_SCH[FOR\_SCH\_ID_r][SCCL\_INDEX_r][i]$ .
- 10           • If  $PILOT\_GATING\_USE\_RATE$  is set to '1' and if  $NUM\_REV\_SCH_r$  or  
 11            $NUM\_FOR\_SCH_r$  is not equal to '00', the mobile station shall perform the  
 12           following:
- 13           – The mobile station shall set  $PILOT\_GATING\_USE\_RATE$  to '0' and shall  
 14           start the continuous reverse pilot at the specified action time and, if a F-  
 15           PDCH is assigned, the mobile station shall start the continuous R-  
 16           CQICH as defined in [3].
- 17           – If a F-PDCH is not assigned and the Fundamental Channel was  
 18           previously established prior to transitioning to the *Control Hold Mode*,  
 19           the mobile station shall start processing F-FCH and start transmitting  
 20           on R-FCH at the action time of the message. The mobile station shall  
 21           establish the Fundamental Channel with the same configuration as  
 22           previously used.
- 23           • If  $FOR\_SCH\_CC\_INCL_r$  equals '1', the mobile station shall store the  
 24            $NUM\_FOR\_SCH_r$  occurrences of the Forward Supplemental Channel  
 25           channel configuration records as follows:
- 26           – The mobile station shall store the Forward Supplemental Channel  
 27           Identification ( $FOR\_SCH\_ID[FOR\_SCH\_ID_r]_s = FOR\_SCH\_ID_r$ ).
- 28           – The mobile station shall store the Forward Supplemental Channel  
 29           Multiplex Option ( $FOR\_SCH\_MUX[FOR\_SCH\_ID_r]_s = FOR\_SCH\_MUX_r$ ).
- 30           – The mobile station shall store the Forward Supplemental Channel Radio  
 31           Configuration ( $FOR\_SCH\_RC[FOR\_SCH\_ID_r]_s = SCH\_RC_r$ ).
- 32           – The mobile station shall store the Forward Supplemental Channel  
 33           Coding Type ( $FOR\_SCH\_CODING[FOR\_SCH\_ID_r]_s = CODING_r$ ).
- 34           – If  $FRAME\_40\_USED_r$  and  $FRAME\_80\_USED_r$  are both equal to '0', the  
 35           mobile station shall set  $FOR\_SCH\_FRAME\_LENGTH_s[FOR\_SCH\_ID_r]$  to  
 36           '00' (i.e., 20 ms frame length).
- 37           – If  $FRAME\_40\_USED_r$  is equal to '1', the mobile station shall set  
 38            $FOR\_SCH\_FRAME\_LENGTH_s[FOR\_SCH\_ID_r]$  to '01' (i.e., 40 ms frame  
 39           length).

- 1           - If FRAME\_80\_USED<sub>r</sub> is equal to '1', the mobile station shall set
- 2           FOR\_SCH\_FRAME\_LENGTH<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] to '10' (i.e., 80 ms frame
- 3           length).
- 4           - F\_MAX\_RATE\_IDX<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] = MAX\_RATE<sub>r</sub>.
- 5       • If REV\_SCH\_CC\_INCL<sub>r</sub> equals '1', the mobile station shall store the
- 6       NUM\_REV\_SCH<sub>r</sub> occurrences of the Reverse Supplemental Channel channel
- 7       configuration records as follows:
- 8           - The mobile station shall store the Reverse Supplemental Channel
- 9           Identification (REV\_SCH\_ID[REV\_SCH\_ID<sub>r</sub>]<sub>s</sub> = REV\_SCH\_ID<sub>r</sub>).
- 10          - The mobile station shall store the Reverse Supplemental Channel
- 11          Multiplex Option (REV\_SCH\_MUX[REV\_SCH\_ID<sub>r</sub>]<sub>s</sub> = REV\_SCH\_MUX<sub>r</sub>).
- 12          - The mobile station shall store the Reverse Supplemental Channel Radio
- 13          Configuration (REV\_SCH\_RC[REV\_SCH\_ID<sub>r</sub>]<sub>s</sub> = SCH\_RC<sub>r</sub>).
- 14          - The mobile station shall store the Reverse Supplemental Channel
- 15          Coding Type (REV\_SCH\_CODING[REV\_SCH\_ID<sub>r</sub>]<sub>s</sub> = CODING<sub>r</sub>).
- 16          - If FRAME\_40\_USED<sub>r</sub> and FRAME\_80\_USED<sub>r</sub> are both equal to '0', the
- 17          mobile station shall set REV\_SCH\_FRAME\_LENGTH<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] to
- 18          '00' (i.e., 20 ms frame length).
- 19          - If FRAME\_40\_USED<sub>r</sub> is equal to '1', the mobile station shall set
- 20          REV\_SCH\_FRAME\_LENGTH<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] to '01' (i.e., 40 ms frame
- 21          length).
- 22          - If FRAME\_80\_USED<sub>r</sub> is equal to '1', the mobile station shall set
- 23          REV\_SCH\_FRAME\_LENGTH<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] to '10' (i.e., 80 ms frame
- 24          length).
- 25          - R\_MAX\_RATE\_IDX<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] = MAX\_RATE<sub>r</sub>.
- 26       14. *Forward Supplemental Channel Assignment Mini Message*: The mobile station
- 27       shall process this message as follows:
- 28       The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field
- 29       set to '00000111' (message can not be handled by the current mobile station
- 30       configuration), if any of the mobile station's forward supplemental channel
- 31       configuration parameters for the corresponding Supplemental Channel is NULL.
- 32       Otherwise, the mobile station shall store the following information and process
- 33       the Forward Supplemental Burst as specified in 2.6.6.2.5.1.1:
- 34       • Set FOR\_SCH\_START\_TIME\_INCL<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] to '1'
- 35       • FOR\_SCH\_START\_TIME<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] = FOR\_SCH\_START\_TIME<sub>r</sub>
- 36       • FOR\_SCH\_DURATION<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] = FOR\_SCH\_DURATION<sub>r</sub>
- 37       • SCCL\_INDEX<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] = SCCL\_INDEX<sub>r</sub>

- If PILOT\_GATING\_USE\_RATE is set to '1', the mobile station shall perform the following:
  - The mobile station shall set PILOT\_GATING\_USE\_RATE to '0' and shall start the continuous reverse pilot at the specified action time and, if a F-PDCH is assigned, the mobile station shall start the continuous R-CQICH as defined in [3].
  - If a F-PDCH is not assigned and the Fundamental Channel was previously established prior to transitioning to the *Control Hold Mode*, the mobile station shall start processing F-FCH and start transmitting on R-FCH at the action time of the message. The mobile station shall establish the Fundamental Channel with the same configuration as previously used.

15. *Reverse Supplemental Channel Assignment Mini Message*: The mobile station shall process this message as follows:

The mobile station shall send a *Mobile Station Reject Order* with the ORDQ field set to '00000111' (message can not be handled by the current mobile station configuration), if any of the mobile station's reverse supplemental channel configuration parameters for the corresponding Supplemental Channel is NULL, or if the Reverse Packet Data Channel is assigned.

If IGNORE\_ESCAM<sub>s</sub> is equal to '1', the mobile station shall not process the Reverse Supplemental Channel assignment information in this message.

Otherwise, the mobile station shall store the following information and process the Reverse Supplemental Burst as specified in 2.6.6.2.5.1.2:

- Set REV\_SCH\_START\_TIME\_INCL<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] to '1'
- REV\_SCH\_START\_TIME<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] = REV\_SCH\_START\_TIME<sub>r</sub>
- REV\_SCH\_DURATION<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] = REV\_SCH\_DURATION<sub>r</sub>
- REV\_SCH\_NUM\_BITS\_IDX<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] = REV\_SCH\_NUM\_BITS\_IDX<sub>r</sub>
- If PILOT\_GATING\_USE\_RATE is set to '1', the mobile station shall perform the following:
  - The mobile station shall set PILOT\_GATING\_USE\_RATE to '0' and shall start the continuous reverse pilot at the specified action time and, if a F-PDCH is assigned, the mobile station shall start the continuous R-CQICH as defined in [3].
  - If a F-PDCH is not assigned and the Fundamental Channel was previously established prior to transitioning to the *Control Hold Mode*, the mobile station shall start processing F-FCH and start transmitting on R-FCH at the action time of the message. The mobile station shall establish the Fundamental Channel with the same configuration as previously used.

#### 2.6.6.2.5.1.1 Processing of the Forward Supplemental Burst Assignment

A Forward Supplemental Assignment specifies the explicit start time identified by FOR\_SCH\_START\_TIME or the implicit start time (if FOR\_SCH\_START\_TIME\_INCL is set to '0'), FOR\_SCH\_DURATION, and SCCL\_INDEX of a forward burst assignment. The time interval of duration is specified by FOR\_SCH\_DURATION (see Table 3.7.3.3.2.37-3) and starts at the time specified by the explicit start time FOR\_SCH\_START\_TIME or the implicit start time (if FOR\_SCH\_START\_TIME\_INCL is set to '0'). This time interval for a Forward Supplemental Assignment is called the Forward Supplemental Assignment Interval. A value of FOR\_SCH\_DURATION equal to '1111' indicates infinite duration. The variable SCCL\_INDEX<sub>s</sub>[FOR\_SCH\_ID] specifies the rate, QOF index and the Active Set for the Forward Supplemental Channel identified by FOR\_SCH\_ID for a given Forward Supplemental Assignment. A value of FOR\_SCH\_DURATION equal to '0000' indicates that the mobile station should stop processing the forward Supplemental Channels at the explicit start time specified by FOR\_SCH\_START\_TIME or the implicit start time (if FOR\_SCH\_START\_TIME\_INCL is set to '0'). The implicit start time is the time occurring no later than the first 80 ms boundary (relative to System Time) which occurs at least 80 ms after the end of the frame containing the last bit of the *Extended Supplemental Channel Assignment Message* or the action time of the *Universal Handoff Direction Message*.

If the mobile station receives an *Extended Supplemental Channel Assignment Message* with FOR\_SCH\_CC\_INCL set to '1', the mobile station shall begin to use the Forward Supplemental Channel configuration specified by this message at the start time of this Forward Supplemental Assignment.

For each Forward Supplemental Assignment the mobile station shall determine the start time for processing forward supplemental channel as the time for which the following equation holds:

$$(\lfloor t / (\text{START\_TIME\_UNIT}_s + 1) \rfloor - \text{FOR\_SCH\_START\_TIME}_r) \bmod 32 = 0,$$

where t is the System Time in units of 20 ms.

Figure 2.6.6.2.5.1.1-1 illustrates the scenario in which a second Forward Supplemental Assignment is received while the mobile station is processing the forward supplemental channel according to a previously received assignment. Two cases are displayed in Figure 2.6.6.2.5.1.1-1: Case a) where the first assignment extends beyond the start time of the second assignment and Case b) where the first assignment ends before the second one starts.

a) "Assignment 1" extends beyond the start time for "Assignment 2"

b) "Assignment 1" ends prior to the start time of "Assignment 2"

**Figure 2.6.6.2.5.1.1-1. New Supplemental Channel Assignment Received while a Previous Supplemental Channel Assignment is in Progress**

Figure 2.6.6.2.5.1.1-2 shows an example scenario in which the mobile station receives a second Forward Supplemental Assignment before it starts processing the supplemental channel according to the first assignment. In this case, the second assignment simply replaces the first assignment.

**Figure 2.6.6.2.5.1.1-2. New Supplemental Channel Assignment Received before a Previous Supplemental Channel Assignment starts**

The mobile station shall set  $FPC\_MODE_S$  to  $FPC\_MODE\_SCH_S$  at the  $FOR\_SCH\_START\_TIME_S$  of the forward Supplemental Channel assignment. The mobile station shall set  $FPC\_MODE_S$  to  $FPC\_MODE\_NO\_SCH_S$  at the end of the forward Supplemental Channel assignment.

For each Forward Supplemental Channel assignment corresponding to each Forward Supplemental Channel (identified by FOR\_SCH\_ID), the mobile station should perform the following:

- If FOR\_SCH\_DURATION<sub>s</sub>[FOR\_SCH\_ID] is not equal to '0000', then
  - If the mobile station is currently processing the Forward Supplemental Channel identified by FOR\_SCH\_ID, then the mobile station should continue processing the Forward Supplemental Channel identified by FOR\_SCH\_ID according to the Forward Supplemental Assignment previously received for the Forward Supplemental Channel identified by FOR\_SCH\_ID up to the time specified by the FOR\_SCH\_START\_TIME<sub>s</sub>[FOR\_SCH\_ID] (i.e., the mobile station should stop processing the forward supplemental channel identified by FOR\_SCH\_ID at either the time specified by the start time of the new assignment, or at the time the previously received assignment ends, whichever time is earlier).

At the time specified by FOR\_SCH\_START\_TIME<sub>s</sub>[FOR\_SCH\_ID], the mobile station should start processing the Forward Supplemental Channel identified by FOR\_SCH\_ID for a duration of time specified by FOR\_SCH\_DURATION[FOR\_SCH\_ID]<sub>s</sub> with FOR\_SCH\_MUX<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>], FOR\_SCH\_RC<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>], FOR\_SCH\_CODING<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>], FOR\_SCH\_FRAME\_LENGTH<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>], the QOF index, the Supplemental Channel Active Set indexed by SCCL\_INDEX<sub>s</sub>[FOR\_SCH\_ID], and number of information bits per frame (or set of number of bits per frame if FSCH\_VAR\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is not equal to '000') specified by N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>].

If the set of number of bits per frame, N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>], has more than one member and F\_INC\_RATE\_ALLOWED<sub>s</sub> is equal to '0', then the following rule applies for the duration of this assignment:

- + Once the mobile station determines the forward Supplemental Channel number of bits per frame, the number of bits per frame in the subsequent Forward Supplemental Channel frames may be any member of the set N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>] which is smaller or equal to the number of bits in the current frame.
- Otherwise, if the mobile station is not currently processing the Forward Supplemental Channel identified by FOR\_SCH\_ID, then at the time specified by FOR\_SCH\_START\_TIME<sub>s</sub>[FOR\_SCH\_ID], the mobile station should start processing the Forward Supplemental Channel identified by FOR\_SCH\_ID for a duration of time specified by FOR\_SCH\_DURATION<sub>s</sub>[FOR\_SCH\_ID] with the QOF index, the Supplemental Channel Active Set indexed by SCCL\_INDEX<sub>s</sub>[FOR\_SCH\_ID], and number of bits per frame (or set of number of information bits per frame if FSCH\_VAR\_TABLE\_ID<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>] is not equal to '000') specified by N\_FSCH\_BITS\_SET<sub>s</sub>[FOR\_SCH\_ID<sub>r</sub>][SCCL\_INDEX<sub>r</sub>].

If the set of number of bits per frame,  $N\_FSCH\_BITS\_SET_S[FOR\_SCH\_ID_I][SCCL\_INDEX_I]$  and  $F\_INC\_RATE\_ALLOWED_S$  is equal to '0', has more than one member, then the following rule applies for the duration of this assignment:

- + Once the mobile station determines the forward Supplemental Channel number of bits per frame, the number of bits per frame in the subsequent Forward Supplemental Channel frames may be any member of the set  $N\_FSCH\_BITS\_SET_S[FOR\_SCH\_ID_I][SCCL\_INDEX_I]$  which is smaller or equal to the number of bits in the current frame.

- If  $FOR\_SCH\_DURATION_S[FOR\_SCH\_ID]$  is equal to '0000', the mobile station should perform the following:

- If the mobile station is currently processing the Forward Supplemental Channel identified by  $FOR\_SCH\_ID$ , then the mobile station should continue processing the Forward Supplemental Channel identified by  $FOR\_SCH\_ID$  according to the Forward Supplemental Assignment previously received for the Forward Supplemental Channel identified by  $FOR\_SCH\_ID$  up to the time specified by the implicit start time ( $FOR\_SCH\_START\_TIME\_INCL_S$  is set to '0') or the explicit start time ( $FOR\_SCH\_START\_TIME\_INCL_S$  is set to '1') (i.e., the mobile station should stop processing the forward supplemental channel identified by  $FOR\_SCH\_ID$  at the time specified by the implicit start time or the explicit start time, or at the time the previously received assignment ends, whichever time is earlier). The mobile station should cancel the pending Forward Supplemental Channel assignment if any.

- + If  $FOR\_SCH\_START\_TIME\_INCL_S$  is equal to '1', the mobile station should stop processing the Forward Supplemental Channel identified by  $FOR\_SCH\_ID$  at the time specified by  $FOR\_SCH\_START\_TIME_S[FOR\_SCH\_ID]$ .

- + If  $FOR\_SCH\_START\_TIME\_INCL_S$  is equal to '0', the mobile station should stop processing the Forward Supplemental Channel identified by  $FOR\_SCH\_ID$  no later than the first 80 ms boundary (relative to System Time) occurring at least 80 ms after the end of the frame containing the last bit of the *Extended Supplemental Channel Assignment Message* or the action time of the *Universal Handoff Direction Message*.

- Otherwise, if the mobile station is not currently processing the Forward Supplemental Channel identified by  $FOR\_SCH\_ID$ , the mobile station should cancel the pending Forward Supplemental Channel assignment if any.

#### 2.6.6.2.5.1.2 Processing of the Reverse Supplemental Burst Assignment

A Reverse Supplemental Assignment specifies the explicit start time identified by  $REV\_SCH\_START\_TIME$  or the implicit start time (if  $REV\_SCH\_START\_TIME\_INCL$  is set to '0'),  $REV\_SCH\_DURATION$ , and  $REV\_SCH\_NUM\_BITS\_IDX$  of a reverse burst assignment. The time interval of duration is specified by  $REV\_SCH\_DURATION$  (see Table 3.7.3.3.2.37-3) and starts at the time specified by the explicit start time  $REV\_SCH\_START\_TIME$  or the

implicit start time (if REV\_SCH\_START\_TIME\_INCL is set to '0'). This time interval for a Reverse Supplemental Assignment is called the reverse supplemental assignment interval. A value of REV\_SCH\_DURATION equal to '1111' indicates infinite duration. A value of REV\_SCH\_DURATION equal to '0000' indicates that the mobile station should stop transmitting the reverse Supplemental Channels at the explicit start time specified by REV\_SCH\_START\_TIME or the implicit start time (if REV\_SCH\_START\_TIME\_INCL is set to '0'). The implicit start time is the time occurring no later than the first 80 ms boundary (relative to System Time) which occurs at least 80 ms after the end of the frame containing the last bit of the *Extended Supplemental Channel Assignment Message* or the action time of the *Universal Handoff Direction Message*.

If the mobile station receives an *Extended Supplemental Channel Assignment Message* with REV\_SCH\_CC\_INCL set to '1', the mobile station shall begin to use the Reverse Supplemental Channel configuration specified by this message at the start time of this Reverse Supplemental Assignment.

For each Reverse Supplemental Assignment the mobile station shall determine the start time for processing reverse supplemental channel as the time for which the following equation holds:

$$(\lfloor t / (\text{START\_TIME\_UNIT}_S + 1) \rfloor - \text{REV\_SCH\_START\_TIME}_R) \bmod 32 = 0,$$

where t is the System Time in units of 20 ms.

Figure 2.6.6.2.5.1.1-1 illustrates the scenario in which a second Reverse Supplemental Assignment is received while the mobile station is transmitting on the reverse supplemental channel according to a previously received assignment. Two cases are displayed in Figure 2.6.6.2.5.1.1-1: Case a) where the first assignment extends beyond the start time of the second assignment and Case b) where the first assignment ends before the second one starts.

Figure 2.6.6.2.5.1.1-2 shows an example scenario in which the mobile station receives a second Reverse Supplemental Assignment before it starts transmitting on the supplemental channel according to the first assignment. In this case, the second assignment simply replaces the first assignment.

For each Reverse Supplemental Channel assignment corresponding to each Reverse Supplemental Channel (identified by REV\_SCH\_ID), the mobile station shall perform the following:

- The mobile station shall determine,  $N_{\text{RSCH\_BITS}_S}[\text{REV\_SCH\_ID}_R]$ , the number of information bits per Reverse Supplemental Channel frame identified by REV\_SCH\_ID according to the following rules:
  - If  $\text{RSCH\_VAR\_TABLE\_ID}_S[\text{REV\_SCH\_ID}_R]$  is equal to '000', then:

- 1           + If USE\_FLEX\_NUM\_BITS<sub>S</sub> is equal to '0' or if USE\_FLEX\_NUM\_BITS<sub>S</sub> is  
2           equal to '1' and RSCH\_NBIT\_TABLE\_ID<sub>S</sub>[REV\_SCH\_ID<sub>R</sub>] is equal to '0000',  
3           then the mobile station shall set the number of information bits per frame,  
4           N\_RSCH\_BITS\_SET<sub>S</sub>[REV\_SCH\_ID<sub>R</sub>] and number of CRC bits per frame,  
5           RSCH\_CRC\_LEN\_SET<sub>S</sub>[REV\_SCH\_ID<sub>R</sub>], according to Table 3.7.3.3.2.37-2  
6           using REV\_SCH\_NUM\_BITS\_IDX<sub>R</sub> as the index to the table.
- 7           + If USE\_FLEX\_NUM\_BITS<sub>S</sub> is equal to '1' and  
8           RSCH\_NBIT\_TABLE\_ID<sub>S</sub>[REV\_SCH\_ID<sub>R</sub>] is not equal to '0000', then the  
9           mobile station shall set the number of CRC bits per frame,  
10          RSCH\_CRC\_LEN\_SET<sub>S</sub>[REV\_SCH\_ID<sub>R</sub>], according to Table 3.7.5.20-1 using  
11          CRC\_LEN\_IDX<sub>S</sub>[RSCH\_NBIT\_TABLE\_ID<sub>S</sub>[REV\_SCH\_ID<sub>R</sub>]][REV\_SCH\_NUM\_BITS\_IDX<sub>R</sub>]  
12          as the index to the table. The mobile station shall also set the  
13          number of information bits per frame, N\_RSCH\_BITS\_SET<sub>S</sub>[REV\_SCH\_ID<sub>R</sub>], to  
14          NUM\_BITS<sub>S</sub>[RSCH\_NBIT\_TABLE\_ID<sub>S</sub>[REV\_SCH\_ID<sub>R</sub>]][  
15          [REV\_SCH\_NUM\_BITS\_IDX<sub>R</sub>].
- 16         - If RSCH\_VAR\_TABLE\_ID<sub>S</sub>[REV\_SCH\_ID<sub>R</sub>] is not equal to '000', then:
- 17           + The mobile station shall set N\_RSCH\_BITS\_IDX\_SET<sub>S</sub>[REV\_SCH\_ID<sub>R</sub>], the  
18           set of indices to the number of information bits per frame as follows:
- 19           o If REV\_SCH\_NUM\_BITS\_IDX<sub>R</sub> is equal to '0000', then  
20           N\_RSCH\_BITS\_IDX\_SET<sub>S</sub>[REV\_SCH\_ID<sub>R</sub>] = {REV\_SCH\_NUM\_BITS\_IDX<sub>R</sub>},
- 21           o otherwise, the mobile station shall set (initialize)  
22           N\_RSCH\_BITS\_IDX\_SET<sub>S</sub>[REV\_SCH\_ID<sub>R</sub>] = { REV\_SCH\_NUM\_BITS\_IDX<sub>R</sub>  
23           }, and for i=1, ..., REV\_SCH\_NUM\_BITS\_IDX<sub>R</sub> the mobile station shall  
24           add REV\_SCH\_NUM\_BITS\_IDX<sub>R</sub> -  
25           VAR\_RSCH\_RATE\_OFFSET<sub>S</sub>[REV\_SCH\_ID<sub>R</sub>][REV\_SCH\_NUM\_BITS\_IDX<sub>R</sub>][  
26           i] to the set specified by N\_RSCH\_BITS\_IDX\_SET<sub>S</sub>[FOR\_SCH\_ID<sub>R</sub>]
- 27           + If USE\_FLEX\_NUM\_BITS<sub>S</sub> is equal to '0' or if USE\_FLEX\_NUM\_BITS<sub>S</sub> is  
28           equal to '1' and RSCH\_NBIT\_TABLE\_ID<sub>S</sub>[REV\_SCH\_ID<sub>R</sub>] is equal to '0000',  
29           then the mobile station shall determine N\_RSCH\_BITS\_SET<sub>S</sub>[REV\_SCH\_ID<sub>R</sub>],  
30           the set of number of information bits per frame as follows. The  $i^{\text{th}}$  member of  
31           the set N\_RSCH\_BITS\_SET<sub>S</sub>[REV\_SCH\_ID<sub>R</sub>] is obtained using Table  
32           3.7.3.3.2.37-1 and the  $i^{\text{th}}$  member of the set  
33           N\_RSCH\_BITS\_IDX\_SET<sub>S</sub>[REV\_SCH\_ID<sub>R</sub>] as the index to the table.
- 34           + If USE\_FLEX\_NUM\_BITS<sub>S</sub> is equal to '1' and  
35           RSCH\_NBIT\_TABLE\_ID<sub>S</sub>[FOR\_SCH\_ID<sub>R</sub>] is not equal to '0000', then
- 36           o the mobile station shall set N\_RSCH\_BITS\_SET<sub>S</sub>[REV\_SCH\_ID<sub>R</sub>], the set  
37           of number of information bits per frame as follows.  
38           The  $i^{\text{th}}$  member of the set N\_RSCH\_BITS\_SET<sub>S</sub>[REV\_SCH\_ID<sub>R</sub>] is equal to  
39           NUM\_BITS<sub>S</sub>[SCH\_NBIT\_TABLE\_ID<sub>S</sub>[REV\_SCH\_ID<sub>R</sub>]][  
40           [N\_RSCH\_BITS\_IDX\_SET<sub>S</sub>[REV\_SCH\_ID<sub>R</sub>]][i]], where  
41           N\_RSCH\_BITS\_IDX\_SET<sub>S</sub>[REV\_SCH\_ID<sub>R</sub>][i] denotes the  $i^{\text{th}}$  member of the  
42           set N\_RSCH\_BITS\_IDX\_SET<sub>S</sub>[REV\_SCH\_ID<sub>R</sub>].

- 1           o the mobile station shall set RSCH\_CRC\_LEN\_SET<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>], the  
2           set of number of information bits per frame as follows.  
3           The  $i^{\text{th}}$  member of the set RSCH\_CRC\_LEN\_IDX\_SET<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] is  
4           equal to  
5           CRC\_LEN\_IDX<sub>s</sub>[RSCH\_NBIT\_TABLE\_ID<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>]][N\_RSCH\_BITS\_I  
6           DX\_SET<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>][i]], where  
7           N\_RSCH\_BITS\_IDX\_SET<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>][i] denotes the  $i^{\text{th}}$  member of the  
8           set N\_RSCH\_BITS\_IDX\_SET<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>].
- 9       • If REV\_SCH\_DURATION<sub>s</sub>[REV\_SCH\_ID] is not equal to '0000', then
- 10       – If the mobile station is currently transmitting on the Reverse Supplemental  
11       Channel identified by REV\_SCH\_ID, then the mobile station may continue  
12       transmitting on the Reverse Supplemental Channel identified by REV\_SCH\_ID  
13       with the Walsh cover specified by  
14       REV\_WALSH\_ID<sub>s</sub>[REV\_SCH\_ID][REV\_SCH\_NUM\_BITS\_IDX[REV\_SCH\_ID<sub>r</sub>]]  
15       according to the current Reverse Supplemental Assignment for the Reverse  
16       Supplemental Channel identified by REV\_SCH\_ID up to the time specified by  
17       the REV\_SCH\_START\_TIME<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] (i.e., the mobile station shall stop  
18       transmitting on the reverse supplemental channel identified by REV\_SCH\_ID at  
19       either the time specified by the start time of the new assignment, or at the time  
20       the previously received assignment ends, whichever time is earlier).
- 21       At the time specified by REV\_SCH\_START\_TIME<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>], the mobile  
22       station may start transmitting on the Reverse Supplemental Channel identified  
23       by REV\_SCH\_ID with REV\_SCH\_MUX<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>],  
24       REV\_SCH\_RC<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>], REV\_SCH\_CODING<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>],  
25       REV\_SCH\_FRAME\_LENGTH<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>], the Walsh cover specified by  
26       REV\_WALSH\_ID<sub>s</sub>[REV\_SCH\_ID][REV\_SCH\_NUM\_BITS\_IDX<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>]]  
27       and number of bits per frame (or set of number of information bits per frame if  
28       RSCH\_VAR\_TABLE\_ID<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>] is not equal to '000') specified by  
29       N\_RSCH\_BITS\_SET<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>].
- 30       If the set of number of bits per frame, N\_RSCH\_BITS\_SET<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>], has  
31       more than one member and R\_INC\_RATE\_ALLOWED<sub>s</sub> is equal to '0', then the  
32       following rule applies for the duration of this assignment:
- 33       + Once the mobile station transmits  $n$  number of bits per Reverse  
34       Supplemental Channel specifies by REV\_SCH\_ID, where  $n$  is a member of  
35       the set N\_RSCH\_BITS\_SET<sub>s</sub>[REV\_SCH\_ID<sub>r</sub>], the mobile station shall not  
36       transmit at a rate higher than the one specifies by  $n$  information bits per  
37       frame for the duration of the assignment.

- 1       – If the mobile station is not currently transmitting on the Reverse Supplemental  
2       Channel identified by  $REV\_SCH\_ID_r$ , then at the time specified by  
3        $REV\_SCH\_START\_TIME_s[REV\_SCH\_ID_r]$ , the mobile station may start  
4       transmitting on the Reverse Supplemental Channel identified by  $REV\_SCH\_ID$   
5       with the Walsh cover specified by  
6        $REV\_WALSH\_ID_s[REV\_SCH\_ID][REV\_SCH\_NUM\_BITS\_IDX_s[REV\_SCH\_ID_r]]$   
7       and number of bits per frame (or set of number of information bits per frame if  
8        $RSCH\_VAR\_TABLE\_ID_s[REV\_SCH\_ID_r]$  is not equal to '000') specified by  
9        $N\_RSCH\_BITS\_SET_s[REV\_SCH\_ID_r]$ . If the set of number of bits per frame,  
10       $N\_RSCH\_BITS\_SET_s[REV\_SCH\_ID_r]$ , has more than one member and  
11       $R\_INC\_RATE\_ALLOWED_s$  is equal to '0', then the following rule applies for the  
12      duration of this assignment:
- 13      + Once the mobile station transmits  $n$  number of bits per Reverse  
14      Supplemental Channel specifies by  $REV\_SCH\_ID$ , where  $n$  is a member of  
15      the set  $N\_RSCH\_BITS\_SET_s[REV\_SCH\_ID_r]$ , the mobile station shall not  
16      transmit at a rate higher than the one specifies by  $n$  information bits per  
17      frame for the duration of the assignment.
- 18   • If  $REV\_SCH\_DURATION_s[REV\_SCH\_ID_r]$  is equal to '0000', the mobile station shall  
19   perform the followings:
- 20      – If the mobile station is currently transmitting on the Reverse Supplemental  
21      Channel identified by  $REV\_SCH\_ID$ , then the mobile station may continue  
22      transmitting on the Reverse Supplemental Channel identified by  $REV\_SCH\_ID$   
23      with the Walsh cover specified by  
24       $REV\_WALSH\_ID_s[REV\_SCH\_ID][REV\_SCH\_NUM\_BITS\_IDX[REV\_SCH\_ID_r]]$   
25      according to the current Reverse Supplemental Assignment for the Reverse  
26      Supplemental Channel identified by  $REV\_SCH\_ID$  up to the time specified by  
27      the implicit start time (if  $REV\_SCH\_START\_TIME\_INCL_s$  is equal to '1') or the  
28      explicit start time (if  $REV\_SCH\_START\_TIME\_INCL_s$  is equal to '1') (i.e., the  
29      mobile station shall stop transmitting on the reverse supplemental channel  
30      identified by  $REV\_SCH\_ID$  at the implicit start time or the explicit start time, or  
31      at the time the previously received assignment ends, whichever time is earlier).  
32      The mobile station shall cancel the pending Reverse Supplemental Channel  
33      assignment if any.
- 34      + If  $REV\_SCH\_START\_TIME\_INCL_s$  is equal to '1', the mobile station shall stop  
35      transmitting on the Reverse Supplemental Channel identified by  
36       $REV\_SCH\_ID_r$  at the time specified by  
37       $REV\_SCH\_START\_TIME_s[REV\_SCH\_ID_r]$ .
- 38      + If  $REV\_SCH\_START\_TIME\_INCL_s$  is equal to '0', the mobile station shall stop  
39      transmitting on the Reverse Supplemental Channel identified by  
40       $REV\_SCH\_ID_r$  no later than the first 80 ms boundary (relative to System  
41      Time) occurring at least 80 ms after the end of the frame containing the last  
42      bit of the *Extended Supplemental Channel Assignment Message* or the action  
43      time of the *Universal Handoff Direction Message*.

- 1       – Otherwise, if the mobile is not currently transmitting on the Reverse  
2       Supplemental Channel identified by REV\_SCH\_ID, the mobile station shall  
3       cancel the pending Forward Supplemental Channel assignment if any.
- 4       • If REV\_SCH\_DTX\_DURATION<sub>S</sub> is not equal to '1111', the mobile station shall  
5       perform the following:
  - 6       – The mobile station shall maintain a  
7       REV\_SCH\_DTX\_TRANSMISSION\_COUNTER[REV\_SCH\_ID<sub>r</sub>] counter counting  
8       discontinuous transmission time in units of 20 ms as follows:
    - 9       + The mobile station shall reset the  
10       REV\_SCH\_DTX\_TRANSMISSION\_COUNTER[REV\_SCH\_ID<sub>r</sub>] counter to 0:
      - 11       o For each Reverse Supplemental Channel assignment corresponding to  
12       REV\_SCH\_ID<sub>r</sub>, at action time specified by the REV\_SCH\_START\_TIME<sub>r</sub>  
13       field for that assignment, if included; otherwise at the action time of the  
14       message.
      - 15       o Each time the mobile station resumes transmission on Reverse  
16       Supplemental Channelc after discontinued operation on the Reverse  
17       Supplemental Channel.
    - 18       + The mobile station shall increment the  
19       REV\_SCH\_DTX\_TRANSMISSION\_COUNTER[REV\_SCH\_ID<sub>r</sub>] counter by one  
20       at each 20ms interval for which the mobile station is not transmitting on  
21       the Reverse Supplemental Channel during the Reverse Supplemental  
22       Channel duration.
  - 23       – If the REV\_SCH\_DTX\_TRANSMISSION\_COUNTER[REV\_SCH\_ID<sub>r</sub>] counter value  
24       exceeds REV\_SCH\_DTX\_DURATION<sub>S</sub> (i.e., the mobile station discontinues  
25       transmission on the Reverse Supplemental Channel for more than the duration  
26       specified by REV\_SCH\_DTX\_DURATION<sub>S</sub>), the mobile station shall perform the  
27       following:
    - 28       + The mobile station shall not resume transmission on the Reverse  
29       Supplemental Channel corresponding to REV\_SCH\_ID<sub>r</sub>.
    - 30       + The mobile station shall send an indication to each affected service instance  
31       indicating that the mobile station has terminated transmission on the  
32       supplemental channel corresponding to REV\_SCH\_ID<sub>r</sub> due to expiration of  
33       the discontinued transmission period.

#### 34 2.6.6.2.5.2 Processing of Reverse Traffic Channel Handoff Messages

35 The mobile station sends the following messages on the Reverse Traffic Channel in support  
36 of handoff when its transmitter is enabled, following the receipt of a *forward dedicated*  
37 *channel acquired* indication from Layer 2 (see [4]):

- 38 1. *Pilot Strength Measurement Message* or *Extended Pilot Strength Measurement*  
39 *Message*: The mobile station shall send an autonomous *Pilot Strength*  
40 *Measurement Message* if P\_REV\_IN\_USE<sub>S</sub> is less than seven or *Extended Pilot*  
41 *Strength Measurement Message* if P\_REV\_IN\_USE<sub>S</sub> is equal to or greater than seven  
42 in assured mode. The mobile station shall send either *Pilot Strength Measurement*

1 *Message or Extended Pilot Strength Measurement Message* containing  
 2 measurements consistent with the event whenever any of the following events  
 3 occur:

- 4 • P\_REV\_IN\_USE<sub>s</sub> is less than or equal to three or SOFT\_SLOPE<sub>s</sub> is equal to  
 5 '000000' and the strength of a Neighbor Set or Remaining Set pilot is found to  
 6 be above T\_ADD<sub>s</sub>.
- 7 • P\_REV\_IN\_USE<sub>s</sub> is greater than three, SOFT\_SLOPE<sub>s</sub> is not equal to '000000',  
 8 and the strength PS, as specified in 2.6.6.2.2, of any Candidate Set pilot is  
 9 found to satisfy the following inequality:

$$10 \times \log_{10} PS > \frac{\text{SOFT\_SLOPE}_s}{8} \times 10 \times \log_{10} \sum_{i \in A} PS_i + \frac{\text{ADD\_INTERCEPT}_s}{2}$$

11 where the summation is performed over all pilots currently in the Active Set and  
 12 a *Pilot Strength Measurement Message* or an *Extended Pilot Strength*  
 13 *Measurement Message* carrying this information has not been sent since the  
 14 last *Extended Handoff Direction Message*, *General Handoff Direction Message* or  
 15 *Universal Handoff Direction Message* was received.

- 16 • P\_REV\_IN\_USE<sub>s</sub> is greater than three, SOFT\_SLOPE<sub>s</sub> is not equal to '000000',
